Amplifier (AMP) - DTCS B1460-11 To B14B9-13 - Gladiator

DTC TROUBLESHOOTING

B1460-11-CHANNEL 1 AUDIO SPEAKER OUTPUT - CIRCUIT SHORT TO GROUND

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, Refer to the appropriate wiring information .

AUDIO CHANNEL MAPPING

NOTE: Proper diagnosis of the audio system will require the use of this Audio Channel Mapping in addition to using the Audio System wiring diagrams. The use of Audio Channel Mapping and sales codes are being used to quickly identify those differences in locations; and the total number of speakers in the audio system configurations noted below.

CHANNEL 12	
SALES CODE	DESCRIPTION
Without RSJ	WIRELESS SPEAKER - BLUETOOTH

CHANNEL 12	
SALES CODE	DESCRIPTION
RSJ	WIRELESS SPEAKER - BLUETOOTH

THEORY OF OPERATION

The Amplifier has a constant fused B+ feed and ground to the module. When an ignition on command is sent over the CAN bus, the Amplifier will wake up and turn on.

The Amplifier receives the audio signal circuits from the radio's front right and left, and rear right and left audio inputs and then converts the signals to amplified audio signals to corresponding speakers. The Amplifier monitors the speaker output feeds for any speaker concerns, wiring opens or shorts.

For additional information regarding the description and operation of the Audio System. Refer to [**DESCRIPTION AND OPERATION**](#) .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Amplifier (AMP) detects a shorted to ground condition on the speaker output circuits.

DEFAULT ACTION

- The Amplifiers power integrated circuit automatically shuts down the individual channel speaker output when this fault is detected.

POSSIBLE CAUSES

Possible Causes
SPEAKER SPEAKER (+/-) CIRCUIT SHORTED TO GROUND AMPLIFIER

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [**PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**](#) .

CIRCUITS TO BE TESTED

Speaker Circuits

Circuit ID	Circuit Description
X209	(+)
X299	(-)

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, erase all DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.

6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. CHECK THE RELATED SPEAKER(S)

1. Ensure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related speaker(s) harness connector.
5. Turn the ignition on.
6. Turn the Radio on.
7. With the scan tool, read the Amplifier DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the related speaker in accordance with the Service Information. Refer to [SPEAKER, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: **When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.**

NOTE: **There should be no continuity between ground and the circuit being tested.**

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.

- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Amplifier harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.**

8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the Service information. Refer to [AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

B1460-12-CHANNEL 1 AUDIO SPEAKER OUTPUT - CIRCUIT SHORT TO BATTERY

8. With the scan tool, read DTCs.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the harness connector at the component of the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage of the circuit being tested at the component harness connector.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

4. CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the harness connector at the component of the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage of the circuit being tested at the component harness connector.

Is there any voltage present?

Yes

- Go To [5](#)

No

- Go To [6](#)

5. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Amplifier harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.**

8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the Service information. Refer to [**AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: **When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any**

possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [3](#)

No

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [4](#)

No

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. REPLACE THE RELATED SPEAKER(S)

1. Replace the related speaker(s) in accordance with the Service Information. Refer to **SPEAKER, REMOVAL AND INSTALLATION** .
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, erase all DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Replacement of the speaker(s) has corrected the concern.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Amplifier harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.

8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the Service information. Refer to [AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

B1460-92-CHANNEL 1 AUDIO SPEAKER OUTPUT - PERFORMANCE OR INCORRECT OPERATION

Speaker Circuits

Circuit ID	Circuit Description
X209	(+)
X299	(-)

DIAGNOSTIC TEST

1. READ AND RECORD DTCs AND ENVIRONMENTAL DATA - ERASE DTCs AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.**
3. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, erase all DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Amplifier harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the Service Information. Refer to [**AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

B1465-11-CHANNEL 2 AUDIO SPEAKER OUTPUT - CIRCUIT SHORT TO GROUND

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **Refer to the appropriate wiring information** .

AUDIO CHANNEL MAPPING

NOTE:

Proper diagnosis of the audio system will require the use of this Audio Channel Mapping in addition to using the Audio System wiring diagrams. The use of Audio Channel Mapping and sales codes are being used to quickly identify those differences in locations; and the total number of speakers in the audio system configurations noted below.

CHANNEL 12	
SALES CODE	DESCRIPTION
Without RSJ	WIRELESS SPEAKER - BLUETOOTH

CHANNEL 12	
SALES CODE	DESCRIPTION
RSJ	WIRELESS SPEAKER - BLUETOOTH

THEORY OF OPERATION

The Amplifier has a constant fused B+ feed and ground to the module. When an ignition on command is sent over the CAN bus, the Amplifier will wake up and turn on.

The Amplifier receives the audio signal circuits from the radio's front right and left, and rear right and left audio inputs and then converts the signals to amplified audio signals to corresponding speakers. The Amplifier monitors the speaker output feeds for any speaker concerns, wiring opens or shorts.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Amplifier (AMP) detects a shorted to ground condition on the speaker output circuits.

DEFAULT ACTION

- The Amplifiers power integrated circuit automatically shuts down the individual channel speaker output when this fault is detected.

POSSIBLE CAUSES

Possible Causes
SPEAKER SPEAKER (+/-) CIRCUIT SHORTED TO GROUND AMPLIFIER

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

CIRCUITS TO BE TESTED

Speaker Circuits

Circuit ID	Circuit Description
X208	(+)
X298	(-)

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, erase all DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE RELATED SPEAKER(S)

1. Ensure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related speaker(s) harness connector.
5. Turn the ignition on.
6. Turn the Radio on.
7. With the scan tool, read the Amplifier DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the related speaker in accordance with the Service Information. Refer to **SPEAKER, REMOVAL AND INSTALLATION** .

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [5](#)

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Amplifier harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.**

8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the Service information. Refer to **AMPLIFIER (AMP), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the harness connector at the component of the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage of the circuit being tested at the component harness connector.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [6](#)

4. CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the harness connector at the component of the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCS.**
3. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data related to the DTCS.
4. With the scan tool, erase all DTCS.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCS.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCS.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Amplifier harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the Service Information. Refer to [**AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

B146A-11-CHANNEL 3 AUDIO SPEAKER OUTPUT - CIRCUIT SHORT TO GROUND

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **Refer to the appropriate wiring information** .

AUDIO CHANNEL MAPPING

NOTE: Proper diagnosis of the audio system will require the use of this Audio Channel Mapping in addition to using the Audio System wiring diagrams. The use of Audio Channel Mapping and sales codes are being used to quickly identify

those differences in locations; and the total number of speakers in the audio system configurations noted below.

CHANNEL 12	
SALES CODE	DESCRIPTION
Without RSJ	WIRELESS SPEAKER - BLUETOOTH

CHANNEL 12	
SALES CODE	DESCRIPTION
RSJ	WIRELESS SPEAKER - BLUETOOTH

THEORY OF OPERATION

The Amplifier has a constant fused B+ feed and ground to the module. When an ignition on command is sent over the CAN bus, the Amplifier will wake up and turn on.

The Amplifier receives the audio signal circuits from the radio's front right and left, and rear right and left audio inputs and then converts the signals to amplified audio signals to corresponding speakers. The Amplifier monitors the speaker output feeds for any speaker concerns, wiring opens or shorts.

For additional information regarding the description and operation of the Audio System. Refer to [**DESCRIPTION AND OPERATION**](#) .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Amplifier (AMP) detects a shorted to ground condition on the speaker output circuits.

DEFAULT ACTION

- The Amplifiers power integrated circuit automatically shuts down the individual channel speaker output when this fault is detected.

POSSIBLE CAUSES

Possible Causes
SPEAKER SPEAKER (+/-) CIRCUIT SHORTED TO GROUND AMPLIFIER

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.
Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

CIRCUITS TO BE TESTED

Speaker Circuits

Circuit ID	Circuit Description

X291	(-)

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, erase all DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE RELATED SPEAKER(S)

1. Ensure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related speaker(s) harness connector.
5. Turn the ignition on.
6. Turn the Radio on.
7. With the scan tool, read the Amplifier DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the related speaker in accordance with the Service Information. Refer to **SPEAKER, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to

follow the path of the circuit.

3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.

3. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data related to the DTCS.
4. With the scan tool, erase all DTCS.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCS.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCS.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [3](#)

3. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Amplifier harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the Service Information. Refer to **AMPLIFIER (AMP), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B146F-11-CHANNEL 4 AUDIO SPEAKER OUTPUT - CIRCUIT SHORT TO GROUND

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **Refer to the appropriate wiring information** .

AUDIO CHANNEL MAPPING

NOTE: Proper diagnosis of the audio system will require the use of this Audio Channel Mapping in addition to using the Audio System wiring diagrams. The use of Audio Channel Mapping and sales codes are being used to quickly identify those differences in locations; and the total number of speakers in the audio system configurations noted below.

CHANNEL 12	
SALES CODE	DESCRIPTION
Without RSJ	WIRELESS SPEAKER - BLUETOOTH

CHANNEL 12	
SALES CODE	DESCRIPTION
RSJ	WIRELESS SPEAKER - BLUETOOTH

THEORY OF OPERATION

The Amplifier has a constant fused B+ feed and ground to the module. When an ignition on command is sent over the CAN bus, the Amplifier will wake up and turn on.

The Amplifier receives the audio signal circuits from the radio's front right and left, and rear right and left audio inputs and then converts the signals to amplified audio signals to corresponding speakers. The Amplifier monitors the speaker output feeds for any speaker concerns, wiring opens or shorts.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Amplifier (AMP) detects a shorted to ground condition on the speaker output circuits.

DEFAULT ACTION

- The Amplifiers power integrated circuit automatically shuts down the individual channel speaker output when this fault is detected.

POSSIBLE CAUSES

Possible Causes
SPEAKER SPEAKER (+/-) CIRCUIT SHORTED TO GROUND AMPLIFIER

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

CIRCUITS TO BE TESTED

Speaker Circuits

Circuit ID	Circuit Description
X202	(+)
X292	(-)

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCS.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
4. With the scan tool, erase all DTCS.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCS.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCS.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. CHECK THE RELATED SPEAKER(S)

1. Ensure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related speaker(s) harness connector.
5. Turn the ignition on.
6. Turn the Radio on.
7. With the scan tool, read the Amplifier DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the related speaker in accordance with the Service Information. Refer to [SPEAKER, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Amplifier harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.

8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the Service information. Refer to [AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

THEORY OF OPERATION

The Amplifier has a constant fused B+ feed and ground to the module. When an ignition on command is sent over the CAN bus, the Amplifier will wake up and turn on.

The Amplifier receives the audio signal circuits from the radio's front right and left, and rear right and left audio inputs and then converts the signals to amplified audio signals to corresponding speakers. The Amplifier monitors the speaker output feeds for any speaker concerns, wiring opens or shorts.

For additional information regarding the description and operation of the Audio System. Refer to [**DESCRIPTION AND OPERATION**](#) .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Amplifier (AMP) detects that the output circuits are shorted together.

DEFAULT ACTION

- The Amplifiers power integrated circuit automatically shuts down the individual channel speaker output when this fault is detected.

POSSIBLE CAUSES

Possible Causes
SPEAKER SPEAKER (+) CIRCUIT SHORTED TO THE SPEAKER (-) CIRCUIT AMPLIFIER

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

CIRCUITS TO BE TESTED

Speaker Circuits

Circuit ID	Circuit Description
X202	(+)
X292	(-)

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCS.**
3. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data related to the DTCS.
4. With the scan tool, erase all DTCS.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCS.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCS.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Amplifier harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the Service Information. Refer to **AMPLIFIER (AMP), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCS.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
4. With the scan tool, erase all DTCS.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCS.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCS.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. CHECK THE RELATED SPEAKER(S)

1. Ensure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related speaker(s) harness connector.
5. Turn the ignition on.
6. Turn the Radio on.
7. With the scan tool, read the Amplifier DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the related speaker in accordance with the Service Information. Refer to [SPEAKER, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.

3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, erase all DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the service information. Refer to [AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

B1478-00-CHANNEL 5 AUDIO SPEAKER OUTPUT - CIRCUIT SHORTED TOGETHER

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, Refer to the appropriate wiring information.

AUDIO CHANNEL MAPPING

NOTE: Proper diagnosis of the audio system will require the use of this Audio Channel Mapping in addition to using the Audio System wiring diagrams. The use of Audio Channel Mapping and sales codes are being used to quickly identify those differences in locations; and the total number of speakers in the audio system configurations noted below.

CHANNEL 12	
SALES CODE	DESCRIPTION
Without RSJ	WIRELESS SPEAKER - BLUETOOTH

CHANNEL 12	
SALES CODE	DESCRIPTION
RSJ	WIRELESS SPEAKER - BLUETOOTH

THEORY OF OPERATION

The Amplifier has a constant fused B+ feed and ground to the module. When an ignition on command is sent over the CAN bus, the Amplifier will wake up and turn on.

The Amplifier receives the audio signal circuits from the radio's front right and left, and rear right and left audio inputs and then converts the signals to amplified audio signals to corresponding speakers. The Amplifier monitors the speaker output feeds for any speaker concerns, wiring opens or shorts.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Amplifier (AMP) detects that the output circuits are shorted together.

DEFAULT ACTION

- The Amplifiers power integrated circuit automatically shuts down the individual channel speaker output when this fault is detected.

POSSIBLE CAUSES

Possible Causes
SPEAKER SPEAKER (+) CIRCUIT SHORTED TO THE SPEAKER (-) CIRCUIT AMPLIFIER

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

CIRCUITS TO BE TESTED

Speaker Circuits

Circuit ID	Circuit Description
X205	(+)
X295	(-)

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCS.**
3. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data related to the DTCS.
4. With the scan tool, erase all DTCS.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCS.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCS.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Amplifier harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the Service Information. Refer to **AMPLIFIER (AMP), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1479-11-CHANNEL 6 AUDIO SPEAKER OUTPUT - CIRCUIT SHORT TO GROUND

5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. CHECK THE RELATED SPEAKER(S)

1. Ensure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related speaker(s) harness connector.
5. Turn the ignition on.
6. Turn the Radio on.
7. With the scan tool, read the Amplifier DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the related speaker in accordance with the Service Information. Refer to [SPEAKER, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.

RSJ	WIRELESS SPEAKER - BLUETOOTH

THEORY OF OPERATION

The Amplifier has a constant fused B+ feed and ground to the module. When an ignition on command is sent over the CAN bus, the Amplifier will wake up and turn on.

The Amplifier receives the audio signal circuits from the radio's front right and left, and rear right and left audio inputs and then converts the signals to amplified audio signals to corresponding speakers. The Amplifier monitors the speaker output feeds for any speaker concerns, wiring opens or shorts.

For additional information regarding the description and operation of the Audio System. Refer to [**DESCRIPTION AND OPERATION**](#) .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- This Diagnostic Trouble Code (DTC) sets if a Direct Current (DC) offset occurs on the output channel, when the ignition is cycled on. The Amplifier (AMP) shall set a DTC after a maturity rate of four to six seconds.

DEFAULT ACTION

- The Amplifiers power integrated circuit automatically shuts down the individual channel speaker output when this fault is detected.

POSSIBLE CAUSES

Possible Causes
AMPLIFIER

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, erase all DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the service information. Refer to [AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

B147D-00-CHANNEL 6 AUDIO SPEAKER OUTPUT - CIRCUIT SHORTED TOGETHER

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, Refer to the appropriate wiring information .

AUDIO CHANNEL MAPPING

NOTE: Proper diagnosis of the audio system will require the use of this Audio Channel Mapping in addition to using the Audio System wiring diagrams. The use of Audio Channel Mapping and sales codes are being used to quickly identify those differences in locations; and the total number of speakers in the audio system configurations noted below.

CHANNEL 12

THEORY OF OPERATION

The Amplifier has a constant fused B+ feed and ground to the module. When an ignition on command is sent over the CAN bus, the Amplifier will wake up and turn on.

The Amplifier receives the audio signal circuits from the radio's front right and left, and rear right and left audio inputs and then converts the signals to amplified audio signals to corresponding speakers. The Amplifier monitors the speaker output feeds for any speaker concerns, wiring opens or shorts.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Amplifier (AMP) detects that the output circuits are shorted together.

DEFAULT ACTION

- The Amplifiers power integrated circuit automatically shuts down the individual channel speaker output when this fault is detected.

POSSIBLE CAUSES

Possible Causes
SPEAKER SPEAKER (+) CIRCUIT SHORTED TO THE SPEAKER (-) CIRCUIT AMPLIFIER

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

CIRCUITS TO BE TESTED

Speaker Circuits

Circuit ID	Circuit Description
X206	(+)
X296	(-)

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN
1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.

2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCS.**

3. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data related to the DTCS.

4. With the scan tool, erase all DTCS.

5. Turn the ignition off for a minimum of 10.0 seconds.

6. Turn the ignition on.

7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.

8. With the scan tool, read DTCS.

NOTE:

The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCS.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Amplifier harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the Service Information. Refer to **AMPLIFIER (AMP), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B147E-11-CHANNEL 7 AUDIO SPEAKER OUTPUT - CIRCUIT SHORT TO GROUND

5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCS.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCS.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. CHECK THE RELATED SPEAKER(S)

1. Ensure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related speaker(s) harness connector.
5. Turn the ignition on.
6. Turn the Radio on.
7. With the scan tool, read the Amplifier DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the related speaker in accordance with the Service Information. Refer to [SPEAKER, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Amplifier harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.

8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the Service information. Refer to [AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

8. With the scan tool, read DTCs.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: **When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.**

Is the resistance below 3.0 Ohms?

Yes

- Go To [3](#)

No

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.

4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [4](#)

No

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. REPLACE THE RELATED SPEAKER(S)

1. Replace the related speaker(s) in accordance with the Service Information. Refer to [SPEAKER, REMOVAL AND INSTALLATION](#) .
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, erase all DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Replacement of the speaker(s) has corrected the concern.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.

4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Amplifier harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.**

8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the Service information. Refer to [**AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

B147E-92-CHANNEL 7 AUDIO SPEAKER OUTPUT - PERFORMANCE OR INCORRECT OPERATION

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **Refer to the appropriate wiring information** .

AUDIO CHANNEL MAPPING

NOTE: **Proper diagnosis of the audio system will require the use of this Audio Channel Mapping in addition to using the Audio System wiring diagrams. The use of**

Audio Channel Mapping and sales codes are being used to quickly identify those differences in locations; and the total number of speakers in the audio system configurations noted below.

CHANNEL 12	
SALES CODE	DESCRIPTION
Without RSJ	WIRELESS SPEAKER - BLUETOOTH

CHANNEL 12	
SALES CODE	DESCRIPTION
RSJ	WIRELESS SPEAKER - BLUETOOTH

THEORY OF OPERATION

The Amplifier has a constant fused B+ feed and ground to the module. When an ignition on command is sent over the CAN bus, the Amplifier will wake up and turn on.

The Amplifier receives the audio signal circuits from the radio's front right and left, and rear right and left audio inputs and then converts the signals to amplified audio signals to corresponding speakers. The Amplifier monitors the speaker output feeds for any speaker concerns, wiring opens or shorts.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#).

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- This Diagnostic Trouble Code (DTC) sets if a Direct Current (DC) offset occurs on the output channel, when the ignition is cycled on. The Amplifier (AMP) shall set a DTC after a maturity rate of four to six seconds.

DEFAULT ACTION

- The Amplifiers power integrated circuit automatically shuts down the individual channel speaker output when this fault is detected.

POSSIBLE CAUSES

Possible Causes
AMPLIFIER

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCS.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
4. With the scan tool, erase all DTCS.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCS.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCS.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the service information. Refer to [AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

CIRCUITS TO BE TESTED

Speaker Circuits

Circuit ID	Circuit Description
X300	(+)
X390	(-)

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCS.**
3. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data related to the DTCS.
4. With the scan tool, erase all DTCS.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCS.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCS.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Amplifier harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the Service Information. Refer to **AMPLIFIER (AMP), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCS.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
4. With the scan tool, erase all DTCS.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCS.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCS.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. CHECK THE RELATED SPEAKER(S)

1. Ensure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related speaker(s) harness connector.
5. Turn the ignition on.
6. Turn the Radio on.
7. With the scan tool, read the Amplifier DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the related speaker in accordance with the Service Information. Refer to [SPEAKER, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Amplifier harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.

8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the Service information. Refer to [AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, erase all DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Replacement of the speaker(s) has corrected the concern.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.

4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Amplifier harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.**

8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the Service information. Refer to [**AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

B1483-92-CHANNEL 8 AUDIO SPEAKER OUTPUT - PERFORMANCE OR INCORRECT OPERATION

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **Refer to the appropriate wiring information** .

AUDIO CHANNEL MAPPING

NOTE: **Proper diagnosis of the audio system will require the use of this Audio Channel Mapping in addition to using the Audio System wiring diagrams. The use of**

Audio Channel Mapping and sales codes are being used to quickly identify those differences in locations; and the total number of speakers in the audio system configurations noted below.

