- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

B16F7-15-FRONT LEFT FOG LAMP CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete FOG LAMPS SYSTEM wiring diagram, Refer to the appropriate wiring information .

THEORY OF OPERATION

Incandescent Front Fog Lamps: The Front Fog Lamp Switch is integral to the Headlamp Switch. When the Body Control Module (BCM) receives an input signal from the Headlamp Switch, requesting Front Fog Lamp illumination, the BCM provides a Pulse Width Modulated (PWM) voltage output, through the Left and Right Front Fog Lamp Control Circuits, to the Left and Right Front Fog Lamps. A separate ground circuit is provided to the Left and Right Front Fog Lamps through the wiring harness to the body sheet metal.

LED Front Fog Lamps: The Fog Lamp Switch is integral to the Headlamp Switch. When the Body Control Module (BCM) receives an input signal from the Headlamp Switch, requesting Front Fog Lamp illumination, the BCM provides a voltage signal, through the Left and Right Front Fog Lamp Control Circuits, to activate the Left and Right Front Fog Lamps. A separate ground circuit is provided to the Left and Right Front Fog Lamps through the wiring harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- **Bulb Equipped:** When the Front Fog Lamps are active and the Body Control Module (BCM) detects less than 0.35 amps on the Left Front Fog Lamp Control circuit for greater than five seconds.
- **LED Equipped:** When the Front Fog Lamps are active and the Body Control Module (BCM) detects less than 0.5 milliamps on the Left Front Fog Lamp Control circuit for greater than five seconds.

DEFAULT ACTION

- The Fog Lamp is always on or inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT FOG LAMP CONTROL CIRCUIT OPEN
LEFT FRONT FOG LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
GROUND CIRCUIT OPEN
LEFT FRONT FOG LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. DISCONNECT THE LEFT FRONT FOG LAMP HARNESS CONNECTOR AND CHECK FOR VOLTAGE ON THE (L89) LEFT FRONT FOG LAMP CONTROL CIRCUIT

NOTE: Make sure the Fog Lamps are off when performing this step.

1. Turn the ignition off.
2. Disconnect the component harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L89) LEFT FRONT FOG LAMP CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [7](#)

4. CHECK THE LEFT FRONT FOG LAMP GROUND CIRCUIT(S) FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#).

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.

- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to **STANDARD PROCEDURE** .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L89) LEFT FRONT FOG LAMP CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A 12-VOLT TEST LIGHT BETWEEN GROUND AND THE (L89) LEFT FRONT FOG LAMP CONTROL CIRCUIT - CHECK THE BCM OUTPUT

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Using a 12-volt test light, connect the test light lead to a known good ground.
3. With the 12-volt test light, probe the circuit being tested at the component harness connector.
4. Turn the ignition on.
5. Activate the system or ECU output for the circuit being tested.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace the Left Front Fog Lamp in accordance with the Service Information. Refer to [LAMP, FOG, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

7. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).

- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

B16FB-11-FRONT RIGHT FOG LAMP CONTROL-CIRCUIT SHORT TO GROUND

For a complete FOG LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information**.

THEORY OF OPERATION

Incandescent Front Fog Lamps: The Front Fog Lamp Switch is integral to the Headlamp Switch. When the Body Control Module (BCM) receives an input signal from the Headlamp Switch, requesting Front Fog Lamp illumination, the BCM provides a Pulse Width Modulated (PWM) voltage output, through the Left and Right Front Fog Lamp Control Circuits, to the Left and Right Front Fog Lamps. A separate ground circuit is provided to the Left and Right Front Fog Lamps through the wiring harness to the body sheet metal.

LED Front Fog Lamps: The Fog Lamp Switch is integral to the Headlamp Switch. When the Body Control Module (BCM) receives an input signal from the Headlamp Switch, requesting Front Fog Lamp illumination, the BCM provides a voltage signal, through the Left and Right Front Fog Lamp Control Circuits, to activate the Left and Right Front Fog Lamps. A separate ground circuit is provided to the Left and Right Front Fog Lamps through the wiring harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- **Bulb Equipped:** When the Front Fog Lamps are active and the Body Control Module (BCM) detects greater than 7.86 amps on the Right Front Fog Lamp Control circuit for greater than four seconds.

- Four consecutive BCM output retry attempts have failed within the same ignition cycle.
- **LED Equipped:** When the Front Fog Lamps are active and the Body Control Module (BCM) detects greater than 3.0 amps on the Right Front Fog Lamp Control circuit for greater than four seconds.
- Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The Fog Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT FOG LAMP CONTROL CIRCUIT SHORTED TO GROUND
RIGHT FRONT FOG LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. CHECK THE RIGHT FRONT FOG LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Right Front Fog Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Right Front Fog Lamp in accordance with the Service Information. Refer to **LAMP, FOG, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L90) RIGHT FRONT FOG LAMP CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.

- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B16FB-15-FRONT RIGHT FOG LAMP CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete FOG LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

Incandescent Front Fog Lamps: The Front Fog Lamp Switch is integral to the Headlamp Switch. When the Body Control Module (BCM) receives an input signal from the Headlamp Switch, requesting Front Fog Lamp illumination, the BCM provides a Pulse Width Modulated (PWM) voltage output, through the Left and Right Front Fog Lamp Control Circuits, to the Left and Right Front Fog Lamps. A separate ground circuit is provided to the Left and Right Front Fog Lamps through the wiring harness to the body sheet metal.

LED Front Fog Lamps: The Fog Lamp Switch is integral to the Headlamp Switch. When the Body Control Module (BCM) receives an input signal from the Headlamp Switch, requesting Front Fog Lamp illumination, the BCM provides a voltage signal, through the Left and Right Front Fog Lamp Control Circuits, to activate the Left and Right Front Fog Lamps. A separate ground circuit is provided to the Left and Right Front Fog Lamps through the wiring harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- **Bulb Equipped:** When the Front Fog Lamps are active and the Body Control Module (BCM) detects less than 0.35 amps on the Right Front Fog Lamp Control circuit for greater than five seconds.
- **LED Equipped:** When the Front Fog Lamps are active and the Body Control Module (BCM) detects less than 0.5 milliamps on the Right Front Fog Lamp Control circuit for greater than five seconds.

DEFAULT ACTION

- The Fog Lamp is always on or inoperative.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT FOG LAMP CONTROL CIRCUIT OPEN
RIGHT FRONT FOG LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
GROUND CIRCUIT OPEN
RIGHT FRONT FOG LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. DISCONNECT THE RIGHT FRONT FOG LAMP HARNESS CONNECTOR AND CHECK FOR VOLTAGE ON THE (L90) RIGHT FRONT FOG LAMP CONTROL CIRCUIT

NOTE: **Make sure the Fog Lamps are off when performing this step.**

1. Turn the ignition off.
2. Disconnect the component harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: **When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.**

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L90) RIGHT FRONT FOG LAMP CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

4. CHECK THE RIGHT FRONT FOG LAMP GROUND CIRCUIT(S) FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1

amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE:

Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE:

When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE:

Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L90) RIGHT FRONT FOG LAMP CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A 12-VOLT TEST LIGHT BETWEEN GROUND AND THE (L90) RIGHT FRONT FOG LAMP CONTROL CIRCUIT - CHECK THE BCM OUTPUT

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Using a 12-volt test light, connect the test light lead to a known good ground.
3. With the 12-volt test light, probe the circuit being tested at the component harness connector.
4. Turn the ignition on.
5. Activate the system or ECU output for the circuit being tested.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace the Right Front Fog Lamp in accordance with the Service Information. Refer to [LAMP, FOG, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

7. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B16FF-11-REAR LEFT FOG LAMP CONTROL-CIRCUIT SHORT TO GROUND

For a complete FOG LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

Incandescent Rear Fog Lamps: When the Body Control Module (BCM) receives an input signal from the Rear Fog Lamp Switch, requesting Rear Fog Lamp illumination, the BCM provides a Pulse Width Modulated (PWM) voltage output, through the Left and Right Rear Fog Lamp Feed Circuits, to the Left and Right Rear Fog Lamps. A separate ground circuit is provided to the Left and Right Rear Fog Lamps through the wiring harness to the body sheet metal.

LED Rear Fog Lamps: When the Body Control Module (BCM) receives an input signal from the Rear Fog Lamp Switch, requesting Rear Fog Lamp illumination, the BCM provides a voltage signal, through the Left and Right Rear Fog Lamp Feed Circuits, to activate the Left and Right Rear Fog Lamps. A separate ground circuit is provided to the Left and Right Rear Fog Lamps through the wiring harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- When the Rear Fog Lamps are active and the Body Control Module (BCM) detects greater than 3.015 amperes on the Left Rear Fog Lamp Feed circuit for greater than 1.28 seconds.
- After four consecutive failed retry attempts the BCM will disable the output for the remainder of the ignition cycle.

DEFAULT ACTION

- The Rear Fog Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT REAR FOG LAMP FEED CIRCUIT SHORTED TO GROUND
LEFT REAR FOG LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **[PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#)**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after wiring repair or module replacement:**

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE LEFT REAR FOG LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Left Rear Fog Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Left Rear Fog Lamp in accordance with the Service Information. Refer to **LAMP, FOG, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L899) LEFT REAR FOG LAMP FEED CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.

2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B16FF-15-REAR LEFT FOG LAMP CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete FOG LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

Incandescent Rear Fog Lamps: When the Body Control Module (BCM) receives an input signal from the Rear Fog Lamp Switch, requesting Rear Fog Lamp illumination, the BCM provides a Pulse Width Modulated (PWM) voltage output, through the Left and Right Rear Fog Lamp Feed Circuits, to the Left and Right Rear Fog Lamps. A separate ground circuit is provided to the Left and Right Rear Fog Lamps through the wiring harness to the body sheet metal.

LED Rear Fog Lamps: When the Body Control Module (BCM) receives an input signal from the Rear Fog Lamp Switch, requesting Rear Fog Lamp illumination, the BCM provides a voltage signal, through the Left and Right Rear Fog Lamp Feed Circuits, to activate the Left and Right Rear Fog Lamps. A separate ground circuit is provided to the Left and Right Rear Fog Lamps through the wiring harness to the body sheet metal.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Rear Fog Lamps are active and the Body Control Module (BCM) detects less than 0.333 volts on the Left Rear Fog Lamp Feed circuit for greater than 1.28 seconds.

DEFAULT ACTION

- The Rear Fog Lamp is always on or inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT REAR FOG LAMP FEED CIRCUIT OPEN
LEFT REAR FOG LAMP FEED CIRCUIT SHORTED TO VOLTAGE
GROUND CIRCUIT OPEN
LEFT REAR FOG LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. **READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN**
 1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
 2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
 3. With the scan tool, erase all DTCs.
 4. Turn the ignition off for a minimum of 10.0 seconds.
 5. Turn the ignition on.
 6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
 7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. DISCONNECT THE LEFT REAR FOG LAMP HARNESS CONNECTOR AND CHECK FOR VOLTAGE ON THE (L899) LEFT REAR FOG LAMP FEED CIRCUIT

NOTE: **Make sure the Fog Lamps are off when performing this step.**

1. Turn the ignition off.
2. Disconnect the component harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: **When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.**

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L899) LEFT REAR FOG LAMP FEED CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: **When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.**

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [7](#)

4. CHECK THE LEFT REAR FOG LAMP GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.

2. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L899) LEFT REAR FOG LAMP FEED CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [6](#)

6. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A 12-VOLT TEST LIGHT BETWEEN GROUND AND THE (L899) LEFT REAR FOG LAMP FEED CIRCUIT - CHECK THE BCM OUTPUT

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Using a 12-volt test light, connect the test light lead to a known good ground.
3. With the 12-volt test light, probe the circuit being tested at the component harness connector.
4. Turn the ignition on.
5. Activate the system or ECU output for the circuit being tested.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace the Left Rear Fog Lamp in accordance with the Service Information. Refer to [LAMP, FOG, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [7](#)

7. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.

7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1703-11-REAR RIGHT FOG LAMP CONTROL-CIRCUIT SHORT TO GROUND

For a complete FOG LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

Incandescent Rear Fog Lamps: When the Body Control Module (BCM) receives an input signal from the Rear Fog Lamp Switch, requesting Rear Fog Lamp illumination, the BCM provides a Pulse Width Modulated (PWM) voltage output, through the Left and Right Rear Fog Lamp Feed Circuits, to the Left and Right Rear Fog Lamps. A separate ground circuit is provided to the Left and Right Rear Fog Lamps through the wiring harness to the body sheet metal.

LED Rear Fog Lamps: When the Body Control Module (BCM) receives an input signal from the Rear Fog Lamp Switch, requesting Rear Fog Lamp illumination, the BCM provides a voltage signal, through the Left and Right Rear Fog Lamp Feed Circuits, to activate the Left and Right Rear Fog Lamps. A separate ground circuit is provided to the Left and Right Rear Fog Lamps through the wiring harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- When the Rear Fog Lamps are active and the Body Control Module (BCM) detects greater than 3.015 amperes on the Right Rear Fog Lamp Feed circuit for greater than 1.28 seconds.
- After four consecutive failed retry attempts the BCM will disable the output for the remainder of the ignition cycle.

DEFAULT ACTION

- The Rear Fog Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
RIGHT REAR FOG LAMP FEED CIRCUIT SHORTED TO GROUND
RIGHT REAR FOG LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after wiring repair or module replacement:**

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE RIGHT REAR FOG LAMP FOR AN INTERNAL SHORT

NOTE: **Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.**

1. Turn the ignition off.
2. Disconnect the Right Rear Fog Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Right Rear Fog Lamp in accordance with the Service Information. Refer to **LAMP, FOG, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L898) RIGHT REAR FOG LAMP FEED CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.

9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1703-15-REAR RIGHT FOG LAMP CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete FOG LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

Incandescent Rear Fog Lamps: When the Body Control Module (BCM) receives an input signal from the Rear Fog Lamp Switch, requesting Rear Fog Lamp illumination, the BCM provides a Pulse Width Modulated (PWM) voltage output, through the Left and Right Rear Fog Lamp Feed Circuits, to the Left and Right Rear Fog Lamps. A separate ground circuit is provided to the Left and Right Rear Fog Lamps through the wiring harness to the body sheet metal.

LED Rear Fog Lamps: When the Body Control Module (BCM) receives an input signal from the Rear Fog Lamp Switch, requesting Rear Fog Lamp illumination, the BCM provides a voltage signal, through the Left and Right Rear Fog Lamp Feed Circuits, to activate the Left and Right Rear Fog Lamps. A separate ground circuit is provided to the Left and Right Rear Fog Lamps through the wiring harness to the body sheet metal.

SET CONDITION

- When the Fog Lamps are active and the Body Control Module (BCM) detects less than 0.333 volts on the Right Rear Fog Lamp Feed circuit for greater than 1.28 seconds.

DEFAULT ACTION

- The Rear Fog Lamp is always on or inoperative.

POSSIBLE CAUSES

Possible Causes
RIGHT REAR FOG LAMP FEED CIRCUIT OPEN
RIGHT REAR FOG LAMP FEED CIRCUIT SHORTED TO VOLTAGE
GROUND CIRCUIT OPEN
RIGHT REAR FOG LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. DISCONNECT THE RIGHT REAR FOG LAMP HARNESS CONNECTOR AND CHECK FOR VOLTAGE ON THE (L898) RIGHT REAR FOG LAMP CIRCUIT

NOTE: Make sure the Fog Lamps are off when performing this step.

1. Turn the ignition off.
2. Disconnect the component harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L898) RIGHT REAR FOG LAMP CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [7](#)

4. CHECK THE RIGHT REAR FOG LAMP GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#).

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.

- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to **STANDARD PROCEDURE** .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L898) RIGHT REAR FOG LAMP CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A 12-VOLT TEST LIGHT BETWEEN GROUND AND THE (L898) RIGHT REAR FOG LAMP CIRCUIT - CHECK THE BCM OUTPUT

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Using a 12-volt test light, connect the test light lead to a known good ground.
3. With the 12-volt test light, probe the circuit being tested at the component harness connector.
4. Turn the ignition on.
5. Activate the system or ECU output for the circuit being tested.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace the Right Rear Fog Lamp in accordance with the Service Information. Refer to [LAMP, FOG, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

7. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).

- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

B1707-11-LEFT REVERSE LAMP CONTROL-CIRCUIT SHORT TO GROUND

For a complete BACK UP LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information**.

THEORY OF OPERATION

When the Body Control Module (BCM) receives a CAN Bus message from the Transmission Control Module (TCM), indicating the transmission is in the REVERSE position, the BCM provides a voltage output through the Left and Right Backup Lamp Driver circuit to the Left and Right Backup Lamps. A ground path for the Left and Right Backup Lamps is present through the harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Backup Lamps are active and the Body Control Module (BCM) detects greater than 5.7 amperes on the Left Backup Lamp Driver circuit for greater than four seconds.
- After four consecutive failed retry attempts the BCM will disable the output for the remainder of the ignition cycle.

DEFAULT ACTION

- The Backup Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT BACKUP LAMP DRIVER CIRCUIT SHORTED TO GROUND
LEFT BACKUP LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after wiring repair or module replacement:**

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. CHECK THE LEFT BACKUP LAMP FOR AN INTERNAL SHORT

NOTE: **Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.**

1. Turn the ignition off.
2. Disconnect the Left Backup Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Left Backup Lamp in accordance with the Service Information. Refer to [LAMP, TAIL STOP TURN, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L15) LEFT BACKUP LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1707-15-LEFT REVERSE LAMP CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete BACK UP LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

When the Body Control Module (BCM) receives a CAN Bus message from the Transmission Control Module (TCM), indicating the transmission is in the REVERSE position, the BCM provides a voltage output through the Left and Right Backup Lamp Driver circuit to the Left and Right Backup Lamps. A ground path for the Left and Right Backup Lamps is present through the harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- **Bulb Equipped:** When the Backup Lamps are active and the Body Control Module (BCM) detects less than 0.35 amperes on the Left Backup Lamp Driver circuit for greater than five seconds.
- **LED Equipped:** When the Backup Lamps are active and the Body Control Module (BCM) detects less than 5.0 milliamperes on the Left Backup Lamp Driver circuit for greater than five seconds.

DEFAULT ACTION

- The Backup Lamp is always on or inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT BACKUP LAMP DRIVER CIRCUIT OPEN
LEFT BACKUP LAMP DRIVER CIRCUIT SHORTED TO VOLTAGE
GROUND CIRCUIT OPEN
LEFT BACKUP LAMP BULB

Possible Causes

BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. DISCONNECT THE LEFT TAIL LAMP ASSEMBLY HARNESS CONNECTOR AND CHECK FOR VOLTAGE ON THE (L15) LEFT BACKUP LAMP DRIVER CIRCUIT

1. Turn the ignition off.
2. Disconnect the component harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L15) LEFT BACKUP LAMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#).

No

- Go To [7](#)

4. CHECK THE LEFT TAIL LAMP ASSEMBLY GROUND CIRCUIT(S) FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

NOTE: Make sure the Backup Lamps are off when performing this step.

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [**STANDARD PROCEDURE**](#).

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to **STANDARD PROCEDURE** .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L15) LEFT BACKUP LAMP DRIVER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.

5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A 12-VOLT TEST LIGHT BETWEEN GROUND AND THE (L15) LEFT BACKUP LAMP DRIVER CIRCUIT - CHECK THE BCM OUTPUT

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Using a 12-volt test light, connect the test light lead to a known good ground.
3. With the 12-volt test light, probe the circuit being tested at the component harness connector.
4. Turn the ignition on.
5. Activate the system or ECU output for the circuit being tested.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace the Left Backup Lamp in accordance with the Service Information. Refer to [LAMP, TAIL STOP TURN, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

7. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.

- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

B170B-11-RIGHT REVERSE LAMP CONTROL-CIRCUIT SHORT TO GROUND

For a complete BACK UP LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information**.

THEORY OF OPERATION

When the Body Control Module (BCM) receives a CAN Bus message from the Transmission Control Module (TCM), indicating the transmission is in the REVERSE position, the BCM provides a voltage output through the Left and Right Backup Lamp Driver circuit to the Left and Right Backup Lamps. A ground path for the Left and Right Backup Lamps is present through the harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Backup Lamps are active and the Body Control Module (BCM) detects greater than 5.7 amperes on the Right Backup Lamp Driver circuit for greater than four seconds.
- After four consecutive failed retry attempts the BCM will disable the output for the remainder of the ignition cycle.

DEFAULT ACTION

- The Backup Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
RIGHT BACKUP LAMP DRIVER CIRCUIT SHORTED TO GROUND
RIGHT BACKUP LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after wiring repair or module replacement:**

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE RIGHT BACKUP LAMP FOR AN INTERNAL SHORT

NOTE: **Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.**

1. Turn the ignition off.
2. Disconnect the Right Backup Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Right Backup Lamp in accordance with the Service Information. Refer to **LAMP, TAIL STOP TURN, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L16) RIGHT BACKUP LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

No

- Go To [7](#)

4. CHECK THE RIGHT TAIL LAMP ASSEMBLY GROUND CIRCUIT(S) FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage

drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L16) RIGHT BACKUP LAMP DRIVER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.

3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [6](#)

6. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A 12-VOLT TEST LIGHT BETWEEN GROUND AND THE (L16) RIGHT BACKUP LAMP DRIVER CIRCUIT - CHECK THE BCM OUTPUT

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Using a 12-volt test light, connect the test light lead to a known good ground.
3. With the 12-volt test light, probe the circuit being tested at the component harness connector.
4. Turn the ignition on.
5. Activate the system or ECU output for the circuit being tested.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace the Right Backup Lamp in accordance with the Service Information. Refer to [LAMP, TAIL STOP TURN, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [7](#)

7. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:

- Proper connector installation.
- Damaged connector locks.
- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1751-11-COURTESY LAMP CONTROL-CIRCUIT SHORT TO GROUND

For a complete INTERIOR LIGHTING SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) provides a battery voltage output to the Dome, Cargo and Footwell Lamps through the Courtesy Lamps Driver circuits. A dedicated path to ground is provided through the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- When the Courtesy Lamps are active and the Body Control Module (BCM) detects greater than 12.3 amps on the Courtesy Lamps Driver circuit for greater than 1.28 seconds.

- Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The Courtesy Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
COURTESY LAMPS DRIVER CIRCUIT SHORTED TO GROUND
COURTESY LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. CHECK EACH LAMP ON THE (M11) COURTESY LAMPS DRIVER CIRCUIT (ONE AT A TIME) FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect a Courtesy Lamp harness connector on the (M11) Courtesy Lamps Driver circuit.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Repeat this step for all the Courtesy Lamps on the circuit. If the DTC is still active once all the lamps are disconnected, Go To [3](#)

No

- Replace the Courtesy Lamp causing the short to ground condition in accordance with the Service Information. Refer to [LAMP, COURTESY, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (M11) COURTESY LAMPS DRIVER CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B177A-11-LEFT FRONT LAMP DIAGNOSTIC LINE-CIRCUIT SHORT TO GROUND

For a complete HEADLAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

When the ignition is on, the Body Control Module (BCM) provides a 12-volt signal, on the Left and Right Lighting Fault Sense circuits, to the Left and Right Front Lamp Assemblies, and the Left and Right Tail Lamp Assemblies. When the Left or Right Turn Lamp is activated, the Body Control Module (BCM) provides a 12-volt signal on the Left or Right Front Turn Lamp Driver circuit, or the Left or Right Rear Turn Lamp Driver circuit, indicating the Turn Lamps have been requested.

When the Left or Right Turn Lamp is activated, an internal driver in the Front and Tail Lamp Assemblies pulls the Lighting Fault Sense circuit voltage signal low (below 6 volts), in sequence with the Turn Lamp flash. When the Turn Lamps are Off, the BCM maintains the Lighting Fault Sense circuit voltage signal high (above 8 volts).

A failure in the Lighting Fault Sense circuit may be caused by one of the following conditions:

- When the Left or Right Turn Lamps are ON, and the voltage on the Lighting Fault Sense circuit is constantly 12 volts (system voltage), may indicate the Lighting Fault Sense circuit is open or shorted to voltage, the Ground circuit is open, a poor connection or an inoperative Lamp Assembly.
- When the Left or Right Turn Lamps are OFF, the Lamp Assembly is not disconnected and the voltage on the Lighting Fault Sense circuit is below 6 volts, may indicate a short to ground on the Lighting Fault Sense circuit, an internally shorted Lamp Assembly, or water/corrosion at a harness connector/terminal.
- When a Lamp Assembly is disconnected, the Lighting Fault Sense circuit is not shorted to ground, and the voltage on the Lighting Fault Sense circuit is below 6 volts, may indicate the BCM is not supplying the 12-volt signal on the Lighting Fault Sense circuit.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Body Control Module (BCM) receives a signal from the Lamp Assembly, through the Fault Sense circuit, indicating a fault is present for greater than five seconds.

POSSIBLE CAUSES

Possible Causes
FAULT SENSE CIRCUIT SHORTED TO GROUND
LAMP ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. CHECK FOR AN ACTIVE DTC

NOTE: To change the status of this DTC from Active to Stored, or to erase the DTC from the module's internal memory, the Turn Lamps must be activated for at least 20 cycles. Failure to perform this after a Fault Sense circuit repair is completed, or the Lamp Assembly is replaced, may lead to an incorrect repair.

1. With the scan tool, read Body Control Module (BCM) DTCs and record on the repair order.
2. Record the Environmental Data.
3. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR INTERMITTENT CONDITIONS procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE LEFT FRONT LAMP ASSEMBLY FOR AN INTERNAL SHORT

1. Turn the ignition off.
2. Disconnect the Left Front Lamp Assembly harness connector.
3. Turn the ignition on.
4. With the scan tool, erase DTCs.
5. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
6. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the Left Front Lamp Assembly in accordance with the Service Information. Refer to [UNIT, HEADLAMP, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. CHECK THE (L551) LEFT FRONT LIGHTING FAULT SENSE CIRCUIT FOR A SHORT TO GROUND

1. Turn the ignition off.
2. Disconnect the BCM C6/F harness connector.
3. Check for continuity between ground and the (L551) Left Front Lighting Fault Sense circuit at the Left Front Lamp Assembly harness connector.

Is there continuity between ground and the (L551) Left Front Lighting Fault Sense circuit?

Yes

- Repair the (L551) Left Front Lighting Fault Sense circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B177B-11-RIGHT FRONT LAMP DIAGNOSTIC LINE-CIRCUIT SHORT TO GROUND

For a complete HEADLAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

When the ignition is on, the Body Control Module (BCM) provides a 12-volt signal, on the Left and Right Lighting Fault Sense circuits, to the Left and Right Front Lamp Assemblies, and the Left and Right Tail Lamp Assemblies. When the Left or Right Turn Lamp is activated, the Body Control Module (BCM) provides a 12-volt signal on the Left or Right Front Turn Lamp Driver circuit, or the Left or Right Rear Turn Lamp Driver circuit, indicating the Turn Lamps have been requested.

When the Left or Right Turn Lamp is activated, an internal driver in the Front and Tail Lamp Assemblies pulls the Lighting Fault Sense circuit voltage signal low (below 6 volts), in sequence with the Turn Lamp flash. When the Turn Lamps are Off, the BCM maintains the Lighting Fault Sense circuit voltage signal high (above 8 volts).

A failure in the Lighting Fault Sense circuit may be caused by one of the following conditions:

- When the Left or Right Turn Lamps are ON, and the voltage on the Lighting Fault Sense circuit is constantly 12 volts (system voltage), may indicate the Lighting Fault Sense circuit is open or shorted to voltage, the Ground circuit is open, a poor connection or an inoperative Lamp Assembly.
- When the Left or Right Turn Lamps are OFF, the Lamp Assembly is not disconnected and the voltage on the Lighting Fault Sense circuit is below 6 volts, may indicate a short to ground on the Lighting Fault Sense circuit, an internally shorted Lamp Assembly, or water/corrosion at a harness connector/terminal.
- When a Lamp Assembly is disconnected, the Lighting Fault Sense circuit is not shorted to ground, and the voltage on the Lighting Fault Sense circuit is below 6 volts, may indicate the BCM is not supplying the 12-volt signal on the Lighting Fault Sense circuit.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Body Control Module (BCM) receives a signal from the Lamp Assembly, through the Fault Sense circuit, indicating a fault is present for greater than five seconds.

POSSIBLE CAUSES

Possible Causes
FAULT SENSE CIRCUIT SHORTED TO GROUND
LAMP ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding.
Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. CHECK FOR AN ACTIVE DTC

NOTE: To change the status of this DTC from Active to Stored, or to erase the DTC from the module's internal memory, the Turn Lamps must be activated for at least 20 cycles. Failure to perform this after a Fault Sense circuit repair is completed, or the Lamp Assembly is replaced, may lead to an incorrect repair.

1. With the scan tool, read Body Control Module (BCM) DTCs and record on the repair order.
2. Record the Environmental Data.
3. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR INTERMITTENT CONDITIONS procedure. Refer to [STANDARD PROCEDURE](#).

2. CHECK THE RIGHT FRONT LAMP ASSEMBLY FOR AN INTERNAL SHORT

1. Turn the ignition off.
2. Disconnect the Right Front Lamp Assembly harness connector.
3. Turn the ignition on.
4. With the scan tool, erase DTCs.
5. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
6. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the Right Front Lamp Assembly in accordance with the Service Information. Refer to [UNIT, HEADLAMP, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. CHECK THE (L552) RIGHT FRONT LIGHTING FAULT SENSE CIRCUIT FOR A SHORT TO GROUND

1. Turn the ignition off.
2. Disconnect the BCM C6/F harness connector.
3. Check for continuity between ground and the (L552) Right Front Lighting Fault Sense circuit at the Right Front Lamp Assembly harness connector.

Is there continuity between ground and the (L552) Right Front Lighting Fault Sense circuit?

Yes

- Repair the (L552) Right Front Lighting Fault Sense circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B178E-11-HEADLAMP SWITCH INPUT-CIRCUIT SHORT TO GROUND

For a complete HEADLAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) provides a 5 volt reference voltage to the Headlamp Switch, through the Headlamp Switch MUX circuit and provides a ground through the Headlamp Switch MUX Return circuit. When the BCM detects the activation of the Headlamp Switch, the BCM provides the appropriate output for the requested exterior lamp(s).

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Headlamps are active and the Body Control Module (BCM) detects less than 0.569 volts on the Headlamp Switch MUX circuit for greater than 10 seconds.

DEFAULT ACTION

- The Headlamps and Park Lamps are always on.

POSSIBLE CAUSES

Possible Causes
HEADLAMP SWITCH MUX CIRCUIT SHORTED TO GROUND
HEADLAMP SWITCH MUX CIRCUIT SHORTED TO THE HEADLAMP SWITCH MUX RETURN CIRCUIT
HEADLAMP SWITCH
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: CLEARING THE DTC AFTER MAKING A REPAIR - Perform after wiring repair or module replacement:

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. CHECK THE HEADLAMP SWITCH FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Headlamp Switch harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Headlamp Switch in accordance with the Service Information. Refer to [SWITCH, HEADLAMP, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L307) HEADLAMP SWITCH MUX CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. CHECK THE (L307) HEADLAMP SWITCH MUX CIRCUIT FOR A SHORT TO THE (L900) HEADLAMP SWITCH MUX RETURN CIRCUIT

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
3. With the other lead of the DVOM probe the other circuit at the component harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and the other circuit?

Yes

- Repair the short between the circuits. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

5. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.

9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B178E-15-HEADLAMP SWITCH INPUT-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete HEADLAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) provides a 5 volt reference voltage to the Headlamp Switch, through the Headlamp Switch MUX circuit and provides a ground through the Headlamp Switch MUX Return circuit. When the BCM detects the activation of the Headlamp Switch, the BCM provides the appropriate output for the requested exterior lamp(s).

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Headlamps are active and the Body Control Module (BCM) detects greater than 100k Ohms on the Headlamp Switch MUX circuit for greater than 10 seconds.

DEFAULT ACTION

- The Headlamps and Park Lamps are always on.

POSSIBLE CAUSES

Possible Causes
HEADLAMP SWITCH MUX CIRCUIT SHORTED TO VOLTAGE
HEADLAMP SWITCH MUX CIRCUIT OPEN
HEADLAMP SWITCH MUX RETURN CIRCUIT OPEN
HEADLAMP SWITCH
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. DISCONNECT THE HEADLAMP SWITCH HARNESS CONNECTOR - MEASURE THE VOLTAGE ON THE (L307) HEADLAMP SWITCH MUX CIRCUIT WITH THE IGNITION OFF

NOTE: Make sure the ignition is off when performing this step.

NOTE: With the ignition off, voltage should not be present on the circuit. With the ignition on, the voltage on the circuit should be approximately 5 volts.

1. Turn the ignition off.
2. Disconnect the component harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present with the ignition off?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L307) HEADLAMP SWITCH MUX CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.

2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [7](#)

4. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L307) HEADLAMP SWITCH MUX CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [5](#)

5. CHECK THE (L900) HEADLAMP SWITCH MUX RETURN CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
2. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
3. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A FUSED JUMPER WIRE BETWEEN GROUND AND THE (L307) HEADLAMP SWITCH MUX CIRCUIT - CHECK FOR ADDITIONAL DTCS

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Connect a fused jumper wire between ground and the circuit being tested at the component harness connector. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. With the scan tool, read the BCM DTCs.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is DTC: B178E-11-HEADLAMP SWITCH INPUT - CIRCUIT SHORT TO GROUND active?

Yes

- Replace the Headlamp Switch in accordance with the Service Information. Refer to [SWITCH, HEADLAMP, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

7. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).

- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to [**MODULE, BODY CONTROL \(BCM\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

B1792-11-LEFT REAR LAMP DIAGNOSTIC LINE - CIRCUIT SHORT TO GROUND

For a complete TURN SIGNAL LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

When the ignition is on, the Body Control Module (BCM) provides a 12-volt signal, on the Left and Right Lighting Fault Sense circuits, to the Left and Right Front Lamp Assemblies, and the Left and Right Tail Lamp Assemblies. When the Left or Right Turn Lamp is activated, the Body Control Module (BCM) provides a 12-volt signal on the Left or Right Front Turn Lamp Driver circuit, or the Left or Right Rear Turn Lamp Driver circuit, indicating the Turn Lamps have been requested.

When the Left or Right Turn Lamp is activated, an internal driver in the Front and Tail Lamp Assemblies pulls the Lighting Fault Sense circuit voltage signal low (below 6 volts), in sequence with the Turn Lamp flash. When the Turn Lamps are Off, the BCM maintains the Lighting Fault Sense circuit voltage signal high (above 8 volts).

A failure in the Lighting Fault Sense circuit may be caused by one of the following conditions:

- When the Left or Right Turn Lamps are ON, and the voltage on the Lighting Fault Sense circuit is constantly 12 volts (system voltage), may indicate the Lighting Fault Sense circuit is open or shorted to voltage, the Ground circuit is open, a poor connection or an inoperative Lamp Assembly.
- When the Left or Right Turn Lamps are OFF, the Lamp Assembly is not disconnected and the voltage on the Lighting Fault Sense circuit is below 6 volts, may indicate a short to ground on the Lighting Fault Sense circuit, an internally shorted Lamp Assembly, or water/corrosion at a harness connector/terminal.
- When a Lamp Assembly is disconnected, the Lighting Fault Sense circuit is not shorted to ground, and the voltage on the Lighting Fault Sense circuit is below 6 volts, may indicate the BCM is not supplying

the 12-volt signal on the Lighting Fault Sense circuit.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Body Control Module (BCM) receives a signal from the Lamp Assembly, through the Fault Sense circuit, indicating a fault is present for greater than five seconds.

POSSIBLE CAUSES

Possible Causes
FAULT SENSE CIRCUIT SHORTED TO GROUND
LAMP ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. CHECK FOR AN ACTIVE DTC

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after wiring repair or module replacement:**

After a Fault Sense circuit repair is completed, or the Lamp Assembly is replaced, the Turn Lamps must be activated for at least 20 cycles, in order for the DTC status to change from Active to Stored. After the DTC status has changed to Stored, the DTC can be erased.

1. With the scan tool, read Body Control Module (BCM) DTCs and record on the repair order.
2. Record the Environmental Data.
3. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR INTERMITTENT CONDITIONS procedure. Refer to **STANDARD PROCEDURE**.

2. CHECK THE LEFT TAIL LAMP ASSEMBLY FOR AN INTERNAL SHORT

1. Turn the ignition off.
2. Disconnect the Left Tail Lamp Assembly harness connector.
3. Turn the ignition on.
4. With the scan tool, erase DTCs.
5. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
6. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the Left Tail Lamp Assembly in accordance with the Service Information. Refer to **LAMP, TAIL STOP TURN, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. CHECK THE (L563) LEFT REAR LIGHTING FAULT SENSE CIRCUIT FOR A SHORT TO GROUND

1. Turn the ignition off.
2. Disconnect the BCM C6/F harness connector.
3. Check for continuity between ground and the (L563) Left Rear Lighting Fault Sense circuit at the Left Rear Lamp Assembly harness connector.

Is there continuity between ground and the (L563) Left Rear Lighting Fault Sense circuit?

Yes

- Repair the (L563) Left Rear Lighting Fault Sense circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.

9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
 - Test complete.
-

2021 ACCESSORIES AND BODY, CAB

Body Control Module (BCM) - DTCS B1793-11 To B1E72-11 - Gladiator

DTC TROUBLESHOOTING

B1793-11-RIGHT REAR LAMP DIAGNOSTIC LINE - CIRCUIT SHORT TO GROUND

For a complete TURN SIGNAL LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information**.

THEORY OF OPERATION

When the ignition is on, the Body Control Module (BCM) provides a 12-volt signal, on the Left and Right Lighting Fault Sense circuits, to the Left and Right Front Lamp Assemblies, and the Left and Right Tail Lamp Assemblies. When the Left or Right Turn Lamp is activated, the Body Control Module (BCM) provides a 12-volt signal on the Left or Right Front Turn Lamp Driver circuit, or the Left or Right Rear Turn Lamp Driver circuit, indicating the Turn Lamps have been requested.

When the Left or Right Turn Lamp is activated, an internal driver in the Front and Tail Lamp Assemblies pulls the Lighting Fault Sense circuit voltage signal low (below 6 volts), in sequence with the Turn Lamp flash. When the Turn Lamps are Off, the BCM maintains the Lighting Fault Sense circuit voltage signal high (above 8 volts).

A failure in the Lighting Fault Sense circuit may be caused by one of the following conditions:

- When the Left or Right Turn Lamps are ON, and the voltage on the Lighting Fault Sense circuit is constantly 12 volts (system voltage), may indicate the Lighting Fault Sense circuit is open or shorted to voltage, the Ground circuit is open, a poor connection or an inoperative Lamp Assembly.
- When the Left or Right Turn Lamps are OFF, the Lamp Assembly is not disconnected and the voltage on the Lighting Fault Sense circuit is below 6 volts, may indicate a short to ground on the Lighting Fault Sense circuit, an internally shorted Lamp Assembly, or water/corrosion at a harness connector/terminal.
- When a Lamp Assembly is disconnected, the Lighting Fault Sense circuit is not shorted to ground, and the voltage on the Lighting Fault Sense circuit is below 6 volts, may indicate the BCM is not supplying the 12-volt signal on the Lighting Fault Sense circuit.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Body Control Module (BCM) receives a signal from the Lamp Assembly, through the Fault Sense circuit, indicating a fault is present for greater than five seconds.

POSSIBLE CAUSES

Possible Causes
FAULT SENSE CIRCUIT SHORTED TO GROUND LAMP ASSEMBLY BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. CHECK FOR AN ACTIVE DTC

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after wiring repair or module replacement:**

After a Fault Sense circuit repair is completed, or the Lamp Assembly is replaced, the Turn Lamps must be activated for at least 20 cycles, in order for the DTC status to change from Active to Stored. After the DTC status has changed to Stored, the DTC can be erased.

1. With the scan tool, read Body Control Module (BCM) DTCs and record on the repair order.
2. Record the Environmental Data.
3. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR INTERMITTENT CONDITIONS procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. CHECK THE RIGHT TAIL LAMP ASSEMBLY FOR AN INTERNAL SHORT

1. Turn the ignition off.
2. Disconnect the Right Tail Lamp Assembly harness connector.
3. Turn the ignition on.
4. With the scan tool, erase DTCs.
5. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
6. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the Right Tail Lamp Assembly in accordance with the Service Information. Refer to [LAMP, TAIL STOP TURN, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. CHECK THE (L562) RIGHT REAR LIGHTING FAULT SENSE CIRCUIT FOR A SHORT TO GROUND

1. Turn the ignition off.
2. Disconnect the BCM C6/F harness connector.
3. Check for continuity between ground and the (L562) Right Rear Lighting Fault Sense circuit at the Right Rear Lamp Assembly harness connector.

Is there continuity between ground and the (L562) Right Rear Lighting Fault Sense circuit?

Yes

- Repair the (L562) Right Rear Lighting Fault Sense circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to [MODULE, BODY CONTROL \(BCM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

B17A0-2A-REAR FOG LAMP SWITCH CIRCUIT STUCK-STUCK

For a complete FOG LAMPS SYSTEM wiring diagram, Refer to the appropriate wiring information .

THEORY OF OPERATION

Incandescent Rear Fog Lamps: When the Body Control Module (BCM) receives an input signal from the Rear Fog Lamp Switch, requesting Rear Fog Lamp illumination, the BCM provides a Pulse Width Modulated (PWM) voltage output, through the Left and Right Rear Fog Lamp Feed Circuits, to the Left and Right Rear Fog Lamps. A separate ground circuit is provided to the Left and Right Rear Fog Lamps through the wiring harness to the body sheet metal.

LED Rear Fog Lamps: When the Body Control Module (BCM) receives an input signal from the Rear Fog Lamp Switch, requesting Rear Fog Lamp illumination, the BCM provides a voltage signal, through the Left and Right Rear Fog Lamp Feed Circuits, to activate the Left and Right Rear Fog Lamps. A separate ground circuit is provided to the Left and Right Rear Fog Lamps through the wiring harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Body Control Module (BCM) detects a continuous ground input signal from the Fog Lamp Switch for greater than 20 seconds.

DEFAULT ACTION

- The Rear Fog Lamps are inoperative.

POSSIBLE CAUSES

Possible Causes
HEADLAMP/FOG LAMP SWITCH SIGNAL CIRCUIT SHORTED TO GROUND FOG LAMP SWITCH

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

- 1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN**
1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
 2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
 3. With the scan tool, erase all DTCS.
 4. Turn the ignition off for a minimum of 10.0 seconds.
 5. Turn the ignition on.
 6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
 7. With the scan tool, read Body Control Module (BCM) DTCS.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK IF BCM DTC: B168E-11-FRONT FOG LAMP SWITCH-CIRCUIT SHORT TO GROUND IS ACTIVE

1. With the scan tool, read Body Control Module (BCM) DTCs.

Does the scan tool display DTC B168E-11-FRONT FOG LAMP SWITCH-CIRCUIT SHORT TO GROUND as active?

Yes

- Perform the diagnostic test for DTC B168E-11-FRONT FOG LAMP SWITCH-CIRCUIT SHORT TO GROUND.

No

- Inspect the Fog Lamp Switch for debris or foreign material that could cause a sticking condition. If no problem is found, replace the Fog Lamp Switch in accordance with the Service Information. Refer to [SWITCH, HEADLAMP, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B17AD-12-REAR LEFT TRAILER TURN LAMP CONTROL - CIRCUIT SHORT TO BATTERY

For a complete TRAILER TOW SYSTEM wiring diagram, Refer to the appropriate wiring information .

THEORY OF OPERATION

Four relays are used to provide voltage to the Trailer Tow connector. The Trailer Tow Relays are used to switch fused battery voltage directly to the Trailer Tow connector when requested. The Trailer Tow Relays are activated through a ground path provided by the Body Control Module (BCM).

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Left Turn Lamps are active and the Body Control Module (BCM) detects greater than 0.95 amps on the Left Rear Turn Lamp Control circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The Left Trailer Tow Turn Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT REAR TURN LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
LEFT TRAILER TOW RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK FOR VOLTAGE ON THE (L655) LEFT REAR TURN LAMP CONTROL CIRCUIT

1. Turn the ignition off.
2. Disconnect the Power Distribution Center (PDC) Assembly harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the PDC Assembly harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L655) LEFT REAR TURN LAMP CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.

4. Using a DVOM, measure the voltage on the circuit being tested at the ECU harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [5](#)

4. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND](#)

INSTALLATION .

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

5. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

For a complete TRAILER TOW SYSTEM wiring diagram, **Refer to the appropriate wiring information .**

THEORY OF OPERATION

Four relays are used to provide voltage to the Trailer Tow connector. The Trailer Tow Relays are used to switch fused battery voltage directly to the Trailer Tow connector when requested. The Trailer Tow Relays are activated through a ground path provided by the Body Control Module (BCM).

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Right Turn Lamps are active and the Body Control Module (BCM) detects greater than 0.95 amps on the Right Rear Turn Lamp Control circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The Right Tailer Tow Turn Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
RIGHT REAR TURN LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
RIGHT TRAILER TOW RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. **READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN**
 1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
 2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
 3. With the scan tool, erase all DTCS.
 4. Turn the ignition off for a minimum of 10.0 seconds.
 5. Turn the ignition on.
 6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
 7. With the scan tool, read Body Control Module (BCM) DTCS.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK FOR VOLTAGE ON THE (L656) RIGHT REAR TURN LAMP CONTROL CIRCUIT

1. Turn the ignition off.
2. Disconnect the Power Distribution Center (PDC) Assembly harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the PDC Assembly harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L656) RIGHT REAR TURN LAMP CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the ECU harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

4. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.

4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

5. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.

- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B17BC-11-LEFT SIDEMARKER LAMP CONTROL-CIRCUIT SHORT TO GROUND

For a complete PARK LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

When the Body Control Module (BCM) receives an input from the Headlamp Switch, requesting Park Lamp illumination, the BCM provides a voltage output to the Left and Right Front Lamp Assemblies, Front Signature Lamps, Tail Lamp Assemblies, License Plate Lamp and Side Marker Lamps, through the appropriate Lamp Driver circuit. A ground path is provided to the Lamp Assemblies through the wiring harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Park Lamps are activated and the Body Control Module (BCM) detects greater than 0.545 amps on the Left Side Marker Control circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- Left Side Marker Turn Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT SIDE MARKER CONTROL CIRCUIT SHORTED TO GROUND
LEFT SIDE MARKER LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE LEFT DRL/SIDE-MARKER LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Left DRL Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Left DRL/Side-Marker Lamp in accordance with the Service Information. Refer to **LAMP, SIDE REPEATER, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. CHECK THE LEFT TAIL LAMP ASSEMBLY/SIDE-MARKER LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Left Tail Lamp Assembly harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [4](#)

No

- Replace the Left Tail Lamp Assembly/Side-Marker Lamp in accordance with the Service Information. Refer to [LAMP, TAIL STOP TURN, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

4. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L145) LEFT SIDE MARKER CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [5](#)

5. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.

4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B17C1-11-RIGHT SIDEMARKER LAMP CONTROL-CIRCUIT SHORT TO GROUND

For a complete PARK LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

When the Body Control Module (BCM) receives an input from the Headlamp Switch, requesting Park Lamp illumination, the BCM provides a voltage output to the Left and Right Front Lamp Assemblies, Front Signature Lamps, Tail Lamp Assemblies, License Plate Lamp and Side Marker Lamps, through the appropriate Lamp Driver circuit. A ground path is provided to the Lamp Assemblies through the wiring harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Park Lamps are activated and the Body Control Module (BCM) detects greater than 0.545 amps on the Right Side Marker Control circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- Right Side Marker Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
RIGHT SIDE MARKER CONTROL CIRCUIT SHORTED TO GROUND
RIGHT SIDE MARKER LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE RIGHT DAYTIME RUNNING LAMP (DRL)/SIDE-MARKER LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Right DRL Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Right DRL/Side-Marker Lamp in accordance with the Service Information. Refer to **LAMP, SIDE REPEATER, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. CHECK THE RIGHT TAIL LAMP ASSEMBLY/SIDE-MARKER LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Right Tail Lamp Assembly harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [4](#)

No

- Replace the Right Tail Lamp Assembly/Side-Marker Lamp in accordance with the Service Information. Refer to **LAMP, TAIL STOP TURN, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L144) RIGHT SIDE MARKER CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

5. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

For a complete TRAILER TOW SYSTEM wiring diagram, **Refer to the appropriate wiring information .**

THEORY OF OPERATION

Four relays are used to provide voltage to the Trailer Tow connector. The Trailer Tow Relays are used to switch fused battery voltage directly to the Trailer Tow connector when requested. The Trailer Tow Relays are activated through a ground path provided by the Body Control Module (BCM).

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Backup Lamps are active and the Body Control Module (BCM) detects greater than 0.95 amps on the Trailer Tow Backup Lamp Relay Control circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The Trailer Tow Backup Lamps are inoperative.

POSSIBLE CAUSES

Possible Causes
TRAILER TOW BACKUP LAMP RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
TRAILER TOW BACKUP LAMP RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. **READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN**
 1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
 2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
 3. With the scan tool, erase all DTCS.
 4. Turn the ignition off for a minimum of 10.0 seconds.
 5. Turn the ignition on.
 6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
 7. With the scan tool, read Body Control Module (BCM) DTCS.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK FOR VOLTAGE ON THE (L658) TRAILER TOW BACKUP LAMP RELAY CONTROL CIRCUIT

1. Turn the ignition off.
2. Disconnect the Power Distribution Center (PDC) Assembly harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the PDC Assembly harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L658) TRAILER TOW BACKUP LAMP RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the ECU harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

4. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.

4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

5. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.

- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B17F4-11-LEFT MIRROR SIGNAL LAMP CONTROL-CIRCUIT SHORT TO GROUND

For a complete MIRRORS wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Left Turn Lamps are activated and the Body Control Module (BCM) detects greater than 3.015 amps on the Left Front Turn Signal Control circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- Left Exterior Mirror Turn Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT TURN SIGNAL CONTROL CIRCUIT SHORTED TO GROUND
LEFT EXTERIOR MIRROR TURN LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE LEFT EXTERIOR MIRROR TURN LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Left Exterior Mirror Turn Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Left Exterior Mirror Turn Lamp in accordance with the Service Information. Refer to **LAMP, MIRROR, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L161) LEFT FRONT TURN SIGNAL CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.

4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B17F5-11-RIGHT MIRROR SIGNAL LAMP CONTROL-CIRCUIT SHORT TO GROUND

For a complete MIRRORS wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Right Turn Lamps are activated and the Body Control Module (BCM) detects greater than 3.015 amps on the Right Front Turn Signal Control circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- Right Exterior Mirror Turn Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT TURN SIGNAL CONTROL CIRCUIT SHORTED TO GROUND
RIGHT EXTERIOR MIRROR TURN LAMP
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .**

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. CHECK THE RIGHT EXTERIOR MIRROR TURN LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Right Exterior Mirror Turn Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Right Exterior Mirror Turn Lamp in accordance with the Service Information. Refer to [LAMP, MIRROR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L160) RIGHT FRONT SIGNAL CONTROL DRIVER CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B17F6-12-TRAILER TAILLAMP CONTROL - CIRCUIT SHORT TO BATTERY

For a complete TRAILER TOW SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

Four relays are used to provide voltage to the Trailer Tow connector. The Trailer Tow Relays are used to switch fused battery voltage directly to the Trailer Tow connector when requested. The Trailer Tow Relays are activated through a ground path provided by the Body Control Module (BCM).

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Park Lamps are active and the Body Control Module (BCM) detects greater than 0.95 amps on the Trailer Tow Tail Lamp Relay Control circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The Trailer Tow Park Lamps are inoperative.

POSSIBLE CAUSES

Possible Causes
TRAILER TOW TAIL LAMP RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
TRAILER TOW PARK LAMP RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK FOR VOLTAGE ON THE (L657) TRAILER TOW TAIL LAMP RELAY CONTROL CIRCUIT

1. Turn the ignition off.
2. Disconnect the Power Distribution Center (PDC) Assembly harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the PDC Assembly harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L657) TRAILER TOW TAIL LAMP RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the ECU harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [5](#)

4. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.

- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [**CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

5. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B17FF-11-AMBIENT CABIN LIGHT DIMMER SWITCH - CIRCUIT SHORT TO GROUND

For a complete INTERIOR LIGHTING SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Dimmer Switch is integral to the Headlamp Switch. The Dimmer Switch is used to control the brightness of components that receive backlighting, such as the Instrument Panel Cluster (IPC), along with other various backlit components.

The Body Control Module (BCM) supplies and monitors a 5.0 volt reference voltage to the Headlamp/Dimmer Switch, through the Panel Lamps Driver circuit or Panel Lamps Dimmer Switch MUX Signal circuit. Based on the Headlamp/Dimmer Switch position, the BCM sets and adjusts the illumination output for the various backlit components.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Ambient Lamps are active and the Body Control Module (BCM) detects less than 50.0 Ohms, or 0.281 volts, on the Ambient Lamps Dimmer Signal circuit for greater than 10 seconds.

DEFAULT ACTION

- The Ambient Lamps are inoperative.

POSSIBLE CAUSES

Possible Causes
PANEL LAMPS DIMMER SWITCH MUX CIRCUIT SHORTED TO GROUND
HEADLAMP SWITCH
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after wiring repair or module replacement:**

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. CHECK THE HEADLAMP SWITCH FOR AN INTERNAL SHORT

NOTE: **Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.**

1. Turn the ignition off.
2. Disconnect the Headlamp Switch harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Headlamp Switch in accordance with the Service Information. Refer to [SWITCH, HEADLAMP, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (E3) PANEL LAMPS DIMMER SWITCH MUX CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.

7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B17FF-15-AMBIENT CABIN LIGHT DIMMER SWITCH - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete INTERIOR LIGHTING SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Dimmer Switch is integral to the Headlamp Switch. The Dimmer Switch is used to control the brightness of components that receive backlighting, such as the Instrument Panel Cluster (IPC), along with other various backlit components.

The Body Control Module (BCM) supplies and monitors a 5.0 volt reference voltage to the Headlamp/Dimmer Switch, through the Panel Lamps Driver circuit or Panel Lamps Dimmer Switch MUX Signal circuit. Based on the Headlamp/Dimmer Switch position, the BCM sets and adjusts the illumination output for the various backlit components.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Ambient Lamps are active and the Body Control Module (BCM) detects greater than 100k Ohms, or 4.687 volts, on the Ambient Lamps Dimmer Signal for greater than 10 seconds.

DEFAULT ACTION

- The Ambient Lamps are inoperative.

POSSIBLE CAUSES

Possible Causes
PANEL LAMPS DIMMER SWITCH MUX CIRCUIT SHORTED TO VOLTAGE
PANEL LAMPS DIMMER SWITCH MUX CIRCUIT OPEN

Possible Causes
HEADLAMP SWITCH
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. DISCONNECT THE HEADLAMP SWITCH HARNESS CONNECTOR AND CHECK THE (E3) PANEL LAMPS DIMMER SWITCH MUX CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Isolate the circuit by disconnecting the component harness connector for the circuit being tested.
Note: Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the voltage above 4.687 volts?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [3](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (E3) PANEL LAMPS DIMMER SWITCH MUX CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A FUSED JUMPER WIRE BETWEEN GROUND AND THE (E3) PANEL LAMPS DIMMER SWITCH MUX CIRCUIT - CHECK FOR ADDITIONAL DTCS

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Connect a fused jumper wire between ground and the circuit being tested at the component harness connector. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. With the scan tool, read the BCM DTCs.

Is DTC: B17FF-11-AMBIENT CABIN LIGHT DIMMER SWITCH - CIRCUIT SHORT TO GROUND active?

Yes

- Replace the Headlamp Switch in accordance with the Service Information. Refer to [SWITCH, HEADLAMP, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [5](#)

5. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.

- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1800-11-DRIVER DOOR LOCK-UNLOCK SWITCH-CIRCUIT SHORT TO GROUND

For a complete LOCK SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) monitors door lock and unlock inputs from the Remote Keyless Entry FOB/IK, Driver Door Lock Switch and Passenger Door Lock Switch, through the Passive Entry Antenna or Left and Right Door Lock Switch Status circuits. The BCM provides a ground to the Door Lock Switches through the Driver and Passenger Door Lock Switch Return circuits.

Based on the door lock and unlock inputs, the BCM activates the lock and unlock functions of the bidirectional Driver, Passenger, and Rear (if equipped) Door Lock Motors (integral to the Door Latches) for 370 milliseconds, before returning to the neutral position.

Door Lock: When the Body Control Module (BCM) receives a request to lock the doors, the BCM provides a voltage signal to the Door Lock Control circuit and a ground signal to the Front Driver Door Unlock Control circuit and Door Unlock Control circuit to actuate the Driver, Passenger, and Rear Door Lock Motors to the lock position.

Driver Door Unlock: When the Body Control Module (BCM) receives a request to unlock the Driver Door only, the BCM provides a ground signal to the Door Lock Control circuit and a voltage signal to the Front Driver Door Unlock circuit, to actuate the Driver Door Lock Motor to the unlock position.

All Doors Unlock: When the Body Control Module (BCM) receives a request to unlock all Doors, the BCM provides a ground signal to the Door Lock Control circuit and a voltage signal to the Front Driver Door Unlock Control circuit and Door Unlock Control circuit to actuate the Driver, Passenger, and Rear Door Lock Motors to the unlock position.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Body Control Module (BCM) detects less than 50.0 Ohms or 0.124 volts on the Left Door Lock Switch Status circuit for greater than three seconds.

POSSIBLE CAUSES

Possible Causes
LEFT DOOR LOCK SWITCH STATUS CIRCUIT SHORTED TO GROUND DRIVER DOOR LOCK SWITCH BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. DISCONNECT THE DRIVER DOOR LOCK SWITCH HARNESS CONNECTOR - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. Turn the ignition off.

2. Disconnect the component harness connector(s) containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the Driver Door Lock Switch in accordance with the Service Information. Refer to [SWITCH, LOCK, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (G161) LEFT DOOR LOCK SWITCH STATUS CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:

- Proper connector installation.
- Damaged connector locks.
- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1805-11-PASSENGER DOOR LOCK-UNLOCK SWITCH-CIRCUIT SHORT TO GROUND

For a complete LOCK SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) monitors door lock and unlock inputs from the Remote Keyless Entry FOB/IK, Driver Door Lock Switch and Passenger Door Lock Switch, through the Passive Entry Antenna or Left and Right Door Lock Switch Status circuits. The BCM provides a ground to the Door Lock Switches through the Driver and Passenger Door Lock Switch Return circuits.

Based on the door lock and unlock inputs, the BCM activates the lock and unlock functions of the bidirectional Driver, Passenger, and Rear (if equipped) Door Lock Motors (integral to the Door Latches) for 370 milliseconds, before returning to the neutral position.

Door Lock: When the Body Control Module (BCM) receives a request to lock the doors, the BCM provides a voltage signal to the Door Lock Control circuit and a ground signal to the Front Driver Door Unlock Control

circuit and Door Unlock Control circuit to actuate the Driver, Passenger, and Rear Door Lock Motors to the lock position.

Driver Door Unlock: When the Body Control Module (BCM) receives a request to unlock the Driver Door only, the BCM provides a ground signal to the Door Lock Control circuit and a voltage signal to the Front Driver Door Unlock circuit, to actuate the Driver Door Lock Motor to the unlock position.

All Doors Unlock: When the Body Control Module (BCM) receives a request to unlock all Doors, the BCM provides a ground signal to the Door Lock Control circuit and a voltage signal to the Front Driver Door Unlock Control circuit and Door Unlock Control circuit to actuate the Driver, Passenger, and Rear Door Lock Motors to the unlock position.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Body Control Module (BCM) detects less than 50.0 Ohms or 0.124 volts on the Right Door Lock Switch Status circuit for greater than three seconds.

POSSIBLE CAUSES

Possible Causes
RIGHT DOOR LOCK SWITCH STATUS CIRCUIT SHORTED TO GROUND
PASSENGER DOOR LOCK SWITCH
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. **READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN**
 1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
 2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
 3. With the scan tool, erase all DTCs.
 4. Turn the ignition off for a minimum of 10.0 seconds.
 5. Turn the ignition on.
 6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
 7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. DISCONNECT THE PASSENGER DOOR LOCK SWITCH HARNESS CONNECTOR - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. Turn the ignition off.
2. Disconnect the component harness connector(s) containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the Passenger Door Lock Switch in accordance with the Service Information. Refer to [SWITCH, LOCK, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (G160) RIGHT DOOR LOCK SWITCH STATUS CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).

3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B180F-11- DRIVER DOOR AJAR - CIRCUIT SHORT TO GROUND

For a complete LOCK SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Driver Door Latch is equipped with internal Primary and Secondary Door Ajar Switches that are monitored by the Body Control Module (BCM) and Powertrain Control Module (PCM). When the Driver Door closes, the Primary Driver Door Ajar Switch opens and the Secondary Driver Door Ajar Switch closes. When the Driver Door opens, the Primary Driver Door Ajar Switch closes and the Secondary Driver Door Ajar Switch opens. The Primary and Secondary Door Ajar Switches share a common return circuit provided by the BCM.

The BCM provides a reference voltage to the Driver Door Latch for the Primary and Secondary Driver Door Ajar Switches. The Door Ajar Switches are each equipped with an internal 604.0 Ohm resistor, along with an

internal 1070.0 Ohm diagnostic resistor, which are in parallel with the internal ajar switches.

- When the Primary Door Ajar Switch is opened (Door is closed), the reference voltage travels through the 604.0 Ohm resistor and the 1070.0 Ohm diagnostic resistor.
- When the Primary Door Ajar Switch is closed (Door is opened), the 1070.0 Ohm diagnostic resistor is bypassed and the reference voltage travels only through the 604.0 Ohm resistor.
- When the Secondary Door Ajar Switch is opened (Door is opened), the reference voltage travels through the 604.0 Ohm resistor and the 1070.0 Ohm diagnostic resistor.
- When the Secondary Door Ajar Switch is closed (Door is closed), the 1070.0 Ohm diagnostic resistor is bypassed and the reference voltage travels only through the 604.0 Ohm resistor.

NOTE: With the Driver Door Latch harness connector **DISCONNECTED**, the voltage measured on the Driver Door Ajar Switch Sense circuits is approximately 12.5 volts (battery voltage).

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects less than 10.0 Ohms, or 0.272 volts, on the Driver Door Ajar Switch Sense circuit for greater than five seconds.

POSSIBLE CAUSES

Possible Causes
DRIVER DOOR AJAR SWITCH SENSE CIRCUIT SHORTED TO GROUND
DRIVER DOOR LATCH
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after wiring repair or module replacement:**

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. CHECK THE DRIVER DOOR LATCH FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Driver Door Latch harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Driver Door Latch in accordance with the Service Information. Refer to [LATCH, DOOR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (G75) DRIVER DOOR AJAR SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to [MODULE, BODY CONTROL \(BCM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

B180F-15-DRIVER DOOR AJAR-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete LOCK SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Driver Door Latch is equipped with internal Primary and Secondary Door Ajar Switches that are monitored by the Body Control Module (BCM) and Powertrain Control Module (PCM). When the Driver Door closes, the

Primary Driver Door Ajar Switch opens and the Secondary Driver Door Ajar Switch closes. When the Driver Door opens, the Primary Driver Door Ajar Switch closes and the Secondary Driver Door Ajar Switch opens. The Primary and Secondary Door Ajar Switches share a common return circuit provided by the BCM.

The BCM provides a reference voltage to the Driver Door Latch for the Primary and Secondary Driver Door Ajar Switches. The Door Ajar Switches are each equipped with an internal 604.0 Ohm resistor, along with an internal 1070.0 Ohm diagnostic resistor, which are in parallel with the internal ajar switches.

- When the Primary Door Ajar Switch is opened (Door is closed), the reference voltage travels through the 604.0 Ohm resistor and the 1070.0 Ohm diagnostic resistor.
- When the Primary Door Ajar Switch is closed (Door is opened), the 1070.0 Ohm diagnostic resistor is bypassed and the reference voltage travels only through the 604.0 Ohm resistor.
- When the Secondary Door Ajar Switch is opened (Door is opened), the reference voltage travels through the 604.0 Ohm resistor and the 1070.0 Ohm diagnostic resistor.
- When the Secondary Door Ajar Switch is closed (Door is closed), the 1070.0 Ohm diagnostic resistor is bypassed and the reference voltage travels only through the 604.0 Ohm resistor.

NOTE: With the Driver Door Latch harness connector DISCONNECTED, the voltage measured on the Driver Door Ajar Switch Sense circuits is approximately 12.5 volts (battery voltage).

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects greater than 4.54 volts on the Driver Door Ajar Switch Sense circuit for greater than five seconds.

POSSIBLE CAUSES

Possible Causes
DRIVER DOOR AJAR SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE
DRIVER DOOR AJAR SWITCH SENSE CIRCUIT OPEN
DRIVER DOOR LATCH
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. **READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN**
 1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
 2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
 3. With the scan tool, erase all DTCS.
 4. Turn the ignition off for a minimum of 10.0 seconds.
 5. Turn the ignition on.

6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. BACK-PROBE AT THE DRIVER DOOR LATCH HARNESS CONNECTOR AND MEASURE THE VOLTAGE ON THE (G75) DRIVER DOOR AJAR SWITCH SENSE CIRCUIT

1. Turn the ignition on.
2. Back-probe at the component harness connector and measure the voltage on the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the voltage above 10.0 volts?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE DRIVER DOOR LATCH AND BCM HARNESS CONNECTORS - CHECK THE (G75) DRIVER DOOR AJAR SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE BCM HARNESS CONNECTORS

NOTE: The ignition may not turn on when the BCM harness connector containing the circuit being tested is disconnected. Therefore, this step can help determine if the circuit being tested is shorted to another voltage circuit in any of the BCM harness connectors.

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Disconnect all Electronic Control Unit (ECU) harness connectors, along with the component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connectors.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To **6**

4. DISCONNECT THE DRIVER DOOR LATCH AND BCM HARNESS CONNECTORS - CHECK THE (G75) DRIVER DOOR AJAR SWITCH SENSE CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) and component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To **5**

5. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A FUSED JUMPER WIRE BETWEEN GROUND AND THE (G75) DRIVER DOOR AJAR SWITCH SENSE CIRCUIT - CHECK FOR ADDITIONAL DTCS

1. Turn the ignition off.
2. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
3. Connect a fused jumper wire between ground and the circuit being tested at the component harness connector. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
4. Turn the ignition on.
5. With the scan tool, read the BCM DTCs.

Is DTC: B180F-11-DRIVER DOOR AJAR-CIRCUIT SHORT TO GROUND active?

Yes

- Replace the Driver Door Latch in accordance with the Service Information. Refer to **LATCH, DOOR, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [6](#)

6. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1812-11-PASSENGER DOOR AJAR-CIRCUIT SHORT TO GROUND

For a complete LOCK SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) provides a reference voltage to the Passenger Door Ajar Switch (integral to the Door Latch) through the Passenger Door Ajar Switch Sense circuit. On vehicles equipped with Rear Doors, the BCM also provides a reference voltage to the Rear Door Ajar Switches (integral to the Door Latches) using the Left Rear Door Ajar Switch Sense circuit and Right Rear Door Ajar Switch Sense circuit. The Passenger and Rear Door Ajar Switches share a common return circuit provided by the BCM. The Door Ajar Switches are normally open when the Doors are closed. When a Door is opened, the related Door Ajar Switch closes.

The Door Ajar Switches are each equipped with an internal 604.0 Ohm resistor, along with an internal 1070.0 Ohm diagnostic resistor, which are in parallel with the internal ajar switches.

When a Door Ajar Switch is opened (Door is closed), the reference voltage travels through the 604.0 Ohm resistor and the 1070.0 Ohm diagnostic resistor.

When a Door Ajar Switch is closed (Door is opened), the 1070.0 Ohm diagnostic resistor is bypassed and the reference voltage travels only through the 604.0 Ohm resistor.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects less than 10.0 Ohms, or 0.272 volts, on the Passenger Door Ajar Switch Sense circuit for greater than five seconds.

POSSIBLE CAUSES

Possible Causes
PASSENGER DOOR AJAR SWITCH SENSE CIRCUIT SHORTED TO GROUND
PASSENGER DOOR LATCH
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE PASSENGER DOOR LATCH FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Passenger Door Latch harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Passenger Door Latch in accordance with the Service Information. Refer to **LATCH, DOOR, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (G74) PASSENGER DOOR AJAR SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1812-15-PASSENGER DOOR AJAR - CIRCUIT SHORT TO BATTERY OR OPEN

7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the Left Rear Door Latch in accordance with the Service Information. Refer to [LATCH, DOOR, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (G77) LEFT REAR DOOR AJAR SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:

- Proper connector installation.
- Damaged connector locks.
- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1815-15-REAR DRIVER DOOR AJAR-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete LOCK SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) provides a reference voltage to the Passenger Door Ajar Switch (integral to the Door Latch) through the Passenger Door Ajar Switch Sense circuit. On vehicles equipped with Rear Doors, the BCM also provides a reference voltage to the Rear Door Ajar Switches (integral to the Door Latches) using the Left Rear Door Ajar Switch Sense circuit and Right Rear Door Ajar Switch Sense circuit. The Passenger and Rear Door Ajar Switches share a common return circuit provided by the BCM. The Door Ajar Switches are normally open when the Doors are closed. When a Door is opened, the related Door Ajar Switch closes.

The Door Ajar Switches are each equipped with an internal 604.0 Ohm resistor, along with an internal 1070.0 Ohm diagnostic resistor, which are in parallel with the internal ajar switches.

When a Door Ajar Switch is opened (Door is closed), the reference voltage travels through the 604.0 Ohm resistor and the 1070.0 Ohm diagnostic resistor.

When a Door Ajar Switch is closed (Door is opened), the 1070.0 Ohm diagnostic resistor is bypassed and the reference voltage travels only through the 604.0 Ohm resistor.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects greater than 0.844 volts on the Left Rear Door Ajar Switch Sense circuit for greater than five seconds.

POSSIBLE CAUSES

Possible Causes
LEFT REAR DOOR AJAR SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE
LEFT REAR DOOR AJAR SWITCH SENSE CIRCUIT OPEN
LEFT REAR DOOR LATCH
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. BACK-PROBE AT THE LEFT REAR DOOR LATCH HARNESS CONNECTOR AND MEASURE THE VOLTAGE ON THE (G77) LEFT REAR DOOR AJAR SWITCH SENSE CIRCUIT

1. Turn the ignition on.

2. Back-probe at the component harness connector and measure the voltage on the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the voltage above 10.0 volts?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE LEFT REAR DOOR LATCH AND BCM HARNESS CONNECTORS - CHECK THE (G77) LEFT REAR DOOR AJAR SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE BCM HARNESS CONNECTORS

NOTE: The ignition may not turn on when the BCM harness connector containing the circuit being tested is disconnected. Therefore, this step can help determine if the circuit being tested is shorted to another voltage circuit in any of the BCM harness connectors.

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Disconnect all Electronic Control Unit (ECU) harness connectors, along with the component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connectors.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [6](#)

4. DISCONNECT THE LEFT REAR DOOR LATCH AND BCM HARNESS CONNECTORS - CHECK THE (G77) LEFT REAR DOOR AJAR SWITCH SENSE CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) and component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.

3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [5](#)

5. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A FUSED JUMPER WIRE BETWEEN GROUND AND THE (G77) LEFT REAR DOOR AJAR SWITCH SENSE CIRCUIT - CHECK FOR ADDITIONAL DTCS

1. Turn the ignition off.
2. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
3. Connect a fused jumper wire between ground and the circuit being tested at the component harness connector. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
4. Turn the ignition on.
5. With the scan tool, read the BCM DTCs.

Is DTC B1815-11-REAR DRIVER DOOR AJAR-CIRCUIT SHORT TO GROUND active?

Yes

- Replace the Left Rear Door Latch in accordance with the Service Information. Refer to [LATCH, DOOR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).

- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

B1818-11-REAR PASSENGER DOOR AJAR-CIRCUIT SHORT TO GROUND

For a complete LOCK SYSTEM wiring diagram, **Refer to the appropriate wiring information**.

THEORY OF OPERATION

The Body Control Module (BCM) provides a reference voltage to the Passenger Door Ajar Switch (integral to the Door Latch) through the Passenger Door Ajar Switch Sense circuit. On vehicles equipped with Rear Doors, the BCM also provides a reference voltage to the Rear Door Ajar Switches (integral to the Door Latches) using the Left Rear Door Ajar Switch Sense circuit and Right Rear Door Ajar Switch Sense circuit. The Passenger and Rear Door Ajar Switches share a common return circuit provided by the BCM. The Door Ajar Switches are normally open when the Doors are closed. When a Door is opened, the related Door Ajar Switch closes.

The Door Ajar Switches are each equipped with an internal 604.0 Ohm resistor, along with an internal 1070.0 Ohm diagnostic resistor, which are in parallel with the internal ajar switches.

When a Door Ajar Switch is opened (Door is closed), the reference voltage travels through the 604.0 Ohm resistor and the 1070.0 Ohm diagnostic resistor.

When a Door Ajar Switch is closed (Door is opened), the 1070.0 Ohm diagnostic resistor is bypassed and the reference voltage travels only through the 604.0 Ohm resistor.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects less than 50.0 Ohms, or 0.07 volts, on the Right Rear Door Ajar Switch Sense circuit for greater than five seconds.

POSSIBLE CAUSES

Possible Causes
RIGHT REAR DOOR AJAR SWITCH SENSE CIRCUIT SHORTED TO GROUND
RIGHT REAR DOOR LATCH
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. DISCONNECT THE RIGHT REAR DOOR LATCH HARNESS CONNECTOR - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. Turn the ignition off.
2. Disconnect the component harness connector(s) containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the Right Rear Door Latch in accordance with the Service Information. Refer to [LATCH, DOOR, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (G76) RIGHT REAR DOOR AJAR SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).

- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

B1818-15-REAR PASSENGER DOOR AJAR-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete LOCK SYSTEM wiring diagram, **Refer to the appropriate wiring information**.

THEORY OF OPERATION

The Body Control Module (BCM) provides a reference voltage to the Passenger Door Ajar Switch (integral to the Door Latch) through the Passenger Door Ajar Switch Sense circuit. On vehicles equipped with Rear Doors, the BCM also provides a reference voltage to the Rear Door Ajar Switches (integral to the Door Latches) using the Left Rear Door Ajar Switch Sense circuit and Right Rear Door Ajar Switch Sense circuit. The Passenger and Rear Door Ajar Switches share a common return circuit provided by the BCM. The Door Ajar Switches are normally open when the Doors are closed. When a Door is opened, the related Door Ajar Switch closes.

The Door Ajar Switches are each equipped with an internal 604.0 Ohm resistor, along with an internal 1070.0 Ohm diagnostic resistor, which are in parallel with the internal ajar switches.

When a Door Ajar Switch is opened (Door is closed), the reference voltage travels through the 604.0 Ohm resistor and the 1070.0 Ohm diagnostic resistor.

When a Door Ajar Switch is closed (Door is opened), the 1070.0 Ohm diagnostic resistor is bypassed and the reference voltage travels only through the 604.0 Ohm resistor.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects greater than 0.844 volts on the Right Rear Door Ajar Switch Sense circuit for greater than five seconds.

POSSIBLE CAUSES

Possible Causes
RIGHT REAR DOOR AJAR SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE
RIGHT REAR DOOR AJAR SWITCH SENSE CIRCUIT OPEN
RIGHT REAR DOOR LATCH
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. BACK-PROBE AT THE RIGHT REAR DOOR LATCH HARNESS CONNECTOR AND MEASURE THE VOLTAGE ON THE (G76) RIGHT REAR DOOR AJAR SWITCH SENSE CIRCUIT

1. Turn the ignition on.
2. Back-probe at the component harness connector and measure the voltage on the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the voltage above 10.0 volts?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE RIGHT REAR DOOR LATCH AND BCM HARNESS CONNECTORS - CHECK THE (G76) RIGHT REAR DOOR AJAR SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE BCM HARNESS CONNECTORS

NOTE: The ignition may not turn on when the BCM harness connector containing the circuit being tested is disconnected. Therefore, this step can help determine if the circuit being tested is shorted to another voltage circuit in any of the BCM harness connectors.

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Disconnect all Electronic Control Unit (ECU) harness connectors, along with the component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connectors.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [6](#)

4. DISCONNECT THE RIGHT REAR DOOR LATCH AND BCM HARNESS CONNECTORS - CHECK THE (G76) RIGHT REAR DOOR AJAR SWITCH SENSE CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) and component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [5](#)

5. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A FUSED JUMPER WIRE BETWEEN GROUND AND THE (G76) RIGHT REAR DOOR AJAR SWITCH SENSE CIRCUIT - CHECK FOR ADDITIONAL DTCS

1. Turn the ignition off.
2. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
3. Connect a fused jumper wire between ground and the circuit being tested at the component harness connector. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
4. Turn the ignition on.
5. With the scan tool, read the BCM DTCS.

Is DTC B1818-11-REAR PASSENGER DOOR AJAR-CIRCUIT SHORT TO GROUND active?

Yes

- Replace the Right Rear Door Latch in accordance with the Service Information. Refer to [**LATCH, DOOR, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [6](#)

6. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.

6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B181E-13-HOOD AJAR INPUT-CIRCUIT OPEN

For a complete VEHICLE THEFT SECURITY SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

NOTE: A single Hood Ajar Switch is used on vehicles without Engine Stop/Start (ESS), e-Torque or Plug-in Hybrid Electric Vehicle (PHEV). Two Hood Ajar Switches (Hood Ajar Switch 1 and Hood Ajar Switch 2) are used on vehicles with ESS, e-Torque or PHEV.

NOTE: This diagnostic procedure is for the Hood Ajar Switch or Hood Ajar Switch 1. For diagnostic information regarding Hood Ajar Switch 2. Refer to the appropriate service information .

The Body Control Module (BCM) sends the position status of the Hood Ajar Switch/Hood Ajar Switch 1, through CAN Bus messages, to the Powertrain Control Module (PCM).

The BCM monitors the hardwired Hood Ajar Switch/Hood Ajar Switch 1 through the Hood Ajar Switch Sense circuit, along with the Sensor Ground circuit.

The Hood Ajar Switch is normally open when the Hood is closed. When the Hood Ajar Switch is open, the reference voltage travels to the Hood Ajar Switch and through an internal 500.0 Ohm diagnostic resistor, which is internally parallel with the Hood Ajar Switch. The reference voltage then travels through an additional internal 500.0 Ohm resistor, within the Hood Ajar Switch. The total resistance of Hood Ajar Switch in the open position is approximately 1000.0 Ohms.

When the Hood is opened, the Hood Ajar Switch closes and the internal diagnostic resistor is bypassed. The reference voltage sent to the Hood Ajar Switch only travels through the internal resistor. The total resistance of Hood Ajar Switch in the open position is approximately 500.0 Ohms.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Hood Ajar Switch is active and the Body Control Module (BCM) detects greater than 100k Ohms, or 0.847 volts, on the Hood Ajar Switch Sense circuit for greater than 10 seconds.

DEFAULT ACTION

- The Hood Ajar indicator is inoperative.

POSSIBLE CAUSES

Possible Causes
HOOD AJAR SWITCH SENSE CIRCUIT OPEN
SENSOR GROUND CIRCUIT OPEN
HOOD AJAR SWITCH
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. DISCONNECT THE HOOD AJAR SWITCH AND CHECK FOR PROPER OPERATION

1. Turn the ignition off.
2. Disconnect the Hood Ajar Switch harness connector.
3. Press the Hood Ajar Switch down and check for continuity between the two terminals at the component side of the switch.
4. Release the Hood Ajar Switch and check for continuity between the two terminals at the component side of the switch.

Is there continuity between the two terminals for both connections?

Yes

- Go To [3](#)

No

- Replace the Hood Ajar Switch in accordance with the Service Information. Refer to **SWITCH, HOOD AJAR, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. CHECK THE VOLTAGE ON THE (G70) HOOD AJAR SWITCH SENSE CIRCUIT

1. Measure the voltage on the circuit being tested at the component harness connector.

Is the voltage above 1.0 volt?

Yes

- Go To [5](#)

No

- Go To [4](#)

4. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (G70) HOOD AJAR SWITCH SENSE CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [6](#)

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (G931) SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.

4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [6](#)

6. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B182C-11-ALL DOOR LOCK CONTROL-CIRCUIT SHORT TO GROUND

For a complete LOCK SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) monitors door lock and unlock inputs from the Remote Keyless Entry FOB/IK, Driver Door Lock Switch and Passenger Door Lock Switch, through the Passive Entry Antenna or Left and Right Door Lock Switch Status circuits. The BCM provides a ground to the Door Lock Switches through the Driver and Passenger Door Lock Switch Return circuits.

Based on the door lock and unlock inputs, the BCM activates the lock and unlock functions of the bidirectional Driver, Passenger, and Rear (if equipped) Door Lock Motors (integral to the Door Latches) for 370 milliseconds, before returning to the neutral position.

Door Lock: When the Body Control Module (BCM) receives a request to lock the doors, the BCM provides a voltage signal to the Door Lock Control circuit and a ground signal to the Front Driver Door Unlock Control circuit and Door Unlock Control circuit to actuate the Driver, Passenger, and Rear Door Lock Motors to the lock position.

Driver Door Unlock: When the Body Control Module (BCM) receives a request to unlock the Driver Door only, the BCM provides a ground signal to the Door Lock Control circuit and a voltage signal to the Front Driver Door Unlock circuit, to actuate the Driver Door Lock Motor to the unlock position.

All Doors Unlock: When the Body Control Module (BCM) receives a request to unlock all Doors, the BCM provides a ground signal to the Door Lock Control circuit and a voltage signal to the Front Driver Door Unlock Control circuit and Door Unlock Control circuit to actuate the Driver, Passenger, and Rear Door Lock Motors to the unlock position.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- **Door Lock Output ON**
 - **Primary Door Locks:** When the Body Control Module (BCM) detects greater than 50.0 amps on the Door Unlock Control circuit.
 - **Secondary Door Locks:** When the BCM detects greater than 18.0 amps on the Door Unlock Control circuit.
- **Door Lock Output OFF**
 - **All Doors:** When the BCM detects less than 1.253 volts on the Door Lock Control circuit.
- The BCM will deactivate the output for the remainder of the ignition cycle after four consecutive BCM output retry attempts have failed within that ignition cycle.

DEFAULT ACTION

- Door Lock functions are inoperative.

POSSIBLE CAUSES

Possible Causes
DOOR LOCK CONTROL CIRCUIT SHORTED TO GROUND
DOOR UNLOCK CONTROL CIRCUIT SHORTED TO GROUND
DRIVER DOOR LOCK/UNLOCK MOTOR (INTEGRAL TO LATCH)
PASSENGER DOOR LOCK/UNLOCK MOTOR (INTEGRAL TO LATCH)
LEFT REAR DOOR LOCK/UNLOCK MOTOR (INTEGRAL TO LATCH)
RIGHT REAR DOOR LOCK/UNLOCK MOTOR (INTEGRAL TO LATCH)
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after wiring repair or component replacement:**

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE DRIVER DOOR LOCK/UNLOCK MOTOR FOR AN INTERNAL SHORT

NOTE: **Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.**

1. Turn the ignition off.
2. Disconnect the Driver Door Lock/Unlock Motor harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Driver Door Lock/Unlock Motor in accordance with the Service Information. Refer to [LATCH, DOOR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. CHECK THE PASSENGER DOOR LOCK/UNLOCK MOTOR FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Passenger Door Lock/Unlock Motor harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [4](#)

No

- Replace the Passenger Door Lock/Unlock Motor in accordance with the Service Information. Refer to [LATCH, DOOR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. CHECK THE LEFT REAR DOOR LOCK/UNLOCK MOTOR FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Left Rear Door Lock/Unlock Motor harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [5](#)

No

- Replace the Left Rear Door Lock/Unlock Motor in accordance with the Service Information. Refer to [LATCH, DOOR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. CHECK THE RIGHT REAR DOOR LOCK/UNLOCK MOTOR FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Right Rear Door Lock/Unlock Motor harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [6](#)

No

- Replace the Right Rear Door Lock/Unlock Motor in accordance with the Service Information. Refer to [LATCH, DOOR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

6. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (P777) DOOR LOCK CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

7. CHECK THE (P292) DOOR UNLOCK CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [8](#)

8. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B182C-12-ALL DOOR LOCK CONTROL-CIRCUIT SHORT TO BATTERY

For a complete LOCK SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) monitors door lock and unlock inputs from the Remote Keyless Entry FOB/IK, Driver Door Lock Switch and Passenger Door Lock Switch, through the Passive Entry Antenna or Left and Right Door Lock Switch Status circuits. The BCM provides a ground to the Door Lock Switches through the Driver and Passenger Door Lock Switch Return circuits.

Based on the door lock and unlock inputs, the BCM activates the lock and unlock functions of the bidirectional Driver, Passenger, and Rear (if equipped) Door Lock Motors (integral to the Door Latches) for 370 milliseconds, before returning to the neutral position.

Door Lock: When the Body Control Module (BCM) receives a request to lock the doors, the BCM provides a voltage signal to the Door Lock Control circuit and a ground signal to the Front Driver Door Unlock Control circuit and Door Unlock Control circuit to actuate the Driver, Passenger, and Rear Door Lock Motors to the lock position.

Driver Door Unlock: When the Body Control Module (BCM) receives a request to unlock the Driver Door only, the BCM provides a ground signal to the Door Lock Control circuit and a voltage signal to the Front Driver Door Unlock circuit, to actuate the Driver Door Lock Motor to the unlock position.

All Doors Unlock: When the Body Control Module (BCM) receives a request to unlock all Doors, the BCM provides a ground signal to the Door Lock Control circuit and a voltage signal to the Front Driver Door Unlock Control circuit and Door Unlock Control circuit to actuate the Driver, Passenger, and Rear Door Lock Motors to the unlock position.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- When the Door Lock Switch is inactive and the Body Control Module (BCM) detects greater than 3.571 volts on the Door Lock Control circuit for greater than 130 milliseconds.

DEFAULT ACTION

- Door Lock functions are inoperative.

POSSIBLE CAUSES

Possible Causes
DOOR LOCK CONTROL CIRCUIT SHORTED TO VOLTAGE
DRIVER DOOR LOCK/UNLOCK MOTOR (INTEGRAL TO LATCH)
PASSENGER DOOR LOCK/UNLOCK MOTOR (INTEGRAL TO LATCH)
LEFT REAR DOOR LOCK/UNLOCK MOTOR (INTEGRAL TO LATCH)

Possible Causes
RIGHT REAR DOOR LOCK/UNLOCK MOTOR (INTEGRAL TO LATCH)
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. DISCONNECT THE DRIVER DOOR LOCK/UNLOCK MOTOR HARNESS CONNECTOR - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. Turn the ignition off.
2. Disconnect the component harness connector(s) containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the Driver Door Lock/Unlock Motor in accordance with the Service Information. Refer to **LATCH, DOOR, REMOVAL AND INSTALLATION**.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. DISCONNECT THE PASSENGER DOOR LOCK/UNLOCK MOTOR HARNESS CONNECTOR - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. Turn the ignition off.
2. Disconnect the component harness connector(s) containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [4](#)

No

- Replace the Passenger Door Lock/Unlock Motor in accordance with the Service Information. Refer to **LATCH, DOOR, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. DISCONNECT THE LEFT REAR DOOR LOCK/UNLOCK MOTOR HARNESS CONNECTOR - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. Turn the ignition off.
2. Disconnect the component harness connector(s) containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Replace the Left Rear Door Lock/Unlock Motor in accordance with the Service Information. Refer to **LATCH, DOOR, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. DISCONNECT THE RIGHT REAR DOOR LOCK/UNLOCK MOTOR HARNESS CONNECTOR - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. Turn the ignition off.
2. Disconnect the component harness connector(s) containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. With the scan tool, erase all DTCs.

4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [6](#)

No

- Replace the Right Rear Door Lock/Unlock Motor in accordance with the Service Information. Refer to [LATCH, DOOR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

6. CHECK THE VOLTAGE ON THE (P777) DOOR LOCK CONTROL CIRCUIT

1. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: **Make sure the Door Lock Switch is not activated while performing this step.**

NOTE: **When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.**

Is there any voltage present?

Yes

- Go To [7](#)

No

- Go To [8](#)

7. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (P777) DOOR LOCK CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the electronic control module (ECU) harness connector(s) for the circuit being tested.
Note: Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the Electronic Control Unit (ECU) harness connector(s).

NOTE: **When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.**

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [8](#)

8. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B182C-13-ALL DOOR LOCK CONTROL-CIRCUIT OPEN

For a complete LOCK SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) monitors door lock and unlock inputs from the Remote Keyless Entry FOB/IK, Driver Door Lock Switch and Passenger Door Lock Switch, through the Passive Entry Antenna or Left and Right Door Lock Switch Status circuits. The BCM provides a ground to the Door Lock Switches through the Driver and Passenger Door Lock Switch Return circuits.

Based on the door lock and unlock inputs, the BCM activates the lock and unlock functions of the bidirectional Driver, Passenger, and Rear (if equipped) Door Lock Motors (integral to the Door Latches) for 370 milliseconds, before returning to the neutral position.

Door Lock: When the Body Control Module (BCM) receives a request to lock the doors, the BCM provides a voltage signal to the Door Lock Control circuit and a ground signal to the Front Driver Door Unlock Control circuit and Door Unlock Control circuit to actuate the Driver, Passenger, and Rear Door Lock Motors to the lock position.

Driver Door Unlock: When the Body Control Module (BCM) receives a request to unlock the Driver Door only, the BCM provides a ground signal to the Door Lock Control circuit and a voltage signal to the Front Driver Door Unlock circuit, to actuate the Driver Door Lock Motor to the unlock position.

All Doors Unlock: When the Body Control Module (BCM) receives a request to unlock all Doors, the BCM provides a ground signal to the Door Lock Control circuit and a voltage signal to the Front Driver Door Unlock Control circuit and Door Unlock Control circuit to actuate the Driver, Passenger, and Rear Door Lock Motors to the unlock position.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- When the Door Lock Switch is active and the Body Control Module (BCM) detects greater than 1.178 volts on the Door Lock Control circuit.

DEFAULT ACTION

- Door Lock functions are inoperative.

POSSIBLE CAUSES

Possible Causes
DOOR LOCK CONTROL CIRCUIT OPEN
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To change the status of this DTC from Active to Stored, or to erase the DTC from the module's internal memory, a normal lock and unlock activation cycle must be performed. Failure to follow this step after a repair has been completed, may lead to an incorrect repair.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.

4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (P777) DOOR LOCK CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

NOTE: This DTC is set when all the door lock motors are inoperative. Check for an open between the BCM, Door Latches and splices.

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms for any of the connections?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [3](#)

3. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.

- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1830-11-ALL DOORS UNLOCK CONTROL-CIRCUIT SHORT TO GROUND

For a complete LOCK SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) monitors door lock and unlock inputs from the Remote Keyless Entry FOB/IK, Driver Door Lock Switch and Passenger Door Lock Switch, through the Passive Entry Antenna or Left and Right Door Lock Switch Status circuits. The BCM provides a ground to the Door Lock Switches through the Driver and Passenger Door Lock Switch Return circuits.

Based on the door lock and unlock inputs, the BCM activates the lock and unlock functions of the bidirectional Driver, Passenger, and Rear (if equipped) Door Lock Motors (integral to the Door Latches) for 370 milliseconds, before returning to the neutral position.

Door Lock: When the Body Control Module (BCM) receives a request to lock the doors, the BCM provides a voltage signal to the Door Lock Control circuit and a ground signal to the Front Driver Door Unlock Control circuit and Door Unlock Control circuit to actuate the Driver, Passenger, and Rear Door Lock Motors to the lock position.

Driver Door Unlock: When the Body Control Module (BCM) receives a request to unlock the Driver Door only, the BCM provides a ground signal to the Door Lock Control circuit and a voltage signal to the Front Driver Door Unlock circuit, to actuate the Driver Door Lock Motor to the unlock position.

All Doors Unlock: When the Body Control Module (BCM) receives a request to unlock all Doors, the BCM provides a ground signal to the Door Lock Control circuit and a voltage signal to the Front Driver Door Unlock

Control circuit and Door Unlock Control circuit to actuate the Driver, Passenger, and Rear Door Lock Motors to the unlock position.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- **Door Unlock Output ON**
 - **Driver Door:** When the Body Control Module (BCM) detects greater than 20.0 amps on the Door Unlock Control circuit.
 - **Passenger Doors:** When the BCM detects greater than 40.0 amps on the Door Unlock Control circuit.
 - **Secondary Doors:** When the BCM detects greater than 18.0 amps on the Door Unlock Control circuit.
- **Door Unlock Output OFF**
 - When the BCM detects less than 1.253 volts on the Door Unlock Control circuit.
- The BCM will deactivate the output for the remainder of the ignition cycle after four consecutive BCM output retry attempts have failed within that ignition cycle.

DEFAULT ACTION

- Door Unlock functions are inoperative.

POSSIBLE CAUSES

Possible Causes
DOOR UNLOCK CONTROL CIRCUIT SHORTED TO GROUND
DOOR LOCK CONTROL CIRCUIT SHORTED TO GROUND
PASSENGER DOOR LOCK/UNLOCK MOTOR (INTEGRAL TO LATCH)
LEFT REAR DOOR LOCK/UNLOCK MOTOR (INTEGRAL TO LATCH)
RIGHT REAR DOOR LOCK/UNLOCK MOTOR (INTEGRAL TO LATCH)
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after wiring repair or component replacement:**

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. CHECK THE DRIVER DOOR LOCK/UNLOCK MOTOR FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Driver Door Lock/Unlock Motor harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Driver Door Lock/Unlock Motor in accordance with the Service Information. Refer to [LATCH, DOOR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. CHECK THE PASSENGER DOOR LOCK/UNLOCK MOTOR FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Passenger Door Lock/Unlock Motor harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [4](#)

No

- Replace the Passenger Door Lock/Unlock Motor in accordance with the Service Information. Refer to [LATCH, DOOR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. CHECK THE LEFT REAR DOOR LOCK/UNLOCK MOTOR FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Left Rear Door Lock/Unlock Motor harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [5](#)

No

- Replace the Left Rear Door Lock/Unlock Motor in accordance with the Service Information. Refer to [LATCH, DOOR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. CHECK THE RIGHT REAR DOOR LOCK/UNLOCK MOTOR FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Right Rear Door Lock/Unlock Motor harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [6](#)

No

- Replace the Right Rear Door Lock/Unlock Motor in accordance with the Service Information. Refer to [LATCH, DOOR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

6. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (P292) DOOR UNLOCK CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [7](#)

7. CHECK THE (P777) DOOR LOCK CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [8](#)

8. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.

- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1830-12-ALL DOORS UNLOCK CONTROL-CIRCUIT SHORT TO BATTERY

For a complete LOCK SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) monitors door lock and unlock inputs from the Remote Keyless Entry FOB/IK, Driver Door Lock Switch and Passenger Door Lock Switch, through the Passive Entry Antenna or Left and Right Door Lock Switch Status circuits. The BCM provides a ground to the Door Lock Switches through the Driver and Passenger Door Lock Switch Return circuits.

Based on the door lock and unlock inputs, the BCM activates the lock and unlock functions of the bidirectional Driver, Passenger, and Rear (if equipped) Door Lock Motors (integral to the Door Latches) for 370 milliseconds, before returning to the neutral position.

Door Lock: When the Body Control Module (BCM) receives a request to lock the doors, the BCM provides a voltage signal to the Door Lock Control circuit and a ground signal to the Front Driver Door Unlock Control circuit and Door Unlock Control circuit to actuate the Driver, Passenger, and Rear Door Lock Motors to the lock position.

Driver Door Unlock: When the Body Control Module (BCM) receives a request to unlock the Driver Door only, the BCM provides a ground signal to the Door Lock Control circuit and a voltage signal to the Front Driver Door Unlock circuit, to actuate the Driver Door Lock Motor to the unlock position.

All Doors Unlock: When the Body Control Module (BCM) receives a request to unlock all Doors, the BCM provides a ground signal to the Door Lock Control circuit and a voltage signal to the Front Driver Door Unlock

Control circuit and Door Unlock Control circuit to actuate the Driver, Passenger, and Rear Door Lock Motors to the unlock position.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- The Body Control Module (BCM) detects greater than 3.571 volts on the Door Unlock Control circuit for greater than 130 milliseconds.

DEFAULT ACTION

- Door Unlock function is inoperative.

POSSIBLE CAUSES

Possible Causes
DOOR UNLOCK CONTROL CIRCUIT SHORTED TO VOLTAGE
PASSENGER DOOR LOCK/UNLOCK MOTOR (INTEGRAL TO LATCH)
LEFT REAR DOOR LOCK/UNLOCK MOTOR (INTEGRAL TO LATCH)
RIGHT REAR DOOR LOCK/UNLOCK MOTOR (INTEGRAL TO LATCH)
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. DISCONNECT THE PASSENGER DOOR UNLOCK MOTOR HARNESS CONNECTOR - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. Turn the ignition off.

2. Disconnect the component harness connector(s) containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the Passenger Door Unlock Motor in accordance with the Service Information. Refer to [LATCH, DOOR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE LEFT REAR DOOR LOCK/UNLOCK MOTOR HARNESS CONNECTOR - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. Turn the ignition off.
2. Disconnect the component harness connector(s) containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [4](#)

No

- Replace the Left Rear Door Lock/Unlock Motor in accordance with the Service Information. Refer to [LATCH, DOOR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. DISCONNECT THE RIGHT REAR DOOR LOCK/UNLOCK MOTOR HARNESS CONNECTOR - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. Turn the ignition off.
2. Disconnect the component harness connector(s) containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.

7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Replace the Right Rear Door Lock/Unlock Motor in accordance with the Service Information. Refer to [LATCH, DOOR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. CHECK FOR VOLTAGE ON THE (P292) DOOR UNLOCK CONTROL CIRCUIT

1. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: Make sure the Door Unlock Switch is not activated while performing this step.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [6](#)

No

- Go To [7](#)

6. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (P292) DOOR UNLOCK CONTROL CIRCUITS FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the Electronic Control Unit (ECU) harness connector(s) for the circuits being tested.
Note: Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuits being tested at the Electronic Control Unit (ECU) harness connector(s).

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

7. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1834-11-DRIVER DOOR UNLOCK CONTROL-CIRCUIT SHORT TO GROUND

For a complete LOCK SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) monitors door lock and unlock inputs from the Remote Keyless Entry FOB/IK, Driver Door Lock Switch and Passenger Door Lock Switch, through the Passive Entry Antenna or Left and Right Door Lock Switch Status circuits. The BCM provides a ground to the Door Lock Switches through the Driver and Passenger Door Lock Switch Return circuits.

Based on the door lock and unlock inputs, the BCM activates the lock and unlock functions of the bidirectional Driver, Passenger, and Rear (if equipped) Door Lock Motors (integral to the Door Latches) for 370 milliseconds, before returning to the neutral position.

Door Lock: When the Body Control Module (BCM) receives a request to lock the doors, the BCM provides a voltage signal to the Door Lock Control circuit and a ground signal to the Front Driver Door Unlock Control circuit and Door Unlock Control circuit to actuate the Driver, Passenger, and Rear Door Lock Motors to the lock position.

Driver Door Unlock: When the Body Control Module (BCM) receives a request to unlock the Driver Door only, the BCM provides a ground signal to the Door Lock Control circuit and a voltage signal to the Front Driver Door Unlock circuit, to actuate the Driver Door Lock Motor to the unlock position.

All Doors Unlock: When the Body Control Module (BCM) receives a request to unlock all Doors, the BCM provides a ground signal to the Door Lock Control circuit and a voltage signal to the Front Driver Door Unlock Control circuit and Door Unlock Control circuit to actuate the Driver, Passenger, and Rear Door Lock Motors to the unlock position.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects greater than 20.0 amperes on the Front Driver Door Unlock circuit for greater than 130 milliseconds.

DEFAULT ACTION

- Driver Door Lock/Unlock functions are inoperative.

POSSIBLE CAUSES

Possible Causes
FRONT DRIVER DOOR UNLOCK CIRCUIT SHORTED TO GROUND
DOOR LOCK CONTROL CIRCUIT SHORTED TO GROUND
DRIVER DOOR LOCK/UNLOCK MOTOR (INTEGRAL TO LATCH)
FRONT PASSENGER DOOR LOCK/UNLOCK MOTOR (INTEGRAL TO LATCH)
LEFT REAR PASSENGER DOOR LOCK/UNLOCK MOTOR (INTEGRAL TO LATCH)
RIGHT REAR PASSENGER DOOR LOCK/UNLOCK MOTOR (INTEGRAL TO LATCH)
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. **READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN**
 1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
 2. For future reference, with the scan tool, run and save a Vehicle Scan Report and all recorded data related to the DTCs.
 3. With the scan tool, erase all DTCs.

4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. DISCONNECT THE RIGHT REAR DOOR LOCK/UNLOCK MOTOR HARNESS CONNECTOR - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the component harness connector(s) containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the component harness connector(s) containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [6](#)

No

- Replace the Right Rear Door Lock/Unlock Motor in accordance with the Service Information. Refer to [LATCH, DOOR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

6. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (P910) FRONT DRIVER DOOR UNLOCK CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [7](#)

7. CHECK THE (P777) DOOR LOCK CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [8](#)

8. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.

7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

B18AA-11-TRUNK-GATE UNLOCK CONTROL 1-CIRCUIT SHORT TO GROUND

For a complete DECKLID LIFTGATE LOCK SYSTEM wiring diagram, **Refer to the appropriate wiring information**.

THEORY OF OPERATION

The BCM controls the lock and unlock functions of the bidirectional Tailgate Lock Motor, integral to the Tailgate Latch, through the Tailgate Lock and Tailgate Unlock circuits.

Lock: When the Body Control Module (BCM) receives a lock request, the BCM provides voltage to the Tailgate Lock circuit and ground to the Tailgate Unlock circuit, to actuate the Tailgate Lock Motor to the lock position.

Unlock: When the Body Control Module (BCM) receives an unlock request, the BCM provides ground to the Tailgate Lock circuit and voltage to the Tailgate Unlock circuit, to actuate the Tailgate Lock Motor to the unlock position.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Lock Switch is active and the Body Control Module detects greater than 1.398 volts on the Tailgate Unlock circuit for greater than 130 milliseconds.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The Tailgate Lock/Unlock function is inoperative.

POSSIBLE CAUSES

Possible Causes
TAILGATE UNLOCK CIRCUIT SHORTED TO GROUND
TAILGATE LOCK/UNLOCK MOTOR (INTEGRAL TO TAILGATE LATCH)
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE TAILGATE LOCK/UNLOCK MOTOR FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Tailgate Lock/Unlock Motor harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Tailgate Lock/Unlock Motor in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (P220) TAILGATE UNLOCK CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.

4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B18CF-11-SECONDARY DRIVER DOOR AJAR-CIRCUIT SHORT TO GROUND

For a complete LOCK SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Driver Door Latch is equipped with internal Primary and Secondary Door Ajar Switches that are monitored by the Body Control Module (BCM) and Powertrain Control Module (PCM). When the Driver Door closes, the Primary Driver Door Ajar Switch opens and the Secondary Driver Door Ajar Switch closes. When the Driver Door opens, the Primary Driver Door Ajar Switch closes and the Secondary Driver Door Ajar Switch opens. The Primary and Secondary Door Ajar Switches share a common return circuit provided by the BCM.

The BCM provides a reference voltage to the Driver Door Latch for the Primary and Secondary Driver Door Ajar Switches. The Door Ajar Switches are each equipped with an internal 604.0 Ohm resistor, along with an internal 1070.0 Ohm diagnostic resistor, which are in parallel with the internal ajar switches.

- When the Primary Door Ajar Switch is opened (Door is closed), the reference voltage travels through the 604.0 Ohm resistor and the 1070.0 Ohm diagnostic resistor.
- When the Primary Door Ajar Switch is closed (Door is opened), the 1070.0 Ohm diagnostic resistor is bypassed and the reference voltage travels only through the 604.0 Ohm resistor.
- When the Secondary Door Ajar Switch is opened (Door is opened), the reference voltage travels through the 604.0 Ohm resistor and the 1070.0 Ohm diagnostic resistor.
- When the Secondary Door Ajar Switch is closed (Door is closed), the 1070.0 Ohm diagnostic resistor is bypassed and the reference voltage travels only through the 604.0 Ohm resistor.

NOTE: **With the Driver Door Latch harness connector DISCONNECTED, the voltage measured on the Driver Door Ajar Switch Sense circuits is approximately 12.5 volts (battery voltage).**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects less than 10.0 Ohms or 0.272 volts on the Driver Door Secondary Ajar Switch Sense circuit for greater than five seconds.

DEFAULT ACTION

- The Engine Stop/Start (ESS) system or eTorque system, if equipped, is disabled.

POSSIBLE CAUSES

Possible Causes
DRIVER DOOR SECONDARY AJAR SWITCH SENSE CIRCUIT SHORTED TO GROUND
DRIVER DOOR LATCH
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after wiring repair or module replacement:**

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. CHECK THE DRIVER DOOR LATCH FOR AN INTERNAL SHORT

NOTE: **Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.**

1. Turn the ignition off.
2. Disconnect the Driver Door Latch harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Driver Door Latch in accordance with the Service Information. Refer to [**LATCH, DOOR, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE DRIVER DOOR SECONDARY AJAR SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [4](#)

4. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.

6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B18CF-15-SECONDARY DRIVER DOOR AJAR-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete LOCK SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Driver Door Latch is equipped with internal Primary and Secondary Door Ajar Switches that are monitored by the Body Control Module (BCM) and Powertrain Control Module (PCM). When the Driver Door closes, the Primary Driver Door Ajar Switch opens and the Secondary Driver Door Ajar Switch closes. When the Driver Door opens, the Primary Driver Door Ajar Switch closes and the Secondary Driver Door Ajar Switch opens. The Primary and Secondary Door Ajar Switches share a common return circuit provided by the BCM.

The BCM provides a reference voltage to the Driver Door Latch for the Primary and Secondary Driver Door Ajar Switches. The Door Ajar Switches are each equipped with an internal 604.0 Ohm resistor, along with an internal 1070.0 Ohm diagnostic resistor, which are in parallel with the internal ajar switches.

- When the Primary Door Ajar Switch is opened (Door is closed), the reference voltage travels through the 604.0 Ohm resistor and the 1070.0 Ohm diagnostic resistor.
- When the Primary Door Ajar Switch is closed (Door is opened), the 1070.0 Ohm diagnostic resistor is bypassed and the reference voltage travels only through the 604.0 Ohm resistor.
- When the Secondary Door Ajar Switch is opened (Door is opened), the reference voltage travels through the 604.0 Ohm resistor and the 1070.0 Ohm diagnostic resistor.
- When the Secondary Door Ajar Switch is closed (Door is closed), the 1070.0 Ohm diagnostic resistor is bypassed and the reference voltage travels only through the 604.0 Ohm resistor.

NOTE: **With the Driver Door Latch harness connector DISCONNECTED, the voltage measured on the Driver Door Ajar Switch Sense circuits is approximately 12.5 volts (battery voltage).**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.

- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects greater than 4.54 volts on the Driver Door Secondary Ajar Switch Sense circuit for greater than five seconds.

DEFAULT ACTION

- The Engine Stop/Start (ESS) system or eTorque system, if equipped, is disabled.

POSSIBLE CAUSES

Possible Causes
DRIVER DOOR SECONDARY AJAR SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE
DRIVER DOOR SECONDARY AJAR SWITCH SENSE CIRCUIT OPEN
DRIVER DOOR LATCH
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. BACK-PROBE AT THE DRIVER DOOR LATCH HARNESS CONNECTOR AND MEASURE THE VOLTAGE ON THE (G755) DRIVER DOOR SECONDARY AJAR SWITCH SENSE CIRCUIT

1. Turn the ignition on.
2. Back-probe at the component harness connector and measure the voltage on the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness

connector terminals.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE DRIVER DOOR LATCH AND BCM HARNESS CONNECTORS - CHECK THE (G755) DRIVER DOOR SECONDARY AJAR SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE BCM HARNESS CONNECTORS

NOTE: This step checks if the circuit being tested is shorted to another voltage circuit in any of the BCM harness connectors, because the ignition may not turn on when the BCM harness connector containing the circuit being tested is disconnected.

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Disconnect all Electronic Control Unit (ECU) harness connectors, along with the component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connectors.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

4. DISCONNECT THE DRIVER DOOR LATCH AND BCM HARNESS CONNECTORS - CHECK THE (G755) DRIVER DOOR SECONDARY AJAR SWITCH SENSE CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) and component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.

5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [5](#)

5. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A FUSED JUMPER WIRE BETWEEN GROUND AND THE (G755) DRIVER DOOR SECONDARY AJAR SWITCH SENSE CIRCUIT - CHECK FOR ADDITIONAL DTCS

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Connect a fused jumper wire between ground and the circuit being tested at the component harness connector. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. With the scan tool, read the BCM DTCS.

Is DTC B18CF-11-SECONDARY DRIVER DOOR AJAR-CIRCUIT SHORT TO GROUND active?

Yes

- Replace the Driver Door Latch in accordance with the Service Information. Refer to [LATCH, DOOR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1E01-11-MIRROR POWER SUPPLY-CIRCUIT SHORT TO GROUND

For a complete MIRRORS wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Power Mirror Relay output is activated and the Body Control Module (BCM) detects a short to ground on the Power Mirror Relay Control circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

POSSIBLE CAUSES

Possible Causes
POWER MIRROR RELAY CONTROL CIRCUIT SHORTED TO GROUND
POWER MIRROR RELAY (INTEGRAL TO THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY)
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. CHECK THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Power Distribution Center (PDC) Assembly harness connector containing the (P408) Power Mirror Relay Control circuit.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Go To [5](#)

3. CHECK THE (P408) POWER MIRROR RELAY CONTROL CIRCUIT FOR CONTINUITY TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Connect the negative lead of the DVOM to a known good ground.
3. Connect the positive lead of the DVOM to the circuit being tested at the PDC Assembly harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Go To [4](#)

No

- Go To [6](#)

4. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (P408) POWER MIRROR RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

5. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

6. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.

9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1E01-15-MIRROR POWER SUPPLY-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete MIRRORS wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Power Mirror Relay output is off and the Body Control Module (BCM) detects an open or short to voltage on the Power Mirror Relay Control circuit for greater than 1.28 seconds.

POSSIBLE CAUSES

Possible Causes
POWER MIRROR RELAY CONTROL CIRCUIT OPEN
POWER MIRROR RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY GROUND CIRCUIT OPEN
POWER MIRROR RELAY (INTEGRAL TO THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY)
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .**

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.

7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK FOR VOLTAGE ON THE (P408) POWER MIRROR RELAY CONTROL CIRCUIT

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the Electronic Control Unit (ECU) harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (P408) POWER MIRROR RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Power Distribution Center (PDC) Assembly harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the Electronic Control Unit (ECU) harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

4. DISCONNECT THE PDC ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (Z906) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit.
3. Connect the negative lead of the load test tool to the ground circuit at the PDC Assembly harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. CHECK THE (P408) POWER MIRROR RELAY CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
3. Connect one lead of the DVOM to the circuit being tested at the PDC Assembly harness connector.
4. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

6. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [**CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

7. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.

- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

B1E72-11 - POWER INVERTER ENABLE CONTROL-CIRCUIT SHORT TO GROUND-110V

For a complete POWER OUTLETS wiring diagram, **Refer to the appropriate wiring information**.

THEORY OF OPERATION

The Body Control Module (BCM) monitors the Inverter Switch by providing a reference voltage to the Inverter Switch, through the Inverter Switch Signal circuit. The reference voltage travels through the Inverter Switch and back to the BCM through the Inverter Switch Return circuit.

When the Inverter Switch is in the OFF position, the internal activation switch is open. The BCM reference voltage travels through the Inverter Switch Signal circuit, to the Inverter Switch. The reference voltage continues through an internal 3.65k Ohm resistor and then through a 6.49k Ohm diagnostic resistor, which is in parallel to the internal activation switch. The remaining reference voltage travels back to the BCM through the Inverter Switch Return circuit.

When the Inverter Switch is in the ON position, the internal activation switch closes. The reference voltage travels to the Inverter Switch and through the internal 3.65k Ohm resistor, but the 6.49k Ohm diagnostic resistor is bypassed. The remaining reference voltage travels back to the BCM through the Inverter Switch Return circuit.

When the BCM detects the Inverter Switch is in the ON position, the BCM sends a signal to the Power Inverter Module (PIM) to activate the 400 Watt Alternating Current (AC) Power Outlets. The BCM communicates with

the PIM through the LIN Bus circuit. For additional information on the Power Inverter system. Refer to **DESCRIPTION AND OPERATION** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Power Inverter is active and the Body Control Module (BCM) detects greater than 1.0 amp on the Inverter Switch Signal circuit.
- After four consecutive failed retry attempts the BCM will disable the output for the remainder of the ignition cycle.

DEFAULT ACTION

- The Power Inverter is inoperative.

POSSIBLE CAUSES

Possible Causes
INVERTER SWITCH SIGNAL CIRCUIT SHORTED TO GROUND
POWER INVERTER MODULE
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after wiring repair or module replacement:**

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE POWER INVERTER MODULE FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Power Inverter Module harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Power Inverter Module in accordance with the Service Information. Refer to **MODULE, POWER INVERTER, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (P807) INVERTER SWITCH SIGNAL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).

3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
 - Test complete.
-

2021 ACCESSORIES AND BODY, CAB

Body Control Module (BCM) - DTCS B2103-11 To P0460-11 - Gladiator

DTC TROUBLESHOOTING

B2103-11-IGNITION RUN/START 1 CONTROL-CIRCUIT SHORT TO GROUND

For a complete FUSES RELAY wiring diagram, **Refer to the appropriate wiring information .**

THEORY OF OPERATION

The Body Control Module (BCM) receives the network communication message from the Radio Frequency (RF Hub) Module indicating run/start operation is requested. The BCM provides a voltage output through the Run/Start Relay Control circuit to the coil side of the RUN/START Relay in the Power Distribution Center (PDC) Assembly. A ground path for the RUN/START Relay is provided through the PDC Assembly.

WHEN MONITORED

- This diagnostic runs continuously when the Run/Start Relay output is active.

SET CONDITION

- When the Body Control Module (BCM) detects greater than 1.0 amp on the Run/Start Relay Control circuit and four retry attempts have failed.

DEFAULT ACTION

- The Run/Start Relay is inoperative.

POSSIBLE CAUSES

Possible Causes
RUN/START RELAY CONTROL CIRCUIT SHORTED TO GROUND
RUN/START RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. SUBSTITUTE THE RUN/START RELAY - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: When removing relays from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.

NOTE: Additional DTCs may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (K617) RUN/START RELAY CONTROL CIRCUIT FOR CONTINUITY TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
4. Connect the negative lead of the DVOM to a known good ground.
5. Connect the positive lead of the DVOM to the circuit being tested at the ECU harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Go To [4](#)

No

- Go To [6](#)

4. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (K617) RUN/START RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Power Distribution Center (PDC) Assembly harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or PDC Assembly harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [5](#)

5. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.

- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).
- Test complete.

6. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.

6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B2103-15-IGNITION RUN/START 1 CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete FUSES RELAY wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) receives the network communication message from the Radio Frequency (RF Hub) Module indicating run/start operation is requested. The BCM provides a voltage output through the Run/Start Relay Control circuit to the coil side of the RUN/START Relay in the Power Distribution Center (PDC) Assembly. A ground path for the RUN/START Relay is provided through the PDC Assembly.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects greater than 1.5 volts on the Run/Start Relay Control circuit for greater than 1.28 seconds.

DEFAULT ACTION

- The RUN/START Relay is inoperative.

POSSIBLE CAUSES

Possible Causes
RUN/START RELAY CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
RUN/START RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
RUN/START RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. SUBSTITUTE THE RUN/START RELAY - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: When removing relays from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.

NOTE: Additional DTCs may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. CHECK FOR VOLTAGE ON THE (K617) RUN/START RELAY CONTROL CIRCUIT AT THE RUN/START RELAY TERMINAL

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the relay terminal in the PDC Assembly.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [6](#)

No

- Go To [4](#)

4. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (K617) RUN/START RELAY CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the relay terminal in the PDC Assembly.
5. Connect the other lead to the circuit being tested at the Electronic Control Unit (ECU) harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Go To [5](#)

No

- Go To [8](#)

5. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (K617) RUN/START RELAY CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Power Distribution Center (PDC) Assembly harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the PDC Assembly harness connector.
5. Connect the other lead to the circuit being tested at the Electronic Control Unit (ECU) harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [7](#)

6. DISCONNECT THE PDC ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (K617) RUN/START RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Power Distribution Center (PDC) Assembly harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the PDC Assembly harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [7](#)

7. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:

- Proper connector installation.
- Damaged connector locks.
- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

8. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).

- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

B2119-11-IGNITION RUN/ACC/SPAD CONTROL-CIRCUIT SHORT TO GROUND

For a complete FUSES RELAY wiring diagram, **Refer to the appropriate wiring information**.

THEORY OF OPERATION

The Body Control Module (BCM) receives the network communication message from the Radio Frequency (RF Hub) Module indicating run or accessory operation is requested. The BCM provides a voltage output through the Accessory Delay 2 Relay Control circuit to the coil side of the RUN/ACCESSORY 2 Relay in the Power Distribution Center (PDC) Assembly. A ground path for the RUN/ACCESSORY 2 Relay is provided through the PDC Assembly.

WHEN MONITORED

- This diagnostic runs continuously when the Run/Accessory 2 Relay output is active.

SET CONDITION

- When the Body Control Module (BCM) detects greater than 1.0 amp on the Accessory Delay 2 Relay Control circuit and four retry attempts have failed.

DEFAULT ACTION

- The Run/Accessory 2 Relay is inoperative.

POSSIBLE CAUSES

Possible Causes
ACCESSORY DELAY 2 RELAY CONTROL CIRCUIT SHORTED TO GROUND

Possible Causes
RUN/ACCESSORY 2 RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. SUBSTITUTE THE ACCESSORY DELAY 2 RELAY - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: When removing relays from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.

NOTE: Additional DTCs may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (P307) ACCESSORY DELAY 2 RELAY CONTROL CIRCUIT FOR CONTINUITY TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
4. Connect the negative lead of the DVOM to a known good ground.
5. Connect the positive lead of the DVOM to the circuit being tested at the ECU harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Go To [4](#)

No

- Go To [6](#)

4. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (P307) ACCESSORY DELAY 2 RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Power Distribution Center (PDC) Assembly harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or PDC Assembly harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

5. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to **CENTER, POWER DISTRIBUTION (PDC), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

6. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B2119-15-IGNITION RUN/ACC/SPAD CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete FUSES RELAY wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) receives the network communication message from the Radio Frequency (RF Hub) Module indicating run or accessory operation is requested. The BCM provides a voltage output through the Accessory Delay 2 Relay Control circuit to the coil side of the RUN/ACCESSORY 2 Relay in the

Power Distribution Center (PDC) Assembly. A ground path for the RUN/ACCESSORY 2 Relay is provided through the PDC Assembly.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects greater than 1.5 volts on the Accessory Delay 2 Relay Control circuit for greater than 1.28 seconds.

DEFAULT ACTION

- The Run/Accessory 2 Relay is inoperative.

POSSIBLE CAUSES

Possible Causes
ACCESSORY DELAY 2 RELAY CONTROL CIRCUIT OPEN
ACCESSORY DELAY 2 RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
RUN/ACCESSORY 2 RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. SUBSTITUTE THE RUN/ACCESSORY 2 RELAY - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: When removing relays from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.

NOTE: Additional DTCs may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. CHECK FOR VOLTAGE ON THE (P307) ACCESSORY DELAY 2 RELAY CONTROL CIRCUIT AT THE RUN/START RELAY TERMINAL

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the relay terminal in the PDC Assembly.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [6](#)

No

- Go To [4](#)

4. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (P307) ACCESSORY DELAY 2 RELAY CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the relay terminal in the PDC Assembly.
5. Connect the other lead to the circuit being tested at the Electronic Control Unit (ECU) harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Go To [5](#)

No

- Go To [8](#)

5. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (P307) ACCESSORY DELAY 2 RELAY CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Power Distribution Center (PDC) Assembly harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the PDC Assembly harness connector.
5. Connect the other lead to the circuit being tested at the Electronic Control Unit (ECU) harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

6. DISCONNECT THE PDC ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (P307) ACCESSORY DELAY 2 RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.

2. Disconnect all Power Distribution Center (PDC) Assembly harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the PDC Assembly harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [7](#)

7. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

8. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to [MODULE, BODY CONTROL \(BCM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

- Test complete.

B2121-11-IGNITION RUN CONTROL 1-CIRCUIT SHORT TO GROUND

For a complete FUSES RELAY wiring diagram, **Refer to the appropriate wiring information .**

THEORY OF OPERATION

The Body Control Module (BCM) receives the network communication message from the Radio Frequency (RF Hub) Module indicating run operation is requested. The BCM provides a voltage output through the Run Relay Control circuit to the coil side of the RUN Relay in the Power Distribution Center (PDC) Assembly. A ground path for the RUN Relay is provided through the PDC Assembly.

WHEN MONITORED

- This diagnostic runs continuously when the Run 1 Relay output is active.

SET CONDITION

- When the Body Control Module (BCM) detects greater than 1.0 amp on the Ignition Run Control Output circuit and four retry attempts have failed.

DEFAULT ACTION

- The Run 1 Relay is inoperative.

POSSIBLE CAUSES

Possible Causes
IGNITION RUN CONTROL OUTPUT CIRCUIT SHORTED TO GROUND
RUN 1 RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. SUBSTITUTE THE RUN 1 RELAY - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: When removing relays from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.

NOTE: Additional DTCs may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (K619) IGNITION RUN CONTROL OUTPUT CIRCUIT FOR CONTINUITY TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
4. Connect the negative lead of the DVOM to a known good ground.
5. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Go To [4](#)

No

- Go To [6](#)

4. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (K619) IGNITION RUN CONTROL OUTPUT CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Power Distribution Center (PDC) Assembly harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or PDC Assembly harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [5](#)

5. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

6. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.

9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B2121-15-IGNITION RUN CONTROL 1-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete FUSES RELAY wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) receives the network communication message from the Radio Frequency (RF Hub) Module indicating run operation is requested. The BCM provides a voltage output through the Run Relay Control circuit to the coil side of the RUN Relay in the Power Distribution Center (PDC) Assembly. A ground path for the RUN Relay is provided through the PDC Assembly.

WHEN MONITORED

- This diagnostic runs continuously with the Run 1 Relay output inactive.

SET CONDITION

- When the Body Control Module (BCM) detects greater than 1.5 volts on the Ignition Run Control Output circuit for greater than 1.28 seconds.

DEFAULT ACTION

- The Run 1 Relay is inoperative.

POSSIBLE CAUSES

Possible Causes
IGNITION RUN CONTROL OUTPUT CIRCUIT OPEN
IGNITION RUN CONTROL OUTPUT CIRCUIT SHORTED TO VOLTAGE
RUN 1 RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. **READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN**

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. SUBSTITUTE THE RUN 1 RELAY - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: When removing relays from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.

NOTE: Additional DTCs may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. CHECK FOR VOLTAGE ON THE (K619) IGNITION RUN CONTROL OUTPUT CIRCUIT AT THE RUN 1 RELAY TERMINAL

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the relay terminal in the PDC Assembly.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [6](#)

No

- Go To [4](#)

4. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (K619) IGNITION RUN CONTROL OUTPUT CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
Note: Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the relay terminal in the PDC Assembly.
5. Connect the other lead to the circuit being tested at the Electronic Control Unit (ECU) harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Go To [5](#)

No

- Go To [8](#)

5. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (K619) IGNITION RUN CONTROL OUTPUT CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Power Distribution Center (PDC) Assembly harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the PDC Assembly harness connector.

5. Connect the other lead to the circuit being tested at the Electronic Control Unit (ECU) harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [7](#)

6. DISCONNECT THE PDC ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (K619) IGNITION RUN CONTROL OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Power Distribution Center (PDC) Assembly harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the PDC Assembly harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [7](#)

7. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.

- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

8. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.

6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B212E-11-IGNITION RUN/ACC CONTROL-CIRCUIT SHORT TO GROUND

For a complete FUSES RELAY wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) receives the network communication message from the Radio Frequency (RF Hub) Module indicating run or accessory operation is requested. The BCM provides a voltage output through the Accessory Delay 1 Relay Control circuit to the coil side of the RUN/ACCESSORY 1 Relay in the Power Distribution Center (PDC) Assembly. A ground path for the RUN/ACCESSORY 1 Relay is provided through the PDC Assembly.

WHEN MONITORED

- This diagnostic runs continuously when the Run/Accessory 1 Relay output active.

SET CONDITION

- When the Body Control Module (BCM) detects greater than 1.0 amp on the Accessory Delay 1 Relay Control circuit and four retry attempts have failed.

DEFAULT ACTION

- The Run/Accessory 1 Relay is inoperative.

POSSIBLE CAUSES

Possible Causes
ACCESSORY DELAY 1 RELAY CONTROL CIRCUIT SHORTED TO GROUND
RUN/ACCESSORY 1 RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. SUBSTITUTE THE RUN/ACCESSORY 1 RELAY - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: When removing relays from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.

NOTE: Additional DTCs may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) RUN/ACCESSORY 1 RELAY AND CHECK THE (P305) ACCESSORY DELAY RELAY 1 CONTROL CIRCUIT FOR CONTINUITY TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
4. Connect the negative lead of the DVOM to a known good ground.
5. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Go To [4](#)

No

- Go To [6](#)

4. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (P305) ACCESSORY DELAY RELAY 1 CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Power Distribution Center (PDC) Assembly harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or PDC Assembly harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [5](#)

5. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

6. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.

4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B212E-15-IGNITION RUN/ACC CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete FUSES RELAY wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) receives the network communication message from the Radio Frequency (RF Hub) Module indicating run or accessory operation is requested. The BCM provides a voltage output through the Accessory Delay 1 Relay Control circuit to the coil side of the RUN/ACCESSORY 1 Relay in the Power Distribution Center (PDC) Assembly. A ground path for the RUN/ACCESSORY 1 Relay is provided through the PDC Assembly.

WHEN MONITORED

- This diagnostic runs continuously with the Run/Accessory 1 Relay output inactive.

SET CONDITION

- When the Body Control Module (BCM) detects greater than 1.5 volts on the Accessory Delay 1 Relay Control circuit for greater than 1.28 seconds.

DEFAULT ACTION

- The Run/Accessory 1 Relay is inoperative.

POSSIBLE CAUSES

Possible Causes
ACCESSORY DELAY 1 RELAY CONTROL CIRCUIT OPEN
ACCESSORY DELAY 1 RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
RUN/ACCESSORY 1 RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. SUBSTITUTE THE RUN/ACCESSORY 1 RELAY - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: When removing relays from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.

NOTE: Additional DTCs may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. CHECK FOR VOLTAGE ON THE (P305) ACCESSORY DELAY 1 RELAY CONTROL CIRCUIT AT THE RUN/ACCESSORY 1 RELAY TERMINAL

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the relay terminal in the PDC Assembly.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [6](#)

No

- Go To [4](#)

4. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (P305) ACCESSORY DELAY 1 RELAY CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
Note: Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the relay terminal in the PDC Assembly.

5. Connect the other lead to the circuit being tested at the Electronic Control Unit (ECU) harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Go To [5](#)

No

- Go To [8](#)

5. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (P305) ACCESSORY DELAY 1 RELAY CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Power Distribution Center (PDC) Assembly harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the PDC Assembly harness connector.
5. Connect the other lead to the circuit being tested at the Electronic Control Unit (ECU) harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

6. DISCONNECT THE PDC ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (P305) ACCESSORY DELAY 1 RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Power Distribution Center (PDC) Assembly harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the PDC Assembly harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [7](#)

7. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [**CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

- Test complete.

8. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B2143-11-UGDO ENABLE CONTROL-CIRCUIT SHORT TO GROUND

For a complete UNIVERSAL TRANSMITTER wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- 10 minutes after the ignition is turned off.

SET CONDITION

- When the Wireless Transmitter/Universal Garage Door Opener (UGDO) Switch is activated and the Body Control Module (BCM) detects a short to ground on the UGDO Enable Control circuit for greater than 1.28 seconds.
- After four consecutive failed retry attempts the BCM will disable the output for the remainder of the ignition cycle.

DEFAULT ACTION

- The UGDO is inoperative.

POSSIBLE CAUSES

Possible Causes
UGDO ENABLE CONTROL CIRCUIT SHORTED TO GROUND
UNIVERSAL GARAGE DOOR OPENER (UGDO) MODULE
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after wiring repair or module replacement:**

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE UNIVERSAL GARAGE DOOR OPENER (UGDO) MODULE FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Universal Garage Door Opener (UGDO) Module harness connector containing the circuit being tested.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Universal Garage Door Opener (UGDO) Module in accordance with the Service Information. Refer to [VISOR, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (G38) UGDO ENABLE CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [4](#)

4. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:

- Proper connector installation.
- Damaged connector locks.
- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B2183-11-IGNITION UNLOCK RUN-START CONTROL-CIRCUIT SHORT TO GROUND

For a complete TRANSMISSION wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects a short to ground on the Ignition Off/Run/Start Control Output circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The Ignition Unlock Run/Start is inoperative.

POSSIBLE CAUSES

Possible Causes
IGNITION OFF/RUN/START CONTROL OUTPUT CIRCUIT SHORTED TO GROUND
TRANSMISSION CONTROL MODULE (TCM)
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. CHECK THE TRANSMISSION CONTROL MODULE (TCM) FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the TCM harness connector containing the (F1) Ignition Off/Run/Start Control Output circuit.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (F1) IGNITION OFF/RUN/START CONTROL OUTPUT CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [5](#)

4. DISCONNECT RELATED TCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all TCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all TCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.

7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Transmission Control Module (TCM) in accordance with the Service Information. Refer to **MODULE, TRANSMISSION CONTROL (TCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

5. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B2193-00-INTELLIGENT BATTERY SENSOR INTERNAL

For a complete CHARGING SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Intelligent Battery Sensor (IBS) is an electrical shunt with a microprocessor that is mounted in-line with the negative Battery Cable. The IBS monitors the current flow and voltage. The IBS also has a built in thermistor that calculates the Battery temperature. The microprocessor uses this data to calculate Battery state of charge, Battery internal resistance, charge received, charge delivered, and time in service. This information is reported through a LIN Bus circuit to the Body Control Module (BCM). The BCM broadcasts the information to the Powertrain Control Module (PCM) over the CAN Bus.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the ignition is in the RUN position and the Body Control Module (BCM) receives a LIN Bus message, for greater than five seconds, indicating an internal fault in the Intelligent Battery Sensor (IBS) exists.

DEFAULT ACTION

- Functionality related to the Intelligent Battery Sensor (IBS) is not fully operational.

POSSIBLE CAUSES

Possible Causes
INTELLIGENT BATTERY SENSOR (IBS)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.

5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Visually inspect the negative battery cable connection to the Intelligent Battery Sensor (IBS) for any damage or corrosion and repair as needed. If no problems are found, replace the Intelligent Battery Sensor (IBS) in accordance with the Service Information. Refer to [**SENSOR, INTELLIGENT BATTERY \(IBS\), REMOVAL AND INSTALLATION**](#) [**SENSOR, INTELLIGENT BATTERY \(IBS\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [**STANDARD PROCEDURE**](#) .

B2199-16-BATTERY VOLTAGE-CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete FUSES wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Body Control Module (BCM) detects the voltage is less than 9.0 volts on the Fused B(+) circuit(s) for greater than 15 seconds.

POSSIBLE CAUSES

POSSIBLE CAUSES
LOW BATTERY VOLTAGE IMPROPER BATTERY CABLE CONNECTION(S) CHARGING SYSTEM CONCERN FUSED B(+) CIRCUIT HIGH RESISTANCE BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [**PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**](#) .

DIAGNOSTIC TEST

1. **READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN**
 1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
 2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
 3. With the scan tool, erase all DTCs.
 4. Turn the ignition off for a minimum of 10.0 seconds.
 5. Turn the ignition on.

6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK FOR CHARGING OR VOLTAGE RELATED DTC(S) PRESENT IN THE POWERTRAIN CONTROL MODULE (PCM)

1. Make sure the Battery and Generator Drive Belt are in good condition.

Inspect the vehicle for aftermarket accessories that may exceed the Generator system output.

Inspect the fuses in the Power Distribution Center (PDC) Assembly. If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.

2. Start the Engine.
3. With the scan tool, read PCM DTCs and record on the repair order.

Are there any charging system or battery voltage related DTCs present?

Yes

- Repair the Powertrain Control Module (PCM) DTCs before continuing with this test. Refer to the appropriate service information .

No

- Go To [3](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (A903) FUSED B(+) CIRCUIT FOR HIGH RESISTANCE BY LOAD TESTING

1. Disconnect all Electronic Control Unit (ECU) harness connectors to isolate the Fused B(+) circuits.
2. Connect the positive lead of the load test tool to the Fused B(+) circuit at the component harness connector (A). **Note:** refer to the diagram below.
3. Connect the negative lead of the load test tool to the ground circuit of the Battery or a good chassis ground.
4. Make sure the circuit being tested is being powered on. If the circuit being tested is an ignition feed for example, the ignition must be on. If testing an output from a relay, verify the relay is energized and on.
5. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE:

Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for

additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright for both circuits?

Yes

- Go To [4](#)

No

- Repair the Fused B(+) circuit for high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B2199-17-BATTERY VOLTAGE-CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete FUSES wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Body Control Module (BCM) detects the voltage on the BCM Main Fused B(+) supply circuit(s) is greater than 16.0 volts for more than 15 seconds.

POSSIBLE CAUSES

POSSIBLE CAUSES
GENERATOR OPERATION
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK FOR CHARGING OR VOLTAGE RELATED DTC(S) PRESENT IN THE POWERTRAIN CONTROL MODULE (PCM)

1. Inspect the vehicle for aftermarket accessories that may exceed the Generator System output.
2. Start the Engine.
3. With the scan tool, read PCM DTCs and record on the repair order.

Are there any charging system or battery voltage related DTCs present?

Yes

- Repair the Powertrain Control Module (PCM) DTCs before continuing with this test. Refer to the appropriate service information .

No

- Go To [3](#)

3. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to [MODULE, BODY CONTROL \(BCM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

B21F8-13-EXTERIOR LIGHTING POWER SUPPLY INPUT 1-CIRCUIT OPEN

For a complete FUSES wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.

- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects less than 4.5 volts on the Fused B(+) circuit for greater than 15 seconds.

POSSIBLE CAUSES

POSSIBLE CAUSES
FUSE OPEN
FUSED B(+) CIRCUIT OPEN OR SHORT TO GROUND
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. REMOVE AND CHECK THE (A903) FUSED B(+) CIRCUIT FUSE FOR AN OPEN

NOTE: Using a suitable tool, remove the fuse or relay from the PDC Assembly by lifting upward at the middle of the component. After removal, inspect the terminals for any damage and repair, if needed.

1. Turn the ignition off.
2. Remove the fuse, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Check the fuse for an open.

Is the fuse open?

Yes

- Replace the fuse and check the system operation. If the fuse continues to open, repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any inline connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To **3**

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (A903) FUSED B(+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the Fused B(+) circuit.
2. Connect the positive lead of the load test tool to the Fused B(+) circuit at the component harness connector (A). **Note:** refer to the diagram below.
3. Connect the negative lead of the load test tool to the ground circuit of the Battery or a good chassis ground.
4. Make sure the circuit being tested is being powered on. If the circuit being tested is an ignition feed for example, the ignition must be on. If testing an output from a relay, verify that the relay is energized and on.
5. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to **STANDARD PROCEDURE** .**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the

CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to **STANDARD PROCEDURE** .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [4](#)

No

- Repair the Fused B(+) circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B21F9-13-EXTERIOR LIGHTING POWER SUPPLY INPUT 2-CIRCUIT OPEN

For a complete FUSES wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects less than 4.5 volts on the Fused B(+) circuit for greater than 15 seconds.

POSSIBLE CAUSES

POSSIBLE CAUSES
FUSE OPEN
FUSED B(+) CIRCUIT OPEN OR SHORTED TO GROUND
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .**

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. REMOVE AND CHECK THE (A904) FUSED B(+) CIRCUIT FUSE FOR AN OPEN

NOTE: Using a suitable tool, remove the fuse or relay from the PDC Assembly by lifting upward at the middle of the component. After removal, inspect the terminals for any damage and repair, if needed.

1. Turn the ignition off.
2. Remove the fuse, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Check the fuse for an open.

Is the fuse open?

Yes

- Replace the fuse and check the system operation. If the fuse continues to open, repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any inline connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [3](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (A904) FUSED B(+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the Fused B(+) circuit.
2. Connect the positive lead of the load test tool to the Fused B(+) circuit at the component harness connector (A). **Note:** refer to the diagram below.
3. Connect the negative lead of the load test tool to the ground circuit of the Battery or a good chassis ground.
4. Make sure the circuit being tested is being powered on. If the circuit being tested is an ignition feed for example, the ignition must be on. If testing an output from a relay, verify that the relay is energized and on.
5. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [4](#)

No

- Repair the Fused B(+) circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

B2204-4A-ECU CONFIGURATION MISMATCH-INCORRECT COMPONENT INSTALLED

THEORY OF OPERATION

The Body Control Module (BCM) for this vehicle can be used for different markets and vehicle content applications. In order for the BCM to function properly, the vehicle configuration information must be correctly programmed into the module when the module or certain components are replaced.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects the Headlamp Switch (for Front or Rear Fog Lamps) is not configured correctly to the vehicle.

DEFAULT ACTION

- The Front or Rear Fog Lamps are inoperative.

POSSIBLE CAUSES

Possible Causes
INCORRECT FRONT OR REAR FOG LAMP SWITCH POSITION
FRONT OR REAR FOG LAMPS NOT CONFIGURED CORRECTLY IN BCM
HEADLAMP SWITCH

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [**STANDARD PROCEDURE**](#) .

2. ACTIVATE THE FRONT OR REAR (IF EQUIPPED) FOG LAMP SWITCH ON AND OFF-ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. Activate the Front and Rear (if equipped) Fog Lamp Switch on and off.
2. With the scan tool, erase all DTCs.
3. Turn the ignition off for a minimum of 10.0 seconds.
4. Turn the ignition on.
5. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
6. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

3. CONFIGURE THE HEADLAMP SWITCH (FOG LAMPS) TO THE VEHICLE - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, configure the Headlamp Switch to the vehicle.
2. With the scan tool, erase all DTCs.
3. Turn the ignition off for a minimum of 10.0 seconds.
4. Turn the ignition on.
5. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
6. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Inspect the Headlamp Switch and make sure it is correct for the vehicle options. If the Headlamp Switch is not correct, replace the Headlamp Switch in accordance with the Service Information and repeat this step. Refer to [**SWITCH, HEADLAMP, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Test complete.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

B2204-56-ECU CONFIGURATION MISMATCH-INVALID-INCOMPATIBLE CONFIGURATION

THEORY OF OPERATION

The Body Control Module (BCM) for this vehicle can be used for different markets and vehicle content applications. In order for the BCM to function properly, the vehicle configuration information must be correctly programmed into the module when the module or certain components are replaced.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects the Daytime Running Lamps (DRLs) are not configured correctly to the vehicle.

DEFAULT ACTION

- The DRLs are inoperative.

POSSIBLE CAUSES

Possible Causes
DAYTIME RUNNING LAMPS ARE NOT CONFIGURED CORRECTLY IN BCM

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- With the scan tool, configure the Body Control Module (BCM) to the Daytime Running Lamp (DRL) system that is equipped on the vehicle.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

B2206-00-CURRENT VIN MISSING/MISMATCH

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.

- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the ignition is in the Run position and the Body Control Module (BCM) detects a module on the CAN Communication Network has been replaced, but not programmed or the Vehicle Identification Number (VIN) stored in a module does not match the VIN stored in the BCM.

POSSIBLE CAUSES

Possible Causes
MODULE NOT PROGRAMMED
MODULE INSTALLED FROM ANOTHER VEHICLE

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: Verify the Vehicle Identification Number (VIN) for all modules matches the VIN of the vehicle.

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- **A module was not recently replaced:** With the scan tool, configure the modules with the vehicle.
- **A module was recently replaced:** If available, perform the programming procedure for the module(s) in accordance with the Service Information. With the scan tool, configure the modules with the vehicle.
- **A module was replaced from another vehicle:** Replace the module with a module that is correct for the vehicle.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

B222C-00-VEHICLE CONFIGURATION NOT PROGRAMMED

THEORY OF OPERATION

The Body Control Module (BCM) for this vehicle can be used for different markets and vehicle content applications. In order for the BCM to function properly, the vehicle configuration information must be correctly programmed into the module when the module or certain components are replaced.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) is not configured correctly to the vehicle.

DEFAULT ACTION

- Various BCM outputs are inoperative.

POSSIBLE CAUSES

Possible Causes
BCM NOT CONFIGURED CORRECTLY BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. CONFIGURE THE BCM TO THE VEHICLE - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, configure the BCM to the vehicle.
2. With the scan tool, erase all DTCs.
3. Turn the ignition off for a minimum of 10.0 seconds.
4. Turn the ignition on.

5. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
6. With the scan tool, read the BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

3. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B225C-00-COMPASS MODULE INTERNAL

For a complete LIN BUS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- The Body Control Module receives a message through the LIN Bus 2 circuit indicating the Compass Module has an internal fault for greater than 3 seconds.

DEFAULT ACTION

- Functionality related to the Compass Module is not fully operational.

POSSIBLE CAUSES

Possible Causes
COMPASS MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .**

DIAGNOSTIC TEST

READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Replace the Compass Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

B2267-00-INTERIOR REAR VIEW MIRROR MODULE INTERNAL

For a complete MIRRORS wiring diagram, **Refer to the appropriate wiring information .**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is in the Run position for greater than five seconds.
- The battery voltage is between 9.0 and 16.0 volts.

SET CONDITION

- The Inside Rear View Mirror reports to the Body Control Module (BCM) that an internal failure exists.

DEFAULT ACTION

- Functionality related to Inside Rear View Mirror is not fully operational.

POSSIBLE CAUSES

Possible Causes
INSIDE REAR VIEW MIRROR

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Replace the Inside Rear View Mirror in accordance with the Service Information. Refer to [MIRROR, REARVIEW, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

B2303-11-WIPER PARK SWITCH INPUT-CIRCUIT SHORT TO GROUND

For a complete WIPER WASHER SYSTEMS wiring diagram, **Refer to the appropriate wiring information .**

THEORY OF OPERATION

FRONT WIPERS:

The Front Wiper Switch is part of the Right Multifunction Switch, which is integral to the Steering Column Control Module (SCCM). The SCCM sends Front Wiper Switch commands through the CAN C Bus, to the Body Control Module (BCM).

When the BCM receives a message to activate the Front Wiper Motor at low speed, the BCM provides voltage through the Wiper On/Off Relay Control circuit, to energize the coil side of the Wiper On/Off Relay, located in the Power Distribution Center (PDC) Assembly. When the Wiper On/Off Relay is active, a voltage output is sent through the Wiper High/Low Relay to the Front Wiper Motor, through the Wiper Low Speed Control Output circuit, which activates the Front Wiper Motor at low speed.

When the BCM receives a message to activate the Front Wiper Motor at high speed, the BCM provides voltage through the Wiper High/Low Relay Control circuit, to energize the coil side of the Wiper High/Low Relay. When the Wiper High/Low Relay is active, a voltage output is sent from the Wiper High/Low Relay to the Front Wiper Motor, through the Wiper High Speed Control Output circuit, which activates the Front Wiper Motor at high speed.

A ground path for the Front Wiper Motor is provided through the wiring harness to the body of the vehicle.

WIPER PARK SWITCH:

The Body Control Module (BCM) provides a battery reference voltage on the Front Wiper Park Switch Sense circuits, through an internal pull-up resistor, to the Front Wiper Motor. The Wiper Park Switch is integral to the Front Wiper Motor and switch the Front Wiper Park Switch Sense circuit from open to ground as the Front Wiper Motor rotates.

WASHER PUMP MOTOR:

The Front Washer Switch is part of the Right Multifunction Switch, which is integral to the Steering Column Control Module (SCCM). The SCCM sends Front Washer Switch commands through the CAN C Bus to the Body Control Module (BCM).

The Front Camera Switch is part of the Integrated Center Stack (ICS), which sends Front Washer Switch commands through the CAN IHS Bus to the Body Control Module (BCM).

When the BCM receives a message to activate the Front Washers, the BCM provides a voltage signal to the Washer Pump Motor, through the Front Washer Pump Motor Control circuit, and a ground path through the Front Camera Washer Pump Motor Control circuit.

When the BCM receives a message to activate the Front Camera Washer, the BCM provides a voltage signal to the Washer Pump Motor, through the Front Camera Washer Pump Motor Control circuit, and a ground path through the Front Washer Pump Motor Control circuit.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects the Front Wiper Switch is activated and the Front Wiper Park Switch is closed for greater than 10 seconds.

DEFAULT ACTION

- The Front Wipers are inoperative.

POSSIBLE CAUSES

Possible Causes
ADDITIONAL DTCS
FUSE OPEN
WIPER LOW SPEED CONTROL OUTPUT CIRCUIT OPEN
WIPER HIGH SPEED CONTROL OUTPUT CIRCUIT OPEN
FRONT WIPER PARK SWITCH SENSE CIRCUIT SHORTED TO GROUND
FRONT WIPER MOTOR
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. CHECK FOR AN ACTIVE DTC

NOTE: Repair any other Front Wiper related DTCs before performing this diagnostic procedure.

1. With the scan tool, read Body Control Module (BCM) DTCs and record on the repair order.
2. Record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
5. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. If no problems are found, test complete.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. CHECK FUSE 27 (30A) FOR AN OPEN

1. Remove Fuse 27 (30A) from the Power Distribution Center (PDC) Assembly.
2. Inspect Fuse 27 (30A) for an open.

Is Fuse 27 (30A) open?

Yes

- Replace Fuse 27 (30A) and operate the Front Wiper Motor.
- **If Fuse 27 (30A) Opens:** Go To [2](#)

- **If Fuse 27 (30A) Does Not Open:** Restart the diagnostic test. Go To [1](#)

No

- Install Fuse 25 (30A) and Go To [3](#)

3. CHECK THE WIPER HIGH/LOW SPEED RELAY OUTPUT ON THE (W3) WIPER LOW SPEED CONTROL OUTPUT CIRCUIT

1. Turn the ignition off.
2. Disconnect the Front Wiper Motor harness connector.
3. Turn the ignition on.
4. Turn the Front Wipers on, at Low Speed.
5. With a 12-volt test light connected to ground, check the (W3) Wiper Low Speed Control Output circuit at the Front Wiper Motor harness connector.

Does the test light illuminate brightly when compared to the test light connected to the Battery?

Yes

- Go To [4](#)

No

- Go To [5](#)

4. CHECK THE WIPER HIGH/LOW SPEED RELAY OUTPUT ON THE (W4) WIPER HIGH SPEED CONTROL OUTPUT CIRCUIT

1. Turn the Front Wipers on, at High Speed.
2. With a 12-volt test light connected to ground, check the (W4) Wiper High Speed Control Output circuit at the Front Wiper Motor harness connector.

Does the test light illuminate brightly when compared to the test light connected to the Battery?

Yes

- Go To [7](#)

No

- Go To [6](#)

5. CHECK THE (W3) WIPER LOW SPEED CONTROL OUTPUT CIRCUIT FOR AN OPEN

1. Turn the ignition off.
2. Disconnect the Power Distribution Center (PDC) Assembly C5 harness connector.
3. Measure the resistance of the (W3) Wiper Low Speed Control Output circuit between the Front Wiper Motor harness connector and the Power Distribution Center (PDC) Assembly C5 harness connector.

Is the resistance above 3.0 Ohms?

Yes

- Repair the open in the (W3) Wiper Low Speed Control Output circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [9](#)

6. CHECK THE (W4) WIPER HIGH SPEED CONTROL OUTPUT CIRCUIT FOR AN OPEN

1. Turn the ignition off.
2. Disconnect the Power Distribution Center (PDC) Assembly C5 harness connector.
3. Measure the resistance of the (W4) Wiper High Speed Control Output circuit between the Front Wiper Motor harness connector and the Power Distribution Center (PDC) Assembly C5 harness connector.

Is the resistance above 3.0 Ohms?

Yes

- Repair the open in the (W4) Wiper High Speed Control Output circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [9](#)

7. CHECK FOR CONTINUITY TO GROUND ON THE (W7) FRONT WIPER PARK SWITCH SENSE CIRCUIT

1. Turn the ignition off.
2. Check for continuity between ground and the (W7) Front Wiper Park Sense circuit at the Front Wiper Motor harness connector.

Is there continuity between ground and the (W7) Front Wiper Park Sense circuit?

Yes

- Go To [8](#)

No

- Replace the Front Wiper Motor in accordance with the Service Information. Refer to **MOTOR, WIPER, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

8. CHECK THE (W7) FRONT WIPER PARK SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

1. Disconnect the BCM C1/A harness connector.
2. Check for continuity between ground and the (W7) Front Wiper Park Sense circuit at the Front Wiper Motor harness connector.

Is there continuity between ground and the (W7) Front Wiper Park Sense circuit?

Yes

- Repair the short to ground in the (W7) Front Wiper Park Switch Sense circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [10](#)

9. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.

4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

10. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.

- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B2303-13-WIPER PARK SWITCH INPUT-CIRCUIT OPEN

For a complete WIPER WASHER SYSTEMS wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

FRONT WIPERS:

The Front Wiper Switch is part of the Right Multifunction Switch, which is integral to the Steering Column Control Module (SCCM). The SCCM sends Front Wiper Switch commands through the CAN C Bus, to the Body Control Module (BCM).

When the BCM receives a message to activate the Front Wiper Motor at low speed, the BCM provides voltage through the Wiper On/Off Relay Control circuit, to energize the coil side of the Wiper On/Off Relay, located in the Power Distribution Center (PDC) Assembly. When the Wiper On/Off Relay is active, a voltage output is sent through the Wiper High/Low Relay to the Front Wiper Motor, through the Wiper Low Speed Control Output circuit, which activates the Front Wiper Motor at low speed.

When the BCM receives a message to activate the Front Wiper Motor at high speed, the BCM provides voltage through the Wiper High/Low Relay Control circuit, to energize the coil side of the Wiper High/Low Relay. When the Wiper High/Low Relay is active, a voltage output is sent from the Wiper High/Low Relay to the Front Wiper Motor, through the Wiper High Speed Control Output circuit, which activates the Front Wiper Motor at high speed.

A ground path for the Front Wiper Motor is provided through the wiring harness to the body of the vehicle.

WIPER PARK SWITCH:

The Body Control Module (BCM) provides a battery reference voltage on the Front Wiper Park Switch Sense circuits, through an internal pull-up resistor, to the Front Wiper Motor. The Wiper Park Switch is integral to the Front Wiper Motor and switch the Front Wiper Park Switch Sense circuit from open to ground as the Front Wiper Motor rotates.

WASHER PUMP MOTOR:

The Front Washer Switch is part of the Right Multifunction Switch, which is integral to the Steering Column Control Module (SCCM). The SCCM sends Front Washer Switch commands through the CAN C Bus to the Body Control Module (BCM).

The Front Camera Switch is part of the Integrated Center Stack (ICS), which sends Front Washer Switch commands through the CAN IHS Bus to the Body Control Module (BCM).

When the BCM receives a message to activate the Front Washers, the BCM provides a voltage signal to the Washer Pump Motor, through the Front Washer Pump Motor Control circuit, and a ground path through the Front Camera Washer Pump Motor Control circuit.

When the BCM receives a message to activate the Front Camera Washer, the BCM provides a voltage signal to the Washer Pump Motor, through the Front Camera Washer Pump Motor Control circuit, and a ground path through the Front Washer Pump Motor Control circuit.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects the Front Wiper Switch is off and the Front Wiper Park Switch is open for greater than 10 seconds.
- When the Body Control Module (BCM) detects the Front Wiper Switch is activated and the Front Wiper Park Switch does not switch from an open to a ground during a Wiper Motor cycle.

DEFAULT ACTION

- The Front Wipers are always on or inoperative.

POSSIBLE CAUSES

Possible Causes
FUSE MISSING OR OPEN
FRONT WIPER PARK SWITCH SENSE CIRCUIT OPEN
WIPER ON/OFF RELAY
WIPER HIGH/LOW RELAY
FRONT WIPER MOTOR
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after any wiring repair or component/module replacement:**

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. CHECK FUSE F27 (30A) FOR AN OPEN

NOTE: **When removing a fuse from the PDC Assembly, do not rock or wiggle the fuse sideways during removal. Lift the fuse upward, using fingers or suitable pliers, at the middle of the fuse body and inspect the fuse terminals for proper contact.**

1. Turn the ignition off.
2. Remove the fuse, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Check the fuse for an open.

Is the fuse open?

Yes

- Replace the fuse and check the system operation. If the fuse continues to open, repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Install the fuse and Go To [3](#)

3. SUBSTITUTE THE WIPER ON/OFF RELAY - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: **When removing relays from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.**

NOTE: Additional DTCs may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [4](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. SUBSTITUTE THE WIPER HIGH/LOW RELAY - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: When removing relays from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.

NOTE: Additional DTCs may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. DISCONNECT THE FRONT WIPER MOTOR HARNESS CONNECTOR - CONNECT A JUMPER WIRE BETWEEN GROUND AND THE (W7) FRONT WIPER PARK SWITCH SENSE CIRCUIT - CHECK FOR ADDITIONAL DTCs

1. Turn the ignition off.
2. Disconnect the Front Wiper Motor harness connector.
3. Connect a fused jumper wire between ground and the (W7) Front Wiper Park Switch Sense circuit at the Front Wiper Motor harness connector.
4. Turn the ignition on.
5. Turn the Wiper Switch on.
6. With the scan tool, read the BCM DTCs.

Is DTC: B2303-11-WIPER PARK SWITCH INPUT-CIRCUIT SHORT TO GROUND active?

Yes

- Go To [7](#)

No

- Go To [6](#)

6. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (W7) FRONT WIPER PARK SWITCH SENSE CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. Turn the ignition off.
2. Disconnect the BCM C1/A harness connector.
3. Measure the resistance of the (W7) Front Wiper Park Switch Sense circuit between the Front Wiper Motor harness connector and BCM C1/A harness connector.

Is the resistance above 3.0 Ohms?

Yes

- Repair the (W7) Front Wiper Park Switch Sense circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [10](#)

7. CHECK FOR VOLTAGE ON THE (W3) WIPER LOW SPEED CONTROL OUTPUT CIRCUIT AND (W4) WIPER HIGH SPEED CONTROL OUTPUT CIRCUIT

NOTE: **Make sure the Wiper Switch is in the OFF position when performing this step.**

1. Turn the Wiper Switch off.
2. Make sure the ignition is on.
3. Measure the voltage on the (W3) Wiper Low Speed Control Output Circuit at the Front Wiper Motor harness connector.
4. Measure the voltage on the (W4) Wiper High Speed Control Output Circuit at the Front Wiper Motor harness connector.

Is there any voltage present at any of the connections?

Yes

- Go To [8](#)

No

- Replace the Front Wiper Motor in accordance with the Service Information. Refer to **MOTOR, WIPER, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

8. DISCONNECT THE PDC ASSEMBLY HARNESS CONNECTOR - CHECK FOR VOLTAGE ON THE (W3) WIPER LOW SPEED CONTROL OUTPUT CIRCUIT AND (W4) WIPER HIGH SPEED CONTROL OUTPUT CIRCUIT

1. Turn the ignition off.
2. Disconnect the PDC Assembly C1 harness connector.
3. Turn the ignition on.
4. Measure the voltage on the (W3) Wiper Low Speed Control Output circuit at the Front Wiper Motor harness connector.
5. Measure the voltage on the (W4) Wiper High Speed Control Output circuit at the Front Wiper Motor harness connector.

Is there any voltage present at any of the connections?

Yes

- Repair the circuit(s) for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [9](#)

9. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.

6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

10. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B2312-11-WIPER ON/OFF CONTROL-CIRCUIT SHORT TO GROUND

For a complete WIPER WASHER SYSTEMS wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

FRONT WIPERS:

The Front Wiper Switch is part of the Right Multifunction Switch, which is integral to the Steering Column Control Module (SCCM). The SCCM sends Front Wiper Switch commands through the CAN C Bus, to the Body Control Module (BCM).

When the BCM receives a message to activate the Front Wiper Motor at low speed, the BCM provides voltage through the Wiper On/Off Relay Control circuit, to energize the coil side of the Wiper On/Off Relay, located in the Power Distribution Center (PDC) Assembly. When the Wiper On/Off Relay is active, a voltage output is sent through the Wiper High/Low Relay to the Front Wiper Motor, through the Wiper Low Speed Control Output circuit, which activates the Front Wiper Motor at low speed.

When the BCM receives a message to activate the Front Wiper Motor at high speed, the BCM provides voltage through the Wiper High/Low Relay Control circuit, to energize the coil side of the Wiper High/Low Relay. When the Wiper High/Low Relay is active, a voltage output is sent from the Wiper High/Low Relay to the Front Wiper Motor, through the Wiper High Speed Control Output circuit, which activates the Front Wiper Motor at high speed.

A ground path for the Front Wiper Motor is provided through the wiring harness to the body of the vehicle.

WIPER PARK SWITCH:

The Body Control Module (BCM) provides a battery reference voltage on the Front Wiper Park Switch Sense circuits, through an internal pull-up resistor, to the Front Wiper Motor. The Wiper Park Switch is integral to the Front Wiper Motor and switch the Front Wiper Park Switch Sense circuit from open to ground as the Front Wiper Motor rotates.

WASHER PUMP MOTOR:

The Front Washer Switch is part of the Right Multifunction Switch, which is integral to the Steering Column Control Module (SCCM). The SCCM sends Front Washer Switch commands through the CAN C Bus to the Body Control Module (BCM).

The Front Camera Switch is part of the Integrated Center Stack (ICS), which sends Front Washer Switch commands through the CAN IHS Bus to the Body Control Module (BCM).

When the BCM receives a message to activate the Front Washers, the BCM provides a voltage signal to the Washer Pump Motor, through the Front Washer Pump Motor Control circuit, and a ground path through the Front Camera Washer Pump Motor Control circuit.

When the BCM receives a message to activate the Front Camera Washer, the BCM provides a voltage signal to the Washer Pump Motor, through the Front Camera Washer Pump Motor Control circuit, and a ground path through the Front Washer Pump Motor Control circuit.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Front Wiper Switch is active and the Body Control Module (BCM) detects a short to ground on the Wiper On/Off Relay Control circuit.
- After four consecutive failed retry attempts the BCM will disable the output for the remainder of the ignition cycle.

DEFAULT ACTION

- The Front Wipers are inoperative.

POSSIBLE CAUSES

Possible Causes
WIPER ON/OFF RELAY CONTROL CIRCUIT SHORTED TO GROUND
WIPER ON/OFF RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after any wiring repair or component/module replacement:**

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. SUBSTITUTE THE WIPER ON/OFF RELAY - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: When removing relays from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.

NOTE: Additional DTCs may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (W8) WIPER ON/OFF RELAY CONTROL CIRCUIT FOR CONTINUITY TO GROUND AT THE WIPER ON/OFF RELAY TERMINAL

1. The ignition must be off when checking a circuit for continuity to ground.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
4. Connect the negative lead of the DVOM to a known good ground.
5. Connect the positive lead of the DVOM to the circuit being tested, at the relay terminal in the Power Distribution Center (PDC) Assembly, and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Go To [4](#)

No

- Go To [6](#)

4. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (W8) WIPER ON/OFF RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Power Distribution Center (PDC) Assembly harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the PDC Assembly harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [5](#)

5. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.

- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).
- Test complete.

6. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.

6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B2312-15-WIPER ON/OFF CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete WIPER WASHER SYSTEMS wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

FRONT WIPERS:

The Front Wiper Switch is part of the Right Multifunction Switch, which is integral to the Steering Column Control Module (SCCM). The SCCM sends Front Wiper Switch commands through the CAN C Bus, to the Body Control Module (BCM).

When the BCM receives a message to activate the Front Wiper Motor at low speed, the BCM provides voltage through the Wiper On/Off Relay Control circuit, to energize the coil side of the Wiper On/Off Relay, located in the Power Distribution Center (PDC) Assembly. When the Wiper On/Off Relay is active, a voltage output is sent through the Wiper High/Low Relay to the Front Wiper Motor, through the Wiper Low Speed Control Output circuit, which activates the Front Wiper Motor at low speed.

When the BCM receives a message to activate the Front Wiper Motor at high speed, the BCM provides voltage through the Wiper High/Low Relay Control circuit, to energize the coil side of the Wiper High/Low Relay. When the Wiper High/Low Relay is active, a voltage output is sent from the Wiper High/Low Relay to the Front Wiper Motor, through the Wiper High Speed Control Output circuit, which activates the Front Wiper Motor at high speed.

A ground path for the Front Wiper Motor is provided through the wiring harness to the body of the vehicle.

WIPER PARK SWITCH:

The Body Control Module (BCM) provides a battery reference voltage on the Front Wiper Park Switch Sense circuits, through an internal pull-up resistor, to the Front Wiper Motor. The Wiper Park Switch is integral to the Front Wiper Motor and switch the Front Wiper Park Switch Sense circuit from open to ground as the Front Wiper Motor rotates.

WASHER PUMP MOTOR:

The Front Washer Switch is part of the Right Multifunction Switch, which is integral to the Steering Column Control Module (SCCM). The SCCM sends Front Washer Switch commands through the CAN C Bus to the Body Control Module (BCM).

The Front Camera Switch is part of the Integrated Center Stack (ICS), which sends Front Washer Switch commands through the CAN IHS Bus to the Body Control Module (BCM).

When the BCM receives a message to activate the Front Washers, the BCM provides a voltage signal to the Washer Pump Motor, through the Front Washer Pump Motor Control circuit, and a ground path through the Front Camera Washer Pump Motor Control circuit.

When the BCM receives a message to activate the Front Camera Washer, the BCM provides a voltage signal to the Washer Pump Motor, through the Front Camera Washer Pump Motor Control circuit, and a ground path through the Front Washer Pump Motor Control circuit.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Front Wiper Switch is off and the Body Control Module (BCM) detects an open or short to voltage on the Wiper On/Off Relay Control circuit for greater than 1.28 seconds.

DEFAULT ACTION

- The Front Wipers are inoperative.

POSSIBLE CAUSES

Possible Causes
WIPER ON/OFF RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
WIPER ON/OFF RELAY CONTROL CIRCUIT OPEN
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY GROUND CIRCUIT OPEN
WIPER ON/OFF RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

- 1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN**
 1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
 2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
 3. With the scan tool, erase all DTCS.
 4. Turn the ignition off for a minimum of 10.0 seconds.
 5. Turn the ignition on.
 6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.

7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. SUBSTITUTE THE WIPER ON/OFF RELAY - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: When removing relays from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.

NOTE: Additional DTCs may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. CHECK FOR VOLTAGE ON THE (W8) WIPER ON/OFF RELAY CONTROL CIRCUIT AT THE WIPER ON/OFF RELAY TERMINAL

NOTE: Make sure the Wiper Switch is in the Off position when performing this step.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Turn the ignition on.

4. Using a DVOM, measure the voltage on the circuit being tested at the relay terminal in the PDC Assembly.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [4](#)

No

- Go To [6](#)

4. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK FOR VOLTAGE ON THE (W8) WIPER ON/OFF RELAY CONTROL CIRCUIT

1. Turn the ignition off.
2. Disconnect all Power Distribution Center (PDC) Assembly harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the PDC Assembly harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [5](#)

No

- Go To [10](#)

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (W8) WIPER ON/OFF RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the PDC Assembly harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [11](#)

6. DISCONNECT THE BCM HARNESS CONNECTOR(S) - CHECK THE RESISTANCE ON THE (W8) WIPER ON/OFF RELAY CONTROL CIRCUIT BETWEEN THE BCM AND WIPER ON/OFF RELAY TERMINAL

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the relay terminal in the PDC Assembly.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Go To [7](#)

No

- Go To [8](#)

7. DISCONNECT THE PDC ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (W8) WIPER ON/OFF RELAY CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Power Distribution Center (PDC) Assembly harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the PDC Assembly harness connector.
5. Connect the other lead to the circuit being tested at the Electronic Control Unit (ECU) harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [10](#)

8. CHECK THE PDC ASSEMBLY GROUND CIRCUIT(S) FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT AT THE WIPER ON/OFF RELAY TERMINAL

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit.
3. Connect the negative lead of the load test tool to the ground circuit at the relay terminal in the PDC Assembly.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [11](#)

No

- Go To [9](#)

9. DISCONNECT THE PDC ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE PDC ASSEMBLY GROUND CIRCUIT(S) FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the

CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to **STANDARD PROCEDURE** .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [10](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

10. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [**CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

11. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.

9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B2316-11-WIPER HIGH/LOW CONTROL-CIRCUIT SHORT TO GROUND

For a complete WIPER WASHER SYSTEMS wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

FRONT WIPERS:

The Front Wiper Switch is part of the Right Multifunction Switch, which is integral to the Steering Column Control Module (SCCM). The SCCM sends Front Wiper Switch commands through the CAN C Bus, to the Body Control Module (BCM).

When the BCM receives a message to activate the Front Wiper Motor at low speed, the BCM provides voltage through the Wiper On/Off Relay Control circuit, to energize the coil side of the Wiper On/Off Relay, located in the Power Distribution Center (PDC) Assembly. When the Wiper On/Off Relay is active, a voltage output is sent through the Wiper High/Low Relay to the Front Wiper Motor, through the Wiper Low Speed Control Output circuit, which activates the Front Wiper Motor at low speed.

When the BCM receives a message to activate the Front Wiper Motor at high speed, the BCM provides voltage through the Wiper High/Low Relay Control circuit, to energize the coil side of the Wiper High/Low Relay. When the Wiper High/Low Relay is active, a voltage output is sent from the Wiper High/Low Relay to the Front Wiper Motor, through the Wiper High Speed Control Output circuit, which activates the Front Wiper Motor at high speed.

A ground path for the Front Wiper Motor is provided through the wiring harness to the body of the vehicle.

WIPER PARK SWITCH:

The Body Control Module (BCM) provides a battery reference voltage on the Front Wiper Park Switch Sense circuits, through an internal pull-up resistor, to the Front Wiper Motor. The Wiper Park Switch is integral to the Front Wiper Motor and switch the Front Wiper Park Switch Sense circuit from open to ground as the Front Wiper Motor rotates.

WASHER PUMP MOTOR:

The Front Washer Switch is part of the Right Multifunction Switch, which is integral to the Steering Column Control Module (SCCM). The SCCM sends Front Washer Switch commands through the CAN C Bus to the Body Control Module (BCM).

The Front Camera Switch is part of the Integrated Center Stack (ICS), which sends Front Washer Switch commands through the CAN IHS Bus to the Body Control Module (BCM).

When the BCM receives a message to activate the Front Washers, the BCM provides a voltage signal to the Washer Pump Motor, through the Front Washer Pump Motor Control circuit, and a ground path through the Front Camera Washer Pump Motor Control circuit.

When the BCM receives a message to activate the Front Camera Washer, the BCM provides a voltage signal to the Washer Pump Motor, through the Front Camera Washer Pump Motor Control circuit, and a ground path through the Front Washer Pump Motor Control circuit.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Front Wiper Switch is active and the Body Control Module (BCM) detects greater than 1.0 amp on the Wiper High/Low Relay Control circuit for greater than four seconds.

DEFAULT ACTION

- The Front Wipers are inoperative.

POSSIBLE CAUSES

Possible Causes
WIPER HIGH/LOW RELAY CONTROL SHORTED TO GROUND
WIPER HIGH/LOW RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after wiring repair or module replacement:**

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. SUBSTITUTE THE WIPER HIGH/LOW RELAY - ERASE DTCs AND CHECK FOR THE DTC TO RETURN

NOTE: When removing relays from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.

NOTE: Additional DTCs may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (W2) WIPER HIGH/LOW RELAY CONTROL CIRCUIT FOR CONTINUITY TO GROUND AT THE WIPER HIGH/LOW RELAY TERMINAL

1. The ignition must be off when checking a circuit for continuity to ground.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
4. Connect the negative lead of the DVOM to a known good ground.
5. Connect the positive lead of the DVOM to the circuit being tested, at the relay terminal in the Power Distribution Center (PDC) Assembly, and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Go To [4](#)

No

- Go To [6](#)

4. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (W2) WIPER HIGH/LOW RELAY CONTROL CIRCUIT FOR CONTINUITY TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect the Power Distribution Center (PDC) Assembly harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the PDC Assembly harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [5](#)

5. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.

- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to **CENTER, POWER DISTRIBUTION (PDC), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

6. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B2316-15-WIPER HIGH/LOW CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete WIPER WASHER SYSTEMS wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

FRONT WIPERS:

The Front Wiper Switch is part of the Right Multifunction Switch, which is integral to the Steering Column Control Module (SCCM). The SCCM sends Front Wiper Switch commands through the CAN C Bus, to the Body Control Module (BCM).

When the BCM receives a message to activate the Front Wiper Motor at low speed, the BCM provides voltage through the Wiper On/Off Relay Control circuit, to energize the coil side of the Wiper On/Off Relay, located in the Power Distribution Center (PDC) Assembly. When the Wiper On/Off Relay is active, a voltage output is sent through the Wiper High/Low Relay to the Front Wiper Motor, through the Wiper Low Speed Control Output circuit, which activates the Front Wiper Motor at low speed.

When the BCM receives a message to activate the Front Wiper Motor at high speed, the BCM provides voltage through the Wiper High/Low Relay Control circuit, to energize the coil side of the Wiper High/Low Relay. When the Wiper High/Low Relay is active, a voltage output is sent from the Wiper High/Low Relay to the Front Wiper Motor, through the Wiper High Speed Control Output circuit, which activates the Front Wiper Motor at high speed.

A ground path for the Front Wiper Motor is provided through the wiring harness to the body of the vehicle.

WIPER PARK SWITCH:

The Body Control Module (BCM) provides a battery reference voltage on the Front Wiper Park Switch Sense circuits, through an internal pull-up resistor, to the Front Wiper Motor. The Wiper Park Switch is integral to the Front Wiper Motor and switch the Front Wiper Park Switch Sense circuit from open to ground as the Front Wiper Motor rotates.

WASHER PUMP MOTOR:

The Front Washer Switch is part of the Right Multifunction Switch, which is integral to the Steering Column Control Module (SCCM). The SCCM sends Front Washer Switch commands through the CAN C Bus to the Body Control Module (BCM).

The Front Camera Switch is part of the Integrated Center Stack (ICS), which sends Front Washer Switch commands through the CAN IHS Bus to the Body Control Module (BCM).

When the BCM receives a message to activate the Front Washers, the BCM provides a voltage signal to the Washer Pump Motor, through the Front Washer Pump Motor Control circuit, and a ground path through the Front Camera Washer Pump Motor Control circuit.

When the BCM receives a message to activate the Front Camera Washer, the BCM provides a voltage signal to the Washer Pump Motor, through the Front Camera Washer Pump Motor Control circuit, and a ground path through the Front Washer Pump Motor Control circuit.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Front Wiper Switch is off and the Body Control Module (BCM) detects greater than 1.5 volts on the Wiper High/Low Relay Control circuit for greater than 1.28 seconds.

DEFAULT ACTION

- The Front Wipers are inoperative.

POSSIBLE CAUSES

Possible Causes
WIPER HIGH/LOW RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
WIPER HIGH/LOW RELAY CONTROL CIRCUIT OPEN
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY GROUND CIRCUIT OPEN
WIPER HIGH/LOW RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCs AND ENVIRONMENTAL DATA - ERASE DTCs AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. SUBSTITUTE THE WIPER HIGH/LOW RELAY - ERASE DTCs AND CHECK FOR THE DTC TO RETURN

NOTE: When removing relays from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.

NOTE: Additional DTCs may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. CHECK FOR VOLTAGE ON THE (W2) WIPER HIGH/LOW RELAY CONTROL CIRCUIT AT THE WIPER HIGH/LOW RELAY TERMINAL

NOTE: Make sure the Wiper Switch is in the Off position when performing this step.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the relay terminal in the PDC Assembly.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [4](#)

No

- Go To [6](#)

4. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK FOR VOLTAGE ON THE (W2) WIPER HIGH/LOW RELAY CONTROL CIRCUIT

1. Turn the ignition off.
2. Disconnect all Power Distribution Center (PDC) Assembly harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the PDC Assembly harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

No

- Go To [10](#)

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (W2) WIPER HIGH/LOW RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the PDC Assembly harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [11](#)

6. DISCONNECT THE BCM HARNESS CONNECTOR(S) - CHECK THE RESISTANCE ON THE (W2) WIPER HIGH/LOW RELAY CONTROL CIRCUIT BETWEEN THE BCM AND WIPER HIGH/LOW RELAY TERMINAL

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the relay terminal in the PDC Assembly.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Go To [7](#)

No

- Go To [8](#)

7. DISCONNECT THE PDC ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (W2) WIPER HIGH/LOW RELAY CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Power Distribution Center (PDC) Assembly harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the PDC Assembly harness connector.
5. Connect the other lead to the circuit being tested at the Electronic Control Unit (ECU) harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [10](#)

8. CHECK THE PDC ASSEMBLY GROUND CIRCUIT(S) FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT AT THE WIPER HIGH/LOW RELAY TERMINAL

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit.
3. Connect the negative lead of the load test tool to the ground circuit at the relay terminal in the PDC Assembly.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [**STANDARD PROCEDURE**](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [**STANDARD PROCEDURE**](#) .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [11](#)

No

- Go To [9](#)

9. DISCONNECT THE PDC ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE PDC ASSEMBLY GROUND CIRCUIT(S) FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [10](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

10. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.

6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

11. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B2335-11-HORN CONTROL-CIRCUIT SHORT TO GROUND

For a complete HORNS wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

When Horn operation is requested, the Body Control Module (BCM) either receives a hard-wire signal from the Horn Switch, through the Steering Column Control Module (SCCM), or a CAN Bus message from the RF-Hub (Radio Frequency Hub) Module. When the normally open Horn Switch is depressed, the Horn Switch closes and a ground signal is sent through the Horn Switch Sense circuit, to the BCM.

When the BCM receives the request for Horn operation, the BCM provides a voltage output to the coil side of the Horn Relay, integral to the Power Distribution Center (PDC) Assembly, through the Horn Relay Control circuit. A ground path for the Horn Relay is provided through the PDC Assembly. When the Horn Relay is active, a voltage output is provided through the Fused Horn Control Output circuit, to the Horn. A ground path for the Horn is provided through the wiring harness, to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Horn Switch is activated and the Body Control Module (BCM) detects greater than 1.0 amp on the Horn Relay Control circuit.
- After four consecutive failed retry attempts the BCM will disable the output for the remainder of the ignition cycle.

DEFAULT ACTION

- The Horn is inoperative.

POSSIBLE CAUSES

Possible Causes
HORN RELAY CONTROL CIRCUIT SHORTED TO GROUND
HORN RELAY (INTEGRAL TO THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY)
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after wiring repair or module replacement:**

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR AND CHECK THE (X4) HORN RELAY CONTROL CIRCUIT FOR CONTINUITY TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect the Power Distribution Center (PDC) Assembly harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the PDC Assembly harness connector and check for continuity between the circuit and ground.

NOTE: **When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.**

NOTE: **There should be no continuity between ground and the circuit being tested.**

Is there continuity between ground and the circuit being tested?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (X4) HORN RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.

2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

4. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.

9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

5. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to [MODULE, BODY CONTROL \(BCM\), REMOVAL AND INSTALLATION](#) .

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B2335-15-HORN CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete HORNS wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

When Horn operation is requested, the Body Control Module (BCM) either receives a hard-wire signal from the Horn Switch, through the Steering Column Control Module (SCCM), or a CAN Bus message from the RF-Hub (Radio Frequency Hub) Module. When the normally open Horn Switch is depressed, the Horn Switch closes and a ground signal is sent through the Horn Switch Sense circuit, to the BCM.

When the BCM receives the request for Horn operation, the BCM provides a voltage output to the coil side of the Horn Relay, integral to the Power Distribution Center (PDC) Assembly, through the Horn Relay Control circuit. A ground path for the Horn Relay is provided through the PDC Assembly. When the Horn Relay is active, a voltage output is provided through the Fused Horn Control Output circuit, to the Horn. A ground path for the Horn is provided through the wiring harness, to the body sheet metal.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Horn Switch is off and the Body Control Module (BCM) detects greater than 1.5 volts on the Horn Relay Control circuit for greater than 1.28 seconds.

DEFAULT ACTION

- The Horn is inoperative.

POSSIBLE CAUSES

Possible Causes
HORN RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
HORN RELAY CONTROL CIRCUIT OPEN
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY GROUND CIRCUIT OPEN
HORN RELAY (INTEGRAL TO THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY)
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK FOR VOLTAGE ON THE (X4) HORN RELAY CONTROL CIRCUIT

1. Turn the ignition off.
2. Disconnect the BCM harness connector(s) for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the BCM harness connector(s).

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (X4) HORN RELAY CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Power Distribution Center (PDC) Assembly connector(s) containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the PDC Assembly harness connector(s).

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

4. DISCONNECT THE PDC ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (X4) HORN RELAY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all PDC Assembly harness connector(s) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the PDC Assembly harness connector.
5. Connect the other lead to the circuit being tested at the BCM harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [6](#)

5. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [**CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

6. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.

9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B233D-11-FRONT/REAR WASHER MOTOR (+) CONTROL-CIRCUIT SHORT TO GROUND

For a complete WIPER WASHER SYSTEMS wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

FRONT WIPERS:

The Front Wiper Switch is part of the Right Multifunction Switch, which is integral to the Steering Column Control Module (SCCM). The SCCM sends Front Wiper Switch commands through the CAN C Bus, to the Body Control Module (BCM).

When the BCM receives a message to activate the Front Wiper Motor at low speed, the BCM provides voltage through the Wiper On/Off Relay Control circuit, to energize the coil side of the Wiper On/Off Relay, located in the Power Distribution Center (PDC) Assembly. When the Wiper On/Off Relay is active, a voltage output is sent through the Wiper High/Low Relay to the Front Wiper Motor, through the Wiper Low Speed Control Output circuit, which activates the Front Wiper Motor at low speed.

When the BCM receives a message to activate the Front Wiper Motor at high speed, the BCM provides voltage through the Wiper High/Low Relay Control circuit, to energize the coil side of the Wiper High/Low Relay. When the Wiper High/Low Relay is active, a voltage output is sent from the Wiper High/Low Relay to the Front Wiper Motor, through the Wiper High Speed Control Output circuit, which activates the Front Wiper Motor at high speed.

A ground path for the Front Wiper Motor is provided through the wiring harness to the body of the vehicle.

WIPER PARK SWITCH:

The Body Control Module (BCM) provides a battery reference voltage on the Front Wiper Park Switch Sense circuits, through an internal pull-up resistor, to the Front Wiper Motor. The Wiper Park Switch is integral to the Front Wiper Motor and switch the Front Wiper Park Switch Sense circuit from open to ground as the Front Wiper Motor rotates.

WASHER PUMP MOTOR:

The Front Washer Switch is part of the Right Multifunction Switch, which is integral to the Steering Column Control Module (SCCM). The SCCM sends Front Washer Switch commands through the CAN C Bus to the Body Control Module (BCM).

The Front Camera Switch is part of the Integrated Center Stack (ICS), which sends Front Washer Switch commands through the CAN IHS Bus to the Body Control Module (BCM).

When the BCM receives a message to activate the Front Washers, the BCM provides a voltage signal to the Washer Pump Motor, through the Front Washer Pump Motor Control circuit, and a ground path through the Front Camera Washer Pump Motor Control circuit.

When the BCM receives a message to activate the Front Camera Washer, the BCM provides a voltage signal to the Washer Pump Motor, through the Front Camera Washer Pump Motor Control circuit, and a ground path through the Front Washer Pump Motor Control circuit.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Front Washer Pump Switch is active and the Body Control Module (BCM) detects greater than 22.0 amps on the Front Washer Pump Motor Control circuit.
- After four consecutive failed retry attempts the BCM will disable the output for the remainder of the ignition cycle.

DEFAULT ACTION

- The Washer Pump Motor is inoperative.

POSSIBLE CAUSES

Possible Causes
OPEN FUSE FUSED B(+) CIRCUIT SHORTED TO GROUND FRONT WASHER PUMP MOTOR CONTROL CIRCUIT SHORTED TO GROUND WASHER PUMP MOTOR POWER DISTRIBUTION CENTER (PDC) ASSEMBLY BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module’s internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. REMOVE AND INSPECT FUSE F27 (30A) FOR AN OPEN

NOTE: When this DTC is Active, it cannot be erased until the Washer Pump Motor is activated and the Body Control Module detects a lower amperage draw than what is specified in Set Conditions.

1. Turn the ignition off.
2. Remove Fuse F27 (30A) from the Power Distribution Center (PDC) Assembly.
3. Inspect Fuse F27 (30A) for an open.

Is Fuse F27 (30A) open?

Yes

- Replace Fuse F27 (30A). If the fuse continues to open, inspect and repair the (A237) Fused B(+) circuit for a short to ground. If no problems are found, replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [3](#)

3. CHECK THE WASHER PUMP MOTOR FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Washer Pump Motor harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [4](#)

No

- Replace the Washer Pump Motor in accordance with the Service Information. Refer to [PUMP, WINDSHIELD WASHER, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (W10) FRONT WASHER PUMP MOTOR CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.

3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

5. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to [MODULE, BODY CONTROL \(BCM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

B23B8-2A-BRAKE PEDAL SWITCH-STUCK

For a complete BRAKE SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Body Control Module (BCM) detects the Stop Lamp Sensor has been consistently activated for greater than eight minutes.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE DTCS
STOP LAMP SENSOR ADJUSTMENT
STOP LAMP SENSOR

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after wiring repair or module replacement:**

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
4. With the scan tool, read Body Control Module (BCM) DTCS.

Is the DTC Active?

Yes

- If there are previous complaints of the Stop Lamps always on, or the Speed Control will not activate, Go To [2](#)

No

- If the Stop Lamps and Speed Control system operate correctly, perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. CHECK FOR STOP LAMP SENSOR RELATED DTC(S) PRESENT IN THE ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

1. Turn the ignition on.
2. With the scan tool, read ABS Module DTCs and record on the repair order.

Are there any Stop Lamp Sensor related DTCs present?

Yes

- Repair the ABS Module DTCs before continuing with this test. Refer to [DIAGNOSIS AND TESTING](#) .

No

- Go To [3](#)

3. CHECK FOR AN IMPROPERLY INSTALLED STOP LAMP SENSOR

1. Turn the ignition off.
2. Check the Stop Lamp Sensor for proper installation, damage, or mechanical failure in accordance with the Service Information.

Were any problems found?

Yes

- Repair as necessary and perform the "Brake Pedal Sensor Calibration" routine.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. COMPARE THE BRAKE PEDAL TRAVEL SENSOR SETPOINT TO THE BRAKE PEDAL POSITION

NOTE: **The voltage of the Brake Pedal Travel Sensor Setpoint and Brake Pedal Position should be equal.**

1. Start the engine.
2. With the scan tool, in ABS Data, compare the Brake Pedal Travel Sensor Setpoint voltage to the Brake Pedal Position voltage.

Is the voltage difference between the ABS Data greater than 0.2 volts?

Yes

- Perform the "Brake Pedal Sensor Calibration" routine.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Replace the Stop Lamp Sensor in accordance with the Service Information. Refer to [SENSOR, STOP LAMP, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B259F-11-TRUNK/LIFTGATE LOCK CONTROL CIRCUIT-CIRCUIT SHORT TO GROUND

For a complete DECKLID LIFTGATE LOCK SYSTEM wiring diagram, Refer to the appropriate wiring information .

THEORY OF OPERATION

The BCM controls the lock and unlock functions of the bidirectional Tailgate Lock Motor, integral to the Tailgate Latch, through the Tailgate Lock and Tailgate Unlock circuits.

Lock: When the Body Control Module (BCM) receives a lock request, the BCM provides voltage to the Tailgate Lock circuit and ground to the Tailgate Unlock circuit, to actuate the Tailgate Lock Motor to the lock position.

Unlock: When the Body Control Module (BCM) receives an unlock request, the BCM provides ground to the Tailgate Lock circuit and voltage to the Tailgate Unlock circuit, to actuate the Tailgate Lock Motor to the unlock position.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Lock Switch is active and the Body Control Module detects greater than 1.398 volts on the Tailgate Lock circuit for greater than 130 milliseconds.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The Tailgate Lock/Unlock function is inoperative.

POSSIBLE CAUSES

Possible Causes
TAILGATE LOCK CIRCUIT SHORTED TO GROUND
TAILGATE LOCK/UNLOCK MOTOR (INTEGRAL TO TAILGATE LATCH)
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. CHECK THE TAILGATE LOCK/UNLOCK MOTOR FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Tailgate Lock/Unlock Motor harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Tailgate Lock/Unlock Motor in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (P221) TAILGATE LOCK CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

For a complete BRAKE SYSTEM wiring diagram, **Refer to the appropriate wiring information .**

THEORY OF OPERATION

The Body Control Module (BCM) provides a reference voltage to the Brake Fluid Level Switch, through the Brake Fluid Level Signal circuit. When the brake fluid level is above the low level switch, the Brake Fluid Level Switch is opened and the reference voltage travels through an internal 10k Ohm diagnostic resistor which is parallel to the internal Brake Fluid Level Switch. When the brake fluid level is below the low level switch, the Brake Fluid Level Switch closes and the reference voltage bypasses the diagnostic resistor.

When the BCM detects the brake fluid level is low, the BCM sends a CAN Bus message to the Instrument Cluster (IC), in order to illuminate the BRAKE warning lamp.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects greater than 100k Ohms on the Brake Fluid Level Signal for greater than 10 seconds.

DEFAULT ACTION

- Brake Fluid Level indicator is activated.

POSSIBLE CAUSES

Possible Causes
BRAKE FLUID LEVEL SIGNAL CIRCUIT OPEN
GROUND CIRCUIT OPEN
BRAKE FLUID LEVEL SWITCH
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. **READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN**
 1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
 2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
 3. With the scan tool, erase all DTCS.
 4. Turn the ignition off for a minimum of 10.0 seconds.
 5. Turn the ignition on.
 6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
 7. With the scan tool, read Body Control Module (BCM) DTCS.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. DISCONNECT THE BRAKE FLUID LEVEL SWITCH HARNESS CONNECTOR - CONNECT A FUSED JUMPER WIRE BETWEEN THE (Z420) GROUND CIRCUIT AND THE (B20) BRAKE FLUID LEVEL SIGNAL CIRCUIT - CHECK THE BCM DATA

1. Turn the ignition off.
2. Disconnect the component harness connector(s) for the circuit being tested.
3. Connect a fused jumper wire between the ground circuit and the circuit being tested at the component harness connector. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
4. Turn the ignition on.
5. With the scan tool, read the Brake Fluid Level data.

Does the Brake Fluid Level data display Low?

Yes

- Replace the Brake Fluid Level Switch in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [3](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR AND CHECK THE (B20) BRAKE FLUID LEVEL SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) and component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. CHECK THE (Z420) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
3. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
4. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [5](#)

5. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

P0070-11-AMBIENT AIR TEMPERATURE SENSOR CIRCUIT-CIRCUIT SHORT TO GROUND

For a complete HVAC SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- The Body Control Module (BCM) detects less than 77.0 Ohms on the Ambient Air Temperature Signal circuit for greater than 10 seconds.

DEFAULT ACTION

- Temperature display defaults to the maximum limit.

POSSIBLE CAUSES

Possible Causes
AMBIENT AIR TEMPERATURE (AAT) SIGNAL CIRCUIT SHORTED TO GROUND
AAT SIGNAL CIRCUIT SHORTED TO THE SENSOR GROUND CIRCUIT
AMBIENT AIR TEMPERATURE (AAT) SENSOR
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .**

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: After repairing an Ambient Air Temperature (AAT) Sensor circuit, or replacing the AAT Sensor, the vehicle **MUST** be driven above 15 mph (24 km/h), for at least five minutes. Performing this allows the AAT Sensor data in the BCM to be updated. Failure to perform this may lead to the incorrect replacement of the BCM.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. CHECK THE AMBIENT AIR TEMPERATURE (AAT) SENSOR FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

NOTE: The AAT Sensor operates between 345, 260 Ohms (low temperature) and 181 Ohms (high temperature).

At 20Â°C (68Â°F) the AAT Sensor resistance should be between 11, 370 Ohms and 13, 610 Ohms.