CHANNEL 12	
SALES CODE	DESCRIPTION
Without RSJ	WIRELESS SPEAKER - BLUETOOTH

CHANNEL 12	
SALES CODE	DESCRIPTION
RSJ	WIRELESS SPEAKER - BLUETOOTH

THEORY OF OPERATION

The Amplifier has a constant fused B+ feed and ground to the module. When an ignition on command is sent over the CAN bus, the Amplifier will wake up and turn on.

The Amplifier receives the audio signal circuits from the radio's front right and left, and rear right and left audio inputs and then converts the signals to amplified audio signals to corresponding speakers. The Amplifier monitors the speaker output feeds for any speaker concerns, wiring opens or shorts.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- This Diagnostic Trouble Code (DTC) sets if a Direct Current (DC) offset occurs on the output channel, when the ignition is cycled on. The Amplifier (AMP) shall set a DTC after a maturity rate of four to six seconds.

DEFAULT ACTION

- The Amplifiers power integrated circuit automatically shuts down the individual channel speaker output when this fault is detected.

POSSIBLE CAUSES

Possible Causes
AMPLIFIER

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, erase all DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the service information. Refer to [AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

B1487-00-CHANNEL 8 AUDIO SPEAKER OUTPUT - CIRCUIT SHORTED TOGETHER

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, Refer to the appropriate wiring information .

AUDIO CHANNEL MAPPING

NOTE: Proper diagnosis of the audio system will require the use of this Audio Channel Mapping in addition to using the Audio System wiring diagrams. The use of Audio Channel Mapping and sales codes are being used to quickly identify those differences in locations; and the total number of speakers in the audio system configurations noted below.

CIRCUITS TO BE TESTED

Speaker Circuits

Circuit ID	Circuit Description
X301	(+)
X391	(-)

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCS.**
3. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data related to the DTCS.
4. With the scan tool, erase all DTCS.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCS.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCS.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Amplifier harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the Service Information. Refer to **AMPLIFIER (AMP), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1488-00-CABIN EQ MISMATCH PERFORMANCE

THEORY OF OPERATION

The Amplifier has a constant fused B+ feed and ground to the module. When an ignition on command is sent over the CAN bus, the Amplifier will wake up and turn on.

The Amplifier receives the audio signal circuits from the radio's front right and left, and rear right and left audio inputs and then converts the signals to amplified audio signals to corresponding speakers. The Amplifier monitors the speaker output feeds for any speaker concerns, wiring opens or shorts.

For additional information regarding the description and operation of the Audio System. Refer to [**DESCRIPTION AND OPERATION**](#) .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Amplifier (AMP) will set this DTC when the Cabin Equalization Curve number message from the Body Control Module (BCM) is not the same as the Cabin Equalization Curve number stored in the AMP.

DEFAULT ACTION

- No audio.

POSSIBLE CAUSES

POSSIBLE CAUSES
NO COMMUNICATION WITH BCM
ACTIVE BCM DTCS
BCM
AMP

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [**PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**](#) .

DIAGNOSTIC TEST

1. **READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN**
1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.

2. **NOTE: The Radio must be on.**

NOTE: A front door must remain open whenever checking or erasing Amplifier DTCS.

3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.

4. With the scan tool, erase all DTCS.

5. Turn the ignition off for a minimum of 10.0 seconds.

6. Turn the ignition on.

7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.

8. With the scan tool, read DTCS.

NOTE: **Make sure the Radio is turned on.**

NOTE: A front door must remain open whenever checking or erasing Amplifier DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. CHECK THE CABIN EQUALIZATION CURVE NUMBER

1. With the scan tool in the BCM ECU Details Tab, Configuration button, record the Cabin Equalization Curve number.
2. With the scan tool in the AMP ECU Details Tab, Configuration button, record the True value.

NOTE: The Cabin EQ Curve value found in the BCM should match the True value found in the AMP.

Do the Cabin EQ settings match one another?

Yes

- Replace the Amplifier in accordance to the service information. Refer to [AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [3](#)

3. VERIFY COMMUNICATION WITH BCM

1. With the scan tool, read the active modules on the BUS.

Does the scan tool show the BCM active on the BUS?

Yes

- Go To [4](#)

No

- Perform the No Response From ECU diagnostic procedure. Refer to [DIAGNOSIS AND TESTING](#) .

4. CHECK BCM FOR ACTIVE DTCs

1. With the scan tool, erase BCM DTCs.
2. Turn the ignition off. Wait approximately 10 seconds.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs and record on the repair order.

Are any active DTCs present?

Yes

- Perform the appropriate diagnostic procedure. Refer to [DIAGNOSIS AND TESTING](#) .

No

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B14B9-11-CHANNEL 9 AUDIO SPEAKER OUTPUT - CIRCUIT SHORT TO GROUND

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **Refer to the appropriate wiring information** .

AUDIO CHANNEL MAPPING

NOTE:

Proper diagnosis of the audio system will require the use of this Audio Channel Mapping in addition to using the Audio System wiring diagrams. The use of Audio Channel Mapping and sales codes are being used to quickly identify those differences in locations; and the total number of speakers in the audio system configurations noted below.

CHANNEL 12	
SALES CODE	DESCRIPTION
Without RSJ	WIRELESS SPEAKER - BLUETOOTH

CIRCUITS TO BE TESTED

Speaker Circuits

Circuit ID	Circuit Description
X214	(+)
X284	(-)

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, erase all DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.

6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. CHECK THE RELATED SPEAKER(S)

1. Ensure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related speaker(s) harness connector.
5. Turn the ignition on.
6. Turn the Radio on.
7. With the scan tool, read the Amplifier DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the related speaker in accordance with the Service Information. Refer to [SPEAKER, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: **When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.**

NOTE: **There should be no continuity between ground and the circuit being tested.**

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.

- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Amplifier harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.**

8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the Service information. Refer to [**AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the harness connector at the component of the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage of the circuit being tested at the component harness connector.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

4. CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the harness connector at the component of the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage of the circuit being tested at the component harness connector.

Is there any voltage present?

Yes

- Go To [5](#)

No

- Go To [6](#)

5. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Amplifier harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.**

8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the Service information. Refer to [**AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

B14B9-13-CHANNEL 9 AUDIO SPEAKER OUTPUT - CIRCUIT OPEN

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **Refer to the appropriate wiring information** .

AUDIO CHANNEL MAPPING

NOTE: Proper diagnosis of the audio system will require the use of this Audio Channel Mapping in addition to using the Audio System wiring diagrams. The use of Audio Channel Mapping and sales codes are being used to quickly identify those differences in locations; and the total number of speakers in the audio system configurations noted below.

CHANNEL 12	
SALES CODE	DESCRIPTION
Without RSJ	WIRELESS SPEAKER - BLUETOOTH

CHANNEL 12	
SALES CODE	DESCRIPTION
RSJ	WIRELESS SPEAKER - BLUETOOTH

THEORY OF OPERATION

The Amplifier has a constant fused B+ feed and ground to the module. When an ignition on command is sent over the CAN bus, the Amplifier will wake up and turn on.

The Amplifier receives the audio signal circuits from the radio's front right and left, and rear right and left audio inputs and then converts the signals to amplified audio signals to corresponding speakers. The Amplifier monitors the speaker output feeds for any speaker concerns, wiring opens or shorts.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Amplifier (AMP) detects an open condition on the speaker output circuits.

DEFAULT ACTION

- The Amplifiers power integrated circuit automatically shuts down the individual channel speaker output when this fault is detected.

POSSIBLE CAUSES

Possible Causes
SPEAKER SPEAKER (+/-) CIRCUIT OPEN AMPLIFIER

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

CIRCUITS TO BE TESTED

Speaker Circuits

Circuit ID	Circuit Description
X214	(+)
X284	(-)

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, erase all DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any

possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [3](#)

No

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [4](#)

No

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. REPLACE THE RELATED SPEAKER(S)

1. Replace the related speaker(s) in accordance with the Service Information. Refer to [SPEAKER, REMOVAL AND INSTALLATION](#) .
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, erase all DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Replacement of the speaker(s) has corrected the concern.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Amplifier harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Amplifier harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Amplifier DTCs.

8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Amplifier DTCs.

Did the DTC return?

Yes

- Replace the Amplifier in accordance with the Service information. Refer to **AMPLIFIER (AMP), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
 - Test complete.

2021 ACCESSORIES AND EQUIPMENT

Audio (Radio) - DTCS B157A-11 To U1519-00 - Gladiator

DIAGNOSIS AND TESTING

B157A-11 DAB ANTENNA-CIRCUIT SHORT TO GROUND

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information**.

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to **DESCRIPTION AND OPERATION**.

WHEN MONITORED

SET CONDITION

DEFAULT ACTION

- Poor or no reception.

POSSIBLE CAUSES

Possible Causes
BAD ANTENNA CONNECTION DAB ANTENNA CABLE DAB ANTENNA MODULE DAB ANTENNA RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.

7. Turn the Radio on and set the volume to 25.
8. Adjust the speakers to the front and center.
9. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ANTENNA AND MODULE INSPECTION

NOTE: **The Digital Audio Broadcasting Antenna is service with the windshield.**

1. Visually inspect the DAB Antenna/DAB Module for damage.

Is the DAB Antenna/DAB Module missing or damaged?

Yes

- Replace the DAB Antenna/DAB Module in accordance with the Service Information. Refer to **MODULE, DIGITAL AUDIO BROADCASTING ANTENNA, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [3](#)

3. CHECK THE ANTENNA CONNECTIONS

1. Turn the ignition off.
2. Disconnect the Radio Antenna connector at the Antenna.
3. Disconnect the Radio Antenna connector at the rear of the Radio.
4. Inspect both of the Radio Antenna connections and verify the DAB Antenna Module is torqued to specification.

Were the antenna connections clean and module torqued to specification?

Yes

- Go To [4](#)

No

- Clean the antenna connection(s) / torque to specification as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. CHECK THE DAB ANTENNA MODULE CABLE

NOTE: **Antenna reception testing**

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Connect the Radio Diagnostic Tool (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) to the DAB Antenna connection on the back of the Radio and to the vehicle DAB Antenna module.
2. Make sure one of the front doors is still open.
3. Turn the ignition on.
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on.
8. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [5](#)

No

- Use the Radio Diagnostic Tool (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) to locate the open circuit, repair or replace the DAB Antenna cable as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. DAB ANTENNA MODULE

NOTE: **Antenna reception testing**

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Replace the DAB Antenna module in accordance with Service Information. Refer to **MODULE, DIGITAL AUDIO BROADCASTING ANTENNA, REMOVAL AND INSTALLATION** .
2. Turn the ignition on.
3. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Turn the Radio on and set the volume to 25.
7. Adjust the speakers to the front and center.
8. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [6](#)

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

6. DAB ANTENNA

NOTE: The Digital Audio Broadcasting Antenna is service with the windshield.

NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Replace the DAB Antenna in accordance with Service Information.
2. Turn the ignition on.
3. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Turn the Radio on and set the volume to 25.
7. Adjust the speakers to the front and center.
8. With the scan tool, read the active Radio DTCs.

NOTE: A front door must remain open whenever checking or erasing Radio DTCs.

Did the DTC return?

Yes

- Go To [7](#)

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.

- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to [**RADIO, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

B157A-12 DAB ANTENNA-CIRCUIT SHORT TO BATTERY

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on and set the volume to 25.
8. Adjust the speakers to the front and center.
9. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ANTENNA AND MODULE INSPECTION

NOTE: **The Digital Audio Broadcasting Antenna is service with the windshield.**

1. Visually inspect the DAB Antenna/DAB Module for damage.

Is the DAB Antenna/DAB Module missing or damaged?

Yes

- Replace the DAB Antenna/DAB Module in accordance with the Service Information. Refer to **MODULE, DIGITAL AUDIO BROADCASTING ANTENNA, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [3](#)

3. CHECK THE ANTENNA CONNECTIONS

1. Turn the ignition off.
2. Disconnect the Radio Antenna connector at the Antenna.
3. Disconnect the Radio Antenna connector at the rear of the Radio.
4. Inspect both of the Radio Antenna connections and verify the DAB Antenna Module is torqued to specification.

Were the antenna connections clean and module torqued to specification?

Yes

- Go To [4](#)

No

- Clean the antenna connection(s) / torque to specification as necessary.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. CHECK THE DAB ANTENNA MODULE CABLE

NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Connect the Radio Diagnostic Tool (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) to the DAB Antenna connection on the back of the Radio and to the vehicle DAB Antenna module.
2. Make sure one of the front doors is still open.
3. Turn the ignition on.
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on.
8. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [5](#)

No

- Use the Radio Diagnostic Tool (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) to locate the open circuit, repair or replace the DAB Antenna cable as necessary.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. DAB ANTENNA MODULE

NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Replace the DAB Antenna module in accordance with Service Information. Refer to **MODULE, DIGITAL AUDIO BROADCASTING ANTENNA, REMOVAL AND INSTALLATION** .
2. Turn the ignition on.
3. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Turn the Radio on and set the volume to 25.
7. Adjust the speakers to the front and center.
8. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [6](#)

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

6. DAB ANTENNA

NOTE: **The Digital Audio Broadcasting Antenna is service with the windshield.**

NOTE: **Antenna reception testing**

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Replace the DAB Antenna in accordance with Service Information.
2. Turn the ignition on.
3. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Turn the Radio on and set the volume to 25.
7. Adjust the speakers to the front and center.
8. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [7](#)

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).
- Test complete.

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to [RADIO, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

- Test complete.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. ANTENNA AND MODULE INSPECTION

NOTE: **The Digital Audio Broadcasting Antenna is service with the windshield.**

1. Visually inspect the DAB Antenna/DAB Module for damage.

Is the DAB Antenna/DAB Module missing or damaged?

Yes

- Replace the DAB Antenna/DAB Module in accordance with the Service Information. Refer to [MODULE, DIGITAL AUDIO BROADCASTING ANTENNA, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [3](#)

3. CHECK THE ANTENNA CONNECTIONS

1. Turn the ignition off.
2. Disconnect the Radio Antenna connector at the Antenna.
3. Disconnect the Radio Antenna connector at the rear of the Radio.
4. Inspect both of the Radio Antenna connections and verify the DAB Antenna Module is torqued to specification.

Were the antenna connections clean and module torqued to specification?

Yes

- Go To [4](#)

No

- Clean the antenna connection(s) / torque to specification as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. CHECK THE DAB ANTENNA MODULE CABLE

NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Connect the Radio Diagnostic Tool (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) to the DAB Antenna connection on the back of the Radio and to the vehicle DAB Antenna module.
2. Make sure one of the front doors is still open.
3. Turn the ignition on.
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on.
8. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [5](#)

No

- Use the Radio Diagnostic Tool (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) to locate the open circuit, repair or replace the DAB Antenna cable as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. DAB ANTENNA MODULE

NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Replace the DAB Antenna module in accordance with Service Information. Refer to **MODULE, DIGITAL AUDIO BROADCASTING ANTENNA, REMOVAL AND INSTALLATION** .
2. Turn the ignition on.
3. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Turn the Radio on and set the volume to 25.
7. Adjust the speakers to the front and center.
8. With the scan tool, read the active Radio DTCs.

NOTE: A front door must remain open whenever checking or erasing Radio DTCs.

Did the DTC return?

Yes

- Go To [6](#)

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

6. DAB ANTENNA

NOTE: The Digital Audio Broadcasting Antenna is service with the windshield.

NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Replace the DAB Antenna in accordance with Service Information.
2. Turn the ignition on.
3. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Turn the Radio on and set the volume to 25.
7. Adjust the speakers to the front and center.

NOTE: The Digital Audio Broadcasting Antenna is service with the windshield.

1. Visually inspect the DAB Antenna/DAB Module for damage.

Is the DAB Antenna/DAB Module missing or damaged?

Yes

- Replace the DAB Antenna/DAB Module in accordance with the Service Information. Refer to [MODULE, DIGITAL AUDIO BROADCASTING ANTENNA, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [3](#)

3. CHECK THE ANTENNA CONNECTIONS

1. Turn the ignition off.
2. Disconnect the Radio Antenna connector at the Antenna.
3. Disconnect the Radio Antenna connector at the rear of the Radio.
4. Inspect both of the Radio Antenna connections and verify the DAB Antenna Module is torqued to specification.

Were the antenna connections clean and module torqued to specification?

Yes

- Go To [4](#)

No

- Clean the antenna connection(s) / torque to specification as necessary.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. CHECK THE DAB ANTENNA MODULE CABLE

NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Connect the Radio Diagnostic Tool (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) to the DAB Antenna connection on the back of the Radio and to the vehicle DAB Antenna module.
2. Make sure one of the front doors is still open.
3. Turn the ignition on.
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.

5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on.
8. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [5](#)

No

- Use the Radio Diagnostic Tool (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) to locate the open circuit, repair or replace the DAB Antenna cable as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. DAB ANTENNA MODULE

NOTE: **Antenna reception testing**

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Replace the DAB Antenna module in accordance with Service Information. Refer to **MODULE, DIGITAL AUDIO BROADCASTING ANTENNA, REMOVAL AND INSTALLATION** .
2. Turn the ignition on.
3. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Turn the Radio on and set the volume to 25.
7. Adjust the speakers to the front and center.
8. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [6](#)

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

6. DAB ANTENNA

NOTE: **The Digital Audio Broadcasting Antenna is service with the windshield.**

NOTE: **Antenna reception testing**

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Replace the DAB Antenna in accordance with Service Information.
2. Turn the ignition on.
3. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Turn the Radio on and set the volume to 25.
7. Adjust the speakers to the front and center.
8. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [7](#)

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.

7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to [**RADIO, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

B157E-00-TOUCH SCREEN LOCKED

NOTE: The Scan Tool may display the description name of this Diagnostic Trouble Code differently with the following below:

TOUCH SCREEN LOCKED - NO SUBTYPE INFORMATION

- Ignition on.
- Radio active on the bus.

SET CONDITION

- The Radio detects a closed switch.

DEFAULT ACTION

- Push-button commands ignored by the radio.

POSSIBLE CAUSES

Possible Causes
RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, record and erase the Radio DTCs.
5. Cycle the ignition switch from on to off, wait five seconds and then back to on.
6. Turn the Radio on and set the volume to 25.
7. Adjust the speakers to the front and center.
8. With the scan tool, read the active Radio DTCs.

NOTE: A front door must remain open whenever checking or erasing Radio DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. VERIFY OPERATION OF THE SCREEN

NOTE: Before performing the diagnostic test, make sure that any part of the radio bezel is not contacting the radio screen.

1. With the scan tool, read Radio DTCs and record on the repair order.
2. Remove the radio bezel.
3. With the scan tool, erase the DTCs.
4. Wait 60 seconds.
5. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service Information.

No

- Go to [3](#)

3. CHECK RADIO BEZEL

1. Reinstall the radio bezel.
2. With the scan tool, erase DTCs.
3. Wait 60 seconds.
4. With the scan tool, read DTCs.

Is the DTC active?

Yes

- Replace the Radio bezel in accordance with the Service Information. Refer to [RADIO, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Test complete.

B210A-16-SYSTEM VOLTAGE LOW - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- If the Radio detects that the battery voltage is less than 9.0 volts.

DEFAULT ACTION

- Radio inoperative.

POSSIBLE CAUSES

Possible Causes
VEHICLE CHARGING SYSTEM
RADIO BATTERY SUPPLY CIRCUIT
RADIO GROUND CIRCUIT
RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, record and erase the Radio DTCs.
5. Cycle the ignition switch from on to off, wait five seconds and then back to on.
6. Turn the Radio on and set the volume to 25.
7. Adjust the speakers to the front and center.
8. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE BATTERY VOLTAGE TO THE RADIO WITH THE SCAN TOOL

1. With the scan tool in Data Display, read the Radio battery voltage.

Is the battery voltage less than 9.0 volts?

Yes

- Go To [3](#)

No

- Replace the Radio in accordance with the Service Information. Refer to **RADIO, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. CHECK THE BATTERY VOLTAGE TO THE RADIO

1. Disconnect the Radio C1 harness connector.

NOTE: Check the Radio harness connector for signs of corrosion, pushed out or bent terminals, and correct pin tension.

2. Measure the voltage between ground and the (A234) Fused B+ circuit at the Radio C1 harness connector.

Is the battery voltage less than 9.0 volts?

Yes

- Go To [4](#)

No

- Replace the Radio in accordance with the Service Information. Refer to [RADIO, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. CHECK FOR CHARGING SYSTEM RELATED DTCS IN THE POWERTRAIN CONTROL MODULE (PCM)

1. With the scan tool in ECU View, select PCM and check for any Charging System related DTCS.

Does the scan tool display any Charging System related DTCS?

Yes

- Refer to [DIAGNOSIS AND TESTING](#) , or [DIAGNOSIS AND TESTING](#) and perform the appropriate charging system or battery DTC diagnostic procedure.

No

- Check for voltage drop concerns across the (A933) Fused B+ circuit and repair as needed.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B210B-17-SYSTEM VOLTAGE HIGH-CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- If the module detects that the battery voltage is greater than 17 volts.

DEFAULT ACTION

- Radio inoperative.

POSSIBLE CAUSES

Possible Causes
VEHICLE CHARGING SYSTEM RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCS.**
4. With the scan tool, record and erase the Radio DTCS.
5. Cycle the ignition switch from on to off, wait five seconds and then back to on.
6. Turn the Radio on and set the volume to 25.
7. Adjust the speakers to the front and center.
8. With the scan tool, read the active Radio DTCS.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCS.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK FOR CHARGING SYSTEM RELATED DTCS IN THE POWERTRAIN CONTROL MODULE (PCM)

1. Verify the Battery is in good condition. and perform the Battery System diagnostic procedure. Refer to the appropriate information .
2. With the scan tool in ECU View, select PCM and check for any Charging System related DTCS.

Does the scan tool display any Charging System related DTCS?

Yes

- Refer to **DIAGNOSIS AND TESTING** , or **DIAGNOSIS AND TESTING** and perform the appropriate charging system or battery DTC diagnostic procedure.

No

- Replace the Radio in accordance with the Service Information. Refer to [RADIO, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B217A-87 REAR CAMERA-MISSING MESSAGE

For a complete BACK UP CAMERA SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Radio detects video connection with the Camera is not present.

DEFAULT ACTION

- Rear video image is blanked out on the video screen.

POSSIBLE CAUSES

Possible Causes
CAMERA WIRING REAR CAMERA RADIO

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**

4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on and set the volume to 25.
8. Adjust the speakers to the front and center.
9. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. TEST THE REAR CAMERA

1. Turn the ignition off.
2. Disconnect the Rear Camera from the harness connector.
3. Disconnect a known good working Camera from a like vehicle with the same Audio/Video system configuration.
4. Connect the known good working Camera to this vehicle.
5. Turn the ignition on.
6. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
7. Turn the ignition off for a minimum of 10.0 seconds.
8. Turn the ignition on.
9. Turn the Radio on and wait 25 seconds.
10. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [3](#)

No

- Replace the Rear Camera in accordance with the service information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. TEST THE REAR CAMERA CIRCUITS

1. Turn the ignition off.
2. Disconnect the coax cable/LVDS camera harness connector from the Radio.
3. Disconnect the known good working Camera from the vehicle harness connector.
4. Connect test tool cable kit (special tool #9977-6-8, Adapter, RG-174 Coax Cable) to the Radio and the known good Camera.
5. Turn the ignition on.
6. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
7. Turn the ignition off for a minimum of 10.0 seconds.

8. Turn the ignition on.
9. Turn the Radio on and wait 25 seconds.
10. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [4](#)

No

- Replace the Rear Camera circuit(s) as needed.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service Information. Refer to **RADIO, REMOVAL AND INSTALLATION** .

.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B217A-9A REAR CAMERA-COMPONENT OR SYSTEM OPERATING CONDITIONS

For a complete BACK UP CAMERA SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to **DESCRIPTION AND OPERATION** .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Radio detects video connection with the Camera is not present.

DEFAULT ACTION

- Rear video image is blanked out on the video screen.

POSSIBLE CAUSES

Possible Causes
CAMERA WIRING
REAR CAMERA
RADIO

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on and set the volume to 25.
8. Adjust the speakers to the front and center.
9. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. TEST THE REAR CAMERA

1. Turn the ignition off.
2. Disconnect the Rear Camera from the harness connector.
3. Disconnect a known good working Camera from a like vehicle with the same Audio/Video system configuration.
4. Connect the known good working Camera to this vehicle.
5. Turn the ignition on.
6. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
7. Turn the ignition off for a minimum of 10.0 seconds.
8. Turn the ignition on.
9. Turn the Radio on and wait 25 seconds.
10. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [3](#)

No

- Replace the Rear Camera in accordance with the service information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. TEST THE REAR CAMERA CIRCUITS

1. Turn the ignition off.
2. Disconnect the coax cable/LVDS camera harness connector from the Radio.
3. Disconnect the known good working Camera from the vehicle harness connector.

4. Connect test tool cable kit (special tool #9977-6-8, Adapter, RG-174 Coax Cable) to the Radio and the known good Camera.
5. Turn the ignition on.
6. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
7. Turn the ignition off for a minimum of 10.0 seconds.
8. Turn the ignition on.
9. Turn the Radio on and wait 25 seconds.
10. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [4](#)

No

- Replace the Rear Camera circuit(s) as needed.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.

12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service Information. Refer to [**RADIO, REMOVAL AND INSTALLATION**](#).
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#).

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#).
- Test complete.

B2206-00-CURRENT VIN MISSING/MISMATCH

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information**.

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [**DESCRIPTION AND OPERATION**](#).

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- Ignition on.

SET CONDITION

- The Vehicle Identification Number (VIN) stored in the original position of the Radio does not match the current VIN broadcasted by the BCM over the Controller Area Network (CAN) bus.

DEFAULT ACTION

- Radio inoperative.
- Radio may request security code.

POSSIBLE CAUSES

Possible Causes
RADIO SWAPPED FROM DIFFERENT VEHICLE

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [**PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**](#).

DIAGNOSTIC TEST

READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, record and erase the Radio DTCs.
5. Cycle the ignition switch from on to off, wait five seconds and then back to on.
6. Turn the Radio on and set the volume to 25.
7. Adjust the speakers to the front and center.
8. With the scan tool, read the active Radio DTCs.

NOTE: A front door must remain open whenever checking or erasing Radio DTCs.

Did the DTC return?

Yes

- Replace the radio in accordance with service information. Refer to [RADIO, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

B221E-00-RADIO INTERNAL

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- With the ignition on.
- Radio on.

SET CONDITION

- The code will set if the Radio detects an internal failure.

DEFAULT ACTION

- Radio inoperative.

POSSIBLE CAUSES

Possible Causes
RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, record and erase the Radio DTCs.
5. Cycle the ignition switch from on to off, wait five seconds and then back to on.
6. Turn the Radio on and set the volume to 25.
7. Adjust the speakers to the front and center.
8. With the scan tool, read the active Radio DTCs.

NOTE: A front door must remain open whenever checking or erasing Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service Information. Refer to **RADIO, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

B222C-00-VEHICLE CONFIGURATION NOT PROGRAMMED

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to **DESCRIPTION AND OPERATION** .

WHEN MONITORED

- If the engine is running.

SET CONDITION

- If the Radio detects no vehicle configuration from the Body Control Module (BCM).

DEFAULT ACTION

- Default system configuration used.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) VEHICLE CONFIGURATION RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

- 1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN**
1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
 2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
 3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
 4. With the scan tool, record and erase the Radio DTCs.
 5. Cycle the ignition switch from on to off, wait five seconds and then back to on.
 6. Turn the Radio on and set the volume to 25.
 7. Adjust the speakers to the front and center.
 8. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate **INTERMITTENT CONDITION** diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. PERFORM A RESTORE VEHICLE CONFIGURATION IN THE BCM

1. With the scan tool, perform the Restore Vehicle Configuration in the BCM.
2. With the scan tool, record and erase the Radio DTCs.
3. Cycle the ignition switch from on to off, wait five seconds and then back to on.
4. With the scan tool, read the active Radio DTCs.

Is the DTC active?

Yes

- Replace the Radio in accordance with the Service Information. Refer to [RADIO, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

B223B-00-VEHICLE CONFIGURATION MISMATCH

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information**.

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#).

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- Ignition on.

SET CONDITION

- If the Radio detects the wrong vehicle configuration from the Body Control Module (BCM).

DEFAULT ACTION

- Limited or no audio output.
- Radio controls not responsive.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) VEHICLE CONFIGURATION RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**

NOTE: Diagnose and repair any BCM VIN or Communication DTCs before continuing with this test.

4. With the scan tool, record and erase the Radio DTCs.
5. Cycle the ignition switch from on to off, wait five seconds and then back to on.
6. Turn the Radio on and set the volume to 25.
7. Adjust the speakers to the front and center.
8. With the scan tool, read the active Radio DTCs.

NOTE: A front door must remain open whenever checking or erasing Radio DTCs.

NOTE: Diagnose and repair any BCM VIN or Communication DTCs before continuing with this test.

Did the DTC return?

Yes

- Go To [2](#)

No

- Use the scan tool to read DTCs in all other modules. If any communication DTCs are present, perform the appropriate diagnostic procedure. Perform any Technical Service Bulletins that apply. If no problems are found, test is complete.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. PERFORM A RESTORE VEHICLE CONFIGURATION IN THE BCM

1. With the scan tool, perform the Restore Vehicle Configuration in the BCM.
2. With the scan tool, record and erase the Radio DTCs.
3. Cycle the ignition switch from on to off, wait five seconds and then back to on.
4. With the scan tool, read the active Radio DTCs.

Is the DTC active?

Yes

- Replace the Radio in accordance with the Service Information. Refer to **RADIO, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B2299-00-REAR CAMERA MODULE INTERNAL

For a complete BACK UP CAMERA SYSTEM wiring diagram, refer to the appropriate wiring information .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to **DESCRIPTION AND OPERATION** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on for greater than five seconds.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- The Radio detects an internal failure in the Rear View Camera Module.

DEFAULT ACTION

- The Rear View Camera Module is not fully operational.

POSSIBLE CAUSES

Possible Causes
CAMERA WIRING
REAR VIEW CAMERA MODULE
RADIO

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.

7. Turn the Radio on and set the volume to 25.
8. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. TEST THE REAR CAMERA CIRCUITS

1. Turn the ignition off.
2. Disconnect the coax cable/LVDS camera harness connector from the Radio.
3. Disconnect the Camera from the vehicle harness connector.
4. Connect test tool cable kit (special tool #9977-6-8, Adapter, RG-174 Coax Cable) to the Radio and the Camera.
5. Turn the ignition on.
6. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
7. Turn the ignition off for a minimum of 10.0 seconds.
8. Turn the ignition on.
9. Turn the Radio on and wait 25 seconds.
10. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [3](#)

No

- Replace the Rear Camera circuit(s) as needed.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. TEST THE REAR CAMERA

1. Turn the ignition off.
2. Disconnect the Rear Camera from the harness connector.
3. Disconnect a known good working Camera from a vehicle.
4. Connect the known good working Camera to this vehicle.
5. Turn the ignition on.
6. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
7. Turn the ignition off for a minimum of 10.0 seconds.
8. Turn the ignition on.
9. Turn the Radio on and wait 25 seconds.
10. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [4](#)

No

- Replace the Rear Camera Module in accordance with the service information. Refer to [CAMERA, REAR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to [RADIO, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

B22AB-23 LIN STEERING WHEEL SWITCHES - SIGNAL STUCK LOW

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- With the ignition on.
- Radio on.

SET CONDITION

- The Radio detects a steering wheel switch stuck in the pressed position.

DEFAULT ACTION

- Steering wheel commands not operating correctly.

POSSIBLE CAUSES

Possible Causes
RADIO LIN BUS CIRCUIT REMOTE STEERING WHEEL SWITCHES STEERING COLUMN CONTROL MODULE (SCCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, perform an ECU reset to the Radio and SCCM, and then erase DTCs.

5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on and set the volume to 25.
8. Adjust the speakers to the front and center.
9. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE STATUS OF THE REMOTE RADIO SWITCHES IN THE RADIO

1. Do not press either remote radio switch.
2. Hands off the Steering Wheel.
3. With the scan tool, monitor the "PRESSED/NOT PRESSED" status of the remote radio switches in the Radio data display.

Do any remote radio switch always show "PRESSED"?

Yes

- Go To [3](#)

No

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. CONTINUE TO CHECK THE STATUS OF THE REMOTE RADIO SWITCHES IN THE RADIO

NOTE: **Do not press either remote radio switch.**

1. Start the engine and allow it to idle.
2. With the scan tool, continuously monitor the "PRESSED/NOT PRESSED" status of the remote radio switches in the Radio data display while performing the test in the following order:
 - Hands on the Steering Wheel turning slowly to full left, full right, and back to center.
 - Hands on the Steering Wheel apply slight straight ahead pressure while turning slowly to full left, full right, and back to center.
 - Hands on the Steering Wheel pulling back with slight pressure while turning slowly to full left, full right, and back to center.
 - If equipped, adjust the steering column up and down in all positions, and repeat the above process.
3. Turn the engine off.

Did the remote radio switch status change during testing?

Yes

- Go To [4](#)

No

- Go To [7](#)

4. CHECK THE (D594) LIN BUS CIRCUIT

1. The ignition must be off when checking the circuit for damage.
2. Using the appropriate wiring diagram, isolate the LIN Bus circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Inspect the LIN Bus circuit for chafed, pierced, pinched, or partially broken wires.
4. Inspect the LIN Bus connectors and terminals for broken, bent, pushed out, spread, corroded, contaminated or the presence of foreign conductive materials on connector pins and terminals.

Was any visual damage found to the LIN Bus circuit?

Yes

- Repair the damaged circuit as needed.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [5](#)

5. ISOLATE AND CHECK THE (D594) LIN BUS CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Connect the negative lead of the DVOM to a known good ground.
3. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. ISOLATE AND CHECK THE (D594) LIN BUS CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE SCCM HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors

connected. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.

3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.

4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [7](#)

7. CHECK THE REMOTE RADIO SWITCHES

1. The ignition must be off.
2. Remove the remote radio switches from the steering wheel. Refer to [SWITCH, REMOTE RADIO, REMOVAL AND INSTALLATION](#).
3. Use an ohmmeter to check the switch resistances as shown in the Remote Radio Switch Test chart.

REMOTE RADIO SWITCH TEST				
Switch	Switch Position	Minimum Resistance (kilohms)	Nominal Resistance (kilohms)	Maximum Resistance (kilohms)
Right	Volume Up	6.732	6.8	6.868
Right	Volume Down	14.850	15	15.151
Right	Mode Advance	0	0	0
Left	Seek Up	1.188	1.2	1.212
Left	Seek Down	3.267	3.3	3.333
Left	Pre-Set Station Advance	0.465	0.47	0.474

Are the remote radio switch resistances in specifications?

Yes

- Go To [8](#)

No

- Replace the Remote Radio Switches in accordance with Service Information. Refer to [SWITCH, REMOTE RADIO, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

8. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Steering Column Control Module (SCCM) harness connectors.
2. Disconnect all related in-line harness connections (if equipped).

3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all SCCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio and SCCM, and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read SCCM DTCs.

Did the DTC return?

Yes

- Replace the SCCM in accordance with the Service information. Refer to **MODULE, STEERING COLUMN CONTROL (SCCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B280B-00-REAR CAMERA VIDEO INPUT

For a complete BACK UP CAMERA SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition

switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to **DESCRIPTION AND OPERATION** .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- Ignition on.

SET CONDITION

- The Radio detects a open or short on the Low Voltage Digital Signal (LVDS) Camera circuits.

DEFAULT ACTION

- Camera inoperative.

POSSIBLE CAUSES

Possible Causes
LVDS CAMERA CIRCUITS DAMAGED
BACKUP CAMERA
RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. **READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN**
1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.

2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.

3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCS.**

4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCS.

5. Turn the ignition off for a minimum of 10.0 seconds.

6. Turn the ignition on.

7. Turn the Radio on and set the volume to 25.

8. Adjust the speakers to the front and center.

9. With the scan tool, read the active Radio DTCS.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCS.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE LVDS CABLE BETWEEN THE RADIO AND REAR VIEW CAMERA

1. Turn the ignition off.
2. Disconnect the C10 connector/LVDS cable at the back of the Radio.
3. Disconnect the LVDS cable at the Rear View Camera.
4. Connect the 9977-6-8 Adapter cable.
5. Turn the ignition on.
6. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
7. Turn the ignition off for a minimum of 10.0 seconds.
8. Turn the ignition on.
9. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the LVDS cable for damage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. REPLACE THE REAR CAMERA AND RETEST FOR DTCS

1. Replace the Rear Camera in accordance with the service information.
2. Turn the ignition on.
3. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Turn the ignition on.
7. Turn the Radio on.
8. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Go To [4](#)

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:

- Proper connector installation.
- Damaged connector locks.
- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Presence of foreign conductive materials on connector pins and terminals.
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to [**RADIO, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

C221C-00-ECU FLASH REQUIRED

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to **DESCRIPTION AND OPERATION** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition On.
- Power supply is greater than 10.0 volts and less than 16.0 volts.

SET CONDITION

- The Radio detects that the module is in bootloader mode and has not been flashed programmed.
- This DTC will set after a Radio is replaced.

DEFAULT ACTION

- Radio functions and audio are completely inoperative.

POSSIBLE CAUSES

Possible Causes
RADIO REQUIRES FLASH PROGRAMMING

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, record and erase the Radio DTCs.
5. Cycle the ignition switch from on to off, wait five seconds and then back to on.
6. Turn the Radio on and set the volume to 25.
7. Adjust the speakers to the front and center.
8. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- With the scan tool, program the Radio.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

U0002-00-CAN C BUS OFF PERFORMANCE

NOTE: This DTC may not be listed in the Body Control Module (BCM) diagnostic procedures. If this DTC is not found in the BCM diagnostic procedures, perform the comparable CAN C Bus diagnostic test, such as CAN C BUS-NO SIGNAL, CAN C BUS OFF PERFORMANCE or CAN C SIGNAL MISSING.

Perform the comparable CAN C Bus diagnostic tests in the BCM. Refer to [BODY CONTROL MODULE \(BCM\) - DIAGNOSTIC CODE INDEX](#).

U0010-00-CAN INTERIOR BUS

NOTE: The DTC number or title listed above may not appear in the Body Control Module (BCM) diagnostic procedures. If this occurs, perform the CAN Interior Bus diagnostic procedure in the BCM that is comparable to the above DTC title (examples: CAN INTERIOR BUS, CAN INTERIOR BUS OFF, CAN INTERIOR BUS PERFORMANCE or CAN INTERIOR BUS OFF PERFORMANCE).

Perform the comparable CAN IHS Bus diagnostic tests in the BCM. Refer to [BODY CONTROL MODULE \(BCM\) - DIAGNOSTIC CODE INDEX](#).

U0011-00-CAN INTERIOR BUS OFF PERFORMANCE

NOTE: The DTC number or title listed above may not appear in the Body Control Module (BCM) diagnostic procedures. If this occurs, perform the CAN Interior Bus diagnostic procedure in the BCM that is comparable to the above DTC title (examples: CAN INTERIOR BUS, CAN INTERIOR BUS OFF, CAN INTERIOR BUS PERFORMANCE or CAN INTERIOR BUS OFF PERFORMANCE).

Perform the comparable U-Code diagnostic procedure(s) for the CAN IHS Bus in the BCM. Refer to [BODY CONTROL MODULE \(BCM\) - DIAGNOSTIC CODE INDEX](#).

U0100-00-LOST COMMUNICATION WITH ECM/PCM

NOTE: Perform this diagnostic procedure **ONLY** when the DTC status is "Active". If the DTC status is "Stored" **DO NOT** proceed with this diagnostic procedure. A "Stored" DTC will not affect the performance of the vehicle.

The COMMUNICATION DIAGNOSTIC PROCEDURE **MUST** be performed before replacing any component(s) or module(s). Perform the COMMUNICATION DIAGNOSTIC PROCEDURE. Refer to [COMMUNICATION DIAGNOSTIC PROCEDURE](#).

For a complete BACK UP CAMERA SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to **DESCRIPTION AND OPERATION** .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- Ignition on.

SET CONDITION

- The Radio detects a open or short on the Low Voltage Digital Signal (LVDS) Camera circuits.

DEFAULT ACTION

- Camera inoperative.

POSSIBLE CAUSES

Possible Causes
LVDS CAMERA CIRCUITS DAMAGED
BACKUP CAMERA
RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, record and erase the Radio DTCs.
5. With the scan tool, perform the **Reset ECU** function under the Guided Diagnostics menu.
6. Cycle the ignition switch from on to off, wait five seconds and then back to on.
7. Turn the Radio on and set the volume to 25.
8. Adjust the speakers to the front and center.
9. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. TEST THE REAR CAMERA

1. Turn the ignition off.
2. Disconnect the Rear Camera from the harness connector.

NOTE: The camera on this vehicle can be swapped with a like configured vehicle for testing purposes since it is not a "smart" module, nor is it VIN written, or connected to the network (CAN or LIN bus) for diagnostic purposes. The camera uses LVDS (Low Voltage Differential Signaling) for sending images to the module.

3. If available, swap the camera from a like configured vehicle. If a like configured vehicle is not available, replace the Rear Camera in accordance with the service information.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. With the scan tool, perform the **Reset ECU** function under the Guided Diagnostics menu.
7. Turn the Radio on and wait 25 seconds.
8. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [3](#)

No

- If a camera was swapped from a like configured vehicle return the camera to that vehicle.
- If the camera has been replaced because a like configured vehicle was not available, perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. TEST THE REAR CAMERA CIRCUITS

1. Turn the ignition off.
2. Disconnect the coax cable/LVDS camera harness connector from the Radio.
3. Disconnect the known good working Camera from the vehicle harness connector.
4. Connect test tool cable kit (special tool #9977-6-8, Adapter, RG-174 Coax Cable) to the Radio and the known good Camera.
5. Turn the ignition on.
6. With the scan tool, erase DTCs.
7. With the scan tool, perform the **Reset ECU** function under the Guided Diagnostics menu.
8. Turn the Radio on and wait 25 seconds.
9. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [4](#)

No

- Replace the Rear Camera circuit(s) as needed.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:

- Proper connector installation.
- Damaged connector locks.
- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Presence of foreign conductive materials on connector pins and terminals.
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. With the scan tool, perform the **Reset ECU** function under the Guided Diagnostics menu.
10. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
11. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

U0422-00-IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE

NOTE: This DTC indicates a communication issue has occurred between the Sending control module (Body Control Module - BCM) and the Reporting control module(s) that set this DTC.