1. Turn the ignition off.
2. Disconnect the Ambient Air Temperature (AAT) Sensor harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Ambient Air Temperature (AAT) Sensor in accordance with the Service Information. Refer to [SENSOR, AMBIENT TEMPERATURE, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (G31) AAT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) and component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. CHECK THE (G31) AAT SENSOR SIGNAL CIRCUIT FOR A SHORT TO THE (G931) SENSOR GROUND CIRCUIT

1. The ignition must be off when checking a circuit for continuity.
2. Connect the negative lead of the DVOM to one of the circuits being tested at the ECU or component harness connector.
3. Connect the positive lead of the DVOM to the other circuit being tested at the ECU or component harness connector and check for continuity between the circuits.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between the circuits being tested.

Is there continuity between the circuits being tested?

Yes

- Repair the short between the circuits.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

5. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

P0070-15-AMBIENT AIR TEMPERATURE SENSOR CIRCUIT-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete HVAC SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- The Body Control Module (BCM) detects greater than 880, 000 Ohms on the Ambient Air Temperature Signal circuit for greater than 10 seconds.

DEFAULT ACTION

- Temperature display defaults to the minimum limit.

POSSIBLE CAUSES

Possible Causes
AMBIENT AIR TEMPERATURE (AAT) SIGNAL CIRCUIT SHORTED TO VOLTAGE
AAT SIGNAL CIRCUIT OPEN
SENSOR GROUND CIRCUIT OPEN
AMBIENT AIR TEMPERATURE (AAT) SENSOR
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: After repairing an Ambient Air Temperature (AAT) Sensor circuit, or replacing the AAT Sensor, the vehicle **MUST** be driven above 15 mph (24 km/h), for at least five minutes. Performing this allows the AAT Sensor data in the BCM to be updated. Failure to perform this may lead to the incorrect replacement of the BCM.

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. DISCONNECT THE AMBIENT AIR TEMPERATURE HARNESS CONNECTOR AND CHECK THE (G31) AAT SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the component harness connector(s) for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the voltage above 5.2 volts?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [3](#)

3. CONNECT A FUSED JUMPER WIRE BETWEEN THE (G31) AAT SENSOR SIGNAL CIRCUIT AND (G931) SENSOR GROUND CIRCUIT - CHECK FOR ADDITIONAL DTCS

NOTE: The AAT Sensor operates between 345, 260 Ohms (low temperature) and 181 Ohms (high temperature).

At 20°C (68°F) the AAT Sensor resistance should be between 11, 370 Ohms and 13, 610 Ohms.

1. Turn the ignition off.
2. Connect a fused jumper wire between the circuits being tested at the component harness connector.
Note: Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. With the scan tool, read the BCM DTCs.

Is DTC: P0070-11-AMBIENT AIR TEMPERATURE SENSOR CIRCUIT - CIRCUIT SHORT TO GROUND active?

Yes

- Replace the Ambient Air Temperature Sensor in accordance with the Service Information. Refer to **SENSOR, AMBIENT TEMPERATURE, REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [4](#)

4. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (G31) AAT SENSOR SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [5](#)

5. CHECK THE (G931) SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
3. Connect one lead of the DVOM to the circuit being tested at the component harness connector.

4. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [6](#)

6. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

P0460-11-FUEL LEVEL SENSOR 1 - CIRCUIT SHORT TO GROUND

For a complete FUEL DELIVERY SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) helps determine the amount of fuel remaining in the Fuel Tank by monitoring the Fuel Level Sensor and sending CAN Bus fuel level messages to the modules that require fuel level information. The BCM monitors the Fuel Level Sensor through hardwired Fuel Level Sensor Signal and Fuel Level Sense Return circuits. The Fuel Level Sensor includes a Fuel Level Sensor Arm and Float, along with an integral variable resistor, which operates between 51.0 Ohms and 992.0 Ohms. The resistance value of the Fuel Level Sensor varies, depending on the amount of fuel remaining in the Fuel Tank. When the Fuel Level Sensor Arm and Float is at the highest point of travel (Fuel Tank FULL), the resistance is approximately 51.0 Ohms. When the Fuel Level Sensor Arm and Float is at the lowest point of travel (Fuel Tank EMPTY), the resistance is approximately 992.0 Ohms.

On a normally functioning system, with no circuit faults and the harness connectors plugged in, the voltage on the Fuel Level Sensor Signal circuit, at the Fuel Level Sensor, should be between approximately 1.0 volt (Fuel Tank FULL) and 10.5 volts (Fuel Tank EMPTY). The voltage is used up through the resistor within the Fuel Level Sensor, therefore the voltage on the Fuel Level Sense Return circuit should be zero volts.

The voltage reading in the scan tool is scaled to read between approximately 0.6 volts (Fuel Tank FULL) and 4.5 volts (Fuel Tank EMPTY).

NOTE: Voltage measuring approximately 12.0 volts (source voltage) on the Fuel Level Sensor Signal circuit, at the BCM and Fuel Level Sensor harness connectors (with the harness connectors plugged in), may indicate a short to voltage on the Fuel Level Sensor Signal circuit or an open on the Fuel Level Sense Return circuit.

NOTE: Voltage measuring approximately 12.0 volts (source voltage) on the Fuel Level Sensor Signal circuit, at the BCM harness connector, but 0.0 volts at the Fuel Level Sensor harness connector (with the harness connectors plugged in), may indicate an open on the Fuel Level Sensor Signal circuit.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects less than 31.0 Ohms on the Fuel Level Sensor Signal circuit for greater than 12 seconds.

DEFAULT ACTION

- Fuel Gauge displays empty.

POSSIBLE CAUSES

Possible Causes
FUEL LEVEL SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
FUEL LEVEL SENSOR SIGNAL CIRCUIT SHORTED TO THE FUEL LEVEL SENSE RETURN CIRCUIT
FUEL LEVEL SENSOR
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. CHECK THE PRIMARY FUEL LEVEL SENSOR FOR AN INTERNAL SHORT

1. Turn the ignition off.
2. Disconnect the Fuel Pump Module harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM and PCM DTCs.

Is BCM DTC: P0460-15-FUEL LEVEL SENSOR 1 - CIRCUIT SHORT TO BATTERY OR OPEN or PCM DTC: P0463-00-FUEL LEVEL SENSOR 1 CIRCUIT HIGH active or pending?

Yes

- Check the Fuel Pump Module harness for any signs of damage which could cause an open or shorted circuit. If no problem is found, replace the Fuel Level Sensor in accordance with the Service Information. Refer to **ASSEMBLY, FUEL PUMP, REMOVAL AND INSTALLATION**.

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [3](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) and component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [4](#)

4. CHECK THE (N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT FOR A SHORT TO THE (G109) FUEL LEVEL SENSE RETURN CIRCUIT

1. The ignition must be off when checking a circuit for continuity.
2. Connect the negative lead of the DVOM to one of the circuits being tested at the ECU or component harness connector.
3. Connect the positive lead of the DVOM to the other circuit being tested at the ECU or component harness connector and check for continuity between the circuits.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between the circuits being tested.

Is there continuity between the circuits being tested?

Yes

- Repair the short between the circuits.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [5](#)

5. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to [MODULE, BODY CONTROL \(BCM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
 - Test complete.
-

2021 ACCESSORIES AND BODY, CAB

Body Control Module (BCM) - DTCS P0460-15 To U1516-87 - Gladiator

DTC TROUBLESHOOTING

P0460-15-FUEL LEVEL SENSOR 1 - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete FUEL DELIVERY SYSTEM wiring diagram, **Refer to the appropriate wiring information .**

THEORY OF OPERATION

The Body Control Module (BCM) helps determine the amount of fuel remaining in the Fuel Tank by monitoring the Fuel Level Sensor and sending CAN Bus fuel level messages to the modules that require fuel level information. The BCM monitors the Fuel Level Sensor through hardwired Fuel Level Sensor Signal and Fuel Level Sense Return circuits. The Fuel Level Sensor includes a Fuel Level Sensor Arm and Float, along with an integral variable resistor, which operates between 51.0 Ohms and 992.0 Ohms. The resistance value of the Fuel Level Sensor varies, depending on the amount of fuel remaining in the Fuel Tank. When the Fuel Level Sensor Arm and Float is at the highest point of travel (Fuel Tank FULL), the resistance is approximately 51.0 Ohms. When the Fuel Level Sensor Arm and Float is at the lowest point of travel (Fuel Tank EMPTY), the resistance is approximately 992.0 Ohms.

On a normally functioning system, with no circuit faults and the harness connectors plugged in, the voltage on the Fuel Level Sensor Signal circuit, at the Fuel Level Sensor, should be between approximately 1.0 volt (Fuel Tank FULL) and 10.5 volts (Fuel Tank EMPTY). The voltage is used up through the resistor within the Fuel Level Sensor, therefore the voltage on the Fuel Level Sense Return circuit should be zero volts.

The voltage reading in the scan tool is scaled to read between approximately 0.6 volts (Fuel Tank FULL) and 4.5 volts (Fuel Tank EMPTY).

NOTE: Voltage measuring approximately 12.0 volts (source voltage) on the Fuel Level Sensor Signal circuit, at the BCM and Fuel Level Sensor harness connectors (with the harness connectors plugged in), may indicate a short to voltage on the Fuel Level Sensor Signal circuit or an open on the Fuel Level Sense Return circuit.

NOTE: Voltage measuring approximately 12.0 volts (source voltage) on the Fuel Level Sensor Signal circuit, at the BCM harness connector, but 0.0 volts at the Fuel Level Sensor harness connector (with the harness connectors plugged in), may indicate an open on the Fuel Level Sensor Signal circuit.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects greater than 1,337 Ohms on the Fuel Level Sensor Signal circuit for greater than 12 seconds.

DEFAULT ACTION

- Fuel Gauge displays empty.

POSSIBLE CAUSES

Possible Causes
FUEL LEVEL SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
FUEL LEVEL SENSOR SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
FUEL LEVEL SENSE RETURN CIRCUIT OPEN/HIGH RESISTANCE
FUEL LEVEL SENSOR
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Go To [2](#)

2. MONITOR THE FUEL LEVEL SENSOR VOLTAGE READING FOR AN OPEN SPOT ON THE SENSOR

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in possible serious or fatal injury.

1. Disconnect the fuel supply line at the fuel rail.
2. Connect a drain hose between the fuel supply line and an approved fuel container.
3. Turn the ignition on.
4. Remove the Fuel Pump Relay from the Power Distribution Center (PDC) Assembly.

NOTE: When the Fuel Tank is completely empty, the Fuel Level Sensor should read at or near empty (indicated by a voltage reading of approximately 4.3-4.5 volts) on the scan tool. If the Fuel Tank is near full, the scan tool should read approximately 0.6 volts on the scan tool.

5. Connect a jumper across Fuel Pump Relay terminal 30 and terminal 87 to actuate the Fuel Pump Assembly until all fuel is removed from the Fuel Tank.
6. Remove the jumper when there is no more fuel coming out of the hose.

NOTE: Make sure that you have enough fuel to put back into the vehicle to make a good determination of the Fuel Level Sensor voltage feedback. It may be necessary to add more fuel to what was removed in order to do so.

NOTE: The Fuel Level Sensor voltage should decrease as fuel is added at a steady rate. Watch for the voltage to change suddenly while fuel is being added. If the voltage suddenly changes to or near 5.0 volts, it would indicate a bad spot (open) on that portion of the sensor.

7. While monitoring the Fuel Level Sensor voltage reading on scan tool, begin putting fuel back into the Fuel Tank.

Did the Fuel Level Sensor reading suddenly change to 5.0 volts at any time while adding fuel?

Yes

- Replace the Fuel Level Sensor in accordance with the Service Information. .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

3. CHECK THE FUEL LEVEL SENSOR (N4) POSITION SIGNAL 1 CIRCUIT VOLTAGE

NOTE: The Fuel Pump Assembly harness connector must be connected when performing this step. The sensor is powered by a voltage close to the vehicle Battery (minus a diode voltage drop). If disconnected, the voltage reading on the Fuel Level Sensor Signal circuit will be equal to source voltage which is approximately Battery voltage.

1. Back probe and measure the voltage on the Fuel Level Sensor (N4) Position Signal 1 circuit at the Fuel Pump Assembly harness connector.

What is the voltage reading?

Source voltage (approximately 12.0 volts):

- Go To [5](#)

Zero volts:

- Go To [4](#)

4. DISCONNECT THE FUEL PUMP MODULE AND BCM HARNESS CONNECTORS - CHECK THE (N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) and component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.

5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [5](#)

5. CHECK THE VOLTAGE AT THE (G109) RETURN CIRCUIT

NOTE: The Fuel Pump Assembly harness connector must be connected when performing this step.

1. Back probe and measure the voltage on the (G109) Return circuit at the Fuel Pump Assembly harness connector.

What is the voltage reading?

Source voltage (approximately 12.0 volts):

- Go To [7](#)

Zero volts:

- Go To [6](#)

6. DISCONNECT THE FUEL PUMP MODULE AND BCM HARNESS CONNECTORS - CHECK THE FUEL LEVEL SENSOR (N4) POSITION SIGNAL 1 CIRCUIT FOR A SHORT TO ANOTHER VOLTAGE SUPPLY CIRCUIT

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) and component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to the circuit being tested.
4. Connect the positive lead of the DVOM to all other circuits at the ECU harness connector and check for continuity between the circuits.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between the circuits.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the circuit being tested for a short to the circuit that showed continuity.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Replace the Fuel Level Sensor in accordance with the Service Information. .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

7. DISCONNECT THE FUEL PUMP MODULE AND BCM HARNESS CONNECTORS - CHECK THE (G109) FUEL LEVEL SENSE RETURN CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [8](#)

8. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.

6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

P1276-12-STARTER CONTROL 2-CIRCUIT SHORT TO BATTERY

For a complete STARTING SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Starter is activated and the Body Control Module (BCM) detects a short to voltage on the Stop/Start Relay Control circuit.
- After four consecutive failed retry attempts the BCM will disable the output for the remainder of the ignition cycle.

DEFAULT ACTION

- The Starter is inoperative.

POSSIBLE CAUSES

Possible Causes
STOP/START RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
STOP/START RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after wiring repair or module replacement:**

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. SUBSTITUTE THE STOP/START RELAY - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: **When removing relays from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.**

NOTE: **Additional DTCs may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.**

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. CHECK FOR VOLTAGE ON THE (K88) STOP/START RELAY CONTROL CIRCUIT AT THE STOP/START RELAY TERMINAL

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the relay terminal in the PDC Assembly.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [4](#)

No

- Go To [7](#)

4. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (K88) STOP/START RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Power Distribution Center (PDC) Assembly harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit at the PDC Assembly harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [5](#)

No

- Go To [6](#)

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (K88) STOP/START RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the PDC Assembly harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [7](#)

6. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [**CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

7. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

P1276-14-STARTER CONTROL 2-CIRCUIT SHORT TO GROUND OR OPEN

For a complete STARTING SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Starter is not activated and the Body Control Module (BCM) detects less than 1.5 volts on the Stop/Start Relay Control circuit for greater than 1.28 seconds.

DEFAULT ACTION

- The Starter will be inoperative.

POSSIBLE CAUSES

Possible Causes
STOP/START RELAY CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
STOP/START RELAY CONTROL CIRCUIT SHORTED TO GROUND
STOP/START RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. SUBSTITUTE THE STOP/START RELAY - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE:

When removing relays from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.

NOTE: Additional DTCs may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (K88) STOP/START RELAY CONTROL CIRCUIT FOR CONTINUITY TO GROUND AT THE STOP/START RELAY TERMINAL

1. The ignition must be off when checking a circuit for continuity to ground.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
4. Connect the negative lead of the DVOM to a known good ground.
5. Connect the positive lead of the DVOM to the circuit being tested, at the relay terminal in the Power Distribution Center (PDC) Assembly, and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Go To [4](#)

No

- Go To [5](#)

4. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (K88) STOP/START RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Power Distribution Center (PDC) Assembly harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the PDC Assembly harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [7](#)

5. CHECK THE (K88) STOP/START RELAY CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
3. Connect one lead of the DVOM to the circuit being tested at the relay terminal in the Power Distribution Center (PDC) Assembly.
4. Connect the other lead to the circuit being tested at the Electronic Control Unit (ECU) harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Go To [6](#)

No

- Go To [8](#)

6. DISCONNECT THE PDC ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (K88) STOP/START RELAY CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.

2. Disconnect the Power Distribution Center (PDC) Assembly harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the PDC Assembly harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [7](#)

7. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to **CENTER, POWER DISTRIBUTION (PDC), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

8. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

-
- Test complete.

U0002-00-CAN C BUS OFF PERFORMANCE

For a complete CAN C BUS SYSTEM wiring diagram, **Refer to the appropriate wiring information .**

THEORY OF OPERATION

Below are a few different ways communication on a vehicle takes place:

1. Scan tool to the Gateway Module
2. ECU to ECU
3. ECU to Device
4. Device to ECU

Communication to the vehicle is established with a scan tool, through the Data Link Connector (DLC) to a Gateway ECU over the Controller Area Network (CAN) Bus. On this vehicle the Security Gateway (SGW) Module communicates with the scan tool through the CAN-C and CAN-IHS Bus networks.

The CAN Bus architecture of this vehicle operates in a "hub" or "star" style, meaning all of the ECUs are connected at a central point in the Star Connectors. The terminating resistors for CAN Bus are located in the Star Connectors and are a part of the body and instrument panel wiring harnesses.

In other CAN Bus architectures a vehicle may operate in a "stub" or "backbone" style, meaning there is a single, main line that connects all ECUs. The terminating resistors for a CAN Bus in the "stub" or "backbone" style are located in 2 separate dominant ECUs and are placed as far apart in the vehicle, as is physically possible.

The header of the scan tool is populated by the BCM with vehicle data, when communication with the scan tool has been established through the SGW Module. The scan tool becomes another ECU on the vehicle's networks by acting as the primary controlling ECU of all Bus networks while connected to the DLC, and contributes voltage to the operation of the CAN Bus.

CAN BUS OPERATIONAL VOLTAGES

CAN C Bus Operational Voltages								
CAN C Circuits	Sleep	Recessive (Bus Idle)	Dominant (Bus Active)	CAN (-) Short to Ground	CAN (+) Short to Ground	CAN (-) Short to Voltage	CAN (+) Short to Voltage	CAN (+) Short to CAN (-)
CAN (-)	0 V	2.4 - 2.5 V	1.3 - 2.3 V	0 V	0.3 - 0.5 V	Battery Voltage	Battery Voltage Less 0.75 V	2.45 V
CAN (+)	0 V	2.4 - 2.5 V	2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V

CAN IHS Bus Operational Voltages							
CAN IHS Circuits	Key-Off (Bus Asleep)	Key-On (Bus Active)	CAN (-) Short to Ground	CAN (+) Short to Ground	CAN (-) Short to Voltage	CAN (+) Short to Voltage	CAN (+) Short to CAN (-)
CAN (-)	0.0 V	1.3 - 2.3 V	0 V	0.3 - 0.5 V	Battery Voltage	Battery Voltage	2.45 V

CAN IHS Bus Operational Voltages							
CAN IHS Circuits	Key-Off (Bus Asleep)	Key-On (Bus Active)	CAN (-) Short to Ground	CAN (+) Short to Ground	CAN (-) Short to Voltage	CAN (+) Short to Voltage	CAN (+) Short to CAN (-)
						Less 0.75 V	
CAN (+)	0.0 V	2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V

Notes
All measurements were taken between a ECU ground and a CAN Bus terminal, using a standard DVOM. The DVOM will display the average network voltage.
Total resistance of the CAN Bus networks should be measured with the battery, and auxiliary battery (if equipped with Engine Stop/Start), disconnected. The normal average CAN Bus resistance is approximately 60 Ohms. The termination resistors are integral to the Star Connectors.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is in the Run position.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the ignition is in the Run position and a module on the CAN C Bus detects a short on a CAN C Bus circuit, the CAN C (+) and CAN C (-) Bus circuits are shorted together, or a faulty CAN C Bus module exists on the network for greater than one second.

DEFAULT ACTION

- Communication on the CAN C Bus is limited, erroneous or does not exist.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE OR GROUND
CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE OR GROUND
CAN C BUS (+) CIRCUIT SHORTED TO THE CAN C BUS (-) CIRCUIT
POOR HARNESS CONNECTOR CONNECTION(S)
STAR CONNECTOR
CAN C BUS RELATED MODULE

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. CHECK FOR AN ACTIVE DTC

NOTE: Due to a loss of communication on the CAN Bus, multiple modules may not communicate on the network. If the scan tool does not communicate with the Body Control Module (BCM), Go To **2**.

1. Turn the ignition on.
2. With the scan tool, read the Body Control Module (BCM) DTCs and record on the repair order.
3. With the scan tool, erase the BCM DTCs.

4. Turn the ignition off and wait 10 seconds.
5. Turn the ignition on.
6. With the scan tool, read the BCM DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. MEASURE THE VOLTAGE ON THE CAN C BUS (+) AND (-) CIRCUITS

NOTE: Disconnecting the Radio Frequency (RF) Hub Module or Body Control Module (BCM) may result in a loss of ignition status messages and may cause scan tool communication concerns.

NOTE: The scan tool Network Review display (network topology) depicts a high level view of the vehicle network and can assist in identifying vehicle communication problems. Modules reporting a loss of communication usually appear in red. Using this display can help determine the location of the fault.

1. Using the wiring diagrams as a guide, locate and access the CAN C IP/Front Star Connector.
2. Make sure the ignition is on.
3. Record the voltage measurements, for use in later steps.
4. Using the appropriate back-probe tools, measure the voltage on the CAN C Bus (+) circuit, at the Security Gateway (SGW) Module side of the CAN C IP/Front Star Connector.
5. Using the appropriate back-probe tools, measure the voltage on the CAN C Bus (-) circuit, at the SGW Module side of the CAN C IP/Front Star Connector.
6. Compare the voltage measurements to the specified CAN C Bus voltages in the above CAN BUS VOLTAGE TABLE.

Are the voltages on the CAN C Bus (+) and (-) circuits **WITHIN** the specified values?

Yes

- Perform the COMMUNICATION DIAGNOSTIC PROCEDURE. Refer to [COMMUNICATION DIAGNOSTIC PROCEDURE](#).

No

- Go To [3](#)

3. CHECK THE CAN C BUS (+) AND (-) CIRCUITS FOR A SHORT TO VOLTAGE

1. Refer to the recorded CAN C Bus voltage measurements and to the CAN BUS VOLTAGE TABLE.

Is the voltage on the CAN C Bus (+) or (-) circuit **ABOVE** the specified values?

Yes

- Inspect for a short to voltage on the CAN C Bus (+) or (-) circuit. Disconnect the 3-wire connector from the CAN C IP/Front Star Connector, isolating the CAN C Bus from the CAN

C Dash/Rear Star Connector, and measure the voltage on the CAN C Bus (+) and (-) circuits, at the SGW Module side of the Star Connector. Proceed, as needed:

- **CAN C Bus Voltages Are WITHIN Specified Values:** Reconnect the 3-wire connector into the CAN C IP/Front Star Connector and access the CAN C Dash/Rear Star Connector. One at a time, disconnect each connector from the CAN C Dash/Rear Star Connector. After disconnecting a connector, measure and record the voltage on the CAN C Bus (+) and (-) circuits, at the SGW Module side of the Star Connector. Repeat until all CAN C Dash/Rear Star Connector connectors are disconnected. Repair or replace the circuit, module or connector, that when disconnected, allows the bus voltages to return to normal.
- **CAN C Bus Voltages Are ABOVE Specified Values:** One at a time, disconnect each connector from the CAN C IP/Front Star Connector. After disconnecting a connector, measure and record the voltage on the CAN C Bus (+) and (-) circuits, at the SGW Module side of the Star Connector. Repeat until all CAN C IP/Front Star Connector connectors are disconnected. Repair or replace the circuit, module or connector, that when disconnected, allows the bus voltages to return to normal.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [4](#)

4. CHECK THE CAN C BUS (+) AND (-) CIRCUITS FOR A SHORT TO GROUND

1. Refer to the recorded CAN C Bus voltage measurements and to the CAN BUS VOLTAGE TABLE.

Is the voltage on the CAN C Bus (+) or (-) circuit **BELOW** the specified values?

Yes

- Inspect for a short to ground on the CAN C Bus (+) or (-) circuit. Disconnect the 3-wire connector from the CAN C IP/Front Star Connector, isolating the CAN C Bus from the CAN C Dash/Rear Star Connector, and measure the voltage on the CAN C Bus (+) and (-) circuits, at the SGW Module side of the Star Connector. Proceed, as needed:
 - **CAN C Bus Voltages Are WITHIN Specified Values:** Reconnect the 3-wire connector into the CAN C IP/Front Star Connector and access the CAN C Dash/Rear Star Connector. One at a time, disconnect each connector from the CAN C Dash/Rear Star Connector. After disconnecting a connector, measure and record the voltage on the CAN C Bus (+) and (-) circuits, at the SGW Module side of the Star Connector. Repeat until all CAN C Dash/Rear Star Connector connectors are disconnected. Repair or replace the circuit, module or connector, that when disconnected, allows the bus voltages to return to normal.
 - **CAN C Bus Voltages Are BELOW Specified Values:** One at a time, disconnect each connector from the CAN C IP/Front Star Connector. After disconnecting a connector, measure and record the voltage on the CAN C Bus (+) and (-) circuits, at the SGW Module side of the Star Connector. Repeat until all CAN C IP/Front Star Connector connectors are disconnected. Repair or replace the circuit, module or connector, that when disconnected, allows the bus voltages to return to normal.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [5](#)

5. CHECK THE CAN C BUS TERMINATION RESISTANCE

1. Turn the ignition off.
2. Disconnect and isolate the battery negative cable.

3. If equipped, disconnect and isolate the auxiliary battery negative cable.
4. Using the appropriate back-probe tools, measure the resistance between the CAN C Bus (+) circuit and the CAN C Bus (-) circuit, at the SGW Module side of the CAN C IP/Front Star Connector.

Is the resistance **BETWEEN** 54.0 and 66.0 Ohms?

Yes

- **If Directed To This Test From Another Module:** Replace the module that directed to this diagnostic procedure, in accordance with the Service Information.
 - Perform the appropriate VERIFICATION TEST. If a VERIFICATION TEST is not available for the module, perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- **If The BCM Set DTC: U0002-00:** Go To [6](#)

No

- **Resistance Is ABOVE 66.0 Ohms:** The internal terminating resistor in one of the Star Connectors is damaged. Inspect and repair, as necessary.
- **Resistance Is BELOW 54.0 Ohms:** Inspect for a short between the CAN C Bus (+) circuit and the CAN C Bus (-) circuit. Disconnecting Star Connectors and modules on the CAN C Bus can help determine the location of the short. Repair or replace the circuit, module or connector, that when disconnected, allows the bus voltages to return to normal.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.

10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

U0010-00-CAN INTERIOR BUS

For a complete CAN IHS BUS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

Below are a few different ways communication on a vehicle takes place:

1. Scan tool to the Gateway Module
2. ECU to ECU
3. ECU to Device
4. Device to ECU

Communication to the vehicle is established with a scan tool, through the Data Link Connector (DLC) to a Gateway ECU over the Controller Area Network (CAN) Bus. On this vehicle the Security Gateway (SGW) Module communicates with the scan tool through the CAN-C and CAN-IHS Bus networks.

The CAN Bus architecture of this vehicle operates in a "hub" or "star" style, meaning all of the ECUs are connected at a central point in the Star Connectors. The terminating resistors for CAN Bus are located in the Star Connectors and are a part of the body and instrument panel wiring harnesses.

In other CAN Bus architectures a vehicle may operate in a "stub" or "backbone" style, meaning there is a single, main line that connects all ECUs. The terminating resistors for a CAN Bus in the "stub" or "backbone" style are located in 2 separate dominant ECUs and are placed as far apart in the vehicle, as is physically possible.

The header of the scan tool is populated by the BCM with vehicle data, when communication with the scan tool has been established through the SGW Module. The scan tool becomes another ECU on the vehicle's networks by acting as the primary controlling ECU of all Bus networks while connected to the DLC, and contributes voltage to the operation of the CAN Bus.

CAN BUS OPERATIONAL VOLTAGES

CAN C Bus Operational Voltages								
CAN C Circuits	Sleep	Recessive (Bus Idle)	Dominant (Bus Active)	CAN (-) Short to Ground	CAN (+) Short to Ground	CAN (-) Short to Voltage	CAN (+) Short to Voltage	CAN (+) Short to CAN (-)
CAN (-)	0 V	2.4 - 2.5 V	1.3 - 2.3 V	0 V	0.3 - 0.5 V	Battery Voltage	Battery Voltage Less 0.75 V	2.45 V

CAN C Bus Operational Voltages								
CAN C Circuits	Sleep	Recessive (Bus Idle)	Dominant (Bus Active)	CAN (-) Short to Ground	CAN (+) Short to Ground	CAN (-) Short to Voltage	CAN (+) Short to Voltage	CAN (+) Short to CAN (-)
CAN (+)	0 V	2.4 - 2.5 V	2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V

CAN IHS Bus Operational Voltages							
CAN IHS Circuits	Key-Off (Bus Asleep)	Key-On (Bus Active)	CAN (-) Short to Ground	CAN (+) Short to Ground	CAN (-) Short to Voltage	CAN (+) Short to Voltage	CAN (+) Short to CAN (-)
CAN (-)	0.0 V	1.3 - 2.3 V	0 V	0.3 - 0.5 V	Battery Voltage	Battery Voltage Less 0.75 V	2.45 V
CAN (+)	0.0 V	2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V

Notes

All measurements were taken between a ECU ground and a CAN Bus terminal, using a standard DVOM. The DVOM will display the average network voltage.

Total resistance of the CAN Bus networks should be measured with the battery, and auxiliary battery (if equipped with Engine Stop/Start), disconnected. The normal average CAN Bus resistance is approximately 60 Ohms. The termination resistors are integral to the Star Connectors.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is in the Run position.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the ignition is in the Run position and a module on the CAN IHS Bus detects a short on a CAN IHS Bus circuit, the CAN IHS (+) and CAN IHS (-) Bus circuits are shorted together, or a faulty CAN IHS Bus module exists on the network for greater than five seconds.

DEFAULT ACTION

- Communication on the CAN IHS Bus is limited, erroneous or does not exist.

POSSIBLE CAUSES

Possible Causes
CAN IHS BUS (+) CIRCUIT SHORTED TO VOLTAGE OR GROUND
CAN IHS BUS (-) CIRCUIT SHORTED TO VOLTAGE OR GROUND
CAN IHS BUS (+) CIRCUIT SHORTED TO THE CAN IHS BUS (-) CIRCUIT
POOR HARNESS CONNECTOR CONNECTION(S)
STAR CONNECTOR
CAN IHS BUS RELATED MODULE

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. CHECK FOR AN ACTIVE DTC

NOTE: Due to a loss of communication on the CAN Bus, multiple modules may not communicate on the network. If the scan tool does not communicate with the Body Control Module (BCM), Go To [2](#).

1. Turn the ignition on.
2. With the scan tool, read the Body Control Module (BCM) DTCs and record on the repair order.
3. With the scan tool, erase the BCM DTCs.
4. Turn the ignition off and wait 10 seconds.
5. Turn the ignition on.
6. With the scan tool, read the BCM DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. MEASURE THE VOLTAGE ON THE CAN IHS BUS (+) AND (-) CIRCUITS

NOTE: The scan tool Network Review display (network topology) depicts a high level view of the vehicle network and can assist in identifying vehicle communication problems. Modules reporting a loss of communication usually appear in red. Using this display can help determine the location of the fault.

1. Using the wiring diagrams as a guide, locate and access the CAN IHS IP/Front Star Connector.
2. Make sure the ignition is on.
3. Record the voltage measurements, for use in later steps.
4. Using the appropriate back-probe tools, measure the voltage on the CAN IHS Bus (+) circuit, at the Security Gateway (SGW) Module side of the CAN IHS IP/Front Star Connector.
5. Using the appropriate back-probe tools, measure the voltage on the CAN IHS Bus (-) circuit, at the SGW Module side of the CAN IHS IP/Front Star Connector.
6. Compare the voltage measurements to the specified CAN IHS Bus voltages in the above CAN BUS VOLTAGE TABLE.

Are the voltages on the CAN IHS Bus (+) and (-) circuits **WITHIN** the specified values?

Yes

- Perform the COMMUNICATION DIAGNOSTIC PROCEDURE. Refer to [COMMUNICATION DIAGNOSTIC PROCEDURE](#).

No

- Go To [3](#)

3. CHECK THE CAN IHS BUS (+) AND (-) CIRCUITS FOR A SHORT TO VOLTAGE

1. Refer to the recorded CAN IHS Bus voltage measurements and to the CAN BUS VOLTAGE TABLE.

Is the voltage on the CAN IHS Bus (+) or (-) circuit **ABOVE** the specified values?

Yes

- Inspect for a short to voltage on the CAN IHS Bus (+) or (-) circuit. Disconnect the 3-wire connector from the CAN IHS IP/Front Star Connector, isolating the CAN IHS Bus from the CAN IHS Body/Rear Star Connector, and measure the voltage on the CAN IHS Bus (+) and (-) circuits, at the SGW Module side of the Star Connector. Proceed, as needed:
 - **CAN IHS Bus Voltages Are WITHIN Specified Values:** Reconnect the 3-wire connector into the CAN IHS IP/Front Star Connector and access the CAN IHS Body/Rear Star Connector. One at a time, disconnect each connector from the CAN IHS Body/Rear Star Connector. After disconnecting a connector, measure and record the voltage on the CAN IHS Bus (+) and (-) circuits, at the SGW Module side of the Star Connector. Repeat until all CAN IHS Body/Rear Star Connector connectors are disconnected. Repair or replace the circuit, module or connector, that when disconnected, allows the bus voltages to return to normal.
 - **CAN IHS Bus Voltages Are ABOVE Specified Values:** One at a time, disconnect each connector from the CAN IHS IP/Front Star Connector. After disconnecting a connector, measure and record the voltage on the CAN IHS Bus (+) and (-) circuits, at the SGW Module side of the Star Connector. Repeat until all CAN IHS IP/Front Star Connector connectors are disconnected. Repair or replace the circuit, module or connector, that when disconnected, allows the bus voltages to return to normal.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [4](#)

4. CHECK THE CAN IHS BUS (+) AND (-) CIRCUITS FOR A SHORT TO GROUND

1. Refer to the recorded CAN IHS Bus voltage measurements and to the CAN BUS VOLTAGE TABLE.

Is the voltage on the CAN IHS Bus (+) or (-) circuit **BELOW** the specified values?

Yes

- Inspect for a short to ground on the CAN IHS Bus (+) or (-) circuit. Disconnect the 3-wire connector from the CAN IHS IP/Front Star Connector, isolating the CAN IHS Bus from the CAN IHS Body/Rear Star Connector, and measure the voltage on the CAN IHS Bus (+) and (-) circuits, at the SGW Module side of the Star Connector. Proceed, as needed:
 - **CAN IHS Bus Voltages Are WITHIN Specified Values:** Reconnect the 3-wire connector into the CAN IHS IP/Front Star Connector and access the CAN IHS Body/Rear Star Connector. One at a time, disconnect each connector from the CAN IHS Body/Rear Star Connector. After disconnecting a connector, measure and record the voltage on the CAN IHS Bus (+) and (-) circuits, at the SGW Module side of the Star Connector. Repeat until all CAN IHS Body/Rear Star Connector connectors are disconnected. Repair or replace the circuit, module or connector, that when disconnected, allows the bus voltages to return to normal.
 - **CAN IHS Bus Voltages Are BELOW Specified Values:** One at a time, disconnect each connector from the CAN IHS IP/Front Star Connector. After disconnecting a connector, measure and record the voltage on the CAN IHS Bus (+) and (-) circuits, at the SGW Module side of the Star Connector. Repeat until all CAN IHS IP/Front Star Connector connectors are disconnected. Repair or replace the circuit, module or connector, that when disconnected, allows the bus voltages to return to normal.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To **5**

5. CHECK THE CAN IHS BUS TERMINATION RESISTANCE

1. Turn the ignition off.
2. Disconnect and isolate the battery negative cable.
3. If equipped, disconnect and isolate the auxiliary battery negative cable.
4. Using the appropriate back-probe tools, measure the resistance between the CAN IHS Bus (+) circuit and the CAN IHS Bus (-) circuit, at the SGW Module side of the CAN IHS IP/Front Star Connector.

Is the resistance **BETWEEN** 54.0 and 66.0 Ohms?

Yes

- **If Directed To This Test From Another Module:** Replace the module that directed to this diagnostic procedure, in accordance with the Service Information.
 - Perform the appropriate VERIFICATION TEST. If a VERIFICATION TEST is not available for the module, perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- **If The BCM Set DTC: U0010-00:** Go To **6**

No

- **Resistance Is ABOVE 66.0 Ohms:** The internal terminating resistor in one of the Star Connectors is damaged. Inspect and repair, as necessary.
- **Resistance Is BELOW 54.0 Ohms:** Inspect for a short between the CAN IHS Bus (+) circuit and the CAN IHS Bus (-) circuit. Disconnecting Star Connectors and modules on the CAN IHS Bus can help determine the location of the short. Repair or replace the circuit, module or connector, that when disconnected, allows the bus voltages to return to normal.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

U0011-00-CAN INTERIOR BUS OFF PERFORMANCE

For a complete CAN IHS BUS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

Below are a few different ways communication on a vehicle takes place:

1. Scan tool to the Gateway Module
2. ECU to ECU
3. ECU to Device
4. Device to ECU

Communication to the vehicle is established with a scan tool, through the Data Link Connector (DLC) to a Gateway ECU over the Controller Area Network (CAN) Bus. On this vehicle the Security Gateway (SGW) Module communicates with the scan tool through the CAN-C and CAN-IHS Bus networks.

The CAN Bus architecture of this vehicle operates in a "hub" or "star" style, meaning all of the ECUs are connected at a central point in the Star Connectors. The terminating resistors for CAN Bus are located in the Star Connectors and are a part of the body and instrument panel wiring harnesses.

In other CAN Bus architectures a vehicle may operate in a "stub" or "backbone" style, meaning there is a single, main line that connects all ECUs. The terminating resistors for a CAN Bus in the "stub" or "backbone" style are located in 2 separate dominant ECUs and are placed as far apart in the vehicle, as is physically possible.

The header of the scan tool is populated by the BCM with vehicle data, when communication with the scan tool has been established through the SGW Module. The scan tool becomes another ECU on the vehicle's networks by acting as the primary controlling ECU of all Bus networks while connected to the DLC, and contributes voltage to the operation of the CAN Bus.

CAN BUS OPERATIONAL VOLTAGES

CAN C Bus Operational Voltages								
CAN C Circuits	Sleep	Recessive (Bus Idle)	Dominant (Bus Active)	CAN (-) Short to Ground	CAN (+) Short to Ground	CAN (-) Short to Voltage	CAN (+) Short to Voltage	CAN (+) Short to CAN (-)
CAN (-)	0 V	2.4 - 2.5 V	1.3 - 2.3 V	0 V	0.3 - 0.5 V	Battery Voltage	Battery Voltage Less 0.75 V	2.45 V
CAN (+)	0 V	2.4 - 2.5 V	2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V

CAN IHS Bus Operational Voltages							
CAN IHS Circuits	Key-Off (Bus Asleep)	Key-On (Bus Active)	CAN (-) Short to Ground	CAN (+) Short to Ground	CAN (-) Short to Voltage	CAN (+) Short to Voltage	CAN (+) Short to CAN (-)
CAN (-)	0.0 V	1.3 - 2.3 V	0 V	0.3 - 0.5 V	Battery Voltage	Battery Voltage Less 0.75 V	2.45 V
CAN (+)	0.0 V	2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V

Notes

All measurements were taken between a ECU ground and a CAN Bus terminal, using a standard DVOM. The DVOM will display the average network voltage.

Total resistance of the CAN Bus networks should be measured with the battery, and auxiliary battery (if equipped with Engine Stop/Start), disconnected. The normal average CAN Bus resistance is approximately 60 Ohms. The termination resistors are integral to the Star Connectors.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is in the Run position.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the ignition is in the Run position and a module on the CAN IHS Bus detects a short on a CAN IHS Bus circuit, the CAN IHS (+) and CAN IHS (-) Bus circuits are shorted together, or a faulty CAN IHS Bus module exists on the network for greater than one second.

DEFAULT ACTION

- Communication on the CAN IHS Bus is limited, erroneous or does not exist.

POSSIBLE CAUSES

Possible Causes
CAN IHS BUS (+) CIRCUIT SHORTED TO VOLTAGE OR GROUND
CAN IHS BUS (-) CIRCUIT SHORTED TO VOLTAGE OR GROUND
CAN IHS BUS (+) CIRCUIT SHORTED TO THE CAN IHS BUS (-) CIRCUIT
POOR HARNESS CONNECTOR CONNECTION(S)
STAR CONNECTOR

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. CHECK FOR AN ACTIVE DTC

NOTE: Due to a loss of communication on the CAN Bus, multiple modules may not communicate on the network. If the scan tool does not communicate with the Body Control Module (BCM), Go To **2**.

1. Turn the ignition on.
2. With the scan tool, read the Body Control Module (BCM) DTCs and record on the repair order.
3. With the scan tool, erase the BCM DTCs.
4. Turn the ignition off and wait 10 seconds.
5. Turn the ignition on.
6. With the scan tool, read the BCM DTCs.

Did the DTC return?

Yes

- Go To **2**

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. MEASURE THE VOLTAGE ON THE CAN IHS BUS (+) AND (-) CIRCUITS

NOTE: The scan tool Network Review display (network topology) depicts a high level view of the vehicle network and can assist in identifying vehicle communication problems. Modules reporting a loss of communication usually appear in red. Using this display can help determine the location of the fault.

1. Using the wiring diagrams as a guide, locate and access the CAN IHS IP/Front Star Connector.
2. Make sure the ignition is on.
3. Record the voltage measurements, for use in later steps.
4. Using the appropriate back-probe tools, measure the voltage on the CAN IHS Bus (+) circuit, at the Security Gateway (SGW) Module side of the CAN IHS IP/Front Star Connector.
5. Using the appropriate back-probe tools, measure the voltage on the CAN IHS Bus (-) circuit, at the SGW Module side of the CAN IHS IP/Front Star Connector.
6. Compare the voltage measurements to the specified CAN IHS Bus voltages in the above CAN BUS VOLTAGE TABLE.

Are the voltages on the CAN IHS Bus (+) and (-) circuits **WITHIN** the specified values?

Yes

- Perform the COMMUNICATION DIAGNOSTIC PROCEDURE. Refer to **COMMUNICATION DIAGNOSTIC PROCEDURE**.

No

- Go To [3](#)

3. CHECK THE CAN IHS BUS (+) AND (-) CIRCUITS FOR A SHORT TO VOLTAGE

1. Refer to the recorded CAN IHS Bus voltage measurements and to the CAN BUS VOLTAGE TABLE.

Is the voltage on the CAN IHS Bus (+) or (-) circuit **ABOVE** the specified values?

Yes

- Inspect for a short to voltage on the CAN IHS Bus (+) or (-) circuit. Disconnect the 3-wire connector from the CAN IHS IP/Front Star Connector, isolating the CAN IHS Bus from the CAN IHS Body/Rear Star Connector, and measure the voltage on the CAN IHS Bus (+) and (-) circuits, at the SGW Module side of the Star Connector. Proceed, as needed:
 - **CAN IHS Bus Voltages Are WITHIN Specified Values:** Reconnect the 3-wire connector into the CAN IHS IP/Front Star Connector and access the CAN IHS Body/Rear Star Connector. One at a time, disconnect each connector from the CAN IHS Body/Rear Star Connector. After disconnecting a connector, measure and record the voltage on the CAN IHS Bus (+) and (-) circuits, at the SGW Module side of the Star Connector. Repeat until all CAN IHS Body/Rear Star Connector connectors are disconnected. Repair or replace the circuit, module or connector, that when disconnected, allows the bus voltages to return to normal.
 - **CAN IHS Bus Voltages Are ABOVE Specified Values:** One at a time, disconnect each connector from the CAN IHS IP/Front Star Connector. After disconnecting a connector, measure and record the voltage on the CAN IHS Bus (+) and (-) circuits, at the SGW Module side of the Star Connector. Repeat until all CAN IHS IP/Front Star Connector connectors are disconnected. Repair or replace the circuit, module or connector, that when disconnected, allows the bus voltages to return to normal.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. CHECK THE CAN IHS BUS (+) AND (-) CIRCUITS FOR A SHORT TO GROUND

1. Refer to the recorded CAN IHS Bus voltage measurements and to the CAN BUS VOLTAGE TABLE.

Is the voltage on the CAN IHS Bus (+) or (-) circuit **BELOW** the specified values?

Yes

- Inspect for a short to ground on the CAN IHS Bus (+) or (-) circuit. Disconnect the 3-wire connector from the CAN IHS IP/Front Star Connector, isolating the CAN IHS Bus from the CAN IHS Body/Rear Star Connector, and measure the voltage on the CAN IHS Bus (+) and (-) circuits, at the SGW Module side of the Star Connector. Proceed, as needed:
 - **CAN IHS Bus Voltages Are WITHIN Specified Values:** Reconnect the 3-wire connector into the CAN IHS IP/Front Star Connector and access the CAN IHS Body/Rear Star Connector. One at a time, disconnect each connector from the CAN IHS Body/Rear Star Connector. After disconnecting a connector, measure and record the voltage on the CAN IHS Bus (+) and (-) circuits, at the SGW Module side of the Star Connector. Repeat until all CAN IHS Body/Rear Star Connector connectors are disconnected. Repair or replace the circuit, module or connector, that when disconnected, allows the bus voltages to return to normal.
 - **CAN IHS Bus Voltages Are BELOW Specified Values:** One at a time, disconnect each connector from the CAN IHS IP/Front Star Connector. After disconnecting a

connector, measure and record the voltage on the CAN IHS Bus (+) and (-) circuits, at the SGW Module side of the Star Connector. Repeat until all CAN IHS IP/Front Star Connector connectors are disconnected. Repair or replace the circuit, module or connector, that when disconnected, allows the bus voltages to return to normal.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

5. CHECK THE CAN IHS BUS TERMINATION RESISTANCE

1. Turn the ignition off.
2. Disconnect and isolate the battery negative cable.
3. If equipped, disconnect and isolate the auxiliary battery negative cable.
4. Using the appropriate back-probe tools, measure the resistance between the CAN IHS Bus (+) circuit and the CAN IHS Bus (-) circuit, at the SGW Module side of the CAN IHS IP/Front Star Connector.

Is the resistance **BETWEEN** 54.0 and 66.0 Ohms?

Yes

- **If Directed To This Test From Another Module:** Replace the module that directed to this diagnostic procedure, in accordance with the Service Information.
 - Perform the appropriate VERIFICATION TEST. If a VERIFICATION TEST is not available for the module, perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- **If The BCM Set DTC: U0011-00:** Go To [6](#)

No

- **Resistance Is ABOVE 66.0 Ohms:** The internal terminating resistor in one of the Star Connectors is damaged. Inspect and repair, as necessary.
- **Resistance Is BELOW 54.0 Ohms:** Inspect for a short between the CAN IHS Bus (+) circuit and the CAN IHS Bus (-) circuit. Disconnecting Star Connectors and modules on the CAN IHS Bus can help determine the location of the short. Repair or replace the circuit, module or connector, that when disconnected, allows the bus voltages to return to normal.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.

- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

U0100-00-LOST COMMUNICATION WITH ECM/PCM

NOTE: Perform this diagnostic procedure **ONLY** when the DTC status is "Active". If the DTC status is "Stored" **DO NOT** proceed with this diagnostic procedure. A "Stored" DTC will not affect the performance of the vehicle.

The COMMUNICATION DIAGNOSTIC PROCEDURE **MUST** be performed before replacing any component(s) or module(s). Perform the COMMUNICATION DIAGNOSTIC PROCEDURE. Refer to **COMMUNICATION DIAGNOSTIC PROCEDURE** .

U0101-00-LOST COMMUNICATION WITH TCM

The COMMUNICATION DIAGNOSTIC PROCEDURE **MUST** be performed before replacing any component(s) or module(s). Perform the COMMUNICATION DIAGNOSTIC PROCEDURE. Refer to **COMMUNICATION DIAGNOSTIC PROCEDURE** .

U0121-00-LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE

The COMMUNICATION DIAGNOSTIC PROCEDURE **MUST** be performed before replacing any component(s) or module(s). Perform the COMMUNICATION DIAGNOSTIC PROCEDURE. Refer to **COMMUNICATION DIAGNOSTIC PROCEDURE** .

U0155-00-LOST COMMUNICATION WITH CLUSTER-CCN

The COMMUNICATION DIAGNOSTIC PROCEDURE **MUST** be performed before replacing any component(s) or module(s). Perform the COMMUNICATION DIAGNOSTIC PROCEDURE. Refer to **COMMUNICATION DIAGNOSTIC PROCEDURE** .

U0161-00-LOST COMMUNICATION WITH COMPASS MODULE

For a complete LIN BUS SYSTEM wiring diagram, **Refer to the appropriate wiring information .**

For a complete FUSES RELAY wiring diagram, **Refer to the appropriate wiring information .**

For a complete GROUNDS wiring diagram, **Refer to the appropriate wiring information .**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on for greater than five seconds.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- The Body Control Module (BCM) does not receive LIN Bus 2 messages from the Compass Module for greater than five seconds.

DEFAULT ACTION

- Functionality related to the compass will be inoperative.

POSSIBLE CAUSES

Possible Causes
FUSED IGNITION SWITCH OUTPUT (RUN/ACC) CIRCUIT OPEN OR SHORTED TO GROUND
LIN BUS 2 CIRCUIT OPEN OR HIGH RESISTANCE
GROUND CIRCUIT OPEN OR HIGH RESISTANCE
COMPASS MODULE
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.
Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [**STANDARD PROCEDURE**](#).

2. DISCONNECT THE COMPASS MODULE HARNESS CONNECTOR AND CHECK THE (F982) FUSED IGNITION SWITCH (RUN/ACC) CIRCUIT BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the Fused B(+) circuit.
2. Connect the positive lead of the load test tool to the Fused B(+) circuit at the component harness connector (A). **Note:** refer to the diagram below.
3. Connect the negative lead of the load test tool to the ground circuit of the Battery or a good chassis ground.
4. Make sure the circuit being tested is being powered on. If the circuit being tested is an ignition feed for example, the ignition must be on. If testing an output from a relay, verify that the relay is energized and on.
5. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [**STANDARD PROCEDURE**](#).**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE**](#).**

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [3](#)

No

- Repair the Fused B(+) circuit for an open, high resistance or short to ground. Use the wiring diagram as a guide to trace the circuit and look for any fuses, in-line connectors or splices to help isolate the location of the open, high resistance or short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. CHECK THE (Z912) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
2. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
3. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#).

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load

test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE:

Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE:

When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE:

Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [4](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. CHECK THE VOLTAGE ON THE (D402) LIN BUS 2 CIRCUIT AT THE COMPASS MODULE HARNESS CONNECTOR

1. Turn the ignition on.
2. Using a DVOM, measure the voltage on the circuit being tested at component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Replace the Compass Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [5](#)

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (D402) LIN BUS 2 CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [6](#)

6. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.

- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

For a complete MIRRORS wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on for greater than five seconds.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) does not receive Local Interface Network (LIN) Bus messages from the Interior Rearview Mirror for greater than five seconds.

DEFAULT ACTION

- Functionality related to the Interior Rearview Mirror will not update.

POSSIBLE CAUSES

Possible Causes
OPEN FUSE
FUSED IGNITION CIRCUIT OPEN OR SHORTED TO GROUND
GROUND CIRCUIT OPEN OR HIGH RESISTANCE
LIN BUS CIRCUIT OPEN OR HIGH RESISTANCE
INTERIOR REARVIEW MIRROR
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [**PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**](#) .

DIAGNOSTIC TEST

1. **READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN**

NOTE: **Diagnose and repair any other LIN Bus related DTCs before proceeding with this diagnostic procedure.**

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.

5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. DISCONNECT THE INTERIOR REARVIEW MIRROR HARNESS CONNECTOR AND CHECK THE (F982) FUSED IGNITION SWITCH (RUN/ACC) CIRCUIT BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the Fused B(+) circuit.
2. Connect the positive lead of the load test tool to the Fused B(+) circuit at the component harness connector (A). **Note:** refer to the diagram below.
3. Connect the negative lead of the load test tool to the ground circuit of the Battery or a good chassis ground.
4. Make sure the circuit being tested is being powered on. If the circuit being tested is an ignition feed for example, the ignition must be on. If testing an output from a relay, verify that the relay is energized and on.
5. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#).**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.

- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to **STANDARD PROCEDURE** .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [3](#)

No

- Remove the Fuse for the Interior Rearview Mirror and inspect it for an open.
- **If Fuse Is Good:** Install the Fuse that was removed and repair the open or high resistance in the Fused Ignition circuit. Using the wiring diagrams as a guide inspect the circuit, related in-line connectors and splice connections for an open or high resistance.
- **If Fuse Is Open:** Repair the short to ground in the Fused Ignition circuit. Using the wiring diagrams as a guide inspect the circuit, related in-line connectors and splice connections for a short. Replace the Fuse that was removed.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. CHECK THE (Z910) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. If not disconnected, disconnect the component harness connector to isolate the ground circuit.
2. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.

4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#).

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#).

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness

connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [4](#)

No

- Repair the ground circuit for an open or high resistance. Using the wiring diagrams as a guide, make sure to also inspect any related in-line connectors or splice connections.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

4. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (D402) LIN BUS 2 CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [5](#)

5. RECONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE VOLTAGE ON THE (D402) LIN BUS 2 CIRCUIT AT THE INTERIOR REARVIEW MIRROR

1. Connect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested.
2. Turn the ignition on.
3. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Replace the Interior Rearview Mirror in accordance with the Service Information. Refer to [MIRROR, REARVIEW, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to [MODULE, BODY CONTROL \(BCM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

For a complete LIN BUS SYSTEM wiring diagram, **Refer to the appropriate wiring information .**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on for greater than five seconds.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- The Body Control Module (BCM) detects the LIN Bus 1 circuit is shorted to ground or battery voltage for greater than three seconds.

DEFAULT ACTION

- No communication on LIN Bus 1 circuit,

POSSIBLE CAUSES

Possible Causes
LIN BUS 1 CIRCUIT SHORTED TO GROUND
LIN BUS 1 CIRCUIT SHORTED TO VOLTAGE
UPPER SWITCH BANK MODULE
UPPER SWITCH BANK 2 MODULE
INTELLIGENT BATTERY SENSOR (IBS)
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.
Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. DISCONNECT THE INTELLIGENT BATTERY SENSOR (IBS) HARNESS CONNECTOR - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. Turn the ignition off.
2. Disconnect the component harness connector(s) containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Visually inspect the negative battery cable connection to the Intelligent Battery Sensor (IBS) for any damage or corrosion and repair as needed. If no problems are found, replace the Intelligent Battery Sensor (IBS) in accordance with the Service Information. Refer to [SENSOR, INTELLIGENT BATTERY \(IBS\), REMOVAL AND INSTALLATION](#) [SENSOR, INTELLIGENT BATTERY \(IBS\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE UPPER SWITCH BANK MODULE HARNESS CONNECTOR - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. Turn the ignition off.
2. Disconnect the component harness connector(s) containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [4](#)

No

- Replace the Upper Switch Bank Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. DISCONNECT THE UPPER SWITCH BANK 2 MODULE HARNESS CONNECTOR - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. Turn the ignition off.
2. Disconnect the component harness connector(s) containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.

3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Replace the Upper Switch Bank 2 Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (D401) LIN BUS 1 CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [6](#)

6. CHECK THE (D401) LIN BUS 1 CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Connect the negative lead of the DVOM to a known good ground.
3. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [7](#)

7. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. DISCONNECT THE STEERING COLUMN CONTROL MODULE (SCCM) HARNESS CONNECTOR - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. Turn the ignition off.
2. Disconnect the component harness connector(s) containing the circuit being tested.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL (SCCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (D403) LIN BUS 3 CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.

2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [4](#)

4. CHECK THE (D403) LIN BUS 3 CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Connect the negative lead of the DVOM to a known good ground.
3. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [5](#)

5. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.

- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

U112D-00-LOST COMMUNICATION WITH EVIC STEERING WHEEL SWITCHES

For a complete MESSAGE SYSTEMS wiring diagram, **Refer to the appropriate wiring information** .

For a complete LIN BUS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on for greater than five seconds.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) does not receive Left Steering Wheel Switch LIN Bus messages from the Steering Column Control Module (SCCM) for greater than three seconds.

DEFAULT ACTION

- Functionality related to the Electronic Vehicle Information Center (EVIC) will not update.

POSSIBLE CAUSES

Possible Causes
ADDITIONAL LIN BUS DTCS SET
FUSED B(+) CIRCUIT OPEN
GROUND CIRCUIT OPEN
LIN BUS CIRCUIT OPEN
LEFT STEERING WHEEL SWITCH
STEERING COLUMN CONTROL MODULE (SCCM)
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. CHECK FOR AN ACTIVE DTC

1. With the scan tool, read Body Control Module (BCM) DTCs and record on the repair order.
2. Record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
5. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. If no problems are found, test complete.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. CHECK IF THE STEERING COLUMN CONTROL MODULE (SCCM) COMMUNICATES ON THE NETWORK

1. Using the scan tool network topology screen, check the status of the Steering Column Control Module (SCCM).

Is the SCCM active on the scan tool network topology screen?

Yes

- Go To [3](#)

No

- Perform the NO RESPONSE FROM ECU procedure. Refer to **DIAGNOSIS AND TESTING** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. CHECK FOR ADDITIONAL DTCS

1. With the scan tool, read DTCs from all modules.

Are there other Steering Column Control Module (SCCM) or LIN Bus related DTCs Active?

Yes

- Repair the Steering Column Control Module (SCCM) or LIN Bus related DTCs before proceeding with this diagnostic procedure.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. CHECK FOR VOLTAGE ON THE (A92/A929) FUSED B(+) CIRCUIT

1. Turn the ignition off.
2. Disconnect the Left Steering Wheel Switch harness connector.
3. Turn the ignition on.
4. Measure the voltage on the (A92/A929) Fused B(+) circuit at Left Steering Wheel Switch harness connector - terminal 4.

Is the voltage above 9.0 volts?

Yes

- Go To [5](#)

No

- Go To [8](#)

5. CHECK THE (Z92/912) GROUND CIRCUIT FOR CONTINUITY TO GROUND

1. Turn the ignition off.
2. Check for continuity between ground and the (Z92/912) Ground circuit at Left Steering Wheel Switch harness connector - terminal 6.

Is there continuity between ground and the (Z92/912) Ground circuit?

Yes

- Go To [6](#)

No

- Go To [9](#)

6. CHECK THE STEERING COLUMN CONTROL MODULE (SCCM) LIN BUS PASS-THROUGH

1. Disconnect the SCCM C3 harness connector.
2. Connect a fused jumper wire between ground and the (D403/D594) LIN Bus circuit at SCCM C3, component side - terminal 12.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is DTC: U1045-00-LIN 3 BUS set as Active?

Yes

- Go To [10](#)

No

- Go To [7](#)

7. CHECK THE BCM FOR PROPER OPERATION

1. Remove the fused jumper wire from the SCCM.
2. Turn the ignition off.
3. Disconnect the SCCM C2 harness connector.
4. Connect a fused jumper wire between ground and the (D403) LIN Bus 3 circuit at SCCM C2 harness connector - terminal 7.
5. Turn the ignition on.
6. With the scan tool, read BCM DTCs.

Is DTC: U1045-00-LIN 3 BUS set as Active?

Yes

- Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to [MODULE, STEERING COLUMN CONTROL \(SCCM\), REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [11](#)

8. CHECK THE (A92/A929) FUSED B(+) CIRCUIT FOR AN OPEN

1. Turn the ignition off.
2. Disconnect the SCCM C3 harness connector.
3. Measure the resistance of the(A92/A929) Fused B(+) circuit between Left Steering Wheel Switch harness connector - terminal 4 and SCCM C3 harness connector - terminal 7.

Is the resistance above 3.0 Ohms?

Yes

- Repair the open in the (A92/A929) Fused B(+) circuit.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to [MODULE, STEERING COLUMN CONTROL \(SCCM\), REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

9. CHECK THE (Z92/912) GROUND CIRCUIT FOR AN OPEN

1. Disconnect the SCCM C3 harness connector.
2. Measure the resistance of the (Z92/912) Ground circuit between Left Steering Wheel Switch harness connector - terminal 6 and SCCM C3 harness connector - terminal 11.

Is the resistance above 3.0 Ohms?

Yes

- Repair the open in the (Z92/912) Ground circuit.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to [**MODULE, STEERING COLUMN CONTROL \(SCCM\), REMOVAL AND INSTALLATION**](#).
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#).

10. CHECK THE (D594) LIN BUS CIRCUIT FOR AN OPEN

1. Turn the ignition off.
2. Measure the resistance of the (D594) LIN Bus circuit between SCCM C3 harness connector - terminal 12 and Left Steering Wheel Switch harness connector - terminal 7.

Is the resistance above 3.0 Ohms?

Yes

- Repair the open in the (D594) LIN Bus circuit.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#).

No

- Replace the Left Steering Wheel Switch in accordance with the Service Information.

Refer to [**SWITCH, REMOTE RADIO, REMOVAL AND INSTALLATION**](#).

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#).

11. CHECK THE (D403) LIN BUS 3 CIRCUIT FOR AN OPEN

1. Turn the ignition off.
2. Disconnect the BCM C5/E harness connector.
3. Measure the resistance of the (D403) LIN Bus 3 circuit between SCCM C2 harness connector - terminal 7 and BCM C5/E harness connector - terminal 45.

Is the resistance above 3.0 Ohms?

Yes

- Repair the open in the (D403) LIN Bus 3 circuit.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#).

No

- Go To [12](#)

12. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).

- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

U113B-00-LOST COMMUNICATION WITH SWITCH BANK MODULE

For a complete MESSAGE SYSTEMS wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on for greater than five seconds.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) does not receive Local Interface Network (LIN) Bus messages from the Upper Switch Bank for greater than five seconds.

DEFAULT ACTION

- Functionality related to the Upper Switch Bank will be inoperative.

POSSIBLE CAUSES

Possible Causes
OPEN FUSE
FUSED B(+) CIRCUIT OPEN OR SHORTED TO GROUND
LIN BUS CIRCUIT OPEN OR HIGH RESISTANCE
GROUND CIRCUIT OPEN
UPPER SWITCH BANK

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: Diagnose and repair any other LIN Bus related DTCs before proceeding with this diagnostic procedure.

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. DISCONNECT THE UPPER SWITCH BANK MODULE HARNESS CONNECTOR AND CHECK THE (A232) FUSED B(+) CIRCUIT BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the Fused B(+) circuit.
2. Connect the positive lead of the load test tool to the Fused B(+) circuit at the component harness connector (A). **Note:** refer to the diagram below.
3. Connect the negative lead of the load test tool to the ground circuit of the Battery or a good chassis ground.
4. Make sure the circuit being tested is being powered on. If the circuit being tested is an ignition feed for example, the ignition must be on. If testing an output from a relay, verify that the relay is energized and on.
5. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for**

additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [3](#)

No

- Remove the Fuse for the Upper Switch Bank Module and inspect it for an open.
- **If Fuse Is Good:** Install the Fuse that was removed and repair the open or high resistance in the Fused Ignition circuit. Using the wiring diagrams as a guide inspect the circuit, related in-line connectors and splice connections for an open or high resistance.
- **If Fuse Is Open:** Repair the short to ground in the Fused Ignition circuit. Using the wiring diagrams as a guide inspect the circuit, related in-line connectors and splice connections for a short. Replace the Fuse that was removed.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

3. CHECK THE (Z910) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
2. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
3. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [**STANDARD PROCEDURE**](#) .**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load

testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [4](#)

No

- Repair the ground circuit for an open or high resistance. Using the wiring diagrams as a guide, make sure to also inspect any related in-line connectors or splice connections.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (D401) LIN BUS 1 CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [5](#)

5. RECONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE VOLTAGE ON THE (D401) LIN BUS 1 CIRCUIT AT THE UPPER SWITCH BANK MODULE

1. Connect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested.
2. Turn the ignition on.
3. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Replace the Upper Switch Bank Module in accordance with the Service Information. Refer to [POD, SWITCH, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.

9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

U113E-00-LOST COMMUNICATION WITH INTELLIGENT BATTERY SENSOR

For a complete CHARGING SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Intelligent Battery Sensor (IBS) is an electrical shunt with a microprocessor that is mounted in-line with the negative Battery Cable. The IBS monitors the current flow and voltage. The IBS also has a built in thermistor that calculates the Battery temperature. The microprocessor uses this data to calculate Battery state of charge, Battery internal resistance, charge received, charge delivered, and time in service. This information is reported through a LIN Bus circuit to the Body Control Module (BCM). The BCM broadcasts the information to the Powertrain Control Module (PCM) over the CAN Bus.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on for greater than five seconds.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) does not receive Local Interface Network (LIN) Bus messages from the Intelligent Battery Sensor (IBS) for greater than five seconds.

DEFAULT ACTION

- Functionality related to the IBS will not update.

POSSIBLE CAUSES

Possible Causes
OPEN FUSE
FUSED B(+) CIRCUIT OPEN OR SHORTED TO GROUND
GROUND CIRCUIT OPEN OR HIGH RESISTANCE
LIN BUS CIRCUIT OPEN OR HIGH RESISTANCE
INTELLIGENT BATTERY SENSOR (IBS)
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: Diagnose and repair any other LIN Bus related DTCs before proceeding with this diagnostic procedure.

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. DISCONNECT THE INTELLIGENT BATTERY SENSOR (IBS) HARNESS CONNECTOR AND CHECK THE (A916) FUSED B(+) CIRCUIT BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the Fused B(+) circuit.
2. Connect the positive lead of the load test tool to the Fused B(+) circuit at the component harness connector (A). **Note:** refer to the diagram below.
3. Connect the negative lead of the load test tool to the ground circuit of the Battery or a good chassis ground.
4. Make sure the circuit being tested is being powered on. If the circuit being tested is an ignition feed for example, the ignition must be on. If testing an output from a relay, verify that the relay is energized and on.
5. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#).**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1**

amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE:

Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [**STANDARD PROCEDURE**](#) .

NOTE:

When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE:

Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To

No

- Inspect the fuse for the Fused B(+) circuit being tested and perform the appropriate condition:
- **If Fuse is Open:** Repair the Fused B(+) circuit for a short to ground.

- **If Fuse is Not Open:** Repair the Fused B(+) circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. CHECK THE (Z2) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit at the ECU/component harness connector.
3. Connect the negative lead of the load test tool to the ground circuit at the ECU/component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [4](#)

No

- Repair the ground circuit for an open or high resistance. Using the wiring diagrams as a guide, make sure to also inspect any related in-line connectors or splice connections.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

4. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (D401) LIN BUS 1 CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [5](#)

5. RECONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE VOLTAGE ON THE (D401) LIN BUS 1 CIRCUIT AT THE IBS

1. Connect the disconnected Electronic Control Unit (ECU) harness connectors containing the circuit being tested.
2. Turn the ignition on.
3. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Visually inspect the negative battery cable connection to the Intelligent Battery Sensor (IBS) for any damage or corrosion and repair as needed. If no problems are found, replace the Intelligent Battery Sensor (IBS) in accordance with the Service Information. Refer to [SENSOR, INTELLIGENT BATTERY \(IBS\), REMOVAL AND INSTALLATION](#) [SENSOR, INTELLIGENT BATTERY \(IBS\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

U114F-00-LOST COMMUNICATION WITH LIN OVERHEAD CONSOLE

For a complete LIN BUS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on for greater than five seconds.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- The Body Control Module (BCM) does not receive LIN Bus 2 messages from the Overhead Console Module for greater than three seconds.

DEFAULT ACTION

- Functionality related to the Overhead Console Module will be inoperative.

POSSIBLE CAUSES

Possible Causes
FUSED B(+) CIRCUIT OPEN OR SHORTED TO GROUND
LIN BUS 2 CIRCUIT OPEN
GROUND CIRCUIT OPEN
OVERHEAD CONSOLE MODULE
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. DISCONNECT THE OVERHEAD CONSOLE MODULE HARNESS CONNECTOR AND CHECK FOR VOLTAGE ON THE FUSED B(+) CIRCUIT

1. Turn the ignition off.
2. Disconnect the component harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the voltage greater than 10.0 volts?

Yes

- Go To [3](#)

No

- Repair the circuit for an open or short to ground. Use the wiring diagram as a guide to trace the circuit and look for any fuses and in-line connectors to help isolate the location of the open or short to ground.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. CHECK THE OVERHEAD CONSOLE MODULE GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
2. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
3. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [**STANDARD PROCEDURE**](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [**STANDARD PROCEDURE**](#) .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [4](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

4. CHECK THE VOLTAGE ON THE (D402) LIN BUS 2 CIRCUIT AT THE OVERHEAD CONSOLE MODULE HARNESS CONNECTOR

1. Turn the ignition on.
2. Using a DVOM, measure the voltage on the circuit being tested at component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Replace the Overhead Console Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [5](#)

5. DISCONNECT THE BCM HARNESS CONNECTOR AND CHECK THE (D402) LIN BUS 2 CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [6](#)

6. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to [MODULE, BODY CONTROL \(BCM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

U1191-00-LOST COMMUNICATION WITH SWITCH BANK MODULE 2

For a complete MESSAGE SYSTEMS wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on for greater than five seconds.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- The Body Control Module (BCM) does not receive LIN Bus 1 messages from the Switch Bank Module 2 for greater than three seconds.

DEFAULT ACTION

- Functionality related to the Switch Bank 2 Module will be inoperative.

POSSIBLE CAUSES

Possible Causes
FUSED B(+) CIRCUIT OPEN OR SHORTED TO GROUND
LIN BUS 1 CIRCUIT OPEN
GROUND CIRCUIT OPEN
SWITCH BANK MODULE 2
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: Diagnose and repair any other LIN Bus related DTCs before proceeding with this diagnostic procedure.

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. DISCONNECT THE UPPER SWITCH BANK MODULE 2 HARNESS CONNECTOR AND CHECK FOR VOLTAGE ON THE (A232) FUSED B(+) CIRCUIT

1. Disconnect the component harness connector to isolate the Fused B(+) circuit.

2. Connect the positive lead of the load test tool to the Fused B(+) circuit at the component harness connector (A). **Note:** refer to the diagram below.
3. Connect the negative lead of the load test tool to the ground circuit of the Battery or a good chassis ground.
4. Make sure the circuit being tested is being powered on. If the circuit being tested is an ignition feed for example, the ignition must be on. If testing an output from a relay, verify that the relay is energized and on.
5. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [3](#)

No

- Remove the Fuse for the Switch Bank 2 Module and inspect it for an open.
- **If Fuse Is Good:** Install the Fuse that was removed and repair the open or high resistance in the Fused Ignition circuit. Using the wiring diagrams as a guide inspect the circuit, related in-line connectors and splice connections for an open or high resistance.
- **If Fuse Is Open:** Repair the short to ground in the Fused Ignition circuit. Using the wiring diagrams as a guide inspect the circuit, related in-line connectors and splice connections for a short. Replace the Fuse that was removed.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. CHECK THE (Z910) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
2. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
3. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#).

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [4](#)

No

- Repair the ground circuit for an open or high resistance. Using the wiring diagrams as a guide, make sure to also inspect any related in-line connectors or splice connections.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (D401) LIN BUS 1 CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [5](#)

5. RECONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE VOLTAGE ON THE (D401) LIN BUS 1 CIRCUIT AT THE SWITCH BANK MODULE 2

1. Connect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested.
2. Turn the ignition on.
3. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Replace the Switch Bank Module 2 in accordance with the Service Information. Refer to [POD, SWITCH, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).

3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

U11B9-00-LOST COMMUNICATION WITH RF HUB

The COMMUNICATION DIAGNOSTIC PROCEDURE **MUST** be performed before replacing any component(s) or module(s). Perform the COMMUNICATION DIAGNOSTIC PROCEDURE. Refer to **COMMUNICATION DIAGNOSTIC PROCEDURE** .

U1433-23-IMPLAUSIBLE IGNITION SWITCH STATUS MESSAGE RECEIVED-SIGNAL STUCK LOW

For a complete STARTING SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) monitors the hard-wired Ignition Signal circuit from the Radio Frequency (RF) Hub Module and compares it to the ignition switch status message received from the RF Hub Module over the Controller Area Network (CAN) Bus.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects the hard-wired input from the Radio Frequency (RF) Hub Module does not match the Ignition Status CAN Bus message from the RF Hub Module for greater than five seconds.

POSSIBLE CAUSES

Possible Causes
IGNITION STATUS CIRCUIT SHORTED TO GROUND RADIO FREQUENCY (RF) HUB MODULE BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
3. With the scan tool, erase all DTCS.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCS.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. DISCONNECT THE RF HUB MODULE HARNESS CONNECTOR - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. Turn the ignition off.

2. Disconnect the indicated Electronic Control Unit (ECU) harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (F20) IGNITION SIGNAL CIRCUIT FOR A SHORT TO GROUND

NOTE: The ignition must be off when checking a circuit for continuity to ground.

1. Disconnect the indicated ECU harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
2. Connect the negative lead of the DVOM to a known good ground.
3. Connect the positive lead of the DVOM to the circuit being tested at the ECU harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [5](#)

4. DISCONNECT RELATED RF HUB MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all RF Hub harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:

- Proper connector installation.
- Damaged connector locks.
- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all RF Hub harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the RF Hub Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

5. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.

- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

U1433-24-IMPLAUSIBLE IGNITION SWITCH STATUS MESSAGE RECEIVED-SIGNAL STUCK HIGH

For a complete STARTING SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) monitors the hard-wired Ignition Signal circuit from the Radio Frequency (RF) Hub Module and compares it to the ignition switch status message received from the RF Hub Module over the Controller Area Network (CAN) Bus.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects the hard-wired input from the Radio Frequency (RF) Hub Module does not match the Ignition Status CAN Bus message from the RF Hub Module for greater than five seconds.

POSSIBLE CAUSES

Possible Causes
IGNITION STATUS CIRCUIT OPEN OR SHORTED TO VOLTAGE
RADIO FREQUENCY (RF) HUB MODULE
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND MEASURE THE VOLTAGE ON THE (F20) IGNITION STATUS CIRCUIT

1. Turn the ignition off.
2. Disconnect the indicated ECU harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition to the ACC position
4. Using a DVOM, measure the voltage on the circuit being tested at the ECU harness connector.

NOTE:

When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE RF HUB MODULE HARNESS CONNECTOR AND CHECK THE (F20) IGNITION STATUS CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the indicated ECU harness connector(s) containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.

3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the ECU harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#).

No

- Go To [5](#)

4. DISCONNECT THE RF HUB MODULE HARNESS CONNECTOR AND CHECK THE (F20) IGNITION STATUS CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

NOTE: The ignition must be off when checking the resistance of a circuit.

NOTE: Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. Note: The meter leads can add resistance to the measurement value.

1. Connect one lead of the DVOM to the circuit being tested at one of the ECU harness connectors.
2. Connect the other lead to the circuit being tested at the other ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#).

No

- Go To [6](#)

5. DISCONNECT RELATED RF HUB MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all RF Hub harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.

- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all RF Hub harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the RF Hub Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

6. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

U1514-64-ENGINE CONTROLLER SECRET CODE - SIGNAL PLAUSIBILITY FAILURE

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is in the Run position.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) receives an invalid Immobilizer System message from the Powertrain Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
POWERTRAIN CONTROL MODULE (PCM) DTCS
INCORRECT VIN PROGRAMMED IN THE PCM
POWERTRAIN CONTROL MODULE (PCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.

3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK FOR STARTING RELATED DTC(S) PRESENT IN THE POWERTRAIN CONTROL MODULE (PCM)

1. Turn the ignition on.
2. With the scan tool, read PCM DTCs and record on the repair order.

Are there any starting DTCs in the PCM?

Yes

- Repair the Powertrain Control Module (PCM) DTCs. Refer to the appropriate service information .

No

- Go To [3](#)

3. VERIFY THE VEHICLE IDENTIFICATION NUMBER (VIN) STORED IN THE POWERTRAIN CONTROL MODULE (PCM) MATCHES THE VEHICLE AND THE VIN STORED IN THE BCM

NOTE: **Verify a VIN has been programmed into the PCM. If a VIN is not displayed, attempt to program the PCM with the correct VIN before continuing.**

1. With the scan tool, access the VIN stored in the PCM.
2. Compare the VIN displayed in the PCM, with the VIN of the vehicle.
3. With the scan tool, access the VIN in the BCM.

Does the VIN in the PCM match the BCM and the vehicle VINs?

Yes

- Go To [4](#)

No

- With the scan tool, perform the PCM programming procedure to update the VIN in the PCM. Refer to **MODULE, POWERTRAIN CONTROL (PCM), MODULE PROGRAMMING** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. DISCONNECT RELATED PCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL (PCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

U1514-87-ENGINE CONTROLLER SECRET CODE - MISSING MESSAGE

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is in the Run position.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) does not receive a Immobilizer System message from the Powertrain Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
MAIN OR AUXILIARY 12-VOLT BATTERY
POWERTRAIN CONTROL MODULE (PCM) DTCS
POWERTRAIN CONTROL MODULE (PCM) PROGRAMMING

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: This diagnostic procedure diagnoses single battery or dual battery systems. Proceed as equipped.

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE OPERATION OF THE 12-VOLT MAIN BATTERY AND AUXILIARY BATTERY (IF EQUIPPED)

NOTE: This DTC may also set if the 12-volt Main Battery, or Auxiliary Battery, does not operate properly.

1. Check the 12.0 Volt Main Battery, and Auxiliary Battery (if equipped), for proper operation. Refer to the appropriate service information .

Does the 12-volt Main Battery, and Auxiliary Battery, operate properly?

Yes

- Go To [3](#)

No

- Repair or replace the inoperative Battery (Main or Auxiliary) in accordance with the Service Information. Refer to [BATTERY, REMOVAL AND INSTALLATION BATTERY, SUPPLEMENTAL, REMOVAL AND INSTALLATION BATTERY, REMOVAL AND INSTALLATION BATTERY, SUPPLEMENTAL, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. 0 [BODY VERIFICATION TEST](#).

3. CHECK FOR STARTING, CHARGING OR IGNITION RELATED DTC(S) PRESENT IN THE POWERTRAIN CONTROL MODULE (PCM)

1. Turn the ignition on.
2. With the scan tool, read PCM DTCs and record on the repair order.

Are there any starting, ignition or charging DTCs in the PCM?

Yes

- Repair the Powertrain Control Module (PCM) DTCs. Refer to the appropriate service information .

No

- With the scan tool, perform the PCM programming procedure. Refer to [MODULE, POWERTRAIN CONTROL \(PCM\), MODULE PROGRAMMING](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

U1515-62-STEERING COLUMN LOCK SECRET CODE - SIGNAL COMPARE FAILURE

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) receives an invalid Immobilizer System message from the Electronic Steering Lock (ESL).

POSSIBLE CAUSES

Possible Causes
ELECTRONIC STEERING LOCK (ESL)
IMMOBILIZER SYSTEM RELATED DTCS
BODY CONTROL MODULE (BCM) NOT PROGRAMMED CORRECTLY
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. VERIFY THE ELECTRONIC STEERING LOCK (ESL) IS ACTIVE ON THE BUS

1. With the scan tool, verify the ESL is active on the bus.

Is the ESL active on the bus?

Yes

- Go To [3](#)

No

- Perform the NO RESPONSE FROM ECU diagnostic procedure for the ESL. Refer to [DIAGNOSIS AND TESTING](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. CHECK FOR ANY ACTIVE IMMOBILIZER SYSTEM RELATED DTCS IN ALL MODULES

NOTE: Check for BCM configuration, VIN Missing/Mismatch or Immobilizer System related DTCs.

1. With the scan tool, read all active DTCs from all modules.

Are there any Immobilizer System related DTCs present?

Yes

- Perform the appropriate diagnostic procedure.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. PERFORM THE BCM RESTORE VEHICLE CONFIGURATION PROCEDURE

1. Perform the BCM "RESTORE VEHICLE CONFIGURATION" procedure, located in BCM MISC FUNCTIONS.
2. With the scan tool, erase all DTCs.
3. Turn the ignition off for a minimum of 10.0 seconds.

4. Turn the ignition on.
5. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
6. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

5. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to [MODULE, BODY CONTROL \(BCM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

U1515-64-STEERING COLUMN LOCK SECRET CODE - SIGNAL PLAUSIBILITY FAILURE WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) receives an invalid Sentry Key Immobilizer System (SKIS) message from the Electronic Steering Lock (ESL).

POSSIBLE CAUSES

Possible Causes
ELECTRONIC STEERING LOCK (ESL) SKIS RELATED DTCS BODY CONTROL MODULE (BCM) NOT PROGRAMMED CORRECTLY BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
3. With the scan tool, erase all DTCS.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCS.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. VERIFY THE ELECTRONIC STEERING LOCK (ESL) IS ACTIVE ON THE BUS

1. With the scan tool, verify the ESL is active on the bus.

Is the ESL active on the bus?

Yes

- Go To [3](#)

No

- Perform the NO RESPONSE FROM ECU diagnostic procedure for the ESL. Refer to **DIAGNOSIS AND TESTING**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. CHECK FOR ANY ACTIVE IMMOBILIZER SYSTEM RELATED DTCS IN ALL MODULES

NOTE: Check for BCM configuration, VIN Missing/Mismatch or Immobilizer System related DTCs.

1. With the scan tool, read all active DTCs from all modules.

Are there any Immobilizer System related DTCs present?

Yes

- Perform the appropriate diagnostic procedure.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [4](#)

4. PERFORM THE BCM RESTORE VEHICLE CONFIGURATION PROCEDURE

1. Perform the BCM "RESTORE VEHICLE CONFIGURATION" procedure, located in BCM MISC FUNCTIONS.
2. With the scan tool, erase all DTCs.
3. Turn the ignition off for a minimum of 10.0 seconds.
4. Turn the ignition on.
5. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
6. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

5. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.

4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

U1515-87-STEERING COLUMN LOCK SECRET CODE - MISSING MESSAGE

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) does not receive a Immobilizer System message from the Electronic Steering Lock (ESL).

POSSIBLE CAUSES

Possible Causes
ELECTRONIC STEERING LOCK (ESL)
IMMOBILIZER SYSTEM RELATED DTCS
BODY CONTROL MODULE (BCM) NOT PROGRAMMED CORRECTLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
3. With the scan tool, erase all DTCS.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCS.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. VERIFY THE ELECTRONIC STEERING LOCK (ESL) IS ACTIVE ON THE BUS

1. With the scan tool, verify the ESL is active on the bus.

Is the ESL active on the bus?

Yes

- Go To [3](#)

No

- Perform the NO RESPONSE FROM ECU diagnostic procedure for the ESL. Refer to **DIAGNOSIS AND TESTING** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. CHECK FOR ANY ACTIVE IMMOBILIZER SYSTEM RELATED DTCS IN ALL MODULES

NOTE: Check for BCM configuration, VIN Missing/Mismatch or Immobilizer System related DTCS.

1. With the scan tool, read all active DTCS from all modules.

Are there any Immobilizer System related DTCs present?

Yes

- Perform the appropriate diagnostic procedure.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. PERFORM THE BCM RESTORE VEHICLE CONFIGURATION PROCEDURE

1. Perform the BCM "RESTORE VEHICLE CONFIGURATION" procedure, located in BCM MISC FUNCTIONS.
2. With the scan tool, erase all DTCs.
3. Turn the ignition off for a minimum of 10.0 seconds.
4. Turn the ignition on.
5. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
6. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

5. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.

6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

U1516-64-RF HUB SECRET CODE - SIGNAL PLAUSIBILITY FAILURE

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is in the Run position.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) receives an invalid Immobilizer System message from the Radio Frequency (RF Hub) Module.

POSSIBLE CAUSES

Possible Causes
IMMOBILIZER SYSTEM RELATED DTCS
ADDITIONAL COMMUNICATION RELATED DTCS
BODY CONTROL MODULE (BCM) NOT PROGRAMMED CORRECTLY
RADIO FREQUENCY (RF HUB) MODULE
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.

3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK FOR ANY ACTIVE IMMOBILIZER SYSTEM RELATED DTCS IN ALL MODULES

NOTE: Check for BCM configuration, VIN Missing/Mismatch or Immobilizer System related DTCs.

1. With the scan tool, read all active DTCs from all modules.

Are there any Immobilizer System related DTCs present?

Yes

- Perform the appropriate diagnostic procedure.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [3](#)

3. VERIFY THE RADIO FREQUENCY (RF HUB) MODULE IS ACTIVE ON THE BUS

1. With the scan tool, verify the RF Hub Module is active on the bus.

Is the RF Hub Module active on the bus?

Yes

- Go To [4](#)

No

- Perform the NO RESPONSE FROM ECU diagnostic procedure for the RF Hub Module. Refer to **DIAGNOSIS AND TESTING** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS IN ALL MODULES

1. With the scan tool, read all active DTCs from all modules.

Is there more than one module with active DTCs "Logged Against" the RF Hub Module?

Yes

- Go To [6](#)

No

- Go To [5](#)

5. PERFORM THE BCM RESTORE VEHICLE CONFIGURATION PROCEDURE

1. Perform the BCM "RESTORE VEHICLE CONFIGURATION" procedure, located in BCM MISC FUNCTIONS.
2. With the scan tool, erase all DTCs.
3. Turn the ignition off for a minimum of 10.0 seconds.
4. Turn the ignition on.
5. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
6. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [7](#)

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

6. DISCONNECT RELATED RF HUB MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all RF Hub Module harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all RF Hub Module harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.

9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Radio Frequency (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

7. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

U1516-87-RF HUB SECRET CODE - MISSING MESSAGE

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is in the Run position.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) does not receive an Immobilizer System message from the Radio Frequency (RF Hub) Module.

POSSIBLE CAUSES

Possible Causes
IMMOBILIZER SYSTEM RELATED DTCS
ADDITIONAL COMMUNICATION RELATED DTCS
BODY CONTROL MODULE (BCM) NOT PROGRAMMED CORRECTLY
RADIO FREQUENCY (RF HUB) MODULE
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
3. With the scan tool, erase all DTCS.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCS.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. CHECK FOR ANY ACTIVE IMMOBILIZER SYSTEM RELATED DTCS IN ALL MODULES

NOTE: Check for BCM configuration, VIN Missing/Mismatch or Immobilizer System related DTCS.

1. With the scan tool, read all active DTCS from all modules.

Are there any Immobilizer System related DTCS present?

Yes

- Perform the appropriate diagnostic procedure.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [3](#)

3. VERIFY THE RADIO FREQUENCY (RF HUB) MODULE IS ACTIVE ON THE BUS

1. With the scan tool, verify the RF Hub Module is active on the bus.

Is the RF Hub Module active on the bus?

Yes

- Go To [4](#)

No

- Perform the NO RESPONSE FROM ECU diagnostic procedure for the RF Hub Module. Refer to [DIAGNOSIS AND TESTING](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS IN ALL MODULES

1. With the scan tool, read all active DTCS from all modules.

Is there more than one module with active DTCS "Logged Against" the RF Hub Module?

Yes

- Go To [6](#)

No

- Go To [5](#)

5. PERFORM THE BCM RESTORE VEHICLE CONFIGURATION PROCEDURE

1. Perform the BCM "RESTORE VEHICLE CONFIGURATION" procedure, located in BCM MISC FUNCTIONS.
2. With the scan tool, erase all DTCS.
3. Turn the ignition off for a minimum of 10.0 seconds.
4. Turn the ignition on.
5. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
6. With the scan tool, read Body Control Module (BCM) DTCS.

Did the DTC return?

Yes

- Go To [7](#)

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

6. DISCONNECT RELATED RF HUB MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all RF Hub Module harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all RF Hub Module harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Radio Frequency (RF Hub) Module in accordance with the Service Information. Refer to [MODULE, RADIO FREQUENCY \(RF HUB\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

- Test complete.

7. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
 - Test complete.
-

2021 GENERAL INFORMATION

(Central Vision Processing Module (CVPM) - Electrical Diagnostics) - Gladiator

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
B217A-1C	REAR CAMERA-CIRCUIT VOLTAGE OUT OF RANGE
B217A-92	REAR CAMERA-PERFORMANCE OR INCORRECT OPERATION
B2199-16	BATTERY VOLTAGE-CIRCUIT VOLTAGE BELOW THRESHOLD
B2199-17	BATTERY VOLTAGE-CIRCUIT VOLTAGE ABOVE THRESHOLD
B21DD-84	SYSTEM VOLTAGE-SIGNAL BELOW ALLOWABLE RANGE
B21DD-85	SYSTEM VOLTAGE-SIGNAL ABOVE ALLOWABLE RANGE
B222C-00	VEHICLE CONFIGURATION NOT PROGRAMMED
B223B-00	VEHICLE CONFIGURATION MISMATCH
B22A9-00	ECU INTERNAL PERFORMANCE
B23C5-1C	FRONT CAMERA-CIRCUIT VOLTAGE OUT OF RANGE
B23C5-92	FRONT CAMERA-PERFORMANCE OR INCORRECT OPERATION
U0010-00	CAN INTERIOR BUS
U0140-00	LOST COMMUNICATION WITH BODY CONTROL MODULE
U0184-00	LOST COMMUNICATION WITH RADIO
U0264-00	LOST COMMUNICATION WITH CAMERA MODULE-REAR
U0265-00	LOST COMMUNICATION WITH FRONT CAMERA
U0422-00	IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE
U0485-00	IMPLAUSIBLE DATA RECEIVED FROM RADIO

DIAGNOSIS AND TESTING

B217A-1C-REAR CAMERA-CIRCUIT VOLTAGE OUT OF RANGE

For a complete SURROUND VIEW CAMERA SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Central Vision Processing Module (CVPM) uses two cameras located on the front and rear of the vehicle. The camera signals are sent via a coaxial cable to the CVPM. The CVPM monitors the camera and camera circuits for concerns.

For an in depth explanation of the CVPM system. Refer to [MODULE, CENTRAL VISION PROCESSING \(CVPM\), DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Central Vision Processing Module (CVPM) detected that the camera voltage is out of range.

DEFAULT ACTION

- The camera video image is blanked out on video screen.

POSSIBLE CAUSES

Possible Causes
CVPM SUPPLY VOLTAGE OUT OF RANGE LVDS COAX CABLE UNPLUGGED OR DAMAGED LVDS COAX CABLE SHORTED TO VOLTAGE CAMERA CENTRAL VISION PROCESSING MODULE (CVPM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

CIRCUITS TO BE TESTED

Camera Circuits

Circuit ID	Circuit Description
J220	REAR

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

NOTE: Verify that the Central Vision Processing Module (CVPM) has the latest software installed. If necessary, update the software and retest.

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. CHECK FOR BATTERY OR SYSTEM VOLTAGE DTCS IN THE CVPM

1. Refer to the saved DTC information recorded on the repair order.

Were any battery or system voltage DTCs set in the CVPM?

Yes

- Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING**.

No

- Go To **3**

3. CHECK THE OPERATION OF ALL CAMERAS CONNECTED TO THE CVPM

NOTE: The Surround View Camera System may use two or more connected cameras through LVDS (Low Voltage Differential Signal) Coaxial Cable.

1. Activate the Surround View Camera System by pressing the Surround View Camera soft key located in the "Controls" screen within the Uconnect system.
2. Compare the operation of all the connected cameras to the CVPM, and confirm at least one camera is operating and functioning normally.

Is one camera operating and functioning normally?

Yes

- Go To **5**

No

- Go To **4**

4. CHECK THE RELATED COAX CABLE CONNECTIONS

NOTE: When using the diagnostic scan tool, the data display screen of the ECU will show voltage values for the cameras associated to the vehicle (i.e. Front, Left, Right or Rear Camera Power). Under normal operating conditions the ECU will display 10.0 volts. If a camera is not connected the voltage value will show 10.0 volts. If the associated camera circuit is shorted (voltage, ground, etc.) those differing voltage results will be reflected on the data display as well for assisting in further troubleshooting.

NOTE: Some vehicles are not be equipped with a camera at each location specified below.

Central Vision Processing Module (CVPM) Connector Color Coding	
Front Camera	Green
Left Camera	Beige
Right Camera	Brown
Rear Camera	Orange
Video Output to Radio / Display	Violet

1. Turn the ignition off.
2. Inspect the CVPM harness connector for a secure and undamaged connection.
3. Inspect the Coax Cable in-line harness connectors for a secure and undamaged connection.
4. Inspect the related Camera harness connector for a secure and undamaged connection.

Are the connections secure and undamaged?

Yes

- Go To **5**

No

- Repair the cable connection as needed and check video operation.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. CHECK THE CVPM

NOTE: When using the diagnostic scan tool, the data display screen of the ECU will show voltage values for the cameras associated to the vehicle (i.e. Front, Left, Right or Rear Camera Power). Under normal operating conditions the ECU will display 10.0 volts. If a camera is not connected the voltage value will show 10.0 volts. If the associated camera circuit is shorted (voltage, ground, etc.) those differing voltage results will be reflected on the data display as well for assisting in further troubleshooting.

NOTE: The following test is being used to determine that the CVPM recognizes a known good camera, cable and the related connections.

Central Vision Processing Module (CVPM) Connector Color Coding	
Front Camera	Green
Left Camera	Beige
Right Camera	Brown
Rear Camera	Orange
Video Output to Radio / Display	Violet

1. On the vehicle, identify and locate the faulted circuit connector for testing at the CVPM.

NOTE: For example, a fault setting for the Front Camera would indicate the **GREEN** connector at the CVPM.

2. Disconnect the connector at the CVPM for the faulted circuit being set against.
3. On the vehicle, identify and locate a known good operating and functioning camera, circuit and related connector at the CVPM.
4. Disconnect the connector at the CVPM for a known good operating and functioning camera.

NOTE: Continuing with the example, if a fault was setting against the Front Camera; and the Rear Camera is operating and functioning normally on the vehicle - disconnect the Rear Camera connector (**ORANGE** connector) at the CVPM to further test with.

5. From the (special tool #9977-6-8, Adapter, RG-174 Coax Cable) kit, connect the 9977-6-8-2 test lead to the 9977-6-8-3 test lead.
6. Connect the other end of the 9977-6-8-2 test lead to the CVPM connection for the fault related camera circuit.