Audio (Radio) - DTCS B1400-11 To B1579-1A - Gladiator

DIAGNOSIS AND TESTING

B1400-11-FRONT LEFT AUDIO SPEAKER OUTPUT-CIRCUIT SHORT TO GROUND

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, refer to the appropriate wiring information .

AUDIO CHANNEL MAPPING

NOTE: Proper diagnosis of the audio system will require the use of this Audio Channel Mapping in addition to using the Audio System wiring diagrams. The use of Audio Channel Mapping and sales codes are being used to quickly identify those differences in locations; and the total number of speakers in the audio system configurations noted below.

CHANNEL 12	
SALES CODE	DESCRIPTION
Without RSJ	WIRELESS SPEAKER - BLUETOOTH

CHANNEL 12	
SALES CODE	DESCRIPTION
RSJ	WIRELESS SPEAKER - BLUETOOTH

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming. The Radio is capable of using AM/FM, Cellular, Global Positioning System (GPS) and Satellite Radio signals depending upon the audio system/vehicle configuration.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to **DESCRIPTION AND OPERATION**.

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- Radio on.

SET CONDITION

- The Radio detects a short to ground condition on a speaker output circuit.

DEFAULT ACTION

- The Radio automatically shuts down the speaker circuit output when this fault is detected.

POSSIBLE CAUSES

Possible Causes
AMPLIFIER SPEAKER SPEAKER (+/-) CIRCUIT SHORTED TO GROUND RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. **READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN**

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

2. DETERMINE THE VEHICLE AUDIO SYSTEM

1. Review the vehicle sales codes and configuration to determine the vehicle audio system.

Is the vehicle equipped with an Amplifier?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. CHECK THE AMPLIFIER

1. Make sure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related Amplifier harness connector.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Turn the radio on and set the volume to 25.
9. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [5](#)

No

- Replace the Amplifier in accordance with the Service Information. Refer to [AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. CHECK THE RELATED SPEAKER(S)

1. Ensure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related speaker(s) harness connector.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Turn the Radio on.
9. With the scan tool, read the Amplifier DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Replace the related speaker in accordance with the Service Information. Refer to [SPEAKER, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the appropriate wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [6](#)

6. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the appropriate wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [7](#)

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. With the scan tool, erase DTCs.
13. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
14. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. DETERMINE THE VEHICLE AUDIO SYSTEM

1. Review the vehicle sales codes and configuration to determine the vehicle audio system.

Is the vehicle equipped with an Amplifier?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. CHECK THE AMPLIFIER

1. Make sure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related Amplifier harness connector.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Turn the radio on and set the volume to 25.
9. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [4](#)

No

- Replace the Amplifier in accordance with the Service Information. Refer to [AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the harness connector at the component of the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage of the circuit being tested at the component harness connector.

Is there any voltage present?

Yes

- Go To [5](#)

No

- Go To [6](#)

5. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [8](#)

6. CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the harness connector at the component of the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage of the circuit being tested at the component harness connector.

Is there any voltage present?

Yes

- Go To [7](#)

No

- Go To [8](#)

7. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.

2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [8](#)

8. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCS.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
4. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCS.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCS.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCS.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. DETERMINE THE VEHICLE AUDIO SYSTEM

1. Review the vehicle sales codes and configuration to determine the vehicle audio system.

Is the vehicle equipped with an Amplifier?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. CHECK THE AMPLIFIER

1. Make sure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related Amplifier harness connector.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Turn the radio on and set the volume to 25.
9. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [4](#)

No

- Replace the Amplifier in accordance with the Service Information. Refer to **AMPLIFIER (AMP), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

4. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [5](#)

No

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [7](#)

No

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

6. REPLACE THE RELATED SPEAKER(S)

1. Replace the related speaker(s) in accordance with the Service Information. Refer to [SPEAKER, REMOVAL AND INSTALLATION](#) .
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. Turn the ignition on.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
9. With the scan tool, read DTCs.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

Did the DTC return?

Yes

- Go To [7](#)

No

- Replacement of the speaker(s) has corrected the concern.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

B1400-1A-FRONT LEFT AUDIO SPEAKER OUTPUT - CIRCUIT RESISTANCE BELOW THRESHOLD

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, refer to the appropriate wiring information .

AUDIO CHANNEL MAPPING

NOTE: Proper diagnosis of the audio system will require the use of this Audio Channel Mapping in addition to using the Audio System wiring diagrams. The use of Audio Channel Mapping and sales codes are being used to quickly identify those differences in locations; and the total number of speakers in the audio system configurations noted below.

CHANNEL 12	
SALES CODE	DESCRIPTION
Without RSJ	WIRELESS SPEAKER - BLUETOOTH

CHANNEL 12	
SALES CODE	DESCRIPTION
RSJ	WIRELESS SPEAKER - BLUETOOTH

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming. The Radio is capable of using AM/FM, Cellular, Global Positioning System (GPS) and Satellite Radio signals depending upon the audio system/vehicle configuration.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to **DESCRIPTION AND OPERATION** .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Radio detects a short together condition on a speaker output circuit.

DEFAULT ACTION

- The Radio automatically shuts down the speaker circuit output when this fault is detected.

POSSIBLE CAUSES

Possible Causes
AMPLIFIER SPEAKER SPEAKER (+) CIRCUIT SHORTED TO THE SPEAKER (-) CIRCUIT RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Turn the radio on and set the volume to 25.
9. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [5](#)

No

- Replace the Amplifier in accordance with the Service Information. Refer to [AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. CHECK THE SPEAKER

1. Make sure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related Speaker harness connector.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Turn the radio on and set the volume to 25.
9. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [5](#)

No

- Replace the related speaker in accordance with the Service Information. Refer to [SPEAKER, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE RADIO HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [6](#)

6. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE RADIO HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [7](#)

7. CHECK RELATED HARNESS CONNECTIONS

4. Disconnect the related Amplifier harness connector.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Turn the radio on and set the volume to 25.
9. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [5](#)

No

- Replace the Amplifier in accordance with the Service Information. Refer to **AMPLIFIER (AMP), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. CHECK THE RELATED SPEAKER(S)

1. Ensure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related speaker(s) harness connector.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Turn the Radio on.
9. With the scan tool, read the Amplifier DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Replace the related speaker in accordance with the Service Information. Refer to **SPEAKER, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the appropriate wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [6](#)

6. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.

2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the appropriate wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [7](#)

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. With the scan tool, erase DTCs.
13. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
14. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to [RADIO, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. DETERMINE THE VEHICLE AUDIO SYSTEM

1. Review the vehicle sales codes and configuration to determine the vehicle audio system.

Is the vehicle equipped with an Amplifier?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. CHECK THE AMPLIFIER

1. Make sure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related Amplifier harness connector.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Turn the radio on and set the volume to 25.
9. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [4](#)

No

- Replace the Amplifier in accordance with the Service Information. Refer to **AMPLIFIER (AMP), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

.

4. CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the harness connector at the component of the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage of the circuit being tested at the component harness connector.

Is there any voltage present?

Yes

- Go To [5](#)

No

- Go To [6](#)

5. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [8](#)

6. CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the harness connector at the component of the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage of the circuit being tested at the component harness connector.

Is there any voltage present?

Yes

- Go To [7](#)

No

- Go To [8](#)

7. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [8](#)

8. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1404-13-FRONT RIGHT AUDIO SPEAKER OUTPUT-CIRCUIT OPEN

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, refer to the appropriate wiring information .

AUDIO CHANNEL MAPPING

NOTE: Proper diagnosis of the audio system will require the use of this Audio Channel Mapping in addition to using the Audio System wiring diagrams. The use of Audio Channel Mapping and sales codes are being used to quickly identify those differences in locations; and the total number of speakers in the audio system configurations noted below.

CHANNEL 12	
SALES CODE	DESCRIPTION
Without RSJ	WIRELESS SPEAKER - BLUETOOTH

CHANNEL 12	
SALES CODE	DESCRIPTION
RSJ	WIRELESS SPEAKER - BLUETOOTH

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming. The Radio is capable of using AM/FM, Cellular, Global Positioning System (GPS) and Satellite Radio signals depending upon the audio system/vehicle configuration.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#).

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- Radio on.

SET CONDITION

- The Radio detects an open condition on a speaker output circuit.

DEFAULT ACTION

- The Radio automatically shuts down the speaker circuit output when this fault is detected.

POSSIBLE CAUSES

Possible Causes
AMPLIFIER SPEAKER SPEAKER (+/-) CIRCUIT OPEN RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#).

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCS.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
4. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCS.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCS.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCS.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

2. DETERMINE THE VEHICLE AUDIO SYSTEM

1. Review the vehicle sales codes and configuration to determine the vehicle audio system.

Is the vehicle equipped with an Amplifier?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. CHECK THE AMPLIFIER

1. Make sure one of the front doors is still open.
2. With the scan tool, erase the DTCS.
3. Turn the ignition off.
4. Disconnect the related Amplifier harness connector.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCS.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Turn the radio on and set the volume to 25.

9. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [4](#)

No

- Replace the Amplifier in accordance with the Service Information. Refer to [AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [5](#)

No

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [7](#)

No

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

6. REPLACE THE RELATED SPEAKER(S)

1. Replace the related speaker(s) in accordance with the Service Information. Refer to [SPEAKER, REMOVAL AND INSTALLATION](#) .
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. Turn the ignition on.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
9. With the scan tool, read DTCs.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [7](#)

No

- Replacement of the speaker(s) has corrected the concern.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.

- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Presence of foreign conductive materials on connector pins and terminals.
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to [**RADIO, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**
3. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. DETERMINE THE VEHICLE AUDIO SYSTEM

1. Review the vehicle sales codes and configuration to determine the vehicle audio system.

Is the vehicle equipped with an Amplifier?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. CHECK THE AMPLIFIER

1. Make sure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related Amplifier harness connector.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Turn the radio on and set the volume to 25.
9. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [5](#)

No

- Replace the Amplifier in accordance with the Service Information. Refer to [AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. CHECK THE SPEAKER

1. Make sure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related Speaker harness connector.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.

7. Turn the ignition on.
8. Turn the radio on and set the volume to 25.
9. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [5](#)

No

- Replace the related speaker in accordance with the Service Information. Refer to **SPEAKER, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE RADIO HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [6](#)

6. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE RADIO HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [7](#)

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.

10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

B1404-92-FRONT RIGHT AUDIO SPEAKER OUTPUT-PERFORMANCE OR INCORRECT OPERATION

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, refer to the appropriate wiring information .

AUDIO CHANNEL MAPPING

NOTE: Proper diagnosis of the audio system will require the use of this Audio Channel Mapping in addition to using the Audio System wiring diagrams. The use of Audio Channel Mapping and sales codes are being used to quickly identify those differences in locations; and the total number of speakers in the audio system configurations noted below.

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#).

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- Radio on.

SET CONDITION

- The Radio sets a Diagnostic Trouble Code (DTC) when a Direct Current (DC) offset occurs on a speaker circuit.

DEFAULT ACTION

- The Radio automatically shuts down the speaker circuit output when this fault is detected.

POSSIBLE CAUSES

Possible Causes
RADIO

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#).

DIAGNOSTIC TEST

READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, erase all DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Replace the Radio in accordance with the service information. Refer to [**RADIO, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to [**TESTING FOR AN INTERMITTENT CONDITION**](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. DETERMINE THE VEHICLE AUDIO SYSTEM

1. Review the vehicle sales codes and configuration to determine the vehicle audio system.

Is the vehicle equipped with an Amplifier?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. CHECK THE AMPLIFIER

1. Make sure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related Amplifier harness connector.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Turn the radio on and set the volume to 25.
9. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [5](#)

No

- Replace the Amplifier in accordance with the Service Information. Refer to [AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. CHECK THE RELATED SPEAKER(S)

1. Ensure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related speaker(s) harness connector.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.

7. Turn the ignition on.
8. Turn the Radio on.
9. With the scan tool, read the Amplifier DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Replace the related speaker in accordance with the Service Information. Refer to **SPEAKER, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the appropriate wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [6](#)

6. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the appropriate wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [7](#)

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. With the scan tool, erase DTCs.
13. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
14. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to [RADIO, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

B1408-12-REAR LEFT AUDIO SPEAKER OUTPUT-CIRCUIT SHORT TO BATTERY

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, refer to the appropriate wiring information .

AUDIO CHANNEL MAPPING

NOTE: Proper diagnosis of the audio system will require the use of this Audio Channel Mapping in addition to using the Audio System wiring diagrams. The use of Audio Channel Mapping and sales codes are being used to quickly identify those differences in locations; and the total number of speakers in the audio system configurations noted below.

CHANNEL 12	
SALES CODE	DESCRIPTION
Without RSJ	WIRELESS SPEAKER - BLUETOOTH

CHANNEL 12	
SALES CODE	DESCRIPTION
RSJ	WIRELESS SPEAKER - BLUETOOTH

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming. The Radio is capable of using AM/FM, Cellular, Global Positioning System (GPS) and Satellite Radio signals depending upon the audio system/vehicle configuration.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#).

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- Radio on.

SET CONDITION

- The Radio detects a short to battery condition on a speaker output circuit.

DEFAULT ACTION

- The Radio automatically shuts down the speaker circuit output when this fault is detected.

POSSIBLE CAUSES

Possible Causes
AMPLIFIER SPEAKER (+/-) CIRCUIT SHORTED TO VOLTAGE RADIO

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#).

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. DETERMINE THE VEHICLE AUDIO SYSTEM

1. Review the vehicle sales codes and configuration to determine the vehicle audio system.

Is the vehicle equipped with an Amplifier?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. CHECK THE AMPLIFIER

1. Make sure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related Amplifier harness connector.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Turn the radio on and set the volume to 25.
9. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [4](#)

No

- Replace the Amplifier in accordance with the Service Information. Refer to **AMPLIFIER (AMP), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

.

4. CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the harness connector at the component of the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage of the circuit being tested at the component harness connector.

Is there any voltage present?

Yes

- Go To [5](#)

No

- Go To [6](#)

5. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [8](#)

6. CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the harness connector at the component of the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage of the circuit being tested at the component harness connector.

Is there any voltage present?

Yes

- Go To [7](#)

No

- Go To [8](#)

7. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE AMPLIFIER HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [8](#)

8. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCS.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
4. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCS.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCS.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCS.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. DETERMINE THE VEHICLE AUDIO SYSTEM

1. Review the vehicle sales codes and configuration to determine the vehicle audio system.

Is the vehicle equipped with an Amplifier?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. CHECK THE AMPLIFIER

1. Make sure one of the front doors is still open.
2. With the scan tool, erase the DTCS.
3. Turn the ignition off.
4. Disconnect the related Amplifier harness connector.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCS.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Turn the radio on and set the volume to 25.

9. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [4](#)

No

- Replace the Amplifier in accordance with the Service Information. Refer to [AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [5](#)

No

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [7](#)

No

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

6. REPLACE THE RELATED SPEAKER(S)

1. Replace the related speaker(s) in accordance with the Service Information. Refer to [SPEAKER, REMOVAL AND INSTALLATION](#) .
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. Turn the ignition on.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
9. With the scan tool, read DTCs.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [7](#)

No

- Replacement of the speaker(s) has corrected the concern.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.

- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Presence of foreign conductive materials on connector pins and terminals.
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. Disconnect the related Amplifier harness connector.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Turn the radio on and set the volume to 25.
9. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [5](#)

No

- Replace the Amplifier in accordance with the Service Information. Refer to [AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. CHECK THE SPEAKER

1. Make sure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related Speaker harness connector.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.

7. Turn the ignition on.
8. Turn the radio on and set the volume to 25.
9. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [5](#)

No

- Replace the related speaker in accordance with the Service Information. Refer to **SPEAKER, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE RADIO HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [6](#)

6. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE RADIO HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [7](#)

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.

10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1408-92-REAR LEFT AUDIO SPEAKER OUTPUT-PERFORMANCE OR INCORRECT OPERATION

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, refer to the appropriate wiring information .

AUDIO CHANNEL MAPPING

NOTE: Proper diagnosis of the audio system will require the use of this Audio Channel Mapping in addition to using the Audio System wiring diagrams. The use of Audio Channel Mapping and sales codes are being used to quickly identify those differences in locations; and the total number of speakers in the audio system configurations noted below.

CHANNEL 12	
SALES CODE	DESCRIPTION
Without RSJ	WIRELESS SPEAKER - BLUETOOTH

CHANNEL 12	
SALES CODE	DESCRIPTION
RSJ	WIRELESS SPEAKER - BLUETOOTH

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#).

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- Radio on.

SET CONDITION

- The Radio sets a Diagnostic Trouble Code (DTC) when a Direct Current (DC) offset occurs on a speaker circuit.

DEFAULT ACTION

- The Radio automatically shuts down the speaker circuit output when this fault is detected.

POSSIBLE CAUSES

Possible Causes
RADIO

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#).

DIAGNOSTIC TEST

READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, erase all DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Replace the Radio in accordance with the service information. Refer to [**RADIO, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to [**TESTING FOR AN INTERMITTENT CONDITION**](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCS.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
4. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCS.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCS.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCS.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. DETERMINE THE VEHICLE AUDIO SYSTEM

1. Review the vehicle sales codes and configuration to determine the vehicle audio system.

Is the vehicle equipped with an Amplifier?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. CHECK THE AMPLIFIER

1. Make sure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related Amplifier harness connector.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Turn the radio on and set the volume to 25.
9. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [5](#)

No

- Replace the Amplifier in accordance with the Service Information. Refer to [AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. CHECK THE RELATED SPEAKER(S)

1. Ensure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related speaker(s) harness connector.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.

7. Turn the ignition on.
8. Turn the Radio on.
9. With the scan tool, read the Amplifier DTCs.

Did the DTC return?

Yes

- Go To [5](#)

No

- Replace the related speaker in accordance with the Service Information. Refer to **SPEAKER, REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the appropriate wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [6](#)

6. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the appropriate wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [7](#)

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. With the scan tool, erase DTCs.
13. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
14. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to [RADIO, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

Is the vehicle equipped with an Amplifier?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. CHECK THE AMPLIFIER

1. Make sure one of the front doors is still open.
2. With the scan tool, erase the DTCS.
3. Turn the ignition off.
4. Disconnect the related Amplifier harness connector.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCS.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Turn the radio on and set the volume to 25.

9. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [4](#)

No

- Replace the Amplifier in accordance with the Service Information. Refer to [AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [5](#)

No

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [7](#)

No

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

6. REPLACE THE RELATED SPEAKER(S)

1. Replace the related speaker(s) in accordance with the Service Information. Refer to [SPEAKER, REMOVAL AND INSTALLATION](#) .
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. Turn the ignition on.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
9. With the scan tool, read DTCs.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [7](#)

No

- Replacement of the speaker(s) has corrected the concern.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.

- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Presence of foreign conductive materials on connector pins and terminals.
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B140C-1A - REAR RIGHT AUDIO SPEAKER OUTPUT-CIRCUIT RESISTANCE BELOW THRESHOLD

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

AUDIO CHANNEL MAPPING

NOTE: **Proper diagnosis of the audio system will require the use of this Audio Channel Mapping in addition to using the Audio System wiring diagrams. The use of Audio Channel Mapping and sales codes are being used to quickly identify those differences in locations; and the total number of speakers in the audio system configurations noted below.**

CHANNEL 12	
SALES CODE	DESCRIPTION
Without RSJ	WIRELESS SPEAKER - BLUETOOTH

CHANNEL 12	
SALES CODE	DESCRIPTION
RSJ	WIRELESS SPEAKER - BLUETOOTH

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming. The Radio is capable of using AM/FM, Cellular, Global Positioning System (GPS) and Satellite Radio signals depending upon the audio system/vehicle configuration.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#).

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Radio detects a short together condition on a speaker output circuit.

DEFAULT ACTION

- The Radio automatically shuts down the speaker circuit output when this fault is detected.

POSSIBLE CAUSES

Possible Causes
AMPLIFIER SPEAKER SPEAKER (+) CIRCUIT SHORTED TO THE SPEAKER (-) CIRCUIT RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

SPEAKER CIRCUITS

Base - without Amplifier

X58	(-)

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**
3. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. DETERMINE THE VEHICLE AUDIO SYSTEM

1. Review the vehicle sales codes and configuration to determine the vehicle audio system.

Is the vehicle equipped with an Amplifier?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. CHECK THE AMPLIFIER

1. Make sure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related Amplifier harness connector.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Turn the radio on and set the volume to 25.
9. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [5](#)

No

- Replace the Amplifier in accordance with the Service Information. Refer to [AMPLIFIER \(AMP\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. CHECK THE SPEAKER

1. Make sure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related Speaker harness connector.
5. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.