NOTE: In the example, the **BLUE** connector from the 9977-6-8-2 test lead would connect to the **GREEN** connector on the CVPM. We are using a known good camera, cable, and connection from the Rear Camera as a substitute for the questionable camera, cable, and connection on the Front Camera.

7. Connect the other end of the 9977-6-8-3 test lead to the coaxial cable going to the known good operating and functioning camera.

NOTE: In the example, the BLUE connector from the 9977-6-8-3 test lead would connect to the ORANGE connector going to the Rear Camera. We are using a known good camera, cable, and connection from the Rear Camera as a substitute for the questionable camera, cable, and connection on the Front Camera.

8. Check the activity status of the camera and fault status.

NOTE: In the example, the status of the Front Camera should show an active image (possibly inverted - due to orientation) of the known good camera circuit being used. The related DTCs for the Front Camera should change to STORED. In this example the CVPM would then show no active image and would show ACTIVE DTCs set against the Rear Camera with no connection being present.

Did camera activity return and the status of the original setting DTC(s) change to Stored?

Yes

- A known good camera, cable, and connection was used for testing and the CVPM is no longer a possible cause. The camera and cable are the remaining possible causes.
- Go To [6](#)

No

- A known good camera, cable, and connection was used for testing and the CVPM is the only remaining cause.
- Go To [7](#)

6. TEST THE COAX CABLE BETWEEN THE CVPM AND RELATED CAMERA

NOTE: When using the diagnostic scan tool, the data display screen of the ECU will show voltage values for the cameras associated to the vehicle (i.e. Front, Left, Right or Rear Camera Power). Under normal operating conditions the ECU will display 10.0 volts. If a camera is not connected the voltage value will show 10.0 volts. If the associated camera circuit is shorted (voltage, ground, etc.) those differing voltage results will be reflected on the data display as well for assisting in further troubleshooting.

1. Turn the ignition off.
2. Disconnect the 9977-6-8-2 and the 9977-6-8-3 test leads from the vehicle.
3. Reconnect the known connector for the known good operating and functioning camera circuit used for testing previously.

NOTE: In the example, the Rear Camera connector (ORANGE connector) was disconnected at the CVPM for testing purposes.

4. From the (special tool #9977-6-8, Adapter, RG-174 Coax Cable) kit, connect the long cable (9977-6-8-1) between the related Camera and the CVPM connector.
5. Turn the ignition on.
6. With the scan tool, erase DTCs.
7. Turn the Radio on and wait 25 seconds.
8. With the scan tool, read DTCs.

Is the DTC active?

Yes

- Replace the Camera in accordance with the service information. Refer to [**CAMERA, REAR, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Replace the Coax Cable in accordance with the service information.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CVPM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all CVPM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read CVPM DTCs.

Did the DTC return?

Yes

- Replace the Central Vision Processing Module (CVPM) in accordance with the Service Information. Refer to [**MODULE, CENTRAL VISION PROCESSING \(CVPM\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

- Test complete.

B217A-92-REAR CAMERA-PERFORMANCE OR INCORRECT OPERATION

For a complete SURROUND VIEW CAMERA SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Central Vision Processing Module (CVPM) uses two cameras located on the front and rear of the vehicle. The camera signals are sent via a coaxial cable to the CVPM. The CVPM monitors the camera and camera circuits for concerns.

For an in depth explanation of the CVPM system. Refer to **MODULE, CENTRAL VISION PROCESSING (CVPM), DESCRIPTION AND OPERATION** .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Central Vision Processing Module (CVPM) detects video connection between the Camera and the module is not present.

DEFAULT ACTION

- The camera video image is blanked out on the video screen.

POSSIBLE CAUSES

Possible Causes
CVPM SUPPLY VOLTAGE OUT OF RANGE
LVDS COAX CABLE OPEN OR DISCONNECTED
CAMERA
CENTRAL VISION PROCESSING MODULE (CVPM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

CIRCUITS TO BE TESTED

Camera Circuits

Circuit ID	Circuit Description
J220	REAR

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

NOTE: Verify that the Central Vision Processing Module (CVPM) has the latest software installed. If necessary, update the software and retest.

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

2. CHECK FOR BATTERY OR SYSTEM VOLTAGE DTCS IN THE CVPM

1. Refer to the saved DTC information recorded on the repair order.

Were any battery or system voltage DTCs set in the CVPM?

Yes

- Perform the appropriate diagnostic procedure. Refer to [DIAGNOSIS AND TESTING](#).

No

- Go To [3](#)

3. CHECK THE OPERATION OF ALL CAMERAS CONNECTED TO THE CVPM

NOTE: The Surround View Camera System may use two or more connected cameras through LVDS (Low Voltage Differential Signal) Coaxial Cable.

1. Activate the Surround View Camera System by pressing the Surround View Camera soft key located in the "Controls" screen within the Uconnect system.
2. Compare the operation of all the connected cameras to the CVPM, and confirm at least one camera is operating and functioning normally.

Is one camera operating and functioning normally?

Yes

- Go To [5](#)

No

- Go To [4](#)

4. CHECK THE RELATED COAX CABLE CONNECTIONS

NOTE: When using the diagnostic scan tool, the data display screen of the ECU will show voltage values for the cameras associated to the vehicle (i.e. Front, Left, Right or Rear Camera Power). Under normal operating conditions the ECU will display 10.0 volts. If a camera is not connected

the voltage value will show 10.0 volts. If the associated camera circuit is shorted (voltage, ground, etc.) those differing voltage results will be reflected on the data display as well for assisting in further troubleshooting.

NOTE: Some vehicles are not be equipped with a camera at each location specified below.

Central Vision Processing Module (CVPM) Connector Color Coding	
Front Camera	Green
Left Camera	Beige
Right Camera	Brown
Rear Camera	Orange
Video Output to Radio / Display	Violet

1. Turn the ignition off.
2. Inspect the CVPM harness connector for a secure and undamaged connection.
3. Inspect the Coax Cable in-line harness connectors for a secure and undamaged connection.
4. Inspect the related Camera harness connector for a secure and undamaged connection.

Are the connections secure and undamaged?

Yes

- Go To [5](#)

No

- Repair the cable connection as needed and check video operation.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. CHECK THE CVPM

NOTE: When using the diagnostic scan tool, the data display screen of the ECU will show voltage values for the cameras associated to the vehicle (i.e. Front, Left, Right or Rear Camera Power). Under normal operating conditions the ECU will display 10.0 volts. If a camera is not connected the voltage value will show 10.0 volts. If the associated camera circuit is shorted (voltage, ground, etc.) those differing voltage results will be reflected on the data display as well for assisting in further troubleshooting.

NOTE: The following test is being used to determine that the CVPM recognizes a known good camera, cable and the related connections.

Central Vision Processing Module (CVPM) Connector Color Coding	
Front Camera	Green
Left Camera	Beige
Right Camera	Brown
Rear Camera	Orange
Video Output to Radio / Display	Violet

1. On the vehicle, identify and locate the faulted circuit connector for testing at the CVPM.

NOTE: For example, a fault setting for the Front Camera would indicate the **GREEN** connector at the CVPM.

2. Disconnect the connector at the CVPM for the faulted circuit being set against.
3. On the vehicle, identify and locate a known good operating and functioning camera, circuit and related connector at the CVPM.
4. Disconnect the connector at the CVPM for a known good operating and functioning camera.

NOTE: Continuing with the example, if a fault was setting against the Front Camera; and the Rear Camera is operating and functioning normally on the vehicle - disconnect the Rear Camera connector (**ORANGE** connector) at the CVPM to further test with.

5. From the (special tool #9977-6-8, Adapter, RG-174 Coax Cable) kit, connect the 9977-6-8-2 test lead to the 9977-6-8-3 test lead.
6. Connect the other end of the 9977-6-8-2 test lead to the CVPM connection for the fault related camera circuit.

NOTE: In the example, the **BLUE** connector from the 9977-6-8-2 test lead would connect to the **GREEN** connector on the CVPM. We are using a known good camera, cable, and connection from the Rear Camera as a substitute for the questionable camera, cable, and connection on the Front Camera.

7. Connect the other end of the 9977-6-8-3 test lead to the coaxial cable going to the known good operating and functioning camera.

NOTE: In the example, the **BLUE** connector from the 9977-6-8-3 test lead would connect to the **ORANGE** connector going to the Rear Camera. We are using a known good camera, cable, and connection from the Rear Camera as a substitute for the questionable camera, cable, and connection on the Front Camera.

8. Check the activity status of the camera and fault status.

NOTE: In the example, the status of the Front Camera should show an active image (possibly inverted - due to orientation) of the known good camera circuit being used. The related DTCs for the Front Camera should change to **STORED**. In this example the CVPM would then show no active image and would show **ACTIVE** DTCs set against the Rear Camera with no connection being present.

Did camera activity return and the status of the original setting DTC(s) change to Stored?

Yes

- A known good camera, cable, and connection was used for testing and the CVPM is no longer a possible cause. The camera and cable are the remaining possible causes.
- Go To [6](#)

No

- A known good camera, cable, and connection was used for testing and the CVPM is the only remaining cause.
- Go To [7](#)

6. TEST THE COAX CABLE BETWEEN THE CVPM AND RELATED CAMERA

NOTE: When using the diagnostic scan tool, the data display screen of the ECU will show voltage values for the cameras associated to the vehicle (i.e. Front, Left, Right or Rear Camera Power). Under normal operating conditions the ECU will display 10.0 volts. If a camera is not connected the voltage value will show 10.0 volts. If the associated camera circuit is shorted (voltage, ground, etc.) those differing voltage results will be reflected on the data display as well for assisting in further troubleshooting.

1. Turn the ignition off.
2. Disconnect the 9977-6-8-2 and the 9977-6-8-3 test leads from the vehicle.
3. Reconnect the known connector for the known good operating and functioning camera circuit used for testing previously.

NOTE: In the example, the Rear Camera connector (ORANGE connector) was disconnected at the CVPM for testing purposes.

4. From the (special tool #9977-6-8, Adapter, RG-174 Coax Cable) kit, connect the long cable (9977-6-8-1) between the related Camera and the CVPM connector.
5. Turn the ignition on.
6. With the scan tool, erase DTCs.
7. Turn the Radio on and wait 25 seconds.
8. With the scan tool, read DTCs.

Is the DTC active?

Yes

- Replace the Camera in accordance with the service information. Refer to [CAMERA, REAR, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Replace the Coax Cable in accordance with the service information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CVPM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all CVPM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read CVPM DTCs.

Did the DTC return?

Yes

- Replace the Central Vision Processing Module (CVPM) in accordance with the Service Information. Refer to **MODULE, CENTRAL VISION PROCESSING (CVPM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

B2199-16-BATTERY VOLTAGE-CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete SURROUND VIEW CAMERA SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Central Vision Processing Module (CVPM) uses two cameras located on the front and rear of the vehicle. The camera signals are sent via a coaxial cable to the CVPM. The CVPM monitors the camera and camera circuits for concerns.

For an in depth explanation of the CVPM system. Refer to **MODULE, CENTRAL VISION PROCESSING (CVPM), DESCRIPTION AND OPERATION**.

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The supply voltage is below 7.5 volts (+/- 0.5 volts).

DEFAULT ACTION

- Functionality severely limited.

POSSIBLE CAUSES

Possible Causes
ECU POWER SUPPLY CIRCUIT EXCESSIVE RESISTANCE

Possible Causes
GROUND CIRCUIT EXCESSIVE RESISTANCE
CHARGING OR BATTERY VOLTAGE LOW
CENTRAL VISION PROCESSING MODULE (CVPM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK FOR BATTERY OR CHARGING SYSTEM DTCS IN THE POWERTRAIN CONTROL MODULE (PCM)

1. Refer to the saved DTC information recorded on the repair order.

Were any battery or charging system DTCs present in the PCM?

Yes

- Perform the appropriate diagnostic procedure. Refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** , or **3.6L (GPEC 2A) - DIAGNOSTIC CODE INDEX** .

No

- Go To [3](#)

3. ISOLATE AND LOAD TEST THE (F928) IGNITION RUN OUTPUT CIRCUIT TO CHECK FOR HIGH RESISTANCE

1. The ignition must be off when performing a load test on a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested.
3. Connect the positive lead of the load test tool to the positive side of the Battery (A). Refer to the diagram below.

4. Using an approved back probe tool, connect the negative lead of the load test tool to the circuit being tested at the one of the component harness connectors (B).
5. Using an approved back probe tool and a fused jumper wire, connect the circuit being tested to the negative side of the Battery or a known good ground at the other component harness connector (C and D).
6. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuit.

NOTE: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

NOTE: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Why perform a Voltage Drop Test? To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

WARNING: To avoid possible serious or fatal injury, DO NOT load test any air bag/restraint system components or circuits using the procedures listed here. Refer to the Service Information for proper air bag/restraint system testing procedures.

CAUTION: Do not load test any circuits with components still connected to the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright for each circuit tested?

Yes

- Go To [4](#)

No

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

4. CHECK THE (Z916) GROUND CIRCUIT FOR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the ground circuit.
2. Connect the positive lead of the load test tool to the positive side of the Battery.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load

testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

NOTE: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CVPM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all CVPM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read CVPM DTCs.

Did the DTC return?

Yes

- Replace the Central Vision Processing Module (CVPM) in accordance with the Service Information. Refer to **MODULE, CENTRAL VISION PROCESSING (CVPM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B2199-17-BATTERY VOLTAGE-CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete SURROUND VIEW CAMERA SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Central Vision Processing Module (CVPM) uses two cameras located on the front and rear of the vehicle. The camera signals are sent via a coaxial cable to the CVPM. The CVPM monitors the camera and camera circuits for concerns.

For an in depth explanation of the CVPM system. Refer to [MODULE, CENTRAL VISION PROCESSING \(CVPM\), DESCRIPTION AND OPERATION](#).

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The supply voltage is above 16.5 volts (+/- 0.5 volts).

DEFAULT ACTION

- Functionality severely limited.

POSSIBLE CAUSES

Possible Causes
CHARGING OR BATTERY VOLTAGE HIGH

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#).

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
3. With the scan tool, erase all DTCS.
4. Turn the ignition off for a minimum of 10 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCS.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

2. CHECK FOR BATTERY OR CHARGING SYSTEM DTCS IN THE POWERTRAIN CONTROL MODULE (PCM)

1. Refer to the saved DTC information recorded on the repair order.

Were any battery or charging system DTCs present in the PCM?

Yes

- Perform the appropriate diagnostic procedure. Refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** , or **3.6L (GPEC 2A) - DIAGNOSTIC CODE INDEX** .

No

- Go To **3**

3. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CVPM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all CVPM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read CVPM DTCs.

Did the DTC return?

Yes

- Replace the Central Vision Processing Module (CVPM) in accordance with the Service Information. Refer to **MODULE, CENTRAL VISION PROCESSING (CVPM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

B21DD-84-SYSTEM VOLTAGE-SIGNAL BELOW ALLOWABLE RANGE

For a complete SURROUND VIEW CAMERA SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Central Vision Processing Module (CVPM) uses two cameras located on the front and rear of the vehicle. The camera signals are sent via a coaxial cable to the CVPM. The CVPM monitors the camera and camera circuits for concerns.

For an in depth explanation of the CVPM system. Refer to [MODULE, CENTRAL VISION PROCESSING \(CVPM\), DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The system voltage value received by the module over the CAN bus is below 10.0 volts.

DEFAULT ACTION

- Functionality severely limited.

POSSIBLE CAUSES

Possible Causes
CHARGING OR BATTERY VOLTAGE LOW
CENTRAL VISION PROCESSING MODULE (CVPM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Turn the ignition on.

7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

2. CHECK FOR BATTERY OR CHARGING SYSTEM DTCS IN THE POWERTRAIN CONTROL MODULE (PCM)

1. Refer to the saved DTC information recorded on the repair order.

Were any battery or charging system DTCS present in the PCM?

Yes

- Perform the appropriate diagnostic procedure. Refer to [3.0L DIESEL - DIAGNOSTIC CODE INDEX](#), or [3.6L \(GPEC 2A\) - DIAGNOSTIC CODE INDEX](#).

No

- Go To [3](#)

3. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CVPM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all CVPM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCS.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read CVPM DTCS.

Did the DTC return?

Yes

- Replace the Central Vision Processing Module (CVPM) in accordance with the Service Information. Refer to [MODULE, CENTRAL VISION PROCESSING \(CVPM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

B21DD-85-SYSTEM VOLTAGE-SIGNAL ABOVE ALLOWABLE RANGE

For a complete SURROUND VIEW CAMERA SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Central Vision Processing Module (CVPM) uses two cameras located on the front and rear of the vehicle. The camera signals are sent via a coaxial cable to the CVPM. The CVPM monitors the camera and camera circuits for concerns.

For an in depth explanation of the CVPM system. Refer to [MODULE, CENTRAL VISION PROCESSING \(CVPM\), DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The system voltage value received by the module over the CAN bus is above 16.0 volts.

DEFAULT ACTION

- Functionality severely limited.

POSSIBLE CAUSES

Possible Causes
CHARGING OR BATTERY VOLTAGE HIGH
CENTRAL VISION PROCESSING MODULE (CVPM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.

4. Turn the ignition off for a minimum of 10 seconds.
5. Turn the ignition on.

 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all CVPM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.

7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read CVPM DTCs.

Did the DTC return?

Yes

- Replace the Central Vision Processing Module (CVPM) in accordance with the Service Information. Refer to [MODULE, CENTRAL VISION PROCESSING \(CVPM\), REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).
- Test complete.

B222C-00-VEHICLE CONFIGURATION NOT PROGRAMMED

For a complete SURROUND VIEW CAMERA SYSTEM wiring diagram, **refer to the appropriate wiring information**.

THEORY OF OPERATION

The Central Vision Processing Module (CVPM) uses two cameras located on the front and rear of the vehicle. The camera signals are sent via a coaxial cable to the CVPM. The CVPM monitors the camera and camera circuits for concerns.

For an in depth explanation of the CVPM system. Refer to [MODULE, CENTRAL VISION PROCESSING \(CVPM\), DESCRIPTION AND OPERATION](#).

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The vehicle configuration is not programmed or incorrect.

DEFAULT ACTION

- Camera View function is inoperative.

POSSIBLE CAUSES

Possible Causes
CVPM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM) NOT CONFIGURED CORRECTLY
CENTRAL VISION PROCESSING MODULE (CVPM)

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

2. CONFIGURE THE CVPM TO THE VEHICLE - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, configure the CVPM to the vehicle.
2. With the scan tool, erase all DTCs.
3. Turn the ignition off for a minimum of 10 seconds.
4. Turn the ignition on.
5. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
6. With the scan tool, read the CVPM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Test complete.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. CONFIGURE THE BCM TO THE VEHICLE - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, configure the BCM to the vehicle.
2. With the scan tool, erase all DTCs.
3. Turn the ignition off for a minimum of 10 seconds.
4. Turn the ignition on.
5. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
6. With the scan tool, read CVPM DTCs.

Did the DTC return?

Yes

- Go To [4](#)

No

- Test complete.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. VERIFY THE BCM HARDWARE AND SOFTWARE PART NUMBERS ARE CORRECT FOR THE VEHICLE

1. With the scan tool, read the BCM hardware and software part numbers and record them on the repair order.

Are the BCM hardware and software part numbers correct for the vehicle?

Yes

- Go To [5](#)

No

- Replace the BCM in accordance with the Service Information. Refer to [MODULE, BODY CONTROL \(BCM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CVPM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all CVPM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.

9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read CVPM DTCs.

Did the DTC return?

Yes

- Replace the Central Vision Processing Module (CVPM) in accordance with the Service Information. Refer to **MODULE, CENTRAL VISION PROCESSING (CVPM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

B223B-00-VEHICLE CONFIGURATION MISMATCH

For a complete SURROUND VIEW CAMERA SYSTEM wiring diagram, **refer to the appropriate wiring information**.

THEORY OF OPERATION

The Central Vision Processing Module (CVPM) uses two cameras located on the front and rear of the vehicle. The camera signals are sent via a coaxial cable to the CVPM. The CVPM monitors the camera and camera circuits for concerns.

For an in depth explanation of the CVPM system. Refer to **MODULE, CENTRAL VISION PROCESSING (CVPM), DESCRIPTION AND OPERATION**.

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The module contains unexpected or incorrect vehicle configuration values.

DEFAULT ACTION

- Camera View is inoperative.

POSSIBLE CAUSES

Possible Causes
CVPM NOT CONFIGURED CORRECTLY BODY CONTROL MODULE (BCM) CENTRAL VISION PROCESSING MODULE (CVPM)

DIAGNOSTIC TEST

1. READ AND RECORD DTCs AND ENVIRONMENTAL DATA - ERASE DTCs AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. CONFIGURE THE CVPM TO THE VEHICLE - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, configure the CVPM to the vehicle.
2. With the scan tool, erase all DTCs.
3. Turn the ignition off for a minimum of 10 seconds.
4. Turn the ignition on.
5. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
6. With the scan tool, read the CVPM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Test complete.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. CONFIGURE THE BCM TO THE VEHICLE - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, configure the BCM to the vehicle.
2. With the scan tool, erase all DTCs.
3. Turn the ignition off for a minimum of 10 seconds.
4. Turn the ignition on.
5. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
6. With the scan tool, read CVPM DTCs.

Did the DTC return?

Yes

- Go To [4](#)

No

- Test complete.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. VERIFY THE BCM HARDWARE AND SOFTWARE PART NUMBERS ARE CORRECT FOR THE VEHICLE

1. With the scan tool, read the BCM hardware and software part numbers and record them on the repair order.

Are the BCM hardware and software part numbers correct for the vehicle?

Yes

- Go To [5](#)

No

- Replace the BCM in accordance with the Service Information. Refer to [MODULE, BODY CONTROL \(BCM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CVPM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all CVPM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read CVPM DTCs.

Did the DTC return?

Yes

- Replace the Central Vision Processing Module (CVPM) in accordance with the Service Information. Refer to **MODULE, CENTRAL VISION PROCESSING (CVPM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B22A9-00-ECU INTERNAL PERFORMANCE

For a complete SURROUND VIEW CAMERA SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Central Vision Processing Module (CVPM) uses two cameras located on the front and rear of the vehicle. The camera signals are sent via a coaxial cable to the CVPM. The CVPM monitors the camera and camera circuits for concerns.

For an in depth explanation of the CVPM system. Refer to **MODULE, CENTRAL VISION PROCESSING (CVPM), DESCRIPTION AND OPERATION** .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Central Vision Processing Module (CVPM) detects an internal hardware or software failure.

DEFAULT ACTION

- Flickering video image or no video image on display screen.

POSSIBLE CAUSES

Possible Causes
CVPM SUPPLY VOLTAGE OUT OF RANGE
CVPM SOFTWARE CORRUPT OR NOT COMPATIBLE
CENTRAL VISION PROCESSING MODULE (CVPM)

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Turn the ignition on.

6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

2. CHECK FOR BATTERY OR SYSTEM VOLTAGE DTCS IN THE CVPM

1. Refer to the saved DTC information recorded on the repair order.

Were any battery or system voltage DTCs present in the CVPM?

Yes

- Perform the appropriate diagnostic procedure. Refer to [DIAGNOSIS AND TESTING](#).

No

- Go To [3](#)

3. CHECK FOR SERVICE BULLETINS AND SOFTWARE UPDATES FOR THE CVPM

1. Refer to the latest Service Information.

Are any Service Bulletins or Software Updates available for the CVPM?

Yes

- Perform the appropriate procedure and retest.

No

- Go To [4](#)

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CVPM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all CVPM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read CVPM DTCs.

Did the DTC return?

Yes

- Replace the Central Vision Processing Module (CVPM) in accordance with the Service Information. Refer to [**MODULE, CENTRAL VISION PROCESSING \(CVPM\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

B23C5-1C-FRONT CAMERA-CIRCUIT VOLTAGE OUT OF RANGE

For a complete SURROUND VIEW CAMERA SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Central Vision Processing Module (CVPM) uses two cameras located on the front and rear of the vehicle. The camera signals are sent via a coaxial cable to the CVPM. The CVPM monitors the camera and camera circuits for concerns.

For an in depth explanation of the CVPM system. Refer to [**MODULE, CENTRAL VISION PROCESSING \(CVPM\), DESCRIPTION AND OPERATION**](#) .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Central Vision Processing Module (CVPM) detected that the camera voltage is out of range.

DEFAULT ACTION

- The camera video image is blanked out on video screen.

POSSIBLE CAUSES

Possible Causes
CVPM SUPPLY VOLTAGE OUT OF RANGE

Possible Causes

LVDS COAX CABLE UNPLUGGED OR DAMAGED
LVDS COAX CABLE SHORTED TO VOLTAGE
CAMERA
CENTRAL VISION PROCESSING MODULE (CVPM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

CIRCUITS TO BE TESTED

Camera Circuits

Circuit ID	Circuit Description
J222	FRONT

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

NOTE: Verify that the Central Vision Processing Module (CVPM) has the latest software installed. If necessary, update the software and retest.

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. CHECK FOR BATTERY OR SYSTEM VOLTAGE DTCS IN THE CVPM

1. Refer to the saved DTC information recorded on the repair order.

Were any battery or system voltage DTCs set in the CVPM?

Yes

- Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING**.

No

- Go To [3](#)

3. CHECK THE OPERATION OF ALL CAMERAS CONNECTED TO THE CVPM

NOTE: The Surround View Camera System may use two or more connected cameras through LVDS (Low Voltage Differential Signal) Coaxial Cable.

1. Activate the Surround View Camera System by pressing the Surround View Camera soft key located in the "Controls" screen within the Uconnect system.
2. Compare the operation of all the connected cameras to the CVPM, and confirm at least one camera is operating and functioning normally.

Is one camera operating and functioning normally?

Yes

- Go To [5](#)

No

- Go To [4](#)

4. CHECK THE RELATED COAX CABLE CONNECTIONS

NOTE: When using the diagnostic scan tool, the data display screen of the ECU will show voltage values for the cameras associated to the vehicle (i.e. Front, Left, Right or Rear Camera Power). Under normal operating conditions the ECU will display 10.0 volts. If a camera is not connected the voltage value will show 10.0 volts. If the associated camera circuit is shorted (voltage, ground, etc.) those differing voltage results will be reflected on the data display as well for assisting in further troubleshooting.

NOTE: Some vehicles are not be equipped with a camera at each location specified below.

Central Vision Processing Module (CVPM) Connector Color Coding	
Front Camera	Green
Left Camera	Beige
Right Camera	Brown
Rear Camera	Orange
Video Output to Radio / Display	Violet

1. Turn the ignition off.
2. Inspect the CVPM harness connector for a secure and undamaged connection.
3. Inspect the Coax Cable in-line harness connectors for a secure and undamaged connection.
4. Inspect the related Camera harness connector for a secure and undamaged connection.

Are the connections secure and undamaged?

Yes

- Go To [5](#)

No

- Repair the cable connection as needed and check video operation.

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

5. CHECK THE CVPM

NOTE: When using the diagnostic scan tool, the data display screen of the ECU will show voltage values for the cameras associated to the vehicle (i.e. Front, Left, Right or Rear Camera Power). Under normal operating conditions the ECU will display 10.0 volts. If a camera is not connected the voltage value will show 10.0 volts. If the associated camera circuit is shorted (voltage, ground, etc.) those differing voltage results will be reflected on the data display as well for assisting in further troubleshooting.

NOTE: The following test is being used to determine that the CVPM recognizes a known good camera, cable and the related connections.

Central Vision Processing Module (CVPM) Connector Color Coding	
Front Camera	Green
Left Camera	Beige
Right Camera	Brown
Rear Camera	Orange
Video Output to Radio / Display	Violet

1. On the vehicle, identify and locate the faulted circuit connector for testing at the CVPM.

NOTE: For example, a fault setting for the Front Camera would indicate the **GREEN** connector at the CVPM.

2. Disconnect the connector at the CVPM for the faulted circuit being set against.
3. On the vehicle, identify and locate a known good operating and functioning camera, circuit and related connector at the CVPM.
4. Disconnect the connector at the CVPM for a known good operating and functioning camera.

NOTE: Continuing with the example, if a fault was setting against the Front Camera; and the Rear Camera is operating and functioning normally on the vehicle - disconnect the Rear Camera connector (**ORANGE** connector) at the CVPM to further test with.

5. From the (special tool #9977-6-8, Adapter, RG-174 Coax Cable) kit, connect the 9977-6-8-2 test lead to the 9977-6-8-3 test lead.
6. Connect the other end of the 9977-6-8-2 test lead to the CVPM connection for the fault related camera circuit.

NOTE: In the example, the **BLUE** connector from the 9977-6-8-2 test lead would connect to the **GREEN** connector on the CVPM. We are using a known good camera, cable, and connection from the Rear Camera as a substitute for the questionable camera, cable, and connection on the Front Camera.

7. Connect the other end of the 9977-6-8-3 test lead to the coaxial cable going to the known good operating and functioning camera.

NOTE: In the example, the **BLUE** connector from the 9977-6-8-3 test lead would connect to the **ORANGE** connector going to the Rear Camera. We are using a known good camera, cable, and connection from the

Rear Camera as a substitute for the questionable camera, cable, and connection on the Front Camera.

8. Check the activity status of the camera and fault status.

NOTE: In the example, the status of the Front Camera should show an active image (possibly inverted - due to orientation) of the known good camera circuit being used. The related DTCs for the Front Camera should change to STORED. In this example the CVPM would then show no active image and would show ACTIVE DTCs set against the Rear Camera with no connection being present.

Did camera activity return and the status of the original setting DTC(s) change to Stored?

Yes

- A known good camera, cable, and connection was used for testing and the CVPM is no longer a possible cause. The camera and cable are the remaining possible causes.
- Go To [6](#)

No

- A known good camera, cable, and connection was used for testing and the CVPM is the only remaining cause.
- Go To [7](#)

6. TEST THE COAX CABLE BETWEEN THE CVPM AND RELATED CAMERA

NOTE: When using the diagnostic scan tool, the data display screen of the ECU will show voltage values for the cameras associated to the vehicle (i.e. Front, Left, Right or Rear Camera Power). Under normal operating conditions the ECU will display 10.0 volts. If a camera is not connected the voltage value will show 10.0 volts. If the associated camera circuit is shorted (voltage, ground, etc.) those differing voltage results will be reflected on the data display as well for assisting in further troubleshooting.

1. Turn the ignition off.
2. Disconnect the 9977-6-8-2 and the 9977-6-8-3 test leads from the vehicle.
3. Reconnect the known connector for the known good operating and functioning camera circuit used for testing previously.

NOTE: In the example, the Rear Camera connector (ORANGE connector) was disconnected at the CVPM for testing purposes.

4. From the (special tool #9977-6-8, Adapter, RG-174 Coax Cable) kit, connect the long cable (9977-6-8-1) between the related Camera and the CVPM connector.
5. Turn the ignition on.
6. With the scan tool, erase DTCs.
7. Turn the Radio on and wait 25 seconds.
8. With the scan tool, read DTCs.

Is the DTC active?

Yes

- Replace the Camera in accordance with the service information. Refer to [**CAMERA, REAR, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Replace the Coax Cable in accordance with the service information.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CVPM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all CVPM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read CVPM DTCs.

Did the DTC return?

Yes

- Replace the Central Vision Processing Module (CVPM) in accordance with the Service Information. Refer to [**MODULE, CENTRAL VISION PROCESSING \(CVPM\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

B23C5-92-FRONT CAMERA-PERFORMANCE OR INCORRECT OPERATION

For a complete SURROUND VIEW CAMERA SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Central Vision Processing Module (CVPM) uses two cameras located on the front and rear of the vehicle. The camera signals are sent via a coaxial cable to the CVPM. The CVPM monitors the camera and camera circuits for concerns.

For an in depth explanation of the CVPM system. Refer to MODULE, CENTRAL VISION PROCESSING (CVPM), DESCRIPTION AND OPERATION .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Central Vision Processing Module (CVPM) detects video connection between the Camera and the module is not present.

DEFAULT ACTION

- The camera video image is blanked out on the video screen.

POSSIBLE CAUSES

Possible Causes
CVPM SUPPLY VOLTAGE OUT OF RANGE
LVDS COAX CABLE OPEN OR DISCONNECTED
CAMERA
CENTRAL VISION PROCESSING MODULE (CVPM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

CIRCUITS TO BE TESTED

Camera Circuits

Circuit ID	Circuit Description
J222	FRONT

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

NOTE: Verify that the Central Vision Processing Module (CVPM) has the latest software installed. If necessary, update the software and retest.

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.

3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. CHECK FOR BATTERY OR SYSTEM VOLTAGE DTCS IN THE CVPM

1. Refer to the saved DTC information recorded on the repair order.

Were any battery or system voltage DTCs set in the CVPM?

Yes

- Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING**.

No

- Go To [3](#)

3. CHECK THE OPERATION OF ALL CAMERAS CONNECTED TO THE CVPM

NOTE: **The Surround View Camera System may use two or more connected cameras through LVDS (Low Voltage Differential Signal) Coaxial Cable.**

1. Activate the Surround View Camera System by pressing the Surround View Camera soft key located in the "Controls" screen within the Uconnect system.
2. Compare the operation of all the connected cameras to the CVPM, and confirm at least one camera is operating and functioning normally.

Is one camera operating and functioning normally?

Yes

- Go To [5](#)

No

- Go To [4](#)

4. CHECK THE RELATED COAX CABLE CONNECTIONS

NOTE: **When using the diagnostic scan tool, the data display screen of the ECU will show voltage values for the cameras associated to the vehicle (i.e. Front, Left, Right or Rear Camera Power). Under normal operating conditions the ECU will display 10.0 volts. If a camera is not connected the voltage value will show 10.0 volts. If the associated camera circuit is shorted (voltage, ground, etc.) those differing voltage results will be**

reflected on the data display as well for assisting in further troubleshooting.

NOTE: Some vehicles are not be equipped with a camera at each location specified below.

Central Vision Processing Module (CVPM) Connector Color Coding	
Front Camera	Green
Left Camera	Beige
Right Camera	Brown
Rear Camera	Orange
Video Output to Radio / Display	Violet

1. Turn the ignition off.
2. Inspect the CVPM harness connector for a secure and undamaged connection.
3. Inspect the Coax Cable in-line harness connectors for a secure and undamaged connection.
4. Inspect the related Camera harness connector for a secure and undamaged connection.

Are the connections secure and undamaged?

Yes

- Go To [5](#)

No

- Repair the cable connection as needed and check video operation.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

5. CHECK THE CVPM

NOTE: When using the diagnostic scan tool, the data display screen of the ECU will show voltage values for the cameras associated to the vehicle (i.e. Front, Left, Right or Rear Camera Power). Under normal operating conditions the ECU will display 10.0 volts. If a camera is not connected the voltage value will show 10.0 volts. If the associated camera circuit is shorted (voltage, ground, etc.) those differing voltage results will be reflected on the data display as well for assisting in further troubleshooting.

NOTE: The following test is being used to determine that the CVPM recognizes a known good camera, cable and the related connections.

Central Vision Processing Module (CVPM) Connector Color Coding	
Front Camera	Green
Left Camera	Beige
Right Camera	Brown
Rear Camera	Orange
Video Output to Radio / Display	Violet

1. On the vehicle, identify and locate the faulted circuit connector for testing at the CVPM.

NOTE: For example, a fault setting for the Front Camera would indicate the GREEN connector at the CVPM.

2. Disconnect the connector at the CVPM for the faulted circuit being set against.
3. On the vehicle, identify and locate a known good operating and functioning camera, circuit and related connector at the CVPM.
4. Disconnect the connector at the CVPM for a known good operating and functioning camera.

NOTE: Continuing with the example, if a fault was setting against the Front Camera; and the Rear Camera is operating and functioning normally on the vehicle - disconnect the Rear Camera connector (ORANGE connector) at the CVPM to further test with.

5. From the (special tool #9977-6-8, Adapter, RG-174 Coax Cable) kit, connect the 9977-6-8-2 test lead to the 9977-6-8-3 test lead.
6. Connect the other end of the 9977-6-8-2 test lead to the CVPM connection for the fault related camera circuit.

NOTE: In the example, the BLUE connector from the 9977-6-8-2 test lead would connect to the GREEN connector on the CVPM. We are using a known good camera, cable, and connection from the Rear Camera as a substitute for the questionable camera, cable, and connection on the Front Camera.

7. Connect the other end of the 9977-6-8-3 test lead to the coaxial cable going to the known good operating and functioning camera.

NOTE: In the example, the BLUE connector from the 9977-6-8-3 test lead would connect to the ORANGE connector going to the Rear Camera. We are using a known good camera, cable, and connection from the Rear Camera as a substitute for the questionable camera, cable, and connection on the Front Camera.

8. Check the activity status of the camera and fault status.

NOTE: In the example, the status of the Front Camera should show an active image (possibly inverted - due to orientation) of the known good camera circuit being used. The related DTCs for the Front Camera should change to STORED. In this example the CVPM would then show no active image and would show ACTIVE DTCs set against the Rear Camera with no connection being present.

Did camera activity return and the status of the original setting DTC(s) change to Stored?

Yes

- A known good camera, cable, and connection was used for testing and the CVPM is no longer a possible cause. The camera and cable are the remaining possible causes.
- Go To [6](#)

No

- A known good camera, cable, and connection was used for testing and the CVPM is the only remaining cause.
- Go To [7](#)

6. TEST THE COAX CABLE BETWEEN THE CVPM AND RELATED CAMERA

NOTE: When using the diagnostic scan tool, the data display screen of the ECU will show voltage values for the cameras associated to the vehicle (i.e.

Front, Left, Right or Rear Camera Power). Under normal operating conditions the ECU will display 10.0 volts. If a camera is not connected the voltage value will show 10.0 volts. If the associated camera circuit is shorted (voltage, ground, etc.) those differing voltage results will be reflected on the data display as well for assisting in further troubleshooting.

1. Turn the ignition off.
2. Disconnect the 9977-6-8-2 and the 9977-6-8-3 test leads from the vehicle.
3. Reconnect the known connector for the known good operating and functioning camera circuit used for testing previously.

NOTE: In the example, the Rear Camera connector (ORANGE connector) was disconnected at the CVPM for testing purposes.

4. From the (special tool #9977-6-8, Adapter, RG-174 Coax Cable) kit, connect the long cable (9977-6-8-1) between the related Camera and the CVPM connector.
5. Turn the ignition on.
6. With the scan tool, erase DTCs.
7. Turn the Radio on and wait 25 seconds.
8. With the scan tool, read DTCs.

Is the DTC active?

Yes

- Replace the Camera in accordance with the service information. Refer to [CAMERA, REAR, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Replace the Coax Cable in accordance with the service information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CVPM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all CVPM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read CVPM DTCs.

Did the DTC return?

Yes

- Replace the Central Vision Processing Module (CVPM) in accordance with the Service Information. Refer to [MODULE, CENTRAL VISION PROCESSING \(CVPM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

U0010-00-CAN INTERIOR BUS

NOTE: The DTC number or title listed above may not appear in the Body Control Module (BCM) diagnostic procedures. If this occurs, perform the CAN Interior Bus diagnostic procedure in the BCM that is comparable to the above DTC title (examples: CAN INTERIOR BUS, CAN INTERIOR BUS OFF, CAN INTERIOR BUS PERFORMANCE or CAN INTERIOR BUS OFF PERFORMANCE).

Perform the comparable CAN IHS Bus diagnostic tests in the BCM. Refer to [BODY CONTROL MODULE \(BCM\) - DIAGNOSTIC CODE INDEX](#) .

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

The COMMUNICATION DIAGNOSTIC PROCEDURE **MUST** be performed before replacing any component(s) or module(s). Perform the COMMUNICATION DIAGNOSTIC PROCEDURE. Refer to [COMMUNICATION DIAGNOSTIC PROCEDURE](#) .

U0184-00-LOST COMMUNICATION WITH RADIO

The COMMUNICATION DIAGNOSTIC PROCEDURE **MUST** be performed before replacing any component(s) or module(s). Perform the COMMUNICATION DIAGNOSTIC PROCEDURE. Refer to [COMMUNICATION DIAGNOSTIC PROCEDURE](#) .

U0264-00-LOST COMMUNICATION WITH CAMERA MODULE-REAR

For a complete SURROUND VIEW CAMERA SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Central Vision Processing Module (CVPM) uses two cameras located on the front and rear of the vehicle. The camera signals are sent via a coaxial cable to the CVPM. The CVPM monitors the camera and camera

circuits for concerns.

For an in depth explanation of the CVPM system. Refer to [MODULE, CENTRAL VISION PROCESSING \(CVPM\), DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- Internal communication to camera is not available or disrupted.

DEFAULT ACTION

- Video image not available.

POSSIBLE CAUSES

Possible Causes
VIDEO CABLE OPEN OR DISCONNECTED REAR CAMERA CENTRAL VISION PROCESSING MODULE (CVPM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

NOTE: Verify that the Central Vision Processing Module (CVPM) has the latest software installed. If necessary, update the software and retest.

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. CHECK FOR BATTERY OR SYSTEM VOLTAGE DTCS IN THE CVPM

1. Refer to the saved DTC information recorded on the repair order.

Were any battery or system voltage DTCS set in the CVPM?

Yes

- Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING**.

No

- Go To [3](#)

3. CHECK THE OPERATION OF ALL CAMERAS CONNECTED TO THE CVPM

NOTE: **The Surround View Camera System may use two or more connected cameras through LVDS (Low Voltage Differential Signal) Coaxial Cable.**

1. Activate the Surround View Camera System by pressing the Surround View Camera soft key located in the "Controls" screen within the Uconnect system.
2. Compare the operation of all the connected cameras to the CVPM, and confirm at least one camera is operating and functioning normally.

Is one camera operating and functioning normally?

Yes

- Go To [5](#)

No

- Go To [4](#)

4. CHECK THE RELATED COAX CABLE CONNECTIONS

NOTE: **Some vehicles are not be equipped with a camera at each location specified below.**

Central Vision Processing Module (CVPM) Connector Color Coding	
Front Camera	Green
Left Camera	Beige
Right Camera	Brown
Rear Camera	Orange
Video Output to Radio / Display	Violet

1. Turn the ignition off.
2. Inspect the CVPM harness connector for a secure and undamaged connection.
3. Inspect the Coax Cable in-line harness connectors for a secure and undamaged connection.
4. Inspect the related Camera harness connector for a secure and undamaged connection.

Are the connections secure and undamaged?

Yes

- Go To [5](#)

No

- Repair the cable connection as needed and check video operation.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. CHECK THE CVPM

NOTE: The following test is being used to determine that the CVPM recognizes a known good camera, cable and the related connections.

Central Vision Processing Module (CVPM) Connector Color Coding	
Front Camera	Green
Left Camera	Beige
Right Camera	Brown
Rear Camera	Orange
Video Output to Radio / Display	Violet

1. On the vehicle, identify and locate the faulted circuit connector for testing at the CVPM.

NOTE: For example, a fault setting for the Front Camera would indicate the **GREEN** connector at the CVPM.

2. Disconnect the connector at the CVPM for the faulted circuit being set against.
3. On the vehicle, identify and locate a known good operating and functioning camera, circuit and related connector at the CVPM.
4. Disconnect the connector at the CVPM for a known good operating and functioning camera.

NOTE: Continuing with the example, if a fault was setting against the Front Camera; and the Rear Camera is operating and functioning normally on the vehicle - disconnect the Rear Camera connector (**ORANGE** connector) at the CVPM to further test with.

5. From the (special tool #9977-6-8, Adapter, RG-174 Coax Cable) kit, connect the 9977-6-8-2 test lead to the 9977-6-8-3 test lead.
6. Connect the other end of the 9977-6-8-2 test lead to the CVPM connection for the fault related camera circuit.

NOTE: In the example, the **BLUE** connector from the 9977-6-8-2 test lead would connect to the **GREEN** connector on the CVPM. We are using a known good camera, cable, and connection from the Rear Camera as a substitute for the questionable camera, cable, and connection on the Front Camera.

7. Connect the other end of the 9977-6-8-3 test lead to the coaxial cable going to the known good operating and functioning camera.

NOTE: In the example, the **BLUE** connector from the 9977-6-8-3 test lead would connect to the **ORANGE** connector going to the Rear Camera. We are using a known good camera, cable, and connection from the Rear Camera as a substitute for the questionable camera, cable, and connection on the Front Camera.

8. Check the activity status of the camera and fault status.

NOTE: In the example, the status of the Front Camera should show an active image (possibly inverted - due to orientation) of the known good camera circuit being used. The related DTCs for the Front

Camera should change to STORED. In this example the CVPM would then show no active image and would show ACTIVE DTCs set against the Rear Camera with no connection being present.

Did camera activity return and the status of the original setting DTC(s) change to Stored?

Yes

- A known good camera, cable, and connection was used for testing and the CVPM is no longer a possible cause. The camera and cable are the remaining possible causes.
- Go To [6](#)

No

- A known good camera, cable, and connection was used for testing and the CVPM is the only remaining cause.
- Go To [7](#)

6. TEST THE COAX CABLE BETWEEN THE CVPM AND RELATED CAMERA

1. Turn the ignition off.
2. Disconnect the 9977-6-8-2 and the 9977-6-8-3 test leads from the vehicle.
3. Reconnect the known connector for the known good operating and functioning camera circuit used for testing previously.

NOTE: In the example, the Rear Camera connector (ORANGE connector) was disconnected at the CVPM for testing purposes.

4. From the (special tool #9977-6-8, Adapter, RG-174 Coax Cable) kit, connect the long cable (9977-6-8-1) between the related Camera and the CVPM connector.
5. Turn the ignition on.
6. With the scan tool, erase DTCs.
7. Turn the Radio on and wait 25 seconds.
8. With the scan tool, read DTCs.

Is the DTC active?

Yes

- Replace the Camera in accordance with the service information. Refer to [CAMERA, REAR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Replace the Coax Cable in accordance with the service information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CVPM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.

- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all CVPM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read CVPM DTCs.

Did the DTC return?

Yes

- Replace the Central Vision Processing Module (CVPM) in accordance with the Service Information. Refer to [**MODULE, CENTRAL VISION PROCESSING \(CVPM\), REMOVAL AND INSTALLATION**](#).
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#).

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#).
- Test complete.

U0265-00-LOST COMMUNICATION WITH FRONT CAMERA

For a complete SURROUND VIEW CAMERA SYSTEM wiring diagram, **refer to the appropriate wiring information**.

THEORY OF OPERATION

The Central Vision Processing Module (CVPM) uses two cameras located on the front and rear of the vehicle. The camera signals are sent via a coaxial cable to the CVPM. The CVPM monitors the camera and camera circuits for concerns.

For an in depth explanation of the CVPM system. Refer to [**MODULE, CENTRAL VISION PROCESSING \(CVPM\), DESCRIPTION AND OPERATION**](#).

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- Internal communication to camera is not available or disrupted.

DEFAULT ACTION

- Video image not available.

POSSIBLE CAUSES

Possible Causes
VIDEO CABLE OPEN OR DISCONNECTED
FRONT CAMERA
CENTRAL VISION PROCESSING MODULE (CVPM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

NOTE: Verify that the Central Vision Processing Module (CVPM) has the latest software installed. If necessary, update the software and retest.

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK FOR BATTERY OR SYSTEM VOLTAGE DTCS IN THE CVPM

1. Refer to the saved DTC information recorded on the repair order.

Were any battery or system voltage DTCs set in the CVPM?

Yes

- Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING**.

No

- Go To [3](#)

3. CHECK THE OPERATION OF ALL CAMERAS CONNECTED TO THE CVPM

NOTE: The Surround View Camera System may use two or more connected cameras through LVDS (Low Voltage Differential Signal) Coaxial Cable.

1. Activate the Surround View Camera System by pressing the Surround View Camera soft key located in the "Controls" screen within the Uconnect system.
2. Compare the operation of all the connected cameras to the CVPM, and confirm at least one camera is operating and functioning normally.

Is one camera operating and functioning normally?

Yes

- Go To [5](#)

No

- Go To [4](#)

4. CHECK THE RELATED COAX CABLE CONNECTIONS

NOTE: Some vehicles are not be equipped with a camera at each location specified below.

Central Vision Processing Module (CVPM) Connector Color Coding	
Front Camera	Green
Left Camera	Beige
Right Camera	Brown
Rear Camera	Orange
Video Output to Radio / Display	Violet

1. Turn the ignition off.
2. Inspect the CVPM harness connector for a secure and undamaged connection.
3. Inspect the Coax Cable in-line harness connectors for a secure and undamaged connection.
4. Inspect the related Camera harness connector for a secure and undamaged connection.

Are the connections secure and undamaged?

Yes

- Go To [5](#)

No

- Repair the cable connection as needed and check video operation.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. CHECK THE CVPM

NOTE: The following test is being used to determine that the CVPM recognizes a known good camera, cable and the related connections.

Central Vision Processing Module (CVPM) Connector Color Coding	
Front Camera	Green

Central Vision Processing Module (CVPM) Connector Color Coding	
Left Camera	Beige
Right Camera	Brown
Rear Camera	Orange
Video Output to Radio / Display	Violet

1. On the vehicle, identify and locate the faulted circuit connector for testing at the CVPM.

NOTE: For example, a fault setting for the Front Camera would indicate the **GREEN** connector at the CVPM.

2. Disconnect the connector at the CVPM for the faulted circuit being set against.
3. On the vehicle, identify and locate a known good operating and functioning camera, circuit and related connector at the CVPM.
4. Disconnect the connector at the CVPM for a known good operating and functioning camera.

NOTE: Continuing with the example, if a fault was setting against the Front Camera; and the Rear Camera is operating and functioning normally on the vehicle - disconnect the Rear Camera connector (**ORANGE** connector) at the CVPM to further test with.

5. From the (special tool #9977-6-8, Adapter, RG-174 Coax Cable) kit, connect the 9977-6-8-2 test lead to the 9977-6-8-3 test lead.
6. Connect the other end of the 9977-6-8-2 test lead to the CVPM connection for the fault related camera circuit.

NOTE: In the example, the **BLUE** connector from the 9977-6-8-2 test lead would connect to the **GREEN** connector on the CVPM. We are using a known good camera, cable, and connection from the Rear Camera as a substitute for the questionable camera, cable, and connection on the Front Camera.

7. Connect the other end of the 9977-6-8-3 test lead to the coaxial cable going to the known good operating and functioning camera.

NOTE: In the example, the **BLUE** connector from the 9977-6-8-3 test lead would connect to the **ORANGE** connector going to the Rear Camera. We are using a known good camera, cable, and connection from the Rear Camera as a substitute for the questionable camera, cable, and connection on the Front Camera.

8. Check the activity status of the camera and fault status.

NOTE: In the example, the status of the Front Camera should show an active image (possibly inverted - due to orientation) of the known good camera circuit being used. The related DTCs for the Front Camera should change to **STORED**. In this example the CVPM would then show no active image and would show **ACTIVE** DTCs set against the Rear Camera with no connection being present.

Did camera activity return and the status of the original setting DTC(s) change to Stored?

Yes

- A known good camera, cable, and connection was used for testing and the CVPM is no longer a possible cause. The camera and cable are the remaining possible causes.

- Go To [6](#)

No

- A known good camera, cable, and connection was used for testing and the CVPM is the only remaining cause.
- Go To [7](#)

6. TEST THE COAX CABLE BETWEEN THE CVPM AND RELATED CAMERA

1. Turn the ignition off.
2. Disconnect the 9977-6-8-2 and the 9977-6-8-3 test leads from the vehicle.
3. Reconnect the known connector for the known good operating and functioning camera circuit used for testing previously.

NOTE: In the example, the Rear Camera connector (ORANGE connector) was disconnected at the CVPM for testing purposes.

4. From the (special tool #9977-6-8, Adapter, RG-174 Coax Cable) kit, connect the long cable (9977-6-8-1) between the related Camera and the CVPM connector.
5. Turn the ignition on.
6. With the scan tool, erase DTCs.
7. Turn the Radio on and wait 25 seconds.
8. With the scan tool, read DTCs.

Is the DTC active?

Yes

- Replace the Camera in accordance with the service information. Refer to [CAMERA, REAR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Replace the Coax Cable in accordance with the service information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CVPM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all CVPM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read CVPM DTCs.

Did the DTC return?

Yes

- Replace the Central Vision Processing Module (CVPM) in accordance with the Service Information. Refer to **MODULE, CENTRAL VISION PROCESSING (CVPM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

U0422-00-IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE

2021 ACCESSORIES AND EQUIPMENT

Chime/Buzzer/Driver Assist (Service Information) - Gladiator

DESCRIPTION AND OPERATION

BLIND SPOT MONITORING

DESCRIPTION

The Blind Spot Monitoring (BSM) with Rear Cross-Path (RCP) detection systems include the following major components:

COMPONENT INDEX

1.	Refer to <u>BODY CONTROL MODULE (BCM).</u>
2.	Refer to <u>EXTERIOR REARVIEW MIRRORS - BLIND SPOT DISPLAY.</u>
3.	Refer to <u>RADIO.</u>
4.	Refer to <u>BLIND SPOT MODULE (BSM) / BLIND SPOT SENSOR (BSS).</u>
5.	Refer to <u>INSTRUMENT PANEL CLUSTER (IPC).</u>

Blind spot monitoring, if enabled in the radio, monitors rear blind zones on both sides of the vehicle via radar. If a vehicle is sensed in one of the blind spot zones, the driver will be notified via an icon in the outside rear view mirror on that side of the vehicle.

Rear cross path detection monitors for vehicles perpendicular to the rear of the vehicle when in reverse. The system provides feedback to the driver via audible chimes and visual icons. The visual and audible alerts correspond to the side that approaching vehicle.

The BSM system:

- Monitors the vehicle's blind spots.
- Notifies the driver when another vehicle is present.
- Uses radar sensors located in the sides of the tail lamps.
- Illuminates icons in the outside review mirrors.
- Chimes when the driver selects a turn signal on the side that has a vehicle in the zone.
- Notifies driver of vehicles in the blind spot areas when changing lanes, passing vehicles, or if being passed.
- RCP detection notifies the driver of a vehicle crossing the vehicle's path when in reverse.
- The driver can turn the system OFF, ON or ON with Chime. (Note: in RCP mode the chime can not be disabled it is always active).

OPERATION

When the vehicle speed exceeds 10 km/h (6 mph) and the Left Blind Spot Sensor (LBSS) or the Right Blind Spot Sensor (RBSS) module detects an object within 50 km/h (30 mph) of the vehicle speed passing through the monitored zone from the rear of the vehicle, the BSM sensors will request a Blind Spot Display (BSD) activation request which is a yellow Light Emitting Diode (LED) triangle will then illuminate in the upper corner of the appropriate mirror through a Pulse Width Modulated (PWM) circuit to the mirror. If the driver attempts to enter the zone where the object has been detected and with the turn signal activated, the sensor will send out two additional requests over the Controller Area Network - Interior High Speed (CAN-IHS) bus:

- Amplifier (AMP) - A chime will sound.
- Radio (if the vehicle is NOT equipped with an AMP) - The audio speakers will mute.

There are three modes for the BSM system:

- OFF: All visual and audible alerts related to objects of interest in the blind sport zone are suppressed.
- ON with LEDs only: The LBSS shall request a visual LED alert only for the appropriate side exterior rearview mirror if there is an object of interest in the blind spot zone.
- ON with LEDs and chime: The LBSS shall request a visual LED and audible alert for the appropriate side mirror if there is an object of interest in the blind spot range and the turn signal status is "ON" on that side of the vehicle. Otherwise, there will be a visual alert only if the turn signal is "Off" and there is an object of interest in the blind spot zone.

Rear Cross Path (RCP) detection system:

- Uses the LED icons on the outside mirrors to warn of vehicles approaching. The alert corresponds to the side that the vehicle is approaching from.
- Is activated when the vehicle is in REVERSE gear and the blind spot system is enabled to ON or ON with Chime in the Radio.

The RCP detection system monitors the rear detection zones for vehicles that are moving toward the sides of the vehicle with a minimum speed of 5 km/h (3 mph).

BLIND SPOT MODULE (BSM) / BLIND SPOT SENSOR (BSS)

BLIND SPOT MODULE (BSM) / BLIND SPOT SENSOR (BSS)

Refer to [**COMPONENT INDEX**](#).

- The BSM system used in this vehicle has two control modules, each internal to the sensor mounted on the inside of the tail lamp assembly. The RBSS is mounted to the backside of the right tail lamp assembly and can be serviced separately from the lamp assembly. The LBSS is mounted to the backside of the left tail lamp assembly and can be serviced separately from the lamp assembly
- Each of the sensors are independent control units.
- Each sensor receives a fused ignition RUN power output.
- Each sensor provides a PWM circuit to its respective side mirror to activate the LED BSD icon.
- Each sensor is also controls the dimming light strategy for the LED BSD icon for each mirror.
- Each sensor activates a bulb-check for approximately 0.6 seconds upon power up for each mirrors LED BSD.
- The LBSS is the master configuration node of the BSM system.
- The LBSS learns the vehicle transmission type through a bus CAN-IHS bus signal gated from the BCM.
- If the sensors are blocked, the LBSS is responsible for sending a signal to the IPC to enable the "Blind Spot Temporarily Unavailable System Blocked" message as well as activating both BSD LED icons in the mirrors.
- The LBSS is responsible for sending the directional chime request for each chime warning event using the signals.

- The detection zone covers a zone approximately one lane on both sides of the vehicle 3.2 meters (10 ft.) and extends from the driver's seat to between 3 and 7 meters (10 ft.) behind the rear fascia depending of the speed of the vehicle.

Inputs

- Fused ignition run/accessory power output
- Vehicle transmission type via the CAN-IHS gated from the BCM
- Transmission gear position signal gated from the BCM

Outputs

- PWM circuit to each sensors respective side mirror to activate the LED BSD icon
- Dimming light strategy for the LED BSD icon for each mirror
- Indication strategy to the IPC to enable the warning indicator
- Directional chime request for each chime warning event

BODY CONTROL MODULE (BCM)

BODY CONTROL MODULE (BCM)

Refer to [COMPONENT INDEX](#).

The BCM performs the gateway function from the CAN-IHS to the CAN-C (Chassis) network.

Outputs

- Vehicle transmission type to the LBSS/RBSS
- Mute request to the radio

EXTERIOR REARVIEW MIRRORS - BLIND SPOT DISPLAY

EXTERIOR REARVIEW MIRRORS - BLIND SPOT DISPLAY

Refer to [COMPONENT INDEX](#).

- Each Blind Spot Display (BSD) located within the exterior rearview mirror is controlled by a hard wired output from the same side LBSS/RBSS.
- Each BSD shares a ground with the turn signal located within the mirror.

The BSM displays provide the vehicle operator with a visual alert that a target vehicle has been detected within one of the BSM or RCP detection zones. The BSM display is also illuminated momentarily as a bulb check each time the ignition switch status transitions to On as a part of the BSM system self tests. If a BSM display remains illuminated with the vehicle in the park or neutral position, it indicates that the BSM system has registered a system fault and may require service. If there is a fault, the mirror indicator opposite from the faulted indicator side will stay illuminated.

INSTRUMENT PANEL CLUSTER (IPC)

INSTRUMENT PANEL CLUSTER (IPC)

Refer to [COMPONENT INDEX](#).

- The IPC is responsible for displaying temporary unavailable and service warnings to the customer.

Inputs

- Indication strategy from the LBSS/RBSS to enable the warning indicator

RADIO

RADIO

Refer to [COMPONENT INDEX](#).

The AMP or Radio (if the vehicle is not equipped with an AMP) is responsible for the audible BSM warnings to the customer.

Inputs

- The Radio receives a request from the BCM to mute any audio outputs during alert events

FULL SPEED RANGE FORWARD COLLISION WARNING PLUS

DESCRIPTION

NOTE: The Forward Collision Warning (FCW) system alerts and assists the driver to help avoid or mitigate a collision. If the driver does not respond to any of the audible, visual, and haptic warnings, the impact may not be avoided.

COMPONENT INDEX

1.	Refer to ANTI-LOCK BRAKE SYSTEM (ABS) MODULE .
2.	Refer to BODY CONTROL MODULE (BCM) .
3.	Refer to DISPLAY SCREEN MODULE (DSM) .
4.	Refer to DRIVER ASSISTANCE SYSTEM MODULE (DASM) .
5.	Refer to INSTRUMENT PANEL CLUSTER (IPC) .
6.	Refer to AMPLIFIER (AMP) IF EQUIPPED OR RADIO .

- The FCW system uses a forward looking radar to determine the range and speed of the vehicles and objects in the forward path of the host vehicle and a camera to perform object classification and to determine road lane markings which are integrated into the DASM Electronic Control Unit (ECU).
- The DASM uses the radar and camera fusion data to determine probable collisions with vehicles and objects in the forward path of the host vehicle.
- Based on the sensor fusion algorithm and vehicle dynamic data, the DASM determines a Time To Collision (TTC) between the host vehicle and any target vehicles or objects in its forward path.
- When the TTC becomes too small the FCW system provides the driver with audible and visual warning, brake prefill, a haptic warning in the form of a brake jerk, limited autonomous braking and Advanced Brake Assist (ABA) to attempt to alert the driver and to mitigate a potential frontal collision.
- At low vehicle speeds, in addition to the above mentioned functionality, the FCW system provides full autonomous braking in an attempt to mitigate a frontal collision.

The FCW system uses three levels of warnings:

- A visual warning displayed in the IPC
- An audible warning generated by the radio or amplifier system
- A haptic warning in the form of a brake jerk. A brake jerk is a brake pulse or a momentary application of the brakes

The FCW system has six customer configurations:

- FCW+ Far
- FCW+ Medium
- FCW+ Near
- FCW Far
- FCW Medium
- FCW Near

The FCW system is disabled and enabled via a soft switch located in the radio settings in the safety and driver assistance menu. When the system is disabled by the user or if the system is disabled due to a fault, the FCW **OFF** icon will be displayed in the IPC.

OPERATION

- The FCW system is only active when the status of the ignition position is ON, the transmission is in **D** rive and wheel speed sensors indicate that the vehicle is moving in a forward direction.
- The system can be manually disabled and enabled by the vehicle operator using the soft switch in the radio. The default status of FCW is ON. The system state is kept in memory from one key cycle to the next. If the system is turned OFF, it will remain OFF when the vehicle is restarted. The minimum speed for FCW activation is 3 mph (5 km/h).
- The FCW+ system uses the forward looking DASM to determine the range and speed of the vehicle(s) and objects in the forward path of the host vehicle.
- The FCW+ system uses the DASM to perform object classification and to determine lane markings.
- The FCW+ system uses a sensor fusion algorithm to combine the information detected from the object detection and the lane markings to determine probable collisions with vehicles and objects in the forward path of the host vehicle. The internal camera provides the DASM with object information, lane information and the camera status. The sensor fusion algorithm and logic is contained within the DASM.
- Based on the sensor fusion algorithm and vehicle dynamic data the FCW+ System determines a TTC between the host vehicle and any target vehicles or objects in its forward path.
- The system will react on moving objects. A target is considered a moving object if it has a velocity greater than zero while the system is tracking it.
- The system will react on stopped objects. A target is considered a stopped object if it has a velocity greater than zero, then comes to a stop while the system is tracking it.
- The system will react on stationary objects. A target is considered a stationary object if it has zero velocity the entire time the system is tracking it.
- When the TTC becomes too small the FCW system issues visual, audible and haptic warning(s) to alert the driver of a probable collision.
- The first warning provided by the system will be a combined audible/visual warning to the driver. This audible/visual warning may be activated at the same time the brake prefill is performed.
- After the first warning, if the driver has not responded and the collision is still probable, the system provides a second warning. The second warning is a haptic warning in the form of a brake jerk. The DASM will request a brake jerk by transmitting a request to the ABS module. The ABS module will respond and execute the brake jerk request. The audible/visual warnings will be active during the brake jerk warning.
- After the brake jerk, if the driver still has not responded and the collision is still probable the system will activate autonomous braking. The DASM makes the deceleration requests for autonomous braking by

transmitting the signals to the ABS module. The ABS module will respond to the deceleration request for autonomous braking. The audible and visual warnings will be active during the autonomous braking.

- If an ABS event is active, the DASM will continuously send an autonomous brake request while the ABS event is active. Under this condition, the ABS module will honor the autonomous brake request based on the arbitration strategy defined for multiple requests to the ABS system. Autonomous braking may be requested after, at the same time as, or without a brake jerk request, and the request must be honored by the ABS in this condition.

BRAKE PREFILL OPERATION

- Under normal circumstances, there is space between the pads and rotors to prevent the pads from wearing out prematurely. This space between the pads and rotors increases the response time during any situation which may require emergency braking. The brake prefill prepares the system for braking by moving the pads closer to the rotor to improve braking response time.
- The brake prefill is performed by the ABS module.
- The DASM controls the activation and deactivation of the brake prefill.
- The brake prefill should cause no audible brake noise.
- The brake prefill should cause no vehicle deceleration.
- The brake lights will not be activated during a brake prefill.

ADVANCED BRAKE ASSIST OPERATION

- The ABA feature of FCW will provide additional braking during an emergency braking event if the driver provides insufficient braking for the situation.
- The DASM will make deceleration requests for the advanced brake assist feature by transmitting request signals to the ABS module.
- ABA will be aborted when the driver completely releases the brake pedal.
- If an ABS event is active, the DASM will continuously send an ABA request while the ABS event is active. Under this condition, the ABS module will honor the ABA request based on the arbitration strategy defined for multiple requests to the ABS system.

AUTONOMOUS BRAKE REQUEST OPERATION

- After the brake jerk, if the driver still has not responded and the collision is still probable the system will activate autonomous braking.
- The DASM will make the deceleration requests for autonomous braking by transmitting the signals to the ABS module.
- The ABS system will send a Controller Area Network-Chassis (CAN-C) bus request to the BCM to activate the brake lights.

Since there are multiple modules involved in the operation of the FCW system, all faults or diagnostic trouble codes should be checked during diagnosis. The DASM integrated radar requires proper alignment. Any alignment or configuration issues may cause the system to be inoperative. If the DASM detects incorrect or compromised information, the FCW will function in a limited capacity.

AMPLIFIER (AMP) IF EQUIPPED OR RADIO

AMPLIFIER (AMP) IF EQUIPPED OR RADIO

Refer to **COMPONENT INDEX**.

Used to provide auditory warning chimes to the cabin of the vehicle. The DASM controls the warning logic and uses the BCM to provide a gated message request to the Radio or AMP.

ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

Refer to [COMPONENT INDEX](#).

The ABS module provides a variety of vehicle dynamic inputs to the DASM. The DASM uses these inputs to manage the FCW strategy. The DASM will output braking requests to the ABS module for autonomous braking and brake prefill.

BODY CONTROL MODULE (BCM)

BODY CONTROL MODULE (BCM)

Refer to [COMPONENT INDEX](#).

The BCM is the gateway for the BUS communication systems. The BCM is also responsible for providing vehicle specific configuration parameters to multiple nodes on the BUS, battery voltage and commanded ignition state signals to the DASM. The BCM receives input signals from the DASM that it gates to the IPC for warning display messages and, under specific conditions, to the Radio or AMP to provide audible chime warnings.

DISPLAY SCREEN MODULE (DSM)

DISPLAY SCREEN MODULE (DSM)

Refer to [COMPONENT INDEX](#).

The DSM provides an interface for the vehicle operator to modify the customer programmable options.

DRIVER ASSISTANCE SYSTEM MODULE (DASM)

DRIVER ASSISTANCE SYSTEM MODULE (DASM)

Refer to [COMPONENT INDEX](#).

The DASM uses an integral radar and camera, by means of data fusion, to detect vehicles in the forward path of the vehicle that are moving, stopped or stationary and lane markings on the road. The DASM considers an object moving if it has a velocity greater than zero while being tracked. The DASM considers an object stopped if it has a velocity greater than zero and then comes to a stop. The DASM will consider an object stationary if it has zero velocity the entire time that it is being tracked.

The DASM controls the activation and deactivation of the visual and audible warning in the IPC. The DASM commanded audible warning used by the FCW system is generated by the radio or amplifier system. All warning signals, visual or auditory, are transmitted to the BCM over the CAN-C bus to be gated to CAN-Interior High Speed (CAN-IHS) and forwarded to the IPC, Radio or AMP.

INSTRUMENT PANEL CLUSTER (IPC)

INSTRUMENT PANEL CLUSTER (IPC)

Refer to [COMPONENT INDEX](#).

The IPC receives vehicle specific configuration data and warning message requests gated from the BCM. The command for the warning messages originate with the DASM.

OFF-ROAD CAMERA SYSTEM

DESCRIPTION

The forward and rear view camera system can consist of the following components:

COMPONENT INDEX

1.	Refer to <u>FRONT VIEW CAMERA (FVC).</u>
2.	Refer to <u>BODY CONTROL MODULE (BCM).</u>
3.	Refer to <u>CENTRAL VISION PROCESSING MODULE (CVPM).</u>
4.	Refer to <u>REAR VIEW CAMERA (RVC).</u>
5.	Refer to <u>RADIO.</u>

RVC - The RVC with trailer hitch zoom displays an on-screen mirrored image of the rear surroundings behind the vehicle whenever the gear shift lever is placed into "REVERSE" or "MANUALLY" activated from the radio screen. The system helps the driver judge the relative position and distance to obstacles behind the vehicle. When enabled, customer selectable Static Gridlines with the center line are overlaid on Backup Camera View. When enabled, customer selectable Dynamic Gridlines with the center line are overlaid on Backup Camera View.

FVC - The FVC displays the front image of the vehicle whenever activated from the radio screen. The system helps the driver to get a better view of the front of the vehicle for Off Road activity. When enabled, customer selectable Dynamic Tire Lines are overlaid on FVC view.

The FVC is capable of displaying camera images under the following conditions:

- The driver has enabled the system
- Ignition state is RUN
- Wheel speed signals are detected (any speeds)
- PRND status is detected (any gear)

The driver is able to enable to the FVC or the RVC with display via a touch screen control soft button entry in the radio menu.

Zoom View Requirements

Zoom in P ark - The CVPM receives a Control Area Network - Interior High Speed (CAN-IHS) bus message from the radio indicating the customer selectable zoom option has been requested. The CVPM confirms that the vehicle is in **P** ark based on an input from the BCM and that the vehicle speed does not indicate that the vehicle is in motion. Once these conditions are confirmed, the CVPM switches from backup camera view mode to a backup zoomed view once the Zoom (+) button is pressed on the video camera display. When pressing the (-) button, the CVPM switches from the zoomed view back to the backup camera view.

Zoom in R everse - The CVPM receives a Control Area Network - Interior High Speed (CAN-IHS) bus message from the radio indicating the customer selectable zoom option has been requested. The CVPM confirms that the vehicle is in **R** everse based on an input from the BCM and that the vehicle speed does not

exceed 8 mph. Once these conditions are confirmed, the CVPM switches from backup camera view mode to a backup zoomed view once the Zoom (+) button is pressed on the video camera display. When pressing the (-) button, the CVPM switches from the zoomed view back to the backup camera view.

Zoom in N eutral - The CVPM receives a Control Area Network - Interior High Speed (CAN-IHS) bus message from the radio indicating the customer selectable zoom option has been requested. The CVPM confirms that the vehicle is in **N eutral** based on an input from the BCM and that the vehicle speed does not exceed 8 mph. Once these conditions are confirmed, the CVPM switches from backup camera view mode to a backup zoomed view once the Zoom (+) button is pressed on the video camera display. When pressing the (-) button, the CVPM switches from the zoomed view back to the backup camera view.

Zoom in D rive - The CVPM receives a Control Area Network - Interior High Speed (CAN-IHS) bus message from the radio indicating the customer selectable zoom option has been requested. The CVPM confirms that the vehicle is in **D rive** based on an input from the BCM and that the vehicle speed does not exceed 8 mph. Once these conditions are confirmed, the CVPM switches from backup camera view mode to a backup zoomed view once the Zoom (+) button is pressed on the video camera display. When pressing the (-) button, the CVPM switches from the zoomed view back to the backup camera view.

CVPM Front Camera Washing System - The FVC radio options include a "Clean Camera" soft button that the CVPM will highlight when needed. When this button is pressed, the CVPM activates a timed wash cycle for up to 20 seconds. The FVC has its own washer nozzle and pump connected near to it in order to perform the washing of the lens.

Grid Lines - RVC

- **Dynamic** - When enabled, dynamic grid lines are projected on the ground plane and overlaid on the backup camera view. The center line is overlaid with the dynamic grid line. The dynamic grid lines represent the maximum width of the vehicle plus an additional one inch per side and the projected path of the vehicle based on its direction of travel. These overlaid active dynamic grid lines are enabled/disabled via a touch screen control (soft button) in the personalization entry in the camera settings menu. The dynamic grid lines will not be present or function if the steering angle signal to the CVPM is absent or implausible.
- **Static** - When enabled, static grid lines are projected on the ground plane and overlaid on the backup camera view. The center line is overlaid with the static grid lines. The static grid lines represent the maximum width of the vehicle. The overlaid static grid lines can be enabled/disabled via a touch screen control (soft button) personalization entry in the camera settings menu.

Tire Lines - FVC - When enabled, tire lines are projected on the ground plane and overlaid on the front camera video image. The overlaid tire lines can be enabled/disabled via a touch screen control (soft button) personalization entry in the camera settings menu. The tire lines will not be present or function if the steering angle signal to the CVPM is absent or implausible.

Radio Soft Buttons for Camera Options - When any of the camera soft buttons for display are selected, the radio sends a signal over the bus to the CVPM with the request and awaits a return signal from the CVPM indicating that the display view is active. The radio then displays the proper camera video image.

Indication Strategy

- The CVPM image output resolution is 1024 x 768 pixels and the radio supports an aspect ratio of 4:3.
- The CVPM overlays the following soft buttons on the backup camera view and the backup zoomed view:
 - Backup Camera
 - Zoom
 - FVC
 - Image Defeat
- The CVPM overlays the following soft buttons on the FVC view:
 - FFC

- Backup Camera
- Clean Camera
- Image Defeat
- When the CVPM has incurred a communication error with any camera, the CVPM will blank the image from the faulty camera.

BODY CONTROL MODULE (BCM)

BODY CONTROL MODULE (BCM)

Refer to [COMPONENT INDEX](#).

The BCM is responsible for vehicle configuration deployment and gating messages between CAN networks for system operations.

Outputs

- Gated vehicle speed message to the CVPM
- PRND state to the CVPM
- Ignition state to the CVPM
- Steering wheel angle to the CVPM
- Vehicle configuration - vehicle line, Body style, which cameras are equipped, transfer case type, transfer case state, transmission type and transmission gear state to the CVPM
- Global drive mode status to the CVPM
- Steering factor to the CVPM
- Camera wash response to the CVPM

CENTRAL VISION PROCESSING MODULE (CVPM)

CENTRAL VISION PROCESSING MODULE (CVPM)

Refer to [COMPONENT INDEX](#).

The video processing unit or CVPM is capable of generating video views for the FVC off road and RVC backup options. Other functions and operations of the CVPM are:

- The camera system uses multiple cameras to provide situational awareness during maneuvers requiring real-time visual checks of the vehicle's perimeter.
- The camera system provides an automatically selected view with minimal distortion from which it is easy to judge distance and orientation to obstacles in the field of view.
- The camera system views are displayed based on PRND status, vehicle speed and trajectory with more view options available through direct on-screen interaction on the touch screen display.
- When enabled, active dynamic, multicolored gridlines are overlaid on the video image to illustrate the width of the vehicle and its projected path based on the steering wheel angle, wheelbase and direction of travel.

Inputs

- Gated vehicle speed message from the BCM
- PRND state from the BCM
- Ignition state from the BCM
- Steering wheel angle from the BCM
- Vehicle configuration - vehicle line, Body style, which cameras are equipped, transfer case type, transfer case state, transmission type and transmission gear state from the BCM
- Global drive mode status from the BCM

- Steering factor from the BCM
- Camera wash response from the BCM
- FVC and RVC video inputs
- Touch screen request from the Radio
- Commanded touch screen status from the Radio
- Camera display status from the Radio

Outputs

- Grid lines display for FVC and RVC to the radio
- Image defeat request status to the Radio
- LVDS video signal to the Radio
- Camera wash request status

FRONT VIEW CAMERA (FVC)

FRONT VIEW CAMERA (FVC)

Refer to [COMPONENT INDEX](#).

The FVC displays front image of the vehicle whenever activated from the radio screen. The system helps driver to get a better view of the front of the vehicle for Off Road activity. When enabled, customer selectable dynamic tire lines are overlaid on FVC view.

The FVC is capable of displaying camera images under the following conditions:

- The driver has enabled the system
- Ignition state is RUN
- Wheel speed signals are detected (any speeds)
- PRND status is detected (any gear)

RADIO

RADIO

Refer to [COMPONENT INDEX](#).

When any of the camera soft buttons for display are selected in the camera menu option on the radio touch screen, the radio sends a signal over the bus to the CVPM with the request and awaits a return signal from the CVPM indicating that the display view is active. The radio then displays the proper camera video image.

Inputs

- Off road pages request from FVC
- Configuration data from the BCM
- PRNDL display gated from the BCM
- Global drive system from the BCM
- Vehicle speed gated from the BCM
- Commanded ignition state from the BCM
- Transfer case state gated from the BCM
- Transmission state gated from the BCM
- Image defeat request from the Radio
- Internal signals from the soft button on the screen to the Radio

Outputs

- Touch screen status
- Touch screen X and Y axis coordinates
- Off road pages request from FVC
- Radio display request status to the CVPM
- Camera display state to the CVPM

REAR VIEW CAMERA (RVC)

REAR VIEW CAMERA (RVC)

Refer to **COMPONENT INDEX**.

The RVC is the device used for Driver assistance which shows the video image of the area behind the vehicle. Its function is to provide a real time, wide angle video image of the area behind the vehicle and display it to the operator when the vehicle is in reverse, or for a short period of time in any other gear when an activation button is pressed. The RVC also provides the capability for trailer hitch zoom, allowing the operator to see a close up image of the vehicle's hitch during maneuvers involving a trailer.

REAR PARK ASSIST

DESCRIPTION

The Rear Park Assist (RPA) system is comprised of the following components:

COMPONENT INDEX

1.	Refer to INSTRUMENT PANEL CLUSTER (IPC) .
2.	Refer to RADIO .
3.	Refer to BODY CONTROL MODULE (BCM) .
4.	Refer to INTEGRATED CENTER STACK (ICS) .
5.	Refer to PARK ASSIST MODULE (PAM) .
6.	Refer to PARK ASSIST SENSORS (PAS) .

The RPA System detects objects located behind the vehicle within defined coverage zones. When an object is detected, the RPA System provides an alert to the customer based on the selected customer configuration and the object's location and distance relative to the vehicle. The system assists the driver during parking by sensing obstacles situated outside the driver's field of view.

The information regarding the presence and distance of an obstacle is transmitted to the driver in the form of an audible alert through the radio and a graphic display on the IPC. The audible alert is pulsed at a rate dependent on distance to the obstacle.

OPERATION

Each time the park assist OFF switch is depressed the switch bank pod circuitry sends an electronic switch status message input to the BCM over the Controller Area Network - Interior High Speed (CAN-IHS) data bus. The BCM then relays an electronic switch request message to the PAM. The PAM responds to each switch request message by toggling the status of the appropriate Park Assist System (PAS) feature from enabled to disabled, or from disabled to enabled, then sends an electronic system status message back to the BCM over the CAN-IHS data bus as confirmation.

The BCM responds to the system status message by sending a message to the ICS over the CAN data bus to control the park assist Light Emitting Diode (LED) units so that they are illuminated only when appropriate while the status of the ignition is ON, and are extinguished when the status of the ignition is anything except ON. If the PAS is disabled due to a monitored fault or failure, a press of the park assist OFF push button will result in the LED flashing on and off for about 5 seconds, then lighting solid.

OPERATING CONDITIONS

- The PAS is active only when the ignition switch is in the ON or START positions and the transmission (manual or automatic) is in one of the following:

- REVERSE gear position and the vehicle speed is less than 11 km/h (7 mph).
- DRIVE or a forward gear position and the vehicle speed is less than 9 km/h (6 mph) on deceleration.
- DRIVE or a forward gear position and the vehicle speed is less than 11 km/h (7 mph) on acceleration.

The PAS is enabled from the factory as a default but can be disabled or enabled by pressing the defeat switch in the Integrated Center Stack (ICS).

DISABLE FEATURE - When the system is disabled, a **PARK ASSIST OFF** textual message will appear within the IPC display of the instrument cluster whenever the gear selector lever is in the REVERSE position.

When the PAM monitors a problem in any of the PAS circuits or components, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit, sends an electronic message to the IPC, and a **SERVICE PARK ASSIST SYSTEM** textual message is displayed in the IPC display.

When the PAS button is pressed to ON, the ICS sends an output signal to the BCM. The BCM then relays an electronic switch request message to the PAM over the CAN data bus. The PAM responds to each switch request message by toggling the status of the appropriate PAS feature from enabled to disabled, or from disabled to enabled, then sends an electronic system status message back to the BCM over the CAN data bus as confirmation.

BODY CONTROL MODULE (BCM)

BODY CONTROL MODULE (BCM)

Refer to [COMPONENT INDEX](#).

The BCM is the gateway for CAN-IHS to CAN-C bus communications.

Inputs

- Receiving the ICS input request for PAS ON/OFF requests
- Reverse gear status input from the Powertrain Control Module (PCM) obtained over the CAN bus from the Transmission Control Module (TCM) if equipped with an automatic transmission or the Neutral Position Sensor (NPS) if equipped with a manual transmission

Outputs

- Enabling and disabling the PAS light
- Outputs the chime activation request
- Requests to the IPC to display the vehicle graphics layout on the IPC screen

INSTRUMENT PANEL CLUSTER (IPC)

INSTRUMENT PANEL CLUSTER (IPC)

Refer to [**COMPONENT INDEX**](#).

The visual warnings are provided in the IPC for when there is an object within 120 cm (47 in) in front of the vehicle or 200 cm (78 in) behind the vehicle. In drive, only the front is active and it is only displayed when the object is detected. In reverse, both the front and rear are active and the screen is requested at all times. The audible warning will change from intermittent beeps to a continuous tone as the vehicle comes to within 30 cm (12 in).

Inputs

- Display activation from the BCM
- Display graphic layouts from the BCM
- Park alerts from the BCM
- Chime activations from the BCM
- PAM system status from the BCM
- Above speed indication from the BCM

Outputs

- PAS display
- PAS Enable/Disable/Unavailable/User Disabled status
- PAM system faults
- Chime activations

INTEGRATED CENTER STACK (ICS)

INTEGRATED CENTER STACK (ICS)

Refer to [**COMPONENT INDEX**](#).

The park assist Off switch is integral to the ICS which is located just below the radio. The switch push button is clearly identified with a white International Control and Display Symbol graphic for Parking Aid and the text OFF. An amber LED unit is illuminated behind a small clear plastic jewel-like lens in the park assist OFF push button to give a visual indication whenever the park assist system has been manually disabled or if a system fault is monitored.

The status of the park assist OFF switch is continually monitored by the circuitry within the ICS. The ICS receives battery voltage at all times on a fused battery feed circuit and has a path to ground at all times through the instrument panel wire harness. The inputs to and outputs from the ICS consist of electronic message communication with the BCM over the CAN data bus.

Inputs

- Receives the semi-automatic park and park assist lighting requests from the PAS switch
- Receives the PAM lighting control inputs from the BCM

Outputs

- Sends the PAM switch status On/Off requests to the BCM
- Sends the semi-automatic park and park assist lighting command to the PAS switch.

PARK ASSIST MODULE (PAM)

PARK ASSIST MODULE (PAM)

Refer to [COMPONENT INDEX](#).

The PAM is the central component of the PAS. It supplies voltage to the park assist sensors, receives and analyzes data from the sensors, calculates and communicates the proper display information to the BCM, performs system diagnostics, and communicates with other electronic modules in the vehicle over the CAN data bus. The module operates on battery voltage received through a fuse in the Power Distribution Center (PDC), and is grounded through a take out of the body wire harness.

Inputs

- Each park assist sensor inputs to the PAM
- PAM operation mode from the BCM
- Ignition status from the BCM
- Vehicle speed from the Anti-lock Brake System (ABS) module
- Reverse gear status from the BCM
- PAM alert mode from the BCM

Outputs

- Power to each park assist sensors
- PAM LED control status to the BCM
- Park chime type to the BCM
- Park chime activation to the BCM
- Park chime repetition rate to the BCM
- PAM system fault to the BCM
- PAM above speed to the BCM
- Trigger signals to all of the park assist sensors

PARK ASSIST SENSORS (PAS)

PARK ASSIST SENSORS (PAS)

Refer to [COMPONENT INDEX](#).

Ultrasonic park assist sensors located in the rear bumper fascia allow the PAS to locate and identify the proximity of nearby obstacles. The sensors each receive battery current and ground in parallel from the PAM, but are each connected to individual dedicated serial bus communication circuits to the PAM. These sensors each generate ultrasonic sound pulses when triggered by the PAM, then signal the PAM when an echo of the reflected sound pulses is received. The detection distance range from the rear of the vehicle is about 200 cm (78 in), and the detection range for the front of the vehicle is within 120 cm (47 in). The detection area extends around the rear corners of the vehicle.

Inputs

- Receives power from the PAM
- Receives ground from the PAM

Outputs

- Outputs the ultrasonic signal to the PAM

RADIO

RADIO

Refer to **COMPONENT INDEX**.

The Radio displays a personalization menu entry that will allow the customer to set the RPA chime volume. When the Radio wakes up on CAN-IHS, the Radio recalls the state of the RPA chime volume feature.

When the customer selects a RPA chime volume setting, the Radio sends a configuration signal to the PAM. When the PAM receives a request for the RPA chime volume feature, the PAM changes the setting and responds back to the Radio with the new volume level request. When the Radio receives this request, the Radio changes the stored status of the RPA chime volume setting and changes the display to the customer.

DIAGNOSIS AND TESTING

BLIND SPOT MONITOR SYSTEM

WARNING:

To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbags, airbag curtains, knee blocker, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect the Intelligent Battery Sensor (IBS)/negative battery cable assembly from the negative battery post, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The following textual messages related to the Blind Spot Monitor (BSM) system may appear within the display of the Instrument Panel Cluster (IPC):

- **BLIND SPOT SYSTEM OFF** - This message to the vehicle operator when the ignition first transitions to the ON status indicates that the BSM system has been turned off using the Setup Menu of the Radio.
- **SERVICE BLIND SPOT SYSTEM** - This message to the vehicle operator while the ignition status is ON indicates that the BSM system is unavailable due to a monitored system fault or faults.
- **BLIND SPOT SYSTEM TEMPORARILY UNAVAILABLE** - This message to the vehicle operator while the ignition status is ON indicates that the BSM system is temporarily unavailable as a result of one of the following:
 1. **Sensor Blockage** - The amber BSM visual icon in both outside rear view mirrors will be illuminated as long as blockage exists or until the ignition status transitions to OFF, whichever occurs first. Remove debris from fascia outer, inner and around the BSM bracket before retesting.
 2. **Monitored System Fault** - The BSM system has detected a monitored system fault condition with some other module in the vehicle that the blind spot receives signals from or relies on to function and has stored a Diagnostic Trouble Code (DTC). The amber BSM visual icon will be illuminated in both outside rear view mirrors for as long as the condition exists or until the ignition status transitions to OFF, whichever occurs first.

BLIND SPOT SYSTEM DOES NOT OPERATE AFTER DOOR IS REMOVED AND INSTALLED - If the BSM system does not activate and no DTCs are found in the system, check the door wiring connector and connector pin integrity. A damaged pin can create a voltage condition that will not allow the BSM to operate.

NOTE:

If the **BLIND SPOT SYSTEM TEMPORARILY UNAVAILABLE** message is received for a minimum of 5 minutes, please verify that sensor enclosures on the sides of the tail lamps where the radar sensors are located is not blocked by snow, ice or road debris. If the area is blocked, remove the blockage and cycle the Ignition.

NOTE:

If the vehicle has experienced any trauma in the sensor enclosures on the sides of the tail lamps where the sensors are located, even if the fascia is not

damaged, the radar sensor may have become misaligned. A misaligned radar sensor will result in the BSM system not operating properly.

For DTC diagnostics for the left side BSM or. Refer to [**DIAGNOSIS AND TESTING**](#) . for the right side BSM. Refer to [**DIAGNOSIS AND TESTING**](#) .

DIAGNOSIS AND TESTING - PARK ASSIST SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbags, airbag curtains, knee blocker, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect the Intelligent Battery Sensor (IBS)/negative battery cable assembly from the negative battery post, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

A Park Assist warning icon or textual message may appear within the Instrument Panel Clusters (IPC). If a warning appears on the IPC and the condition is related to the Park Assist system; be certain to confirm the following:

- Be certain that the fascia is free of dirt and debris to keep the system operating properly. The Park Assist system is self correcting, verify that the area of the fascia where the sensors are located (both the face and the back) is not blocked by ice, snow, mud or other obstructions. If the area is blocked, remove the blockage, shift the transmission selector lever into **R** everse and verify the warning is no longer present on the IPC display.
- Be certain that the parking brake is not applied.
- The presence of operating heavy construction equipment, large trucks and other vibrations in the vicinity of the vehicle could impact the performance of the Park Assist system.
- Verify the park assist sensors are properly seated. A loose sensor can prompt a warning to wipe the sensor or a warning that the sensors are blocked. This condition may not set a Diagnostic Trouble Code (DTC).

CAMERA

REMOVAL AND INSTALLATION

FRONT

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .
2. Remove the front grill assembly. Refer to [**GRILLE, REMOVAL AND INSTALLATION**](#) .
3. Disconnect the wire harness connector for the Front View Camera (FVC).

4. Remove the two fasteners (1) securing the FVC retaining bracket (2).

5. Remove the FVC (1) from the vehicle grill.

INSTALLATION

1. Install the FVC into the grill.
2. Install the FVC bracket and the two fasteners and securely tighten.
3. Connect the wiring harness connector to the FVC.
4. Install the front grill assembly. Refer to [GRILLE, REMOVAL AND INSTALLATION](#) .
5. Connect the negative battery cable(s). Refer to the appropriate service information .

REAR

The Rear View Camera (RVC), when equipped with a Front View Camera (FVC), is removed and installed the same as the RVC without FVC. For removal and installation of the RVC, Refer to [CAMERA, REAR, REMOVAL AND INSTALLATION](#) .

DISPLAY, BLIND SPOT

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

The Blind Spot Monitor (BSM) display Light Emitting Diode (LED) indicator and icon are integral to the outside rear view mirror glass and case unit. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL AND INSTALLATION** **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL AND INSTALLATION** .

MODULE, PARK ASSIST

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

For removal and installation of the Park Assist Module (PAM). Refer to **MODULE, PARK ASSIST (PAM), REMOVAL AND INSTALLATION** .

SENSOR, BLIND SPOT

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

The optional Blind Spot Monitor (BSM) system used in this vehicle has two control modules, each internal to the sensor mounted on the inside of the tail lamp assembly. The Right Blind Spot Sensor (RBSS) is mounted to the backside of the right tail lamp assembly and can be serviced separately from the lamp assembly. The Left Blind Spot Sensor (LBSS) is mounted to the backside of the left tail lamp assembly and can be serviced separately from the lamp assembly. Refer to **MODULE, BLIND SPOT (BSM), REMOVAL AND INSTALLATION** .

SENSOR, PARK ASSIST

REMOVAL AND INSTALLATION

REAR CENTER

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the rear bumper. Refer to **BUMPER, REAR, REMOVAL AND INSTALLATION** .
4. Disconnect the Park Assist Sensor harness connector (1).

5. Carefully pry the park assist sensor bracket latch features (2) away from the latch tabs of the park assist sensor (3) far enough to disengage the sensor from the bracket.
6. Disengage the resilient O-ring spacer from around the circumference of the sensor membrane protrusion and remove the sensor.

INSTALLATION

1. Position the park assist sensor to engage the O-ring spacer (also known as the decoupling ring) around the circumference of the park assist sensor membrane protrusion.

NOTE: Production and all service replacement O-ring spacers are tapered. The wide side (base) of the O-ring should be seated against the sensor housing and the narrow side should be oriented toward the outer surface of the sensor membrane and the rear fascia.

2. Align and insert the park assist sensor into the sensor bracket until the bracket latch features are fully engaged over the latch tabs of the park assist sensor.
3. Connect the wire harness connector to the park assist sensor connector receptacle.
4. Install the rear bumper. Refer to [BUMPER, REAR, REMOVAL AND INSTALLATION](#) .
5. Remove the supports and lower the vehicle. Refer to [HOISTING, STANDARD PROCEDURE](#) .
6. Connect the negative battery cable(s). Refer to the appropriate service information .

REAR OUTBOARD

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .
2. Raise and support the vehicle. Refer to [HOISTING, STANDARD PROCEDURE](#) .
3. Remove the rear bumper. Refer to [BUMPER, REAR, REMOVAL AND INSTALLATION](#) .

4. Disconnect the Park Assist Sensor harness connector (1).
5. Carefully pry the park assist sensor bracket latch features (2) away from the latch tabs of the park assist sensor (3) far enough to disengage the sensor from the bracket.
6. Disengage the resilient O-ring spacer from around the circumference of the sensor membrane protrusion and remove the park assist sensor.

INSTALLATION

1. Position the park assist sensor to engage the O-ring spacer (also known as the decoupling ring) around the circumference of the park assist sensor membrane protrusion.

NOTE: **Production and all service replacement O-ring spacers are tapered. The wide side (base) of the O-ring should be seated against the sensor housing and the narrow side should be oriented toward the outer surface of the sensor membrane and the rear fascia.**

2. Connect the wire harness connector to the park assist sensor.
 3. Install the rear bumper. Refer to [**BUMPER, REAR, REMOVAL AND INSTALLATION**](#) .
 4. Remove the supports and lower the vehicle. Refer to [**HOISTING, STANDARD PROCEDURE**](#) .
 5. Connect the negative battery cable(s). Refer to the appropriate service information .

DIAGNOSIS AND TESTING

B10C4-11-HEATED STEERING WHEEL CONTROL-CIRCUIT SHORT TO GROUND

For a complete HEATED STEERING WHEEL SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

To control the temperature of the Heated Steering Wheel (HSW), the Comfort Seat and Wheel Module (CSWM) provides power and return circuits to the HSW, using a Pulse Width Modulation (PWM) signal to control current to the heating element.

To monitor the temperature of the heating element, the HSW uses an internal Negative Temperature Coefficient (NTC) type thermistor, which is connected to the left Steering Wheel Switch (SWS). The SWS sends the temperature over a LIN bus circuit to the Steering Column Control Module (SCCM), which then sends the temperature to the CSWM over the CAN-IHS data bus.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.