7. Turn the ignition on.
8. Turn the radio on and set the volume to 25.
9. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [5](#)

No

- Replace the related speaker in accordance with the Service Information. Refer to **SPEAKER, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. ISOLATE AND CHECK THE SPEAKER (+) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE RADIO HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [6](#)

6. ISOLATE AND CHECK THE SPEAKER (-) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE RADIO HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [7](#)

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio and AMP (if equipped), and then erase DTCs.

10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B140C-92-REAR RIGHT AUDIO SPEAKER OUTPUT-PERFORMANCE OR INCORRECT OPERATION

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, refer to the appropriate wiring information .

AUDIO CHANNEL MAPPING

NOTE: Proper diagnosis of the audio system will require the use of this Audio Channel Mapping in addition to using the Audio System wiring diagrams. The use of Audio Channel Mapping and sales codes are being used to quickly identify those differences in locations; and the total number of speakers in the audio system configurations noted below.

CHANNEL 12	
SALES CODE	DESCRIPTION
Without RSJ	WIRELESS SPEAKER - BLUETOOTH

CHANNEL 12	
SALES CODE	DESCRIPTION
RSJ	WIRELESS SPEAKER - BLUETOOTH

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#).

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- Radio on.

SET CONDITION

- The Radio sets a Diagnostic Trouble Code (DTC) when a Direct Current (DC) offset occurs on a speaker circuit.

DEFAULT ACTION

- The Radio automatically shuts down the speaker circuit output when this fault is detected.

POSSIBLE CAUSES

Possible Causes
RADIO

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#).

DIAGNOSTIC TEST

READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, erase all DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Replace the Radio in accordance with the service information. Refer to [**RADIO, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to [**TESTING FOR AN INTERMITTENT CONDITION**](#) .

B142A-4B-RADIO UNIT HIGH TEMPERATURE - OVER TEMPERATURE

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [**DESCRIPTION AND OPERATION**](#) .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- Radio on.

SET CONDITION

- The code will set if the temperature inside the radio is between 175°F and 220°F.

DEFAULT ACTION

- One or more modes in the Radio may be unavailable.

POSSIBLE CAUSES

Possible Causes
RADIO SUBJECTED TO EXTREME HIGH AMBIENT TEMPERATURE
RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, record and erase the Radio DTCs.
5. Cycle the ignition switch from on to off, wait five seconds and then back to on.
6. Turn the Radio on and set the volume to 25.
7. With the scan tool, read the active Radio DTCs.

NOTE: A front door must remain open whenever checking or erasing Radio DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION**.

2. CHECK THE OPERATION OF THE RADIO

1. If the vehicle has been in the hot sunlight or extreme cold, move the vehicle indoors and open the doors to allow the inside temperature to stabilize.
2. Start the engine and allow the engine to reach normal operating temperature.
3. The Radio should operate between -23°C and 65°C (-10°F and 149°F).
4. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes - First and only occurrence

- Turn the Radio off and allow the unit to cool before retesting.

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

Yes - Multiple Occurrences

- Replace the Radio in accordance to the service information. Refer to [RADIO, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Test Complete.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B1431-00-BLUETOOTH ANTENNA INTERNAL PERFORMANCE

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- Ignition on.

SET CONDITION

- The Radio detects an internal fault with the Bluetooth antenna.

DEFAULT ACTION

- No Bluetooth operation.

POSSIBLE CAUSES

Possible Causes
BLUETOOTH ANTENNA RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. **READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN**

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, record and erase the Radio DTCs.
5. Cycle the ignition switch from on to off, wait five seconds and then back to on.
6. Turn the Radio on and set the volume to 25.
7. Adjust the speakers to the front and center.
8. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. CHECK THE BLUETOOTH CABLE AND CONNECTIONS

1. Turn the ignition off.
2. Inspect the Bluetooth cable connection at the rear of the Radio.
3. Inspect the Bluetooth cable connection at Bluetooth/WiFi Antenna.
4. Inspect the Bluetooth cable for damage or an open or shorted condition.

Were any problems found?

Yes

- Repair or replace the Bluetooth antenna cable or connection as needed.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [3](#)

3. TEST THE BLUETOOTH ANTENNA

1. Connect the 9977-6-WiFi BT test antenna (special tool #9977-6-WiFi-BT, Antenna, WiFi Blue Tooth)
2. Turn the ignition on.
3. With the scan tool, erase DTCs.
4. Cycle the ignition switch from on to off, wait five seconds and then back to on.
5. Adjust the speakers to the front and center.

Is the DTC active?

Yes

- Replace the Radio in accordance with the service information. Refer to [RADIO, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Replace the Bluetooth Antenna in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

B1434-13-BLUETOOTH ANTENNA - CIRCUIT OPEN

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information**.

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming. The Radio is capable of using AM/FM, Cellular, Global Positioning System (GPS) and Satellite Radio signals depending upon the audio system/vehicle configuration.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#).

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- Radio in Bluetooth mode.

SET CONDITION

- This DTC sets when the Radio does not detect a Bluetooth Antenna connection for greater than 60 seconds.

POSSIBLE CAUSES

Possible Causes
BAD BLUETOOTH ANTENNA CONNECTION
OPEN BLUETOOTH ANTENNA CABLE
OPEN BLUETOOTH RADIO ANTENNA
RADIO

Always perform the **PRE-PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#).

DIAGNOSTIC TEST

1. CHECK THE BLUETOOTH ANTENNA CONNECTION

1. Turn the ignition off.
2. Disconnect the Bluetooth Antenna connector at the back of the Radio.

3. Inspect the Bluetooth Antenna connections.

Are the Bluetooth Antenna connections clean and secure?

Yes

- Go To [2](#)

No

- Repair the Bluetooth Antenna connection as needed.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

2. CHECK THE BLUETOOTH ANTENNA AND CABLE

1. Connect the 9977-6-WiFi BT (special tool #9977-6-WiFi-BT, Antenna, WiFi Blue Tooth)to the antenna connection on the back of the Radio.
2. Make sure one of the front doors is still open.
3. Using the scan tool, erase the DTCs.
4. Turn the ignition on.
5. Turn the Radio on.

Did the DTC return?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. TEST THE BLUETOOTH ANTENNA CABLE

1. Disconnect the Bluetooth Antenna cable at the base.
2. Connect the appropriate (special tool #9977-6-1, Adapter) or (special tool #9977-6-3, Adapter) to the Bluetooth Antenna cable at the back of the Radio.
3. Connect the appropriate (special tool #9977-6-4, Jumper) or (special tool #9977-6-2, Jumper) to the Bluetooth Antenna cable at the Bluetooth Antenna base.
4. Measure the Resistance across the tool terminals.

Is the resistance above 52.5 Ohms?

Yes

- Use the (special tool #9977-6, Kit, Radio Antenna Diagnostic) to locate the open/damaged circuit, repair or replace the Bluetooth Antenna cable as necessary.
- Once the repair is complete clear all DTCs.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Replace the Bluetooth Antenna base in accordance with the Service Information.
- Once the repair is complete clear all DTCs.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. RADIO

1. Visually inspect the terminal on the radio.
2. Ensure the terminal is clean and free of any corrosion or damage.

- Is the terminal free of corrosion and damage?

Yes

- Go To [5](#)

No

- Repair the terminal as necessary.
- Perform the BODY VERIFICATION TEST.

Refer to **BODY VERIFICATION TEST** .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1434-1A-BLUETOOTH ANTENNA - CIRCUIT RESISTANCE BELOW THRESHOLD

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming. WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- With the ignition on.
- Radio in bluetooth mode.

SET CONDITION

- This DTC sets when the Radio detects a Bluetooth Antenna connection is shorted to ground

DEFAULT ACTION

- No bluetooth operation.

POSSIBLE CAUSES

Possible Causes
BAD BLUETOOTH ANTENNA CONNECTION
BLUETOOTH ANTENNA CABLE SHORTED TO GROUND
BLUETOOTH ANTENNA SHORTED TO GROUND
RADIO

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding.
Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

DIAGNOSTIC TEST

1. CHECK THE BLUETOOTH ANTENNA CONNECTION

1. Turn the ignition off.
2. Disconnect the Bluetooth Antenna connector at the back of the Radio.
3. Inspect the Bluetooth Antenna connections.

Are the Bluetooth Antenna connections clean and secure?

Yes

- Go To [2](#)

No

- Repair the Bluetooth Antenna connection as needed.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

2. CHECK THE BLUETOOTH ANTENNA AND CABLE

1. Connect the 9977-6-WiFi BT (special tool #9977-6-WiFi-BT, Antenna, WiFi Blue Tooth) to the antenna connection on the back of the Radio.
2. Make sure one of the front doors is still open.
3. Using the scan tool, erase the DTCs.
4. Turn the ignition on.
5. Turn the Radio on.
6. Using the scan tool, read the active Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [3](#)

3. TEST THE BLUETOOTH ANTENNA CABLE

1. Disconnect the Bluetooth Antenna cable at the base.
2. Connect the appropriate (special tool #9977-6-1, Adapter) or (special tool #9977-6-3, Adapter) to the Bluetooth Antenna cable at the back of the Radio.
3. Connect the appropriate (special tool #9977-6-4, Jumper) or (special tool #9977-6-2, Jumper) to the Bluetooth Antenna cable at the Bluetooth Antenna base.
4. Measure the Resistance across the tool terminals.

Is the resistance below 47.5 Ohms?

Yes

- Use the (special tool #9977-6, Kit, Radio Antenna Diagnostic) to locate the short together, repair or replace the Bluetooth Antenna cable as necessary.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Replace the Bluetooth Antenna base in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B143A-11-MICROPHONE 1 - CIRCUIT SHORT TO GROUND

For a complete HANDS FREE SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [**DESCRIPTION AND OPERATION**](#).

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Radio detects a shorted to ground condition on the hands free Microphone (+) or (-) circuits.

DEFAULT ACTION

- Microphone is inoperative.

POSSIBLE CAUSES

Possible Causes
MICROPHONE MICROPHONE (+/-) CIRCUIT SHORTED TO GROUND RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [**PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**](#).

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCS.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCS.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.

7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE RELATED MICROPHONE

1. Ensure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related Microphone harness connector.
5. Turn the ignition on.
6. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
7. Turn the ignition off for a minimum of 10.0 seconds.
8. Turn the ignition on.
9. Turn the Radio on.
10. With the scan tool, read the Radio DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the related Microphone in accordance with the Service Information. Refer to **MICROPHONE, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. ISOLATE AND CHECK THE MICROPHONE (+) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: **When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.**

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the appropriate wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. ISOLATE AND CHECK THE MICROPHONE (-) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the appropriate wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.

- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

8. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
9. Turn the ignition off for a minimum of 10.0 seconds.
10. Turn the ignition on.
11. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
12. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B143A-12-MICROPHONE 1 - CIRCUIT SHORT TO BATTERY

DIAGNOSTIC TEST

1. READ AND RECORD DTCs AND ENVIRONMENTAL DATA - ERASE DTCs AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

2. CHECK THE MICROPHONE (+) CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the harness connector at the component of the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using a DVOM, measure the voltage of the circuit being tested at the component harness connector.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. ISOLATE AND CHECK THE MICROPHONE (+) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE RADIO HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [6](#)

4. CHECK THE MICROPHONE (-) CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the harness connector at the component of the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage of the circuit being tested at the component harness connector.

Is there any voltage present?

Yes

- Go To [5](#)

No

- Go To [6](#)

5. ISOLATE AND CHECK THE MICROPHONE (-) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE RADIO HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [6](#)

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.

- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Presence of foreign conductive materials on connector pins and terminals.
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

8. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
9. Turn the ignition off for a minimum of 10.0 seconds.
10. Turn the ignition on.
11. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
12. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCS.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.

7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE OPERATION OF THE RELATED MICROPHONE

NOTE: **Verify the connection of the Microphone harness connector.**

1. Turn the ignition off.
2. Disconnect the Microphone harness connector
3. Connect a jumper wire between the Microphone (+) and the Microphone (-) circuits at the Microphone harness connector.
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

7. With the scan tool, read DTCs.

NOTE: **A correlating Microphone Shorted Together circuit DTC should display as active as a result of this test.**

Does the scan tool display the Microphone Circuit Open as active DTC?

Yes

- Replace the Microphone in accordance with the Service Information. Refer to **MICROPHONE, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE MICROPHONE (+) CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.

3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [4](#)

No

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. ISOLATE AND CHECK THE MICROPHONE (-) CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [5](#)

No

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.

- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Presence of foreign conductive materials on connector pins and terminals.
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

8. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
9. Turn the ignition off for a minimum of 10.0 seconds.
10. Turn the ignition on.
11. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
12. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCS.**
3. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data related to the DTCS.
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCS.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.

7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. CHECK THE OPERATION OF THE RELATED MICROPHONE

NOTE: **Verify the connection of the Microphone harness connector.**

1. Turn the ignition off.
2. Disconnect the Microphone harness connector.
3. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

6. With the scan tool, read DTCs.

NOTE: **A correlating Microphone Circuit Open DTC should display as active as a result of this test.**

Does the scan tool display the Microphone Circuits Shorted Together as an active DTC?

Yes

- Go To [3](#)

No

- Replace the Microphone in accordance with the Service Information. Refer to [MICROPHONE, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. ISOLATE AND CHECK THE MICROPHONE (+) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE RADIO HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. ISOLATE AND CHECK THE MICROPHONE (-) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE RADIO HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [5](#)

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.

- Damaged connector locks.
- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Presence of foreign conductive materials on connector pins and terminals.
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
9. Turn the ignition off for a minimum of 10.0 seconds.
10. Turn the ignition on.
11. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
12. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to [**RADIO, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

B143D-11 - MICROPHONE 2-CIRCUIT SHORT TO GROUND

For a complete HANDS FREE SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to **DESCRIPTION AND OPERATION** .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Radio detects a shorted to ground condition on the hands free Microphone (+) or (-) circuits.

DEFAULT ACTION

- Microphone is inoperative.

POSSIBLE CAUSES

Possible Causes
MICROPHONE MICROPHONE (+/-) CIRCUIT SHORTED TO GROUND RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.

8. With the scan tool, read DTCs.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. CHECK THE RELATED MICROPHONE

1. Ensure one of the front doors is still open.
2. With the scan tool, erase the DTCs.
3. Turn the ignition off.
4. Disconnect the related Microphone harness connector.
5. Turn the ignition on.
6. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
7. Turn the ignition off for a minimum of 10.0 seconds.
8. Turn the ignition on.
9. Turn the Radio on.
10. With the scan tool, read the Radio DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the related Microphone in accordance with the Service Information. Refer to [MICROPHONE, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. ISOLATE AND CHECK THE MICROPHONE (+) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the appropriate wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. ISOLATE AND CHECK THE MICROPHONE (-) CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. With the positive lead of the DVOM, probe the circuit being tested at the component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the appropriate wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.

- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

8. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
9. Turn the ignition off for a minimum of 10.0 seconds.
10. Turn the ignition on.
11. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
12. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCS.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCS.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCS.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE MICROPHONE (+) CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the harness connector at the component of the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using a DVOM, measure the voltage of the circuit being tested at the component harness connector.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. ISOLATE AND CHECK THE MICROPHONE (+) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE RADIO HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [6](#)

4. CHECK THE MICROPHONE (-) CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.

2. Disconnect the harness connector at the component of the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage of the circuit being tested at the component harness connector.

Is there any voltage present?

Yes

- Go To [5](#)

No

- Go To [6](#)

5. ISOLATE AND CHECK THE MICROPHONE (-) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE RADIO HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.

- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Presence of foreign conductive materials on connector pins and terminals.
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

8. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
9. Turn the ignition off for a minimum of 10.0 seconds.
10. Turn the ignition on.
11. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.

7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.

8. With the scan tool, read DTCs.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. CHECK THE OPERATION OF THE RELATED MICROPHONE

NOTE: Verify the connection of the Microphone harness connector.

1. Turn the ignition off.
2. Disconnect the Microphone harness connector
3. Connect a jumper wire between the Microphone (+) and the Microphone (-) circuits at the Microphone harness connector.
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

7. With the scan tool, read DTCs.

NOTE: A correlating Microphone Shorted Together circuit DTC should display as active as a result of this test.

Does the scan tool display the Microphone Circuit Open as active DTC?

Yes

- Replace the Microphone in accordance with the Service Information. Refer to [MICROPHONE, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [3](#)

3. ISOLATE AND CHECK THE MICROPHONE (+) CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.

5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [4](#)

No

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. ISOLATE AND CHECK THE MICROPHONE (-) CIRCUIT FOR AN OPEN/HIGH RESISTANCE

1. The ignition must be off when checking the continuity of a circuit.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and the component harness connector containing the circuit being tested. **Note:** Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

Is the resistance below 3.0 Ohms?

Yes

- Go To [5](#)

No

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.

- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Presence of foreign conductive materials on connector pins and terminals.
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

NOTE: **The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**

8. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
9. Turn the ignition off for a minimum of 10.0 seconds.
10. Turn the ignition on.
11. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
12. With the scan tool, read Radio DTCs.

Did the DTC return?

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. **NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.**
3. With the scan tool, run a Vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.

8. With the scan tool, read DTCs.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. CHECK THE OPERATION OF THE RELATED MICROPHONE

NOTE: Verify the connection of the Microphone harness connector.

1. Turn the ignition off.
2. Disconnect the Microphone harness connector.
3. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.

NOTE: The Radio must be on and a front door must remain open whenever checking or erasing Radio DTCs.

6. With the scan tool, read DTCs.

NOTE: A correlating Microphone Circuit Open DTC should display as active as a result of this test.

Does the scan tool display the Microphone Circuits Shorted Together as an active DTC?

Yes

- Go To [3](#)

No

- Replace the Microphone in accordance with the Service Information. Refer to [MICROPHONE, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. ISOLATE AND CHECK THE MICROPHONE (+) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE RADIO HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any

possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [4](#)

4. ISOLATE AND CHECK THE MICROPHONE (-) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT AT THE RADIO HARNESS CONNECTOR

1. The ignition must be off when performing a resistance check to find a short between circuits.
2. Isolate the circuit by disconnecting the Electronic Control Unit (ECU) and every component harness connector containing the circuit being tested. At this time leave all in-line connectors connected. Note: Use the appropriate wiring diagram as a guide to follow the path of the circuit.
3. Connect one lead of the DVOM to the circuit being tested at the ECU harness connector.
4. With the other lead of the DVOM probe all other circuits at the ECU harness connector.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: With the circuit isolated there should be no continuity between the circuit being tested and any other circuit.

Is there continuity between the circuit being tested and any other circuit?

Yes

- Repair the short between the circuits that have continuity. Use the appropriate wiring diagram as a guide to trace the circuits and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [5](#)

5. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.

- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Presence of foreign conductive materials on connector pins and terminals.
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
9. Turn the ignition off for a minimum of 10.0 seconds.
10. Turn the ignition on.
11. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
12. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to [**RADIO, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

B1488-00-CABIN EQ MISMATCH PERFORMANCE

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [**DESCRIPTION AND OPERATION**](#) .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- Ignition on.

SET CONDITION

- If the Cabin Equalization Curve number value from the Body Control Module (BCM) is not the same as the Cabin Equalization Curve number stored in the Radio for 10 consecutive cycles, then the Radio will set this DTC.

DEFAULT ACTION

- Reduced audio quality.

POSSIBLE CAUSES

Possible Causes
INCORRECT CONFIGURATION

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, record and erase the Radio DTCs.
5. Cycle the ignition switch from on to off, wait five seconds and then back to on.
6. Turn the Radio on and set the volume to 25.
7. Adjust the speakers to the front and center.
8. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE CABIN EQUALIZATION CURVE NUMBER

1. With the scan tool in the BCM ECU Details Tab, Configuration button, record the Cabin Equalization Curve number.
2. With the scan tool in the Radio ECU Details Tab, Configuration button, record the True value.

NOTE: The Cabin EQ Curve value found in the BCM should match the True value found in the Radio.

Do the Cabin EQ settings match one another?

Yes

- Replace the Radio in accordance to the service information. Refer to **RADIO, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [3](#)

3. VERIFY COMMUNICATION WITH BCM

1. With the scan tool, read the active modules on the BUS.

Does the scan tool show the BCM active on the BUS?

Yes

- Go To [4](#)

No

- Perform the No Response From ECU diagnostic procedure. Refer to **NO RESPONSE FROM ECU** .

4. CHECK THE BCM FOR ACTIVE DTCs

1. With the scan tool, erase BCM DTCs.
2. Turn the ignition off. Wait approximately 10 seconds.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs and record them on the repair order.

Are any active DTCs present?

Yes

- Perform the appropriate diagnostic procedure. Refer to **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** .

No

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1494-00-APP FAILED TO LOAD

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- Ignition on.

SET CONDITION

- The Radio has detected an application has not loaded from an external device (phone, ipod etc.).

DEFAULT ACTION

- Reduced audio quality.