SET CONDITION

- With the Heated Steering Wheel Turned ON:
 - Module detects a short to ground on the Heated Steering Wheel Feed circuit for more than 2 seconds.
- With the Heated Steering Wheel Turned OFF:
 - Module detects a short to ground on the Heated Steering Wheel Return circuit for more than 2 seconds.

DEFAULT ACTION

- When the Heated Steering Wheel is turned on, the indicator turns on for 2 seconds and turns off.
- The Heated Steering Wheel output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
HEATED STEERING WHEEL FEED CIRCUIT SHORTED TO GROUND
HEATED STEERING WHEEL RETURN CIRCUIT SHORTED TO GROUND
HEATED STEERING WHEEL FEED CIRCUIT SHORTED TO THE HEATED STEERING WHEEL RETURN CIRCUIT
HEATED STEERING WHEEL (HSW)
STEERING COLUMN CONTROL MODULE (SCCM)
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Start the engine.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read the CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE RESISTANCE BETWEEN GROUND AND THE (C91) HEATED STEERING WHEEL FEED AND (C986) RETURN CIRCUITS AT THE CSWM C4 HARNESS CONNECTOR

1. Turn the ignition off.
2. Disconnect the CSWM C4 harness connector.
3. Check for continuity between ground and the (C91) Heated Steering Wheel Feed circuit at the CSWM C4 harness connector.
4. Check for continuity between ground and the (C986) Heated Steering Wheel Return circuit at the CSWM C4 harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuits being tested.

Is there continuity between ground and either circuit being tested?

Yes

- Go To [3](#)

No

- Go To [6](#)

3. ISOLATE AND CHECK THE (C91) HEATED STEERING WHEEL FEED AND (C986) RETURN CIRCUITS FOR A SHORT TO GROUND BETWEEN THE CSWM C4 HARNESS CONNECTOR AND THE SCCM C1 HARNESS CONNECTOR

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Remove the Driver Airbag in accordance with the Service Information. Refer to [AIR BAG, DRIVER, REMOVAL AND INSTALLATION](#) .
2. Disconnect the SCCM C1 harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. Turn the ignition off.
4. Check for continuity between ground and the (C91) Heated Steering Wheel Feed circuit at the SCCM C1 harness connector.
5. Check for continuity between ground and the (C986) Heated Steering Wheel Return circuit at the SCCM C1 harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuits being tested.

Is there continuity between ground and either circuit being tested?

Yes

- Repair the circuit(s) for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. ISOLATE AND CHECK THE (C91) HEATED STEERING WHEEL FEED AND (C986) RETURN CIRCUITS FOR A SHORT TO GROUND WITHIN THE SCCM

1. Disconnect the SCCM C4 harness connector.
2. Check for continuity between ground and the (C91) Heated Steering Wheel Feed circuit at either SCCM component connector.

3. Check for continuity between ground and the (C986) Heated Steering Wheel Return circuit at either SCCM component connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) connector, always use an appropriate probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuits being tested.

Is there continuity between ground and either circuit being tested?

Yes

- Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to [MODULE, STEERING COLUMN CONTROL \(SCCM\), REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [5](#)

5. ISOLATE AND CHECK THE (C91) HEATED STEERING WHEEL FEED AND (C986) RETURN CIRCUITS FOR A SHORT TO GROUND BETWEEN THE SCCM C4 HARNESS CONNECTOR AND THE HSW HARNESS CONNECTOR

1. Disconnect the HSW harness connector.
2. Check for continuity between ground and the (C91) Heated Steering Wheel Feed circuit at the HSW harness connector.
3. Check for continuity between ground and the (C986) Heated Steering Wheel Return circuit at the HSW harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) connector, always use an appropriate probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuits being tested.

Is there continuity between ground and either circuit being tested?

Yes

- Repair the circuit(s) for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Replace the Heated Steering Wheel (HSW) in accordance with the Service Information. Refer to [WHEEL, STEERING, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

6. CHECK FOR A SHORT BETWEEN THE (C91) HEATED STEERING WHEEL FEED CIRCUIT AND (C986) HEATED STEERING WHEEL RETURN CIRCUIT AT HSW HARNESS CONNECTOR

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in

possible serious or fatal injury.

1. Remove the Driver Airbag in accordance with the Service Information. Refer to [AIR BAG, DRIVER, REMOVAL AND INSTALLATION](#) .
2. Disconnect the HSW harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. Turn the ignition off.
4. Check for continuity between the (C91) Heated Steering Wheel Feed circuit and the (C986) Heated Steering Wheel Return circuit at the HSW harness connector.

Is there continuity between the circuits being tested?

Yes

- Repair the short between the (C91) Heated Steering Wheel Feed circuit and the (C986) Heated Steering Wheel Return circuit. Use the appropriate wiring diagram as a guide to follow the path of the circuit.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

7. CHECK FOR A SHORT BETWEEN THE (C91) HEATED STEERING WHEEL FEED CIRCUIT AND (C986) HEATED STEERING WHEEL RETURN CIRCUIT WITHIN THE HSW

1. The ignition must be off when checking the continuity of a circuit.
2. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
3. Measure the resistance between the (C91) Heated Steering Wheel Feed circuit and the (C986) Heated Steering Wheel Return circuit at the HSW component connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance 1.45 Ohms B $\pm$ 10%?

Yes

- Go To [8](#)

No

- Replace the Heated Steering Wheel (HSW) in accordance with the Service Information. Refer to [WHEEL, STEERING, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

8. CHECK RELATED HARNESS CONNECTIONS

1. Turn the ignition off.
2. Disconnect all CSWM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.

5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase DTCs.
10. Turn the ignition off for a minimum of 10 seconds.
11. Start the engine.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B10C4-12-HEATED STEERING WHEEL CONTROL-CIRCUIT SHORT TO BATTERY

For a complete HEATED STEERING WHEEL SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

To control the temperature of the Heated Steering Wheel (HSW), the Comfort Seat and Wheel Module (CSWM) provides power and return circuits to the HSW, using a Pulse Width Modulation (PWM) signal to control current to the heating element.

To monitor the temperature of the heating element, the HSW uses an internal Negative Temperature Coefficient (NTC) type thermistor, which is connected to the left Steering Wheel Switch (SWS). The SWS sends the temperature over a LIN bus circuit to the Steering Column Control Module (SCCM), which then sends the temperature to the CSWM over the CAN-IHS data bus.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.
- Heated Steering Wheel is turned off.

SET CONDITION

- Module detects that the Heated Steering Wheel output voltage is above 5.0 volts for more than 2 seconds when the Heated Steering Wheel is turned off.

DEFAULT ACTION

- When the Heated Steering Wheel is turned on, the indicator turns on for 2 seconds and turns off.
- The Heated Steering Wheel output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
HEATED STEERING WHEEL FEED CIRCUIT SHORTED TO VOLTAGE
HEATED STEERING WHEEL RETURN CIRCUIT SHORTED TO VOLTAGE
HEATED STEERING WHEEL (HSW)
STEERING COLUMN CONTROL MODULE (SCCM)
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

NOTE: **The Heated Steering Wheel must be turned off when checking for this short to voltage DTC.**

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Start the Engine.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

2. CHECK THE VOLTAGE OF THE (C91) HEATED STEERING WHEEL FEED AND (C986) RETURN CIRCUITS AT THE CSWM C4 HARNESS CONNECTOR

1. Turn the ignition off.
2. Disconnect the CSWM C4 harness connector.
3. Start the engine.
4. Measure the voltage of the (C91) Heated Steering Wheel Feed circuit at the CSWM C4 harness connector.
5. Measure the voltage of the (C986) Heated Steering Wheel Return circuit at the CSWM C4 harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) connector, always use an appropriate probing tool to prevent any possible damage to the ECU terminals.

Is there voltage present on either circuit?

Yes

- Go To [3](#)

No

- Go To [6](#)

3. ISOLATE AND CHECK THE (C91) HEATED STEERING WHEEL FEED AND (C986) RETURN CIRCUITS FOR A SHORT TO VOLTAGE BETWEEN THE CSWM C4 HARNESS CONNECTOR AND THE SCCM C1 HARNESS CONNECTOR

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Remove the Driver Airbag in accordance with the Service Information. Refer to [AIR BAG, DRIVER, REMOVAL AND INSTALLATION](#).
2. Disconnect the SCCM C1 harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. Start the engine.
4. Measure the voltage of the (C91) Heated Steering Wheel Feed circuit at the SCCM C1 harness connector.
5. Measure the voltage of the (C986) Heated Steering Wheel Return circuit at the SCCM C1 harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) connector, always use an appropriate probing tool to prevent any

possible damage to the ECU terminals.

Is there voltage present on either circuit?

Yes

- Repair the circuit(s) for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. ISOLATE AND CHECK THE (C91) HEATED STEERING WHEEL FEED AND (C986) RETURN CIRCUITS FOR A SHORT TO VOLTAGE WITHIN THE SCCM

1. Turn the ignition off.
2. Disconnect the SCCM C4 harness connector.
3. Start the engine.
4. Measure the voltage of the (C91) Heated Steering Wheel Feed circuit at either SCCM component connector.
5. Measure the voltage of the (C986) Heated Steering Wheel Return circuit at either SCCM component connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) connector, always use an appropriate probing tool to prevent any possible damage to the ECU terminals.

Is there voltage present on either circuit?

Yes

- Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to [MODULE, STEERING COLUMN CONTROL \(SCCM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [5](#)

5. ISOLATE AND CHECK THE (C91) HEATED STEERING WHEEL FEED AND (C986) RETURN CIRCUITS FOR A SHORT TO VOLTAGE BETWEEN THE SCCM C4 HARNESS CONNECTOR AND THE HSW HARNESS CONNECTOR

1. Turn the ignition off.
2. Disconnect the HSW harness connector.
3. Start the engine.
4. Measure the voltage of the (C91) Heated Steering Wheel Feed circuit at the HSW harness connector.
5. Measure the voltage of the (C986) Heated Steering Wheel Return circuit at the HSW harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) connector, always use an appropriate probing tool to prevent any possible damage to the ECU terminals.

Is there voltage present on either circuit?

Yes

- Repair the circuit(s) for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Heated Steering Wheel (HSW) in accordance with the Service Information. Refer to **WHEEL, STEERING, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

6. CHECK RELATED HARNESS CONNECTIONS

1. Turn the ignition off.
2. Disconnect all CSWM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase DTCs.
10. Turn the ignition off for a minimum of 10 seconds.
11. Start the Engine.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read CSWM DTCs.

NOTE: **The HSW must be turned off when checking for this short to voltage DTC.**

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM)**,

REMOVAL AND INSTALLATION

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B10C4-13-HEATED STEERING WHEEL CONTROL-CIRCUIT OPEN

For a complete HEATED STEERING WHEEL SYSTEM wiring diagram, refer to the appropriate wiring information.

THEORY OF OPERATION

To control the temperature of the Heated Steering Wheel (HSW), the Comfort Seat and Wheel Module (CSWM) provides power and return circuits to the HSW, using a Pulse Width Modulation (PWM) signal to control current to the heating element.

To monitor the temperature of the heating element, the HSW uses an internal Negative Temperature Coefficient (NTC) type thermistor, which is connected to the left Steering Wheel Switch (SWS). The SWS sends the temperature over a LIN bus circuit to the Steering Column Control Module (SCCM), which then sends the temperature to the CSWM over the CAN-IHS data bus.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.
- Heated Steering Wheel is turned on.

SET CONDITION

- Module detects the Heated Steering Wheel Feed circuit current level is below its threshold for more than 2 seconds.

DEFAULT ACTION

- When the Heated Steering Wheel is turned on, the indicator turns on for 2 seconds and turns off.
- The Heated Steering Wheel output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
HEATED STEERING WHEEL FEED CIRCUIT OPEN
HEATED STEERING WHEEL RETURN CIRCUIT OPEN
HEATED STEERING WHEEL (HSW)
STEERING COLUMN CONTROL MODULE (SCCM)
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Start the engine.
6. Turn the Heated Steering Wheel (HSW) on.
7. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

2. ISOLATE AND CHECK THE (C91) HEATED STEERING WHEEL FEED AND (C986) RETURN CIRCUITS FOR AN OPEN BETWEEN CSWM C4 HARNESS CONNECTOR AND THE SCCM C1 HARNESS CONNECTOR

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Remove the Driver Airbag in accordance with the Service Information. Refer to [AIR BAG, DRIVER, REMOVAL AND INSTALLATION](#).
2. Isolate the circuits by disconnecting the CSWM C4 harness connector and the SCCM C1 harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. The ignition must be off when checking the continuity of a circuit.
4. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
5. Measure the resistance of the (C91) Heated Steering Wheel Feed circuit between the CSWM C4 harness connector and the SCCM C1 harness connector.
6. Measure the resistance of the (C986) Heated Steering Wheel Return circuit between the CSWM C4 harness connector and the SCCM C1 harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance above 3.0 Ohms for either circuit?

Yes

- Repair the circuit(s) above 3.0 Ohms for an open.

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE (C91) HEATED STEERING WHEEL FEED AND (C986) RETURN CIRCUITS FOR AN OPEN WITHIN THE SCCM

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuits by disconnecting the SCCM C4 harness connector.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Measure the resistance of the (C91) Heated Steering Wheel Feed circuit between the SCCM C1 component connector and the SCCM C4 component connector.
5. Measure the resistance of the (C986) Heated Steering Wheel Return circuit between the SCCM C1 component connector and the SCCM C4 component connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance above 3.0 Ohms for either circuit?

Yes

- Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to [MODULE, STEERING COLUMN CONTROL \(SCCM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. CHECK THE (C91) HEATED STEERING WHEEL FEED AND (C986) RETURN CIRCUIT WIRING AND CONNECTORS BETWEEN THE SCCM AND THE HSW

1. Thoroughly inspect the wiring harness and connectors between the SCCM C4 harness connector and the HSW harness connector.
2. Look for chafed, pierced, pinched, or partially broken wires.
3. Check for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Were any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [5](#)

5. CHECK THE (C91) HEATED STEERING WHEEL FEED AND (C986) RETURN CIRCUITS FOR AN OPEN WITHIN THE HSW

1. The ignition must be off when checking the continuity of a circuit.
2. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.

3. Measure the resistance between the (C91) Heated Steering Wheel Feed circuit and the (C986) Heated Steering Wheel Return circuit at the SCCM C4 harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance 1.45 Ohms B $\pm$ 10%?

Yes

- Go To [6](#)

No

- Replace the Heated Steering Wheel (HSW) in accordance with the Service Information. Refer to [WHEEL, STEERING, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

6. CHECK RELATED HARNESS CONNECTIONS

1. Turn the ignition off.
2. Disconnect all CSWM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase DTCs.
10. Turn the ignition off for a minimum of 10 seconds.
11. Start the engine.
12. Turn the HSW on.
13. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
14. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to [MODULE, COMFORT SEAT AND WHEEL \(CSWM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B10C4-19-HEATED STEERING WHEEL CONTROL-OVERCURRENT

For a complete HEATED STEERING WHEEL SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

To control the temperature of the Heated Steering Wheel (HSW), the Comfort Seat and Wheel Module (CSWM) provides power and return circuits to the HSW, using a Pulse Width Modulation (PWM) signal to control current to the heating element.

To monitor the temperature of the heating element, the HSW uses an internal Negative Temperature Coefficient (NTC) type thermistor, which is connected to the left Steering Wheel Switch (SWS). The SWS sends the temperature over a LIN bus circuit to the Steering Column Control Module (SCCM), which then sends the temperature to the CSWM over the CAN-IHS data bus.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.
- Heated Steering Wheel is turned on.

SET CONDITION

- Module detects Heated Steering Wheel current above 9.6 amps for more than 2 seconds.

DEFAULT ACTION

- When the Heated Steering Wheel is turned on, the indicator turns on for 2 seconds and turns off.
- The Heated Steering Wheel output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
HEATED STEERING WHEEL FEED CIRCUIT OPEN, HIGH RESISTANCE OR SHORTED
HEATED STEERING WHEEL RETURN CIRCUIT OPEN, HIGH RESISTANCE OR SHORTED
HEATED STEERING WHEEL FEED CIRCUIT SHORTED TO THE HEATED STEERING WHEEL RETURN CIRCUIT
HEATED STEERING WHEEL (HSW)
STEERING COLUMN CONTROL MODULE (SCCM)
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **[PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#)**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Heated Steering Wheel (HSW) on.
7. With the scan tool, read the CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **[TESTING FOR AN INTERMITTENT CONDITION](#)**.

2. CHECK THE HEATED STEERING WHEEL CIRCUIT RESISTANCE AT THE COMFORT SEAT WHEEL MODULE (CSWM) C4 HARNESS CONNECTOR

1. Turn the ignition off for a minimum of 10.0 seconds.
2. Disconnect the CSWM C4 harness connector.
3. Measure the resistance between the (C91) Heated Steering Wheel Feed circuit and the (C986) Heated Steering Wheel Return circuit at the CSWM C4 harness connector.

Is the resistance 1.45 Ohms B $\pm$ 10% ?

Yes

- Go To [5](#)

No

- Go To [3](#)

3. CHECK THE HEATED STEERING WHEEL CIRCUIT RESISTANCE AT THE STEERING COLUMN CONTROL MODULE C1 COMPONENT CONNECTOR

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Remove the Driver Airbag in accordance with the Service Information. Refer to **[AIR BAG, DRIVER, REMOVAL AND INSTALLATION](#)**.
2. Disconnect the SCCM C1 harness connector.
3. Before proceeding, thoroughly inspect the wiring harness and connectors between the CSWM and the SCCM. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed

out, spread, corroded, or contaminated terminals and repair or replace as necessary.

4. Measure the resistance between the (C91) Heated Steering Wheel Feed circuit and the (C986) Heated Steering Wheel Return circuit at the SCCM C1 component connector.

Is the resistance 1.45 Ohms B $\pm$ 10% ?

Yes

- Repair the (C91) Heated Steering Wheel Feed circuit or the (C986) Heated Steering Wheel Return circuit for an open, high resistance or shorted condition.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. CHECK THE HEATED STEERING WHEEL CIRCUIT RESISTANCE AT THE STEERING COLUMN CONTROL MODULE C4 CONNECTOR

1. Disconnect the Steering Column Control Module (SCCM) C4 harness connector.
2. Before proceeding, thoroughly inspect the wiring harness and connectors between the Heated Steering Wheel (HSW) and the Steering Column Control Module. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals and repair or replace as necessary.
3. Measure the resistance between the (C91) Heated Steering Wheel Feed circuit and the (C986) Heated Steering Wheel Return circuit at the SCCM C4 harness connector.

Is the resistance 1.45 Ohms B $\pm$ 10% ?

Yes

- Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL (SCCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Heated Steering Wheel (HSW) in accordance with the Service Information. Refer to **WHEEL, STEERING, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. CHECK RELATED HARNESS CONNECTIONS

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect all CSWM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.

- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B10C4-4B-HEATED STEERING WHEEL CONTROL-OVER TEMPERATURE

For a complete HEATED STEERING WHEEL SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

To control the temperature of the Heated Steering Wheel (HSW), the Comfort Seat and Wheel Module (CSWM) provides power and return circuits to the HSW, using a Pulse Width Modulation (PWM) signal to control current to the heating element.

To monitor the temperature of the heating element, the HSW uses an internal Negative Temperature Coefficient (NTC) type thermistor, which is connected to the left Steering Wheel Switch (SWS). The SWS sends the temperature over a LIN bus circuit to the Steering Column Control Module (SCCM), which then sends the temperature to the CSWM over the CAN-IHS data bus.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.
- Heated Steering Wheel is turned on.

SET CONDITION

- CAN bus message for Heated Steering Wheel temperature is above the maximum allowed temperature for 2 seconds.

DEFAULT ACTION

- When the Heated Steering Wheel is turned on, the indicator turns on for 2 seconds and turns off.
- The Heated Steering Wheel output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
HEATED STEERING WHEEL SIGNAL CIRCUIT HIGH RESISTANCE OR SHORTED
HEATED STEERING WHEEL EVIC MUX RETURN CIRCUIT HIGH RESISTANCE OR SHORTED
HEATED STEERING WHEEL SIGNAL CIRCUIT SHORTED TO THE HEATED STEERING WHEEL EVIC MUX RETURN CIRCUIT
HEATED STEERING WHEEL TEMPERATURE SENSOR
STEERING COLUMN CONTROL MODULE (SCCM)
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Start the Engine.
6. Turn the HSW on.
7. Using the scan tool, monitor the Heated Steering Wheel temperature. The value should rise steadily until the Heated Steering Wheel reaches the calibrated desired temperature. This will take several minutes.
8. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. CHECK FOR HEATED STEERING WHEEL CONTROL CIRCUIT DTC(S) IN THE CSWM

1. Refer to the saved DTC information recorded on the repair order.

Were any HSW control circuit DTCs present in the CSWM?

Yes

- Perform the appropriate diagnostic procedure for the control circuit DTC(s) and retest.

No

- Go To [3](#)

3. CHECK FOR IMPLAUSIBLE HEATED STEERING WHEEL TEMPERATURE DTC IN THE CSWM

1. Refer to the saved DTC information recorded on the repair order.

Was U1446-00 - IMPLAUSIBLE HEATED STEERING WHEEL TEMPERATURE MESSAGE RECEIVED present in the CSWM?

Yes

- Perform the diagnostic procedure for U1446-00 and retest.

No

- Go To [4](#)

4. CHECK RELATED WIRING AND HARNESS CONNECTIONS

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbags, airbag curtains, knee blocker, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect the Intelligent Battery Sensor (IBS)/negative battery cable assembly from the negative battery post, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Turn the ignition off.
2. Disconnect all CSWM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Using the possible causes list above and the wiring diagram as a guide, inspect wiring and harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).

- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To **5**

5. REPLACE THE HEATED STEERING WHEEL (HSW) AND CHECK FOR DTC TO RETURN

1. Replace the Heated Steering Wheel (HSW) in accordance with the Service Information. Refer to **WHEEL, STEERING, REMOVAL AND INSTALLATION** .
2. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
3. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
4. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
5. With the scan tool, erase DTCs.
6. Turn the ignition off for a minimum of 10 seconds.
7. Start the engine.
8. Turn the HSW on.
9. Using the scan tool, monitor the Heated Steering Wheel temperature. The value should rise steadily until the HSW reaches the calibrated desired temperature. This will take several minutes.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replacing the Heated Steering Wheel (HSW) corrected the condition.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B11C1-13-STEERING WHEEL HEATER POWER SUPPLY CIRCUIT-CIRCUIT OPEN

For a complete HEATED STEERING WHEEL SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

To control the temperature of the Heated Steering Wheel (HSW), the Comfort Seat and Wheel Module (CSWM) provides power and return circuits to the HSW, using a Pulse Width Modulation (PWM) signal to control current to the heating element.

To monitor the temperature of the heating element, the HSW uses an internal Negative Temperature Coefficient (NTC) type thermistor, which is connected to the left Steering Wheel Switch (SWS). The SWS sends the temperature over a LIN bus circuit to the Steering Column Control Module (SCCM), which then sends the temperature to the CSWM over the CAN-IHS data bus.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.

SET CONDITION

- Module detects no voltage on the Fused Ignition circuit for more than 2 seconds.

DEFAULT ACTION

- When the Heated Steering Wheel is turned on, the indicator turns on for 2 seconds and turns off.
- The Heated Steering Wheel output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
FUSED IGNITION CIRCUIT OPEN OR SHORTED TO GROUND
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE (F924) FUSED IGNITION CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the 12.0 volt supply circuit.
2. Connect the positive lead of the load test tool to the 12.0 volt supply circuit at the component harness connector (A). **Note:** refer to the diagram below.
3. Connect the negative lead of the load test tool to the ground circuit of the Battery or a good chassis ground.
4. Ensure that the circuit being tested is being powered on. If the 12.0 volt circuit being tested is an ignition feed for example, the ignition must be on. If testing an output from a relay, verify that the relay is energized and on.
5. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test? To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [3](#)

No

- Repair the (F924) Fused Ignition circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CSWM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Check for spread terminals and verify proper terminal tension.

Repair any conditions that are found.

5. Connect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.

7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Test drive or operate the vehicle in accordance with the when monitored and set conditions.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B1E99-11-FRONT LEFT HEATER CONTROL 1-CIRCUIT SHORT TO GROUND

For a complete HEATED SEAT SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.
- Heated Seat is turned on.

SET CONDITION

- Module detects a short to ground on the Left Front Seat Cushion Heater Supply circuit for more than 2 seconds.

DEFAULT ACTION

- When the Left Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Left Front Seat Cushion Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT SHORTED TO GROUND
LEFT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT SHORTED TO ANOTHER CIRCUIT
SEAT CUSHION HEATER ELEMENT
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Heated Seat on.
7. With the scan tool, read CSWM DTCs.

Is the Same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. ISOLATE AND CHECK THE (F503) LEFT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the (F503) Left Front Seat Cushion Heater Supply circuit?

Yes

- Repair the (F503) Left Front Seat Cushion Heater Supply circuit for a short to ground. Use the appropriate wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [3](#)

3. ISOLATE AND CHECK THE (F503) LEFT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (F503) Left Front Seat Cushion Heater Supply circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. CHECK THE LEFT FRONT SEAT CUSHION HEATER ELEMENT RESISTANCE

1. Measure the resistance of the Left Front Seat Cushion Heater element between the (F503) Left Front Seat Cushion Heater Supply circuit and the (Z917) Ground circuit at the Left Seat Cushion Heater component connector.

NOTE: When probing a circuit always use an appropriate back probing tool to prevent any possible damage to the terminals.

Is the resistance between 2.26 Ohms and 3.38 Ohms at 20B°C (68B°F)?

Yes

- Go To [5](#)

No

- Replace the Left Front Seat Cushion Heater element in accordance with the Service Information. Refer to [PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CSWM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.

4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Check for spread terminals and verify proper terminal tension.

Repair any conditions that are found.

5. Connect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Test drive or operate the vehicle in accordance with the when monitored and set conditions.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B1E99-12-FRONT LEFT HEATER CONTROL 1-CIRCUIT SHORT TO BATTERY

For a complete HEATED SEAT SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.

- Heated seat is turned off.

SET CONDITION

- Module detects that the Left Front Seat Cushion Heater Supply circuit voltage is above 5.0 volts for more than 2 seconds.

DEFAULT ACTION

- When the Left Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Left Front Seat Cushion Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT SHORTED TO VOLTAGE
LEFT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT SHORTED TO ANOTHER CIRCUIT
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

NOTE: **Seat and steering wheel heaters must remain OFF during this test.**

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE (F503) LEFT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the Comfort Seat Wheel Module (CSWM) C2 harness connector.
3. Start the engine.

4. Measure the voltage of the (F503) Left Front Seat Cushion Heater Supply circuit in the CSWM C2 harness connector.

Is the voltage 5.0 volts or above?

Yes

- Repair the (F503) Left Front Seat Cushion Heater Supply circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [**3**](#)

3. ISOLATE AND CHECK THE (F503) LEFT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (F503) Left Front Seat Cushion Heater Supply circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [**4**](#)

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CSWM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).

- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Check for spread terminals and verify proper terminal tension.

Repair any conditions that are found.

5. Connect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Test drive or operate the vehicle in accordance with the when monitored and set conditions.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to [MODULE, COMFORT SEAT AND WHEEL \(CSWM\), REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

B1E99-13-FRONT LEFT HEATER CONTROL 1-CIRCUIT OPEN

For a complete HEATED SEAT SYSTEM wiring diagram, **refer to the appropriate wiring information**.

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.
- Heated seat is turned on.

SET CONDITION

- Module detects an open on the Left Front Seat Cushion Heater Supply circuit for more than 2 seconds.

DEFAULT ACTION

- When the Left Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.

- The Left Front Seat Cushion Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
GROUND CIRCUIT OPEN OR HIGH RESISTANCE
SEAT CUSHION HEATER ELEMENT
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Left Front Heated Seat on.
7. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. ISOLATE AND LOAD TEST THE (F503) LEFT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT TO CHECK FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when performing a load test on a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested.
3. Connect the positive lead of the load test tool to the positive side of the Battery (A). **Note:** Refer to the diagram below.
4. Using an approved back probe tool, connect the negative lead of the load test tool to the circuit being tested at the one of the component harness connectors (B).
5. Using an approved back probe tool and a fused jumper wire, connect the circuit being tested to the negative side of the Battery or a known good ground at the other component harness connector (C and D).
6. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuit.

NOTE:

Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156

bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test? To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

WARNING: To avoid possible serious or fatal injury, DO NOT load test any air bag/restraint system components or circuits using the procedures listed here. Refer to the Service Information for proper air bag/restraint system testing procedures.

CAUTION: Do not load test any circuits with components still connected to the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [3](#)

No

- Repair the (F503) Left Front Seat Cushion Supply circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. CHECK THE (Z917) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the ground circuit.
2. Connect the positive lead of the load test tool to the positive side of the Battery.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#).

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.

- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#).

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [4](#)

No

- Repair the (Z917) Ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

4. CHECK THE LEFT FRONT SEAT CUSHION HEATER ELEMENT RESISTANCE

1. Measure the resistance of the Left Front Seat Cushion Heater element between the (F503) Left Front Seat Cushion Heater Supply circuit and the (Z917) Ground circuit at the Left Seat Cushion Heater component connector.

NOTE: When probing a circuit always use an appropriate back probing tool to prevent any possible damage to the terminals.

Is the resistance between 2.26 Ohms and 3.38 Ohms at 20B°C (68B°F)?

Yes

- Go To [5](#)

No

- Replace the Left Front Seat Cushion Heater element in accordance with the Service Information. Refer to **PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CSWM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Check for spread terminals and verify proper terminal tension.

Repair any conditions that are found.

5. Connect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Test drive or operate the vehicle in accordance with the when monitored and set conditions.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1E99-4B-FRONT LEFT HEATER CONTROL 1-OVER TEMPERATURE

For a complete HEATED SEAT SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.
- Heated seat is turned on.

SET CONDITION

- Module detects that the Left Front Seat Cushion Heater temperature is above the maximum allowed temperature for 2 seconds.

DEFAULT ACTION

- When the Left Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Left Front Seat Cushion Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT SHORTED TO ANOTHER CIRCUIT
SEAT CUSHION HEATER ELEMENT
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Left Front Heated Seat on.
7. Using the scan tool, monitor the Left Front Seat Cushion temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
8. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [**TESTING FOR AN INTERMITTENT CONDITION**](#).

2. ISOLATE AND CHECK THE (F503) LEFT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT IN THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (F503) Left Front Seat Cushion Heater Supply circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#).

No

- Go To [3](#)

3. REPLACE THE LEFT FRONT SEAT CUSHION HEATER ELEMENT AND RETEST FOR DTCS

1. Turn the ignition off.
2. Replace the Left Front Seat Cushion Heater element in accordance with the Service Information. Refer to [**PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION**](#).
3. Connect the Left Front Seat Cushion Heater element and CSWM harness connectors.
4. With the scan tool, erase CSWM DTCs.
5. Turn the ignition off for 10.0 seconds.
6. Start the Engine.
7. Turn the Left Front Heated Seat on.
8. Using the scan tool, monitor the Left Front Seat Cushion temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
9. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [4](#)

No

- Replacing the Left Front Seat Cushion Heater element repaired the fault.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. CHECK RELATED HARNESS CONNECTIONS

1. Turn the ignition off.
2. Disconnect all CSWM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase DTCs.
10. Turn the ignition off for 10.0 seconds.
11. Start the Engine.
12. Turn the Left Front Heated Seat on.
13. Using the scan tool, monitor the Left Front Seat Cushion temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
14. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1E99-92-FRONT LEFT HEATER CONTROL 1-PERFORMANCE OR INCORRECT OPERATION

For a complete HEATED SEAT SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.
- Heated Seat is turned on.

SET CONDITION

- Module detects that the Left Front Seat Cushion Heater temperature is below the target temperature after a calculated amount of time.

DEFAULT ACTION

- When the Left Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Left Front Seat Cushion Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT SHORTED OR HIGH RESISTANCE
LEFT FRONT HEATED SEAT CUSHION TEMP SENSE CIRCUIT SHORTED OR HIGH RESISTANCE
HEATED SEAT SENSOR RETURN CIRCUIT SHORTED OR HIGH RESISTANCE
GROUND CIRCUIT SHORTED OR HIGH RESISTANCE
SEAT CUSHION HEATER ELEMENT
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Left Front Heated Seat on.
7. Using the scan tool, monitor the Left Front Seat Cushion temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
8. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

2. ISOLATE AND LOAD TEST THE (F503) LEFT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT TO CHECK FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when performing a load test on a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested.
3. Connect the positive lead of the load test tool to the positive side of the Battery (A). **Note:** Refer to the diagram below.
4. Using an approved back probe tool, connect the negative lead of the load test tool to the circuit being tested at the one of the component harness connectors (B).
5. Using an approved back probe tool and a fused jumper wire, connect the circuit being tested to the negative side of the Battery or a known good ground at the other component harness connector (C and D).
6. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuit.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#).**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test? To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared

to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to **CIRCUIT LOAD TESTING PROCEDURES** .

WARNING: To avoid possible serious or fatal injury, **DO NOT** load test any air bag/restraint system components or circuits using the procedures listed here. Refer to the Service Information for proper air bag/restraint system testing procedures.

CAUTION: Do not load test any circuits with components still connected to the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [3](#)

No

- Repair the (F503) Left Front Seat Cushion Heater Supply circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. ISOLATE AND CHECK THE (F503) LEFT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT IN THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (F503) Left Front Seat Cushion Heater Supply circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. ISOLATE AND CHECK THE (P413) LEFT FRONT HEATED SEAT CUSHION TEMP SENSE CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [5](#)

No

- Repair the (P413) Left Front Heated Seat Cushion Temp Sense circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. ISOLATE AND CHECK THE (P413) LEFT FRONT HEATED SEAT CUSHION TEMP SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.

4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (P413) Left Front Heated Seat Cushion Temp Sense circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [6](#)

6. ISOLATE AND CHECK THE (P419) HEATED SEAT SENSOR RETURN CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [7](#)

No

- Repair the (P419) Heated Seat Sensor Return circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

7. ISOLATE AND CHECK THE (P419) HEATED SEAT SENSOR RETURN CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.

4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (P419) Heated Seat Sensor Return circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [8](#)

8. CHECK THE (Z917) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the ground circuit.
2. Connect the positive lead of the load test tool to the positive side of the Battery.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the [CIRCUIT LOAD TESTING PROCEDURE](#) for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.

- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#).

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [9](#)

No

- Repair the (Z917) Ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

9. ISOLATE AND CHECK THE (Z917) GROUND CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any

possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (Z917) Ground circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [10](#)

10. REPLACE THE LEFT FRONT SEAT CUSHION HEATER ELEMENT AND RETEST FOR DTCS

1. Turn the ignition off.
2. Replace the Left Front Seat Cushion Heater element in accordance with the Service Information. Refer to **PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION** .
3. Connect the Left Front Seat Cushion Heater element and CSWM harness connectors.
4. Turn the ignition on.
5. With the scan tool, erase CSWM DTCs.
6. Turn the ignition off for 10.0 seconds.
7. Start the Engine.
8. Turn the Left Front Heated Seat on.
9. Using the scan tool, monitor the Left Front Seat Cushion temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [11](#)

No

- Replacing the Left Front Seat Cushion Heater element repaired the fault.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

11. CHECK RELATED HARNESS CONNECTIONS

1. Turn the ignition off.
2. Disconnect all CSWM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.

- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase DTCs.
10. Turn the ignition off for 10.0 seconds.
11. Start the Engine.
12. Turn the Left Front Heated Seat on.
13. Using the scan tool, monitor the Left Front Seat Cushion temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
14. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B1E9A-11-FRONT RIGHT HEATER CONTROL 1-CIRCUIT SHORT TO GROUND

For a complete HEATED SEAT SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.
- Heated Seat is turned on.

SET CONDITION

- Module detects a short to ground on the Right Front Seat Cushion Heater Supply circuit for more than 2 seconds.

DEFAULT ACTION

- When the Right Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Right Front Seat Cushion Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT SHORTED TO GROUND
RIGHT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT SHORTED TO ANOTHER CIRCUIT
SEAT CUSHION HEATER ELEMENT
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Right Front Heated Seat on.
7. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ISOLATE AND CHECK THE (F506) RIGHT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the (F506) Right Front Seat Cushion Heater Supply circuit?

Yes

- Repair the (F506) Right Front Seat Cushion Heater Supply circuit for a short to ground. Use the appropriate wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE (F506) RIGHT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (F506) Right Front Seat Cushion Heater Supply circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [4](#)

4. CHECK THE RIGHT FRONT SEAT CUSHION HEATER ELEMENT RESISTANCE

1. Measure the resistance of the Right Front Seat Cushion Heater element between the (F506) Right Front Seat Cushion Heater Supply circuit and the (Z917) Ground circuit at the Right Front Seat Cushion Heater component connector.

NOTE: When probing a circuit always use an appropriate back probing tool to prevent any possible damage to the terminals.

Is the resistance between 2.26 Ohms and 3.38 Ohms at 20B°C (68B°F)?

Yes

- Go To [5](#)

No

- Replace the Right Front Seat Cushion Heater element in accordance with the Service Information. Refer to [PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CSWM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Check for spread terminals and verify proper terminal tension.

Repair any conditions that are found.

5. Connect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Test drive or operate the vehicle in accordance with the when monitored and set conditions.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to [MODULE, COMFORT SEAT AND WHEEL \(CSWM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B1E9A-12-FRONT RIGHT HEATER CONTROL 1-CIRCUIT SHORT TO BATTERY

For a complete HEATED SEAT SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.
- Heated seat is turned off.

SET CONDITION

- Module detects that the Right Front Seat Cushion Heater Supply circuit voltage is above 5.0 volts for more than 2 seconds.

DEFAULT ACTION

- When the Right Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Right Front Seat Cushion Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT SHORTED TO VOLTAGE
RIGHT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT SHORTED TO ANOTHER CIRCUIT
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

NOTE: **Seat and steering wheel heaters must remain OFF during this test.**

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

2. CHECK THE (F506) RIGHT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the Comfort Seat Wheel Module (CSWM) C3 harness connector.
3. Start the engine.
4. Measure the voltage of the (F506) Right Front Seat Cushion Heater Supply circuit in the CSWM C3 harness connector.

Is the voltage 5.0 volts or above?

Yes

- Repair the (F506) Right Front Seat Cushion Heater Supply circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [3](#)

3. ISOLATE AND CHECK THE (F506) RIGHT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (F506) Right Front Seat Cushion Heater Supply circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [4](#)

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CSWM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Check for spread terminals and verify proper terminal tension.

Repair any conditions that are found.

5. Connect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Test drive or operate the vehicle in accordance with the when monitored and set conditions.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1E9A-13-FRONT RIGHT HEATER CONTROL 1-CIRCUIT OPEN

For a complete HEATED SEAT SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.
- Heated seat is turned on.

SET CONDITION

- Module detects an open on the Right Front Seat Cushion Heater Supply circuit for more than 2 seconds.

DEFAULT ACTION

- When the Right Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Right Front Seat Cushion Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
GROUND CIRCUIT OPEN OR HIGH RESISTANCE
SEAT CUSHION HEATER ELEMENT
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Right Front Heated Seat on.
7. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ISOLATE AND LOAD TEST THE (F506) RIGHT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT TO CHECK FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when performing a load test on a circuit.

2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested.
3. Connect the positive lead of the load test tool to the positive side of the Battery (A). **Note:** Refer to the diagram below.
4. Using an approved back probe tool, connect the negative lead of the load test tool to the circuit being tested at the one of the component harness connectors (B).
5. Using an approved back probe tool and a fused jumper wire, connect the circuit being tested to the negative side of the Battery or a known good ground at the other component harness connector (C and D).
6. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuit.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test? To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

WARNING: To avoid possible serious or fatal injury, DO NOT load test any air bag/restraint system components or circuits using the procedures listed here. Refer to the Service Information for proper air bag/restraint system testing procedures.

CAUTION: Do not load test any circuits with components still connected to the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [3](#)

No

- Repair the (F506) Right Front Seat Cushion Heater Supply circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. CHECK THE (Z917) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the ground circuit.
2. Connect the positive lead of the load test tool to the positive side of the Battery.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load

testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#).

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the [CIRCUIT LOAD TESTING PROCEDURE](#) for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#).

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [4](#)

No

- Repair the (Z917) Ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

4. CHECK THE RIGHT FRONT SEAT CUSHION HEATER ELEMENT RESISTANCE

1. Measure the resistance of the Right Front Seat Cushion Heater element between the (F506) Right Front Seat Cushion Heater Supply circuit and the (Z917) Ground circuit at the Right Seat Cushion Heater component connector.

NOTE: When probing a circuit always use an appropriate back probing tool to prevent any possible damage to the terminals.

Is the resistance between 2.26 Ohms and 3.38 Ohms at 20B°C (68B°F)?

Yes

- Go To [5](#)

No

- Replace the Right Front Seat Cushion Heater element in accordance with the Service Information. Refer to **PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CSWM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Check for spread terminals and verify proper terminal tension.

Repair any conditions that are found.

5. Connect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Test drive or operate the vehicle in accordance with the when monitored and set conditions.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to [MODULE, COMFORT SEAT AND WHEEL \(CSWM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B1E9A-4B-FRONT RIGHT HEATER CONTROL 1-OVER TEMPERATURE

For a complete HEATED SEAT SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.
- Heated seat is turned on.

SET CONDITION

- Module detects Right Front Seat Cushion Heater temperature is above the maximum allowed temperature for 2 seconds.

DEFAULT ACTION

- When the Right Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Right Front Seat Cushion Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT SHORTED TO ANOTHER CIRCUIT
SEAT CUSHION HEATER ELEMENT
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Right Front Heated Seat on.
7. Using the scan tool, monitor the Right Front Seat Cushion temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
8. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. ISOLATE AND CHECK THE (F506) RIGHT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT IN THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (F506) Right Front Seat Cushion Heater Supply circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [3](#)

3. REPLACE THE RIGHT FRONT SEAT CUSHION HEATER ELEMENT AND RETEST FOR DTCS

1. Turn the ignition off.
2. Replace the Right Front Seat Cushion Heater element in accordance with the Service Information. Refer to **PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION**.

3. Connect the Right Front Seat Cushion Heater element and CSWM harness connectors.
4. Turn the ignition on.
5. With the scan tool, erase CSWM DTCs.
6. Turn the ignition off for 10.0 seconds.
7. Start the Engine.
8. Turn the Right Front Heated Seat on.
9. Using the scan tool, monitor the Right Front Seat Cushion temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [4](#)

No

- Replacing the Right Front Seat Cushion Heater element repaired the fault.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. CHECK RELATED HARNESS CONNECTIONS

1. Turn the ignition off.
2. Disconnect all CSWM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase DTCs.
10. Turn the ignition off for 10.0 seconds.
11. Start the Engine.
12. Turn the Right Front Heated Seat on.

13. Using the scan tool, monitor the Right Front Seat Cushion temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
14. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1E9A-92-FRONT RIGHT HEATER CONTROL 1-PERFORMANCE OR INCORRECT OPERATION

For a complete HEATED SEAT SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.
- Heated seat is turned on.

SET CONDITION

- Module detects Right Front Seat Cushion Heater temperature is below the target temperature after a calculated amount of time.

DEFAULT ACTION

- When the Right Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Right Front Seat Cushion Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT SHORTED OR HIGH RESISTANCE
RIGHT FRONT HEATED SEAT CUSHION TEMP SENSE CIRCUIT SHORTED OR HIGH RESISTANCE
HEATED SEAT SENSOR RETURN CIRCUIT SHORTED OR HIGH RESISTANCE
GROUND CIRCUIT SHORTED OR HIGH RESISTANCE
SEAT CUSHION HEATER ELEMENT
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Right Front Heated Seat on.
7. Using the scan tool, monitor the Right Front Seat Cushion temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
8. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. ISOLATE AND LOAD TEST THE (F506) RIGHT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT TO CHECK FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when performing a load test on a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested.
3. Connect the positive lead of the load test tool to the positive side of the Battery (A). **Note:** Refer to the diagram below.
4. Using an approved back probe tool, connect the negative lead of the load test tool to the circuit being tested at the one of the component harness connectors (B).
5. Using an approved back probe tool and a fused jumper wire, connect the circuit being tested to the negative side of the Battery or a known good ground at the other component harness connector (C and D).
6. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuit.

NOTE:

Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test? To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#).

WARNING: To avoid possible serious or fatal injury, DO NOT load test any air bag/restraint system components or circuits using the procedures listed here. Refer to the Service Information for proper air bag/restraint system testing procedures.

CAUTION: Do not load test any circuits with components still connected to the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [3](#)

No

- Repair the (F506) Right Front Seat Cushion Heater Supply circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. ISOLATE AND CHECK THE (F506) RIGHT FRONT SEAT CUSHION HEATER SUPPLY CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT IN THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (F506) Right Front Seat Cushion Heater Supply circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. ISOLATE AND CHECK THE (P417) RIGHT FRONT HEATED SEAT CUSHION TEMP SENSE CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [5](#)

No

- Repair the (P417) Right Front Heated Seat Cushion Temp Sense circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. ISOLATE AND CHECK THE (P417) RIGHT FRONT HEATED SEAT CUSHION TEMP SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (P417) Right Front Heated Seat Cushion Temp Sense circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [6](#)

6. ISOLATE AND CHECK THE (P419) HEATED SEAT SENSOR RETURN CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any

possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [7](#)

No

- Repair the (P419) Heated Seat Sensor Return circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

7. ISOLATE AND CHECK THE (P419) HEATED SEAT SENSOR RETURN CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (P419) Heated Seat Sensor Return circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [8](#)

8. CHECK THE (Z917) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the ground circuit.
2. Connect the positive lead of the load test tool to the positive side of the Battery.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for

information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the [CIRCUIT LOAD TESTING PROCEDURE](#) for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [9](#)

No

- Repair the (Z917) Ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

9. ISOLATE AND CHECK THE (Z917) GROUND CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (Z917) Ground circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [10](#)

10. REPLACE THE RIGHT FRONT SEAT CUSHION HEATER ELEMENT AND RETEST FOR DTCS

1. Turn the ignition off.
2. Replace the Right Front Seat Cushion Heater element in accordance with the Service Information. Refer to [PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION](#).
3. Connect the Right Front Seat Cushion Heater element and CSWM harness connectors.
4. Turn the ignition on.
5. With the scan tool, erase CSWM DTCs.
6. Turn the ignition off for 10.0 seconds.
7. Start the Engine.
8. Turn the Right Front Heated Seat on.
9. Using the scan tool, monitor the Right Front Seat Cushion temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [11](#)

No

- Replacing the Right Front Seat Cushion Heater element repaired the fault.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

11. CHECK RELATED HARNESS CONNECTIONS

1. Turn the ignition off.
2. Disconnect all CSWM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase DTCs.
10. Turn the ignition off for 10.0 seconds.
11. Start the Engine.
12. Turn the Right Front Heated Seat on.
13. Using the scan tool, monitor the Right Front Seat Cushion temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
14. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to [MODULE, COMFORT SEAT AND WHEEL \(CSWM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1EB1-1A-FRONT LEFT SEAT HEATER SENSOR 1-CIRCUIT RESISTANCE BELOW THRESHOLD

For a complete HEATED SEAT SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 19.0 volts.

SET CONDITION

- Module detects that the signal from the Negative Temperature Coefficient (NTC) thermistor is below its threshold for more than 2 seconds.

DEFAULT ACTION

- When the Left Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Left Front Seat Cushion Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT HEATED SEAT CUSHION TEMP SENSE CIRCUIT SHORTED TO GROUND
LEFT FRONT HEATED SEAT CUSHION TEMP SENSE CIRCUIT SHORTED TO THE HEATED SEAT SENSOR RETURN CIRCUIT
HEATED SEAT CUSHION TEMPERATURE SENSOR
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Left Front Heated Seat on.

7. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ISOLATE AND CHECK (P413) LEFT FRONT HEATED SEAT CUSHION TEMP SENSE CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the (P413) Left Front Heated Seat Cushion Temp Sense circuit?

Yes

- Repair the (P413) Left Front Heated Seat Cushion Temp Sense circuit for a short to ground. Use the appropriate wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE (P413) LEFT FRONT HEATED SEAT CUSHION TEMP SENSE CIRCUIT FOR A SHORT TO THE (P419) HEATED SEAT SENSOR RETURN CIRCUIT

1. The ignition must be off when checking for a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the test leads of the DVOM and check for continuity between the circuits being tested at the component harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between the circuits being tested.

Is there continuity between the circuits?

Yes

- Repair the short between the circuits.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. REPLACE THE LEFT FRONT HEATED SEAT CUSHION TEMPERATURE SENSOR AND RETEST FOR DTCS

1. Turn the ignition off.
2. Replace the Left Front Heated Seat Cushion Temperature Sensor (Left Front Seat Cushion Heater Element) in accordance with the Service Information. Refer to **PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION** .
3. Connect the Left Front Heated Seat Cushion Temperature Sensor (Left Front Seat Cushion Heater Element) and CSWM harness connectors.
4. Turn the ignition on.
5. With the scan tool, erase CSWM DTCs.
6. Turn the ignition off for 10.0 seconds.
7. Start the Engine.
8. Turn the Left Front Heated Seat on.
9. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [5](#)

No

- Replacing the Left Front Heated Seat Cushion Temperature Sensor (Left Front Seat Cushion Heater Element) repaired the fault.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. CHECK RELATED HARNESS CONNECTIONS

1. Turn the ignition off.
2. Disconnect all CSWM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).

- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase CSWM DTCs.
10. Turn the ignition off for 10.0 seconds.
11. Start the Engine.
12. Turn the Left Front Heated Seat on.
13. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to [MODULE, COMFORT SEAT AND WHEEL \(CSWM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B1EB1-1B-FRONT LEFT SEAT HEATER SENSOR 1-CIRCUIT RESISTANCE ABOVE THRESHOLD

For a complete HEATED SEAT SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.

SET CONDITION

- Module detects that the signal from the Negative Temperature Coefficient (NTC) thermistor is above its threshold for more than two seconds.

DEFAULT ACTION

- When the Left Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Left Front Seat Cushion Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT HEATED SEAT CUSHION TEMP SENSE CIRCUIT SHORTED TO VOLTAGE
LEFT FRONT HEATED SEAT CUSHION TEMP SENSE CIRCUIT OPEN
HEATED SEAT SENSOR RETURN CIRCUIT OPEN
HEATED SEAT CUSHION TEMPERATURE SENSOR
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Left Front Heated Seat on.
7. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE (P413) LEFT FRONT HEATED SEAT CUSHION TEMP SENSE CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the CSWM C2 harness connector.
3. Start the engine.
4. Measure the voltage between ground and the (P413) Left Front Heated Seat Cushion Temp Sense circuit at the CSWM C2 harness connector.

Is there any voltage present?

Yes

- Repair the (P413) Left Front Heated Seat Cushion Temp Sense circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE (P413) LEFT FRONT HEATED SEAT CUSHION TEMP SENSE CIRCUIT OR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [4](#)

No

- Repair the (P413) Left Front Heated Seat Cushion Temp Sense circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. ISOLATE AND CHECK THE (P419) HEATED SEAT SENSOR RETURN CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [5](#)

No

- Repair the (P419) Heated Seat Sensor Return circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. REPLACE THE LEFT FRONT HEATED SEAT CUSHION TEMPERATURE SENSOR AND RETEST FOR DTCS

1. Turn the ignition off.
2. Replace the Left Front Heated Seat Cushion Temperature Sensor (Left Front Seat Cushion Heater Element) in accordance with the Service Information. Refer to [PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION](#) .
3. Connect the Left Front Heated Seat Cushion Temperature Sensor (Left Front Seat Cushion Heater Element) and CSWM harness connectors.
4. Turn the ignition on.
5. With the scan tool, erase CSWM DTCs.
6. Turn the ignition off for 10.0 seconds.
7. Start the Engine.
8. Turn the Left Front Heated Seat on.
9. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [6](#)

No

- Replacing the Left Front Heated Seat Cushion Temperature Sensor (Left Front Seat Cushion Heater Element) repaired the fault.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

6. CHECK RELATED HARNESS CONNECTIONS

1. Turn the ignition off.
2. Disconnect all CSWM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase CSWM DTCs.
10. Turn the ignition off for 10.0 seconds.
11. Start the Engine.
12. Turn the Left Front Heated Seat on.
13. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B1EB2-1A-FRONT RIGHT SEAT HEATER SENSOR 1-CIRCUIT RESISTANCE BELOW THRESHOLD

For a complete HEATED SEAT SYSTEM wiring diagram, **refer to the appropriate wiring information**.

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.

SET CONDITION

- Module detects that the signal from the Negative Temperature Coefficient (NTC) thermistor is below its threshold for more than 2 seconds.

DEFAULT ACTION

- When the Right Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Right Front Seat Cushion Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT HEATED SEAT CUSHION TEMP SENSE CIRCUIT SHORTED TO GROUND
RIGHT FRONT HEATED SEAT CUSHION TEMP SENSE CIRCUIT SHORTED TO THE HEATED SEAT SENSOR RETURN CIRCUIT
HEATED SEAT CUSHION TEMPERATURE SENSOR
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Right Front Heated Seat on.
7. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. ISOLATE AND CHECK (P417) RIGHT FRONT HEATED SEAT CUSHION TEMP SENSE CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the (P417) Right Front Heated Seat Cushion Temp Sense circuit?

Yes

- Repair the (P417) Right Front Heated Seat Cushion Temp Sense circuit for a short to ground. Use the appropriate wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE (P417) RIGHT FRONT HEATED SEAT CUSHION TEMP SENSE CIRCUIT FOR A SHORT TO THE (P419) HEATED SEAT SENSOR RETURN CIRCUIT

1. The ignition must be off when checking for a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the test leads of the DVOM and check for continuity between the circuits being tested at the component harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between the circuits being tested.

Is there continuity between the circuits?

Yes

- Repair the short between the circuits.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [4](#)

4. REPLACE THE RIGHT FRONT HEATED SEAT CUSHION TEMPERATURE SENSOR AND RETEST FOR DTCS

1. Turn the ignition off.
2. Replace the Right Front Heated Seat Cushion Temperature Sensor (Right Front Seat Cushion Heater Element) in accordance with the Service Information. Refer to [**PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION**](#) .
3. Connect the Right Front Heated Seat Cushion Temperature Sensor (Right Front Seat Cushion Heater Element) and CSWM harness connectors.
4. Turn the ignition on.
5. With the scan tool, erase CSWM DTCs.
6. Turn the ignition off for 10.0 seconds.
7. Start the Engine.
8. Turn the Right Front Heated Seat on.
9. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [5](#)

No

- Replacing the Right Front Heated Seat Cushion Temperature Sensor (Right Front Seat Cushion Heater Element) repaired the fault.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. CHECK RELATED HARNESS CONNECTIONS

1. Turn the ignition off.
2. Disconnect all CSWM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase CSWM DTCs.
10. Turn the ignition off for 10.0 seconds.
11. Start the Engine.
12. Turn the Right Front Heated Seat on.
13. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to [MODULE, COMFORT SEAT AND WHEEL \(CSWM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1EB2-1B-FRONT RIGHT SEAT HEATER SENSOR 1-CIRCUIT RESISTANCE ABOVE THRESHOLD

For a complete HEATED SEAT SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.

SET CONDITION

- Module detects that the signal from the Negative Temperature Coefficient (NTC) thermistor is above its threshold for more than two seconds.

DEFAULT ACTION

- When the Right Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Right Front Seat Cushion Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT HEATED SEAT CUSHION TEMP SENSE CIRCUIT SHORTED TO VOLTAGE
RIGHT FRONT HEATED SEAT CUSHION TEMP SENSE CIRCUIT OPEN
HEATED SEAT SENSOR RETURN CIRCUIT OPEN
HEATED SEAT CUSHION TEMPERATURE SENSOR
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Right Front Heated Seat on.

7. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE (P417) RIGHT FRONT HEATED SEAT CUSHION TEMP SENSE CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the CSWM C3 harness connector.
3. Start the Engine.
4. Measure the voltage between ground and the (P417) Right Front Heated Seat Cushion Temp Sense circuit at the CSWM C3 harness connector.

Is there any voltage present?

Yes

- Repair the (P417) Right Front Heated Seat Cushion Temp Sense circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE (P417) RIGHT FRONT HEATED SEAT CUSHION TEMP SENSE CIRCUIT OR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [4](#)

No

- Repair the (P417) Right Front Heated Seat Cushion Temp Sense circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. ISOLATE AND CHECK THE (P419) HEATED SEAT SENSOR RETURN CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [5](#)

No

- Repair the (P419) Heated Seat Sensor Return circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. REPLACE THE RIGHT FRONT HEATED SEAT CUSHION TEMPERATURE SENSOR AND RETEST FOR DTCS

1. Turn the ignition off.
2. Replace the Right Front Heated Seat Cushion Temperature Sensor (Right Front Seat Cushion Heater Element) in accordance with the Service Information. Refer to [PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION](#) .
3. Connect the Right Front Heated Seat Cushion Temperature Sensor (Right Front Seat Cushion Heater Element) and CSWM harness connectors.
4. Turn the ignition on.
5. With the scan tool, erase CSWM DTCs.
6. Turn the ignition off for 10.0 seconds.
7. Start the Engine.
8. Turn the Right Front Heated Seat on.
9. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [6](#)

No

- Replacing the Right Front Heated Seat Cushion Temperature Sensor (Right Front Seat Cushion Heater Element) repaired the fault.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

6. CHECK RELATED HARNESS CONNECTIONS

1. Turn the ignition off.
2. Disconnect all CSWM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase CSWM DTCs.
10. Turn the ignition off for 10.0 seconds.
11. Start the Engine.
12. Turn the Right Front Heated Seat on.
13. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1F10-11-FRONT LEFT HEATER CONTROL 2-CIRCUIT SHORT TO GROUND

For a complete HEATED SEAT SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.
- Heated seat is turned on.

SET CONDITION

- Module detects a short to ground on the Left Front Seat Back Heater Supply circuit for more than 2 seconds.

DEFAULT ACTION

- When the Left Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Left Front Seat Back Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT SEAT BACK HEATER SUPPLY CIRCUIT SHORTED TO GROUND
LEFT FRONT SEAT BACK HEATER SUPPLY CIRCUIT SHORTED TO ANOTHER CIRCUIT
SEAT BACK HEATER ELEMENT
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Left Front Heated Seat on.
7. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. ISOLATE AND CHECK THE (F507) LEFT FRONT SEAT BACK HEATER SUPPLY CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the (F507) Left Front Seat Back Heater Supply circuit?

Yes

- Repair the (F507) Left Front Seat Back Heater Supply circuit for a short to ground. Use the appropriate wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [3](#)

3. ISOLATE AND CHECK THE (F507) LEFT FRONT SEAT BACK HEATER SUPPLY CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (F507) Left Front Seat Back Heater Supply circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. CHECK THE LEFT FRONT SEAT BACK HEATER ELEMENT RESISTANCE

1. Measure the resistance of the Left Front Seat Back Heater element between the (F507) Left Front Seat Back Heater Supply circuit and the (Z917) Ground circuit at the Left Seat Back Heater component connector.

NOTE: When probing a circuit always use an appropriate back probing tool to prevent any possible damage to the terminals.

Is the resistance between 2.43 Ohms and 3.65 Ohms at 20B°C (68B°F)?

Yes

- Go To [5](#)

No

- Replace the Left Front Seat Back Heater element in accordance with the Service Information. Refer to **PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CSWM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Check for spread terminals and verify proper terminal tension.

Repair any conditions that are found.

5. Connect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

8. With the scan tool, erase DTCs.
9. Test drive or operate the vehicle in accordance with the when monitored and set conditions.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to [**MODULE, COMFORT SEAT AND WHEEL \(CSWM\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

B1F10-12-FRONT LEFT HEATER CONTROL 2-CIRCUIT SHORT TO BATTERY

For a complete HEATED SEAT SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.
- Heated seat is turned off.

SET CONDITION

- Module detects that the Left Front Seat Back Heater Supply circuit voltage is above 5.0 volts for more than 2 seconds.

DEFAULT ACTION

- When the Left Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Left Front Seat Back Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT SEAT BACK HEATER SUPPLY CIRCUIT SHORTED TO VOLTAGE
LEFT FRONT SEAT BACK HEATER SUPPLY CIRCUIT SHORTED TO ANOTHER CIRCUIT
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [**PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

NOTE: **Seat and steering wheel heaters must remain OFF during this test.**

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. CHECK THE (F507) LEFT FRONT SEAT BACK HEATER SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the Comfort Seat Wheel Module (CSWM) C2 harness connector.
3. Start the engine.
4. Measure the voltage of the (F507) Left Front Seat Back Heater Supply circuit in the CSWM C2 harness connector.

Is the voltage 5.0 volts or above?

Yes

- Repair the (F507) Left Front Seat Back Heater Supply circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE (F507) LEFT FRONT SEAT BACK HEATER SUPPLY CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (F507) Left Front Seat Back Heater Supply circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CSWM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Check for spread terminals and verify proper terminal tension.

Repair any conditions that are found.

5. Connect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Test drive or operate the vehicle in accordance with the when monitored and set conditions.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B1F10-13-FRONT LEFT HEATER CONTROL 2-CIRCUIT OPEN

For a complete HEATED SEAT SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.
- Heated seat is turned on.

SET CONDITION

- Module detects an open on the Left Front Seat Back Heater Supply circuit for more than 2 seconds.

DEFAULT ACTION

- When the Left Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Left Front Seat Back Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT SEAT BACK HEATER SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
GROUND CIRCUIT OPEN OR HIGH RESISTANCE
SEAT BACK HEATER ELEMENT
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.

4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Left Front Heated Seat on.
7. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. ISOLATE AND LOAD TEST THE (F507) LEFT FRONT SEAT BACK HEATER SUPPLY CIRCUIT TO CHECK FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when performing a load test on a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested.
3. Connect the positive lead of the load test tool to the positive side of the Battery (A). **Note:** Refer to the diagram below.
4. Using an approved back probe tool, connect the negative lead of the load test tool to the circuit being tested at the one of the component harness connectors (B).
5. Using an approved back probe tool and a fused jumper wire, connect the circuit being tested to the negative side of the Battery or a known good ground at the other component harness connector (C and D).
6. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuit.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to **CIRCUIT LOAD TESTING PROCEDURES**.**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test? To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#).

WARNING: To avoid possible serious or fatal injury, **DO NOT** load test any air bag/restraint system components or circuits using the procedures listed here. Refer to the Service Information for proper air bag/restraint system testing procedures.

CAUTION: Do not load test any circuits with components still connected to the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [3](#)

No

- Repair the (F507) Left Front Seat Back Heater Supply circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. CHECK THE (Z917) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the ground circuit.
2. Connect the positive lead of the load test tool to the positive side of the Battery.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [4](#)

No

- Repair the (Z917) Ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. CHECK THE LEFT FRONT SEAT BACK HEATER ELEMENT RESISTANCE

1. Measure the resistance of the Left Front Seat Back Heater element between the (F507) Left Front Seat Back Heater Supply circuit and the (Z917) Ground circuit at the Left Front Seat Back Heater component connector.

NOTE: When probing a circuit always use an appropriate back probing tool to prevent any possible damage to the terminals.

Is the resistance between 2.43 Ohms and 3.65 Ohms at 20B°C (68B°F)?

Yes

- Go To [5](#)

No

- Replace the Left Front Seat Back Heater element in accordance with the Service Information. Refer to [PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CSWM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:

- Proper connector installation.
- Damaged connector locks.
- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Check for spread terminals and verify proper terminal tension.

Repair any conditions that are found.

5. Connect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Test drive or operate the vehicle in accordance with the when monitored and set conditions.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B1F10-4B-FRONT LEFT HEATER CONTROL 2-OVER TEMPERATURE

For a complete HEATED SEAT SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.
- Heated Seat is turned on.

SET CONDITION

- Module detects that the Left Front Seat Back Heater temperature is above the maximum allowed temperature for 2 seconds.

DEFAULT ACTION

- When the Left Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Left Front Seat Back Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT SEAT BACK HEATER SUPPLY CIRCUIT SHORTED TO ANOTHER CIRCUIT
SEAT BACK HEATER ELEMENT
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Left Front Heated Seat on.
7. Using the scan tool, monitor the Left Front Seat Back temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
8. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. ISOLATE AND CHECK THE (F507) LEFT FRONT SEAT BACK HEATER SUPPLY CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT IN THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (F507) Left Front Seat Back Heater Supply circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [**3**](#)

3. REPLACE THE LEFT FRONT SEAT BACK HEATER ELEMENT AND RETEST FOR DTCS

1. Turn the ignition off.
2. Replace the Left Front Seat Back Heater element in accordance with the Service Information. Refer to [**PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION**](#) .
3. Connect the Left Front Seat Back Heater element and CSWM harness connectors.
4. Turn the ignition on.
5. With the scan tool, erase CSWM DTCs.
6. Turn the ignition off for 10.0 seconds.
7. Start the Engine.
8. Turn the Left Front Heated Seat on.
9. Using the scan tool, monitor the Left Front Seat Back temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [**4**](#)

No

- Replacing the Left Front Seat Back Heater element repaired the fault.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

4. CHECK RELATED HARNESS CONNECTIONS

1. Turn the ignition off.
2. Disconnect all CSWM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.

- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase DTCs.
10. Turn the ignition off for 10.0 seconds.
11. Start the Engine.
12. Turn the Left Front Heated Seat on.
13. Using the scan tool, monitor the Left Front Seat Back temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
14. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1F10-92-FRONT LEFT HEATER CONTROL 2-PERFORMANCE OR INCORRECT OPERATION

For a complete HEATED SEAT SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.

- Heated seat is turned on.

SET CONDITION

- Module detects that the Left Front Seat Back Heater temperature is below the target temperature after a calculated amount of time.

DEFAULT ACTION

- When the Left Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Left Front Seat Back Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT SEAT BACK HEATER SUPPLY CIRCUIT SHORTED OR HIGH RESISTANCE
LEFT FRONT HEATED SEAT BACK TEMP SENSE CIRCUIT SHORTED OR HIGH RESISTANCE
HEATED SEAT SENSOR RETURN CIRCUIT SHORTED OR HIGH RESISTANCE
GROUND CIRCUIT SHORTED OR HIGH RESISTANCE
SEAT BACK HEATER ELEMENT
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Left Front Heated Seat on.
7. Using the scan tool, monitor the Left Front Seat Back temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
8. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ISOLATE AND LOAD TEST THE (F507) LEFT FRONT SEAT BACK HEATER SUPPLY CIRCUIT TO CHECK FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when performing a load test on a circuit.

2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested.
3. Connect the positive lead of the load test tool to the positive side of the Battery (A). **Note:** Refer to the diagram below.
4. Using an approved back probe tool, connect the negative lead of the load test tool to the circuit being tested at the one of the component harness connectors (B).
5. Using an approved back probe tool and a fused jumper wire, connect the circuit being tested to the negative side of the Battery or a known good ground at the other component harness connector (C and D).
6. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuit.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test? To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

WARNING: To avoid possible serious or fatal injury, DO NOT load test any air bag/restraint system components or circuits using the procedures listed here. Refer to the Service Information for proper air bag/restraint system testing procedures.

CAUTION: Do not load test any circuits with components still connected to the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [3](#)

No

- Repair the (F507) Left Front Seat Back Heater Supply circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. ISOLATE AND CHECK THE (F507) LEFT FRONT SEAT BACK HEATER SUPPLY CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT IN THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (F507) Left Front Seat Back Heater Supply circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. ISOLATE AND CHECK THE (P415) LEFT FRONT HEATED SEAT BACK TEMP SENSE CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [5](#)

No

- Repair the (P415) Left Front Heated Seat Back Temp Sense circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. ISOLATE AND CHECK THE (P415) LEFT FRONT HEATED SEAT BACK TEMP SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (P415) Left Front Heated Seat Back Temp Sense circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [6](#)

6. ISOLATE AND CHECK THE (P419) HEATED SEAT SENSOR RETURN CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [7](#)

No

- Repair the (P419) Heated Seat Sensor Return circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

7. ISOLATE AND CHECK THE (P419) HEATED SEAT SENSOR RETURN CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (P419) Heated Seat Sensor Return circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [8](#)

8. CHECK THE (Z917) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the ground circuit.
2. Connect the positive lead of the load test tool to the positive side of the Battery.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and

alternative methods of load testing or voltage drop. Refer to **CIRCUIT LOAD TESTING PROCEDURES** .

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [9](#)

No

- Repair the (Z917) Ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

9. ISOLATE AND CHECK THE (Z917) GROUND CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (Z917) Ground circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [10](#)

10. REPLACE THE LEFT FRONT SEAT BACK HEATER ELEMENT AND RETEST FOR DTCS

1. Turn the ignition off.
2. Replace the Left Front Seat Back Heater element in accordance with the Service Information. Refer to **PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION** .
3. Connect the Left Front Seat Back Heater element and CSWM harness connectors.
4. Turn the ignition on.
5. With the scan tool, erase CSWM DTCs.
6. Turn the ignition off for 10.0 seconds.
7. Start the Engine.
8. Turn the Left Front Heated Seat on.
9. Using the scan tool, monitor the Left Front Seat Back temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [11](#)

No

- Replacing the Left Front Seat Back Heater element repaired the fault.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

11. CHECK RELATED HARNESS CONNECTIONS

1. Turn the ignition off.
2. Disconnect all CSWM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.

7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase DTCs.
10. Turn the ignition off for 10.0 seconds.
11. Start the Engine.
12. Turn the Left Front Heated Seat on.
13. Using the scan tool, monitor the Left Front Seat Back temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
14. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to [**MODULE, COMFORT SEAT AND WHEEL \(CSWM\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

B1F11-11-FRONT RIGHT HEATER CONTROL 2-CIRCUIT SHORT TO GROUND

For a complete HEATED SEAT SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.
- Heated seat is turned on.

SET CONDITION

- Module detects a short to ground on the Right Front Seat Back Heater Supply circuit for more than 2 seconds.

DEFAULT ACTION

- When the Right Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Right Front Seat Back Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT SEAT BACK HEATER SUPPLY CIRCUIT SHORTED TO GROUND
RIGHT FRONT SEAT BACK HEATER SUPPLY CIRCUIT SHORTED TO ANOTHER CIRCUIT
SEAT BACK HEATER ELEMENT
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Right Front Heated Seat on.
7. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. ISOLATE AND CHECK THE (F508) RIGHT FRONT SEAT BACK HEATER SUPPLY CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the (F508) Right Front Seat Back Heater Supply circuit?

Yes

- Repair the (F508) Right Front Seat Back Heater Supply circuit for a short to ground. Use the appropriate wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE (F508) RIGHT FRONT SEAT BACK HEATER SUPPLY CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (F508) Right Front Seat Back Heater Supply circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [4](#)

4. CHECK THE RIGHT FRONT SEAT BACK HEATER ELEMENT RESISTANCE

1. Measure the resistance of the Right Front Seat Back Heater element between the (F508) Right Front Seat Back Heater Supply circuit and the (Z917) Ground circuit at the Right Front Seat Back Heater component connector.

NOTE: When probing a circuit always use an appropriate back probing tool to prevent any possible damage to the terminals.

Is the resistance between 2.43 Ohms and 3.65 Ohms at 20B°C (68B°F)?

Yes

- Go To [5](#)

No

- Replace the Right Front Seat Back Heater element in accordance with the Service Information. Refer to [**PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION**](#) .

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CSWM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Check for spread terminals and verify proper terminal tension.

Repair any conditions that are found.

5. Connect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Test drive or operate the vehicle in accordance with the when monitored and set conditions.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1F11-12-FRONT RIGHT HEATER CONTROL 2-CIRCUIT SHORT TO BATTERY

For a complete HEATED SEAT SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.
- Heated seat is turned off.

SET CONDITION

- Module detects that the Right Front Seat Back Heater Supply circuit voltage is above 5.0 volts for more than 2 seconds.

DEFAULT ACTION

- When the Right Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Right Front Seat Back Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT SEAT BACK HEATER SUPPLY CIRCUIT SHORTED TO VOLTAGE
RIGHT FRONT SEAT BACK HEATER SUPPLY CIRCUIT SHORTED TO ANOTHER CIRCUIT
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

NOTE: **Seat and steering wheel heaters must remain OFF during this test.**

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. CHECK THE (F508) RIGHT FRONT SEAT BACK HEATER SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the Comfort Seat Wheel Module (CSWM) C3 harness connector.
3. Start the Engine.
4. Measure the voltage of the (F508) Right Front Seat Back Heater Supply circuit in the CSWM C3 harness connector.

Is the voltage 5.0 volts or above?

Yes

- Repair the (F508) Right Front Seat Back Heater Supply circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE (F508) RIGHT FRONT SEAT BACK HEATER SUPPLY CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (F508) Right Front Seat Back Heater Supply circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CSWM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.

- Damaged connector locks.
- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Check for spread terminals and verify proper terminal tension.

Repair any conditions that are found.

5. Connect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Test drive or operate the vehicle in accordance with the when monitored and set conditions.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1F11-13-FRONT RIGHT HEATER CONTROL 2-CIRCUIT OPEN

For a complete HEATED SEAT SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.
- Heated seat is turned on.

SET CONDITION

- Module detects an open on the Right Front Seat Back Heater Supply circuit for more than 2 seconds.

DEFAULT ACTION

- When the Right Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Right Front Seat Back Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT SEAT BACK HEATER SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
GROUND CIRCUIT OPEN OR HIGH RESISTANCE
SEAT BACK HEATER ELEMENT
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Right Front Heated Seat on.
7. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ISOLATE AND LOAD TEST THE (F508) RIGHT FRONT SEAT BACK HEATER SUPPLY CIRCUIT TO CHECK FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when performing a load test on a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested.
3. Connect the positive lead of the load test tool to the positive side of the Battery (A). **Note:** Refer to the diagram below.
4. Using an approved back probe tool, connect the negative lead of the load test tool to the circuit being tested at the one of the component harness connectors (B).

5. Using an approved back probe tool and a fused jumper wire, connect the circuit being tested to the negative side of the Battery or a known good ground at the other component harness connector (C and D).
6. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuit.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test? To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

NOTE:

testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#).

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the [CIRCUIT LOAD TESTING PROCEDURE](#) for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#).

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [4](#)

No

- Repair the (Z917) Ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. CHECK THE RIGHT FRONT SEAT BACK HEATER ELEMENT RESISTANCE

1. Measure the resistance of the Right Front Seat Back Heater element between the (F508) Right Front Seat Back Heater Supply circuit and the (Z917) Ground circuit at the Right Seat Back Heater component connector.

NOTE: When probing a circuit always use an appropriate back probing tool to prevent any possible damage to the terminals.

Is the resistance between 2.43 Ohms and 3.65 Ohms at 20B°C (68B°F)?

Yes

- Go To [5](#)

No

- Replace the Right Front Seat Back Heater element in accordance with the Service Information. Refer to **PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CSWM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Check for spread terminals and verify proper terminal tension.

Repair any conditions that are found.

5. Connect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Test drive or operate the vehicle in accordance with the when monitored and set conditions.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to [**MODULE, COMFORT SEAT AND WHEEL \(CSWM\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

B1F11-4B-FRONT RIGHT HEATER CONTROL 2-OVER TEMPERATURE

For a complete HEATED SEAT SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.
- Heated seat is turned on.

SET CONDITION

- Module detects that the Right Front Seat Back Heater temperature is above the maximum allowed temperature for 2 seconds.

DEFAULT ACTION

- When the Right Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Right Front Seat Back Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT SEAT BACK HEATER SUPPLY CIRCUIT SHORTED TO ANOTHER CIRCUIT
SEAT BACK HEATER ELEMENT
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [**PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Right Front Heated Seat on.
7. Using the scan tool, monitor the Right Front Seat Back temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
8. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. ISOLATE AND CHECK THE (F508) RIGHT FRONT SEAT BACK HEATER SUPPLY CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT IN THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (F508) Right Front Seat Back Heater Supply circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [3](#)

3. REPLACE THE RIGHT FRONT SEAT BACK HEATER ELEMENT AND RETEST FOR DTCS

1. Turn the ignition off.
2. Replace the Right Front Seat Back Heater element in accordance with the Service Information. Refer to **PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION**.
3. Connect the Right Front Seat Back Heater element and CSWM harness connectors.
4. Turn the ignition on.

5. With the scan tool, erase CSWM DTCs.
6. Turn the ignition off for 10.0 seconds.
7. Start the Engine.
8. Turn the Right Front Heated Seat on.
9. Using the scan tool, monitor the Right Front Seat Back temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [4](#)

No

- Replacing the Right Front Seat Back Heater element repaired the fault.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. CHECK RELATED HARNESS CONNECTIONS

1. Turn the ignition off.
2. Disconnect all CSWM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase DTCs.
10. Turn the ignition off for 10.0 seconds.
11. Start the Engine.
12. Turn the Right Front Heated Seat on.
13. Using the scan tool, monitor the Right Front Seat Back temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.

14. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to [**MODULE, COMFORT SEAT AND WHEEL \(CSWM\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

B1F11-92-FRONT RIGHT HEATER CONTROL 2-PERFORMANCE OR INCORRECT OPERATION

For a complete HEATED SEAT SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.
- Heated seat is turned on.

SET CONDITION

- Module detects that the Right Front Seat Back Heater temperature is below the target temperature after a calculated amount of time.

DEFAULT ACTION

- When the Right Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Right Front Seat Back Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT SEAT BACK HEATER SUPPLY CIRCUIT SHORTED OR HIGH RESISTANCE
RIGHT FRONT HEATED SEAT BACK TEMP SENSE CIRCUIT SHORTED OR HIGH RESISTANCE
HEATED SEAT SENSOR RETURN CIRCUIT SHORTED OR HIGH RESISTANCE
GROUND CIRCUIT SHORTED HIGH RESISTANCE
SEAT BACK HEATER ELEMENT
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [**PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Right Front Heated Seat on.
7. Using the scan tool, monitor the Right Front Seat Back temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
8. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

2. ISOLATE AND LOAD TEST THE (F508) RIGHT FRONT SEAT BACK HEATER SUPPLY CIRCUIT TO CHECK FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when performing a load test on a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested.
3. Connect the positive lead of the load test tool to the positive side of the Battery (A). **Note:** Refer to the diagram below.
4. Using an approved back probe tool, connect the negative lead of the load test tool to the circuit being tested at the one of the component harness connectors (B).
5. Using an approved back probe tool and a fused jumper wire, connect the circuit being tested to the negative side of the Battery or a known good ground at the other component harness connector (C and D).
6. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuit.

NOTE:

Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#).

NOTE:

Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load

test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE:

Note: Why perform a Voltage Drop Test? To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#).

WARNING:

To avoid possible serious or fatal injury, DO NOT load test any air bag/restraint system components or circuits using the procedures listed here. Refer to the Service Information for proper air bag/restraint system testing procedures.

CAUTION:

Do not load test any circuits with components still connected to the circuit.

NOTE:

When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE:

Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [3](#)

No

- Repair the (F508) Right Front Seat Back Heater Supply circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. ISOLATE AND CHECK THE (F508) RIGHT FRONT SEAT BACK HEATER SUPPLY CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT IN THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (F508) Right Front Seat Back Heater Supply circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [4](#)

4. ISOLATE AND CHECK THE (P418) RIGHT FRONT HEATED SEAT BACK TEMP SENSE CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [5](#)

No

- Repair the (P418) Right Front Heated Seat Back Temp Sense circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

5. ISOLATE AND CHECK THE (P418) RIGHT FRONT HEATED SEAT BACK TEMP SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (P418) Right Front Heated Seat Back Temp Sense circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [6](#)

6. ISOLATE AND CHECK THE (P419) HEATED SEAT SENSOR RETURN CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [7](#)

No

- Repair the (P419) Heated Seat Sensor Return circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

7. ISOLATE AND CHECK THE (P419) HEATED SEAT SENSOR RETURN CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (P419) Heated Seat Sensor Return circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [8](#)

8. CHECK THE (Z917) GROUND CIRCUIT FOR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the ground circuit.
2. Connect the positive lead of the load test tool to the positive side of the Battery.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#).

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#).

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [9](#)

No

- Repair the (Z917) Ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

9. ISOLATE AND CHECK THE (Z917) GROUND CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE CSWM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the (Z917) Ground circuit and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [10](#)

10. REPLACE THE RIGHT FRONT SEAT BACK HEATER ELEMENT AND RETEST FOR DTCS

1. Turn the ignition off.
2. Replace the Right Front Seat Back Heater element in accordance with the Service Information. Refer to [PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION](#) .
3. Connect the Right Front Seat Back Heater element and CSWM harness connectors.
4. Turn the ignition on.
5. With the scan tool, erase CSWM DTCs.
6. Turn the ignition off for 10.0 seconds.
7. Start the Engine.
8. Turn the Right Front Heated Seat on.
9. Using the scan tool, monitor the Right Front Seat Back temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [11](#)

No

- Replacing the Right Front Seat Back Heater element repaired the fault.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

11. CHECK RELATED HARNESS CONNECTIONS

1. Turn the ignition off.
2. Disconnect all CSWM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase DTCs.
10. Turn the ignition off for 10.0 seconds.
11. Start the Engine.
12. Turn the Right Front Heated Seat on.
13. Using the scan tool, monitor the Right Front Seat Back temperature. The value should rise steadily until the seat reaches the calibrated target temperature. This will take several minutes.
14. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1F16-1A-FRONT LEFT SEAT HEATER SENSOR 2-CIRCUIT RESISTANCE BELOW THRESHOLD

For a complete HEATED SEAT SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.

SET CONDITION

- Module detects that the signal from the Negative Temperature Coefficient (NTC) thermistor is below its threshold for more than 2 seconds.

DEFAULT ACTION

- When the Left Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Left Front Seat Back Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT HEATED SEAT BACK TEMP SENSE CIRCUIT SHORTED TO GROUND
LEFT FRONT HEATED SEAT BACK TEMP SENSE CIRCUIT SHORTED TO THE HEATED SEAT SENSOR RETURN CIRCUIT
HEATED SEAT BACK TEMPERATURE SENSOR
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Left Front Heated Seat on.
7. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

2. ISOLATE AND CHECK (P415) LEFT FRONT HEATED SEAT BACK TEMP SENSE CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the (P415) Left Front Heated Seat Back Temp Sense circuit?

Yes

- Repair the (P415) Left Front Heated Seat Back Temp Sense circuit for a short to ground. Use the appropriate wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [3](#)

3. ISOLATE AND CHECK THE (P415) LEFT FRONT HEATED SEAT BACK TEMP SENSE CIRCUIT FOR A SHORT TO THE (P419) HEATED SEAT SENSOR RETURN CIRCUIT

1. The ignition must be off when checking for a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the test leads of the DVOM and check for continuity between the circuits being tested at the component harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between the circuits being tested.

Is there continuity between the circuits?

Yes

- Repair the short between the circuits.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. REPLACE THE LEFT FRONT HEATED SEAT BACK TEMPERATURE SENSOR AND RETEST FOR DTCS

1. Turn the ignition off.
2. Replace the Left Front Heated Seat Back Temperature Sensor (Left Front Seat Back Heater Element) in accordance with the Service Information. Refer to **PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION** .
3. Connect the Left Front Heated Seat Back Temperature Sensor (Left Front Seat Back Heater Element) and CSWM harness connectors.
4. Turn the ignition on.
5. With the scan tool, erase CSWM DTCs.
6. Turn the ignition off for 10.0 seconds.
7. Start the Engine.
8. Turn the Left Front Heated Seat on.
9. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [5](#)

No

- Replacing the Left Front Heated Seat Back Temperature Sensor (Left Front Seat Back Heater Element) repaired the fault.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. CHECK RELATED HARNESS CONNECTIONS

1. Turn the ignition off.
2. Disconnect all CSWM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase CSWM DTCs.
10. Turn the ignition off for 10.0 seconds.
11. Start the Engine.
12. Turn the Left Front Heated Seat on.
13. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1F16-1B-FRONT LEFT SEAT HEATER SENSOR 2-CIRCUIT RESISTANCE ABOVE THRESHOLD

For a complete HEATED SEAT SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.

SET CONDITION

- Module detects that the signal from the Negative Temperature Coefficient (NTC) thermistor is above its threshold for more than two seconds.

DEFAULT ACTION

- When the Left Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Left Front Seat Back Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT HEATED SEAT BACK TEMP SENSE CIRCUIT SHORTED TO VOLTAGE
LEFT FRONT HEATED SEAT BACK TEMP SENSE CIRCUIT OPEN
HEATED SEAT SENSOR RETURN CIRCUIT OPEN
HEATED SEAT BACK TEMPERATURE SENSOR
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Left Front Heated Seat on.
7. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE (P415) LEFT FRONT HEATED SEAT BACK TEMP SENSE CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the CSWM C2 harness connector.
3. Start the Engine.
4. Measure the voltage between ground and the (P415) Left Front Heated Seat Back Temp Sense circuit at the CSWM C2 harness connector.

Is there any voltage present?

Yes

- Repair the (P415) Left Front Heated Seat Back Temp Sense circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE (P415) LEFT FRONT HEATED SEAT BACK TEMP SENSE CIRCUIT OR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [4](#)

No

- Repair the (P415) Left Front Heated Seat Back Temp Sense circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. ISOLATE AND CHECK THE (P419) HEATED SEAT SENSOR RETURN CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [5](#)

No

- Repair the (P419) Heated Seat Sensor Return circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. REPLACE THE LEFT FRONT HEATED SEAT BACK TEMPERATURE SENSOR AND RETEST FOR DTCS

1. Turn the ignition off.
2. Replace the Left Front Heated Seat Back Temperature Sensor (Left Front Seat Back Heater Element) in accordance with the Service Information. Refer to **PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION**.
3. Connect the Left Front Heated Seat Back Temperature Sensor (Left Front Seat Back Heater Element) and CSWM harness connectors.
4. Turn the ignition on.
5. With the scan tool, erase CSWM DTCs.
6. Turn the ignition off for 10.0 seconds.
7. Start the Engine.
8. Turn the Left Front Heated Seat on.
9. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [6](#)

No

- Replacing the Left Front Heated Seat Back Temperature Sensor (Left Front Seat Back Heater Element) repaired the fault.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

6. CHECK RELATED HARNESS CONNECTIONS

1. Turn the ignition off.
2. Disconnect all CSWM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.

8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase CSWM DTCs.
10. Turn the ignition off for 10.0 seconds.
11. Start the Engine.
12. Turn the Left Front Heated Seat on.
13. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1F17-1A-FRONT RIGHT SEAT HEATER SENSOR 2-CIRCUIT RESISTANCE BELOW THRESHOLD

For a complete HEATED SEAT SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.

SET CONDITION

- Module detects that the signal from the Negative Temperature Coefficient (NTC) thermistor is below its threshold for more than 2 seconds.

DEFAULT ACTION

- When the Right Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Right Front Seat Back Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT HEATED SEAT BACK TEMP SENSE CIRCUIT SHORTED TO GROUND
RIGHT FRONT HEATED SEAT BACK TEMP SENSE CIRCUIT SHORTED TO THE HEATED SEAT SENSOR RETURN CIRCUIT
HEATED SEAT BACK TEMPERATURE SENSOR

Possible Causes

COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCs AND ENVIRONMENTAL DATA - ERASE DTCs AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Right Front Heated Seat on.
7. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. ISOLATE AND CHECK (P418) RIGHT FRONT HEATED SEAT BACK TEMP SENSE CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the (P418) Right Front Heated Seat Back Temp Sense circuit?

Yes

- Repair the (P418) Right Front Heated Seat Back Temp Sense circuit for a short to ground. Use the appropriate wiring diagram as a guide to trace the circuit and look for any in-line connectors to

help isolate the location of the short.

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE (P418) RIGHT FRONT HEATED SEAT BACK TEMP SENSE CIRCUIT FOR A SHORT TO THE (P419) HEATED SEAT SENSOR RETURN CIRCUIT

1. The ignition must be off when checking for a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the test leads of the DVOM and check for continuity between the circuits being tested at the component harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between the circuits being tested.

Is there continuity between the circuits?

Yes

- Repair the short between the circuits.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. REPLACE THE RIGHT FRONT HEATED SEAT BACK TEMPERATURE SENSOR AND RETEST FOR DTCS

1. Turn the ignition off.
2. Replace the Right Front Heated Seat Back Temperature Sensor (Right Front Seat Back Heater Element) in accordance with the Service Information. Refer to [PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION](#) .
3. Connect the Right Front Heated Seat Back Temperature Sensor (Right Front Seat Back Heater Element) and CSWM harness connectors.
4. Turn the ignition on.
5. With the scan tool, erase CSWM DTCs.
6. Turn the ignition off for 10.0 seconds.
7. Start the Engine.
8. Turn the Right Front Heated Seat on.
9. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [5](#)

No

- Replacing the Right Front Heated Seat Back Temperature Sensor (Right Front Seat Back Heater Element) repaired the fault.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. CHECK RELATED HARNESS CONNECTIONS

1. Turn the ignition off.
2. Disconnect all CSWM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed BACK into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase CSWM DTCs.
10. Turn the ignition off for 10.0 seconds.
11. Start the Engine.
12. Turn the Right Front Heated Seat on.
13. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1F17-1B-FRONT RIGHT SEAT HEATER SENSOR 2-CIRCUIT RESISTANCE ABOVE THRESHOLD

For a complete HEATED SEAT SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

DEFAULT ACTION

- When the Right Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Right Front Seat Back Heater output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT HEATED SEAT BACK TEMP SENSE CIRCUIT SHORTED TO VOLTAGE
RIGHT FRONT HEATED SEAT BACK TEMP SENSE CIRCUIT OPEN
HEATED SEAT SENSOR RETURN CIRCUIT OPEN
HEATED SEAT BACK TEMPERATURE SENSOR
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Turn the Right Front Heated Seat on.
7. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE (P418) RIGHT FRONT HEATED SEAT BACK TEMP SENSE CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the CSWM C3 harness connector.
3. Start the Engine.
4. Measure the voltage between ground and the (P418) Right Front Heated Seat Back Temp Sense circuit at the CSWM C3 harness connector.

Is there any voltage present?

Yes

- Repair the (P418) Right Front Heated Seat Back Temp Sense circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE (P418) RIGHT FRONT HEATED SEAT BACK TEMP SENSE CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [4](#)

No

- Repair the (P418) Right Front Heated Seat Back Temp Sense circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. ISOLATE AND CHECK THE (P419) RIGHT FRONT HEATED SEAT SENSOR RETURN CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [5](#)

No

- Repair the (P419) Heated Seat Sensor Return circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. REPLACE THE RIGHT FRONT HEATED SEAT BACK TEMPERATURE SENSOR AND RETEST FOR DTCS

1. Turn the ignition off.
2. Replace the Right Front Heated Seat Back Temperature Sensor (Right Front Seat Back Heater Element) in accordance with the Service Information. Refer to [PAD, HEATER, CUSHION, REMOVAL AND INSTALLATION](#) .
3. Connect the Right Front Heated Seat Back Temperature Sensor (Right Front Seat Back Heater Element) and CSWM harness connectors.
4. Turn the ignition on.
5. With the scan tool, erase CSWM DTCs.
6. Turn the ignition off for 10.0 seconds.
7. Start the Engine.
8. Turn the Right Front Heated Seat on.
9. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [6](#)

No

- Replacing the Right Front Heated Seat Back Temperature Sensor (Right Front Seat Back Heater Element) repaired the fault.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

6. CHECK RELATED HARNESS CONNECTIONS

1. Turn the ignition off.
2. Disconnect all CSWM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase CSWM DTCs.
10. Turn the ignition off for 10.0 seconds.
11. Start the Engine.
12. Turn the Right Front Heated Seat on.
13. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B2199-16-BATTERY VOLTAGE-CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete HEATED SEAT SYSTEM wiring diagram, refer to the appropriate wiring information .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- Engine running.

SET CONDITION

- Module detects a voltage below 9.0 volts on the Fused Ignition circuit for more than 60 seconds.

DEFAULT ACTION

- No control of Comfort Seat Wheel Module (CSWM) functions.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT IN POWERTRAIN CONTROL MODULE (PCM) OR BODY CONTROL MODULE (BCM)
LOW BATTERY VOLTAGE
FUSED IGNITION CIRCUIT HIGH RESISTANCE
GROUND CIRCUIT HIGH RESISTANCE
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
3. With the scan tool, erase all DTCS.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the engine.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read CSWM DTCS.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK FOR BATTERY OR CHARGING SYSTEM RELATED DTCS IN THE PCM

1. With the scan tool, check the PCM for Battery and Charging System DTCS.

Are any Battery or Charging System DTCS set?

Yes

- Perform the appropriate PCM DTC diagnostic procedure(s). Refer to [3.0L DIESEL - DIAGNOSTIC CODE INDEX](#) , or [3.6L \(GPEC 2A\) - DIAGNOSTIC CODE INDEX](#) .

No

- Go To [3](#)

3. CHECK FOR BATTERY OR CHARGING SYSTEM RELATED DTCS IN THE BCM

1. With the scan tool, check the BCM for Battery and Charging System DTCS.

Are any Battery or Charging System DTCS set?

Yes

- Perform the appropriate BCM DTC diagnostic procedure(s). Refer to [BODY CONTROL MODULE \(BCM\) - DIAGNOSTIC CODE INDEX](#) .

No

- Go To [4](#)

4. CHECK THE (F921) FUSED IGNITION CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the 12.0 volt supply circuit.
2. Connect the positive lead of the load test tool to the 12.0 volt supply circuit at the component harness connector (A). **Note:** refer to the diagram below.
3. Connect the negative lead of the load test tool to the ground circuit of the Battery or a good chassis ground.
4. Ensure that the circuit being tested is being powered on. If the 12.0 volt circuit being tested is an ignition feed for example, the ignition must be on. If testing an output from a relay, verify that the relay is energized and on.
5. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test? To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.

- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#).

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the (F921) Fused Ignition circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

5. CHECK THE (Z914) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the ground circuit.
2. Connect the positive lead of the load test tool to the positive side of the Battery.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [6](#)

No

- Repair the (Z914) Ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CSWM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Check for spread terminals and verify proper terminal tension.

Repair any conditions that are found.

5. Connect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Test drive or operate the vehicle in accordance with the when monitored and set conditions.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to [MODULE, COMFORT SEAT AND WHEEL \(CSWM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B2199-17-BATTERY VOLTAGE-CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete HEATED SEAT SYSTEM wiring diagram, refer to the appropriate wiring information .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.

SET CONDITION

- Module detects a voltage above 16.0 volts on the Fused Ignition circuit for more than 60 seconds.

DEFAULT ACTION

- No control of Comfort Seat Wheel Module (CSWM) functions.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT IN POWERTRAIN CONTROL MODULE (PCM) OR BODY CONTROL MODULE (BCM)
OVERCHARGE CONDITION
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. CHECK FOR ANY SERVICE BULLETINS OR MODULE SOFTWARE UPDATES

1. Check for any applicable Service Bulletins or Flash updates related to the DTC.

Are there any applicable Service Bulletins or Flash updates?

Yes

- Perform the applicable repair.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [2](#)

2. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. For future reference, run and save a vehicle Scan Report and all related recorded data.
3. With the scan tool, erase all DTCS.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.

6. Using the When Monitored and Set Conditions above and recorded data, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

3. CHECK FOR PCM BATTERY OR CHARGING SYSTEM DTCs

1. Refer to the recorded DTCs.

Are there any PCM battery OR charging system DTCs present?

Yes

- Perform the applicable diagnostic procedure(s). Refer to [3.0L DIESEL - DIAGNOSTIC CODE INDEX](#) , or [3.6L \(GPEC 2A\) - DIAGNOSTIC CODE INDEX](#) .

No

- Go To [4](#)

4. CHECK OTHER MODULES FOR DTCs

1. With the scan tool, read DTCs.

Are there any other Modules setting a high system voltage DTC?

Yes

- Check the battery and charging system in accordance with the Service Information for an overcharge or high voltage condition.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [5](#)

5. CHECK RELATED CSWM AND COMPONENT CONNECTIONS

1. Turn the ignition off.
2. Disconnect all CSWM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.

- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Check for spread terminals and verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase DTCs.
10. Test drive or operate the vehicle in accordance with the when monitored and set conditions.
11. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Replace and program the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- The wiring or poor connection problem has been repaired.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B21DD-84-SYSTEM VOLTAGE-SIGNAL BELOW ALLOWABLE RANGE

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- Engine running.

SET CONDITION

- The CAN bus message for battery voltage is below 9.0 volts for 15 seconds.

DEFAULT ACTION

- No control of Comfort Seat Wheel Module (CSWM) functions.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM VOLTAGE LOW
BODY CONTROL MODULE (BCM) DTCS
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the engine.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. CHECK BATTERY VOLTAGE BUSSED INPUT

1. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
2. With the scan tool, monitor the CSWM Battery Voltage bussed input for at least 60 seconds.

Does the CSWM Battery Voltage reading drop below 9.0 volts?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. CHECK FOR VOLTAGE RELATED DTCS IN THE BODY CONTROL MODULE (BCM)

1. With the scan tool, read BCM DTCs.

Are any charging system BCM DTCs present?

Yes

- Perform the appropriate BCM DTC diagnostic procedure(s). Refer to [BODY CONTROL MODULE \(BCM\) - DIAGNOSTIC CODE INDEX](#) .

No

- Go To [4](#)

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CSWM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.

4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Check for spread terminals and verify proper terminal tension.

Repair any conditions that are found.

5. Connect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Test drive or operate the vehicle in accordance with the when monitored and set conditions.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

B21DD-85-SYSTEM VOLTAGE-SIGNAL ABOVE ALLOWABLE RANGE

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.

SET CONDITION

- The CAN bus message for battery voltage is above 16.0 volts for 60 seconds.

DEFAULT ACTION

- No control of Comfort Seat Wheel Module (CSWM) functions.

POSSIBLE CAUSES

Possible Causes
VEHICLE CHARGING SYSTEM
BODY CONTROL MODULE (BCM) DTCS
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the engine.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. CHECK BATTERY VOLTAGE BUSSED INPUT

1. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
2. With the scan tool, monitor the CSWM Battery Voltage bussed input for at least 60 seconds.

Is the CSWM Battery Voltage reading above 16.0 volts?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. CHECK FOR VOLTAGE RELATED DTCS IN THE BODY CONTROL MODULE (BCM)

1. With the scan tool, read BCM DTCs.

Are any charging system BCM DTCs present?

Yes

- Perform the appropriate BCM DTC diagnostic procedure(s). Refer to **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** .

No

- Go To [4](#)

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all CSWM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Check for spread terminals and verify proper terminal tension.

Repair any conditions that are found.

5. Connect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Test drive or operate the vehicle in accordance with the when monitored and set conditions.
10. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B2204-00-ECU CONFIGURATION MISMATCH

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts

SET CONDITION

- The Comfort Seat Wheel Module (CSWM) configuration code does not match actual vehicle configuration.

DEFAULT ACTION

- When any CSWM function is turned on, the indicator turns on for 2 seconds and turns off.
- The corresponding output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
COMFORT SEAT WHEEL MODULE (CSWM) NOT CONFIGURED OR CONFIGURED INCORRECTLY

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. Diagnose and repair any Vehicle Identification Number (VIN) or Communication DTCs before continuing with this test.

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the engine.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. CHECK THE BODY CONTROL MODULE (BCM) FOR PROPER VEHICLE CONFIGURATION

1. With the scan tool verify the vehicle configuration is correct in the BCM.
2. With the scan tool, perform any available Comfort Seat Wheel Module (CSWM) software updates or calibration procedures in accordance with the service information.

3. With the scan tool, erase all DTCs.
4. Turn the ignition off for 10 seconds.
5. Start the engine.
6. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Verify that the proper Vehicle Identification Number (VIN) is stored in the PCM and BCM. Check for any Service Bulletins that may apply.
- If no problems are found, replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Test Complete.

B227E-00-ECU OVER TEMPERATURE

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts

SET CONDITION

- Module detects that the internal temperature exceeded 120 degrees C for 500 ms.

DEFAULT ACTION

- When any CSWM function is turned on, the indicator turns on for 2 seconds and turns off.
- The corresponding output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
COMFORT SEAT WHEEL MODULE (CSWM) OVER TEMPERATURE
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. **READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN**

NOTE: Allow the vehicle to cool down for at least one hour before proceeding with test.

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the engine.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

2. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Comfort Seat Wheel Module (CSWM) harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Turn the ignition off for 10 seconds.
10. Start the engine.
11. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service information. Refer to [MODULE, COMFORT SEAT AND WHEEL \(CSWM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B22A9-00-ECU INTERNAL PERFORMANCE

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.

SET CONDITION

- Comfort Seat Wheel Module (CSWM) fails an internal self test.

DEFAULT ACTION

- No control of Comfort Seat Wheel Module (CSWM) functions.

POSSIBLE CAUSES

Possible Causes
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the engine.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK RELATED WIRING AND CONNECTORS

1. Turn the ignition off.
2. Disconnect all related ECU harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect all related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all ECU harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. Turn the ignition on.
10. With the scan tool, erase DTCs.
11. Turn the ignition off for 10 seconds.
12. Start the engine.
13. With the scan tool, read DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

For a complete HEATED SEAT SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides a variable Pulse Width Modulation (PWM) signal to the Heated Seat element in each seat cushion and seat back. The CSWM provides temperature sense and return circuits to a thermistor in order to monitor and regulate Heated Seat element function.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.

SET CONDITION

- The Fused Ignition circuit voltage at the Comfort Seat Wheel Module (CSWM) is low for 3 seconds.

DEFAULT ACTION

- When the Right Front Heated Seat is turned on, the indicator turns on for 2 seconds and turns off.
- The Right Front Heated Seat output drivers will be turned off.

POSSIBLE CAUSES

Possible Causes
RELATED LOW VOLTAGE DTCS PRESENT
FUSED IGNITION CIRCUIT OPEN OR HIGH RESISTANCE
GROUND CIRCUIT OPEN OR HIGH RESISTANCE
COMFORT SEAT WHEEL MODULE (CSWM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.
Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
3. With the scan tool, erase all DTCS.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Start the Engine.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read CSWM DTCS.

Is the same DTC active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [**TESTING FOR AN INTERMITTENT CONDITION**](#) .

2. CHECK THE (F922) FUSED IGNITION CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the 12.0 volt supply circuit.
2. Connect the positive lead of the load test tool to the 12.0 volt supply circuit at the component harness connector (A). **Note:** refer to the diagram below.
3. Connect the negative lead of the load test tool to the ground circuit of the Battery or a good chassis ground.
4. Ensure that the circuit being tested is being powered on. If the 12.0 volt circuit being tested is an ignition feed for example, the ignition must be on. If testing an output from a relay, verify that the relay is energized and on.
5. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [**CIRCUIT LOAD TESTING PROCEDURES**](#) .**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test? To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES**](#) .**

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [3](#)

No

- Repair the (F922) Fused Ignition circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. CHECK THE (Z914) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the ground circuit.
2. Connect the positive lead of the load test tool to the positive side of the Battery.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE:

Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .**

**NOTE:**

When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE:

Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [4](#)

No

- Repair the (Z914) Ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. CHECK RELATED HARNESS CONNECTIONS

1. Turn the ignition off.
2. Disconnect all CSWM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).

4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all CSWM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase DTCs.
10. Turn the ignition off for 10.0 seconds.
11. Test drive or operate the vehicle in accordance with the when monitored and set conditions.
12. With the scan tool, read CSWM DTCs.

Is the same DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL (CSWM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Repairing the wiring harness or connections corrected the problem.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

U0011-00-CAN INTERIOR BUS OFF PERFORMANCE

NOTE: The DTC number or title listed above may not appear in the Body Control Module (BCM) diagnostic procedures. If this occurs, perform the CAN Interior Bus diagnostic procedure in the BCM that is comparable to the above DTC title (examples: CAN INTERIOR BUS, CAN INTERIOR BUS OFF, CAN INTERIOR BUS PERFORMANCE or CAN INTERIOR BUS OFF PERFORMANCE).

Perform the comparable U-Code diagnostic procedure(s) for the CAN IHS Bus in the BCM. Refer to **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX**.

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

The COMMUNICATION DIAGNOSTIC PROCEDURE **MUST** be performed before replacing any component(s) or module(s). Perform the COMMUNICATION DIAGNOSTIC PROCEDURE. Refer to **COMMUNICATION DIAGNOSTIC PROCEDURE** .

U0184-00-LOST COMMUNICATION WITH RADIO

The COMMUNICATION DIAGNOSTIC PROCEDURE **MUST** be performed before replacing any component(s) or module(s). Perform the COMMUNICATION DIAGNOSTIC PROCEDURE. Refer to **COMMUNICATION DIAGNOSTIC PROCEDURE** .

U11B8-00 LOST COMMUNICATION WITH INTEGRATED CENTER STACK (ICS)

The COMMUNICATION DIAGNOSTIC PROCEDURE **MUST** be performed before replacing any component(s) or module(s). Perform the COMMUNICATION DIAGNOSTIC PROCEDURE. Refer to **COMMUNICATION DIAGNOSTIC PROCEDURE** .

U1446-00-IMPLAUSIBLE HEATED STEERING WHEEL TEMPERATURE MESSAGE RECEIVED

For a complete HEATED STEERING WHEEL SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Comfort Seat and Wheel Module (CSWM) provides power and return to the steering wheel heating element, using PWM to control the hard wired signals. The Heated Steering Wheel (HSW) contains a Negative Temperature Coefficient (NTC) type thermistor for temperature sensing, and provides feedback to the Steering Wheel Switch (SWS) using hard wired signal and return circuits. The SWS reports the temperature using a LIN signal.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Controller voltage between 9.0 and 16.0 volts.

SET CONDITION

- Module receives an implausible CAN bus message from the Heated Steering Wheel (HSW) Temperature Sensor for more than two seconds.

DEFAULT ACTION

- When the Heated Steering Wheel is turned on, the indicator turns on for 2 seconds and turns off.
- The Heated Steering Wheel output driver will be turned off.

POSSIBLE CAUSES

Possible Causes
RELATED LIN OR CAN COMMUNICATION DTCS
HEATED STEERING WHEEL TEMPERATURE SENSOR
LEFT STEERING WHEEL SWITCH

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. CHECK FOR AN ACTIVE DTC

1. **Diagnose and repair all active Bus related Diagnostic Trouble Codes (DTCs) including Lost Communication DTCs before diagnosing this DTC.**
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

Is this DTC active?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. CHECK HEATED STEERING WHEEL TEMPERATURE SENSOR MESSAGE STATUS

1. With the scan tool, check the status of the Heated Steering Wheel Temperature Sensor.

Does the Heated Steering Wheel Temperature Sensor status read "Signal Not Available (SNA)"?

Yes

- Go To [3](#)

No

- The conditions that caused this DTC are not present at this time.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

3. PERFORM VISUAL INSPECTION OF HEATED STEERING WHEEL TEMPERATURE SENSOR CONNECTORS, TERMINALS AND WIRING

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Remove the Driver Airbag in accordance with the Service Information. Refer to [AIR BAG, DRIVER, REMOVAL AND INSTALLATION](#) .
2. Disconnect all Heated Steering Wheel Temperature Sensor related harness connectors.
3. Inspect the harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Were any problems found?

Yes

- Repair or replace the Heated Steering Wheel Temperature Sensor wiring harness in accordance with Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To **4**

4. CHECK THE HEATED STEERING WHEEL TEMPERATURE SENSOR RESISTANCE

1. Measure the resistance of the Heated Steering Wheel Temperature Sensor between the (C92) Heated Steering Wheel Signal circuit and the (G907) EVIC Mux Return circuit at the Heated Steering Wheel Temperature Sensor component connector.
2. Compare your findings to the chart below:

Temperature Sensor Resistance				
B°C	B°F	Nominal (Ohms)	Minimum (Ohms)	Maximum (Ohms)
0	32	32650	30601	34699
5	41	25388	23861	26914
10	50	19900	18754	21046
15	59	15708	14842	16574
20	68	12490	11831	13149
25	77	10000	9500	10500
30	86	8057	7632	8482
35	95	6531	6173	6889
40	104	5327	5024	5630
45	113	4369	4111	4626
50	122	3603	3384	3822
55	131	2986	2799	3174
60	140	2488	2327	2649
65	149	2083	1945	2221
70	158	1752	1633	1871
75	167	1481	1378	1585
80	176	1258	1168	1348
85	185	1072	994.2	1151
90	194	917.7	849.4	986.0
95	203	788.5	728.6	848.4
100	212	680.0	627.4	732.6

Is the resistance within range?

Yes

- Replace the Left EVIC Switch in accordance with the Service Information. Refer to **SWITCH, EVIC CONTROL, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** s.

No

- Replace the Heated Steering Wheel Temperature Sensor (Heated Steering Wheel (HSW)) in accordance with the Service Information. Refer to **WHEEL, STEERING, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2021 ACCESSORIES AND BODY, CAB

Communication - NON-DTC Based Diagnostics - Gladiator

DIAGNOSIS AND TESTING

MULTIPLE MODULES WILL NOT COMMUNICATE WITH CAN C OR IHS

THEORY OF OPERATION

Depending upon the vehicle configuration for CAN-C or IHS, there can be multiple Controller Area Network (CAN) Bus Star Connectors located throughout the vehicle. The Star Connectors contain the CAN terminating resistors and are located so that they can be accessed for diagnosis of the CAN Bus networks. For an in-depth explanation of the Controller Area Network (CAN) Bus system operation, refer to the appropriate service information.

The (special tool #2073400080, Kit, PowerNet / CUSW CAN BUS Diagnostic Tool), is used in place of a Star Connector to assist in CAN Bus network diagnosis. The diagram on the front displays how the tool is to be used, while the back displays a schematic which will be helpful when using the CAN Bus diagnostic tools. The tool kit consists of a 2-Pin ECU testers and one 3-Pin Star Connector tester.

NOTE: **Wording on the PowerNet / CUSW CAN BUS Diagnostic Tool shows "STAR BLOCK" instead of "STAR CONNECTOR".**

2-PIN CAN BUS DIAGNOSTIC TOOL

- The 2-Pin CAN Bus diagnostic tool being used for testing between a Star Connector and Electronic Control Unit (ECU), **does not contain** an in-line resistor. The CAN Bus Diagnostic Tools use toggle switches to Connect and Disconnect the tool to the CAN Bus network being tested on. When the 2-Pin CAN Bus diagnostic tool is connected to a CAN, it is wired in series to the CAN Bus network. The 2-Pin CAN Bus diagnostic tool uses the flow of the CAN through a Star Connector, **through the CAN Bus diagnostic tool**, and then downstream to the ECU in question for testing.

NOTE: **CAN Bus systems using Star Connectors are configured with one or two Star Connectors. Those systems having one Star Connector contain a 60.0 Ohm resistor; and systems with two Star Connectors contain 120.0 Ohm terminating resistors that are**

wired in parallel

to allow communication with 60.0 Ohms.

Further testing with the (special tool #2073400080, Kit, PowerNet / CUSW CAN BUS Diagnostic Tool) testing ports are equivalent to the CAN C and IHS Bus (+) and (-) circuits and can be used to read CAN Bus measurements with a DVOM or analyze waveform patterns with an Oscilloscope.

NOTE: Wording on the PowerNet / CUSW CAN BUS Diagnostic Tool shows "STAR BLOCK" instead of "STAR CONNECTOR".

3-PIN CAN BUS DIAGNOSTIC TOOL

- The 3-Pin CAN Bus diagnostic tool being used for the testing of a Star Connector **does contain** a separate in-line 120.0 Ohm resistor for each switch. The CAN Bus Diagnostic Tools use toggle switches to Connect and Disconnect the tool to the CAN Bus network being tested on. When the 3-Pin CAN Bus diagnostic tool is connected to a CAN, it is wired in series to the CAN Bus network. The 3-Pin CAN Bus diagnostic tool uses the flow of the CAN **through the CAN Bus diagnostic tool** , to the Star connector in question for testing, and then continues on to the downstream ECUs.

The 3-Pin resistance table below shows the resistance values the 3-Pin CAN Bus diagnostic tool will add to the CAN being tested.

3-PIN RESISTANCE TABLE

SWITCH - TO STAR BLOCK	SWITCH - HARNESS TO OTHER STAR BLOCK	APPROXIMATE RESISTANCE WHEN MEASURED WITH DVOM
CONNECTED	CONNECTED	OL (OUT OF LIMIT) / PASS THROUGH FOR VEHICLE CAN
CONNECTED	DISCONNECTED	120

SWITCH - TO STAR BLOCK	SWITCH - HARNESS TO OTHER STAR BLOCK	APPROXIMATE RESISTANCE WHEN MEASURED WITH DVOM
DISCONNECTED	CONNECTED	120
DISCONNECTED	DISCONNECTED	60 (BOTH SWITCHES IN PARALLEL)

NOTE: CAN Bus systems using Star Connectors are configured with one or two Star Connectors. Those systems having one Star Connector contain a 60.0 Ohm resistor; and systems with two Star Connectors contain 120.0 Ohm terminating resistors that are

wired in parallel

to allow communication with 60.0 Ohms.

Further testing with an oscilloscope or DVOM can be performed at the testing ports of the (special tool #2073400080, Kit, PowerNet / CUSW CAN BUS Diagnostic Tool).

CAN BUS OPERATIONAL VOLTAGES

CAN C Bus Operational Voltages								
CAN C Circuits	Sleep	Recessive (Bus Idle)	Dominant (Bus Active)	CAN (-) Short to Ground	CAN (+) Short to Ground	CAN (-) Short to Voltage	CAN (+) Short to Voltage	CAN (+) Short to CAN (-)
CAN (-)	0 V	2.4 - 2.5 V	1.3 - 2.3 V	0 V	0.3 - 0.5 V	Battery Voltage	Battery Voltage Less 0.75 V	2.45 V
CAN (+)	0 V	2.4 - 2.5 V	2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V

CAN IHS Bus Operational Voltages							
CAN IHS Circuits	Key-Off (Bus Asleep)	Key-On (Bus Active)	CAN (-) Short to Ground	CAN (+) Short to Ground	CAN (-) Short to Voltage	CAN (+) Short to Voltage	CAN (+) Short to CAN (-)
CAN (-)	0.0 V	1.3 - 2.3 V	0 V	0.3 - 0.5 V	Battery Voltage	Battery Voltage Less 0.75 V	2.45 V
CAN (+)	0.0 V	2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V

Notes

All measurements were taken between a node ground and a CAN Bus terminal, using a standard DVOM. The DVOM will display the average network voltage.

Total resistance of the CAN Bus networks should be measured with the battery, and auxiliary battery (if equipped with Engine Stop/Start), disconnected. The normal average CAN Bus resistance is approximately 60 Ohms. The termination resistors are integral to the Star Connectors.

TESTING WITH THE MOPARB® DIAGNOSTIC STAR CONNECTOR KIT AND MOPARB® SCOPE

NOTE: The Scan Tool Topology may not correctly display the CAN Bus module layout yet should still be used when diagnosing a CAN Bus network with Star Connectors. Wording on the PowerNet / CUSW CAN BUS Diagnostic Tool shows "STAR BLOCK" instead of "STAR CONNECTOR".

The Star Connector locations **must** be determined before proceeding to diagnose the CAN Bus. To help determine the flow of the CAN Bus network, use the Wiring Diagrams, Component Views, Connector End Views and the Star Connector terminal information on the back-side of the (special tool #2073400080, Kit, PowerNet / CUSW CAN BUS Diagnostic Tool).

NOTE: For best results, allow the network and scan tool to update before opening or closing other switches.

BASIC POWERNET / CUSW CAN BUS EXAMPLE

IDENTIFICATION	DESCRIPTION
RED STAR	STAR CONNECTOR
A	3-Pin STAR CONNECTOR POWERNET / CUSW CAN BUS DIAGNOSTIC TOOL
B	2-Pin ECU POWERNET / CUSW CAN BUS DIAGNOSTIC TOOL

CAN BUS DIAGNOSTIC TOOL STRATEGIES

- There are several strategies for testing the Powernet / CUSW CAN Bus when multiple modules will not communicate with CAN C or IHS. Understanding the strategies below, along with the above 2-Pin and 3-Pin CAN Bus Diagnostic Tool descriptions, will help with diagnosing a CAN Bus equipped with one or more Star Connectors.
- The testing tools ports are configured to the CAN C and IHS Bus (+) and (-) circuits and can be used to read CAN Bus measurements with a DVOM or analyze waveform patterns with an Oscilloscope. For best results, allow the network and scan tool to update before opening or closing other switches.

FAULTY ECU CONNECTED

- When the toggle switch is in the **"CONNECTED"** position, the Powernet / CUSW CAN Bus Diagnostic Tool is a pass-through for CAN communication.

NOTE: **Wording on the PowerNet / CUSW CAN BUS Diagnostic Tool shows "STAR BLOCK" instead of "STAR CONNECTOR". Steps with an asterisk (*) indicates additional testing capabilities with a DVOM / Oscilloscope.**

TWO STAR CONNECTOR CAN BUS

1. With the ignition ON, view the scan tool topology screen and note any module(s) in Red.
2. Using the Bus Topology Locations in Wiring Diagrams, locate the single Star Connector closest to the module(s) in Red.
3. Using the Location Views in the Wiring Diagrams, locate the Star Connector on the vehicle where the Powernet / CUSW CAN Bus Diagnostic Tool will be connected.
4. Using the Connector End Views in Wiring Diagrams, determine the CAN Bus circuits to be tested.
5. Using the Connector End Views in Wiring Diagrams, match the CAN Bus connector terminals with the Star Connector terminal information on the back-side of the Powernet / CUSW CAN Bus Diagnostic Tool.
6. According to the Basic Powernet / CUSW CAN Bus image example shown above, disconnect the 2-Pin connector of the suspect ECU from the Star Connector.
7. Connect the 2-Pin CAN Bus Diagnostic Tool to the Star Connector in place of the suspect ECU.
8. * Connect the suspect ECU to the 2-Pin CAN Bus Diagnostic Tool. *
9. * Toggle the switch on the 2-Pin CAN Bus Diagnostic Tool from **DISCONNECT** to **CONNECTED** . *
10. * Check the CAN bus activity status of the suspect ECU with the diagnostic scan tool. *
11. * Toggle the switch on the 2-Pin CAN Bus Diagnostic Tool from **CONNECTED** to **DISCONNECT** . *
12. * Check the CAN bus activity status of the suspect ECU with the diagnostic scan tool. *
13. * Check the CAN bus wiring for shorts or opens and repair or replace as needed. If no trouble found proceed to the next step. *
14. If applicable, replace the ECU when disconnected from the CAN which allowed the CAN bus activity status to return to normal communication. If not applicable, proceed to the next step.
15. If the CAN bus activity does not return to normal communication, repeat steps 1 through 13 to all ECUs connected to the Star Connector before proceeding to the next step.
16. If the CAN bus activity does not return to normal communication, after testing all ECUs connected to the Star Connector proceed to the testing below for a **FAULTY STAR CONNECTOR** .

ONE STAR CONNECTOR CAN BUS

1. With the ignition ON, view the scan tool topology screen and note any module(s) in Red.
2. Using the Bus Topology Locations in Wiring Diagrams, locate the single Star Connector closest to the module(s) in Red.
3. Using the Location Views in the Wiring Diagrams, locate the Star Connector on the vehicle where the Powernet / CUSW CAN Bus Diagnostic Tool will be connected.
4. Using the Connector End Views in Wiring Diagrams, determine the CAN Bus circuits to be tested.
5. Using the Connector End Views in Wiring Diagrams, match the CAN Bus connector terminals with the Star Connector terminal information on the back-side of the Powernet / CUSW CAN Bus Diagnostic Tool.
6. According to the Basic Powernet / CUSW CAN Bus image example shown above, disconnect the 2-Pin connector of the suspect ECU from the Star Connector.
7. Connect the 2-Pin CAN Bus Diagnostic Tool to the Star Connector in place of the suspect ECU.
8. * Connect the suspect ECU to the 2-Pin CAN Bus Diagnostic Tool. *
9. * Toggle the switch on the 2-Pin CAN Bus Diagnostic Tool from **DISCONNECT** to **CONNECTED** . *
10. * Check the CAN bus activity status of the suspect ECU with the diagnostic scan tool. *
11. * Toggle the switch on the 2-Pin CAN Bus Diagnostic Tool from **CONNECTED** to **DISCONNECT** . *
12. * Check the CAN bus activity status of the suspect ECU with the diagnostic scan tool. *

13. * Check the CAN bus wiring for shorts or opens and repair or replace as needed. If no trouble found proceed to the next step. *
14. If applicable, replace the ECU when disconnected from the CAN which allowed the CAN bus activity status to return to normal communication. If not applicable, proceed to the next step.
15. If the CAN bus activity does not return to normal communication, repeat steps 1 through 13 to all ECUs connected to the Star Connector before proceeding to the next step.
16. If the CAN bus activity does not return to normal communication, after testing all ECUs connected to the Star Connector - replace Star Connector.

FAULTY STAR CONNECTOR

- When a switch is toggled in the **"CONNECTED"** position, the Powernet / CUSW CAN Bus Diagnostic Tool is a pass-through for CAN communication.

NOTE: Wording on the PowerNet / CUSW CAN BUS Diagnostic Tool shows "STAR BLOCK" instead of "STAR CONNECTOR". Steps with an asterisk (*) indicates additional testing capabilities with a DVOM / Oscilloscope.

TWO STAR CONNECTOR CAN BUS

1. With the ignition ON, view the scan tool topology screen and note any module(s) in Red.
2. Using the Bus Topology Locations in Wiring Diagrams, locate the single Star Connector closest to the module(s) in Red.
3. Using the Location Views in the Wiring Diagrams, locate the Star Connector on the vehicle where the Powernet / CUSW CAN Bus Diagnostic Tool will be connected.
4. Using the Connector End Views in Wiring Diagrams, determine the CAN Bus circuits to be tested.
5. Using the Connector End Views in Wiring Diagrams, match the CAN Bus connector terminals with the Star Connector terminal information on the back-side of the Powernet / CUSW CAN Bus Diagnostic Tool.
6. According to the Basic Powernet / CUSW CAN Bus image example shown above, disconnect the 3-Pin connector of the Star Connector that is the furthest from the Gateway.
7. Connect the 3-Pin CAN Bus Diagnostic Tool to the vehicle harness side in place of the suspect Star Connector.
8. * Connect the suspect Star Connector to the 3-Pin CAN Bus Diagnostic Tool. *

NOTE: Do NOT have both toggle switches in the **DISCONNECT** position, as this will change the resistance of the tool from 120 Ohms to 60 Ohms resistance, and hinder CAN communication.

9. * Toggle the switch on the 3-Pin CAN Bus Diagnostic Tool from **DISCONNECT** to **CONNECTED** . *
10. * It may be needed to toggle the switch on the 3-Pin CAN Bus Diagnostic Tool from **CONNECTED** to **DISCONNECT** . *
11. * Check the CAN bus activity status of the suspect ECU with the diagnostic scan tool. *
12. * Check the CAN bus wiring for shorts or opens and repair or replace as needed. If no trouble found proceed to the next step. *
13. If the CAN bus activity does not return to normal communication, after testing the Star Connector - replace Star Connector.

ONE STAR CONNECTOR CAN BUS

1. With the ignition ON, view the scan tool topology screen and note any module(s) in Red.
2. Using the Bus Topology Locations in Wiring Diagrams, locate the single Star Connector closest to the module(s) in Red.
3. Using the Location Views in the Wiring Diagrams, locate the Star Connector on the vehicle where the Powernet / CUSW CAN Bus Diagnostic Tool will be connected.
4. Using the Connector End Views in Wiring Diagrams, determine the CAN Bus circuits to be tested.
5. Using the Connector End Views in Wiring Diagrams, match the CAN Bus connector terminals with the Star Connector terminal information on the back-side of the Powernet / CUSW CAN Bus Diagnostic Tool.
6. According to the Basic Powernet / CUSW CAN Bus image example shown above, disconnect the 2-Pin connector of the suspect ECU from the Star Connector.
7. Connect the 2-Pin CAN Bus Diagnostic Tool to the Star Connector in place of the suspect ECU.
8. * Connect the suspect ECU to the 2-Pin CAN Bus Diagnostic Tool. *
9. * Toggle the switch on the 2-Pin CAN Bus Diagnostic Tool from **DISCONNECT** to **CONNECTED** . *
10. * Check the CAN bus activity status of the suspect ECU with the diagnostic scan tool. *
11. * Toggle the switch on the 2-Pin CAN Bus Diagnostic Tool from **CONNECTED** to **DISCONNECT** . *
12. * Check the CAN bus activity status of the suspect ECU with the diagnostic scan tool. *
13. * Check the CAN bus wiring for shorts or opens and repair or replace as needed. If no trouble found proceed to the next step. *
14. If applicable, replace the ECU when disconnected from the CAN which allowed the CAN bus activity status to return to normal communication. If not applicable, proceed to the next step.
15. If the CAN bus activity does not return to normal communication, repeat steps 1 through 13 to all ECUs connected to the Star Connector before proceeding to the next step.
16. If the CAN bus activity does not return to normal communication, after testing all ECUs connected to the Star Connector - replace Star Connector.

DVOM / OSCILLOSCOPE TESTING ANALYSIS

- Disconnecting and Connecting the switches on the 3-Pin Powernet / CUSW CAN Bus Diagnostic Tools can be used when measuring the voltage and resistance on the CAN Bus circuits. Use the Wiring Diagrams and the Star Connector terminal information on the back-side of the Powernet / CUSW CAN Bus Diagnostic Tools, to further analyze and determine if a module or CAN Bus circuit within the Star Connector being used for testing is the cause of the CAN Bus failure.

The 3-Pin resistance table below shows the resistance values the 3-pin CAN Bus diagnostic tool will add to the CAN being tested.

3-PIN RESISTANCE TABLE

SWITCH - TO STAR BLOCK	SWITCH - HARNESS TO OTHER STAR BLOCK	APPROXIMATE RESISTANCE WHEN MEASURED WITH DVOM
CONNECTED	CONNECTED	OL (OUT OF LIMIT) / PASS THROUGH FOR VEHICLE CAN
CONNECTED	DISCONNECTED	120
DISCONNECTED	CONNECTED	120
DISCONNECTED	DISCONNECTED	60 (BOTH SWITCHES IN PARALLEL)

Perform the following steps to measure and record the voltage and resistance values of CAN Bus circuits using a DVOM or Oscilloscope:

1. Using the Powernet / CUSW CAN Bus Diagnostic Tools determine the **DISCONNECT** to **CONNECTED** flow of the CAN Bus network before proceeding.
2. With the ignition ON, use a DVOM /Oscilloscope to measure and record the **voltage** on the CAN Bus (+) circuit at connection port **1** of the Powernet / CUSW CAN Bus Diagnostic Tool. Connect the ground lead from the DVOM /Oscilloscope to connection port **3** on the Powernet / CUSW CAN Bus Diagnostic Tool.
3. With the ignition ON, use a DVOM /Oscilloscope to measure and record the **voltage** on the CAN Bus (-) circuit at connection port **2** of the Powernet / CUSW CAN Bus Diagnostic Tool. Connect the ground lead from the DVOM /Oscilloscope to connection port **3** on the Powernet / CUSW CAN Bus Diagnostic Tool.
4. With the battery and auxiliary battery (if equipped with Engine Stop/Start) disconnected, use a DVOM/Oscilloscope to measure and record the **resistance** on the CAN Bus (+) and (-) circuits at the Powernet / CUSW CAN Bus Diagnostic Tool ports **1** and **2**.
5. Compare the recorded CAN Bus voltage measurements with the above CAN Bus Voltages (Normal Operation) table. For additional information, refer to the appropriate CAN Bus circuit failure below:
 - **CAN Bus (+) or (-) Circuit Open:** The measurements with the incorrect voltage and less than 120.0 Ohms of resistance indicates which CAN Bus circuit is open, along with the direction of where the CAN Bus circuit is open.
 - **CAN Bus (+) or (-) Circuit Short To Ground:** The measurements with the incorrect voltage and the least amount of resistance indicates which CAN Bus circuit is shorted to ground, along with the direction of where the CAN Bus circuit is shorted.

- **CAN Bus (+) or (-) Circuit Short To Voltage:** The measurements with the incorrect voltage indicates which CAN Bus circuit is shorted to voltage, along with the direction of where the CAN Bus circuit is shorted.
- **CAN Bus (+) or (-) Circuits Shorted Together:** The measurements with equal voltage and the least amount of resistance indicates the direction of where the CAN Bus circuits are shorted together.

A NORMAL CAN Bus OSCILLOSCOPE WAVEFORM

Mopar Scope Settings

DESCRIPTION	MEASUREMENT
CHANNEL A	10 volts
CHANNEL B	10 volts
TIME BASE	50 μ s/div [microseconds / division control]
ZOOM / VIEW	X1 - HORIZONTAL & VERTICAL

NOTE: The Mopar Scope has preset Guided Tests for Communications testing of the CAN.

SCAN TOOL WILL NOT COMMUNICATE WITH CAN BUS

NOTE: This procedure diagnoses CAN Bus circuits after the Security Gateway (SGW) Module.

NOTE: If the vehicle operates, but the scan tool topology screen indicates all modules on a CAN Bus do not communicate, proceed to **SCAN TOOL DOES NOT COMMUNICATE WITH VEHICLE**. Refer to [DIAGNOSIS AND TESTING](#).

NOTE: Due to the loss of communication on the CAN Bus, multiple modules may not communicate on the network and certain U-code DTCs, such as CAN BUS OFF, CAN BUS MISSING MESSAGE or CAN BUS NO SIGNAL, may not be displayed on the scan tool until the cause of the fault is repaired.

If the vehicle **does not** operate properly and the scan tool topology screen indicates modules on a CAN Bus do not communicate, **perform** the appropriate Body Control Module (BCM) CAN BUS OFF, CAN BUS MISSING MESSAGE or CAN BUS NO SIGNAL U-code diagnostic procedure for the CAN Bus being diagnosed. Refer to [DIAGNOSIS AND TESTING](#) .

SCAN TOOL WILL NOT COMMUNICATE WITH VEHICLE

THEORY OF OPERATION

Below are a few different ways communication on a vehicle takes place:

1. Scan tool to the Gateway Module

2. ECU to ECU
3. ECU to Device
4. Device to ECU

Communication to the vehicle is established with a scan tool, through the Data Link Connector (DLC) to a Gateway ECU over the Controller Area Network (CAN) Bus. On this vehicle the Security Gateway (SGW) Module communicates with the scan tool through the CAN-C and CAN-IHS Bus networks.

The CAN Bus architecture of this vehicle operates in a "hub" or "star" style, meaning all of the ECUs are connected at a central point in the Star Connectors. The terminating resistors for CAN Bus are located in the Star Connectors and are a part of the body and instrument panel wiring harnesses.

In other CAN Bus architectures a vehicle may operate in a "stub" or "backbone" style, meaning there is a single, main line that connects all ECUs. The terminating resistors for a CAN Bus in the "stub" or "backbone" style are located in 2 separate dominant ECUs and are placed as far apart in the vehicle, as is physically possible.

The header of the scan tool is populated by the BCM with vehicle data, when communication with the scan tool has been established through the SGW Module. The scan tool becomes another ECU on the vehicle's networks by acting as the primary controlling ECU of all Bus networks while connected to the DLC, and contributes voltage to the operation of the CAN Bus.

CAN BUS OPERATIONAL VOLTAGES

CAN C Bus Operational Voltages								
CAN C Circuits	Sleep	Recessive (Bus Idle)	Dominant (Bus Active)	CAN (-) Short to Ground	CAN (+) Short to Ground	CAN (-) Short to Voltage	CAN (+) Short to Voltage	CAN (+) Short to CAN (-)
CAN (-)	0 V	2.4 - 2.5 V	1.3 - 2.3 V	0 V	0.3 - 0.5 V	Battery Voltage	Battery Voltage Less 0.75 V	2.45 V
CAN (+)	0 V	2.4 - 2.5 V	2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V

CAN IHS Bus Operational Voltages							
CAN IHS Circuits	Key-Off (Bus Asleep)	Key-On (Bus Active)	CAN (-) Short to Ground	CAN (+) Short to Ground	CAN (-) Short to Voltage	CAN (+) Short to Voltage	CAN (+) Short to CAN (-)
CAN (-)	0.0 V	1.3 - 2.3 V	0 V	0.3 - 0.5 V	Battery Voltage	Battery Voltage Less 0.75 V	2.45 V
CAN (+)	0.0 V	2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V

Notes

All measurements were taken between a ECU ground and a CAN Bus terminal, using a standard DVOM. The DVOM will display the average network voltage.

Total resistance of the CAN Bus networks should be measured with the battery, and auxiliary battery (if equipped with Engine Stop/Start), disconnected. The normal average CAN Bus resistance is approximately 60 Ohms. The termination resistors are integral to the Star Connectors.

WHEN MONITORED AND SET CONDITIONS

NOTE: This procedure diagnoses the CAN Bus circuits between the Data Link Connector (DLC) and the Security Gateway (SGW) Module.

NOTE: For the CAN C Bus, if the scan tool is able to communicate with the SGW Module, but does not communicate with other CAN C Bus modules, perform the appropriate Body Control Module (BCM) CAN BUS OFF, CAN BUS MISSING MESSAGE or CAN BUS NO SIGNAL U-code diagnostic procedure for the CAN C Bus. Refer to [DIAGNOSIS AND TESTING](#) .

NOTE: This condition will not display any Diagnostic Trouble Codes (DTCs).

CAN C Bus Off Symptoms:

- The ignition turns on and the engine starts.
- The scan tool does not automatically detect the vehicle and the Vehicle Identification Number (VIN) has to be manually entered. (**Exception:** CAN C (-) circuit is shorted to ground.)
- The scan tool displays a Security Gateway (SGW) Module is unresponsive message. (**Exception:** CAN C (-) circuit is shorted to ground.)
- The scan tool topology screen indicates all CAN IHS Bus modules communicate, as intended.
- The scan tool topology screen indicates there is no communication with the SGW Module, all CAN C Bus modules, and possibly the Radio. (**Exception:** CAN C (-) circuit is shorted to ground.)
- If a CAN C (-) or (+) circuit is shorted to ground, the voltage on the circuit will measure 0.0 volts.

CAN IHS Bus Off Symptoms:

- The ignition turns on and the engine starts.
- The scan tool is able to communicate with the Security Gateway (SGW) Module and the Radio.
- The scan tool topology screen indicates all CAN C Bus modules communicate, as intended.
- The scan tool topology screen indicates there is no communication with all CAN IHS Bus modules. (**Exception:** CAN IHS (-) circuit is shorted to ground.)
- If a CAN IHS (-) or (+) circuit is shorted to ground, the voltage on the circuit will measure 0.0 volts.

CAN C Bus and CAN IHS Bus Off Symptoms:

If the scan tool is unable to communicate with **All** CAN C Bus and CAN IHS Bus modules, check the following:

- Scan tool not operating properly.
- DLC power and ground circuits.
- SGW Module power and ground circuits.

Possible Causes
INOPERATIVE SCAN TOOL
POOR TERMINAL CONTACT OR CONNECTOR CONNECTION(S)
DATA LINK CONNECTOR (DLC)
DATA LINK CONNECTOR FUSED B (+) CIRCUIT OPEN OR HIGH RESISTANCE
DATA LINK CONNECTOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
CAN C (+) BUS CIRCUIT OPEN, SHORTED OR HIGH RESISTANCE
CAN C (-) BUS CIRCUIT OPEN, SHORTED OR HIGH RESISTANCE
CAN IHS (+) BUS CIRCUIT OPEN, SHORTED OR HIGH RESISTANCE
CAN IHS (-) BUS CIRCUIT OPEN, SHORTED OR HIGH RESISTANCE
CAN C (+) AND (-) BUS CIRCUITS SHORTED TOGETHER
CAN IHS (+) AND (-) BUS CIRCUITS SHORTED TOGETHER

DIAGNOSTIC TEST**1. CHECK THE SCAN TOOL FOR PROPER OPERATION**

1. Verify the scan tool can communicate with another vehicle.

Does the scan tool communicate with another vehicle?

Yes

- Go To [2](#)

No

- Contact the scan tool support.

2. CHECK THE DATA LINK CONNECTOR (DLC) AND TERMINALS FOR DAMAGE

1. For complete communication wiring at the Data Link connector, **Refer to the appropriate wiring information**
2. Verify all terminals in the DLC are locked into place and there is no damage to the connector or terminals.

Are all terminals in the DLC locked into place and no damage found to the connector or terminals?

Yes

- Go To [3](#)

No

- Repair the DLC and terminals as needed. Once the repair is complete, check the communication between the scan tool and this vehicle.

3. CHECK THE DLC (B+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

NOTE: **Connect a battery charger to the vehicle in accordance with Service Information to maintain a full state of charge throughout testing on this vehicle.**

1. Connect the (special tool #CH7002, Break Out Box, J1962, 16-Way) to the DLC.

NOTE: **Do not connect the scan tool to the Break Out Box.**

2. Measure the voltage on the DLC Fused (B+) circuit at the Break Out Box.

Is the voltage above 10.0 volts?

Yes

- Go To [4](#)

No

- Using the wiring diagrams as a guide, Inspect for an open fuse. If the fuse is open, check the DLC Fused (B+) circuit for a short to ground and repair, if needed. If the fuse is OK, repair the DLC Fused (B+) circuit for an open or high resistance.

4. CHECK THE DLC GROUND CIRCUITS FOR AN OPEN OR HIGH RESISTANCE

1. Measure the resistance of the DLC Ground circuits between ground and the Breakout Box.

Is the resistance above 3.0 Ohms?

Yes

- Repair the DLC Ground circuit for an open or high resistance.

No

- Go To [5](#)

5. CHECK THE CAN C BUS (+) AND (-) CIRCUITS FOR PROPER VOLTAGE

1. Measure the voltage on the CAN C Bus (+) circuit at the Breakout Box and note the results.
2. Measure the voltage on the CAN C Bus (-) circuit at the Breakout Box and note the results.
3. Compare the results to the above NORMAL CAN CIRCUIT VOLTAGE TABLE.

Are the CAN C Bus (+) and (-) circuit voltages within the specified values?

Yes

- Go To [6](#)

No

- **Voltage below the specified value:** Go To [7](#)
- **Voltage above the specified value:** Repair the short to voltage in the CAN C Bus circuit(s), between the DLC and the SGW Module.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

6. CHECK THE CAN IHS BUS (+) AND (-) CIRCUITS FOR PROPER VOLTAGE

1. Measure the voltage on the CAN IHS Bus (+) circuit at the Breakout Box and note the results.
2. Measure the voltage on the CAN IHS Bus (-) circuit at the Breakout Box and note the results.
3. Compare the results to the above NORMAL CAN CIRCUIT VOLTAGE TABLE.

Are the CAN IHS Bus (+) and (-) circuit voltages within the specified values?

Yes

- Contact scan tool support.

No

- **Voltage below the specified value:** Go To [7](#)
- **Voltage above the specified value:** Repair the short to voltage in the CAN IHS Bus circuit(s), between the DLC and the SGW Module.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

7. CHECK THE SGW MODULE FUSED B(+) AND FUSED IGNITION CIRCUITS FOR AN OPEN OR HIGH RESISTANCE

1. Turn the ignition off.
2. Disconnect the SGW Module C1 and C2 harness connectors.
3. Measure the voltage on the SGW Module Fused B(+) circuit at the SGW Module C2 harness connector, terminal 5.
4. Turn the ignition on.
5. Measure the voltage on the SGW Module Fused Ignition circuit at the SGW Module C1 harness connector, terminal 7.

Is the voltage above 10.0 volts for the Fused B(+) circuit and Fused Ignition circuit?

Yes

- Go To [8](#)

No

- Repair the Fused B (+) circuit or Fused Ignition circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

8. CHECK THE SGW MODULE GROUND CIRCUITS FOR AN OPEN OR HIGH RESISTANCE

1. Turn the ignition off.
2. Measure the resistance between ground and the SGW Module Ground circuit at SGW Module C1 harness connector, terminal 6.
3. Measure the resistance between ground and the SGW Module Ground circuit at SGW Module C2 harness connector, terminal 4.

Is the resistance above 3.0 Ohms on one or both Ground circuits?

Yes

- Repair the Ground circuit(s) for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [9](#)

9. CHECK THE CAN C BUS AND CAN IHS BUS CIRCUITS FOR AN OPEN OR HIGH RESISTANCE

1. Measure the resistance of the CAN C Bus (+) circuit between the Breakout Box and the SGW Module C1 harness connector, terminal 3.
2. Measure the resistance of the CAN C Bus (-) circuit between the Breakout Box and the SGW Module C1 harness connector, terminal 10.
3. Measure the resistance of the CAN IHS Bus (+) circuit between the Breakout Box and the SGW Module C2 harness connector, terminal 2.
4. Measure the resistance of the CAN IHS Bus (-) circuit between the Breakout Box and the SGW Module C2 harness connector, terminal 7.

Is the resistance above 3.0 Ohms for any of the CAN Bus circuits?

Yes

- Check the CAN Bus wiring and electrical connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension and repair as necessary. If no problems are found, repair the open or high resistance in the CAN Bus circuit(s), between the DLC and the SGW Module.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [10](#)

10. CHECK THE CAN C BUS AND CAN IHS BUS CIRCUITS FOR A SHORT TO GROUND

1. Check for continuity between ground and the CAN C Bus (+) circuit at SGW Module C1 harness connector, terminal 3.

2. Check for continuity between ground and the CAN C Bus (-) circuit at SGW Module C1 harness connector, terminal 10.
3. Check for continuity between ground and the CAN IHS Bus (+) circuit at SGW Module C2 harness connector, terminal 2.
4. Check for continuity between ground and the CAN IHS Bus (-) circuit at SGW Module C2 harness connector, terminal 7.

Is there continuity between ground and any of the CAN Bus circuits?

Yes

- Repair the short to ground in the CAN Bus circuit(s), between the DLC and the SGW Module.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [11](#)

11. CHECK THE CAN C BUS CIRCUITS FOR A SHORT TOGETHER

1. Check for continuity between the CAN C Bus (+) circuit and the CAN C Bus (-) circuit at SGW Module C1 harness connector, terminals 3 and 10.

Is there continuity between the CAN C Bus (+) circuit and the CAN C Bus (-) circuit?

Yes

- Repair the short between the CAN C Bus (+) and (-) circuits, between the DLC and the SGW Module.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [12](#)

12. CHECK THE CAN IHS BUS CIRCUITS FOR A SHORT TOGETHER

1. Check for continuity between the CAN IHS Bus (+) circuit and the CAN IHS Bus (-) circuit at SGW Module C2 harness connector, terminals 2 and 7.

Is there continuity between the CAN IHS Bus (+) circuit and the CAN IHS Bus (-) circuit?

Yes

- Repair the short between the CAN IHS Bus (+) and (-) circuits, between the DLC and the SGW Module.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [13](#)

13. CHECK RELATED SGW MODULE HARNESS CONNECTIONS

1. Disconnect all SGW Module harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.

- Damaged connector locks.
- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all SGW Module harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase any DTCs.
9. With the scan tool, attempt to communicate with the SGW Module.

Is the SGW active on all of the CAN buses connected to the ECU?

NOTE: Choose the one answer that best describes the vehicle condition that exists.

Yes - The SGW is active on all of the CAN buses connected to the ECU without any history of this concern.

- The wiring or poor connection problem has been repaired.
- Perform the appropriate ECU verification test. If a verification test is not available, perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Go To [14](#)

14. CHECK ALL CAN BUS COMMUNICATION CIRCUITS FROM THE DLC TO THE SGW WITH THE MOPAR SCOPE

NOTE: Some vehicles can have multiple CAN connections within a connector, make sure that you are testing the same CAN for both circuits.

Connect the black pin for each test lead to Chassis ground. Connect the blue lead to CAN (+) and the red lead to CAN (-) for the circuits to be tested.

1. Start the Mopar Scope.
2. Once the Mopar Scope is running, select **Guided Tests** .
3. Select **Communications** .
4. Select **CAN L&H** .
5. Select **CAN bus testing / diagnostics** .
6. Select **Load settings file** .
7. Turn the ignition on.

NOTE: When connected to the vehicle harness correctly, the LEDs on the breakout box will light up to indicate that there is activity on the bus.

8. A waveform should appear.

The image below is of a normal CAN bus waveform using the Mopar Scope. The waveform should reveal that data is being exchanged continuously along the CAN bus and the peak voltages are correct.

DESCRIPTION	MEASUREMENT
CHANNEL A	10 volts
CHANNEL B	10 volts
TIME BASE	50 μ s/div [microseconds / division control]
ZOOM / VIEW	X1 - HORIZONTAL & VERTICAL

9. With the Mopar Scope running, use the wiring diagrams as a guide to trace the circuits and look for any in-line connectors where the fault could occur intermittently by wiggling **ALL related** wire harness and connectors.

Did the Mopar Scope show the CAN bus waveform fault?

Yes

- Repair any conditions that are found.
- Replace the Security Gateway (SGW) Module in accordance with the Service Information. Refer to **MODULE, SECURITY GATEWAY (SGW), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

CHECKING CAN-C BUS USING MOPAR SCOPE

THEORY OF OPERATION CAN-C

1. CHARACTERISTICS OF CAN-C

1. CAN-C is a multiplexed network that allow all modules to share information using high speed data signals. These networks use a twisted pair of insulated copper wires for the data bus. One wire is designated as CAN (+), the other is CAN (-). Connectors house the bus network circuit terminals in adjacent cavities and connect them to a module. The connectors also connect certain branches of wiring in-line along the wiring harness. A gateway module is used to link CAN-C to other communication networks.

The number of modules placed on a CAN-C bus is limited. In these instances, the modules are organized by interior and exterior location on the vehicle, and placed on different bus networks.

2. CAN MESSAGE CONTENT, ARBITRATION, AND TERMINATION

1. The CAN network is the most common vehicle communication network and is quickly becoming the industry standard. While other communication network protocols do exist, we will focus on the details of the CAN vehicle communication protocol. Knowledge of the CAN protocol is crucial because every late model FCA vehicle currently uses some form of CAN-based communication network.

A characteristic with CAN communication networks is that each module can bias the network. This means each module can alter the voltage level of the network, both on CAN (+) and CAN (-). Modules transmit information by biasing the network, and receive information by measuring the changing bias.

Information is shared over a CAN network using a sequence of controlled voltage pulses sent out on the bus wires. At the proper time, a module biases the bus voltage to transmit a data signal. It does so with a sequence of voltage pulses that vary in frequency. The combination of these voltage pulses forms a data message and is called a data frame. By design, CAN modules will recognize certain frequency voltage pulses at specific times. The sequence of voltage pulses that form a data frame can be broken down into specific parts.

Start of frame (SOF) - The transmission of data begins with the sending module biasing the bus dominant from a recessive state.
Arbitration Field - The sending module identifies itself, and is prioritized; modules that require data from the sending module are alerted.
Control Field - Identifies the format and bit construction of a message.
Data Field - The actual data or information is contained within this field. The DLC (Data Length Code) in Classic CAN uses 0-8 bytes.
Cyclical redundancy check (CRC) - A redundant check that verifies the message was received correctly.
Acknowledgement (ACK) - Receiving modules verify if they successfully received the intended information.
End of frame (EOF) - The bus returns to a recessive state, signaling the end of the transfer of data. There are two frame formats used in classic CAN:

- CAN base format - 11 bit identifier and fixed bit rate.
- CAN extended format - 29 bit identifier and fixed bit rate.

3. ARBITRATION

1. When multiple modules are connected to a single communication network, there is a potential that two modules could attempt to transmit data on to the network at the same time. To prevent this from occurring, modules that are considered more important will have priority when attempting to transmit data. The less important modules are signaled to wait until all other data transfers are complete. This process is called arbitration. When normal operation occurs, arbitration prevents modules from disrupting the network. If a module fails and ceases to adhere to this arbitration, faults could occur on the communication network.

4. THEORY AND OPERATION OF CAN-C

1. Each CAN-C module can bias the network. This means the module will determine the voltage, and change in voltage, transmitted on the bus wires. Keep in mind there are many modules wired into the CAN-C or FD networks. Arbitration allows for all modules to share information in an orderly manner. Modules with messages deemed highly important take priority.

5. TERMINATION RESISTANCE

1. The CAN-C network has terminating resistors wired parallel in the circuit. Termination resistance allows for CAN (+) and CAN (-) circuit voltages to pull in different directions as well as absorb any stray voltage spikes throughout the network, preventing network signal interference. Optimal CAN-C bus termination resistance is 60 ohms. In some CAN architectures (Stub, Hub, or Daisy-Chain), this is achieved using two 120-ohm resistors located inside dominant network modules or Star Connectors if equipped. Certain vehicles may contain non-dominant modules with internal resistance, typically around 2.8- 3.0 kilo-ohms, but this resistance is part of the modules' data transmit/receive processor, and is not used to stabilize the network. A non-dominant module with this resistance will have an effect on the total network resistance when measured with a Multi Meter.

Understanding the fault characteristics of the CAN-C bus is key to identifying where to begin diagnosis. Diagnostic strategies are different between concerns of one module experiencing a communication fault versus a fault that affects the entire network. Using techniques like unplugging in-line connectors to break the CAN-C circuit in half and taking voltage and resistance measurements will quickly isolate a communication network fault.

6. TOLERANCE

1. CAN-C has limited fault tolerance. The majority of faults result in a complete loss of communication with the CAN-C network. One of the first steps in proper diagnosis is identifying whether a CAN-C fault is present. The symptoms of a CAN-C communication network fault are not unique. Lost time and improper repairs may result if the concern is not properly verified and identified. Whenever a CAN-C communication network fault is suspected, the first step is to connect the scan tool and check for network communication and U-codes.

7. FAULT SYMPTOMS AND DIAGNOSIS

1. When communication hard faults occur on the CAN-C bus circuits, such as a short to ground or short to power, typically the vehicle will experience a no crank/no start with the MIL illuminated. U-codes may be found in any of the modules on the bus. Check power, ground, the connector, and both bus circuits to the suspect module before replacing the module. If communication on an entire network or networks is not possible, ensure the scan tool is functioning properly and operating with the latest software level.

There are several faults that can interrupt normal operation of the CAN-C communication network. The network wire may chafe, resulting in one or both wires shorting to chassis ground, shorting to power, or shorting to each other. Damage to a connector can result in the same faults. If either CAN (+) or CAN (-) is shorted to ground, voltage, or together at any place in the circuit, communication is not possible. When an open occurs in the circuit, any module downstream of the open will not communicate. It is possible for a module to fail, resulting in loss of communication

with that particular module. If internally shorted, a module fault may bring the whole network down, resulting in no communication on the entire CAN-C network. If this type of concern occurs, typically the network will begin to communicate normally if the faulty module is disconnected. Remember to verify power and ground, as well as connector faults, before replacing any module.

8. CAN BUS FAULTS

1. There are five types of CAN Bus messaging faults, they are as follows:

TYPE	DESCRIPTION
LOSS OF COMMUNICATION	will set by an active receiving/reporting ECU on a CAN Bus network that detects no communication from another ECU on the same CAN Bus network. Insufficient power, ground, bus voltage, or inaccurate vehicle configuration will cause a loss of communication.
IMPLAUSIBLE MESSAGE	will set by an active receiving/reporting ECU, when it determines the data sent from the active transmitting/sending ECU is missing part of the message, or the message is an irrational value over the CAN Bus.
MISSING MESSAGE	will set by an active receiving/reporting ECU, when it determines a data message to be missing partial information when sent from the active transmitting/sending ECU over the CAN Bus network.
BUS OFF	set by an ECU that has experienced approximately 32 transmit errors, this can be caused by ECU internal faults as well as external bus faults like shorts or plugging and unplugging test tools to the diagnostic connector.
PHYSICAL	is only detectable by an ECU that has a transceiver that is able to detect shorts on the bus. If the ECU does not, it generally will set bus off faults due to shorted bus lines.

9. CORRUPTION

1. A certain type of fault called corruption exhibits unique fault symptoms. One type of corruption occurs when an open on CAN (+), CAN (-), or both, separates a dominant module or Star Connector if equipped from the network. Removing the dominant module (or Star Connector if equipped) greatly affects the optimal termination resistance. Failed modules may produce network corruption. When a module that has termination fails, it may attempt to communicate (bias) on only CAN bus (+) or (-), causing corruption. Another type of corruption is caused by EMI due to stray, high-voltage magnetic fields or untwisted communication wires. When corruption occurs, communication may still be possible, but erratic. When viewed with a diagnostic scan tool, corruption causes the network modules to flash between yellow and red, indicating they are communicating one moment but not the next. If one particular module stays red (not communicating) and does not flash, suspect a concern with either this module, its connectors, or the bus circuits leading up to that module.

Electronic Control Units require the following four components to properly communicate on a Controller Area Network (CAN) data bus: Power (Battery/Fused B+/Ignition), Ground, CAN bus voltage and correct vehicle configuration.

If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using the Mopar Scope may reveal activity that appears to be bus data messaging, even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

CAN Bus Voltages (Normal Operation)								
CAN-C Bus Circuits	Sleep	Recessive (Bus Idle)	Dominant (Bus Active)	CAN-L Short to Ground	CAN-H Short to Ground	CAN-L Short to Battery	CAN-H Short to Battery	CAN-H Short to CAN-L
CAN-L (-)	0 V	2.4 - 2.5 V	1.3 - 2.3 V	0 V	0.3 - 0.5V	Battery Voltage	Battery Voltage Less 0.75 V	2.45 V
CAN-H (+)	0 V	2.4 - 2.5 V	2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V
Notes								
All measurements taken between node ground and CAN terminal with a standard DVOM. DVOM will display average network voltage. Total resistance of CAN-C network can also be measured (60 ohms).								

CAN BUS TERMINATION RESISTANCE TABLE											
NON-DOMINANT	0	1	2	3	4	5	6	7	8	9	10
ONE DOMINANT	120.00	115.38	111.11	107.14	103.44	100.00	96.77	93.75	90.90	88.23	85.71
TWO DOMINANT	60.00	58.82	57.69	57.60	55.55	54.54	53.57	52.63	51.73	50.84	50.00
NON-DOMINANT	11	12	13	14	15	16	17	18	19	20	
ONE DOMINANT	83.33	81.08	78.94	76.87	75.00	73.17	71.42	69.76	69.18	66.66	
TWO DOMINANT	49.18	48.38	47.61	46.87	46.15	45.45	44.77	44.11	43.47	42.85	

Possible Causes
DEALER INSTALLED EQUIPMENT
ECU POWER SUPPLY (FUSED B+/IGNITION) RELATED CIRCUIT(S) OPEN CIRCUIT, SHORTED TO GROUND OR ANOTHER CIRCUIT
ECU GROUND CIRCUIT(S) OPEN/HIGH RESISTANCE
ECU CAN BUS CIRCUIT(+/-) OPEN/HIGH RESISTANCE, SHORTED TO GROUND, TOGETHER, VOLTAGE, OR ANOTHER CIRCUIT
STAR CONNECTOR (IF EQUIPPED)
ECU

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

TESTING CAN BUS USING THE MOPAR SCOPE

NOTE: Some vehicles can have multiple CAN connections within a connector, make sure that you are testing the same CAN for both circuits.

For a complete CAN C BUS SYSTEM wiring diagram, Refer to the appropriate wiring information .

1. Connect the black pin for each test lead to Chassis ground. Connect the blue lead to CAN (+) and the red lead to CAN (-) for the circuits to be tested.

2. Start the Mopar Scope.
3. Turn the ignition on.

NOTE: When connected to the vehicle harness correctly, the LEDs on the breakout box will light up to indicate that there is activity on the bus.

4. A waveform should appear.

The image below is of a normal CAN bus waveform using the Mopar Scope.

DESCRIPTION	MEASUREMENT
CHANNEL A	10 volts
CHANNEL B	10 volts
TIME BASE	50 μ s/div [microseconds / division control]
ZOOM / VIEW	X1 - HORIZONTAL & VERTICAL

NOTE: The waveform should reveal that data is being exchanged continuously along the CAN bus and the peak voltages are correct.

5. Determine the type of CAN-C waveform fault the vehicle presently has from below:
 - (+) Short To Ground

- (-) Short To Ground

- (+) Short To Voltage

NOTE: Channel A and B voltage measurements taken at the 20 V range, measurements taken at 10 V range would display a Channel overrange message.

- (-) Short To Voltage

NOTE: Channel A and B voltage measurements taken at the 20 V range, measurements taken at 10 V range would display a Channel overrange message.

- Short Together

- (+) Circuit Open

NOTE: The scope pattern shown is from the ECU side missing the HIGH side connection to the CAN bus harness. When checking the CAN bus is checked from the harness side a normal CAN bus scope pattern will appear.

- (-) Circuit Open

NOTE: The scope pattern shown is from the ECU side missing the LOW side connection to the CAN bus harness. When checking the CAN bus is checked from the harness side a normal CAN bus scope pattern will appear.

Did the Mopar Scope show the CAN-C bus waveform fault?

NOTE:

The CAN communication network wires typically contain 33-50 twists per meter (one twist for every 20 to 30.3 mm, or one twist for every 0.75 to 1.2 inches). It is important to maintain the twisted pair configuration whenever servicing a dual-wire communication network.

The length of the circuit wires are also important in communication systems so both wires need to maintain their same lengths or it can result in communication fault / error.

Due to the twisted pair configuration and length of wiring, an overlay harness is NOT a recommended repair.

- Use the wiring diagrams as a guide to follow the path of the circuit(s) to isolate the fault further and then repair / replace as needed.
- The condition that originally caused the concern may not be present at this time.
- Continue to use the Mopar Scope and wiring diagrams as a guide to trace the circuits and look for any in-line connectors where the fault could occur intermittently by wiggling the wire harness and connectors.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

CHECKING CAN-IHS BUS USING MOPAR SCOPE

THEORY OF OPERATION CAN-IHS

1. CHARACTERISTICS OF CAN-IHS

1. CAN-IHS is an event-driven multiplexed network that allows modules to share data. CAN-IHS is a medium-speed bus operating at 125 kbps. The voltages, termination resistance, and wiring configuration, are very similar to that of CAN-C. CAN-IHS is primarily used for interior and body systems. FCA vehicles that utilize a CAN bus architecture for module communication use either a CAN-IHS bus or another network called the CAN-B bus for interior module communication. While both CAN-IHS and CAN-B communication networks are utilized for similar purposes, modules on the CAN-IHS network are internally different from modules on the CAN-B bus. The CAN-IHS is wired using stub, or backbone, topology.

2. CAN MESSAGE CONTENT, ARBITRATION, AND TERMINATION

1. The CAN network is the most common vehicle communication network and is quickly becoming the industry standard. While other communication network protocols do exist, we will focus on the details of the CAN vehicle communication protocol. Knowledge of the CAN protocol is crucial

because every late model FCA vehicle currently uses some form of CAN-based communication network.

A characteristic with CAN communication networks is that each module can bias the network. This means each module can alter the voltage level of the network, both on CAN (+) and CAN (-). Modules transmit information by biasing the network, and receive information by measuring the changing bias.

Information is shared over a CAN network using a sequence of controlled voltage pulses sent out on the bus wires. At the proper time, a module biases the bus voltage to transmit a data signal. It does so with a sequence of voltage pulses that vary in frequency. The combination of these voltage pulses forms a data message and is called a data frame. By design, CAN modules will recognize certain frequency voltage pulses at specific times. The sequence of voltage pulses that form a data frame can be broken down into specific parts.

Start of frame (SOF) - The transmission of data begins with the sending module biasing the bus dominant from a recessive state.
Arbitration Field - The sending module identifies itself, and is prioritized; modules that require data from the sending module are alerted.
Control Field - Identifies the format and bit construction of a message.
Data Field - The actual data or information is contained within this field. The DLC (Data Length Code) in Classic CAN uses 0-8 bytes.
Cyclical redundancy check (CRC) - A redundant check that verifies the message was received correctly.
Acknowledgement (ACK) - Receiving modules verify if they successfully received the intended information.
End of frame (EOF) - The bus returns to a recessive state, signaling the end of the transfer of data. There are two frame formats used in classic CAN: • CAN base format - 11 bit identifier and fixed bit rate. • CAN extended format - 29 bit identifier and fixed bit rate.

3. ARBITRATION

1. When multiple modules are connected to a single communication network, there is a potential that two modules could attempt to transmit data on to the network at the same time. To prevent this from occurring, modules that are considered more important will have priority when attempting to transmit data. The less important modules are signaled to wait until all other data transfers are complete. This process is called arbitration. When normal operation occurs, arbitration prevents modules from disrupting the network. If a module fails and ceases to adhere to this arbitration, faults could occur on the communication network.

4. THEORY AND OPERATION OF CAN-IHS

1. Like CAN C voltages can only be seen using an oscilloscope. Each module on the CAN-IHS bus provides its own bias. This means that every module can apply power and ground on the data bus, allowing all modules to send and receive data. The active, idle, and sleep voltages are approximately the same for CAN-IHS as they are for both Diagnostic CAN-C, CAN-C and FD. The CAN (+) and CAN (-) will be biased to 2.5V. When active, or dominant, CAN (+) is pulled high to 3.5V, and CAN (-) is pulled low to 1.5V. The CAN-IHS bus is always awake when the ignition is ON. Multi Meter's will average the readings. When using a Multi Meter, in the active state, normal voltages levels on CAN (+) are approximately 2.5V to 2.7V, and on CAN (-) are approximately 2.5V to 2.3V. CAN-IHS can go into sleep mode when the ignition is in the OFF position. When in sleep mode, voltages on both CAN (+) and CAN (-) are 0V. Modules that are powered by an ignition-OFF draw (IOD) fuse can awaken the network if a switched input, such as a door ajar switch, is activated.

5. CAN-IHS SLEEP VOLTAGES

1. The CAN-IHS bus is awake whenever the ignition switch is turned to RUN. With the ignition in the OFF position, modules on the CAN-IHS network will time out and go to sleep. When the

modules are asleep, voltages on the CAN-IHS bus will read 0V. The CAN-IHS can awaken without the ignition switch turning to the RUN position due to direct inputs, such as a door ajar switch, or bus inputs from another module.

6. TERMINATION RESISTANCE

1. Just like the CAN-C and FD network, termination resistance is used in the CAN-IHS circuit to separate CAN (+) and CAN (-) voltages and to absorb any stray voltage spikes throughout the communication network, preventing network signal interference. Optimal CAN-IHS bus total circuit termination resistance is 60 ohms. In some CAN architectures (Stub, Hub, or Daisy-Chain), this is achieved using two 120-ohm resistors located inside dominant network modules or Star Connectors if equipped. Certain CAN-IHS non-dominant modules have some level of termination resistance, typically around 2.8-3.0 kilo-ohms. Remember that with the modules on the CAN-IHS network, the termination resistors are wired in parallel in the network. Because of this, the 2.8-3.0 kilo-ohms resistance in other modules will have some effect on total circuit resistance. Initially, all non-dominant CAN-IHS modules had some internal termination resistance. To permit common modules on multiple platforms, termination resistance is no longer present in many of these modules.

7. TOLERANCE

1. CAN-IHS has a limited fault tolerance. If either CAN (+) or CAN (-) are shorted to voltage or together, communication is not possible. When an open occurs on both wires in the circuit, any module downstream of the open will not communicate. CAN-IHS can withstand certain short to ground faults on the CAN (-) circuit. Communication can still occur because a voltage difference between CAN (+) and (-) is possible when the CAN (+) voltage is pulled above 0V.

8. FAULT SYMPTOMS AND DIAGNOSIS

1. When communication hard faults occur on the CAN-IHS communication network, such as a short circuit, open circuit, or an internally shorted module, the vehicle's windshield wipers typically will run continuously and the head lamps will stay on. U-codes will be found in the gateway module and possibly other modules. If a specific module is separated or drops off the network, loss of functions controlled by that module will occur, and U-codes will be set in several modules. When diagnosing a CAN-IHS fault, remember to:

Begin by measuring bus voltages and total circuit termination resistance.
Check power, ground, and voltages on both bus circuits to any suspect module before replacement of that module.
If communication on an entire network or networks is not possible, ensure the scan tool is functioning properly and operating with the latest software
Failed modules or an open circuit fault that isolates a dominant module may produce network corruption.

9. CAN BUS FAULTS

1. There are five types of CAN Bus messaging faults, they are as follows:

TYPE	DESCRIPTION
LOSS OF COMMUNICATION	will set by an active receiving/reporting ECU on a CAN Bus network that detects no communication from another ECU on the same CAN Bus network. Insufficient power, ground, bus voltage, or inaccurate vehicle configuration will cause a loss of communication.
IMPLAUSIBLE MESSAGE	will set by an active receiving/reporting ECU, when it determines the data sent from the active transmitting/sending ECU is missing part of the message, or the message is an irrational value over the CAN Bus.
MISSING MESSAGE	will set by an active receiving/reporting ECU, when it determines a data message to be missing partial information when sent from the active transmitting/sending ECU over the CAN Bus network.
BUS OFF	set by an ECU that has experienced approximately 32 transmit errors, this can be caused by ECU internal faults as well as external bus faults like

TYPE	DESCRIPTION
	shorts or plugging and unplugging test tools to the diagnostic connector.
PHYSICAL	is only detectable by an ECU that has a transceiver that is able to detect shorts on the bus. If the ECU does not, it generally will set bus off faults due to shorted bus lines.

10. CORRUPTION

1. A certain type of fault called corruption exhibits unique fault symptoms. One type of corruption occurs when an open on CAN (+), CAN (-), or both, separates a dominant module or Star Connector if equipped from the network. Removing the dominant module (or Star Connector if equipped) greatly affects the optimal termination resistance. Failed modules may produce network corruption. When a module that has termination fails, it may attempt to communicate (bias) on only CAN bus (+) or (-), causing corruption. Another type of corruption is caused by EMI due to stray, high-voltage magnetic fields or untwisted communication wires. When corruption occurs, communication may still be possible, but erratic. When viewed with a diagnostic scan tool, corruption causes the network modules to flash between yellow and red, indicating they are communicating one moment but not the next. If one particular module stays red (not communicating) and does not flash, suspect a concern with either this module, its connectors, or the bus circuits leading up to that module.

Electronic Control Units require the following four components to properly communicate on a Controller Area Network (CAN) data bus: Power (Battery/Fused B+/Ignition), Ground, CAN bus voltage and correct vehicle configuration.

If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using the Mopar Scope may reveal activity that appears to be bus data messaging, even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

CAN Bus Voltages (Normal Operation)								
CAN-IHS Bus Circuits	Sleep	Recessive (Bus Idle)	Dominant (Bus Active)	CAN-L Short to Ground	CAN-H Short to Ground	CAN-L Short to Battery	CAN-H Short to Battery	CAN-H Short to CAN-L
CAN-L (-)	0 V	2.4 - 2.5 V	1.3 - 2.3 V	0 V	0.3 - 0.5V	Battery Voltage	Battery Voltage Less 0.75 V	2.45 V
CAN-H (+)	0 V	2.4 - 2.5 V	2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V
Notes								
All measurements taken between node ground and CAN terminal with a standard DVOM. DVOM will display average network voltage.								
Total resistance of CAN-IHS network can also be measured (60 ohms).								

CAN BUS TERMINATION RESISTANCE TABLE											
NON-DOMINANT	0	1	2	3	4	5	6	7	8	9	10
ONE DOMINANT	120.00	115.38	111.11	107.14	103.44	100.00	96.77	93.75	90.90	88.23	85.71

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

TESTING CAN BUS USING THE MOPAR SCOPE

NOTE: Some vehicles can have multiple CAN connections within a connector, make sure that you are testing the same CAN for both circuits.

For a complete CAN BH BUS SYSTEM (if equipped) wiring diagram, Refer to the appropriate wiring information .

For a complete CAN IHS BUS SYSTEM (if equipped) wiring diagram, Refer to the appropriate wiring information .

1. Connect the black pin for each test lead to Chassis ground. Connect the blue lead to CAN (+) and the red lead to CAN (-) for the circuits to be tested.

2. Start the Mopar Scope.
3. Turn the ignition on.

NOTE: When connected to the vehicle harness correctly, the LEDs on the breakout box will light up to indicate that there is activity on the bus.

4. A waveform should appear.

The image below is of a normal CAN bus waveform using the Mopar Scope.

DESCRIPTION	MEASUREMENT
CHANNEL A	10 volts
CHANNEL B	10 volts
TIME BASE	50 μ s/div [microseconds / division control]
ZOOM / VIEW	X1 - HORIZONTAL & VERTICAL

NOTE: The waveform should reveal that data is being exchanged continuously along the CAN bus and the peak voltages are correct.

5. Determine the type of CAN-IHS waveform fault the vehicle presently has from below:

- (+) Short To Ground

- (-) Short To Ground

- (+) Short To Voltage

NOTE: Channel A and B voltage measurements taken at the 20 V range, measurements taken at 10 V range would display a Channel overrange message.

- (-) Short To Voltage

NOTE: Channel A and B voltage measurements taken at the 20 V range, measurements taken at 10 V range would display a Channel overrange message.

- Short Together

- (+) Circuit Open

NOTE: The scope pattern shown is from the ECU side missing the HIGH side connection to the CAN bus harness. When checking the CAN bus is checked from the harness side a normal CAN bus scope pattern will appear.

- (-) Circuit Open

NOTE: The scope pattern shown is from the ECU side missing the LOW side connection to the CAN bus harness. When checking the CAN bus is checked from the harness side a normal CAN bus scope pattern will appear.

Did the Mopar Scope show the CAN-IHS bus waveform fault?

NOTE: The CAN communication network wires typically contain 33-50 twists per meter (one twist for every 20 to 30.3 mm, or one twist for every 0.75 to 1.2 inches). It is important to maintain the twisted pair configuration whenever servicing a dual-wire communication network.

The length of the circuit wires are also important in communication systems so both wires need to maintain their same lengths or it can result in communication fault / error.

Due to the twisted pair configuration and length of wiring, an overlay harness is NOT a recommended repair.

- Use the wiring diagrams as a guide to follow the path of the circuit(s) to isolate the fault further and then repair / replace as needed.
- The condition that originally caused the concern may not be present at this time.
- Continue to use the Mopar Scope and wiring diagrams as a guide to trace the circuits and look for any in-line connectors where the fault could occur intermittently by wiggling the wire harness and connectors.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

CHECKING LIN BUS USING MOPAR SCOPE

THEORY OF OPERATION LIN

1. CHARACTERISTICS OF LIN (Local Interface Network)

1. The LIN communication network is a single-wire, low-speed network different from the CAN networks. The LIN bus is a Class A data bus system that uses a centralized module, called a Master module, often referred to as the Master module, with a series of other modules, called Slave modules, directly wired to it on a dedicated, single-wire circuit. The communication over a LIN bus only occurs between the Master and Slave modules. Each module on the LIN bus can provide bias, but only the Master module is capable of recognizing a signal sent by a Slave module with its protected ID, only if its data has been updated. Even though it is limited, the LIN bus simplifies wiring in a vehicle by combining multiple input and output circuits on a single bus wire. The LIN bus utilizes stub (backbone) topology.

Class A	Class B	Class C	Class D
A low-speed protocol operating at speeds up to 10 kbps. It is used in older communication systems and for low priority communications (ISO-K), such as for convenience features.	A medium-speed protocol operating at speeds up to 125 kbps and is often used for body and interior systems (CAN B and CAN IHS).	A high-speed protocol, operating at speeds up to 1 mbps; because of its high speed, it is used for highly important systems that require instantaneous, real time updating of information (CAN C).	Speeds greater than 1 Mb/sec. Used in applications such as Emission diagnostics, Safety, Mobile Media and X-by Wire.

2. SPECIFIC COMPONENTS

1. The LIN bus uses a single, insulated copper wire for the data bus which connects multiple Slave modules together. Typically, Slave modules are simple inputs and outputs that may not perform self diagnostics. Controlled modules are active with the ignition in the ON position, and some may be active with the ignition in the OFF position. Components such as an instrument panel (IP) switch bank, compass module, heated seat module, and tire pressure transponders are examples of Slave modules. A LIN bus requires a Master module. The Master module accepts inputs from and sends commands to the LIN modules. A vehicle may be equipped with more than one LIN bus. For example, the tire pressure transponders may use the WIN as the Master module, and the multi-function switch may use the CCN as the Master module on a separate LIN bus.

3. MASTER MODULE

1. The Master module is central to the LIN bus system. All LIN modules connect to a Master module through the LIN bus circuit. The Master module is also wired to a CAN bus for information sharing and to allow for scan tool diagnosis. The Master module is responsible for LIN diagnostics and is capable of setting fault codes for any LIN module or circuit faults. Since a Slave module cannot communicate with any other module directly, the Master module relays LIN Slave module data over the CAN bus to the scan tool, similar to a CGW.

Controlled module inputs and commands must be given only to the Master module, which then sends the information to another Slave module or out onto the CAN bus.

4. THEORY AND OPERATION OF LIN

1. The LIN bus is biased through the Master and Slave modules. When at rest, the voltage on the LIN network is close to battery voltage. When LIN bus communication occurs, the voltage is pulled low to nearly 0V, creating a digital signal. If a Slave module is disconnected or removed from the network, that module no longer pulls voltage low on the LIN bus, and the average network voltage level will be lower. LIN voltage reads 12V when in sleep mode.

The Master module communicates with Slave modules by pulling the voltage from high to low, creating a digital signal. Controlled modules communicate with the Master by biasing the network voltage in the same manner. Even though the LIN Slave modules are wired to each other, they only recognize the voltage pulses sent by the Master module, making communication possible only between the Slave and the Master. However, LIN communication can occur between Slave modules by using the Master module to relay information.

The power feed to the LIN Slave is determined by its function. Controlled modules with a battery feed voltage supply operate and communicate even if the ignition is in the OFF position. For example, to support the hazard lamp function, the instrument panel switch bank is battery fed. If the LIN module only needs to function with the ignition ON, such as the compass module, the power feed is ignition only. The lighting and wiper multifunction switch require both feeds. This allows the lighting functions to be independent of ignition status, while the operation of the wipers requires the ignition feed.

LIN Slave modules that receive their power feed from an ignition circuit enter sleep mode when the ignition power is removed. LIN Slave modules that receive their power from a direct battery feed receive a sleep message when the vehicle data bus enters sleep mode. For circuits where the LIN modules are battery fed, either the Master or the Slave module can wake the other. If the Slave module wakes up the Master, the vehicle bus also wakes.

5. TOLERANCE

1. As with any single-wire communication bus, a LIN bus has low fault tolerance. If a short to ground or power occurs on the LIN bus, the entire LIN bus loses the ability to communicate with the Master module. If an open occurs within the network, modules on the other side of the break (that are no longer connected to the Master module) lose communication. If an open occurs within the network, modules still connected to the Master module continue to communicate. Loss of power or ground to a Slave module results in that particular Slave module losing communication as well, whereas loss of power or ground to a Master module results in no LIN bus communication. Generally, one Slave module is triggered for information at a time - meaning zero collision risk and no need for arbitration as is used in CAN (Controller Area Network). If multiple Slave modules respond, a collision occurs and the Master ECU defaults to unconditional frames.

6. FAULT SYMPTOMS AND DIAGNOSIS

1. When the LIN bus is shorted, no modules can communicate on the network and a loss of all LIN module functionality occurs. Loss of communication codes (U-codes) will set in the Master module. A short to ground or to power on the LIN bus does not affect Master module communication over the CAN bus.

Combine the LIN bus data with CAN bus data to get a complete detailed perspective of the vehicle, while in use with the Mopar Scope. Consider the following type of questions when diagnosing:

- How is driving behavior correlated with use of various LIN bus features?
- Do issues arise in the interaction between LIN Master ECUs and the CAN bus?
- Are LIN related issues correlated with certain CAN based events?

Begin diagnosis by checking the voltage on the LIN bus to see if voltage is present. Modules may be isolated by disconnecting Slave modules one at a time and then checking for LIN communication to return when a particular Slave is disconnected. When all Slave and Master modules are disconnected, test the LIN circuit for a short to ground or to power. If an open occurs, modules downstream of the open lose functionality and communication codes will set. If a single LIN Slave module is not communicating but all other LIN modules are functioning normally, always verify power, ground, and LIN voltage at the suspect module before replacing any parts. As long as at least one module on the LIN network is connected, then the circuit is able to be biased.

Possible Causes
DEALER INSTALLED EQUIPMENT
ECU POWER SUPPLY (FUSED B+/IGNITION) RELATED CIRCUIT(S) OPEN CIRCUIT, SHORTED TO GROUND OR ANOTHER CIRCUIT
ECU GROUND CIRCUIT(S) OPEN/HIGH RESISTANCE
ECU LIN BUS CIRCUIT(+/-) OPEN/HIGH RESISTANCE, SHORTED TO GROUND, VOLTAGE, OR ANOTHER CIRCUIT
SLAVE MODULE
MASTER MODULE

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [**PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**](#) .

DIAGNOSTIC TEST

TESTING LIN BUS USING THE MOPAR SCOPE

NOTE: Some vehicles can have multiple LIN connections within a connector, make sure that you are testing the correct LIN circuit.

For a complete LIN BUS SYSTEM wiring diagram, Refer to the appropriate wiring information .

1. Connect the black pin for each test lead to Chassis ground. Connect the blue lead to the LIN circuit to be tested.

2. Start the Mopar Scope.
3. Turn the ignition on.
4. Operate the systems connected to the LIN bus being tested to observe signal changes. Move connectors and wiring to look for any signal drop-out.
5. When connected to the vehicle harness correctly, the LED on the breakout box will light up to indicate that there is activity on the bus.
6. A waveform should appear.

The image below is of a normal LIN bus waveform using the Mopar Scope.

DESCRIPTION	MEASUREMENT
CHANNEL A	20 volts
TIME BASE	1 ms/div [milliseconds / division control]
ZOOM / VIEW	X1 - HORIZONTAL & VERTICAL

NOTE: The Mopar Scope has preset **Guided Tests for Communications** testing of the LIN bus.

7. The waveform should reveal that data is being exchanged continuously along the LIN bus and the peak voltages are correct.
8. Determine the type of LIN waveform fault (short, open, etc.) the vehicle presently has.

Did the Mopar Scope show the LIN bus waveform fault?

- Use the wiring diagrams as a guide to follow the path of the circuit(s) to isolate the fault further and then repair / replace as needed.
- The condition that originally caused the concern may not be present at this time.
- Continue to use the Mopar Scope and wiring diagrams as a guide to trace the circuits and look for any in-line connectors where the fault could occur intermittently by wiggling the wire harness and connectors.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

NO RESPONSE FROM ECU

For a complete wiring diagram, refer to appropriate **SYSTEM WIRING DIAGRAMS** article .

THEORY OF OPERATION

Electronic Control Units (ECUs) require the following four components to properly communicate on a Controller Area Network (CAN) data bus:

- Power (Battery/Fused B+/Ignition)
- Ground
- Correct CAN bus voltage
- Correct vehicle configuration

CAN BUS FAULTS

TYPES OF CAN BUS FAULTS	
LOSS OF COMMUNICATION	will set by an active receiving/reporting ECU on a CAN Bus network that detects no communication from another ECU on the same CAN Bus network. Insufficient power, ground, bus voltage, or inaccurate vehicle configuration will cause a loss of communication.
IMPLAUSIBLE MESSAGE	will set by an active receiving/reporting ECU, when it determines the data sent from the active transmitting/offending ECU is missing part of the message, or the message is an irrational value over the CAN Bus.
MISSING MESSAGE	will set by an active receiving/reporting ECU, when it determines a data message to be missing partial information when sent from the active transmitting/offending ECU over the CAN Bus network.
BUS OFF	set by an ECU that has experienced approximately 32 transmit errors, this can be caused by ECU internal faults as well as external bus faults like shorts or plugging and unplugging test tools to the diagnostic connector.
PHYSICAL	is only detectable by an ECU that has a transceiver that is able to detect shorts on the bus. If the ECU does not, it generally will set bus off faults due to shorted bus lines.

Several ECUs on this vehicle are connected to and communicate on multiple CANs. For additional information on the communication network(s), Refer to the appropriate service information.

WHEN MONITORED AND SET CONDITIONS

Possible Causes
DEALER INSTALLED EQUIPMENT POWER SUPPLY (FUSED B+/IGNITION) RELATED CIRCUIT(S) SHORTED TO GROUND, OPEN, OR SHORTED GROUND CIRCUIT(S) OPEN/HIGH RESISTANCE CAN BUS CIRCUIT(+/-) OPEN/HIGH RESISTANCE ELECTRONIC CONTROL UNIT (ECU)

If the **COMMUNICATION DIAGNOSTIC PROCEDURE** has not been performed. Refer to **STANDARD PROCEDURE**.

DIAGNOSTIC TEST

1. CHECK THE ECU STATUS ON THE CAN BUS

1. Turn the ignition on.
2. With the scan tool, read the Controller Area Network (CAN) topology on the Vehicle View screen.

NOTE: This vehicle may be equipped with a CAN architecture using multiple CAN buses (i.e. CAN-BH, CAN-C1, CAN-C2, CAN-FD, CAN-IHS etc.) for communication with an ECU.

Is the ECU active on all of the CAN buses connected to the ECU?

Yes

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

No

- Go To [2](#)

2. CHECK THE VEHICLE CONFIGURATION

1. Turn the ignition off.
2. Connect a battery charger to the vehicle battery to maintain proper system voltage during this diagnostic procedure.
3. Leave the scan tool connected and on the Vehicle View screen. The CAN bus will remain active with the scan tool connected and the ignition off.
4. Using Dealer Connect, perform a Single VIN Inquiry.
5. Select the OPTIONS tab.
6. Review the information found under the Dealer Installed Equipment section.

NOTE: This is to review the possibility of an Electronic Control Unit upgrade/addition (i.e. upgrading a Radio from a base to a Premium or the addition of a Rear Seat Video System).

Does this vehicle have any Dealer Installed Equipment?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. CHECK THE DEALER INSTALLED EQUIPMENT

Is the Dealer Installed Equipment related to the ECU that is not active on the bus?

Yes

- Contact Mopar Accessories for further technical and diagnostic support.

No

- Go To [4](#)

4. ISOLATE AND LOAD TEST ALL POWER SUPPLY (FUSED B+/IGNITION) RELATED CIRCUITS TO THE ECU FOR A SHORT TO GROUND, OPEN, OR HIGH RESISTANCE

1. Check the fuse for an open. If the fuse is open, make sure to check for a short to ground prior to replacing the fuse.
2. The ignition must be off when performing a load test on a circuit.
3. Isolate the circuit(s) by disconnecting the Electronic Control Unit (ECU) and all other harness connectors containing the circuit(s) being tested.
4. Connect the positive lead of the load test tool to the positive side of the Battery (A). Refer to the diagram below.
5. Using an approved back probe tool, connect the negative lead of the load test tool to the circuit being tested at the ECU harness connectors (B).
6. Using an approved back probe tool and a fused jumper wire, connect the circuit being tested to the negative side of the Battery or a known good ground at the other ECU/Power Distribution Center

(PDC) harness connector (C and D).

7. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuit.

NOTE: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [**CIRCUIT LOAD TESTING PROCEDURES**](#) .

NOTE: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Why perform a Voltage Drop Test? To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [**CIRCUIT LOAD TESTING PROCEDURES**](#) .

WARNING: To avoid possible serious or fatal injury, DO NOT load test any air bag/restraint system components or circuits using the procedures listed here. Refer to the Service Information for proper air bag/restraint system testing procedures.

CAUTION: Do not load test any circuits with components still connected to the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the circuit(s) for an open or high resistance.
- Perform the appropriate ECU verification test. If a verification test is not available, perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

5. CHECK THE GROUND CIRCUIT(S) TO THE ECU BY LOAD TESTING THE CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. Disconnect the ECU harness connector to isolate the ground circuit(s).
2. Connect the positive lead of the load test tool to the positive side of the Battery.
3. Connect the negative lead of the load test tool to the ground circuit at the ECU harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test

tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to **CIRCUIT LOAD TESTING PROCEDURES** .

NOTE: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

- **1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.**
- **2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.**
- **3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.**

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#).

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [6](#)

No

- Repair the ground circuit(s) for an open or high resistance.
- Perform the appropriate ECU verification test. If a verification test is not available, perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

6. CHECK THE CAN BUS (+) CIRCUIT(S) FOR AN OPEN OR HIGH RESISTANCE

1. Measure the voltage on the CAN Bus (+) circuit(s) at the harness connector(s) of the ECU.

Is the voltage below 2.6 volts?

NOTE:

The CAN communication network wires typically contain 33-50 twists per meter (one twist for every 20 to 30.3 mm, or one twist for every 0.75 to 1.2 inches). It is important to maintain the twisted pair configuration whenever servicing a dual-wire communication network.

The length of the circuit wires are also important in communication systems so both wires need to maintain their same lengths or it can result in communication fault / error.

Due to the twisted pair configuration and length of wiring, an overlay harness is NOT a recommended repair.

Yes

- Repair the CAN Bus (+) circuit(s) for an open or high resistance.
- Perform the appropriate ECU verification test. If a verification test is not available, perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [7](#)

7. CHECK THE CAN BUS (-) CIRCUIT(S) FOR AN OPEN OR HIGH RESISTANCE

1. Measure the voltage on the CAN Bus (-) circuit(s) at the harness connector(s) of the ECU.

Is the voltage below 1.3 volts?

NOTE:

The CAN communication network wires typically contain 33-50 twists per meter (one twist for every 20 to 30.3 mm, or one twist for every 0.75 to 1.2 inches). It is important to maintain the twisted pair configuration whenever servicing a dual-wire communication network.

The length of the circuit wires are also important in communication systems so both wires need to maintain their same lengths or it can result in communication fault / error.

Due to the twisted pair configuration and length of wiring, an overlay harness is NOT a recommended repair.

Yes

- Repair the CAN Bus (-) circuit(s) for an open or high resistance.

- Perform the appropriate ECU verification test. If a verification test is not available, perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [8](#)

8. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect the scan tool at this time.
2. Disconnect all related harness connectors to the ECU.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related ECU harness connectors.
5. Inspect harness connectors, ECU connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all related harness connectors to the ECU. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related ECU harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. Turn the ignition on.
10. With the scan tool, read the Controller Area Network (CAN) topology on the Vehicle View screen.

Is the ECU active on all of the CAN buses connected to the ECU?

NOTE: Choose the one answer that best describes the vehicle condition that exists.

WITHOUT previous history of a related concern.

- The ECU is active on all of the CAN buses connected to the ECU.
- The wiring or poor connection problem has been repaired.
- Perform the appropriate ECU verification test. If a verification test is not available, perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

WITH previous history of a related concern.

- The ECU is active on all of the CAN buses connected to the ECU.. OR.. The ECU is not active on all of the CAN buses connected to the ECU.
- Go To [9](#)

9. CHECK THE CAN BUS COMMUNICATION WITH THE MOPAR SCOPE

NOTE: Some vehicles can have multiple CAN connections within a connector, make sure that you are testing the same CAN for both circuits.

Connect the black pin for each test lead to Chassis ground. Connect the blue lead to CAN (+) and the red lead to CAN (-) for the circuits to be tested.

1. Start the Mopar Scope.
2. Once the Mopar Scope is running, select **Guided Tests** .
3. Select **Communications** .
4. Select **CAN L&H** .
5. Select **CAN bus testing / diagnostics** .
6. Select **Load settings file** .
7. Turn the ignition on.

NOTE: When connected to the vehicle harness correctly, the LEDs on the breakout box will light up to indicate that there is activity on the bus.

8. A waveform should appear.

The image below is of a normal CAN bus waveform using the Mopar Scope. The waveform should reveal that data is being exchanged continuously along the CAN bus and the peak voltages are correct.

DESCRIPTION	MEASUREMENT
CHANNEL A	10 volts
CHANNEL B	10 volts
TIME BASE	50 μ s/div [microseconds / division control]
ZOOM / VIEW	X1 - HORIZONTAL & VERTICAL

9. With the Mopar Scope running, use the wiring diagrams as a guide to trace the circuits and look for any in-line connectors where the fault could occur intermittently by wiggling **ALL related** wire harness and connectors.

Did the Mopar Scope show the CAN bus waveform fault?

NOTE:

The CAN communication network wires typically contain 33-50 twists per meter (one twist for every 20 to 30.3 mm, or one twist for every 0.75 to 1.2 inches). It is important to maintain the twisted pair configuration whenever servicing a dual-wire communication network.

The length of the circuit wires are also important in communication systems so both wires need to maintain their same lengths or it can result in communication fault / error.

Due to the twisted pair configuration and length of wiring, an overlay harness is **NOT** a recommended repair.