POSSIBLE CAUSES

Possible Causes
INCORRECT CONFIGURATION

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, record and erase the Radio DTCs.
5. Cycle the ignition switch from on to off, wait five seconds and then back to on.
6. Turn the Radio on and set the volume to 25.
7. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Replace the Radio in accordance to the service information. Refer to **RADIO, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

B1498-13-USB HUB-CIRCUIT OPEN

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

For a complete AUDIO SYSTEM MEDIA PORT BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming. The Radio is capable of using AM/FM, Cellular, Global Positioning System (GPS) and Satellite Radio signals depending upon the audio system/vehicle configuration.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to **DESCRIPTION AND OPERATION**.

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- Ignition on.

SET CONDITION

- The Radio detects a fault with the USB hub / Media port cable.

DEFAULT ACTION

- The USB hub / Media port is inoperative.

POSSIBLE CAUSES

Possible Causes
USB HUB / MEDIA PORT CABLE
USB HUB / MEDIA PORT
RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, record and erase the Radio DTCs.
5. Cycle the ignition switch from on to off, wait five seconds and then back to on.
6. Turn the Radio on and set the volume to 25.
7. Adjust the speakers to the front and center.
8. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go to [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE USB/MEDIA PORT CABLE

NOTE: Confirm the USB/Media port cable is connected to the Radio and USB/Media port before proceeding with this diagnostic.

1. Disconnect the USB/Media port cable at the Radio.
2. Disconnect the USB/Media port cable at the USB/Media port.
3. From the 9977-6-11 Radio Antenna Diagnostic Kit (special tool #9977-6-11, Kit, USB Mini-B - 4 and 5 Wire) connect the appropriate length adapter cable between the Radio and USB Port.
4. With the scan tool, erase the Radio DTCs.
5. Cycle the ignition switch from on to off, wait five seconds and then back to on.
6. With the scan tool, read the Radio DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the USB hub / Media Port Cable for damage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. CHECK THE MEDIA PORT

NOTE: This test is designed to validate the ability of the Audio/Media system to play audio from a customer's device that has been connected to the USB port on the radio or the external USB port (Universal Customer Interface (UCI) / Multi- Media port). By connecting a known good compatible device to the USB ports it will also determine if the USB port can provide power to a connected device.

It is important to determine the system features supported by the vehicle's multi-media systems, customer's personal device and their compatibility with another.

For device compatibility, refer to <http://www.driveuconnect.com>

Prior to performing any testing of the multi-media systems, the compatibility between the customer's personal device and the vehicle's multi-media systems must be confirmed.

1. Confirm the USB port is not a **Charge only** port.
2. Using a known good USB Cable, connect the USB Cable to the vehicle's USB port.
3. Connect the USB Cable to the known good compatible device.
4. Select and audio file from the known good compatible device to be heard with the volume all the way up.
5. Using the vehicle controls, place the audio system into USB Mode. (Audio system may automatically enter into USB Mode.)

Does the Radio play audio from the known good compatible device?

Yes

- Go To [4](#)

No

- Replace the Media Port in accordance with the Service Information. Refer to [MEDIA HUB, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to [RADIO, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

For a complete AUDIO SYSTEM MEDIA PORT BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to **DESCRIPTION AND OPERATION** .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- Ignition on.

SET CONDITION

- The Radio detects an internal fault with the USB hub / Media port.

DEFAULT ACTION

- USB hub/Media port inoperative.

POSSIBLE CAUSES

Possible Causes
USB HUB / MEDIA PORT CABLE
USB HUB / MEDIA PORT
RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. CHECK FOR AN ACTIVE DTC

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, record and erase the Radio DTCs.
5. Cycle the ignition switch from on to off, wait five seconds and then back to on.
6. With the scan tool, read the Radio DTCs.

Is the DTC active?

Yes

- Go to [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. CHECK THE USB/MEDIA PORT CABLE

1. Disconnect the USB/Media port cable at the Radio.
2. Disconnect the USB/Media port cable at the USB/Media port.
3. From the 9977-6-11 Radio Antenna Diagnostic Kit (special tool #9977-6-11, Kit, USB Mini-B - 4 and 5 Wire) connect the appropriate length adapter cable between the Radio and USB Port.
4. With the scan tool, erase the Radio DTCs.
5. Cycle the ignition switch from on to off, wait five seconds and then back to on.
6. With the scan tool, read the Radio DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the USB hub / Media Port Cable for damage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. CHECK THE MEDIA PORT

NOTE: This test is designed to validate the ability of the Audio/Media system to play audio from a customer's device that has been connected to the USB port on the radio or the external USB port (Universal Customer Interface (UCI) / Multi- Media port). By connecting a known good compatible device to the USB ports it will also determine if the USB port can provide power to a connected device.

It is important to determine the system features supported by the vehicle's multi-media systems, customer's personal device and their compatibility with another.

For device compatibility, refer to <http://www.driveuconnect.com>

Prior to performing any testing of the multi-media systems, the compatibility between the customer's personal device and the vehicle's multi-media systems must be confirmed.

1. Confirm the USB port is not a **Charge only** port.
2. Using a known good USB Cable, connect the USB Cable to the vehicle's USB port.
3. Connect the USB Cable to the known good compatible device.
4. Select and audio file from the known good compatible device to be heard with the volume all the way up.
5. Using the vehicle controls, place the audio system into USB Mode. (Audio system may automatically enter into USB Mode.)

Does the Radio play audio from the known good compatible device?

Yes

- Replace the Radio in accordance with the Service Information. Refer to [**RADIO, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Replace the Media Port in accordance with the Service Information. Refer to [**MEDIA HUB, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

B14DA-2A-HEAD UNIT BUTTON - STUCK

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [**DESCRIPTION AND OPERATION**](#) .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- Radio active on the bus.

SET CONDITION

- In vehicles built **without** a disassociated touchscreen display the Radio detects a closed switch. In vehicles built **with** a disassociated touchscreen display the Radio receives a bussed input for a closed switch.

DEFAULT ACTION

- Push-button commands ignored by the Radio.

POSSIBLE CAUSES

Possible Causes
INTEGRATED CENTER STACK (ICS) RELATED DTCS
STEERING COLUMN CONTROL MODULE (SCCM) RELATED DTCS
DIRT, FOREIGN OBJECTS, STICKY SUBSTANCE, OR PHYSICAL DAMAGE TO BUTTON(S)
ICS
SCCM
RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.
Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, record and erase the Radio DTCs.
5. Cycle the ignition switch from on to off, wait five seconds and then back to on.
6. Turn the Radio on and set the volume to 25.
7. Adjust the speakers to the front and center.
8. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

2. DETERMINE THE VEHICLE CONFIGURATION

1. Review the Radio sales codes and display screen to determine the vehicle audio system configuration.

Is the vehicle equipped with a disassociated / separate touchscreen display?

Yes

- Go To [4](#)

No

- Go To [3](#)

3. VERIFY OPERATION OF THE BUTTON

1. With the scan tool, read DTCs and record on repair order.
2. With the scan tool, erase DTCs.
3. Press and release all the Radio hard and soft keys three times.
4. Wait 60 seconds.
5. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service Information. Refer to [RADIO, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Test complete.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. CHECK THE INTEGRATED CENTER STACK (ICS)

1. With the scan tool, read the ICS DTCs.

NOTE: **The ICS is capable of setting a similar type DTC for B157F-2A-BUTTON/KNOB - STUCK**

Does the ICS have DTCs?

Yes

- Refer to - DTC-Based Diagnostics/MODULE, Integrated Center Stack (ICS) Diagnosis and Testing.

No

- Go To [5](#)

5. CHECK THE STEERING COLUMN CONTROL MODULE (SCCM)

1. With the scan tool, read the SCCM DTCs.

NOTE: **The SCCM is capable of setting a similar type DTC for B1425-2A-REMOTE RADIO SWITCH INPUT - STUCK**

Does the SCCM have DTCs?

Yes

- Refer to DTC-Based Diagnostics/MODULE, Steering Column Control) Diagnosis and Testing.

No

- Go To [6](#)

6. CHECK THE ICS AND STEERING WHEEL SWITCH BUTTONS

1. Carefully check the ICS and Steering Wheel Switch buttons by pressing and releasing each button for the following:
 - Debris (Dirt, Foreign Objects, Sticky Substances, etc.) that may be causing the button(s) to remain in a pressed state.
 - Physical damage to the buttons.

Do the buttons show any of the above noted?

Yes

- IF needed - replace the ICS in accordance with the Service Information, refer to - Electronic Control Modules / MODULE, Integrated Center Stack (ICSM) / Removal and Installation.

- IF needed - replace the Steering Wheel Switches in accordance with the Service Information, refer to - Audio/Video/Entertainment/Connectivity / SWITCH, Remote Radio / Removal and Installation.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [7](#)

7. CHECK THE RADIO BUSSED INPUTS

1. Do not press any buttons in **or** on the vehicle during this portion.
2. With the scan tool, check the Radio data tab for each bussed input value / status for the following:

NOTE: Those bussed inputs to the Radio with a SWS designation originate from the Steering Wheel Switches on LIN bus to the SCCM. The other bussed inputs are through the Integrated Center Stack.

- Pressed or Not Pressed (ICS)
- Active or Not Active (SCCM)

Does the scan tool show a "Pressed" or "Active" bussed input value / status in the Radio data?

Yes

- Go To [9](#)

No

- Go To [8](#)

8. CHECK THE ASSOCIATED ECU

1. Turn the ignition off.
2. Based on the information found in STEP, REMOVE THE RELATED ECU found from communicating on the CAN bus to confirm as the possible cause:

NOTE: An ECU will stop communicating on a CAN bus by removing its power(s), ground(s), or disconnecting the ECU.

- ICS - Integrated Center Stack
- SCCM - Steering Column Control Module

NOTE: Communication DTCs (i.e. Loss of Com, Implausible, Invalid) may appear for those ECUs that are removed from communicating on the CAN bus.

3. Turn the ignition on
4. With the scan tool, check the Radio data tab for each bussed input value / status for the following:

NOTE: Those bussed inputs to the Radio with a SWS designation originate from the Steering Wheel Switches on LIN bus to the SCCM. The other bussed inputs are through the Integrated Center Stack.

- Pressed or Not Pressed (ICS)
- Active or Not Active (SCCM)

Did the bussed input value / status in the Radio data change to "Not Pressed" or "Not Active"?

Yes

- Replace the related ECU in accordance with Service Information
 - For the ICS refer to - Electronic Control Modules / MODULE, Integrated Center Stack (ICSM) / Removal and Installation.
 - For the SCCM refer to - Electronic Control Modules / MODULE, Steering Column Control (SCCM) / Removal and Installation.
 - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Replace the Radio in accordance with the Service Information. Refer to **RADIO, REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

9. CHECK THE ASSOCIATED ECUS FOR POSSIBLE CAUSE

1. Turn the ignition off.
2. The following ECUs listed below will need to be removed (**one at a time**) from communicating on the CAN bus to determine the ECU as the possible cause:

NOTE: An ECU will stop communicating on a CAN bus by removing its power(s), ground(s), or disconnecting the ECU.

- ICS - Integrated Center Stack
- SCCM - Steering Column Control Module

NOTE: Communication DTCs (i.e. Loss of Com, Implausible, Invalid) may appear for those ECUs that are removed from communicating on the CAN bus.

3. Turn the ignition on
4. With the scan tool, check the Radio data tab for each bussed input value / status for the following:

NOTE: Those bussed inputs to the Radio with a SWS designation originate from the Steering Wheel Switches. The other bussed inputs are through the Integrated Center Stack.

- Pressed or Not Pressed
 - Active or Not Active (SWS related only)
5. Repeat the above sub steps 1 - 4 of Step 9 for the remaining ECU.

Which ECU when disconnected changed the "Pressed" or "Active" bussed input value / status in the Radio data to "Not Pressed" or "Not Active"?

ICS

- Replace the ICS in accordance with the Service Information. refer to - Electronic Control Modules / MODULE, Integrated Center Stack (ICSM) / Removal and Installation.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

SCCM

- Replace the SCCM in accordance with the Service Information, refer to - Electronic Control Modules / MODULE, Steering Column Control (SCCM) / Removal and Installation.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

NEITHER

- Replace the Radio in accordance with the Service Information. Refer to [RADIO, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

B1560-11-CELLULAR ANTENNA 1-CIRCUIT SHORT TO GROUND

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- With the ignition on.
- Radio in cellular mode.

SET CONDITION

- This DTC sets when the Radio detects a Cellular Antenna connection is shorted to ground

DEFAULT ACTION

- No cellular operation.

POSSIBLE CAUSES

Possible Causes
BAD ANTENNA CONNECTION CELLULAR ANTENNA CABLE CELLULAR ANTENNA RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on and set the volume to 25.
8. Adjust the speakers to the front and center.
9. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ANTENNA INSPECTION

1. Using Service Information locate and verify the antenna is on the vehicle.
2. Visually inspect the Antenna for damage.

Is the antenna missing or damaged?

Yes

- Replace the Cellular Antenna in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [3](#)

3. CHECK THE ANTENNA CONNECTIONS

1. Turn the ignition off.
2. Disconnect the Cellular Antenna connector at the Antenna.
3. Disconnect the Cellular Antenna connector at the rear of the Radio.
4. Inspect both of the Cellular Antenna connections and verify the Antenna is torqued to specification.

Were the antenna connections clean and torqued to specification?

Yes

- Go To [4](#)

No

- Clean the Cellular Antenna connection(s) / torque to specification as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. CHECK THE ANTENNA AND CABLE

NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Connect the Radio Diagnostic Tool (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) and (special tool #9977-6-CELL-LTE, Adapter, Cellular Antenna Diagnostic) to the Cellular Antenna connection on the back of the Radio.
2. Make sure one of the front doors is still open.
3. Turn the ignition on.
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on.
8. Using the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go to [6](#)

No

- Go To [5](#)

5. TEST THE CELLULAR ANTENNA CABLE

NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Turn the ignition off.
2. Disconnect the vehicles Cellular Antenna cable at the Cellular Antenna.

NOTE: Special tool 9977-6-13 should still be connected at the back of the Radio during this test.

3. Connect the (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) to the vehicles Cell Antenna.
4. Make sure one of the front doors is still open.
5. Turn the ignition on.
6. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
7. Turn the ignition off for a minimum of 10.0 seconds.
8. Turn the ignition on.
9. Turn the Radio on.
10. Using the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Replace the Cellular Antenna in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Use the Radio Diagnostic Tool (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) to locate the open circuit, repair or replace the Cellular Antenna cable as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

B1560-13-CELLULAR ANTENNA 1-CIRCUIT OPEN

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [DESCRIPTION AND OPERATION](#) .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- Radio in Cellular mode.

SET CONDITION

- This DTC sets when the Radio does not detect a Cellular Antenna connection.

POSSIBLE CAUSES

Possible Causes
BAD ANTENNA CONNECTION CELLULAR ANTENNA CABLE CELLULAR ANTENNA RADIO

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.

6. Turn the ignition on.
7. Turn the Radio on and set the volume to 25.
8. Adjust the speakers to the front and center.
9. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#) .

2. ANTENNA INSPECTION

1. Using Service Information locate and verify the antenna is on the vehicle.
2. Visually inspect the Antenna for damage.

Is the antenna missing or damaged?

Yes

- Replace the Cellular Antenna in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [3](#)

3. CHECK THE ANTENNA CONNECTIONS

1. Turn the ignition off.
2. Disconnect the Cellular Antenna connector at the Antenna.
3. Disconnect the Cellular Antenna connector at the rear of the Radio.
4. Inspect both of the Cellular Antenna connections and verify the Antenna is torqued to specification.

Were the antenna connections clean and torqued to specification?

Yes

- Go To [4](#)

No

- Clean the Cellular Antenna connection(s) / torque to specification as necessary.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. CHECK THE ANTENNA AND CABLE

NOTE: **Antenna reception testing**
must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Connect the Radio Diagnostic Tool (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) and (special tool #9977-6-CELL-LTE, Adapter, Cellular Antenna Diagnostic) to the Cellular Antenna connection on the back of the Radio.
2. Make sure one of the front doors is still open.
3. Turn the ignition on.
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on.
8. Using the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [6](#)

No

- Go To [5](#)

5. TEST THE CELLULAR ANTENNA CABLE

NOTE: **Antenna reception testing**

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Turn the ignition off.
2. Disconnect the vehicles Cellular Antenna cable at the Cellular Antenna.

NOTE: **Special tool 9977-6-13 should still be connected at the back of the Radio during this test.**

3. Connect the (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) to the vehicles Cell Antenna.
4. Make sure one of the front doors is still open.
5. Turn the ignition on.
6. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
7. Turn the ignition off for a minimum of 10.0 seconds.
8. Turn the ignition on.
9. Turn the Radio on.
10. Using the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Replace the Cellular Antenna in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Use the Radio Diagnostic Tool (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) to locate the open circuit, repair or replace the Cellular Antenna cable as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.

5. TEST THE GPS ANTENNA CABLE

NOTE: **Antenna reception testing**

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Turn the ignition off.
2. Disconnect the vehicles GPS Antenna cable at the GPS Antenna.

NOTE: **Special tool 9977-6-13 should still be connected at the back of the Radio during this test.**

3. Connect the (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) to the vehicles GPS Antenna.
4. Make sure one of the front doors is still open.
5. Turn the ignition on.
6. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
7. Turn the ignition off for a minimum of 10.0 seconds.
8. Turn the ignition on.
9. Turn the Radio on.
10. Using the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Replace the GPS Antenna in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Use the Radio Diagnostic Tool (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) to locate the open circuit, repair or replace the Satellite Antenna cable as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to **DESCRIPTION AND OPERATION** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- With the ignition on.
- Radio in navigation mode.

SET CONDITION

- This DTC sets when the Radio detects a Global Positioning System (GPS) Antenna connection is shorted to battery.

DEFAULT ACTION

- GPS inoperative.

POSSIBLE CAUSES

Possible Causes
BAD ANTENNA CONNECTION
GPS ANTENNA CABLE
GPS ANTENNA
RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. **READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN**
1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.

2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.

3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCS.**

4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCS.

5. Turn the ignition off for a minimum of 10.0 seconds.

6. Turn the ignition on.

7. Turn the Radio on and set the volume to 25.
8. Adjust the speakers to the front and center.
9. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ANTENNA INSPECTION

1. Using Service Information locate and verify the antenna is on the vehicle.
2. Visually inspect the Antenna for damage.

Is the antenna missing or damaged?

Yes

- Replace the GPS Antenna in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [3](#)

3. CHECK THE ANTENNA CONNECTIONS

1. Turn the ignition off.
2. Disconnect the GPS Antenna connector at the Antenna.
3. Disconnect the GPS Antenna connector at the rear of the Radio.
4. Inspect both of the GPS Antenna connections and verify the Antenna is torqued to specification.

Were the antenna connections clean and torqued to specification?

Yes

- Go To [4](#)

No

- Clean the GPS Antenna connection(s) / torque to specification as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. CHECK THE ANTENNA AND CABLE

NOTE: **If the vehicle is equipped with satellite audio, a combined antenna for satellite and navigation is used.**

NOTE: **Antenna reception testing
must**

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Connect the Radio Diagnostic Tool (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) and (special tool #9977-6-GPS-GLO, Antenna, GPS GLONASS) to the GPS Antenna connection on the back of the Radio.
2. Make sure one of the front doors is still open.
3. Turn the ignition on.
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on.
8. Using the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [6](#)

No

- Go To [5](#)

5. TEST THE GPS ANTENNA CABLE

NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Turn the ignition off.
2. Disconnect the vehicles GPS Antenna cable at the GPS Antenna.

NOTE: Special tool 9977-6-13 should still be connected at the back of the Radio during this test.

3. Connect the (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) to the vehicles GPS Antenna.
4. Make sure one of the front doors is still open.
5. Turn the ignition on.
6. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
7. Turn the ignition off for a minimum of 10.0 seconds.
8. Turn the ignition on.
9. Turn the Radio on.
10. Using the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Replace the GPS Antenna in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Use the Radio Diagnostic Tool (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) to locate the open circuit, repair or replace the Satellite Antenna cable as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

SET CONDITION

- This DTC sets when the Radio detects a Satellite Antenna connection is shorted to ground.

Set Conditions:

- Satellite Radio inoperative.

POSSIBLE CAUSES

Possible Causes
BAD ANTENNA CONNECTION SATELLITE ANTENNA CABLE

Possible Causes
SATELLITE ANTENNA RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on and set the volume to 25.
8. Adjust the speakers to the front and center.
9. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ANTENNA INSPECTION

1. Using Service Information locate and verify the antenna is on the vehicle.
2. Visually inspect the Antenna for damage.

Is the antenna missing or damaged?

Yes

- Replace the Satellite Antenna in accordance with the Service Information. Refer to **ANTENNA, SATELLITE, AUDIO, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [3](#)

3. CHECK THE ANTENNA CONNECTIONS

1. Turn the ignition off.
2. Disconnect the Satellite Radio Antenna connector at the Antenna.

3. Disconnect the Satellite Radio Antenna connector at the rear of the Radio.
4. Inspect both of the Satellite Radio Antenna connections and verify the Antenna is torqued to specification.

Were the antenna connections clean and torqued to specification?