Yes

- Repair any conditions that are found.
- Replace the ECU in accordance with the Service information.
- Perform the appropriate ECU verification test. If a verification test is not available, perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

STORED LOST COMMUNICATION DTCS

For a complete wiring diagram, refer to appropriate **SYSTEM WIRING DIAGRAMS** article.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on for greater than five seconds.
- The battery voltage is between 10.0 and 16.0 volts.
- The Body Control Module (BCM) is configured correctly.

SET CONDITION

- CAN Bus messages are not received for greater than two seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS CIRCUITS OPEN OR SHORT
CAN IHS BUS CIRCUITS OPEN OR SHORT
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
POWER OR GROUND FROM THE REPORTING MODULE
MODULE THAT SET THIS DTC
PREVIOUS SERVICE PERFORMED WITHIN THE LAST 100 KEY CYCLES (FUSE/RELAYS REMOVED, WIRING SERVICE, BATTERY DISCONNECT)
LOW BATTERY/JUMP START CONDITION
CHECK FOR RELATED SERVICE BULLETINS

DIAGNOSTIC TEST

1. VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS STORED

NOTE: Stored faults may indicate a customer perceived intermittent condition.

NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

1. Turn the ignition on.
2. With the scan tool, read stored DTCs and record on the repair order.

Is this DTC stored?

Yes

- Go To [2](#)

No

- Go to and perform the appropriate diagnostic procedure.

2. CHECK THE ENVIRONMENTAL DATA

1. With the scan tool, read the loss of communication environmental data.

Does the loss of communication environmental odometer data match up to any of the previous service procedures listed in the possible causes or are there any stored CAN C hardware electrical, battery, ignition voltage, VIN missing/mismatch, or BCM configuration DTCs present with matching environmental data?

Yes

- These DTCs may have been the result of other service procedures performed. Clear the DTCs.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [3](#)

3. VERIFY INTERMITTENT LOST COMMUNICATION DTC - WIRING CONCERNS

1. With the scan tool, read all DTCs.

Is there more than one ECU with stored DTCs "Logged Against" the module and one or more lost communication DTCs stored in the sending module?

Yes

- Verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals. Repair as necessary.

No

- Go To [4](#)

4. VERIFY INTERMITTENT LOST COMMUNICATION DTC - SENDING MODULE

1. With the scan tool, read all DTCs.

Is there more than one ECU with stored DTCs "Logged Against" the module and NO lost communication DTCs stored in the sending module?

Yes

- Check for a Service Bulletin related to this sending module.

No

- Go To [5](#)

5. VERIFY INTERMITTENT LOST COMMUNICATION DTC - REPORTING MODULE

1. With the scan tool, read all DTCs.

Is there ONLY ONE ECU with stored DTCs "Logged Against" the module?

Yes

- Check for a Service Bulletin related to the module that set this DTC.

No

- Go To [6](#)

6. CHECK THE CAN BUS COMMUNICATION WITH THE MOPAR SCOPE

NOTE: Some vehicles can have multiple CAN connections within a connector, make sure that you are testing the same CAN for both circuits.

Connect the black pin for each test lead to Chassis ground. Connect the blue lead to CAN (+) and the red lead to CAN (-) for the circuits to be tested.

1. Start the Mopar Scope.
2. Once the Mopar Scope is running, select **Guided Tests** .
3. Select **Communications** .
4. Select **CAN L&H** .
5. Select **CAN bus testing / diagnostics** .
6. Select **Load settings file** .
7. Turn the ignition on.

NOTE: When connected to the vehicle harness correctly, the LEDs on the breakout box will light up to indicate that there is activity on the bus.

8. A waveform should appear.

The image below is of a normal CAN bus waveform using the Mopar Scope. The waveform should reveal that data is being exchanged continuously along the CAN bus and the peak voltages are correct.

DESCRIPTION	MEASUREMENT
CHANNEL A	10 volts
CHANNEL B	10 volts
TIME BASE	50 μ s/div [microseconds / division control]
ZOOM / VIEW	X1 - HORIZONTAL & VERTICAL

With the Mopar Scope running, use the wiring diagrams as a guide to trace the circuits and look for any in-line connectors where the fault could occur intermittently by wiggling **ALL related** wire harness and connectors.

NOTE: A reporting ECU sets DTCs against a Sending ECU.

Did the Mopar Scope show the CAN bus waveform fault?

NOTE: The CAN communication network wires typically contain 33-50 twists per meter (one twist for every 20 to 30.3 mm, or one twist for every 0.75 to 1.2 inches). It is important to maintain the twisted pair configuration whenever servicing a dual-wire communication network.

The length of the circuit wires are also important in communication systems so both wires need to maintain their same lengths or it can result in communication fault / error.

Due to the twisted pair configuration and length of wiring, an overlay harness is NOT a recommended repair.

Yes

- Check for related Technical Service Bulletins (TSB's).
 - Repair any conditions that are found.
 - For intermittent communication issues, or if multiple communication related DTCs are set in other Electronic Control Modules (ECUs), check the suspected ECU power and ground circuits, including at the body sheet-metal, for loose or poor connections. Performing a load test on these circuits will verify the circuit is capable of carrying the amperage needed to perform properly, along with confirming that excessive resistance does not exist in the circuit(s) being tested. For additional information on CIRCUIT LOAD TESTING PROCEDURES. Refer to [**CIRCUIT LOAD TESTING PROCEDURES**](#) .
 - If there is a history of this DTC setting multiple times, replace the reporting ECU in accordance with the Service Information.
 - Perform the appropriate VERIFICATION TEST. If a VERIFICATION TEST is not available for an ECU, perform the BCM VERIFICATION TEST. Refer to [**STANDARD PROCEDURE**](#) .
 - If there is a history of this DTC setting multiple times, replace the sending ECU in accordance with the Service Information.
 - Perform the appropriate VERIFICATION TEST. If a VERIFICATION TEST is not available for an ECU, perform the BCM VERIFICATION TEST. Refer to [**STANDARD PROCEDURE**](#) .

U0184-00	LOST COMMUNICATION WITH RADIO

DIAGNOSIS AND TESTING

B1499-11 - TV ANTENNA 1-CIRCUIT SHORT TO GROUND

For a complete DIGITAL TV SYSTEM wiring diagram, refer to the appropriate wiring information .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The TV Antenna circuit is shorted to ground.

DEFAULT ACTION

- Degradation of TV signal quality

POSSIBLE CAUSES

Possible Causes
TV ANTENNA CIRCUIT SHORTED TO GROUND
TV ANTENNA SHORTED TO GROUND
DIGITAL TV (DTV) MODULE

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE RELATED TV ANTENNA CONNECTION AT THE DTV MODULE

1. Turn the ignition off.
2. Verify that the related TV Antenna cable and connections are secure and undamaged.

Are the connection(s) secure and undamaged?

Yes

- Go To [3](#)

No

- Repair the connection(s) as needed.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. DISCONNECT THE TV ANTENNA CONNECTOR AT THE DTV MODULE - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. Turn the ignition off.
2. Disconnect the related TV Antenna connector at the DTV Module.

NOTE: The short to ground DTC should not set. An open circuit DTC should set in the DTV with the antenna disconnected.

3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the short to ground DTC return?

Yes

- Replace the DTV module.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Replace the related TV Antenna and the coax cable.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B1499-12 - TV ANTENNA 1-CIRCUIT SHORT TO BATTERY

For a complete DIGITAL TV SYSTEM wiring diagram, refer to the appropriate wiring information .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The TV Antenna circuit is shorted to voltage.

DEFAULT ACTION

- Degradation of TV signal quality

POSSIBLE CAUSES

Possible Causes
TV ANTENNA CIRCUIT SHORTED TO VOLTAGE
TV ANTENNA SHORTED TO VOLTAGE
DIGITAL TV (DTV) MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.

5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. CHECK THE RELATED TV ANTENNA CONNECTION AT THE DTV MODULE

1. Turn the ignition off.
2. Verify that the related TV Antenna cable and connections are secure and undamaged.

Are the connection(s) secure and undamaged?

Yes

- Go To [3](#)

No

- Repair the connection(s) as needed.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. CHECK THE RELATED TV ANTENNA CABLE FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the related TV Antenna connector at the DTV Module.
3. Turn the ignition on.
4. Measure the voltage of the related TV Antenna circuits at the DTV connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate tool to prevent any possible damage to the ECU terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Replace related TV Antenna and the coax cable as necessary.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Replace the DTV module.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B1499-13 - TV ANTENNA 1-CIRCUIT OPEN

For a complete DIGITAL TV SYSTEM wiring diagram, refer to the appropriate wiring information .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The TV Antenna circuit is open.

DEFAULT ACTION

- Degradation of TV signal quality

POSSIBLE CAUSES

Possible Causes
BAD TV ANTENNA CONNECTION TV ANTENNA CIRCUIT OPEN TV ANTENNA OPEN DIGITAL TV (DTV) MODULE

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. CHECK THE RELATED TV ANTENNA CONNECTION AT THE DTV MODULE

1. Turn the ignition off.
2. Verify that the related TV Antenna cable and connections are secure and undamaged.

Are the connection(s) secure and undamaged?

Yes

- Go To [3](#)

No

- Repair the connection(s) as needed.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT AND RECONNECT RELATED TV ANTENNA AT THE DTV MODULE - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. Turn the ignition off.
2. Disconnect and reconnect related TV Antenna connection at the DTV Module.
3. Start the engine and allow it to run for 30 seconds.
4. With the scan tool, read DTV DTCs.

Is the DTC active?

Yes

- Go To [4](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

4. REPLACE RELATED TV ANTENNA AND THE COAX CABLE - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. Turn the ignition off.
2. Replace related TV Antenna and the coax cable.
3. Start the engine and allow to run for 30 seconds.
4. With the scan tool, read DTV DTCs.

Did the DTC return?

Yes

- Replace the DTV Module.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Replacing the related TV Antenna and the coax cable corrected the condition.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B149B-11 - TV ANTENNA 2-CIRCUIT SHORT TO GROUND

For a complete DIGITAL TV SYSTEM wiring diagram, refer to the appropriate wiring information .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The TV Antenna circuit is shorted to ground.

DEFAULT ACTION

- Degradation of TV signal quality

POSSIBLE CAUSES

Possible Causes
TV ANTENNA CIRCUIT SHORTED TO GROUND
TV ANTENNA SHORTED TO GROUND
DIGITAL TV (DTV) MODULE

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.
Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE RELATED TV ANTENNA CONNECTION AT THE DTV MODULE

1. Turn the ignition off.
2. Verify that the related TV Antenna cable and connections are secure and undamaged.

Are the connection(s) secure and undamaged?

Yes

- Go To [3](#)

No

- Repair the connection(s) as needed.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. DISCONNECT THE TV ANTENNA CONNECTOR AT THE DTV MODULE - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. Turn the ignition off.
2. Disconnect the related TV Antenna connector at the DTV Module.

NOTE: **The short to ground DTC should not set. An open circuit DTC should set in the DTV with the antenna disconnected.**

3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the short to ground DTC return?

Yes

- Replace the DTV module.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the related TV Antenna and the coax cable.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B149B-12 - TV ANTENNA 2-CIRCUIT SHORT TO BATTERY

For a complete DIGITAL TV SYSTEM wiring diagram, refer to the appropriate wiring information .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The TV Antenna circuit is shorted to voltage.

DEFAULT ACTION

- Degradation of TV signal quality

POSSIBLE CAUSES

Possible Causes
TV ANTENNA CIRCUIT SHORTED TO VOLTAGE
TV ANTENNA SHORTED TO VOLTAGE
DIGITAL TV (DTV) MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. CHECK THE RELATED TV ANTENNA CONNECTION AT THE DTV MODULE

1. Turn the ignition off.
2. Verify that the related TV Antenna cable and connections are secure and undamaged.

Are the connection(s) secure and undamaged?

Yes

- Go To [3](#)

No

- Repair the connection(s) as needed.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. CHECK THE RELATED TV ANTENNA CABLE FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the related TV Antenna connector at the DTV Module.
3. Turn the ignition on.
4. Measure the voltage of the related TV Antenna circuits at the DTV connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate tool to prevent any possible damage to the ECU terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Replace related TV Antenna and the coax cable as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Replace the DTV module.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B149B-13 - TV ANTENNA 2-CIRCUIT OPEN

For a complete DIGITAL TV SYSTEM wiring diagram, refer to the appropriate wiring information .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The TV Antenna circuit is open.

DEFAULT ACTION

- Degradation of TV signal quality

POSSIBLE CAUSES

Possible Causes
BAD TV ANTENNA CONNECTION TV ANTENNA CIRCUIT OPEN TV ANTENNA OPEN DIGITAL TV (DTV) MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. CHECK THE RELATED TV ANTENNA CONNECTION AT THE DTV MODULE

1. Turn the ignition off.
2. Verify that the related TV Antenna cable and connections are secure and undamaged.

Are the connection(s) secure and undamaged?

Yes

- Go To [3](#)

No

- Repair the connection(s) as needed.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT AND RECONNECT RELATED TV ANTENNA AT THE DTV MODULE - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. Turn the ignition off.
2. Disconnect and reconnect related TV Antenna connection at the DTV Module.
3. Start the engine and allow it to run for 30 seconds.
4. With the scan tool, read DTV DTCs.

Is the DTC active?

Yes

- Go To [4](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

4. REPLACE RELATED TV ANTENNA AND THE COAX CABLE - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. Turn the ignition off.
2. Replace related TV Antenna and the coax cable.
3. Start the engine and allow to run for 30 seconds.
4. With the scan tool, read DTV DTCs.

Did the DTC return?

Yes

- Replace the DTV Module.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Replacing the related TV Antenna and the coax cable corrected the condition.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B1550-4B - DIGITAL TELEVISION MODULE-OVER TEMPERATURE

For a complete DIGITAL TV SYSTEM wiring diagram, refer to the appropriate wiring information .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Digital TV (DTV) Module exceeds its operating temperature.

DEFAULT ACTION

- TV and cameras unavailable, DTV HMI unavailable.

POSSIBLE CAUSES

Possible Causes
DTV TEMPERATURE OVER LIMIT

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ALLOW THE AMBIENT TEMPERATURE TO STABILIZE - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. If the vehicle has been in the hot sunlight or extreme temperatures, move the vehicle indoors and open the doors to allow the inside temperature to stabilize.
2. With the scan tool, erase DTCs.
3. Start the engine and allow the engine to reach normal operating temperature.
4. With the scan tool, read DTV DTCs.

Did the DTC return?

Yes

- Replace the DTV Module.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Moving the vehicle indoors and allowing the inside temperature to stabilize corrected the condition.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B2199-16 - BATTERY VOLTAGE-CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete DIGITAL TV SYSTEM wiring diagram, refer to the appropriate wiring information .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the engine running.

SET CONDITION

- The Digital TV (DTV) Module supply voltage less than 6.5 volts.

DEFAULT ACTION

- TV and cameras unavailable, DTV HMI unavailable

POSSIBLE CAUSES

Possible Causes
BATTERY OR CHARGING SYSTEM VOLTAGE LOW
FUSED B+ CIRCUIT EXCESSIVE RESISTANCE
GROUND CIRCUIT EXCESSIVE RESISTANCE
DIGITAL TV (DTV) MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
3. With the scan tool, erase all DTCS.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCS.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

2. CHECK FOR BATTERY OR CHARGING SYSTEM DTCS IN THE POWERTRAIN CONTROL MODULE (PCM)

1. Refer to the saved DTC information recorded on the repair order.

Were any battery or charging system DTCS present in the PCM?

Yes

- Perform the appropriate diagnostic procedure. Refer to [3.0L DIESEL - DIAGNOSTIC CODE INDEX](#), or [3.6L \(GPEC 2A\) - DIAGNOSTIC CODE INDEX](#).

No

- Go To [3](#)

3. ISOLATE AND LOAD TEST THE (A238) AND (F982) FUSED (B+) CIRCUITS TO CHECK FOR HIGH RESISTANCE

1. The ignition must be off when performing a load test on a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested.
3. Connect the positive lead of the load test tool to the positive side of the Battery (A). Refer to the diagram below.
4. Using an approved back probe tool, connect the negative lead of the load test tool to the circuit being tested at the one of the component harness connectors (B).
5. Using an approved back probe tool and a fused jumper wire, connect the circuit being tested to the negative side of the Battery or a known good ground at the other component harness connector (C and D).
6. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuit.

NOTE: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#).

NOTE: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Why perform a Voltage Drop Test? To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#).

WARNING: To avoid possible serious or fatal injury, **DO NOT** load test any air bag/restraint system components or circuits using the procedures listed here. Refer to the Service Information for proper air bag/restraint system testing procedures.

CAUTION: Do not load test any circuits with components still connected to the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright for each circuit tested?

Yes

- Go To [4](#)

No

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

4. CHECK THE (Z912) GROUND CIRCUIT FOR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the ground circuit.
2. Connect the positive lead of the load test tool to the positive side of the Battery.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [**CIRCUIT LOAD TESTING PROCEDURES**](#) .

NOTE: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [**CIRCUIT LOAD TESTING PROCEDURES**](#) .

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all DTV harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTV harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.

7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTV DTCs.

Did the DTC return?

Yes

- Replace the DTV in accordance with the Service information.
- Perform the BCM VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BCM VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B2199-17 - BATTERY VOLTAGE-CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete DIGITAL TV SYSTEM wiring diagram, refer to the appropriate wiring information .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the engine running.

SET CONDITION

- The Digital TV (DTV) Module supply voltage greater than 16.0 volts.

DEFAULT ACTION

- TV and cameras unavailable, DTV HMI unavailable

POSSIBLE CAUSES

Possible Causes
BATTERY OR CHARGING SYSTEM VOLTAGE HIGH DIGITAL TV (DTV) MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.

6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. CHECK FOR BATTERY OR CHARGING SYSTEM DTCS IN THE POWERTRAIN CONTROL MODULE (PCM)

1. Refer to the saved DTC information recorded on the repair order.

Were any battery or charging system DTCs present in the PCM?

Yes

- Perform the appropriate diagnostic procedure. Refer to [3.0L DIESEL - DIAGNOSTIC CODE INDEX](#) , or [3.6L \(GPEC 2A\) - DIAGNOSTIC CODE INDEX](#) .

No

- Replace the DTV Module.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B21DD-84 - SYSTEM VOLTAGE-SIGNAL BELOW ALLOWABLE RANGE

For a complete DIGITAL TV SYSTEM wiring diagram, refer to the appropriate wiring information .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The voltage value that the Digital TV (DTV) Module received over the CAN bus is less than 6.5 volts.

DEFAULT ACTION

- Audio system not functional

POSSIBLE CAUSES

Possible Causes
BATTERY OR CHARGING SYSTEM VOLTAGE LOW
DIGITAL TV (DTV) MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. CHECK FOR BATTERY OR CHARGING SYSTEM DTCS IN THE POWERTRAIN CONTROL MODULE (PCM)

1. Refer to the saved DTC information recorded on the repair order.

Were any battery or charging system DTCs present in the PCM?

Yes

- Perform the appropriate diagnostic procedure. Refer to [3.0L DIESEL - DIAGNOSTIC CODE INDEX](#) , or [3.6L \(GPEC 2A\) - DIAGNOSTIC CODE INDEX](#) .

No

- Replace the DTV Module.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B21DD-85 - SYSTEM VOLTAGE-SIGNAL ABOVE ALLOWABLE RANGE

For a complete DIGITAL TV SYSTEM wiring diagram, refer to the appropriate wiring information .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The voltage value that the Digital TV (DTV) Module received over the CAN bus is greater than 16.0 volts.

DEFAULT ACTION

- Audio system not functional

POSSIBLE CAUSES

Possible Causes
BATTERY OR CHARGING SYSTEM VOLTAGE HIGH
DIGITAL TV (DTV) MODULE

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK FOR BATTERY OR CHARGING SYSTEM DTCS IN THE POWERTRAIN CONTROL MODULE (PCM)

1. Refer to the saved DTC information recorded on the repair order.

Were any battery or charging system DTCs present in the PCM?

Yes

- Perform the appropriate diagnostic procedure. Refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** , or **3.6L (GPEC 2A) - DIAGNOSTIC CODE INDEX** .

No

- Replace the DTV Module.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B2206-00-CURRENT VIN MISSING / MISMATCH

For a complete DIGITAL TV SYSTEM wiring diagram, refer to the appropriate wiring information .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Vehicle Identification Number (VIN) stored in the Digital TV (DTV) Module does not match the VIN stored in the BCM/ PCM.

DEFAULT ACTION

- None

POSSIBLE CAUSES

Possible Causes
VIN IN DIGITAL TV (DTV) MODULE DOES NOT MATCH VEHICLE VIN

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all DTV harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.

- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTV harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTV DTCs.

Did the DTC return?

Yes

- Replace the DTV Module.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

B222C-00-VEHICLE CONFIGURATION NOT PROGRAMMED

For a complete DIGITAL TV SYSTEM wiring diagram, **refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Body Control Module (BCM) is not configured correctly.

DEFAULT ACTION

- DTV may not operate correctly. Camera display may not be available.

POSSIBLE CAUSES

Possible Causes
BCM NOT CONFIGURED CORRECTLY BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. VERIFY COMMUNICATION WITH BCM

1. With the scan tool, read the active modules on the bus.

Does the scan tool show the BCM as active on the bus?

Yes

- Go To [3](#)

No

- Perform the No Response From BCM diagnostic procedure. Refer to **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** .

3. CHECK BCM FOR ACTIVE DTCS

1. With the scan tool, erase BCM DTCs.
2. Turn the ignition off for a minimum of 10.0 seconds.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs and record on the repair order.

Are any active DTCs present?

Yes

- Perform the appropriate diagnostic procedure. Refer to **STANDARD PROCEDURE** .

No

- Go To [4](#)

4. CHECK THE VEHICLE CONFIGURATION INFORMATION WITH SCAN TOOL

1. With the scan tool run an ECU Details Report, read the Original and Current VINs, and the Body Style of the vehicle.

Does the information displayed match the vehicle?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

5. PERFORM THE RESTORE VEHICLE CONFIGURATION ROUTINE

1. With the scan tool, perform the Restore Vehicle Configuration routine.
2. Turn the ignition off for a minimum of 10.0 seconds.
3. Turn the ignition on.
4. With the scan tool, read DTCs.

Does the scan tool display B222C-00-VEHICLE CONFIGURATION NOT PROGRAMMED as active?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- The condition or conditions that originally set this DTC are not present at this time. Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** . If no problems are found, test complete.

B22A9-00 - ECU INTERNAL PERFORMANCE

For a complete DIGITAL TV SYSTEM wiring diagram, **refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Digital TV (DTV) Module detects an internal failure.

DEFAULT ACTION

- TV and cameras unavailable.
- DTV HMI unavailable.
- CAN not available.

POSSIBLE CAUSES

Possible Causes

DIGITAL TV (DTV) MODULE

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all DTV harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTV harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.

6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTV DTCs.

Did the DTC return?

Yes

- Replace the DTV Module.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

B23C4-12 - SIDE CAMERA-CIRCUIT SHORT TO BATTERY

For a complete DIGITAL TV SYSTEM wiring diagram, refer to the appropriate wiring information .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Side View Camera circuit is shorted to voltage.

DEFAULT ACTION

- The Side View Camera is unavailable.

POSSIBLE CAUSES

Possible Causes
SIDE VIEW CAMERA CIRCUIT SHORTED TO VOLTAGE SIDE VIEW CAMERA DIGITAL TV (DTV) MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [**PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.

3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. CHECK THE SIDE VIEW CAMERA CONNECTIONS

1. Turn the ignition off.
2. Verify that the Side View Camera connections are secure and undamaged.

Are the connection(s) secure and undamaged?

Yes

- Go To [3](#)

No

- Repair the connection(s) as needed.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE SIDE VIEW CAMERA CONNECTOR - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. Turn the ignition off.
2. Disconnect the Side View Camera harness connectors.

NOTE: **The short to voltage DTC should not set. A short to ground DTC should set in the DTV with the cameras disconnected.**

3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the short to voltage DTC return?

Yes

- Replace the Side View Cameras.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. CHECK THE SIDE VIEW CAMERA CIRCUITS FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the DTV Module harness connector.
3. Turn the ignition on.
4. Measure the voltage between ground and the Side View Camera circuits at the DTV Module harness connector.

Is there any voltage present?

Yes

- Repair the Side View Camera circuit(s) for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [5](#)

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all DTV harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTV harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTV DTCs.

Did the DTC return?

Yes

- Replace the DTV Module.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Repairing the wiring or connectors corrected the condition.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B23C4-14 - SIDE CAMERA-CIRCUIT SHORT TO GROUND OR OPEN

For a complete DIGITAL TV SYSTEM wiring diagram, refer to the appropriate wiring information .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Side View Camera circuit is shorted to ground or open.

DEFAULT ACTION

- The Side View Camera is unavailable.

POSSIBLE CAUSES

Possible Causes
SIDE VIEW CAMERA DISCONNECTED
SIDE VIEW CAMERA CIRCUIT OPEN
SIDE VIEW CAMERA CIRCUIT SHORTED TO GROUND
SIDE VIEW CAMERA
DIGITAL TV (DTV) MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE SIDE VIEW CAMERA CONNECTIONS

NOTE: **A disconnected Side Camera will set this DTC.**

1. Turn the ignition off.
2. Verify that the Side View Camera connections are secure and undamaged.

Are the connection(s) secure and undamaged?

Yes

- Go To [3](#)

No

- Repair the connection(s) as needed.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. CHECK THE SIDE VIEW CAMERA CIRCUITS FOR A SHORT TO GROUND

1. Turn the ignition off.
2. Disconnect the DTV Module harness connector.
3. Disconnect both Side View Camera harness connectors.
4. Check for continuity between ground and the Side View Camera circuits at the DTV harness connector.

Is there continuity between ground and the Side View Camera circuits?

Yes

- Repair the camera circuit(s) for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. CHECK THE SIDE VIEW CAMERA CIRCUITS FOR AN OPEN OR HIGH RESISTANCE

1. Measure the resistance of the Side View Camera circuits between the DTV Module harness connector and the Side View Camera harness connectors.

Is the resistance below 3.0 Ohms?

Yes

- Go To [5](#)

No

- Repair the Side View Camera circuit(s) for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. REPLACE THE SIDE VIEW CAMERAS - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. Replace the Side Cameras.
2. Reconnect all harness connectors.
3. With the scan tool, erase DTCs.
4. Turn the ignition on.
5. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [6](#)

No

- Replacing the Side View Cameras corrected the condition.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all DTV harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTV harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTV DTCs.

Did the DTC return?

Yes

- Replace the DTV Module.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Repairing the wiring or connectors corrected the condition.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B23C5-12 - FRONT CAMERA-CIRCUIT SHORT TO BATTERY

For a complete DIGITAL TV SYSTEM wiring diagram, refer to the appropriate wiring information .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Front Camera circuit is shorted to voltage.

DEFAULT ACTION

- The Front Camera is unavailable

POSSIBLE CAUSES

Possible Causes
FRONT CAMERA CIRCUIT SHORTED TO VOLTAGE FRONT CAMERA DIGITAL TV (DTV) MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
3. With the scan tool, erase all DTCS.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCS.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE FRONT CAMERA CONNECTIONS

1. Turn the ignition off.
2. Verify that the Front Camera connections are secure and undamaged.

Are the connection(s) secure and undamaged?

Yes

- Go To [3](#)

No

- Repair the connection(s) as needed.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. DISCONNECT THE FRONT CAMERA CONNECTOR - ERASE DTCs AND CHECK FOR DTC TO RETURN

1. Turn the ignition off.
2. Disconnect the Front Camera harness connector.

NOTE: **The short to voltage DTC should not set. A short to ground DTC should set in the DTV with the cameras disconnected.**

3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the short to voltage DTC return?

Yes

- Replace the Front Camera.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. CHECK THE FRONT CAMERA CIRCUITS FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the DTV Module harness connector.
3. Turn the ignition on.
4. Measure the voltage between ground and the Front Camera circuits at the DTV Module harness connector.

Is there any voltage present?

Yes

- Repair the Front Camera circuit(s) for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all DTV harness connector.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connector.
4. Inspect harness connector, component connector, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTV harness connector. Be certain that all harness connector are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connector (if equipped). Be certain that all connector are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connector. Be certain that all connector are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTV DTCs.

Did the DTC return?

Yes

- Replace the DTV Module.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Repairing the wiring or connector corrected the condition.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B23C5-14 - FRONT CAMERA-CIRCUIT SHORT TO GROUND OR OPEN

For a complete DIGITAL TV SYSTEM wiring diagram, refer to the appropriate wiring information .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Front Camera circuit is shorted to ground or open.

DEFAULT ACTION

- The Front Camera is unavailable

POSSIBLE CAUSES

Possible Causes
FRONT CAMERA DISCONNECTED
FRONT CAMERA CIRCUIT OPEN
FRONT CAMERA CIRCUIT SHORTED TO GROUND
FRONT CAMERA
DIGITAL TV (DTV) MODULE

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE FRONT CAMERA CONNECTION

NOTE: A disconnected Front Camera will set this DTC.

1. Turn the ignition off.
2. Verify that the Front Camera connection is secure and undamaged.

Is the connection secure and undamaged?

Yes

- Go To [3](#)

No

- Repair the connection(s) as needed.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. CHECK THE FRONT CAMERA CIRCUIT FOR A SHORT TO GROUND

1. Turn the ignition off.
2. Disconnect the DTV Module harness connector.
3. Disconnect the Front Camera harness connector.
4. Check for continuity between ground and the Front Camera circuit at the DTV harness connector.

Is there continuity between ground and the Front Camera circuit?

Yes

- Repair the camera circuit(s) for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. CHECK THE FRONT CAMERA CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. Measure the resistance of the Front Camera circuit between the DTV Module harness connector and the Front Camera harness connector.

Is the resistance below 3.0 Ohms?

Yes

- Go To [5](#)

No

- Repair the Front Camera circuit(s) for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. REPLACE THE FRONT CAMERA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. Replace the Front Camera.
2. Reconnect all harness connectors.
3. With the scan tool, erase DTCs.
4. Turn the ignition on.
5. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [6](#)

No

- Replacing the Front Camera corrected the condition.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all DTV harness connector.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connector.
4. Inspect harness connector, component connector, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTV harness connector. Be certain that all harness connector are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connector (if equipped). Be certain that all connector are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connector. Be certain that all connector are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTV DTCs.

Did the DTC return?

Yes

- Replace the DTV Module.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Repairing the wiring or connector corrected the condition.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

U0010-00-CAN INTERIOR BUS

NOTE: The DTC number or title listed above may not appear in the Body Control Module (BCM) diagnostic procedures. If this occurs, perform the CAN Interior Bus diagnostic procedure in the BCM that is comparable to the above DTC title (examples: CAN INTERIOR BUS, CAN INTERIOR BUS OFF, CAN INTERIOR BUS PERFORMANCE or CAN INTERIOR BUS OFF PERFORMANCE).

Perform the comparable CAN IHS Bus diagnostic tests in the BCM. Refer to [**BODY CONTROL MODULE \(BCM\) - DIAGNOSTIC CODE INDEX**](#) .

U0011-00-CAN INTERIOR BUS OFF PERFORMANCE

NOTE: The DTC number or title listed above may not appear in the Body Control Module (BCM) diagnostic procedures. If this occurs, perform the CAN Interior Bus diagnostic procedure in the BCM that is comparable to the above DTC title (examples: CAN INTERIOR BUS, CAN INTERIOR BUS OFF, CAN INTERIOR BUS PERFORMANCE or CAN INTERIOR BUS OFF PERFORMANCE).

Perform the comparable U-Code diagnostic procedure(s) for the CAN IHS Bus in the BCM. Refer to **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** .

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

The COMMUNICATION DIAGNOSTIC PROCEDURE **MUST** be performed before replacing any component(s) or module(s). Perform the COMMUNICATION DIAGNOSTIC PROCEDURE. Refer to **COMMUNICATION DIAGNOSTIC PROCEDURE** .

U0184-00-LOST COMMUNICATION WITH RADIO

The COMMUNICATION DIAGNOSTIC PROCEDURE **MUST** be performed before replacing any component(s) or module(s). Perform the COMMUNICATION DIAGNOSTIC PROCEDURE. Refer to **COMMUNICATION DIAGNOSTIC PROCEDURE** .

2021 GENERAL INFORMATION

(Driver Presence Detection Module (DPDM) - Electrical Diagnostics) - Gladiator [DP]

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
B1B9D-00	BLADDER FLUID LEVEL LOW
B1BA8-00	SYSTEM OUT OF CALIBRATION/NOT CALIBRATED
B2206-00	CURRENT VIN MISSING-MISMATCH
B222A-00	VEHICLE LINE MISMATCH
B22A9-00	ECU INTERNAL PERFORMANCE
B23D4-00	ECU CALIBRATION RANGE PERFORMANCE
U0002-00	CAN C BUS OFF PERFORMANCE
U0140-00	LOST COMMUNICATION WITH THE BODY CONTROL MODULE

DIAGNOSIS AND TESTING

B1B9D-00-BLADDER FLUID LEVEL LOW

For a complete RESTRAINT SYSTEMS wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Driver Presence Detection Module (DPDM) monitors the bladder fluid pressure. The DPDM uses pressure data to determine the status (occupied or empty) of the driver's seat and verify the operational status of the bladder. The bladder fluid pressure and temperature are analog measurements and converted to digital counts.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.

SET CONDITION

- This DTC will set if the Driver Presence Detection Module (DPDM) detects raw pressure less than 30 counts for more than 60 seconds with the temperature above 0B° C (32B° F).

DEFAULT ACTION

- This DTC will set SNA status for Driver Presence Signal.

POSSIBLE CAUSES

Possible Causes
DRIVER PRESENCE DETECTION MODULE (DPDM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

REPLACE THE DRIVER PRESENCE DETECTION MODULE (DPDM)

1. Make sure the battery is fully charged.

2. Perform the DRIVER PRESENCE DETECTION MODULE (DPDM) VERIFICATION TEST. Refer to **DRIVER PRESENCE DETECTION MODULE (DPDM) VERIFICATION TEST**.
3. With the scan tool, read Driver Presence Detection Module (DPDM) DTCs.

Does the scan tool display this DTC as active?

Yes

- Replace the Driver Presence Detection Module (DPDM) in accordance with Service Information. Refer to **MODULE, DRIVER PRESENCE DETECTION (DPDM), REMOVAL AND INSTALLATION** .
- Perform the DRIVER PRESENCE DETECTION MODULE (DPDM) VERIFICATION TEST. Refer to **DRIVER PRESENCE DETECTION MODULE (DPDM) VERIFICATION TEST**.

No

- Test complete.
- Perform the DRIVER PRESENCE DETECTION MODULE (DPDM) VERIFICATION TEST. Refer to **DRIVER PRESENCE DETECTION MODULE (DPDM) VERIFICATION TEST**.

B1BA8-00-SYSTEM OUT OF CALIBRATION/NOT CALIBRATED

THEORY OF OPERATION

The Driver Presence Detection Module (DPDM), seat cushion, bladder, vent and heater mat are calibrated as one unit in the assembly plant. If this DTC is active, the seat assembly plant did not calibrate the DPDM or the seat assembly plant did not calibrate the Service DPDM/Foam kit or the Re-zero process failed. Go to the DPDM Re-zero procedure portion for instructions.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.

SET CONDITION

- This DTC will set if the DPDM has not been calibrated as a pair with the foam at the seat assembly plant.

DEFAULT ACTION

- This DTC will set SNA status for Driver Presence Signal.

POSSIBLE CAUSES

Possible Causes
DRIVER PRESENCE DETECTION MODULE (DPDM) NOT CALIBRATED

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

VERIFY ACTIVE DTC

NOTE: Make sure the battery is fully charged.

NOTE: Follow the ignition off warning, due to any special tools or body harness connectors that may need to be reconnected reintroducing voltage to a wire

harness and component area.

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery.
2. Make sure the passenger seat is empty and in the upright position. Make sure the temperature of the seat is lower than 90 degrees F and higher than 35 degrees F.
3. The following DTCs will cause the procedure to fail: B1B9D-00 and/or B2212-00. Follow the instructions for repairing these DTCs before attempting the Empty Seat Relearn procedure.

NOTE: Failure to follow the test instructions or aborting the test causes faults to set when performing the Scan tool Driver Presence Detection Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed, verify that the ignition is in run position. Only press scan tool buttons when directed to do so and perform the scan tool Driver Presence Detection Verification Test to completion.

4. With the scan tool in DPDM, select the Miscellaneous Functions tab on the scan tool, select Empty Seat Value Relearn. Run the test by following the instructions displayed on the scan tool. When the test completes, wait two minutes and then proceed as follows.
5. With the scan tool, read active DTCs.

Does the scan tool display DTC: B1BA8-00-OCM SYSTEM OUT OF CALIBRATION/NOT CALIBRATED as active?

Yes

- Replace the Driver Presence Detection Module in accordance with Service Information. Refer to **MODULE, DRIVER PRESENCE DETECTION (DPDM), REMOVAL AND INSTALLATION**.
- Perform the DRIVER PRESENCE DETECTION MODULE (DPDM) VERIFICATION TEST. Refer to **DRIVER PRESENCE DETECTION MODULE (DPDM) VERIFICATION TEST**.

No

- Test complete.
- Perform the DRIVER PRESENCE DETECTION MODULE (DPDM) VERIFICATION TEST. Refer to **DRIVER PRESENCE DETECTION MODULE (DPDM) VERIFICATION TEST**.

B2206-00-CURRENT VIN MISSING-MISMATCH

THEORY OF OPERATION

During initialization, the Driver Presence Detection Module (DPDM) determines if it has received and agrees with the VIN message which is broadcast on the Bus.

WHEN MONITORED

- Ignition on.

SET CONDITION

- This DTC will set if the DPDM does not receive the VIN information which is broadcast on the Bus or if VIN is different than that stored in DPDM.

POSSIBLE CAUSES

Possible Causes
BCM DTCS OR COMMUNICATION DTCS DRIVER PRESENCE DETECTION MODULE (DPDM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#).

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)

NOTE: Diagnose and repair any BCM VIN or Communication DTCs before continuing with this procedure.

1. Turn the ignition on.
2. With the scan tool, read Driver Presence Detection Module (DPDM) DTCs.

Does the scan tool display this DTC as active?

Yes

- Verify the correct vehicle configuration is programmed in the BCM.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Use the scan tool to read DTCs in all other modules and verify the Driver Presence Detection Module (DPDM) part number is correct. If any communication DTCs are present, perform the appropriate diagnostic procedure. Perform any Technical Service Bulletins that apply. If no problems are found, replace the Driver Presence Detection Module (DPDM) in accordance with Service Information. Refer to [MODULE, DRIVER PRESENCE DETECTION \(DPDM\), REMOVAL AND INSTALLATION](#).
- Perform the DRIVER PRESENCE DETECTION MODULE (DPDM) VERIFICATION TEST. Refer to [DRIVER PRESENCE DETECTION MODULE \(DPDM\) VERIFICATION TEST](#).

B222A-00-VEHICLE LINE MISMATCH

THEORY OF OPERATION

During initialization the Driver Presence Detection Module (DPDM) verifies that the vehicle configuration stored matches the data in the Body Control Module (BCM).

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- With the ignition on.

SET CONDITION

- This DTC sets when the DPDM configuration does not match the vehicle configuration.

DEFAULT ACTION

- This DTC will set fault flag and status to SNA/Undetermined.

POSSIBLE CAUSES

Possible Causes
INCORRECT VIN PROGRAMMED INTO THE BCM
DRIVER PRESENCE DETECTION MODULE (DPDM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#).

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)

NOTE: Diagnose and repair any BCM VIN or Communication DTCs before continuing with this procedure.

1. Turn the ignition on.
2. With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Verify the correct vehicle configuration is programmed in the BCM.
- Perform the BODY VERIFICATION TEST. Refer to [BODY CONTROL MODULE \(BCM\)- DIAGNOSTIC CODE INDEX](#).

No

- Use the scan tool to read DTCs in all other modules and verify the Driver Presence Detection Module (DPDM) part number is correct. If any communication DTCs are present, perform the appropriate diagnostic procedure. Perform any Technical Service Bulletins that apply. If no problems are found, replace the Driver Presence Detection Module (DPDM) in accordance with Service Information. Refer to [MODULE, DRIVER PRESENCE DETECTION \(DPDM\), REMOVAL AND INSTALLATION](#).
- Perform the DRIVER PRESENCE DETECTION MODULE (DPDM) VERIFICATION TEST. Refer to [DRIVER PRESENCE DETECTION MODULE \(DPDM\) VERIFICATION TEST](#).

B22A9-00-ECU INTERNAL PERFORMANCE

THEORY OF OPERATION

The DPDM performs self-diagnostics on a continuous basis and will set a DTC when an internal faults are detected.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- With the ignition on.

SET CONDITION

- This DTC sets when a fault is detected internal to DPDM hardware and/or software. Once set, this DTC is latched for the entire power cycle. If the same failure is detected in two consecutive power cycles, this DTC is latched active indefinitely.

DEFAULT ACTION

- This DTC will set fault flag and status to SNA/Undetermined.

POSSIBLE CAUSES

Possible Causes
DRIVER PRESENCE DETECTION MODULE (DPDM))

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

REPLACE DRIVER PRESENCE DETECTION MODULE (DPDM)

1. Turn the ignition on.
2. With the scan tool, erase and read Driver Presence Detection Module (DPDM) DTCs.

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

When this code is set, view Repair, below.

Repair

- Replace the Driver Presence Detection Module (DPDM) in accordance with Service Information. Refer to **MODULE, DRIVER PRESENCE DETECTION (DPDM), REMOVAL AND INSTALLATION** .
- Perform the DRIVER PRESENCE DETECTION MODULE (DPDM) VERIFICATION TEST. Refer to **DRIVER PRESENCE DETECTION MODULE (DPDM) VERIFICATION TEST**.

B23D4-00-ECU CALIBRATION RANGE PERFORMANCE

THEORY OF OPERATION

The Driver Presence Detection Module (DPDM), seat cushion, bladder, vent and heater mat are calibrated as one unit in the assembly plant. The DPDM will automatically re-calibrate the assembly from time to time to retain the calibrated relationship between the seat, bladder and module as the seat and bladder change due to age and wear. The re-zero Driver Presence Detection Module Test uses a scan tool process called the Driver Presence Detection System Verification Test to force the DPDM to re-calibrate or re-zero. To ensure up to date calibration and functional performance the scan tool Driver Presence Detection System Verification Test is performed during and after servicing the system.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- During the execution of the re-zero process and remains until a successful re-zero process is completed

SET CONDITION

- This DTC will set if the DPDM or the scan tool initiated re-zero failed, the system verification routine was aborted or a update option table from the flash routine was incomplete or missing.

DEFAULT ACTION

- This DTC will set fault flag and status to SNA/Undetermined.

POSSIBLE CAUSES

Possible Causes
SEAT NOT CALIBRATED
OTHER ACTIVE (DPDM) DTCs
DRIVER PRESENCE DETECTION MODULE (DPDM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

VERIFY ACTIVE DTC

NOTE: Make sure the battery is fully charged.

NOTE: Follow the ignition off warning, due to any special tools or body harness connectors that may need to be reconnected reintroducing voltage to a wire harness and component area.

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery.
2. Make sure the driver's seat is not occupied.
3. If equipped with the keyless ignition, use this ignition on warning.

NOTE: Failure to follow the test instructions or aborting the test causes faults to set when performing the Scan tool Driver Presence Detection System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed, verify that the ignition is in run position. Only press scan tool buttons when directed to do so and perform the scan tool DPDM System Verification Test to completion.

4. With the scan tool in Driver Presence Detection Module (DPDM), select the Miscellaneous Functions tab on the scan tool, select Empty Seat Value Relearn. Run the test by following the instructions displayed on the scan tool. When the test completes, wait two minutes and then proceed as follows.
5. With the scan tool, read active DTCs.

NOTE: Active DTCs will cause the relearn procedure to fail.

Does the scan tool display DTC: B23D4-00-ECU CALIBRATION RANGE PERFORMANCE as active?

Yes

- Recheck connections and perform Calibration Out of Range procedure again. If the Calibration Out of Range procedure fails three consecutive times, replace the Driver Presence Detection Module (DPDM) in accordance with Service Information. Refer to **MODULE, DRIVER PRESENCE DETECTION (DPDM), REMOVAL AND INSTALLATION** .
- Perform the DRIVER PRESENCE DETECTION MODULE (DPDM) VERIFICATION TEST. Refer to **DRIVER PRESENCE DETECTION MODULE (DPDM) VERIFICATION TEST**.

No

- Test complete.
- Perform the DRIVER PRESENCE DETECTION MODULE (DPDM) VERIFICATION TEST. Refer to **DRIVER PRESENCE DETECTION MODULE (DPDM) VERIFICATION TEST**.

U0002-00-CAN C BUS OFF PERFORMANCE

NOTE: This DTC may not be listed in the Body Control Module (BCM) diagnostic procedures. If this DTC is not found in the BCM diagnostic procedures, perform the comparable CAN C Bus diagnostic test, such as CAN C BUS-NO SIGNAL, CAN C BUS OFF PERFORMANCE or CAN C SIGNAL MISSING.

Perform the comparable CAN C Bus diagnostic tests in the BCM. Refer to **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** .

U0140-00-LOST COMMUNICATION WITH THE BODY CONTROL MODULE

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- With the ignition on for at least five seconds.
- Battery voltage between 10 and 16 volts.

SET CONDITION

- Bus messages not received from the Body Control Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CONTROLLER AREA NETWORK (CAN) C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE (BCM) NOT CONFIGURED CORRECTLY
BCM POWER AND GROUND
BCM
MODULE THAT SET THIS DTC

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding.

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

NOTE: For vehicle communication issues, use the scan tool Module Topology, which depicts a high level view of the vehicle networks. Modules without network communication will appear in red.

1. Turn the ignition on.
2. With a scan tool, read DTCs and record on the repair order.
3. Record the Environmental Data.
4. With a scan tool, read DTCs.

Is the DTC active?

Yes

- Perform the NO RESPONSE FROM ECU procedure for the Body Control Module (BCM). Refer to **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX**.

No

- Perform the STORED LOST COMMUNICATION DTCs procedure. Refer to the appropriate information.

STANDARD PROCEDURE

EMPTY SEAT RELEARN PROCEDURE

For a complete wiring diagram, refer to appropriate SYSTEM WIRING DIAGRAMS article .

DPDM RELEARN PROCEDURE

EMPTY SEAT RELEARN

NOTE: Make sure the battery is fully charged.

NOTE: Follow the ignition off warning, due to any special tools or body harness connectors that may need to be reconnected reintroducing voltage to a wire harness and component area.

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery.
2. Make sure the passenger seat is empty and in the upright position. Make sure the temperature of the seat is lower than 32B° C (90B° F) and higher than 2B° C (35B° F).
3. Active DTCs B1B9D-00 and B2212-00 must be repaired before performing Empty Seat Value Relearn procedure.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Failure to follow the test instructions or aborting the test causes faults to set when performing the scan tool Driver Presence Detection Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed, verify that the ignition is in run position. Only press scan tool buttons when directed to do so and perform the scan tool Driver Presence Detection Module System Verification Test to completion.

4. Turn the ignition on.
5. With the scan tool in DPDM, select the Miscellaneous Functions tab on the Scan Tool, select Empty Seat Value Relearn. Run the test by following the instructions displayed on the scan tool. When the test completes, wait two minutes and then proceed.
6. With the scan tool, read active DTCs.

Does the scan tool display any DPDM active DTCs?

Yes

- Perform the appropriate diagnostic procedures. Refer to [DIAGNOSIS AND TESTING](#).

No

- The DPDM Re-zero procedure is complete.
- Perform the DRIVER PRESENCE DETECTION MODULE VERIFICATION TEST. Refer to [DRIVER PRESENCE DETECTION MODULE \(DPDM\) VERIFICATION TEST](#).

DRIVER PRESENCE DETECTION MODULE (DPDM) VERIFICATION TEST

DIAGNOSTIC VERIFICATION TEST

DIAGNOSTIC VERIFICATION TEST

NOTE: Follow the ignition off warning, due to any special tools or body harness connectors that may need to be reconnected reintroducing voltage to a wire harness and component area.

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. VERIFICATION TEST

2. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery.
3. Turn the ignition on.
4. Connect the scan tool to the Data Link Connector - use the most current software available.
5. With the scan tool erase stored DTCs in the Restraint System or whichever subsystem DTCs set.
6. Turn the ignition off, and wait 15 seconds, then turn the ignition on.
7. Wait one minute, using the scan tool read active subsystem DTCs and if there are none present read the stored codes.
8. If the scan tool shows any active or stored codes, follow path specified for that trouble code. If no active or stored codes are present, the repair is complete.

Are any DTCs present or is the original condition still present?

Yes

- Repair is not complete. Perform the appropriate diagnostic procedure for any DTCs that are set. Refer to [DIAGNOSIS AND TESTING](#).

No

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

If equipped with the keyless ignition, use this ignition on warning.

- Perform the DRIVER PRESENCE DETECTION MODULE VERIFICATION TEST. Refer to [DRIVER PRESENCE DETECTION MODULE \(DPDM\) VERIFICATION TEST](#).
-

DIAGNOSIS AND TESTING

B1EAD-2A-LANE DEPARTURE WARNING SWITCH-STUCK

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to **MODULE, DRIVERS ASSISTANCE SYSTEM (DASM), DESCRIPTION AND OPERATION** .

WHEN MONITORED

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- Module is not in Plant-Mode.
- Electronic Stability Program (ESP) is not in diagnostic mode.
- ACC, FCW or LDW system(s) are enabled.

SET CONDITION

- The Lane Departure Warning Switch has been activated for more than 60 seconds.

DEFAULT ACTION

- ACC, FCW and LDW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
LANE DEPARTURE WARNING SWITCH
DRIVER ASSISTANCE SYSTEM MODULE (DASM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK FOR ACTIVE DTCS AFTER REPLACING THE LANE DEPARTURE WARNING SWITCH

1. Turn the ignition off.
2. Replace the Lane Departure Warning Switch in accordance with the Service Information.
3. Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to **DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST**.
4. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Test complete.

3. CHECK RELATED HARNESS CONNECTIONS - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. Turn the ignition off.
2. Disconnect all DASM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all DASM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase DTCs.
10. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
11. With the scan tool, read DASM DTCs.

Did the DTC return?

Yes

- Replace the Driver Assistance System Module (DASM) in accordance with the Service Information. Refer to **MODULE, DRIVERS ASSISTANCE SYSTEM (DASM), REMOVAL AND INSTALLATION**.
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to **DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST**.

No

- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to **DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST**.
- Test complete.

C0063-9A-YAW RATE SENSOR-COMPONENT OR SYSTEM OPERATING CONDITIONS

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to MODULE, DRIVERS ASSISTANCE SYSTEM (DASM), DESCRIPTION AND OPERATION .

WHEN MONITORED

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- DASM is not in Plant-Mode.
- Electronic Stability Program (ESP) is not in diagnostic mode.
- ACC, FCW or LDW system(s) are enabled.

SET CONDITION

- The yaw rate offset value received over the CAN Bus from the Antilock Brake System (ABS) Module is beyond an allowable threshold of 4 degrees per second for 100 ms.

DEFAULT ACTION

- ACC, FCW and LDW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
ABS MODULE DTCS PRESENT
ABS MODULE NOT INITIALIZED/PROGRAMED

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.

4. Turn the ignition off for a minimum of 10 seconds.
5. Start the engine.
6. Park the vehicle on a level surface and allow to idle for a minimum of 10 seconds.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Repair the ABS DTCs. Refer to [ANTILOCK BRAKE SYSTEM \(ABS\) - DIAGNOSTIC CODE INDEX](#).

NOTE: It may be necessary to perform the ABS Initialization routine with the scan tool to reset the vehicle configuration.

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

C008E-00-ECU INTERNAL PERFORMANCE

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to [MODULE, DRIVERS ASSISTANCE SYSTEM \(DASM\), DESCRIPTION AND OPERATION](#).

WHEN MONITORED

- Ignition on.
- System voltage between 10.0 and 16.0 volts.
- ACC, FCW or LDW system(s) are enabled.

SET CONDITION

- The module detects an internal failure or hardware performance error.

DEFAULT ACTION

- ACC, FCW and LDW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
DRIVER ASSISTANCE SYSTEM MODULE (DASM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Turn the ignition on.
6. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Replace the Driver Assistance System Module (DASM) in accordance with the Service Information. Refer to **MODULE, DRIVERS ASSISTANCE SYSTEM (DASM), REMOVAL AND INSTALLATION** .
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to **DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST**.

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

C008F-00-CALIBRATION NOT LEARNED

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to **MODULE, DRIVERS ASSISTANCE SYSTEM (DASM), DESCRIPTION AND OPERATION** .

WHEN MONITORED

- During module start up.
- ACC, FCW or LDW system(s) are enabled.

SET CONDITION

- The module has either not gone through the alignment process or has not completed the alignment process successfully.

DEFAULT ACTION

- ACC and FCW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
DASM CALIBRATION NOT COMPLETED SUCCESSFULLY DRIVER ASSISTANCE SYSTEM MODULE (DASM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. PERFORM THE DRIVER ASSISTANCE SYSTEM MODULE (DASM) - CALIBRATION PROCEDURE

NOTE: A secure and unmodified mounting location is critical to the proper operation of the DASM.

NOTE: Vehicles that have had the suspension modified and/or an aftermarket grill installed that blocks the DASM can cause the DASM to not function properly.

1. Verify that the DASM is correctly installed and aligned in accordance with the service information.
2. With the scan tool, perform the Driver Assistance System Module (DASM) - Calibration Procedure.
3. Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to **DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST**.

Does this DTC reset after performing the verification test?

Yes

- Go To [2](#)

No

- Performing the calibration routine corrected the condition.

2. CHECK RELATED HARNESS CONNECTIONS - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. Turn the ignition off.
2. Disconnect all DASM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:

- Proper connector installation.
- Damaged connector locks.
- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all DASM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase DTCs.
10. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
11. With the scan tool, read DASM DTCs.

Did the DTC return?

Yes

- Replace the Driver Assistance System Module (DASM) in accordance with the Service Information. Refer to **MODULE, DRIVERS ASSISTANCE SYSTEM (DASM), REMOVAL AND INSTALLATION** .
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to **DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST**.

No

- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to **DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST**.
- Test complete.

C1240-00-STEERING ANGLE SENSOR ANGLE OVERTRAVEL PERFORMANCE

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)

- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to **MODULE, DRIVERS ASSISTANCE SYSTEM (DASM), DESCRIPTION AND OPERATION** .

WHEN MONITORED

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- DASM is not in Plant-Mode.
- Electronic Stability Program (ESP) is not in diagnostic mode.
- ACC, FCW or LDW system(s) are enabled.

SET CONDITION

- The steering angle offset value received over the Can Bus from the Steering Column Control Module (SCCM) is beyond an allowable threshold of 12 degrees for 100 ms.

DEFAULT ACTION

- ACC, FCW and LDW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
STEERING COLUMN CONTROL MODULE (SCCM) DTCS PRESENT

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN AFTER TEST DRIVING THE VEHICLE AND ALLOWING IT TO IDLE FOR 10 SECONDS

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Test drive the vehicle.
6. Park the vehicle on a level surface and allow it to sit for at least 10.0 seconds.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Repair the SCCM DTCs. Refer to **DIAGNOSIS AND TESTING** .

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

C127A-00-ESP DID NOT RESPOND TO DECELERATION REQUEST

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to [MODULE, DRIVERS ASSISTANCE SYSTEM \(DASM\), DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- DASM is not in Plant-Mode.
- Electronic Stability Program (ESP) is not in diagnostic mode.
- ACC, FCW or LDW system(s) are enabled.

SET CONDITION

- The ESP/ESC does not react to a deceleration request from the ACC module within 760 ms.

DEFAULT ACTION

- ACC system is disabled.

POSSIBLE CAUSES

Possible Causes
CONFIGURATION, COMMUNICATION OR OTHER DTCS SET IN THE ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN AFTER TEST DRIVING THE VEHICLE AND ALLOWING IT TO IDLE FOR 10 SECONDS

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Test drive the vehicle.
6. Park the vehicle on a level surface and allow it to idle for at least 10.0 seconds.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- This DTC is an indication that there are configuration, communication or other DTCs set in the ABS module.
- Perform the appropriate diagnostic procedure(s). Refer to [**ANTILOCK BRAKE SYSTEM \(ABS\)-
DIAGNOSTIC CODE INDEX**](#) .

NOTE: It may be necessary to perform the ABS Initialization routine with the scan tool to reset the vehicle configuration.

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION diagnostic procedure. Refer to [**TESTING FOR AN INTERMITTENT CONDITION**](#) .

C14A3-00-XBW RULE VIOLATION

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to [**MODULE, DRIVERS ASSISTANCE SYSTEM \(DASM\), DESCRIPTION AND OPERATION**](#) .

WHEN MONITORED

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- DASM is not in Plant-Mode.
- Electronic Stability Program (ESP) is not in diagnostic mode.
- ACC, FCW or LDW system(s) are enabled.

SET CONDITION

- The module detects a sudden, externally induced acceleration or deceleration or a DTC in another module.

DEFAULT ACTION

- ACC and FCW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
DTCS PRESENT IN OTHER MODULE(S) BRAKE SYSTEM NOT FUNCTIONING PROPERLY SUDDEN ACCELERATION OR DECELERATION ACCIDENT OCCURRED

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. CHECK FOR DTCS SET IN OTHER MODULE(S) OR BRAKE SYSTEM MALFUNCTION

NOTE: This DTC cannot be caused without faults elsewhere, other than deceleration/acceleration induced externally (e.g. driving in sand or an accident).

1. Refer to the saved DTC information recorded on the repair order.
2. Repair any DTCs set in the ABS, PCM and/or TCM in accordance with the service information.
3. Check the functionality of the brake system in accordance with the service information.

Repair

- Repair as necessary.
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to [DRIVER ASSISTANCE SYSTEM MODULE \(DASM\) VERIFICATION TEST](#).

C14A4-00-SENSOR ADJUSTMENT REQUIRED

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to [MODULE, DRIVERS ASSISTANCE SYSTEM \(DASM\), DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

- System voltage between 10.0 and 16.0 volts.

SET CONDITION

- The module detects that the radar or camera sensor is misaligned.

DEFAULT ACTION

- ACC and FCW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
RADAR OR CAMERA SENSOR MISALIGNED RADAR OR CAMERA SENSOR MOUNTING HARDWARE DAMAGED, BROKEN OR BENT DRIVER ASSISTANCE SYSTEM MODULE (DASM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

NOTE: When servicing the DASM, it is recommended to obtain the environmental conditions when the concern took place from the customer. Heavy rain, snow, ice, and fog can cause the DASM to become inoperative. This is

considered as a normal operational reaction of the DASM and no repair is necessary.

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

2. INSPECT DASM MOUNTING AND LENS ALIGNMENT

NOTE: A secure and unmodified mounting location is critical to the proper operation of the DASM.

NOTE: Vehicles that have had the suspension modified and/or an aftermarket grill installed that blocks the DASM can cause the DASM to not function properly.

1. Perform a thorough visual and physical inspection of the DASM and the mounting bracket and location.
2. Check for:
 - Bent mounting bracket
 - Damage to the DASM
 - Damaged, obscured, or out of alignment lens
 - DASM not fully seated or broken/missing securing clips

Were there any problems found?

Yes

- Repair as necessary in accordance with the Service Information.
- Replace the DASM Sensor only if visible damage is present, then replace the bracket and sensor assembly. Refer to [MODULE, DRIVERS ASSISTANCE SYSTEM \(DASM\), REMOVAL AND INSTALLATION](#).
- Perform the DASM alignment procedure in accordance with the Service Information.
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to [DRIVER ASSISTANCE SYSTEM MODULE \(DASM\) VERIFICATION TEST](#).

No

- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to [DRIVER ASSISTANCE SYSTEM MODULE \(DASM\) VERIFICATION TEST](#).

C14A5-00-SENSOR BLINDED

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to [MODULE, DRIVERS ASSISTANCE SYSTEM \(DASM\), DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

- System voltage between 10.0 and 16.0 volts.
- DASM is not in Plant-Mode.
- ACC, FCW or LDW system(s) are enabled.

SET CONDITION

- The module detects that the radar or camera sensor is obstructed, damaged or vertically misaligned.

DEFAULT ACTION

- ACC and FCW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
RADAR OR CAMERA SENSOR OBSTRUCTED OR DAMAGED
RADAR OR CAMERA SENSOR MOUNTING HARDWARE DAMAGED, BROKEN OR BENT
RADAR OR CAMERA SENSOR MISALIGNED;
DRIVER ASSISTANCE SYSTEM MODULE (DASM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

NOTE: When servicing the DASM, it is recommended to obtain the environmental conditions when the concern took place from the customer. Heavy rain, snow, ice, and fog can cause the DASM to become inoperative. This is considered as a normal operational reaction of the DASM and no repair is necessary.

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

2. INSPECT DASM MOUNTING AND LENS ALIGNMENT

NOTE: A secure and unmodified mounting location is critical to the proper operation of the DASM.

NOTE: Vehicles that have had the suspension modified or aftermarket parts installed that block the DASM can cause the DASM to not function properly.

NOTE: Make sure the DASM Sensor lens area is free from any obstruction that would compromise the function of the DASM.

1. Perform a thorough visual and physical inspection of the DASM and the mounting location.
2. Check for:
 - Damage to the DASM
 - Lens damaged, obscured, or out of alignment
 - DASM mounted incorrectly or broken/missing mounting hardware

Were there any problems found?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to [DRIVER ASSISTANCE SYSTEM MODULE \(DASM\) VERIFICATION TEST](#).

No

- Align the DASM in accordance to the Service Information. If the alignment is correct, and the DTC continues to set, Go To [3](#)

3. CHECK RELATED HARNESS CONNECTIONS - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. Turn the ignition off.
2. Disconnect all DASM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all DASM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase DTCs.
10. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
11. With the scan tool, read DASM DTCs.

Did the DTC return?

Yes

- Replace the Driver Assistance System Module (DASM) in accordance with the Service Information. Refer to [MODULE, DRIVERS ASSISTANCE SYSTEM \(DASM\), REMOVAL AND INSTALLATION](#) .
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to [DRIVER ASSISTANCE SYSTEM MODULE \(DASM\) VERIFICATION TEST](#).

No

- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to [DRIVER ASSISTANCE SYSTEM MODULE \(DASM\) VERIFICATION TEST](#).
- Test complete.

C14A6-92-VEHICLE REACTION-PERFORMANCE OR INCORRECT OPERATION

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to MODULE, DRIVERS ASSISTANCE SYSTEM (DASM), DESCRIPTION AND OPERATION .

WHEN MONITORED

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- DASM is not in Plant-Mode.
- Electronic Stability Program (ESP) is not in diagnostic mode.
- ACC, FCW or LDW system(s) are enabled.

SET CONDITION

- After requesting acceleration or deceleration, the module detects that the rate of acceleration or deceleration is either greater than, less than, or not within the specified range when requested.

DEFAULT ACTION

- ACC, FCW and LDW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
DTCS PRESENT IN OTHER MODULE(S)
VEHICLE CONFIGURATION INCORRECT

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

CHECK FOR ACTIVE DTCS

NOTE: When servicing the DASM, it is recommended to obtain the environmental conditions when the concern took place from the customer. Heavy rain, snow, ice, and fog can cause the DASM to become inoperative. This is considered as a normal operational reaction of the DASM and no repair is necessary.

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.

Are any other modules reporting DTCs?

Yes

- Refer to the appropriate diagnostic procedure and repair as necessary.

No

- This is an informational DTC.
- Check for proper operation of all supporting systems, such as engine, transmission and braking systems.
- Verify that all vehicle supporting systems are properly configured.
- A vehicle collision can cause this DTC to set.
- Perform the TESTING FOR AN INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

C2129-16-BATTERY VOLTAGE-CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to **MODULE, DRIVERS ASSISTANCE SYSTEM (DASM), DESCRIPTION AND OPERATION** .

WHEN MONITORED

- Engine running.
- Engine not cranking.
- DASM is not in Plant-Mode.
- ACC, FCW or LDW system(s) are enabled.

SET CONDITION

- The monitored voltage to the module is below 9.0 volts for 250 ms.

DEFAULT ACTION

- ACC, FCW and LDW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM VOLTAGE LOW
BATTERY VOLTAGE LOW
FUSED IGNITION CIRCUIT OPEN OR HIGH RESISTANCE
GROUND CIRCUIT OPEN OR HIGH RESISTANCE
DRIVER ASSISTANCE SYSTEM MODULE (DASM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK FOR CHARGING SYSTEM OR BATTERY VOLTAGE DTCS IN THE POWERTRAIN CONTROL MODULE (PCM)

1. Refer to the saved DTC information recorded on the repair order.

Were any charging system or battery voltage DTCs set in the PCM?

Yes

- Repair the DTCs set in the PCM and retest. Refer to **3.0L DIESEL - DIAGNOSTIC CODE INDEX** , or **3.6L (GPEC 2A) - DIAGNOSTIC CODE INDEX** .

No

- Go To [3](#)

3. ISOLATE AND LOAD TEST (F916) FUSED IGNITION RUN/START CIRCUIT TO CHECK FOR HIGH RESISTANCE

1. The ignition must be off when performing a load test on a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested.

3. Connect the positive lead of the load test tool to the positive side of the Battery (A). **Note:** Refer to the diagram below.
4. Using an approved back probe tool, connect the negative lead of the load test tool to the circuit being tested at the one of the component harness connectors (B).
5. Using an approved back probe tool and a fused jumper wire, connect the circuit being tested to the negative side of the Battery or a known good ground at the other component harness connector (C and D).
6. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuit.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test? To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

WARNING: To avoid possible serious or fatal injury, DO NOT load test any air bag/restraint system components or circuits using the procedures listed here. Refer to the Service Information for proper air bag/restraint system testing procedures.

CAUTION: Do not load test any circuits with components still connected to the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [4](#)

No

- Repair the circuit for an open or high resistance.
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to **DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST**.

4. CHECK THE (Z910) GROUND CIRCUIT FOR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the ground circuit.
2. Connect the positive lead of the load test tool to the positive side of the Battery.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load

testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the [CIRCUIT LOAD TESTING PROCEDURE](#) for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to **DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST**.

5. CHECK RELATED HARNESS CONNECTIONS - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. Turn the ignition off.
2. Disconnect all DASM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all DASM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase DTCs.
10. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
11. With the scan tool, read DASM DTCs.

Did the DTC return?

Yes

- Replace the Driver Assistance System Module (DASM) in accordance with the Service Information. Refer to **MODULE, DRIVERS ASSISTANCE SYSTEM (DASM), REMOVAL AND INSTALLATION**.
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to **DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST**.

No

- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to **DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST**.

TEST.

- Test complete.

C2129-17-BATTERY VOLTAGE-CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, **refer to the appropriate wiring information .**

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to **MODULE, DRIVERS ASSISTANCE SYSTEM (DASM), DESCRIPTION AND OPERATION .**

WHEN MONITORED

- Engine running.
- DASM is not in Plant-Mode.
- Electronic Stability Program (ESP) is not in diagnostic mode.

SET CONDITION

- The monitored voltage to the module is above 16.0 volts for 250 ms.

DEFAULT ACTION

- ACC, FCW and LDW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM VOLTAGE HIGH BATTERY VOLTAGE HIGH GROUND CIRCUIT HIGH RESISTANCE DRIVER ASSISTANCE SYSTEM MODULE (DASM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding.
Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.

3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

2. CHECK FOR CHARGING SYSTEM OR BATTERY VOLTAGE DTCS IN THE POWERTRAIN CONTROL MODULE (PCM)

1. Refer to the saved DTC information recorded on the repair order.

Were any charging system or battery voltage DTCs set in the PCM?

Yes

- Repair the DTCs set in the PCM and retest. Refer to [3.0L DIESEL - DIAGNOSTIC CODE INDEX](#), or [3.6L \(GPEC 2A\) - DIAGNOSTIC CODE INDEX](#).

No

- Go To [3](#)

3. CHECK FOR SYSTEM VOLTAGE DTCS SET IN OTHER MODULES

1. Refer to the saved DTC information recorded on the repair order.

Were any system voltage DTCs set in other modules?

Yes

- This is an indication of a charging system or battery malfunction. Check the battery and charging system in accordance with the Service Information.
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to [DRIVER ASSISTANCE SYSTEM MODULE \(DASM\) VERIFICATION TEST](#).

No

- Go To [4](#)

4. CHECK THE (Z910) GROUND CIRCUIT FOR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the ground circuit.
2. Connect the positive lead of the load test tool to the positive side of the Battery.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [**CIRCUIT LOAD TESTING PROCEDURES**](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [**CIRCUIT LOAD TESTING PROCEDURES**](#) .

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to **DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST**.

5. CHECK RELATED HARNESS CONNECTIONS - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. Turn the ignition off.
2. Disconnect all DASM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all DASM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase DTCs.
10. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
11. With the scan tool, read DASM DTCs.

Did the DTC return?

Yes

- Replace the Driver Assistance System Module (DASM) in accordance with the Service Information. Refer to **MODULE, DRIVERS ASSISTANCE SYSTEM (DASM), REMOVAL AND INSTALLATION**.

- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to [**DRIVER ASSISTANCE SYSTEM MODULE \(DASM\) VERIFICATION TEST**](#).

No

- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to [**DRIVER ASSISTANCE SYSTEM MODULE \(DASM\) VERIFICATION TEST**](#).
- Test complete.

C212A-84-SYSTEM VOLTAGE-SIGNAL BELOW ALLOWABLE RANGE

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to [**MODULE, DRIVERS ASSISTANCE SYSTEM \(DASM\), DESCRIPTION AND OPERATION**](#) .

WHEN MONITORED

- Engine running.
- Engine not cranking.
- ACC, FCW or LDW system(s) are enabled.

SET CONDITION

- The voltage value that the module receives over the CAN Bus from the BCM is less than or equal to 10.0 volts for 15 seconds or more.

DEFAULT ACTION

- ACC, FCW and LDW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM VOLTAGE LOW
BODY CONTROL MODULE (BCM) VOLTAGE LOW

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**](#) .**

DIAGNOSTIC TEST

CHECK POWERTRAIN CONTROL MODULE (PCM) DTCS

1. With the scan tool, read PCM DTCS and record on the repair order.

Are there any PCM Charging or Battery DTCS present?

Yes

- Repair the PCM DTCS. Refer to [3.0L DIESEL - DIAGNOSTIC CODE INDEX](#) , or [3.6L \(GPEC 2A\) - DIAGNOSTIC CODE INDEX](#) .

No

- This DTC is a CAN system message for information only. Check the charging system in accordance with the Service Information.

C212A-85-SYSTEM VOLTAGE-SIGNAL ABOVE ALLOWABLE RANGE

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to [MODULE, DRIVERS ASSISTANCE SYSTEM \(DASM\), DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

- Engine running.
- ACC, FCW or LDW system(s) are enabled.

SET CONDITION

- The voltage value that the module receives over the CAN Bus from the BCM is greater than or equal to 16.0 volts for 15 seconds or more.

DEFAULT ACTION

- ACC, FCW and LDW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM VOLTAGE HIGH
BODY CONTROL MODULE (BCM) VOLTAGE HIGH

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

CHECK FOR POWERTRAIN CONTROL MODULE (PCM) RELATED DTCS

1. With the scan tool, read Powertrain Control Module (PCM) DTCs and record on the repair order.

Are there any PCM charging or battery DTCs present?

Yes

- Repair the PCM DTCs. Refer to [3.0L DIESEL - DIAGNOSTIC CODE INDEX](#) , or [3.6L \(GPEC 2A\) - DIAGNOSTIC CODE INDEX](#) .

No

- This DTC is a CAN system message for information only. Check the charging system in accordance with the Service Information.

C2206-00-VEHICLE CONFIGURATION MISMATCH

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to [MODULE, DRIVERS ASSISTANCE SYSTEM \(DASM\), DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- ACC, FCW or LDW system(s) are enabled.

SET CONDITION

- Learned vehicle configuration does not match to current vehicle configuration transmitted over CAN.

DEFAULT ACTION

- ACC, FCW and LDW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
VEHICLE CONFIGURATION NOT STORED CORRECTLY

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Start the engine.
6. Park the vehicle on a level surface and allow to idle for a minimum of 10 seconds.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK FOR DTCS SET IN OTHER MODULES

1. Refer to the saved DTC information recorded on the repair order.

Were any DTCs set in other modules?

Yes

- Diagnose and repair any DTCs set in other modules and retest.

No

- Go To [3](#)

3. VERIFY VEHICLE CONFIGURATION

1. This DTC indicates that the vehicle configuration is incomplete or incorrect.
2. Check vehicle configuration for any of the following conditions:
 - Vehicle Identification Number (VIN) not valid.
 - VIN mismatch.
 - Vehicle line, body style, engine displacement, fuel type, XWD type, axle ratio, transmission type, FCW/CMS configuration from CAN Bus doesn't match vehicle parameter set as specified and learned in Plant Mode.
 - Country code does not match.
 - Model year does not match.

Repair

- Perform the In-Plant Mode service procedure to learn new vehicle configuration. Exit In-Plant mode with correct configuration data being sent over CAN. Cycle the ignition.
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to [**DRIVER ASSISTANCE SYSTEM MODULE \(DASM\) VERIFICATION TEST**](#).

C2210-00-ECU OVERTEMPERATURE

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to [**MODULE, DRIVERS ASSISTANCE SYSTEM \(DASM\), DESCRIPTION AND OPERATION**](#) .

WHEN MONITORED

- Ignition on.
- System voltage between 10.0 and 16.0 volts.

SET CONDITION

- The internal module temperature has exceeded the maximum operating temperature for 60 seconds.

DEFAULT ACTION

- ACC, FCW and LDW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
AMBIENT TEMPERATURE TOO HIGH DRIVER ASSISTANCE SYSTEM MODULE (DASM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**](#) .**

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.

3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION diagnostic procedure. Refer to [**TESTING FOR AN INTERMITTENT CONDITION**](#).

2. VERIFY AMBIENT TEMPERATURE READING

1. With the scan tool, read ambient air temperature in the Powertrain Control Module (PCM).

Is the ambient air temperature reading 85B° C (185B° F) or above?

Yes

- The Driver Assistance System Module (DASM) has detected the ambient temperature above operating range. Once the temperature has decreased below 85B°C (185B°F), DASM operation will be restored.
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to [**DRIVER ASSISTANCE SYSTEM MODULE \(DASM\) VERIFICATION TEST**](#).

No

- Go To [3](#)

3. CHECK RELATED HARNESS CONNECTIONS - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. Turn the ignition off.
2. Disconnect all DASM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

- Repair any conditions that are found.
6. Reconnect all DASM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
 7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
 8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
 9. With the scan tool, erase DTCs.
 10. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
 11. With the scan tool, read DASM DTCs.

Did the DTC return?

Yes

- Replace the Driver Assistance System Module (DASM) in accordance with the Service Information. Refer to **MODULE, DRIVERS ASSISTANCE SYSTEM (DASM), REMOVAL AND INSTALLATION**.
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to **DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST**.

No

- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to **DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST**.
- Test complete.

C2212-00-ECU IN-PLANT MODE

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, **refer to the appropriate wiring information**.

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to **MODULE, DRIVERS ASSISTANCE SYSTEM (DASM), DESCRIPTION AND OPERATION**.

WHEN MONITORED

- Ignition on.
- System voltage between 10.0 and 16.0 volts.

SET CONDITION

- In-Plant mode is active in the module.

DEFAULT ACTION

- ACC, FCW and LDW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
MODULE IN-PLANT MODE IS ACTIVE
VEHICLE NOT CONFIGURED OR CONFIGURED INCORRECTLY

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- No repair is necessary. Make sure the lens is free of dirt, damage, and other obstructions that would hinder the performance of the DASM lens. Clear the DTC and verify proper operation of the DASM.
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to **DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST**.

2. CHECK FOR RELATED DTCS SET IN OTHER MODULES

1. Refer to the saved DTC information recorded on the repair order.

Were any vehicle configuration related DTCs set in other modules?

Yes

- Diagnose and repair any related DTCs set in other modules and retest.

No

- Go To [3](#)

3. CHECK VEHICLE CONFIGURATION

1. Check vehicle configuration for any of the following conditions:

- The Vehicle Identification Number (VIN) is not valid.
- VIN mismatch.
- Vehicle line, body style, engine displacement, fuel type, XWD type, axle ratio, transmission type, FCW/CMS configuration from CAN Bus doesn't match vehicle parameter set as specified and learned in Plant Mode.
- Country code does not match.
- Model year does not match.
- Vehicle is not configured to be equipped with DASM.

Were any configuration problems found?

Yes

- Perform the In-Plant Mode service procedure to learn new vehicle configuration. Exit In-Plant mode with correct configuration data being sent over the CAN Bus. Cycle the ignition OFF, then to ON, engine not running.

NOTE: **Engine RPM must be equal to zero (IGN=RUN, engine not running) in order for new configurations to be learned.**

- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to **DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST**.

No

- With the scan tool, perform the DASM Aim Mode Auto Alignment procedure.

NOTE: **Performing the DASM Aim Mode Auto Alignment procedure will remove the Module from the In-Plant mode.**

- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to **DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST**.

C2223-00-ECU CONFIGURATION MISMATCH

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, **refer to the appropriate wiring information .**

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to [MODULE, DRIVERS ASSISTANCE SYSTEM \(DASM\), DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- DASM is not in Plant-Mode.
- ACC, FCW or LDW system(s) are enabled.

SET CONDITION

- Body Control Module (BCM) does not expect the DASM module to be present.

DEFAULT ACTION

- ACC, FCW and LDW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
VEHICLE CONFIGURATION INCORRECT

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

NOTE: **This DTC will set if the Body Control Module (BCM) is not configured for Driver Assistance System Module (DASM).**

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. Record any Freeze Frame or Environmental Data related to the DTCs.

Is the DTC active?

Yes

- With the scan tool, perform a vehicle configuration routine.
- Verify that the DASM alignment is correct. Perform the DASM Alignment procedure.
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to [DRIVER ASSISTANCE SYSTEM MODULE \(DASM\) VERIFICATION TEST](#).

No

- No repair is necessary. Clear the DTC and verify proper operation of the DASM.
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to [DRIVER ASSISTANCE SYSTEM MODULE \(DASM\) VERIFICATION TEST](#).

C2225-00-PCM DISABLED ECU

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to [**MODULE, DRIVERS ASSISTANCE SYSTEM \(DASM\), DESCRIPTION AND OPERATION**](#) .

WHEN MONITORED

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- DASM is not in Plant-Mode.
- Electronic Stability Program (ESP) is not in diagnostic mode.
- ACC, FCW or LDW system(s) are enabled.

SET CONDITION

- An active DTC is set in the Powertrain Control Module (PCM).

DEFAULT ACTION

- ACC and FCW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
PCM NOT READY FOR DASM OPERATION PCM DTC(S) PRESENT PCM IN LIMP-IN MODE

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [**PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**](#) .

DIAGNOSTIC TEST

CHECK FOR POWERTRAIN CONTROL MODULE (PCM) DTCS

This Diagnostic Trouble Code (DTC) will set if a DTC is detected in the PCM.

- Repair the PCM DTCs. Refer to [**3.0L DIESEL - DIAGNOSTIC CODE INDEX**](#) , or [**3.6L \(GPEC 2A\) - DIAGNOSTIC CODE INDEX**](#) .
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to [**DRIVER ASSISTANCE SYSTEM MODULE \(DASM\) VERIFICATION TEST**](#).

C2226-00-TCM DISABLED ECU

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to MODULE, DRIVERS ASSISTANCE SYSTEM (DASM), DESCRIPTION AND OPERATION .

WHEN MONITORED

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- DASM is not in Plant-Mode.
- Electronic Stability Program (ESP) is not in diagnostic mode.
- ACC, FCW or LDW system(s) are enabled.

SET CONDITION

- An active DTC is set in the Transmission Control Module (TCM)

DEFAULT ACTION

- ACC and FCW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
TCM NOT READY FOR DASM OPERATION
TCM DTC(S) PRESENT
TCM IN LIMP-IN MODE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

CHECK FOR TRANSMISSION CONTROL MODULE (TCM) DTCS

This Diagnostic Trouble Code (DTC) will set if a DTC is detected in the TCM.

- Repair the TCM DTCs. Refer to 3.0L DIESEL - DIAGNOSTIC CODE INDEX , or 3.6L (GPEC 2A) - DIAGNOSTIC CODE INDEX .
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST.

C2227-00-ABS DISABLED ECU

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to [MODULE, DRIVERS ASSISTANCE SYSTEM \(DASM\), DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- DASM is not in Plant-Mode.
- Electronic Stability Program (ESP) is not in diagnostic mode.
- ACC, FCW or LDW system(s) are enabled.

SET CONDITION

- An active DTC is set in the Antilock Brake System (ABS) Module.

DEFAULT ACTION

- ACC and FCW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
ABS MODULE NOT READY FOR DASM OPERATION
ABS MODULE DTC(S) PRESENT
ESP IS DISABLED

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

CHECK FOR ANTILOCK BRAKE SYSTEM (ABS) MODULE DTCS

This Diagnostic Trouble Code (DTC) will set if a DTC is detected in the ABS module.

- Repair the ABS DTCs. Refer to [ANTILOCK BRAKE SYSTEM \(ABS\) - DIAGNOSTIC CODE INDEX](#) .

- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to **DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST**.

P0585-00-SPEED CONTROL SWITCH 1/2 CORRELATION

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to **MODULE, DRIVERS ASSISTANCE SYSTEM (DASM), DESCRIPTION AND OPERATION** .

WHEN MONITORED

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No Bus DTCs present.
- Module is not in Plant-Mode.
- Electronic Stability Control (ESC) is not in diagnostic mode.
- Adaptive Cruise Control (ACC), Forward Collision Warning (FCW) or Lane Departure Warning (LDW) system(s) are enabled.

SET CONDITION

- The module receives a Bus message from the Steering Column Control Module (SCCM) that the Speed Control Switch is not functioning properly.

DEFAULT ACTION

- ACC, FCW and LDW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
SPEED CONTROL SWITCH
SCCM DTC(S) PRESENT

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .**

DIAGNOSTIC TEST

1. **READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN**

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. CHECK THE BODY CONTROL MODULE (BCM) FOR RELATED DTCS

1. With the scan tool, read BCM DTCs.

Are there any BCM DTCs present?

Yes

- Repair the BCM DTCs. Refer to [BODY CONTROL MODULE \(BCM\) - DIAGNOSTIC CODE INDEX](#) .

No

- Go To [3](#)

3. CHECK SPEED CONTROL SWITCH OPERATION

1. With the scan tool, read the Speed Control Switch status under the Steering Column Control Module (SCCM) while pressing switch multiple positions.

Does the switch positions change correctly in the scan tool?

Yes

- Inspect the wiring and connectors between the SCCM and the Speed Control Switch and the output to the BCM for any possible problems. If no problems are found, replace and program the SCCM in accordance with the Service Information. Refer to [MODULE, STEERING COLUMN CONTROL \(SCCM\), REMOVAL AND INSTALLATION](#) .
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to [DRIVER ASSISTANCE SYSTEM MODULE \(DASM\) VERIFICATION TEST](#) .

No

- Inspect the wiring and connectors between the SCCM and the Speed Control Switch. If no problems are found, replace the Speed Control Switch in accordance with the Service Information. Refer to [**SWITCH, SPEED CONTROL, REMOVAL AND INSTALLATION**](#) .
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to [**DRIVER ASSISTANCE SYSTEM MODULE \(DASM\) VERIFICATION TEST**](#).

P1593-2A-SPEED CONTROL SWITCH 1/2 - STUCK

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to [**MODULE, DRIVERS ASSISTANCE SYSTEM \(DASM\), DESCRIPTION AND OPERATION**](#) .

WHEN MONITORED

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No Bus DTCs present.
- Module is not in Plant-Mode.
- Electronic Stability Control (ESC) is not in diagnostic mode.
- Adaptive Cruise Control (ACC), Forward Collision Warning (FCW) or Lane Departure Warning (LDW) system(s) are enabled.

SET CONDITION

- The Bus message from the Steering Column Control Module (SCCM) indicates that the Speed Control Switch has been pressed for 120 seconds or more.

DEFAULT ACTION

- ACC, FCW and LDW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
SPEED CONTROL SWITCH STUCK SPEED CONTROL SWITCH

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE BODY CONTROL MODULE (BCM) FOR RELATED DTCS

1. With the scan tool, read BCM DTCs.

Are there any BCM DTCs present?

Yes

- Repair the BCM DTCs. Refer to **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** .

No

- Go To [3](#)

3. CHECK SPEED CONTROL SWITCH OPERATION

1. With the scan tool, read the Speed Control Switch status under the Steering Column Control Module (SCCM) while pressing multiple switch positions.

Does the switch positions change correctly in the scan tool?

Yes

- Inspect the wiring and connectors between the SCCM and the Speed Control Switch and the output to the BCM for any possible problems. If no problems are found, replace and program the SCCM in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL (SCCM), REMOVAL AND INSTALLATION** .

- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to [**DRIVER ASSISTANCE SYSTEM MODULE \(DASM\) VERIFICATION TEST**](#).

No

- Inspect the wiring and connectors between the SCCM and the Speed Control Switch. If no problems are found, replace the Speed Control Switch in accordance with the Service Information. Refer to [**SWITCH, SPEED CONTROL, REMOVAL AND INSTALLATION**](#).
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to [**DRIVER ASSISTANCE SYSTEM MODULE \(DASM\) VERIFICATION TEST**](#).

U0002-00-CAN C BUS OFF PERFORMANCE

NOTE: This DTC may not be listed in the Body Control Module (BCM) diagnostic procedures. If this DTC is not found in the BCM diagnostic procedures, perform the comparable CAN C Bus diagnostic test, such as CAN C BUS-NO SIGNAL, CAN C BUS OFF PERFORMANCE or CAN C SIGNAL MISSING.

Perform the comparable CAN C Bus diagnostic tests in the BCM. Refer to [**BODY CONTROL MODULE \(BCM\) - DIAGNOSTIC CODE INDEX**](#).

U0100-00-LOST COMMUNICATION WITH ECM/PCM "A"

The COMMUNICATION DIAGNOSTIC PROCEDURE **MUST** be performed before replacing any component(s) or module(s). Perform the COMMUNICATION DIAGNOSTIC PROCEDURE. Refer to [**COMMUNICATION DIAGNOSTIC PROCEDURE**](#).

U11F9-00 - ENGINE DID NOT RESPOND TO ACC TORQUE REQUEST

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)

- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to **MODULE, DRIVERS ASSISTANCE SYSTEM (DASM), DESCRIPTION AND OPERATION** .

WHEN MONITORED

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- Module is not in Plant-Mode.
- Electronic Stability Control (ESC) is not in diagnostic mode.
- ACC, FCW or LDW system(s) are enabled.

SET CONDITION

- The Powertrain Control Module (PCM) is not responding to Driver Assistance System Module (DASM) module torque request.

DEFAULT ACTION

- ACC system is disabled.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) DTC(S) PRESENT
PCM DTC(S) PRESENT
PCM IMPROPERLY CONFIGURED

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. This is an informational Diagnostic Trouble Code (DTC). The Driver Assistance System Module (DASM) communicates over the CAN Bus with the Powertrain Control Module (PCM) to increase engine speed when needed. If other DASM DTCs are present, perform their respective diagnostic procedures first.
 1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
 2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
 3. With the scan tool, erase all DTCs.
 4. Turn the ignition off for a minimum of 10 seconds.
 5. Turn the ignition on.
 6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
 7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- No repair is necessary. Make sure the lens is free of dirt, damage, and other obstructions that would hinder the performance of the DASM imager lens. Clear the DTC and verify proper operation of the DASM.
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to [DRIVER ASSISTANCE SYSTEM MODULE \(DASM\) VERIFICATION TEST](#).

2. CHECK FOR DTCS SET IN OTHER MODULES

Check for:

- PCM DTCs present.
- PCM improperly configured.
- BCM DTCs present.
- BCM improperly configured.
- Implausible DTCs against the PCM.
- Any Service Bulletins that may apply.

Were any of the above conditions present?

Yes

- Refer to the appropriate diagnostic procedure and repair/reprogram as necessary.
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to [DRIVER ASSISTANCE SYSTEM MODULE \(DASM\) VERIFICATION TEST](#).

No

- Erase this DTC and perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to [DRIVER ASSISTANCE SYSTEM MODULE \(DASM\) VERIFICATION TEST](#).

U121E-00-LOST COMMUNICATION WITH STEERING WHEEL CRUISE CONTROL SWITCH

The COMMUNICATION DIAGNOSTIC PROCEDURE **MUST** be performed before replacing any component(s) or module(s). Perform the COMMUNICATION DIAGNOSTIC PROCEDURE. Refer to [COMMUNICATION DIAGNOSTIC PROCEDURE](#) .

U141E-00-IMPLAUSIBLE DATA RECEIVED FROM CRUISE CONTROL SWITCH

The COMMUNICATION DIAGNOSTIC PROCEDURE **MUST** be performed before replacing any component(s) or module(s). Perform the COMMUNICATION DIAGNOSTIC PROCEDURE. Refer to [COMMUNICATION DIAGNOSTIC PROCEDURE](#) .

U1442-00-IMPLAUSIBLE DATA RECEIVED FROM DRIVER PRESENCE DETECTION MODULE

The COMMUNICATION DIAGNOSTIC PROCEDURE **MUST** be performed before replacing any component(s) or module(s). Perform the COMMUNICATION DIAGNOSTIC PROCEDURE. Refer to [COMMUNICATION DIAGNOSTIC PROCEDURE](#) .

U1600-00 - ECU APPLICATION SOFTWARE MISMATCH

For a complete ADAPTIVE SPEED CONTROL SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Driver Assistance System Module (DASM) integrates radar and camera sensors into a single unit and is used to detect objects near a vehicle. The module communicates with other modules on the vehicle to provide a system of enhanced safety functions.

- Conventional Cruise Control
- Adaptive Cruise Control (ACC)
- Automatic High Beam Control (AHBC)
- Lane Departure Warning (LDW)
- Advanced Emergency Braking (AEB)
- Forward Collision Warning (FCW)

For an in-depth explanation of the DASM system. Refer to MODULE, DRIVERS ASSISTANCE SYSTEM (DASM), DESCRIPTION AND OPERATION .

WHEN MONITORED

- One time during an ignition cycle.

SET CONDITION

- The Driver Assistance System Module (DASM) was reprogrammed with a corrupted flash file, or the reprogramming of the DASM was interrupted before it was complete.

DEFAULT ACTION

- ACC and FCW system(s) are disabled.

POSSIBLE CAUSES

Possible Causes
DASM NOT PROGRAMMED PROPERLY DRIVER ASSISTANCE SYSTEM MODULE (DASM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN**
 1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
 2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
 3. With the scan tool, erase all DTCS.
 4. Turn the ignition off for a minimum of 10 seconds.
 5. Turn the ignition on.
 6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
 7. With the scan tool, read DTCS.

Did the DTC return?

Yes

- This is an indication that the software installed on the vehicle is corrupted, incorrect or the flash procedure was interrupted. Flash the controller, making sure the correct flash file is used. If this DTC continues to set after flashing at least three times, Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. CHECK RELATED HARNESS CONNECTIONS - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. Turn the ignition off.
2. Disconnect all DASM harness connectors.
3. Disconnect all related in-line harness connections (if equipped).
4. Disconnect the related component harness connectors.
5. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

6. Reconnect all DASM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
9. With the scan tool, erase DTCs.
10. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
11. With the scan tool, read DASM DTCs.

Did the DTC return?

Yes

- Replace the Driver Assistance System Module (DASM) in accordance with the Service Information. Refer to [MODULE, DRIVERS ASSISTANCE SYSTEM \(DASM\), REMOVAL AND INSTALLATION](#) .
- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to [DRIVER ASSISTANCE SYSTEM MODULE \(DASM\) VERIFICATION](#)

TEST.

No

- Perform the DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST. Refer to **DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST.**
- Test complete.

STANDARD PROCEDURE

DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST

DIAGNOSTIC TEST

DRIVER ASSISTANCE SYSTEM MODULE (DASM) VERIFICATION TEST

1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
2. With the scan tool, erase DASM DTCs.
3. Make sure that all accessories are turned off and that the battery is fully charged.
4. If the DASM was replaced or moved in any way, the DASM must be aligned. Perform the alignment procedure in accordance with the Service Information.
5. Test drive the vehicle and verify proper operation.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Repair the DASM DTC(s). Refer to **DIAGNOSIS AND TESTING.**

No

- Repair is complete.
-

Drivetrain Control Module (DTCM) - DTCS C1403-11 To C1463-13 - Gladiator

DTC TROUBLESHOOTING

C1403-11-TRANSFER CASE RANGE POSITION SENSOR-CIRCUIT SHORT TO GROUND

For a complete TRANSFER CASE wiring diagram, **Refer to the appropriate wiring information .**

THEORY OF OPERATION

The Transfer Case Range Position Sensor (RPS) is a serviceable component located on the top center of the Transfer Case next to the vent tube. There are two circuits between the sensor and the (DTCM) Drivetrain Control Module:

- Signal
- Sensor Ground

The RPS is a five-position, resistive type sensor. The sensor contains a plunger that contacts the sector plate inside the Transfer Case which has four discrete positions. The plunger moves in and out of the sensor body as the Transfer Case is shifted. As the plunger is depressed, the resistance value changes.

The sensor ground is used as a low voltage reference. The signal circuit feeds an analog input to the Drivetrain Control Module (DTCM) using a pull-up resistor to 5 volts. The resulting voltage value for each position is read by the DTCM to determine the Transfer Case range position. The voltage is also used by the DTCM software for diagnostic purposes.

TRANSFER CASE RANGE POSITION VS SIGNAL VOLTAGE

Range Position	Minimum voltage	Nominal Voltage	Maximum Voltage
2WD	3.336	3.517	3.682
4WD HIGH/4WD-AUTO	2.713	2.893	3.061
Neutral	1.356	1.491	1.633
4WD LOW	0.482	0.556	0.654

TRANSFER CASE RANGE POSITION VS SENSOR RESISTANCE

Range Position	Minimum Resistance	Nominal Resistance	Maximum Resistance
2WD	1, 124.2 Ω	1, 183.4 Ω	1, 242.6 Ω
4WD HIGH/4WD-AUTO	650.18 Ω	684.4 Ω	718.6 Ω
Neutral	199.9 Ω	210.4 Ω	220.9 Ω
4WD LOW	57.4 Ω	60.4 Ω	63.4 Ω

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition is on or 1 second after engine crank.
- No Sensor Supply DTCs set.
- No Under/Over voltage DTCs set.
- Battery voltage is between 6.0 and 16.0 volts for more than 500 ms.

SET CONDITION

- Transfer Case Range Position Signal circuit voltage is below 0.305 volt for more than 500 ms.

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service 4WD system will be displayed.
- T-CASE SHIFTING:
 - **DHF/DHP** : Lock the clutch if last known position is in 4WD. If failed in 2WD, maintain clutch open position.
 - **DHN/DHW** : No action.
- FRONT AXLE DISCONNECT (FAD) ACTUATOR:
 - **DHF/DHP** : Maintain last engage/disengage position.
 - **DHN/DHW** : Engage when condition is safe (zero vehicle speed).
- FRONT AXLE LOCKER ACTUATOR: Maintain position if locked, allow customer selected disengagement. Don't allow re-lock
- REAR AXLE LOCKER ACTUATOR: Normal Operation

POSSIBLE CAUSES

Possible Causes
TRANSFER CASE RANGE POSITION SIGNAL CIRCUIT SHORTED TO GROUND
RANGE POSITION SENSOR (RPS)
DRIVETRAIN CONTROL MODULE (DTCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ISOLATE AND CHECK THE (T314) TRANSFER CASE RANGE POSITION SIGNAL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to

follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.

3. Connect the negative lead of the Digital Volt-Ohm Meter (DVOM) to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and identify any in-line connectors that may help isolate the location of the short.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#).

No

- Go To [3](#)

3. CHECK THE RANGE POSITION SENSOR (RPS)

TRANSFER CASE RANGE POSITION VS SENSOR RESISTANCE

Range Position	Minimum Resistance	Nominal Resistance	Maximum Resistance
2WD	1124.2Ω	1183.4Ω	1242.6Ω
4WD HIGH/4WD-AUTO	650.18Ω	684.4Ω	718.6Ω
Neutral	199.9Ω	210.4Ω	220.9Ω
4WD LOW	57.4Ω	60.4Ω	63.4Ω

1. Disconnect the RPS harness connector.
2. Measure the resistance across the Signal and Ground terminals at the sensor while moving the Transfer Case Shifter to all four positions. Note the resistance reading for each position.

Is the resistance within specification for each position?

Yes

- Go To [4](#)

No

- Replace the RPS in accordance with the Service Information. Refer to the appropriate service information.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#).

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Drivetrain Control Module (DTCM) harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:

- Proper connector installation.
- Damaged connector locks.
- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to **MODULE, DRIVETRAIN CONTROL (DTCM), REMOVAL AND INSTALLATION** .
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

C1403-15-TRANSFER CASE RANGE POSITION SENSOR-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete TRANSFER CASE wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Transfer Case Range Position Sensor (RPS) is a serviceable component located on the top center of the Transfer Case next to the vent tube. There are two circuits between the sensor and the (DTCM) Drivetrain Control Module:

- Signal
- Sensor Ground

The RPS is a five-position, resistive type sensor. The sensor contains a plunger that contacts the sector plate inside the Transfer Case which has four discrete positions. The plunger moves in and out of the sensor body as the Transfer Case is shifted. As the plunger is depressed, the resistance value changes.

The sensor ground is used as a low voltage reference. The signal circuit feeds an analog input to the Drivetrain Control Module (DTCM) using a pull-up resistor to 5 volts. The resulting voltage value for each position is read by the DTCM to determine the Transfer Case range position. The voltage is also used by the DTCM software for diagnostic purposes.

TRANSFER CASE RANGE POSITION VS SIGNAL VOLTAGE

Range Position	Minimum voltage	Nominal Voltage	Maximum Voltage
2WD	3.336	3.517	3.682
4WD HIGH/4WD-AUTO	2.713	2.893	3.061
Neutral	1.356	1.491	1.633
4WD LOW	0.482	0.556	0.654

TRANSFER CASE RANGE POSITION VS SENSOR RESISTANCE

Range Position	Minimum Resistance	Nominal Resistance	Maximum Resistance
2WD	1, 124.2Ω	1, 183.4Ω	1, 242.6Ω
4WD HIGH/4WD-AUTO	650.18Ω	684.4Ω	718.6Ω
Neutral	199.9Ω	210.4Ω	220.9Ω
4WD LOW	57.4Ω	60.4Ω	63.4Ω

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition is on or 1 second after engine crank.
- No Sensor Supply DTCs set.
- No Under/Over voltage DTCs set.
- Battery voltage is between 6.0 and 16.0 volts for more than 500 ms.

SET CONDITION

- Transfer Case Range Position Signal circuit voltage is more than 4.15 volts for more than 500 ms.

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service 4WD system will be displayed.
- T-CASE SHIFTING:
 - **DHF/DHP** : Lock the clutch if last known position was in 4WD. If failed in 2WD, maintain clutch open position.
 - **DHN/DHW** : No action.
- FRONT AXLE DISCONNECT (FAD) ACTUATOR:
 - **DHF/DHP** : Maintain last engage/disengage position.
 - **DHN/DHW** : Engage when condition is safe (zero vehicle speed).
- FRONT AXLE LOCKER ACTUATOR: Maintain position if locked, allow customer selected disengagement. Don't allow re-lock
- REAR AXLE LOCKER ACTUATOR: Normal Operation

POSSIBLE CAUSES

Possible Causes
TRANSFER CASE RANGE POSITION SIGNAL CIRCUIT SHORTED TO VOLTAGE
TRANSFER CASE RANGE POSITION SIGNAL CIRCUIT SHORTED TO ANOTHER CIRCUIT
MODE SELECT CIRCUIT OPEN OR HIGH RESISTANCE
RANGE POSITION SENSOR (RPS)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. ISOLATE AND CHECK THE (T314) TRANSFER CASE RANGE POSITION SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

1. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
2. Connect the negative lead of the Digital Volt-Ohm Meter (DVOM) to a known good ground.
3. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for voltage.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is voltage present on the circuit?

Yes

- Repair the circuit for a short to voltage. Use the wiring diagram as a guide to trace the circuit and identify any in-line connectors that may help isolate the location of the short.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST**.

No

- Go To [3](#)

3. ISOLATE AND CHECK THE (T314) TRANSFER CASE RANGE POSITION SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE DRIVETRAIN CONTROL MODULE (DTCM) HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the ECU and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the circuit for a short to another circuit. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#).

No

- Go To [4](#)

4. ISOLATE AND CHECK THE (K977) MODE SELECT CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the ECU and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Before testing a circuit, measure the resistance between the two leads of the DVOM. **Note:** Resistance in the meter leads can cause an error in the test results.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [5](#)

No

- Repair the circuit for an open or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#).

5. CHECK THE RANGE POSITION SENSOR (RPS)

TRANSFER CASE RANGE POSITION VS SENSOR RESISTANCE

Range Position	Minimum Resistance	Nominal Resistance	Maximum Resistance
2WD	1124.2Ω	1183.4Ω	1242.6Ω
4WD HIGH/4WD-AUTO	650.18Ω	684.4Ω	718.6Ω
Neutral	199.9Ω	210.4Ω	220.9Ω
4WD LOW	57.4Ω	60.4Ω	63.4Ω

1. Disconnect the RPS harness connector.
2. Measure the resistance across the Signal and Ground terminals at the sensor while moving the Transfer Case Shifter to all four positions. Note the resistance reading for each position.

Is the resistance within specification for each position?

Yes

- Go To [6](#)

No

- Replace the RPS in accordance with the Service Information. Refer to the appropriate service information .
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all DTCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to [MODULE, DRIVETRAIN CONTROL \(DTCM\), REMOVAL AND INSTALLATION](#) .
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

C1403-92-TRANSFER CASE RANGE POSITION SENSOR-PERFORMANCE OR INCORRECT OPERATION

For a complete TRANSFER CASE wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Transfer Case Range Position Sensor (RPS) is a serviceable component located on the top center of the Transfer Case next to the vent tube. There are two circuits between the sensor and the (DTCM) Drivetrain Control Module:

- Signal
- Sensor Ground

The RPS is a five-position, resistive type sensor. The sensor contains a plunger that contacts the sector plate inside the Transfer Case which has four discrete positions. The plunger moves in and out of the sensor body as the Transfer Case is shifted. As the plunger is depressed, the resistance value changes.

The sensor ground is used as a low voltage reference. The signal circuit feeds an analog input to the Drivetrain Control Module (DTCM) using a pull-up resistor to 5 volts. The resulting voltage value for each position is read by the DTCM to determine the Transfer Case range position. The voltage is also used by the DTCM software for diagnostic purposes.

TRANSFER CASE RANGE POSITION VS SIGNAL VOLTAGE

Range Position	Minimum voltage	Nominal Voltage	Maximum Voltage
2WD	3.336	3.517	3.682
4WD HIGH/4WD-AUTO	2.713	2.893	3.061
Neutral	1.356	1.491	1.633
4WD LOW	0.482	0.556	0.654

TRANSFER CASE RANGE POSITION VS SENSOR RESISTANCE

Range Position	Minimum Resistance	Nominal Resistance	Maximum Resistance
2WD	1, 124.2Ω	1, 183.4Ω	1, 242.6Ω
4WD HIGH/4WD-AUTO	650.18Ω	684.4Ω	718.6Ω
Neutral	199.9Ω	210.4Ω	220.9Ω
4WD LOW	57.4Ω	60.4Ω	63.4Ω

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine speed is more than 700 rpm for longer than 1 second.
- No Controller Area Network (CAN) Bus DTCs.

- Vehicle speed is more than a calibrated limit.
- Vehicle is steady-state condition.

SET CONDITION

NOTE: An improper shift from 4WD HIGH to 4WD LOW can cause this DTC to set in some 2018 model year vehicles. If the condition can not be duplicated by shifting the Transfer Case normally, erase the DTCs and do not make any repairs. Advise the customer on proper Transfer Case shifting in accordance with the Owners Manual.

NOTE: An incorrect Transfer Case or Axle ratio can also cause this DTC to set. If the Axles or Transfer Case was replaced, make sure the Body Control Module (BCM) was reprogrammed with the correct gear ratios. If the BCM was recently reprogrammed, make sure it was programmed correctly.

- Engine speed and wheel speed do not correspond to the Transfer Case Range Position Sensor value
- Voltage on the (T314) Transfer Case Range Position Signal is out of normal limits.
- Either condition above is present for more than 10 seconds.

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service 4WD system will be displayed.
- T-CASE SHIFTING:
 - **DHF/DHP** : Lock the clutch if last known position was in 4WD. If failed in 2WD, maintain clutch open position.
 - **DHN/DHW** : No action.
- FRONT AXLE DISCONNECT (FAD) ACTUATOR:
 - **DHF/DHP** : Maintain last engage/disengage position.
 - **DHN/DHW** : Engage when condition is safe (zero vehicle speed).
- FRONT AXLE LOCKER ACTUATOR: Maintain position if locked, allow customer selected disengagement. Don't allow re-lock
- REAR AXLE LOCKER ACTUATOR: Normal Operation

POSSIBLE CAUSES

Possible Causes
TRANSFER CASE SHIFT CABLE OUT OF ADJUSTMENT
TRANSFER CASE RANGE POSITION SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
TRANSFER CASE RANGE POSITION SIGNAL CIRCUIT SHORTED TO GROUND
TRANSFER CASE RANGE POSITION SIGNAL CIRCUIT SHORTED TO VOLTAGE
TRANSFER CASE RANGE POSITION SIGNAL CIRCUIT SHORTED TO ANOTHER CIRCUIT
MODE SELECT CIRCUIT OPEN OR HIGH RESISTANCE
RANGE POSITION SENSOR (RPS)
DRIVETRAIN CONTROL MODULE (DTCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: An improper shift from 4WD HIGH to 4WD LOW can cause this DTC to set in some 2018 model year vehicles. If the condition can not be duplicated by shifting the Transfer Case normally, erase the DTCs and do not make any repairs. Advise the customer on proper Transfer Case shifting in accordance with the Owners Manual.

NOTE: An incorrect Transfer Case or Axle ratio can also cause this DTC to set. If the Axles or Transfer Case was replaced, make sure the Body Control Module (BCM) was reprogrammed with the correct gear ratios. If the BCM was recently reprogrammed, make sure it was programmed correctly.

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. CHECK TRANSFER CASE SHIFT CABLE ADJUSTMENT

1. Check the Transfer Case Shift cable adjustment in accordance with the Service Information. Refer to [CABLE, SHIFT, REMOVAL AND INSTALLATION CABLE, SHIFT, REMOVAL AND INSTALLATION](#) .

Is the Shift cable adjusted properly?

Yes

- Go To [3](#)

No

- Adjust the Shift cable as needed. Refer to [CABLE, SHIFT, REMOVAL AND INSTALLATION CABLE, SHIFT, REMOVAL AND INSTALLATION](#) .
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

3. ISOLATE AND CHECK THE (T314) TRANSFER CASE RANGE POSITION SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.

3. Before testing a circuit, measure the resistance between the two leads of the Digital Volt-Ohm Meter (DVOM). **Note:** Resistance in the meter leads can cause an error in the test results.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [4](#)

No

- Repair the circuit for an open or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#).

4. ISOLATE AND CHECK THE (T314) TRANSFER CASE RANGE POSITION SIGNAL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the ECU and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and identify any in-line connectors that may help isolate the location of the short.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#).

No

- Go To [5](#)

5. ISOLATE AND CHECK THE (T314) TRANSFER CASE RANGE POSITION SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

1. Isolate the circuit by disconnecting the ECU and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
2. Connect the negative lead of the DVOM to a known good ground.
3. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for voltage.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is voltage present on the circuit?

Yes

- Repair the circuit for a short to voltage. Use the wiring diagram as a guide to trace the circuit and identify any in-line connectors that may help isolate the location of the short.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#).

No

- Go To [6](#)

6. ISOLATE AND CHECK THE (T314) TRANSFER CASE RANGE POSITION SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE DRIVETRAIN CONTROL MODULE (DTCM) HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the ECU and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the circuit for a short to another circuit. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#).

No

- Go To [7](#)

7. ISOLATE AND CHECK THE (K977) MODE SELECT CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the ECU and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Before testing a circuit, measure the resistance between the two leads of the DVOM. **Note:** Resistance in the meter leads can cause an error in the test results.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [8](#)

No

- Repair the circuit for an open or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#).

8. CHECK THE RANGE POSITION SENSOR (RPS)

TRANSFER CASE RANGE POSITION VS SENSOR RESISTANCE

Range Position	Minimum Resistance	Nominal Resistance	Maximum Resistance
2WD	1124.2Ω	1183.4Ω	1242.6Ω
4WD HIGH/4WD-AUTO	650.18Ω	684.4Ω	718.6Ω
Neutral	199.9Ω	210.4Ω	220.9Ω
4WD LOW	57.4Ω	60.4Ω	63.4Ω

1. Disconnect the RPS harness connector.
2. Measure the resistance across the Signal and Ground terminals at the sensor while moving the Transfer Case Shifter to all four positions. Note the resistance reading for each position.

Is the resistance within specification for each position?

Yes

- Go To [9](#)

No

- Replace the RPS in accordance with the Service Information. Refer to the appropriate service information.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#).

9. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all DTCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.

- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to **MODULE, DRIVETRAIN CONTROL (DTCM), REMOVAL AND INSTALLATION** .
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

C1406-11-TRANSFER CASE BRAKE CONTROL-CIRCUIT SHORT TO GROUND

For a complete TRANSFER CASE wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition is on or 1 second after engine crank.
- No Under/Over voltage DTCs set.
- Battery voltage is between 6.0 and 16.0 volts for more than 500 ms.

SET CONDITION

- When Step Motor Control D circuit is commanded off and both of the following conditions are true:
 - Voltage on the Step Motor Control D circuit is less than 0.734
 - Voltage on the Switched Battery Solenoid Supply circuit is less than 1.95 volts.
- When Switched Battery Solenoid Supply circuit is commanded on:
 - Current monitored across the H-bridge driver is more than 6.42 amps.
- Either of the above conditions are present for more than 500 ms.

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service 4WD system will be displayed.
- T-CASE SHIFTING: Maintain current position.
- FRONT AXLE DISCONNECT (FAD) ACTUATOR: Normal Operation.
- AXLE LOCKERS: Normal Operation.

- T-CASE CLUTCH: Normal Operation.

POSSIBLE CAUSES

Possible Causes
SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT SHORTED TO GROUND
TRANSFER CASE SHIFT MOTOR
DRIVETRAIN CONTROL MODULE (DTCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. ISOLATE AND CHECK THE (T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Connect the negative lead of the Digital Volt-Ohm Meter (DVOM) to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and identify any in-line connectors that may help isolate the location of the short.
- Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To [3](#)

3. CHECK THE DRIVETRAIN CONTROL MODULE (DTCM) MOTOR BRAKE SOLENOID DRIVERS FOR PROPER OPERATION

1. Reconnect the DTCM C1 harness connector.
2. Turn the ignition on.
3. Connect a 12-volt test light across the (T301) Switched Battery Solenoid Supply circuit and the (T317) Step Motor Control D in the Transfer Case Shift Motor C1 harness connector.

NOTE: **This DTC disables the high side driver for this circuit. Erasing the DTCs will allow the DTCM to re-enable the high side driver so the following steps can be performed.**

4. With the scan tool, erase DTCs.
5. With the scan tool, actuate the T-Case Motor Solenoid Lock in the DTCM.

NOTE: **Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly?

Yes

- Replace the Transfer Case Shift Motor in accordance with the Service Information. Refer to **MOTOR, SHIFT, REMOVAL AND INSTALLATION** .
- Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To [4](#)

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all DTCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.

- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to **MODULE, DRIVETRAIN CONTROL (DTCM), REMOVAL AND INSTALLATION** .
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

C1406-15-TRANSFER CASE BRAKE CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete TRANSFER CASE wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition is on or 1 second after cranking engine.
- No Under/Over voltage DTCs set.
- System voltage is between 6.0 and 16.0 volts for more than 500 ms.

SET CONDITION

- One or more of the following conditions are true:
 - The Drivetrain Control Module (DTCM) detects an open or short to voltage with the (T317) Step Motor Control D circuit commanded off.
 - The DTCM detects the current draw is below 6.42 amps with the (T317) Step Motor Control D circuit commanded on.

DEFAULT ACTION

- Shift Motor brake will be disabled while the fault is present.
- Service telltale lamp will be illuminated and on-screen message to service 4WD system will be displayed.
- T-CASE SHIFTING: T-Case Clutch position will be maintained.
- FRONT AXLE DISCONNECT (FAD) ACTUATOR: Current state will be maintained unless an over temperature condition is detected.

- FRONT AXLE LOCKER ACTUATOR: Normal Operation.
- REAR AXLE LOCKER ACTUATOR: Normal Operation

POSSIBLE CAUSES

Possible Causes
SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
STEP MOTOR CONTROL D CIRCUIT OPEN OR HIGH RESISTANCE
SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT SHORTED TO ANOTHER CIRCUIT
STEP MOTOR CONTROL D CIRCUIT SHORTED TO ANOTHER CIRCUIT
TRANSFER CASE SHIFT MOTOR
DTCM

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ISOLATE AND CHECK THE (T317) STEP MOTOR CONTROL D CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Before testing a circuit, measure the resistance between the two leads of the Digital Volt-Ohm Meter (DVOM). **Note:** Resistance in the meter leads can cause an error in the test results.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [3](#)

No

- Repair the circuit for an open or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

3. ISOLATE AND CHECK THE (T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the ECU and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Before testing a circuit, measure the resistance between the two leads of the DVOM. **Note:** Resistance in the meter leads can cause an error in the test results.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [4](#)

No

- Repair the circuit for an open or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

4. ISOLATE AND CHECK THE (T317) STEP MOTOR CONTROL D CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE DRIVETRAIN CONTROL MODULE (DTCM) HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the ECU and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

terminals.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the circuit for a short to another circuit. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the DTCM VERIFICATION TEST. Refer to [**DTCM VERIFICATION TEST**](#).

No

- Go To [5](#)

5. ISOLATE AND CHECK THE (T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE DTCM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the ECU and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the circuit for a short to another circuit. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the DTCM VERIFICATION TEST. Refer to [**DTCM VERIFICATION TEST**](#).

No

- Go To [6](#)

6. REPLACE THE TRANSFER CASE SHIFT MOTOR AND CHECK FOR THE DTC TO RETURN

1. Replace the Transfer Case Shift Motor in accordance with the Service Information. Refer to [**MOTOR, SHIFT, REMOVAL AND INSTALLATION**](#).
2. Connect the Transfer Case Shift Motor and all other harness connectors.
3. Turn the ignition on.
4. With the scan tool, erase DTCs.
5. Using the recorded Environmental Data and the When Monitored conditions, operate the vehicle in the conditions that set the DTC.
6. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [7](#)

No

- Replacing the Transfer Case Shift Motor corrected the condition.
- Perform the DTCM VERIFICATION TEST. Refer to [**DTCM VERIFICATION TEST**](#) .

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all DTCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to [**MODULE, DRIVETRAIN CONTROL \(DTCM\), REMOVAL AND INSTALLATION**](#) .
- Perform the DTCM VERIFICATION TEST. Refer to [**DTCM VERIFICATION TEST**](#) .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to [**DTCM VERIFICATION TEST**](#) .

C1406-92-TRANSFER CASE BRAKE CONTROL-PERFORMANCE OR INCORRECT OPERATION

For a complete TRANSFER CASE wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine speed is more than 700 rpm for 1 second.
- Shift Motor Brake is requested to be engaged.
- No Controller Area Network (CAN) Bus DTCs.

SET CONDITION

- Drivetrain Control Module (DTCM) is detecting pulses from the Shift Motor internal Mode Sensors when the motor brake is commanded to be engaged.
- The above condition occurs 8 times during an ignition cycle.

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service 4WD system will be displayed.
- T-CASE SHIFTING: Normal Functionality but use motor holding current to achieve and maintain desired position, assuming no motor over-temp.
- FRONT AXLE DISCONNECT (FAD) ACTUATOR: Normal Operation
- FRONT AXLE LOCKER ACTUATOR: Normal Operation.
- REAR AXLE LOCKER ACTUATOR: Normal Operation

POSSIBLE CAUSES

Possible Causes
TRANSFER CASE SHIFT MOTOR DTCM

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCs AND ENVIRONMENTAL DATA - ERASE DTCs AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. CHECK THE DRIVETRAIN CONTROL MODULE (DTCM) MOTOR BRAKE SOLENOID DRIVERS FOR PROPER OPERATION

1. Turn the ignition on.
2. Disconnect the Shift Motor harness connector.
3. Connect a 12-volt test light across the (T301) Switched Battery Solenoid Supply circuit and the (T317) Step Motor Control D at the Transfer Case Shift Motor C1 harness connector.

NOTE: This DTC disables the high side driver for this circuit. Erasing the DTCs will allow the DTCM to re-enable the high side driver so the following steps can be performed.

4. With the scan tool, erase the DTCs.
5. With the scan tool, actuate the T-Case Motor Solenoid Lock in the DTCM.

NOTE: Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace the Transfer Case Shift Motor in accordance with the Service Information. Refer to [MOTOR, SHIFT, REMOVAL AND INSTALLATION](#).
- Perform the TRANSFER CASE VERIFICATION TEST. Refer to [STANDARD PROCEDURE](#).

No

- Go To [3](#)

3. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all DTCM Module harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM Module harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.

7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM Module DTCs.

Did the DTC return?

Yes

- Replace the DTCM Module in accordance with the Service information. Refer to [MODULE, DRIVETRAIN CONTROL \(DTCM\), REMOVAL AND INSTALLATION](#) .
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

No

- Repair the poor connections as necessary.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

C140A-11-TRANSFER CASE MOTOR CONTROL-CIRCUIT SHORT TO GROUND

For a complete TRANSFER CASE wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

Active Transfer Case (DHP and DHF) - Shift Motor Operation

The Shift Motor is a serviceable component of the Transfer Case. There are two Control circuits between the Shift Motor and DTCM:

- Shift Motor Control A
- Shift Motor Control B

The Shift Motor turns a worm gear that in turn rotates a mechanical ramp style clutch actuator to apply and release the Front Drive Clutch.

The Shift Motor is used to apply and release the Front Drive Clutch in 2WD, 4WD, and 4WD-AUTO modes as follows:

- **2WD Mode:** The Front drive Clutch is released. No actuation of the clutch will occur and all torque is applied the Rear Axle.
- **4WD HIGH and 4WD LOW Modes:** The Front Drive Clutch will be applied at all times. Torque is split 50/50 between the Front and Rear Axles. However, the clutch is still actively controlled depending on engine torque. At a minimum, the clutch will be applied with 800 Nm of force. If engine torque increases, the DTCM will command the Shift Motor to increase clutch force up to 1600 Nm. Increasing the clutch force only when needed extends the life of the Front Drive Clutch, Clutch Actuator, and other Transfer Case components.
- **4WD-AUTO Mode:** The DTCM will automatically modulate the torque between the front and rear axles according to traction conditions by modulating the Front Drive Clutch. The ABS Wheel Speed Sensors are monitored via CAN communication to determine traction conditions.

The DTCM learns the relative clutch position (Kisspoint) in order to adapt to normal wear of the clutch over its lifespan. If any clutch related components are replaced, the Kisspoint must be relearned by initiating a Non-Volatile Memory Reset (Clear T-Case Adaptives) with the scan tool.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running more than 1 second.
- No Under/Over Voltage DTCs set.
- System voltage is between 6 and 16 volts for 500 ms.

SET CONDITION

- Shift Motor Control circuit voltage is less than 2.9 volts for more than 3.0 seconds when 4WD mode is not active.
- Shift Motor Control circuit current is greater than 85.713 amps for more than 3.0 seconds when 4WD mode is active (30A fuse will be blown).

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service 4WD system will be displayed.
- T-CASE SHIFTING: T-Case Clutch position will be maintained.
- FRONT AXLE DISCONNECT (FAD) ACTUATOR: Current state will be maintained unless an over temperature condition is detected.
- FRONT AXLE LOCKER ACTUATOR: Normal Operation.
- REAR AXLE LOCKER ACTUATOR: Normal Operation

POSSIBLE CAUSES

Possible Causes
SHIFT MOTOR CONTROL A CIRCUIT SHORTED TO GROUND
SHIFT MOTOR CONTROL B CIRCUIT SHORTED TO GROUND
TRANSFER CASE SHIFT MOTOR
DRIVETRAIN CONTROL MODULE (DTCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.
Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to [**TESTING FOR AN INTERMITTENT CONDITION**](#) .

2. ISOLATE AND CHECK THE (T315) SHIFT MOTOR CONTROL A CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Connect the negative lead of the Digital Volt-Ohm Meter (DVOM) to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and identify any in-line connectors that may help isolate the location of the short.
- Perform the DTCM VERIFICATION TEST. Refer to [**DTCM VERIFICATION TEST**](#) .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE (T316) SHIFT MOTOR CONTROL B CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the ECU and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and identify any in-line connectors that may help isolate the location of the short.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

No

- Go To [4](#)

4. REPLACE THE TRANSFER CASE SHIFT MOTOR AND CHECK FOR THE DTC TO RETURN

1. Replace the Transfer Case Shift Motor in accordance with the Service Information. Refer to [MOTOR, SHIFT, REMOVAL AND INSTALLATION](#) .
2. Connect the Transfer Case Shift Motor and all other harness connectors.
3. Turn the ignition on.
4. With the scan tool, erase DTCs.
5. Using the recorded Environmental Data and the When Monitored conditions, operate the vehicle in the conditions that set the DTC.
6. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Replacing the Transfer Case Shift Motor corrected the condition.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Drivetrain Control Module (DTCM) harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.

7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to **MODULE, DRIVETRAIN CONTROL (DTCM), REMOVAL AND INSTALLATION** .
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

C140A-12-TRANSFER CASE MOTOR CONTROL-CIRCUIT SHORT TO BATTERY

For a complete TRANSFER CASE wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

Active Transfer Case (DHP and DHF) - Shift Motor Operation

The Shift Motor is a serviceable component of the Transfer Case. There are two Control circuits between the Shift Motor and DTCM:

- Shift Motor Control A
- Shift Motor Control B

The Shift Motor turns a worm gear that in turn rotates a mechanical ramp style clutch actuator to apply and release the Front Drive Clutch.

The Shift Motor is used to apply and release the Front Drive Clutch in 2WD, 4WD, and 4WD-AUTO modes as follows:

- **2WD Mode:** The Front drive Clutch is released. No actuation of the clutch will occur and all torque is applied the Rear Axle.
- **4WD HIGH and 4WD LOW Modes:** The Front Drive Clutch will be applied at all times. Torque is split 50/50 between the Front and Rear Axles. However, the clutch is still actively controlled depending on engine torque. At a minimum, the clutch will be applied with 800 Nm of force. If engine torque increases, the DTCM will command the Shift Motor to increase clutch force up to 1600 Nm. Increasing the clutch force only when needed extends the life of the Front Drive Clutch, Clutch Actuator, and other Transfer Case components.
- **4WD-AUTO Mode:** The DTCM will automatically modulate the torque between the front and rear axles according to traction conditions by modulating the Front Drive Clutch. The ABS Wheel Speed Sensors are monitored via CAN communication to determine traction conditions.

The DTCM learns the relative clutch position (Kisspoint) in order to adapt to normal wear of the clutch over its lifespan. If any clutch related components are replaced, the Kisspoint must be relearned by initiating a Non-Volatile Memory Reset (Clear T-Case Adaptives) with the scan tool.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running more than 1 second.
- No Under/Over Voltage DTCs set.
- System voltage is between 6 and 16 volts for 500 ms.

SET CONDITION

- Motor Control circuit voltage is more than 4.5 volts for more than 3.0 seconds when 4WD mode is not active.
- Motor Control circuit current is greater than 85.713 amps for more than 3.0 seconds when 4WD mode is active (30A fuse will be blown). (May not be detected if duty cycle is 100%.)

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service 4WD system will be displayed.
- T-CASE SHIFTING: T-Case Clutch position will be maintained.
- FRONT AXLE DISCONNECT (FAD) ACTUATOR: Current state will be maintained unless an over temperature condition is detected.
- FRONT AXLE LOCKER ACTUATOR: Normal Operation.
- REAR AXLE LOCKER ACTUATOR: Normal Operation

POSSIBLE CAUSES

Possible Causes
SHIFT MOTOR CONTROL A CIRCUIT SHORTED TO VOLTAGE
SHIFT MOTOR CONTROL B CIRCUIT SHORTED TO VOLTAGE
TRANSFER CASE SHIFT MOTOR
DRIVETRAIN CONTROL MODULE (DTCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

- 1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN**
1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
 2. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data.
 3. With the scan tool, erase DTCs.
 4. Turn the ignition off for at least 10.0 seconds.
 5. Turn the ignition on.
 6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
 7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to [**TESTING FOR AN INTERMITTENT CONDITION**](#) .

2. ISOLATE AND CHECK THE (T315) SHIFT MOTOR CONTROL A CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Turn the ignition on, engine not running.
4. Measure voltage on the circuit being tested.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the DTCM VERIFICATION TEST. Refer to [**DTCM VERIFICATION TEST STANDARD PROCEDURE**](#) .

No

- Go To [**3**](#)

3. ISOLATE AND CHECK THE (T316) SHIFT MOTOR CONTROL B CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Isolate the circuit by disconnecting the ECU and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Turn the ignition on, engine not running.
4. Measure voltage on the circuit being tested.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the DTCM VERIFICATION TEST. Refer to [**DTCM VERIFICATION TEST**](#) .

No

- Go To [**4**](#)

4. REPLACE THE TRANSFER CASE SHIFT MOTOR AND CHECK FOR THE DTC TO RETURN

1. Replace the Transfer Case Shift Motor in accordance with the Service Information. Refer to [**MOTOR, SHIFT, REMOVAL AND INSTALLATION**](#) .
2. Connect the Transfer Case Shift Motor and all other harness connectors.
3. Turn the ignition on.
4. With the scan tool, erase DTCs.
5. Using the recorded Environmental Data and the When Monitored conditions, operate the vehicle in the conditions that set the DTC.
6. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Replacing the Transfer Case Shift Motor corrected the condition.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Drivetrain Control Module (DTCM) harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to [MODULE, DRIVETRAIN CONTROL \(DTCM\), REMOVAL AND INSTALLATION](#) .
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

C140A-13-TRANSFER CASE MOTOR CONTROL-CIRCUIT OPEN

For a complete TRANSFER CASE wiring diagram, **Refer to the appropriate wiring information .**

THEORY OF OPERATION

Active Transfer Case (DHP and DHF) - Shift Motor Operation

The Shift Motor is a serviceable component of the Transfer Case. There are two Control circuits between the Shift Motor and DTCM:

- Shift Motor Control A
- Shift Motor Control B

The Shift Motor turns a worm gear that in turn rotates a mechanical ramp style clutch actuator to apply and release the Front Drive Clutch.

The Shift Motor is used to apply and release the Front Drive Clutch in 2WD, 4WD, and 4WD-AUTO modes as follows:

- **2WD Mode:** The Front drive Clutch is released. No actuation of the clutch will occur and all torque is applied the Rear Axle.
- **4WD HIGH and 4WD LOW Modes:** The Front Drive Clutch will be applied at all times. Torque is split 50/50 between the Front and Rear Axles. However, the clutch is still actively controlled depending on engine torque. At a minimum, the clutch will be applied with 800 Nm of force. If engine torque increases, the DTCM will command the Shift Motor to increase clutch force up to 1600 Nm. Increasing the clutch force only when needed extends the life of the Front Drive Clutch, Clutch Actuator, and other Transfer Case components.
- **4WD-AUTO Mode:** The DTCM will automatically modulate the torque between the front and rear axles according to traction conditions by modulating the Front Drive Clutch. The ABS Wheel Speed Sensors are monitored via CAN communication to determine traction conditions.

The DTCM learns the relative clutch position (Kisspoint) in order to adapt to normal wear of the clutch over its lifespan. If any clutch related components are replaced, the Kisspoint must be relearned by initiating a Non-Volatile Memory Reset (Clear T-Case Adaptives) with the scan tool.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running more than 1 second.
- No Under/Over Voltage DTCs set.
- System voltage is between 6 and 16 volts for 500 ms.

SET CONDITION

- Both of the following conditions are true for more than 3 seconds:
 - Voltage on Shift Motor Control A circuit is less than 2.9 volts.
 - Voltage on Shift Motor Control B circuit is above 4.5 volts

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service 4WD system will be displayed.
- T-CASE SHIFTING: T-Case Clutch position will be maintained.
- FRONT AXLE DISCONNECT (FAD) ACTUATOR: Current state will be maintained unless an over temperature condition is detected.

- FRONT AXLE LOCKER ACTUATOR: Normal Operation.
- REAR AXLE LOCKER ACTUATOR: Normal Operation

POSSIBLE CAUSES

Possible Causes
SHIFT MOTOR CONTROL A CIRCUIT OPEN OR HIGH RESISTANCE
SHIFT MOTOR CONTROL B CIRCUIT OPEN OR HIGH RESISTANCE
TRANSFER CASE SHIFT MOTOR
DRIVETRAIN CONTROL MODULE (DTCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ISOLATE AND CHECK THE (T315) SHIFT MOTOR CONTROL A CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Before testing a circuit, measure the resistance between the two leads of the Digital Volt-Ohm Meter (DVOM). **Note:** Resistance in the meter leads can cause an error in the test results.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [3](#)

No

- Repair the circuit for an open or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

3. ISOLATE AND CHECK THE (T316) SHIFT MOTOR CONTROL B CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the ECU and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Before testing a circuit, measure the resistance between the two leads of the DVOM. **Note:** Resistance in the meter leads can cause an error in the test results.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [4](#)

No

- Repair the circuit for an open or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

4. REPLACE THE TRANSFER CASE SHIFT MOTOR AND CHECK FOR THE DTC TO RETURN

1. Replace the Transfer Case Shift Motor in accordance with the Service Information. Refer to [MOTOR, SHIFT, REMOVAL AND INSTALLATION](#) .
2. Connect the Transfer Case Shift Motor and all other harness connectors.
3. Turn the ignition on.
4. With the scan tool, erase DTCs.
5. Using the recorded Environmental Data and the When Monitored conditions, operate the vehicle in the conditions that set the DTC.
6. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Replacing the Transfer Case Shift Motor corrected the condition.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Drivetrain Control Module (DTCM) harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to **MODULE, DRIVETRAIN CONTROL (DTCM), REMOVAL AND INSTALLATION** .
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

C140A-4B-TRANSFER CASE MOTOR CONTROL-OVER TEMPERATURE

For a complete TRANSFER CASE wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

Active Transfer Case (DHP and DHF) - Shift Motor Operation

The Shift Motor is a serviceable component of the Transfer Case. There are two Control circuits between the Shift Motor and DTCM:

- Shift Motor Control A
- Shift Motor Control B

The Shift Motor turns a worm gear that in turn rotates a mechanical ramp style clutch actuator to apply and release the Front Drive Clutch.

The Shift Motor is used to apply and release the Front Drive Clutch in 2WD, 4WD, and 4WD-AUTO modes as follows:

- **2WD Mode:** The Front drive Clutch is released. No actuation of the clutch will occur and all torque is applied the Rear Axle.
- **4WD HIGH and 4WD LOW Modes:** The Front Drive Clutch will be applied at all times. Torque is split 50/50 between the Front and Rear Axles. However, the clutch is still actively controlled depending on engine torque. At a minimum, the clutch will be applied with 800 Nm of force. If engine torque increases, the DTCM will command the Shift Motor to increase clutch force up to 1600 Nm. Increasing the clutch force only when needed extends the life of the Front Drive Clutch, Clutch Actuator, and other Transfer Case components.
- **4WD-AUTO Mode:** The DTCM will automatically modulate the torque between the front and rear axles according to traction conditions by modulating the Front Drive Clutch. The ABS Wheel Speed Sensors are monitored via CAN communication to determine traction conditions.

The DTCM learns the relative clutch position (Kisspoint) in order to adapt to normal wear of the clutch over its lifespan. If any clutch related components are replaced, the Kisspoint must be relearned by initiating a Non-Volatile Memory Reset (Clear T-Case Adaptives) with the scan tool.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running more than 1 second.
- No Under/Over Voltage DTCs set.
- System voltage is between 6 and 16 volts for 500 ms.

SET CONDITION

- Thermistor located on the Drivetrain Control Module near the H-bridge for the Motor Control circuits indicates an over-temperature condition.

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service 4WD system will be displayed.
- T-CASE SHIFTING: T-Case Clutch position will be maintained.
- FRONT AXLE DISCONNECT (FAD) ACTUATOR: Current state will be maintained.
- FRONT AXLE LOCKER ACTUATOR: Normal Operation.
- REAR AXLE LOCKER ACTUATOR: Normal Operation

POSSIBLE CAUSES

Possible Causes
MOTOR CONTROL CIRCUIT DTCS ARE SET DTCM

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. CHECK FOR RELATED DTCS

1. Refer to the recorded DTCs.

Are any Transfer Case Motor Control related DTCs set?

Yes

- Refer to the appropriate procedure. Refer to **DIAGNOSIS AND TESTING**.

No

- Go To [3](#)

3. CHECK RELATED HARNESS CONNECTIONS

NOTE: This DTC can be caused by overuse of the Transfer Case Motor. Ensure customer driving habits are not causing this DTC before continuing with this procedure.

1. Disconnect all Drivetrain Control Module (DTCM) harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.

- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Go To [4](#)

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST**.

4. REPLACE TRANSFER CASE SHIFT MOTOR AND CHECK FOR THE DTC TO RETURN

1. Replace the Transfer Case Shift Motor in accordance with the Service Information. Refer to **MOTOR, SHIFT, REMOVAL AND INSTALLATION**.
2. With the scan tool, erase DTCs.
3. Turn the ignition off then back on.
4. Operate the vehicle within the conditions that originally set this DTC or use the When Monitored Conditions as a guide.
5. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL (DTCM), REMOVAL AND INSTALLATION**.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST**.

No

- Replacing the Transfer Case Shift Motor corrected the condition.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST**.

C140E-00-TRANSFER CASE MOTOR BLOCKED

For a complete TRANSFER CASE wiring diagram, **Refer to the appropriate wiring information**.

THEORY OF OPERATION

Active Transfer Case (DHP and DHF) - Shift Motor Operation

The Shift Motor is a serviceable component of the Transfer Case. There are two Control circuits between the Shift Motor and DTCM:

- Shift Motor Control A
- Shift Motor Control B

The Shift Motor turns a worm gear that in turn rotates a mechanical ramp style clutch actuator to apply and release the Front Drive Clutch.

The Shift Motor is used to apply and release the Front Drive Clutch in 2WD, 4WD, and 4WD-AUTO modes as follows:

- **2WD Mode:** The Front drive Clutch is released. No actuation of the clutch will occur and all torque is applied the Rear Axle.
- **4WD HIGH and 4WD LOW Modes:** The Front Drive Clutch will be applied at all times. Torque is split 50/50 between the Front and Rear Axles. However, the clutch is still actively controlled depending on engine torque. At a minimum, the clutch will be applied with 800 Nm of force. If engine torque increases, the DTCM will command the Shift Motor to increase clutch force up to 1600 Nm. Increasing the clutch force only when needed extends the life of the Front Drive Clutch, Clutch Actuator, and other Transfer Case components.
- **4WD-AUTO Mode:** The DTCM will automatically modulate the torque between the front and rear axles according to traction conditions by modulating the Front Drive Clutch. The ABS Wheel Speed Sensors are monitored via CAN communication to determine traction conditions.

The DTCM learns the relative clutch position (Kisspoint) in order to adapt to normal wear of the clutch over its lifespan. If any clutch related components are replaced, the Kisspoint must be relearned by initiating a Non-Volatile Memory Reset (Clear T-Case Adaptives) with the scan tool.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine speed is more than 700 rpm for 1 second.
- No Controller Area Network (CAN) Bus DTCs.
- Incremental sensor data valid.

SET CONDITION

- Transfer Case Motor speed is less than 1 rpm when motor current is above 15 amps for more than 30 ms.

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service 4WD system will be displayed.
- T-CASE SHIFTING: T-Case Clutch position will be maintained.
- FRONT AXLE DISCONNECT (FAD) ACTUATOR: Current state will be maintained unless an over temperature condition is detected.
- FRONT AXLE LOCKER ACTUATOR: Normal Operation.
- REAR AXLE LOCKER ACTUATOR: Normal Operation

POSSIBLE CAUSES

Possible Causes
TRANSFER CASE INTERNAL CONDITION
TRANSFER CASE SHIFT MOTOR

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE TRANSFER CASE FOR MECHANICAL ISSUES

1. Turn the ignition off.
2. Inspect the Transfer Case in accordance with the Service Information to determine if there are any mechanical conditions that are preventing the Shift Motor from engaging the requested range. Remove the Transfer Case Shift Motor and inspect the shift mechanism to determine if a mechanical condition exists with the Transfer Case.

Were any mechanical issues found?

Yes

- Repair or replace the Transfer Case in accordance with the Service Information.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- Go To [3](#)

3. CHECK THE TRANSFER CASE SHIFT MOTOR FOR PROPER OPERATION

1. Turn the ignition off.
2. Using the wiring diagram/schematic as a guide, inspect all wiring and connectors that pertain to this circuit.
3. If any problems are found, repair as necessary and retest.

4. If no problems were found, replace the Transfer Case Shift Motor in accordance with the Service Information. Refer to **MOTOR, SHIFT, REMOVAL AND INSTALLATION** .
5. With the scan tool, erase the DTCs.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Replace the Transfer Case in accordance with the Service information. Refer to **REMOVAL AND INSTALLATION REMOVAL AND INSTALLATION** .
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- Repairing the wiring condition or replacing the Transfer Case Shift Motor corrected the condition.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

C1412-11-TRANSFER CASE 4WD MODE SWITCH-CIRCUIT SHORT TO GROUND

For a complete TRANSFER CASE wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Transfer Case Selector (4WD-AUTO) Switch is not a serviceable component of the Transfer Case Shifter assembly. There are 2 circuits between the Transfer Case Selector Switch and the DTCM:

- 4WD-Auto Request Signal
- Ground

When the Transfer Case shifter is put into the 4WD-AUTO position, the Transfer Case Selector Switch located on the Transfer Case Shifter assembly completes a circuit to ground through the 4WD-Auto Request Signal circuit. The DTCM then monitors the ABS Wheel Speeds that are received over the CAN. When wheel slippage is detected, the DTCM modulates the front drive clutch to send torque to the front axle as needed.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition is on.
- No Under/Over voltage DTCs are set.

SET CONDITION

- Transfer Case Position Sensor Input circuit voltage is below 0.25 volts for more than 500 ms.

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service 4WD system will be displayed.
- T-CASE SHIFTING: If (T314) Transfer Case Range Position Signal indicates 4WD HIGH, that position will be maintained.
- FRONT AXLE DISCONNECT (FAD) ACTUATOR: Normal operation.
- FRONT AXLE LOCKER ACTUATOR: Normal Operation.

- REAR AXLE LOCKER ACTUATOR: Normal Operation

POSSIBLE CAUSES

Possible Causes
TRANSFER CASE POSITION SENSOR INPUT CIRCUIT SHORTED TO GROUND
TRANSFER CASE SELECTOR SWITCH
DRIVETRAIN CONTROL MODULE (DTCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. ISOLATE AND CHECK THE (K77) TRANSFER CASE POSITION SENSOR INPUT CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Connect the negative lead of the Digital Volt-Ohm Meter (DVOM) to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and identify any in-line connectors that may help isolate the location of the short.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- Go To [3](#)

3. REPLACE THE TRANSFER CASE SELECTOR SWITCH AND CHECK FOR THE DTC TO RETURN

1. Replace the Transfer Case Selector Switch in accordance with the Service Information.
2. Connect the component and ECU harness connectors.
3. Turn the ignition on.
4. With the scan tool, erase DTCs.
5. Using the Environmental Data or When Monitored information above, operate the vehicle within the conditions that set the DTC.
6. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [4](#)

No

- Replacing the Transfer Case Selector Switch corrected the condition.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Drivetrain Control Module (DTCM) harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.

7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to **MODULE, DRIVETRAIN CONTROL (DTCM), REMOVAL AND INSTALLATION** .
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

C1412-15-TRANSFER CASE 4WD MODE SWITCH-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete TRANSFER CASE wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Transfer Case Selector (4WD-AUTO) Switch is not a serviceable component of the Transfer Case Shifter assembly. There are 2 circuits between the Transfer Case Selector Switch and the DTCM:

- 4WD-Auto Request Signal
- Ground

When the Transfer Case shifter is put into the 4WD-AUTO position, the Transfer Case Selector Switch located on the Transfer Case Shifter assembly completes a circuit to ground through the 4WD-Auto Request Signal circuit. The DTCM then monitors the ABS Wheel Speeds that are received over the CAN. When wheel slippage is detected, the DTCM modulates the front drive clutch to send torque to the front axle as needed.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition is on.
- No Under/Over voltage DTCs are set.

SET CONDITION

- Transfer Case Position Sensor Input circuit voltage is above a calibrated value for more than 500 ms.

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service 4WD system will be displayed.
- T-CASE SHIFTING: If (T314) Transfer Case Range Position Signal indicates 4WD HIGH, that position will be maintained.
- FRONT AXLE DISCONNECT (FAD) ACTUATOR: Normal operation.
- FRONT AXLE LOCKER ACTUATOR: Normal Operation.
- REAR AXLE LOCKER ACTUATOR: Normal Operation

POSSIBLE CAUSES

Possible Causes
TRANSFER CASE POSITION SENSOR INPUT CIRCUIT OPEN OR HIGH RESISTANCE
TRANSFER CASE POSITION SENSOR INPUT CIRCUIT SHORTED TO VOLTAGE
TRANSFER CASE SELECTOR SWITCH
DRIVETRAIN CONTROL MODULE (DTCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ISOLATE AND CHECK THE (K77) TRANSFER CASE POSITION SENSOR INPUT CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Turn the ignition on, engine not running.
4. Measure voltage on the circuit being tested.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE (K77) TRANSFER CASE POSITION SENSOR INPUT CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the ECU and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Before testing a circuit, measure the resistance between the two leads of the Digital Volt-Ohm Meter (DVOM). **Note:** Resistance in the meter leads can cause an error in the test results.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [4](#)

No

- Repair the circuit for an open or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#).

4. REPLACE THE TRANSFER CASE SELECTOR SWITCH AND CHECK FOR THE DTC TO RETURN

1. Replace the Transfer Case Selector Switch in accordance with the Service Information.
2. Connect the component and ECU harness connectors.
3. Turn the ignition on.
4. With the scan tool, erase DTCs.
5. Using the Environmental Data or When Monitored information above, operate the vehicle within the conditions that set the DTC.
6. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Replacing the Transfer Case Selector Switch corrected the condition.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#).

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Drivetrain Control Module (DTCM) harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:

- Proper connector installation.
- Damaged connector locks.
- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to **MODULE, DRIVETRAIN CONTROL (DTCM), REMOVAL AND INSTALLATION** .
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

C1415-92-TRANSFER CASE MOTOR CURRENT-PERFORMANCE OR INCORRECT OPERATION

For a complete TRANSFER CASE wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

Active Transfer Case (DHP and DHF) - Shift Motor Operation

The Shift Motor is a serviceable component of the Transfer Case. There are two Control circuits between the Shift Motor and DTCM:

- Shift Motor Control A
- Shift Motor Control B

The Shift Motor turns a worm gear that in turn rotates a mechanical ramp style clutch actuator to apply and release the Front Drive Clutch.

The Shift Motor is used to apply and release the Front Drive Clutch in 2WD, 4WD, and 4WD-AUTO modes as follows:

- **2WD Mode:** The Front drive Clutch is released. No actuation of the clutch will occur and all torque is applied the Rear Axle.
- **4WD HIGH and 4WD LOW Modes:** The Front Drive Clutch will be applied at all times. Torque is split 50/50 between the Front and Rear Axles. However, the clutch is still actively controlled depending on engine torque. At a minimum, the clutch will be applied with 800 Nm of force. If engine torque increases, the DTCM will command the Shift Motor to increase clutch force up to 1600 Nm. Increasing the clutch force only when needed extends the life of the Front Drive Clutch, Clutch Actuator, and other Transfer Case components.
- **4WD-AUTO Mode:** The DTCM will automatically modulate the torque between the front and rear axles according to traction conditions by modulating the Front Drive Clutch. The ABS Wheel Speed Sensors are monitored via CAN communication to determine traction conditions.

The DTCM learns the relative clutch position (Kisspoint) in order to adapt to normal wear of the clutch over its lifespan. If any clutch related components are replaced, the Kisspoint must be relearned by initiating a Non-Volatile Memory Reset (Clear T-Case Adaptives) with the scan tool.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on or 1 second after engine crank.
- No Sensor supply circuit DTCs.
- Battery voltage between 6.0 and 16.0 volts for 500 ms.

SET CONDITION

- Current on one of the Motor Control circuits is more than 25 amps when the Shift Motor is active.
- Current on one of the Motor Control circuits is more than 250 mA when the Shift Motor is not active.

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service 4WD system will be displayed.
- T-CASE SHIFTING: T-Case Clutch position will be maintained unless an over temperature condition is detected.
- FRONT AXLE DISCONNECT (FAD) ACTUATOR: Current state will be maintained unless an over temperature condition is detected.
- FRONT AXLE LOCKER ACTUATOR: Normal Operation.
- REAR AXLE LOCKER ACTUATOR: Normal Operation

POSSIBLE CAUSES

Possible Causes
SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
SHIFT MOTOR CONTROL A CIRCUIT OPEN OR HIGH RESISTANCE
SHIFT MOTOR CONTROL A CIRCUIT SHORTED TO GROUND
SHIFT MOTOR CONTROL A CIRCUIT SHORTED TO VOLTAGE
SHIFT MOTOR CONTROL A CIRCUIT SHORTED TO ANOTHER CIRCUIT
SHIFT MOTOR CONTROL B CIRCUIT OPEN OR HIGH RESISTANCE
SHIFT MOTOR CONTROL B CIRCUIT SHORTED TO GROUND
SHIFT MOTOR CONTROL B CIRCUIT SHORTED TO VOLTAGE
SHIFT MOTOR CONTROL B CIRCUIT SHORTED TO ANOTHER CIRCUIT

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. ISOLATE AND CHECK THE (T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Before testing a circuit, measure the resistance between the two leads of the Digital Volt-Ohm Meter (DVOM). **Note:** Resistance in the meter leads can cause an error in the test results.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [3](#)

No

- Repair the circuit for an open or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

3. ISOLATE AND CHECK THE (T315) SHIFT MOTOR CONTROL A CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the ECU and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Before testing a circuit, measure the resistance between the two leads of the DVOM. **Note:** Resistance in the meter leads can cause an error in the test results.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [4](#)

No

- Repair the circuit for an open or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

4. ISOLATE AND CHECK THE (T315) SHIFT MOTOR CONTROL A CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the ECU and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and identify any in-line connectors that may help isolate the location of the short.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

No

- Go To [5](#)

5. ISOLATE AND CHECK THE (T315) SHIFT MOTOR CONTROL A CIRCUIT FOR A SHORT TO VOLTAGE

1. Isolate the circuit by disconnecting the ECU and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
2. Connect the negative lead of the DVOM to a known good ground.
3. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for voltage.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is voltage present on the circuit?

Yes

- Repair the circuit for a short to voltage. Use the wiring diagram as a guide to trace the circuit and identify any in-line connectors that may help isolate the location of the short.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

No

- Go To [6](#)

6. ISOLATE AND CHECK THE (T315) SHIFT MOTOR CONTROL A CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE DRIVETRAIN CONTROL MODULE (DTCM) HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the ECU and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the circuit for a short to another circuit. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

No

- Go To [7](#)

7. ISOLATE AND CHECK THE (T316) SHIFT MOTOR CONTROL B CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the ECU and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Before testing a circuit, measure the resistance between the two leads of the DVOM. **Note:** Resistance in the meter leads can cause an error in the test results.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [8](#)

No

- Repair the circuit for an open or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#).

8. ISOLATE AND CHECK THE (T316) SHIFT MOTOR CONTROL B CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the ECU and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and identify any in-line connectors that may help isolate the location of the short.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#).

No

- Go To [9](#)

9. ISOLATE AND CHECK THE (T316) SHIFT MOTOR CONTROL B CIRCUIT FOR A SHORT TO VOLTAGE

1. Isolate the circuit by disconnecting the ECU and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
2. Connect the negative lead of the DVOM to a known good ground.
3. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for voltage.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is voltage present on the circuit?

Yes

- Repair the circuit for a short to voltage. Use the wiring diagram as a guide to trace the circuit and identify any in-line connectors that may help isolate the location of the short.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

No

- Go To [10](#)

10. ISOLATE AND CHECK THE (T316) SHIFT MOTOR CONTROL B CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE DTCM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the ECU and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the circuit for a short to another circuit. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

No

- Go To [11](#)

11. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all DTCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:

- Proper connector installation.
- Damaged connector locks.
- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to **MODULE, DRIVETRAIN CONTROL (DTCM), REMOVAL AND INSTALLATION** .
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

C1416-11-FRONT DIFFERENTIAL CONTROL-CIRCUIT SHORT TO GROUND

For a complete AXLE LOCKER SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition is on.
- No system Under/Over voltage DTCs set.
- Front Axle Locker Actuator is in OFF state (disengaged).

SET CONDITION

- Front Locker Return circuit voltage below 1.47 volts for more than 500 ms.

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service Axle Locker System will be displayed.
- T-CASE SHIFTING: Normal Operation.
- FRONT AXLE DISCONNECT (FAD) ACTUATOR: Normal Operation.
- FRONT AXLE LOCKER ACTUATOR: Maintain current state. Allow customer disengagement. No reengage allowed.
- REAR AXLE LOCKER ACTUATOR: Normal Operation

POSSIBLE CAUSES

Possible Causes
FRONT LOCKER RETURN CIRCUIT SHORTED TO GROUND FRONT AXLE LOCKER ACTUATOR DTCM

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ISOLATE AND CHECK THE (T524) FRONT LOCKER RETURN CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Connect the negative lead of the Digital Volt-Ohm Meter (DVOM) to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and identify any in-line connectors that may help isolate the location of the short.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST**.

No

- Go To [3](#)

3. CHECK THE DTCM HARNESS CONNECTOR AND TERMINALS

1. Turn the ignition off.
2. Check the DTCM harness connector for proper connection at the Front Differential.
3. Verify that the connector is completely plugged in and locked prior to disconnecting.
4. Disconnect the DTCM harness connector and check for pushed out or spread terminals, brineling on terminals, discoloration from excessive heat, or corrosion and water intrusion.

Were any issues found with the connector or terminals?

Yes

- Repair the found issues in accordance with the service information or properly connect and lock the COMPONENT harness connector.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST**.

No

- Go To [4](#)

4. REPLACE THE FRONT AXLE LOCKER ACTUATOR AND CHECK FOR THE DTC TO RETURN

1. Replace the Front Axle Locker Actuator in accordance with the Service Information. Refer to **REMOVAL AND INSTALLATION**.
2. Connect the component and ECU harness connectors.
3. Turn the ignition on.
4. With the scan tool, erase DTCs.
5. Using the Environmental Data or When Monitored information above, operate the vehicle within the conditions that set the DTC.
6. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Replacing the Front Axle Locker Actuator corrected the condition.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Drivetrain Control Module (DTCM) harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to **MODULE, DRIVETRAIN CONTROL (DTCM), REMOVAL AND INSTALLATION** .
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

C1416-12-FRONT DIFFERENTIAL CONTROL-CIRCUIT SHORT TO BATTERY

For a complete AXLE LOCKER SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition is on.
- No system Under/Over voltage DTCs set.
- Front Axle Locker Actuator is in ON state (engaged).

SET CONDITION

- The low-side driver Field-Effect Transistor (FET) (T524) Front Locker Return circuit could be shorted to voltage.

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service Axle Locker System will be displayed.
- T-CASE SHIFTING: Normal Operation.
- FRONT AXLE DISCONNECT (FAD) ACTUATOR: Normal Operation.
- FRONT AXLE LOCKER ACTUATOR: Maintain current state. Allow customer disengagement. No reengage allowed.
- REAR AXLE LOCKER ACTUATOR: Normal Operation.

POSSIBLE CAUSES

Possible Causes
FRONT LOCKER RETURN CIRCUIT SHORTED TO VOLTAGE
FRONT AXLE LOCKER ACTUATOR
DRIVETRAIN CONTROL MODULE (DTCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ISOLATE AND CHECK THE (T524) FRONT LOCKER RETURN CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Turn the ignition on, engine not running.
4. Measure voltage on the circuit being tested.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the DTCM VERIFICATION TEST. Refer to [**DTCM VERIFICATION TEST**](#) .

No

- Go To [3](#)

3. CHECK THE DTCM HARNESS CONNECTOR AND TERMINALS

1. Turn the ignition off.
2. Check the DTCM harness connector for proper connection at the Front Differential.
3. Verify that the connector is completely plugged in and locked prior to disconnecting.
4. Disconnect the DTCM harness connector and check for pushed out or spread terminals, brineling on terminals, discoloration from excessive heat, or corrosion and water intrusion.

Were any issues found with the connector or terminals?

Yes

- Repair the found issues in accordance with the service information or properly connect and lock the COMPONENT harness connector.
- Perform the DTCM VERIFICATION TEST. Refer to [**DTCM VERIFICATION TEST**](#) .

No

- Go To [4](#)

4. REPLACE THE FRONT AXLE LOCKER ACTUATOR AND CHECK FOR THE DTC TO RETURN

1. Replace the Front Axle Locker Actuator in accordance with the Service Information. .
2. Connect the component and ECU harness connectors.
3. Turn the ignition on.
4. With the scan tool, erase DTCs.
5. Using the Environmental Data or When Monitored information above, operate the vehicle within the conditions that set the DTC.
6. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Replacing the Front Axle Locker Actuator corrected the condition.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Drivetrain Control Module (DTCM) harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to **MODULE, DRIVETRAIN CONTROL (DTCM), REMOVAL AND INSTALLATION** .
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

C1416-13-FRONT DIFFERENTIAL CONTROL-CIRCUIT OPEN

For a complete AXLE LOCKER SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition is on.
- No system Under/Over voltage DTCs set.
- Front Axle Locker Actuator is in OFF state (disengaged).

SET CONDITION

- Front Locker Return circuit voltage is between 1.47 and 6.37 volts for more than 500 ms.

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service Axle Locker System will be displayed.
- T-CASE SHIFTING: Normal Operation.
- FRONT AXLE DISCONNECT (FAD) ACTUATOR: Normal Operation.
- FRONT AXLE LOCKER ACTUATOR: Maintain current state. Allow customer disengagement. No reengage allowed.
- REAR AXLE LOCKER ACTUATOR: Normal Operation.

POSSIBLE CAUSES

Possible Causes
FRONT LOCKER RETURN CIRCUIT OPEN OR HIGH RESISTANCE
FUSED IGNITION RUN/START CONTROL OUTPUT
FRONT AXLE LOCKER ACTUATOR
DTCM

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE (F946) FUSED IGNITION CIRCUIT FOR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the 12.0 volt supply circuit.
2. Connect the positive lead of the load test tool to the 12.0 volt supply circuit at the component harness connector (A). **Note:** refer to the diagram below.
3. Connect the negative lead of the load test tool to the ground circuit of the Battery or a good chassis ground.
4. Ensure that the circuit being tested is being powered on. If the 12.0 volt circuit being tested is an ignition feed for example, the ignition must be on. If testing an output from a relay, verify that the relay is energized and on.
5. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Why perform a Voltage Drop Test? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [**CIRCUIT LOAD TESTING PROCEDURES**](#).

NOTE: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Why perform a Voltage Drop Test? To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [**CIRCUIT LOAD TESTING PROCEDURES**](#).

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [3](#)

No

- Repair the 12.0 volt circuit for an open or high resistance. If the fuse is found to be open, check the circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate service information .

3. ISOLATE AND CHECK THE (T524) FRONT LOCKER RETURN CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Before testing a circuit, measure the resistance between the two leads of the Digital Volt-Ohm Meter (DVOM). **Note:** Resistance in the meter leads can cause an error in the test results.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [4](#)

No

- Repair the circuit for an open or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

4. CHECK THE DTCM HARNESS CONNECTOR AND TERMINALS

1. Turn the ignition off.
2. Check the DTCM harness connector for proper connection at the Front Differential.
3. Verify that the connector is completely plugged in and locked prior to disconnecting.
4. Disconnect the DTCM harness connector and check for pushed out or spread terminals, brineling on terminals, discoloration from excessive heat, or corrosion and water intrusion.

Were any issues found with the connector or terminals?

Yes

- Repair the found issues in accordance with the service information or properly connect and lock the COMPONENT harness connector.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- Go To [5](#)

5. REPLACE THE FRONT AXLE LOCKER ACTUATOR AND CHECK FOR THE DTC TO RETURN

1. Replace the Front Axle Locker Actuator in accordance with the Service Information. Refer to **REMOVAL AND INSTALLATION** .
2. Connect the component and ECU harness connectors.
3. Turn the ignition on.
4. With the scan tool, erase DTCs.
5. Using the Environmental Data or When Monitored information above, operate the vehicle within the conditions that set the DTC.
6. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [6](#)

No

- Replacing the Front Axle Locker Actuator corrected the condition.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Drivetrain Control Module (DTCM) harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).

- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to [MODULE, DRIVETRAIN CONTROL \(DTCM\), REMOVAL AND INSTALLATION](#) .
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

C141C-11-REAR DIFFERENTIAL CONTROL-CIRCUIT SHORT TO GROUND

For a complete AXLE LOCKER SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition is on.
- No system Under/Over voltage DTCs set.
- Rear Locker is in OFF state (disengaged).

SET CONDITION

- Rear Locker Return circuit voltage is less than 1.47 volts for more than 500 ms.

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service Axle Locker System will be displayed.
- T-CASE SHIFTING: Normal Operation.
- FRONT AXLE DISCONNECT (FAD) ACTUATOR: Normal Operation.
- FRONT AXLE LOCKER ACTUATOR: Front Axle will be disengaged if locked.
- REAR AXLE LOCKER ACTUATOR: Maintain current state.

POSSIBLE CAUSES

Possible Causes
REAR LOCKER RETURN CIRCUIT SHORTED TO GROUND
REAR AXLE LOCKER ACTUATOR
DRIVETRAIN CONTROL MODULE (DTCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. ISOLATE AND CHECK THE (T528) REAR LOCKER RETURN CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Connect the negative lead of the Digital Volt-Ohm Meter (DVOM) to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and identify any in-line connectors that may help isolate the location of the short.
- Perform the DTCM VERIFICATION TEST. Refer to [**DTCM VERIFICATION TEST**](#) .

No

- Go To [**3**](#)

3. CHECK THE DTCM HARNESS CONNECTOR AND TERMINALS

1. Turn the ignition off.
2. Check the DTCM harness connector for proper connection at the Rear Differential.
3. Verify that the connector is completely plugged in and locked prior to disconnecting.
4. Disconnect the DTCM harness connector and check for pushed out or spread terminals, brining on terminals, discoloration from excessive heat, or corrosion and water intrusion.

Were any issues found with the connector or terminals?

Yes

- Repair the found issues in accordance with the service information or properly connect and lock the COMPONENT harness connector.
- Perform the DTCM VERIFICATION TEST. Refer to [**DTCM VERIFICATION TEST**](#) .

No

- Go To [**4**](#)

4. REPLACE THE REAR AXLE LOCKER ACTUATOR AND CHECK FOR THE DTC TO RETURN

1. Replace the Rear Axle Locker Actuator in accordance with the Service Information.
2. Connect the component and ECU harness connectors.
3. Turn the ignition on.
4. With the scan tool, erase DTCs.
5. Using the Environmental Data or When Monitored information above, operate the vehicle within the conditions that set the DTC.
6. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To

No

- Replacing the Rear Axle Locker Actuator corrected the condition.
- Perform the DTCM VERIFICATION TEST. Refer to [**DTCM VERIFICATION TEST**](#) .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Drivetrain Control Module (DTCM) harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.

- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to **MODULE, DRIVETRAIN CONTROL (DTCM), REMOVAL AND INSTALLATION**.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST**.

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST**.

C141C-12-REAR DIFFERENTIAL CONTROL-CIRCUIT SHORT TO BATTERY

For a complete AXLE LOCKER SYSTEM wiring diagram, **Refer to the appropriate wiring information**.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition is on.
- No system Under/Over voltage DTCs set.
- Rear Locker is in ON state (engaged).

SET CONDITION

- The low-side driver Field-Effect Transistor Rear Locker Return circuit could be shorted to voltage.

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service Axle Locker System will be displayed.
- T-CASE SHIFTING: Normal Operation.

- FRONT AXLE DISCONNECT (FAD) ACTUATOR: Normal Operation.
- FRONT AXLE LOCKER ACTUATOR: Front Axle will be disengaged if locked.
- REAR AXLE LOCKER ACTUATOR: Maintain current state.

POSSIBLE CAUSES

Possible Causes
REAR LOCKER RETURN CIRCUIT SHORTED TO VOLTAGE
REAR AXLE LOCKER ACTUATOR
DRIVETRAIN CONTROL MODULE (DTCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ISOLATE AND CHECK THE (T528) REAR LOCKER RETURN CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Turn the ignition on, engine not running.
4. Measure voltage on the circuit being tested.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- Go To [3](#)

3. CHECK THE DTCM HARNESS CONNECTOR AND TERMINALS

1. Turn the ignition off.
2. Check the DTCM harness connector for proper connection at the Rear Differential.
3. Verify that the connector is completely plugged in and locked prior to disconnecting.
4. Disconnect the DTCM harness connector and check for pushed out or spread terminals, brineling on terminals, discoloration from excessive heat, or corrosion and water intrusion.

Were any issues found with the connector or terminals?

Yes

- Repair the found issues in accordance with the service information or properly connect and lock the COMPONENT harness connector.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

No

- Go To [4](#)

4. REPLACE THE REAR AXLE LOCKER ACTUATOR AND CHECK FOR THE DTC TO RETURN

1. Replace the Rear Axle Locker Actuator in accordance with the Service Information.
2. Connect the component and ECU harness connectors.
3. Turn the ignition on.
4. With the scan tool, erase DTCs.
5. Using the Environmental Data or When Monitored information above, operate the vehicle within the conditions that set the DTC.
6. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Replacing the Rear Axle Locker Actuator corrected the condition.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Drivetrain Control Module (DTCM) harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).

- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to **MODULE, DRIVETRAIN CONTROL (DTCM), REMOVAL AND INSTALLATION** .
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

C141C-13-REAR DIFFERENTIAL CONTROL-CIRCUIT OPEN

For a complete AXLE LOCKER SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition is on.
- No system Under/Over voltage DTCs set.
- Rear Locker is in OFF state (disengaged).

SET CONDITION

- Rear Locker Return circuit voltage is between 1.47 and 6.37 volts for more than 500 ms.

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service Axle Locker System will be displayed.
- T-CASE SHIFTING: Normal Operation.
- FRONT AXLE DISCONNECT (FAD) ACTUATOR: Normal Operation.
- FRONT AXLE LOCKER ACTUATOR: Front Axle will be disengaged if locked.
- REAR AXLE LOCKER ACTUATOR: Maintain current state.

POSSIBLE CAUSES

Possible Causes
REAR LOCKER RETURN CIRCUIT OPEN OR HIGH RESISTANCE
REAR AXLE LOCKER ACTUATOR
DRIVETRAIN CONTROL MODULE (DTCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE (F946) FUSED IGNITION CIRCUIT FOR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Disconnect the component harness connector to isolate the 12.0 volt supply circuit.
2. Connect the positive lead of the load test tool to the 12.0 volt supply circuit at the component harness connector (A). **Note:** refer to the diagram below.
3. Connect the negative lead of the load test tool to the ground circuit of the Battery or a good chassis ground.
4. Ensure that the circuit being tested is being powered on. If the 12.0 volt circuit being tested is an ignition feed for example, the ignition must be on. If testing an output from a relay, verify that the relay is energized and on.
5. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE:

Why perform a Voltage Drop Test? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load

testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

NOTE: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Why perform a Voltage Drop Test? To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT LOAD TESTING PROCEDURE** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#) .

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [3](#)

No

- Repair the 12.0 volt circuit for an open or high resistance. If the fuse is found to be open, check the circuit for a short to ground.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate service information .

3. ISOLATE AND CHECK THE (T528) REAR LOCKER RETURN CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Before testing a circuit, measure the resistance between the two leads of the Digital Volt-Ohm Meter (DVOM). **Note:** Resistance in the meter leads can cause an error in the test results.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [4](#)

No

- Repair the circuit for an open or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

4. CHECK THE DTCM HARNESS CONNECTOR AND TERMINALS

1. Turn the ignition off.
2. Check the DTCM harness connector for proper connection at the Rear Differential.
3. Verify that the connector is completely plugged in and locked prior to disconnecting.
4. Disconnect the DTCM harness connector and check for pushed out or spread terminals, brineling on terminals, discoloration from excessive heat, or corrosion and water intrusion.

Were any issues found with the connector or terminals?

Yes

- Repair the found issues in accordance with the service information or properly connect and lock the DTCM harness connector.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

No

- Go To [5](#)

5. REPLACE THE REAR AXLE LOCKER ACTUATOR AND CHECK FOR THE DTC TO RETURN

1. Replace the Rear Axle Locker Actuator in accordance with the Service Information. Refer to [REMOVAL AND INSTALLATION](#) .
2. Connect the component and ECU harness connectors.
3. Turn the ignition on.
4. With the scan tool, erase DTCs.

5. Using the Environmental Data or When Monitored information above, operate the vehicle within the conditions that set the DTC.
6. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [6](#)

No

- Replacing the Rear Axle Locker Actuator corrected the condition.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Drivetrain Control Module (DTCM) harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to [MODULE, DRIVETRAIN CONTROL \(DTCM\), REMOVAL AND INSTALLATION](#) .
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

C1438-00-TRANSFER CASE DIFFERENTIAL CLUTCH WORN

For a complete TRANSFER CASE wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine speed is more than 700 rpm for 1 second.
- No Over-travel DTCs.
- No Encoder Signal circuit DTCs.

SET CONDITION

- The Drivetrain Control Module (DTCM) has detected that the clutch has traveled beyond safe limits during normal operation or when a kiss-point learn routine has been performed.

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service 4WD system will be displayed.
- T-CASE SHIFTING: T-Case Clutch position will be maintained.
- FRONT AXLE DISCONNECT (FAD) ACTUATOR: Current state will be maintained unless an over temperature condition is detected.
- FRONT AXLE LOCKER ACTUATOR: Normal Operation.
- REAR AXLE LOCKER ACTUATOR: Normal Operation

POSSIBLE CAUSES

Possible Causes
DRIVETRAIN 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
TRANSFER CASE ENCODER SIG 1 CIRCUIT OPEN OR HIGH RESISTANCE
DRIVETRAIN SENSOR RETURN CIRCUIT OPEN OR HIGH RESISTANCE
TRANSFER CASE CLUTCH WORN
DTCM

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding.
Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. ISOLATE AND CHECK THE (K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Before testing a circuit, measure the resistance between the two leads of the Digital Volt-Ohm Meter (DVOM). **Note:** Resistance in the meter leads can cause an error in the test results.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [3](#)

No

- Repair the circuit for an open or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

3. ISOLATE AND CHECK THE (T308) TRANSFER CASE ENCODER SIG 1 CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the ECU and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Before testing a circuit, measure the resistance between the two leads of the DVOM. **Note:** Resistance in the meter leads can cause an error in the test results.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [4](#)

No

- Repair the circuit for an open or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

4. ISOLATE AND CHECK THE (K594) DRIVETRAIN SENSOR RETURN CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the ECU and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Before testing a circuit, measure the resistance between the two leads of the DVOM. **Note:** Resistance in the meter leads can cause an error in the test results.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [5](#)

No

- Repair the circuit for an open or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

5. CHECK FOR A WORN TRANSFER CASE CLUTCH

1. Turn the ignition on.
2. With the scan tool, erase DTCs.
3. Shift the Transfer case into 2WD.
4. With the scan tool, perform the "Non-Volatile Memory Reset (Clear T-Case Adaptives)" routine.
5. Turn the ignition off for 10 seconds, then turn ignition on. (Do not perform any Transfer Case shifts.)

NOTE: When the ignition is turned back on, the Drivetrain Control Module (DTCM) will perform a Clutch Learn.

6. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Replace the worn clutch pack assembly in accordance with the Service Information.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

No

- Go To [6](#)

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all DTCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to [MODULE, DRIVETRAIN CONTROL \(DTCM\), REMOVAL AND INSTALLATION](#) .
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

C1444-00-T-CASE MOTOR OVERUSE

For a complete TRANSFER CASE wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

Active Transfer Case (DHP and DHF) - Shift Motor Operation

The Shift Motor is a serviceable component of the Transfer Case. There are two Control circuits between the Shift Motor and DTCM:

- Shift Motor Control A
- Shift Motor Control B

The Shift Motor turns a worm gear that in turn rotates a mechanical ramp style clutch actuator to apply and release the Front Drive Clutch.

The Shift Motor is used to apply and release the Front Drive Clutch in 2WD, 4WD, and 4WD-AUTO modes as follows:

- **2WD Mode:** The Front drive Clutch is released. No actuation of the clutch will occur and all torque is applied the Rear Axle.
- **4WD HIGH and 4WD LOW Modes:** The Front Drive Clutch will be applied at all times. Torque is split 50/50 between the Front and Rear Axles. However, the clutch is still actively controlled depending on engine torque. At a minimum, the clutch will be applied with 800 Nm of force. If engine torque increases, the DTCM will command the Shift Motor to increase clutch force up to 1600 Nm. Increasing the clutch force only when needed extends the life of the Front Drive Clutch, Clutch Actuator, and other Transfer Case components.
- **4WD-AUTO Mode:** The DTCM will automatically modulate the torque between the front and rear axles according to traction conditions by modulating the Front Drive Clutch. The ABS Wheel Speed Sensors are monitored via CAN communication to determine traction conditions.

The DTCM learns the relative clutch position (Kisspoint) in order to adapt to normal wear of the clutch over its lifespan. If any clutch related components are replaced, the Kisspoint must be relearned by initiating a Non-Volatile Memory Reset (Clear T-Case Adaptives) with the scan tool.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine speed is more than 700 rpm for 1 second.
- No Controller Area Network (CAN) Bus DTCs.

SET CONDITION

- A thermal model is used to determine motor temperature. If the predicted motor temperature is more than a safe value, this DTC sets.

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service 4WD system will be displayed.
- T-CASE SHIFTING: T-Case Clutch will be locked, if possible.
- FRONT AXLE DISCONNECT (FAD) ACTUATOR: Engaged.
- FRONT AXLE LOCKER ACTUATOR: Normal Operation.
- REAR AXLE LOCKER ACTUATOR: Normal Operation

POSSIBLE CAUSES

Possible Causes
AMBIENT AIR TEMPERATURE (AAT) SENSOR
TRANSFER CASE SHIFT MOTOR
DRIVETRAIN CONTROL MODULE (DTCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: Extreme vehicle maneuvers can cause this DTC to set if the motor lock is constantly being engaged and disengaged making the shift motor work harder to keep the clutch engaged.

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

NOTE: Diagnose and repair any system voltage or Transfer Case related DTCs in the Drivetrain Control Module (DTCM) before continuing with this test.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. CHECK AMBIENT AIR TEMPERATURE SENSOR VALUE

1. With the scan tool, read the Ambient Air Temperature Sensor value in the Body Control Module (BCM) data list.

Is the ambient air temperature value accurate?

Yes

- Go To [3](#)

No

- Check the Ambient Air Temperature sensor circuits for an open, high resistance, and shorts. If no problems are found, replace the Ambient Air Temperature Sensor in accordance with the Service Information.
- Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. REPLACE THE TRANSFER CASE SHIFT MOTOR AND CHECK FOR THE DTC TO RETURN

NOTE: A Mechanical failure of the Motor Brake can cause the motor to constantly keep the clutch electronically engaged. Extreme vehicle maneuvers can also cause this DTC to set if the motor lock is constantly being engaged and disengaged making the shift motor work harder to keep the clutch engaged.

1. Replace the Transfer Case Shift Motor in accordance with the Service Information. Refer to **MOTOR, SHIFT, REMOVAL AND INSTALLATION** .
2. Connect the Transfer Case Shift Motor and all other harness connectors.
3. Turn the ignition on.
4. With the scan tool, erase DTCs.
5. Using the recorded Environmental Data and the When Monitored conditions, operate the vehicle in the conditions that set the DTC.
6. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [4](#)

No

- Replacing the Transfer Case Shift Motor corrected the condition.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all DTCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.

9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to **MODULE, DRIVETRAIN CONTROL (DTCM), REMOVAL AND INSTALLATION** .
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

C144D-11-FRONT DIFFERENTIAL POSITION SENSOR-CIRCUIT SHORT TO GROUND

For a complete AXLE LOCKER SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition is on.
- No Over/Under system voltage DTCs set.

SET CONDITION

- Current draw on the Front Locker Switch Sense circuit is more than 22.3 mA for more than 500 ms.

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to Service Axle Locker System will be displayed.
- T-Case Shifting: Normal Operation.
- Front Axle Disconnect (FAD) Actuator: Normal Operation.
- Front Axle Locker Actuator: Front Axle will remain engaged if locked. Customer is allowed to disengage however, locker can not be re-engaged.
- Rear Axle Locker Actuator: Maintain current state.

POSSIBLE CAUSES

Possible Causes
FRONT LOCKER SWITCH SENSE CIRCUIT SHORTED TO GROUND FRONT AXLE LOCKER SENSOR DRIVETRAIN CONTROL MODULE (DTCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. **READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN**

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

2. ISOLATE AND CHECK THE (T522) FRONT LOCKER SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Connect the negative lead of the Digital Volt-Ohm Meter (DVOM) to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and identify any in-line connectors that may help isolate the location of the short.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#).

No

- Go To [3](#)

3. CHECK THE DTCM HARNESS CONNECTOR AND TERMINALS

1. Turn the ignition off.
2. Check the DTCM harness connector for proper connection at the Front Differential.
3. Verify that the connector is completely plugged in and locked prior to disconnecting.

4. Disconnect the DTCM harness connector and check for pushed out or spread terminals, brineling on terminals, discoloration from excessive heat, or corrosion and water intrusion.

Were any issues found with the connector or terminals?

Yes

- Repair the found issues in accordance with the service information or properly connect and lock the COMPONENT harness connector.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST**.

No

- Go To [4](#)

4. REPLACE THE FRONT AXLE LOCKER SENSOR AND CHECK FOR THE DTC TO RETURN

1. Replace the Front Axle Locker Sensor in accordance with the Service Information. .
2. Connect the component and ECU harness connectors.
3. Turn the ignition on.
4. With the scan tool, erase DTCs.
5. Using the Environmental Data or When Monitored information above, operate the vehicle within the conditions that set the DTC.
6. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Replacing the Front Axle Locker Sensor corrected the condition.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST**.

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Drivetrain Control Module (DTCM) harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to **MODULE, DRIVETRAIN CONTROL (DTCM), REMOVAL AND INSTALLATION** .
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

C144D-15-FRONT DIFFERENTIAL POSITION SENSOR-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete AXLE LOCKER SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition is on.
- No Over/Under system voltage DTCs set.

SET CONDITION

- Current draw on the Front Locker Switch Sense circuit is less than 4.1 mA for more than 500 ms.

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service Axle Locker System will be displayed.
- T-Case Shifting: Normal Operation.
- Front Axle Disconnect (FAD) Actuator: Normal Operation.
- Front Axle Locker Actuator: Maintain current state. Allow customer disengagement. No reengage allowed.
- Rear Axle Locker Actuator: Maintain current state.

POSSIBLE CAUSES

Possible Causes
FRONT LOCKER SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE
FRONT LOCKER SWITCH SENSE CIRCUIT OPEN/HIGH RESISTANCE
FRONT LOCKER SENSOR RETURN CIRCUIT OPEN/HIGH RESISTANCE

Possible Causes
FRONT AXLE LOCKER SENSOR DRIVETRAIN CONTROL MODULE (DTCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE DTCM HARNESS CONNECTOR AND TERMINALS

1. Turn the ignition off.
2. Check the DTCM harness connector for proper connection at the Front Differential.
3. Verify that the connector is completely plugged in and locked prior to disconnecting.
4. Disconnect the DTCM harness connector and check for pushed out or spread terminals, brineling on terminals, discoloration from excessive heat, or corrosion and water intrusion.

Were any issues found with the connector or terminals?

Yes

- Repair the found issues in accordance with the service information or properly connect and lock the COMPONENT harness connector.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE (T522) FRONT LOCKER SWITCH SENSE CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow

the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.

3. Before testing a circuit, measure the resistance between the two leads of the Digital Volt-Ohm Meter (DVOM). **Note:** Resistance in the meter leads can cause an error in the test results.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [4](#)

No

- Repair the circuit for an open or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#).

4. ISOLATE AND CHECK THE (T522) FRONT LOCKER SWITCH SENSE CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Isolate the circuit by disconnecting the ECU and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Turn the ignition on, engine not running.
4. Measure voltage on the circuit being tested.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#).

No

- Go To [5](#)

5. ISOLATE AND CHECK THE (T523) FRONT LOCKER SENSOR RETURN CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Before testing a circuit, measure the resistance between the two leads of the Digital Volt-Ohm Meter (DVOM). **Note:** Resistance in the meter leads can cause an error in the test results.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [6](#)

No

- Repair the circuit for an open or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#).

6. REPLACE THE FRONT AXLE LOCKER SENSOR AND CHECK FOR THE DTC TO RETURN

1. Replace the Front Axle Locker Sensor in accordance with the Service Information. .
2. Connect the component and ECU harness connectors.
3. Turn the ignition on.
4. With the scan tool, erase DTCs.
5. Using the Environmental Data or When Monitored information above, operate the vehicle within the conditions that set the DTC.
6. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [7](#)

No

- Replacing the Front Axle Locker Sensor corrected the condition.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#).

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Drivetrain Control Module (DTCM) harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to **MODULE, DRIVETRAIN CONTROL (DTCM), REMOVAL AND INSTALLATION** .
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

C144D-64-FRONT DIFFERENTIAL POSITION SENSOR-SIGNAL PLAUSIBILITY FAILURE

For a complete AXLE LOCKER SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Vehicle speed is more than 1 mph.
- Engine speed is more than 700 rpm for more than 1 second.
- Rear axle locker is not engaged.
- No Electronic Control Unit (ECU) memory or Controller Area Network (CAN) DTCs set.

SET CONDITION

- There is a mismatch between the commanded state and actual state of the front axle locker.

DEFAULT ACTION

- This monitor stops running once this DTC is set for the current ignition cycle.
- Service telltale lamp will be illuminated and on-screen message to service Axle Locker System will be displayed.
- T-Case Shifting: Normal Operation.
- Front Axle Disconnect (FAD) Actuator: Normal Operation.
- Front Axle Locker Actuator: Maintain current state. Allow customer disengagement. No reengage allowed.
- Rear Axle Locker Actuator: Normal operation.

POSSIBLE CAUSES

Possible Causes
FRONT AXLE LOCKER SENSOR
DRIVETRAIN CONTROL MODULE (DTCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: Diagnose all Front Axle Locker circuit related DTCs before continuing.

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE DTCM HARNESS CONNECTOR AND TERMINALS

1. Turn the ignition off.
2. Check the DTCM harness connector for proper connection at the Rear Differential.
3. Verify that the connector is completely plugged in and locked prior to disconnecting.
4. Disconnect the DTCM harness connector and check for pushed out or spread terminals, brineling on terminals, discoloration from excessive heat, or corrosion and water intrusion.

Were any issues found with the connector or terminals?

Yes

- Repair the found issues in accordance with the service information or properly connect and lock the DTCM harness connector.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- Go To [3](#)

3. REPLACE THE FRONT AXLE LOCKER SENSOR AND CHECK FOR THE DTC TO RETURN

1. Replace the Front Axle Locker Sensor in accordance with the Service Information. Refer to **REMOVAL AND INSTALLATION** .

2. Connect the component and ECU harness connectors.
3. Turn the ignition on.
4. With the scan tool, erase DTCs.
5. Using the Environmental Data or When Monitored information above, operate the vehicle within the conditions that set the DTC.
6. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [4](#)

No

- Replacing the Front Axle Locker Sensor corrected the condition.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST**.

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Drivetrain Control Module (DTCM) harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to **MODULE, DRIVETRAIN CONTROL (DTCM), REMOVAL AND INSTALLATION** .
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

C1451-11-REAR DIFFERENTIAL POSITION SENSOR-CIRCUIT SHORT TO GROUND

For a complete AXLE LOCKER SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition is on.
- No Over/Under system voltage DTCs set.

SET CONDITION

- Current draw on the Rear Locker Switch Sense circuit is more than 22.3 mA for more than 500 ms.

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service Axle Locker System will be displayed.
- T-Case Shifting: Normal Operation.
- Front Axle Disconnect (FAD) Actuator: Normal Operation.
- Front Axle Locker Actuator: Limited Operation.
- Rear Axle Locker Actuator: Maintain current state. Allow customer disengagement. No reengage allowed.

POSSIBLE CAUSES

Possible Causes
REAR LOCKER SWITCH SENSE CIRCUIT SHORTED TO GROUND
REAR AXLE LOCKER SENSOR
DRIVETRAIN CONTROL MODULE (DTCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .**

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.

6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. ISOLATE AND CHECK THE (T527) REAR LOCKER SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Connect the negative lead of the Digital Volt-Ohm Meter (DVOM) to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and identify any in-line connectors that may help isolate the location of the short.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

No

- Go To [3](#)

3. CHECK THE DTCM HARNESS CONNECTOR AND TERMINALS

1. Turn the ignition off.
2. Check the DTCM harness connector for proper connection at the Rear Differential.
3. Verify that the connector is completely plugged in and locked prior to disconnecting.
4. Disconnect the DTCM harness connector and check for pushed out or spread terminals, brineling on terminals, discoloration from excessive heat, or corrosion and water intrusion.

Were any issues found with the connector or terminals?

Yes

- Repair the found issues in accordance with the service information or properly connect and lock the DTCM harness connector.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

No

- Go To [4](#)

4. REPLACE THE REAR AXLE LOCKER ACTUATOR AND CHECK FOR THE DTC TO RETURN

1. Replace the Rear Axle Locker Sensor in accordance with the Service Information. .
2. Connect the component and ECU harness connectors.
3. Turn the ignition on.
4. With the scan tool, erase DTCs.
5. Using the Environmental Data or When Monitored information above, operate the vehicle within the conditions that set the DTC.
6. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Replacing the Rear Axle Locker Sensor corrected the condition.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#) .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Drivetrain Control Module (DTCM) harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.

7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to **MODULE, DRIVETRAIN CONTROL (DTCM), REMOVAL AND INSTALLATION** .
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

C1451-15-REAR DIFFERENTIAL POSITION SENSOR-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete AXLE LOCKER SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition is on.
- No Over/Under system voltage DTCs set.

SET CONDITION

- Current draw on the Rear Locker Switch Sense circuit is less than 4.1 mA for more than 500 ms.

DEFAULT ACTION

- Service telltale lamp will be illuminated and on-screen message to service Axle Locker System will be displayed.
- T-Case Shifting: Normal Operation.
- Front Axle Disconnect (FAD) Actuator: Normal Operation.
- Front Axle Locker Actuator: Limited operation.
- Rear Axle Locker Actuator: Maintain current state. Allow customer disengagement. No reengage allowed.

POSSIBLE CAUSES

Possible Causes
REAR LOCKER SWITCH SENSE CIRCUIT OPEN OR HIGH RESISTANCE
REAR LOCKER SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE
REAR LOCKER SENSOR RETURN CIRCUIT OPEN OR HIGH RESISTANCE
REAR LOCKER SENSOR RETURN CIRCUIT SHORTED TO VOLTAGE
REAR AXLE LOCKER SENSOR
DRIVETRAIN CONTROL MODULE (DTCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ISOLATE AND CHECK THE (T527) REAR LOCKER SWITCH SENSE CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Before testing a circuit, measure the resistance between the two leads of the Digital Volt-Ohm Meter (DVOM). **Note:** Resistance in the meter leads can cause an error in the test results.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [3](#)

No

- Repair the circuit for an open or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

3. ISOLATE AND CHECK THE (T527) REAR LOCKER SWITCH SENSE CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Isolate the circuit by disconnecting the ECU and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Turn the ignition on, engine not running.
4. Measure voltage on the circuit being tested.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#).

No

- Go To [4](#)

4. ISOLATE AND CHECK THE (T538) REAR LOCKER SENSOR RETURN CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit. Check the disconnected connectors and related harnesses for damage, corrosion, and loose fitting terminals.
3. Before testing a circuit, measure the resistance between the two leads of the Digital Volt-Ohm Meter (DVOM). **Note:** Resistance in the meter leads can cause an error in the test results.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When back-probing a circuit at a harness connector, always use an appropriate back probing tool to prevent damage to the connector terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [5](#)

No

- Repair the circuit for an open or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to [DTCM VERIFICATION TEST](#).

5. CHECK THE DTCM HARNESS CONNECTOR AND TERMINALS

1. Turn the ignition off.
2. Check the DTCM harness connector for proper connection at the Rear Differential.
3. Verify that the connector is completely plugged in and locked prior to disconnecting.
4. Disconnect the DTCM harness connector and check for pushed out or spread terminals, brineling on terminals, discoloration from excessive heat, or corrosion and water intrusion.

Were any issues found with the connector or terminals?

Yes

- Repair the found issues in accordance with the service information or properly connect and lock the DTCM harness connector.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- Go To [6](#)

6. REPLACE THE REAR AXLE LOCKER SENSOR AND CHECK FOR THE DTC TO RETURN

1. Replace the Rear Axle Locker Sensor in accordance with the Service Information. .
2. Connect the component and ECU harness connectors.
3. Turn the ignition on.
4. With the scan tool, erase DTCs.
5. Using the Environmental Data or When Monitored information above, operate the vehicle within the conditions that set the DTC.
6. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [7](#)

No

- Replacing the Rear Axle Locker Sensor corrected the condition.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Drivetrain Control Module (DTCM) harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all DTCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.

6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read DTCM DTCs.

Did the DTC return?

Yes

- Replace the DTCM in accordance with the Service information. Refer to **MODULE, DRIVETRAIN CONTROL (DTCM), REMOVAL AND INSTALLATION** .
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- The wiring or poor connection problem has been repaired.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

C1451-64-REAR DIFFERENTIAL POSITION SENSOR-SIGNAL PLAUSIBILITY FAILURE

For a complete AXLE LOCKER SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Vehicle speed is more than 1 mph.
- Engine speed is more than 700 rpm for more than 1 second.
- Rear axle locker is not engaged.
- No Electronic Control Unit (ECU) memory or Controller Area Network (CAN) DTCs set.

SET CONDITION

- There is a mismatch between the commanded state and actual state of the Rear Axle Locker.

DEFAULT ACTION

- This monitor stops running once this DTC is set for the current ignition cycle.
- Service telltale lamp will be illuminated and on-screen message to service Axle Locker System will be displayed.
- T-Case Shifting: Normal Operation.
- Front Axle Disconnect (FAD) Actuator: Normal Operation.
- Front Axle Locker Actuator: Disengage Front Locker if engaged.
- Rear Axle Locker Actuator: Maintain current state. Allow customer disengagement. No reengage allowed.

POSSIBLE CAUSES

Possible Causes
REAR AXLE LOCKER SENSOR
DRIVETRAIN CONTROL MODULE (DTCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: **Diagnose all Rear Axle Locker circuit related DTCs before continuing.**

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a Vehicle Scan Report or record the Environmental Data.
3. With the scan tool, erase DTCs.
4. Turn the ignition off for at least 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE DTCM HARNESS CONNECTOR AND TERMINALS

1. Turn the ignition off.
2. Check the DTCM harness connector for proper connection at the Rear Differential.
3. Verify that the connector is completely plugged in and locked prior to disconnecting.
4. Disconnect the DTCM harness connector and check for pushed out or spread terminals, brineling on terminals, discoloration from excessive heat, or corrosion and water intrusion.

Were any issues found with the connector or terminals?

Yes

- Repair the found issues in accordance with the service information or properly connect and lock the DTCM harness connector.
- Perform the DTCM VERIFICATION TEST. Refer to **DTCM VERIFICATION TEST** .

No

- Go To [3](#)

3. REPLACE THE REAR AXLE LOCKER SENSOR AND CHECK FOR THE DTC TO RETURN