Yes

- Go To [4](#)

No

- Clean the Satellite Antenna connection(s) / torque to specification as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. CHECK THE ANTENNA AND CABLE

NOTE: **Antenna reception testing**

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Connect the Radio Diagnostic Tool (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) and (special tool #9977-6-SATXM, Antenna, Satellite/Sirius XM) to the Satellite Antenna connection on the back of the Radio.
2. Make sure one of the front doors is still open.
3. Turn the ignition on.
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on.
8. Using the scan tool, read Radio DTCs.

NOTE: **While using the 9977-6-SATXM test antenna the GPS reception will not be available and GPS faults may occur. The 9977-6-SATXM test tool will only enable satellite radio reception to work. For GPS reception concerns use test antenna 9977-6-GPS-GLO.**

Is the DTC active?

Yes

No

- Go To [5](#)

5. TEST THE SATELLITE ANTENNA CABLE

NOTE: **Antenna reception testing**

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Turn the ignition off.

NOTE: Special tool 9977-6-13 should still be connected at the back of the Radio during this test.

2. Connect the (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) to the vehicles Satellite Antenna.
3. Make sure one of the front doors is still open.
4. Turn the ignition on.
5. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Turn the Radio on.
9. Using the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Replace the Satellite Antenna in accordance with the Service Information. Refer to [ANTENNA, SATELLITE, AUDIO, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Use the Radio Diagnostic Tool (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) to locate the open circuit, repair or replace the Satellite Antenna cable as necessary.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.

6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B156B-12 SATELLITE RADIO ANTENNA-CIRCUIT SHORT TO BATTERY

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to **DESCRIPTION AND OPERATION** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- With the ignition on.
- Radio in satellite mode.

SET CONDITION

- This DTC sets when the Radio detects a Satellite Antenna connection is shorted to battery.

Set Conditions:

- Satellite Radio inoperative.

POSSIBLE CAUSES

Possible Causes
BAD ANTENNA CONNECTION SATELLITE ANTENNA CABLE SATELLITE ANTENNA RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on and set the volume to 25.
8. Adjust the speakers to the front and center.
9. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ANTENNA INSPECTION

1. Using Service Information locate and verify the antenna is on the vehicle.
2. Visually inspect the Antenna for damage.

Is the antenna missing or damaged?

Yes

- Replace the Satellite Antenna in accordance with the Service Information. Refer to **ANTENNA, SATELLITE, AUDIO, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [3](#)

3. CHECK THE ANTENNA CONNECTIONS

1. Turn the ignition off.
2. Disconnect the Satellite Radio Antenna connector at the Antenna.
3. Disconnect the Satellite Radio Antenna connector at the rear of the Radio.
4. Inspect both of the Satellite Radio Antenna connections and verify the Antenna is torqued to specification.

Were the antenna connections clean and torqued to specification?

Yes

- Go To [4](#)

No

- Clean the Satellite Antenna connection(s) / torque to specification as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

4. CHECK THE ANTENNA AND CABLE

NOTE: **Antenna reception testing**

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Connect the Radio Diagnostic Tool (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) and (special tool #9977-6-SATXM, Antenna, Satellite/Sirius XM) to the Satellite Antenna connection on the back of the Radio.
2. Make sure one of the front doors is still open.
3. Turn the ignition on.
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on.
8. Using the scan tool, read Radio DTCs.

NOTE: **While using the 9977-6-SATXM test antenna the GPS reception will not be available and GPS faults may occur. The 9977-6-SATXM test tool will only enable satellite radio reception to work. For GPS reception concerns use test antenna 9977-6-GPS-GLO.**

Is the DTC active?

Yes

- Go To [6](#)

No

- Go To [5](#)

5. TEST THE SATELLITE ANTENNA CABLE

NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Turn the ignition off.

NOTE: Special tool 9977-6-13 should still be connected at the back of the Radio during this test.

2. Connect the (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) to the vehicles Satellite Antenna.
3. Make sure one of the front doors is still open.
4. Turn the ignition on.
5. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
6. Turn the ignition off for a minimum of 10.0 seconds.
7. Turn the ignition on.
8. Turn the Radio on.
9. Using the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Replace the Satellite Antenna in accordance with the Service Information. Refer to [ANTENNA, SATELLITE, AUDIO, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Use the Radio Diagnostic Tool (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) to locate the open circuit, repair or replace the Satellite Antenna cable as necessary.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.

- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

B156B-13-SATELLITE RADIO ANTENNA - CIRCUIT OPEN

B156D-00-LOW VOLTAGE DIFFERENTIAL SIGNAL (LVDS) VIDEO CABLE

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

For a complete BACK UP CAMERA SYSTEM wiring diagram, **refer to the appropriate wiring information** .

For a complete SURROUND VIEW CAMERA SYSTEM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media

sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to **DESCRIPTION AND OPERATION** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- With the ignition on.
- Battery voltage between 9.0-16.0 volts.

SET CONDITION

- The Radio detects that the Low Voltage Differential Signal (LVDS) Video Cable is disconnected for greater than 10 seconds.

DEFAULT ACTION

- The Radio display screen is blue with no input message.

POSSIBLE CAUSES

Possible Causes
LOW VOLTAGE DIFFERENTIAL SIGNAL (LVDS) VIDEO CABLE DISCONNECTED OR DAMAGED REAR CAMERA MODULE CENTRAL VISION PROCESSING MODULE (CVPM) RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. **READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN**
 1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
 2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
 3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
 4. With the scan tool, perform an ECU reset to the Radio and CVPM (if equipped), and then erase DTCs.
 5. Turn the ignition off for a minimum of 10.0 seconds.
 6. Turn the ignition on.
 7. Turn the Radio on and set the volume to 25.
 8. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE VEHICLE CONFIGURATION

1. Review the vehicle sales codes to determine the vehicle configuration.

Sales Code	Description
XAC	Parkview Rear Back-Up Camera
OR	
XAK	Surround View Camera System

Which sales code is the vehicle built with?

XAC (Parkview Rear Back-Up Camera)

- Go To [3](#)

XAK (Surround View Camera System)

- Go To [8](#)

3. CHECK THE (J220) LVDS / COAX CABLE CONNECTION AT THE REAR CAMERA MODULE

1. Previous Step Refer to [2](#).
2. Turn the ignition off.
3. Inspect the cable connection at the Rear Camera Module.

Is the cable connection secure and undamaged?

Yes

- Go To [4](#)

No

- Repair the cable connection as needed.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. CHECK THE (J220) LVDS / COAX CABLE CONNECTION AT THE RADIO

1. Inspect the cable connection at the rear of the Radio.

Is the video cable connection secure and undamaged?

Yes

- Go To [5](#)

No

- Repair the video cable connection as needed.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. TEST THE (J220) LVDS / COAX CABLE

1. Connect the (special tool #9977-6-8, Adapter, RG-174 Coax Cable) between the Radio and Rear Camera Module.
2. Turn the ignition on.
3. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. With the scan tool, read DTCs.

Is the DTC active?

Yes

- Go To [6](#)

No

- Replace the Low Voltage Differential Signal (LVDS) Video Cable in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

6. TEST THE RADIO

NOTE: To continue with this test, you must secure a Known Good Radio.

1. Turn the ignition off.
2. Connect a known good Radio to the LVDS cable.
3. With the scan tool, erase DTCs.
4. With the scan tool, perform the **Reset ECU** function under the Guided Diagnostics menu.
5. Turn the ignition on.
6. With the scan tool, read DTCs.

Is the DTC active?

Yes

- Replace the Rear Camera Module in accordance with the Service Information. Refer to [CAMERA, REAR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.

- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Presence of foreign conductive materials on connector pins and terminals.
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

8. CHECK THE (J228) LVDS / COAX CABLE CONNECTION AT THE CENTRAL VISION PROCESSING MODULE (CVPM)

1. Previous Step Refer to [2](#).
2. Turn the ignition off.
3. Inspect the cable connection at the CVPM.

Is the cable connection secure and undamaged?

Yes

- Go To [9](#)

No

- Repair the cable connection as needed.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

9. CHECK THE (J228) LVDS / COAX CABLE CONNECTION AT THE RADIO

1. Inspect the cable connection at the rear of the Radio.

Is the video cable connection secure and undamaged?

Yes

- Go To [10](#)

No

- Repair the video cable connection as needed.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

10. TEST THE (J228) LVDS / COAX CABLE

1. Connect the (special tool #9977-6-8, Adapter, RG-174 Coax Cable) between the Radio and Rear Camera Module.
2. Turn the ignition on.
3. With the scan tool, perform an ECU reset to the Radio and CVPM, and then erase DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. With the scan tool, read DTCs.

Is the DTC active?

Yes

- Go To [11](#)

No

- Replace the Low Voltage Differential Signal (LVDS) Video Cable in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

11. TEST THE RADIO

NOTE: To continue with this test, you must secure a Known Good Radio.

1. Turn the ignition off.
2. Connect a known good Radio to the LVDS cable.
3. Turn the ignition on.
4. With the scan tool, perform an ECU reset to the Radio and CVPM, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. With the scan tool, read DTCs.

Is the DTC active?

Yes

- Replace the Central Vision Processing Module in accordance with the Service Information. Refer to [MODULE, CENTRAL VISION PROCESSING \(CVPM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [12](#)

12. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio and CVPM, and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to [RADIO, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to **DESCRIPTION AND OPERATION** .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Radio detects a problem with the WIFI antenna.

DEFAULT ACTION

- No Bluetooth operation.

POSSIBLE CAUSES

Possible Causes
WIFI ANTENNA RADIO

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN
1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.

2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.

3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCS.**

4. With the scan tool, record and erase the Radio DTCS.

5. Cycle the ignition switch from on to off, wait five seconds and then back to on.

6. Turn the Radio on and set the volume to 25.

7. Adjust the speakers to the front and center.

8. With the scan tool, read the active Radio DTCS.

NOTE:

A front door must remain open whenever checking or erasing Radio DTCS.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE WIFI CABLE CONNECTION AT THE RADIO

1. Turn the ignition off.
2. Inspect the WIFI cable connection at the rear of the Radio.

Is the WIFI cable connection secure and undamaged?

Yes

- Go To [3](#)

No

- Repair or replace the WIFI antenna cable connection as needed.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. TEST THE WIFI ANTENNA

1. Connect the 9977-6-WIFI-BT WiFi Blue Tooth Antenna (special tool #9977-6-WiFi-BT, Antenna, WiFi Blue Tooth) test tool to the Radio.
2. With the scan tool, erase DTCs.
3. Turn the ignition on.
4. With the scan tool, read DTCs.

Is the DTC active?

Yes

- Go To [4](#)

No

- Replace the WIFI Antenna in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.

- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Presence of foreign conductive materials on connector pins and terminals.
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

B156F-1A-WIFI ANTENNA-CIRCUIT RESISTANCE BELOW THRESHOLD

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information**.

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming. The Radio is capable of using AM/FM, Cellular, Global Positioning System (GPS) and Satellite Radio signals depending upon the audio system/vehicle configuration.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to **DESCRIPTION AND OPERATION**.

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- The Radio detects a problem with the WIFI antenna.

DEFAULT ACTION

- No Bluetooth operation.

POSSIBLE CAUSES

Possible Causes
WIFI ANTENNA RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. CHECK FOR AN ACTIVE DTC

1. Turn the ignition on and open one of the front doors.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

2. With the scan tool, read Radio DTCs and record on the repair order.
3. With the scan tool, erase DTCs.
4. Cycle the ignition switch from on to off, wait five seconds and then back to on.
5. Adjust the speakers to the front and center.
6. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR AN INTERMITTENT CONDITION procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE WIFI CABLE CONNECTION AT THE RADIO

1. Turn the ignition off.
2. Inspect the WIFI cable connection at the rear of the Radio.

Is the WIFI cable connection secure and undamaged?

Yes

- Go To [3](#)

No

- Repair or replace the WIFI antenna cable connection as needed.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. TEST THE WIFI ANTENNA

1. Connect the 9977-6-WIFI-BT WiFi Blue Tooth Antenna (special tool #9977-6-WiFi-BT, Antenna, WiFi Blue Tooth) test tool to the Radio.
2. With the scan tool, erase DTCs.
3. Turn the ignition on.
4. With the scan tool, read DTCs.

Is the DTC active?

Yes

- Replace the Radio in accordance with the service information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the WIFI Antenna in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1570-19-USB COMMUNICATION - OVERCURRENT

For a complete AUDIO SYSTEM MEDIA PORT BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to **DESCRIPTION AND OPERATION** .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- With the ignition on.

SET CONDITION

- This DTC will set by connecting an unsupported USB device into the USB port for greater than 10 seconds.

DEFAULT ACTION

- USB inoperative.

POSSIBLE CAUSES

Possible Causes
DAMAGED OR UNSUPPORTED USB DEVICE
DAMAGED OR UNSUPPORTED USB CABLE
MEDIA PORT

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, record and erase the Radio DTCs.
5. Cycle the ignition switch from on to off, wait five seconds and then back to on.
6. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE CONNECTORS AND HARNESS

1. Turn the ignition off.
2. Disconnect the USB harness connector at the back of the radio.
3. Inspect the connectors and harness between the USB port and the radio.

Are there any issues with the harness or connectors?

Yes

- Repair or replace as needed.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [3](#)

3. CHECK THE MEDIA PORT

NOTE: **This test is designed to validate the ability of the Audio/Media system to play audio from a customer's device that has been connected to the USB port on the radio or the external USB port (Universal Customer Interface (UCI) / Multi- Media port). By connecting a known good compatible device to the USB ports it will also determine if the USB port can provide power to a connected device.**

It is important to determine the system features supported by the vehicle's multi-media systems, customer's personal device and their compatibility with another.

For device compatibility, refer to <http://www.driveuconnect.com>

Prior to performing any testing of the multi-media systems, the compatibility between the customer's personal device and the vehicle's multi-media systems must be confirmed.

1. Confirm the USB port is not a **Charge only** port.
2. Using a known good USB Cable, connect the USB Cable to the vehicle's USB port.
3. Connect the USB Cable to the known good compatible device.
4. Select and audio file from the known good compatible device to be heard with the volume all the way up.
5. Using the vehicle controls, place the audio system into USB Mode. (Audio system may automatically enter into USB Mode.)

Does the Radio play audio from the known good compatible device?

Yes

- Go To [4](#)

No

- Replace the Media Port in accordance with the Service Information. Refer to [MEDIA HUB, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.

7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

B1578-11 - AUDIO ANTENNA - CIRCUIT SHORT TO GROUND

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information**.

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to **DESCRIPTION AND OPERATION**.

WHEN MONITORED

- If the ignition is on.
- If battery voltage is within 9 V and 16 V.

SET CONDITION

- If the Radio detects voltage sensed on the antenna is of 0 V.

DEFAULT ACTION

- No reception on AM/FM signal.

POSSIBLE CAUSES

Possible Causes
BAD ANTENNA CONNECTION AUDIO ANTENNA CIRCUIT AUDIO ANTENNA

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCs AND ENVIRONMENTAL DATA - ERASE DTCs AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on and set the volume to 25.
8. Adjust the speakers to the front and center.
9. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ANTENNA INSPECTION

1. Using Service Information locate and verify the antenna is on the vehicle.
2. Visually inspect the Antenna for damage.

Is the antenna missing or damaged?

Yes

- Replace the Antenna in accordance with the Service Information. Refer to **BODY AND CABLE, ANTENNA, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [3](#)

3. CHECK THE ANTENNA CONNECTIONS

1. Turn the ignition off.
2. Disconnect the Radio Antenna connector at the Antenna.
3. Disconnect the Radio Antenna connector at the rear of the Radio.

4. Inspect both of the Radio Antenna connections and verify the Antenna is torqued to specification.

Were the antenna connections clean and torqued to specification?

Yes

- Go To [4](#)

No

- Clean the antenna connection(s) / torque to specification as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. CHECK THE ANTENNA AND CABLE

NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Connect the (special tool #9977-6-FM, Antenna) to the antenna connection on the back of the Radio.
2. Make sure one of the front doors is still open.
3. Turn the ignition on.
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on.
8. Using the scan tool, read the active Radio DTCs.

Is the DTC active?

Yes

- Go To [7](#)

No

- Go To [5](#)

5. TEST THE ANTENNA CABLE

NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Disconnect the Antenna cable at the base.
2. Connect the appropriate (special tool #9977-6-1, Adapter) or (special tool #9977-6-3, Adapter) to the Antenna cable at the back of the Radio.
3. Connect the appropriate (special tool #9977-6-4, Jumper) or (special tool #9977-6-2, Jumper) to the Antenna cable at the Antenna base.
4. Measure the Resistance across the tool terminals.

Is the resistance below 47.5 Ohms?

Yes

- Use the (special tool #9977-6, Kit, Radio Antenna Diagnostic) to locate the short to battery in the circuit, repair or replace the Antenna cable as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [6](#)

6. CHECK THE AUDIO ANTENNA

1. Turn the ignition off.
2. Replace the audio antenna for a known good one (replacement for test).
3. Turn the ignition on.
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Operate the vehicle in the conditions that set this DTC.
8. With the scan tool, read DTCs from the Radio.

Did the DTC return?

Yes

- Replace the audio antenna in accordance with Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

5. TEST THE ANTENNA CABLE

NOTE: **Antenna reception testing**

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Disconnect the Antenna cable at the base.
2. Connect the appropriate (special tool #9977-6-1, Adapter) or (special tool #9977-6-3, Adapter) to the Antenna cable at the back of the Radio.
3. Connect the appropriate (special tool #9977-6-4, Jumper) or (special tool #9977-6-2, Jumper) to the Antenna cable at the Antenna base.
4. Measure the Resistance across the tool terminals.

Is the resistance below 47.5 Ohms?

Yes

- Use the (special tool #9977-6, Kit, Radio Antenna Diagnostic) to locate the short to battery in the circuit, repair or replace the Antenna cable as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [6](#)

6. CHECK THE AUDIO ANTENNA

1. Turn the ignition off.
2. Replace the audio antenna for a faultless one (replacement for test).
3. Turn the ignition on.
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Operate the vehicle in the conditions that set this DTC.
8. With the scan tool, read DTCs from the Radio.

Did the DTC return?

Yes

- Replace the audio antenna in accordance with Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

7. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.

- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Presence of foreign conductive materials on connector pins and terminals.
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to [**RADIO, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

B1578-13-AM/FM ANTENNA - CIRCUIT OPEN

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information** .

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [**DESCRIPTION AND OPERATION**](#) .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- With the ignition on.
- Radio in seek mode.

SET CONDITION

- With the Radio in seek mode for two minutes and the Radio does not detect an Antenna connection or does not receive a Radio station signal.

DEFAULT ACTION

- Poor or no radio reception.

POSSIBLE CAUSES

Possible Causes
BAD ANTENNA CONNECTION
ANTENNA CABLE
ANTENNA
RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on and set the volume to 25.
8. Adjust the speakers to the front and center.
9. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ANTENNA INSPECTION

1. Using Service Information locate and verify the antenna is on the vehicle.
2. Visually inspect the Antenna for damage.

Is the antenna missing or damaged?

Yes

- Replace the Antenna in accordance with the Service Information. Refer to **BODY AND CABLE, ANTENNA, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [3](#)

3. CHECK THE ANTENNA CONNECTIONS

1. Turn the ignition off.
2. Disconnect the Radio Antenna connector at the Antenna.
3. Disconnect the Radio Antenna connector at the rear of the Radio.
4. Inspect both of the Radio Antenna connections and verify the Antenna is torqued to specification.

Were the antenna connections clean and torqued to specification?

Yes

- Go To [4](#)

No

- Clean the antenna connection(s) / torque to specification as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. CHECK THE ANTENNA AND CABLE

NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Connect the Radio Diagnostic Tool (special tool #9977-6-FM, Antenna) to the Antenna connection on the back of the Radio.
2. Make sure one of the front doors is still open.
3. Turn the ignition on.
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on.
8. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [6](#)

No

- Go To [5](#)

5. TEST THE ANTENNA CABLE

NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Turn the ignition off.
2. Disconnect the Antenna cable at the base.
3. Connect the appropriate Radio Diagnostic Tool (special tool #9977-6-1, Adapter) or (special tool #9977-6-3, Adapter) to the Antenna cable at the back of the Radio.
4. Connect the appropriate Radio Diagnostic Tool (special tool #9977-6-4, Jumper) or (special tool #9977-6-2, Jumper) to the Antenna cable at the Antenna base.
5. Measure the Resistance across the tool terminals.

Is the resistance above 52.5 Ohms?

Yes

- Use the Radio Diagnostic Tool (special tool #9977-6, Kit, Radio Antenna Diagnostic) to locate the open circuit, repair or replace the Antenna cable as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Antenna base in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.

6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to [**RADIO, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition On
- Radio in SEEK mode

SET CONDITION

- The Radio does not detect the FM2 Diversity Antenna connection or does not receive a radio station signal.

DEFAULT ACTION

- Poor or no radio reception

POSSIBLE CAUSES

Possible Causes
BAD ANTENNA CONNECTION
DIVERSITY ANTENNA CABLE
DIVERSITY ANTENNA
RADIO

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCs.**

4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on and set the volume to 25.
8. Adjust the speakers to the front and center.
9. With the scan tool, read the active Radio DTCs.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCs.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ANTENNA INSPECTION

1. Using Service Information locate and verify the antenna is on the vehicle.
2. Visually inspect the Antenna for damage.

Is the antenna missing or damaged?

Yes

- Replace the FM2 Diversity Antenna in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [3](#)

3. CHECK THE ANTENNA CONNECTIONS

1. Turn the ignition off.
2. Disconnect the FM2 Diversity Antenna connector at the Antenna.
3. Disconnect the FM2 Diversity Antenna connector at the rear of the Radio.
4. Inspect both of the FM2 Diversity Antenna connections and verify the Antenna is torqued to specification.

Were the antenna connections clean and torqued to specification?

Yes

- Go To [4](#)

No

- Clean the FM2 Diversity Antenna connection(s) / torque to specification as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. CHECK THE ANTENNA AND CABLE

NOTE: **Antenna reception testing**

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Connect the (special tool #9977-6-FM, Antenna) to the antenna connection on the back of the Radio.
2. Make sure one of the front doors is still open.
3. Turn the ignition on.
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on.
8. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [6](#)

No

- Go To [5](#)

5. TEST THE ANTENNA CABLE

NOTE: **Antenna reception testing**

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Disconnect the Antenna cable at the base.
2. Connect the appropriate (special tool #9977-6-1, Adapter) or (special tool #9977-6-3, Adapter) to the Antenna cable at the back of the Radio.
3. Connect the appropriate (special tool #9977-6-4, Jumper) or (special tool #9977-6-2, Jumper) to the Antenna cable at the Antenna base.
4. Measure the Resistance across the tool terminals.

Is the resistance above 52.5 Ohms?

Yes

- Use the (special tool #9977-6, Kit, Radio Antenna Diagnostic) to locate the open circuit, repair or replace the Antenna cable as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Antenna base in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.

2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Presence of foreign conductive materials on connector pins and terminals.
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to **RADIO, REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

B1579-1A DIVERSITY ANTENNA - CIRCUIT RESISTANCE BELOW THRESHOLD

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, **refer to the appropriate wiring information**.

THEORY OF OPERATION

The Radio manages the hands-free, navigation, and satellite functions of the vehicle. The Radio becomes operational after receiving a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is On. Depending upon audio system options, the Radio can play audio from many different media sources, such as the 3.5 millimeter auxiliary (AUX) port, a universal serial bus (USB) port or through wireless Bluetooth™ audio streaming.

Make sure any serviced speakers are similar to the one being removed. The Radio uses the vehicle build configuration data (based upon sales code) to determine the audio configuration.

For additional information regarding the description and operation of the Audio System. Refer to [**DESCRIPTION AND OPERATION**](#) .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on
- Radio in SEEK mode

SET CONDITION

- The Radio detects that the FM2 Diversity Antenna circuit is shorted together.

DEFAULT ACTION

- Limited or no reception.

POSSIBLE CAUSES

Possible Causes
BAD ANTENNA CONNECTION DIVERSITY ANTENNA CABLE DIVERSITY ANTENNA RADIO

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [**PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**](#) .

DIAGNOSTIC TEST

1. **READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR DTC TO RETURN**
1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.

2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.

3. **NOTE: A front door must remain open whenever checking or erasing Radio DTCS.**

4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCS.

5. Turn the ignition off for a minimum of 10.0 seconds.

6. Turn the ignition on.

7. Turn the Radio on and set the volume to 25.

8. Adjust the speakers to the front and center.

9. With the scan tool, read the active Radio DTCS.

NOTE: **A front door must remain open whenever checking or erasing Radio DTCS.**

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. ANTENNA INSPECTION

1. Using Service Information locate and verify the antenna is on the vehicle.
2. Visually inspect the Antenna for damage.

Is the antenna missing or damaged?

Yes

- Replace the FM2 Diversity Antenna in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [3](#)

3. CHECK THE ANTENNA CONNECTIONS

1. Turn the ignition off.
2. Disconnect the FM2 Diversity Antenna connector at the Antenna.
3. Disconnect the FM2 Diversity Antenna connector at the rear of the Radio.
4. Inspect both of the FM2 Diversity Antenna connections and verify the Antenna is torqued to specification.

Were the antenna connections clean and torqued to specification?

Yes

- Go To [4](#)

No

- Clean the FM2 Diversity Antenna connection(s) / torque to specification as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. CHECK THE ANTENNA AND CABLE

NOTE: **Antenna reception testing**

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Connect the (special tool #9977-6-FM, Antenna) to the antenna connection on the back of the Radio.
2. Make sure one of the front doors is still open.
3. Turn the ignition on.
4. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.

5. Turn the ignition off for a minimum of 10.0 seconds.
6. Turn the ignition on.
7. Turn the Radio on.
8. With the scan tool, read Radio DTCs.

Is the DTC active?

Yes

- Go To [6](#)

No

- Go To [5](#)

5. TEST THE ANTENNA CABLE

NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Disconnect the Antenna cable at the base.
2. Connect the appropriate (special tool #9977-6-1, Adapter) or (special tool #9977-6-3, Adapter) to the Antenna cable at the back of the Radio.
3. Connect the appropriate (special tool #9977-6-4, Jumper) or (special tool #9977-6-2, Jumper) to the Antenna cable at the Antenna base.
4. Measure the Resistance across the tool terminals.

Is the resistance below 47.5 Ohms?

Yes

- Use the (special tool #9977-6, Kit, Radio Antenna Diagnostic) to locate the short together, repair or replace the Antenna cable as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Antenna base in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

6. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all Radio harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).

- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Presence of foreign conductive materials on connector pins and terminals.
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all Radio harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. Turn the ignition on.
9. With the scan tool, perform an ECU reset to the Radio, and then erase DTCs.
10. Turn the ignition off for a minimum of 10.0 seconds.
11. Turn the ignition on.
12. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
13. With the scan tool, read Radio DTCs.

Did the DTC return?

Yes

- Replace the Radio in accordance with the Service information. Refer to [**RADIO, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
 - Test complete.

Software Update Error Code	Software Update Error String	Explanation	Guidelines
			1.Don't remove the USB. Do's: 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.) 2.Once head unit comes back into application mode and fully functional, remove the USB. 3.Format the USB in PC. 4.Copy a software update package in USB other than what is currently running in Head Unit. 5.Perform software update again.
3	Invalid Software Update Error	Observed when unexpected error is observed.	Don'ts : 1.Don't remove the USB. Do's: 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.) 2.Once head unit comes back into application mode and fully functional, remove the USB. 3.Format the USB in PC. 4.Copy VP4R_ Update and map package folders into USB root. 5.Perform software update again.
4	Corrupted Package Error	Observed when one or more files are corrupted in VP4R_ Update folder in USB.	Don'ts: 1.Don't remove the USB. Do's: 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.) 2.Once head unit comes back into application mode and fully functional, remove the USB. 3.Format the USB in PC. 4.Copy VP4R_ Update and map package folders into USB root. 5.Perform software update again.
5	Invalid Signature Error	Observed when the security of USB package files is compromised.	Don'ts: 1.Don't remove the USB. Do's: 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.) 2.Once head unit comes back into application mode and fully functional, remove the USB. 3.Format the USB in PC. 4.Copy VP4R_ Update and map package folders into USB root. 5.Perform software update again. 6.If still same error is observed, replace Radio.
6	Start to Application Mode - Error	Observed when head unit failed to come back into application mode after software update.	Do's: 1.Remove USB from Head unit. 2.Wait for 2 minutes. 3.If Head unit is still stuck into this error, do a power OFF (Ignition OFF). 4.Insert the USB again. 5.Do a Power ON (Ignition ON). 6.Wait for head unit to come back into application mode. 7.Still facing same issue, replace Radio.
7	Flashing: Meta Info information Error	Observed when there is an error in flashing Meta info segment.	Don'ts: 1.Don't remove the USB. Do's: 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.) 2.Initiate the software update again. 3.Try 2 iterations of software update, if still facing error, replace Radio.
8	Flashing: BootManager LBA information Error	Observed when there is an error in flashing BootManager LBA segment.	Don'ts: 1.Don't remove the USB. Do's: 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.) 2.Initiate the software update again. 3.Try 2 iterations of software update, if still facing error, replace Radio.
9	Flashing: LBA information Error	Observed when there is an error in writing into LBA information.	Don'ts: 1.Don't remove the USB. Do's: 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.) 2.Initiate the software update again. 3.Try 2 iterations of software update, if still facing error, replace Radio.
10	Flashing: J6 Application information Error	Observed when there is an error in flashing J6 Application segment.	Don'ts: 1.Don't remove the USB. Do's: 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.) 2.Initiate the software update again. 3.Try 2 iterations of software update, if still facing error, replace Radio.
11	Flashing: J6 Flash Loader information Error	Observed when there is an error in flashing J6 Flashloader segment.	Don'ts: 1.Don't remove the USB. Do's: 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.) 2.Initiate the software update again. 3.Try 2 iterations of software update, if still facing error, replace Radio.
12	Flashing: Boot Loader information Error	Observed when there is an error in flashing Bootloader.	Don'ts: 1.Don't remove the USB. Do's: 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.) 2.Initiate the software update again. 3.Try 2 iterations of software update, if still facing error, replace Radio.
13	Flashing: NOR OS information Error	Observed when there is an error in flashing J6 NOR OS segment.	Don'ts: 1.Don't remove the USB. Do's : 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.) 2.Initiate the software update again. 3.Try 2 iterations of software update, if still facing error, replace Radio.
14	Flashing: NOR Animation information Error	Observed when there is an error in flashing NOR Animation segment.	Don'ts: 1.Don't remove the USB. Do's: 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.) 2.Initiate the software update again. 3.Try 2 iterations of software update, if still facing error, replace Radio.
15	Flashing: Boot Micro information Error	Observed when there is an error in flashing Boot Micro.	Don'ts: 1.Don't remove the USB. Do's: 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.)

Software Update Error Code	Software Update Error String	Explanation	Guidelines
			2.Initiate the software update again. 3.Try 2 iterations of software update, if still facing error, replace Radio.
16	Flashing: Boot Micro User Boot information Error	Observed when there is an error in flashing Boot Micro User Boot.	Don'ts: 1.Don't remove the USB. Do's: 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.) 2.Initiate the software update again. 3.Try 2 iterations of software update, if still facing error, replace Radio.
17	Flashing: VR information Error	Observed when there is an error in flashing VR information.	Don'ts: 1.Don't remove the USB. Do's: 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.) 2.Initiate the software update again. 3.Try 2 iterations of software update, if still facing error, replace Radio.
18	Flashing: HMI Skin information Error	Observed when there is an error in flashing HMI Skin information.	Don'ts: 1.Don't remove the USB. Do's: 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.) 2.Initiate the software update again. 3.Try 2 iterations of software update, if still facing error, replace Radio.
19	Flashing: Receiver information Error	Observed when there is an error in flashing Receiver information.	Don'ts: 1.Don't remove the USB. Do's: 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.) 2.Initiate the software update again. 3.Try 2 iterations of software update, if still facing error, replace Radio.
20	Flashing: Cell Modem information Error	Observed when there is an error in flashing Cell Modem information.	Don'ts: 1.Don't remove the USB. Do's: 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.) 2.Initiate the software update again. 3.Try 2 iterations of software update, if still facing error, replace Radio.
21	Flashing: Audio DSP information Error	Observed when there is an error in flashing Audio DSP information.	Don'ts: 1.Don't remove the USB. Do's: 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.) 2.Initiate the software update again. 3.Try 2 iterations of software update, if still facing error, replace Radio.
22	Flashing: Internal Communication Error	Observed when there is an error in IPC channel between J6 and Boot micro.	Don'ts: 1.Don't remove the USB. Do's: 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.) 2.Initiate the software update again. 3.Try 2 iterations of software update, if still facing error, replace Radio.
23	Flashing: Navigation Map information Error	Observed when there is an error Flashing Navigation Maps.	Don'ts: 1.Don't remove the USB. Do's: 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.) 2.Initiate the software update again. 3.Try 2 iterations of software update, if still facing error, replace Radio.
24	Update Delta information Error	Observed when CRC error of J6 partitions failed to match with CRC in delta package.	Don'ts: 1.Don't insert the USB having software update packages during FOTA update. Do's: 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.) 2.On next Ignition on, Head unit will download the delta package again. 3.On ignition off, try to do delta update again. 4.If still facing same error code, contact PASA team.
25	Backup Collection Error	Observed when backup collection failed.	Don'ts: 1.Don't remove the USB. Do's: 1.Allow Head unit to rollback into application mode. (This may take approximately 10 minutes, you will be asked would you like to perform update when completed.) 2.Initiate the software update again. 3.Try 2 iterations of software update, if still facing error, replace Radio.

DIAGNOSIS AND TESTING - AUDIO

Any diagnosis of the Audio system should begin with duplicating the customer concern (verify the problem), include checking for applicable Technical Service Bulletins (TSB), Star Online Publications, software updates and the use of a diagnostic scan tool. Check for any Diagnostic Trouble Code (DTC) data. If a DTC is found, refer to - Radio and perform the appropriate diagnostic procedure before proceeding in this information. Refer to the appropriate wiring information.

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, refer to the appropriate wiring information .

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbags, airbag curtains, knee blocker, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect the Intelligent Battery Sensor (IBS)/negative battery cable assembly from the negative battery post, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

AUDIO SYSTEM DIAGNOSTIC TABLE			
CONDITION	POSSIBLE CAUSES	CORRECTION	
RADIO INOPERATIVE	1. Fuse inoperative. 2. Open wiring. 3. Security Gateway Module (SGW) inoperative.	Check radio fuse. Check "No Response from ECU". Refer to NO RESPONSE FROM ECU . Check "Scan Tool Will Not Communicate With Vehicle". Refer to SCAN TOOL WILL NOT COMMUNICATE WITH VEHICLE .	
NO AUDIO - BUT RADIO LIGHTS UP	1. Antenna problem. 2. Radio or Amplifier (if equipped) connector damaged. 3. Wiring damaged. 4. Radio or Amplifier (if equipped) ground damaged. 5. Amplifier (if equipped) inoperative. 6. Speakers inoperative.	Perform the "Poor or No AM/FM Audio Reception" test. Refer to POOR OR NO AM/FM AUDIO RECEPTION . Check for loose or corroded radio/amplifier connector. Repair, as required. Check for shorted or open wires. Repair wiring as required. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground as required. Refer to AMPLIFIER (AMP) - DIAGNOSTIC CODE INDEX . Refer to AUDIO (RADIO) - DIAGNOSTIC CODE INDEX .	
NO RADIO DISPLAY	1. Fuse inoperative. 2. Radio connector damaged. 3. Wiring damaged. 4. Radio ground circuit damaged. 5. Radio inoperative. 6. Center stack screen	Check radio fuse. Replace fuses as required. Check for loose or corroded radio connector. Repair as required. Check for battery voltage at radio connector. Repair wiring as required. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground as required. Check "No Response from Radio". Refer to the appropriate information. Refer to the appropriate information.	
POOR AM/FM RADIO RECEPTION	1. Antenna inoperative. 2. Radio ground damaged. 3. Radio inoperative.	Perform the "Poor or No AM/FM Audio Reception" test. Refer to POOR OR NO AM/FM AUDIO RECEPTION . Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground as required. Refer to AUDIO (RADIO) - DIAGNOSTIC CODE INDEX or Refer to DIAGNOSIS AND TESTING .	
POOR SATELLITE DIGITAL AUDIO RADIO SERVICE (SDARS) AUDIO RECEPTION	1. SDARS antenna Inoperative.	Perform the "Poor or No Satellite Audio Reception" test. Refer to POOR OR NO AM/FM AUDIO RECEPTION .	
SOUND DISTORTION (VIBRATION FROM SPEAKER AREA, BUZZING - HUMMING)	1. Door trim panel loose or missing fasteners. 2. Water shield loose or misaligned. 3. Items placed in door trim panel map pockets vibrating or moving from side to side.	Inspect door trim panel and correct as necessary. Replace any missing fasteners. Inspect water shield and adjust as required. Remove items from door trim panel. Make sure that the vibration is no longer present.	

POOR OR NO AM/FM AUDIO RECEPTION

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, refer to the appropriate wiring information .

POSSIBLE CAUSES

Possible Causes
ANTENNA CONNECTION ANTENNA CABLE ANTENNA RADIO

DIAGNOSTIC TEST

1. ANTENNA INSPECTION

- Using Service Information locate and verify the antenna is on the vehicle.
- Visually inspect the Antenna for damage.

Is the antenna missing or damaged?

Yes

- Replace the Antenna in accordance with the Service Information. Refer to [BODY AND CABLE, ANTENNA, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To the appropriate information

2. CHECK THE ANTENNA CONNECTIONS

- Turn the ignition off.
- Disconnect the Radio Antenna connector at the Antenna.
- Disconnect the Radio Antenna connector at the rear of the Radio.
- Inspect both of the Radio Antenna connections and verify the Antenna is torqued to specification.

Were the antenna connections clean and torqued to specification?

Yes

- Go To the appropriate information

No

- Clean the antenna connection(s) / torque to specification as necessary.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. RADIO

NOTE: **Antenna reception testing**

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

- Connect the (special tool #9977-6-FM, Antenna) to the Radio C3 component connector.
- Place the test antenna base on the roof of the vehicle.
- Turn the ignition on.
- Drive the vehicle outside to an un-obstructed area.
- Turn the Radio on and select several different known good stations from the AM and FM bands.
- Note any of the following type of reception concerns being heard:

- Silence
- Static
- Noise
- Popping
- Screeching
- Hissing
- Crackling
- Humming
- Weak Signal
- Interference
- Motor Sound

Is the audio reception still poor or not available?

Yes

- Replace the Radio in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. ANTENNA

NOTE: **Antenna reception testing**

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

- Turn the ignition off.
- Reconnect the Radio C3 harness connector.
- Disconnect the Radio Antenna harness connector.
- Connect the (special tool #9977-6-FM, Antenna) to the Radio Antenna harness connector.
- Turn the Radio on and select several different known good stations from the AM and FM bands.
- Note any of the following type of reception concerns being heard:

- Silence
- Static
- Noise
- Popping
- Screeching
- Hissing
- Crackling
- Humming
- Weak Signal
- Interference
- Motor Sound

Is the audio reception still poor or not available?

Yes

- Go To [5](#)

No

- Replace the Radio Antenna in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

5. ANTENNA CABLE

1. Turn the ignition off.
2. Disconnect the (special tool #9977-6-FM, Antenna) from the Radio Antenna harness connector.
3. Connect the appropriate (special tool #9977-6-4, Jumper) (1) or (special tool #9977-6-2, Jumper) (1) to the Radio Antenna harness connector (2) at the Antenna.

4. Disconnect the Radio C3 harness connector.
5. Connect the appropriate (special tool #9977-6-1, Adapter) (1) or (special tool #9977-6-3, Adapter) (1) to the Radio C3 harness connector (2).
6. Measure the resistance across the tool terminals.

Is the resistance between 47.5 and 52.5 Ohms?

Yes

- The source of the poor reception is not caused by the Radio, Antenna Cable or Radio Antenna.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Replace the Antenna Cable in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

POOR OR NO SATELLITE AUDIO RECEPTION

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, refer to the appropriate wiring information .

POSSIBLE CAUSES

Possible Causes
SATELLITE ANTENNA CONNECTION SATELLITE ANTENNA CABLE SATELLITE ANTENNA RADIO

DIAGNOSTIC TEST

1. ANTENNA INSPECTION

1. Using Service Information locate and verify the antenna is on the vehicle.
2. Visually inspect the Antenna for damage.

Is the antenna missing or damaged?

Yes

- Replace the Satellite Antenna in accordance with the Service Information. Refer to [ANTENNA, SATELLITE, AUDIO, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [2](#)

2. CHECK THE ANTENNA CONNECTIONS

1. Turn the ignition off.
2. Disconnect the Satellite Radio Antenna connector at the Antenna.
3. Disconnect the Satellite Radio Antenna connector at the rear of the Radio.
4. Inspect both of the Satellite Radio Antenna connections and verify the Antenna is torqued to specification.

Were the antenna connections clean and torqued to specification?

Yes

- Go To [3](#)

No

- Clean the Satellite Antenna connection(s) / torque to specification as necessary.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. RADIO

NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Connect the Radio Diagnostic Tool (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) and (special tool #9977-6-SATXM, Antenna, Satellite/Sirius XM) to the Satellite Antenna connection on the back of the Radio.

- Place the test antenna base on the roof of the vehicle.
- Turn the ignition on.
- Drive the vehicle outside to an un-obstructed area.
- Turn the Satellite Radio on and select several different known good stations.

Is the reception still poor or not available?

Yes

- Replace the Radio in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. ANTENNA

NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

- Turn the ignition off.
- Reconnect the Radio C6 harness connector.
- Disconnect the Satellite Audio Antenna harness connector.
- Connect the (special tool #9977-6-SATXM, Antenna, Satellite/Sirius XM) (1) to the Satellite Audio Antenna harness connector (2).
- Turn the Satellite Radio on and select several different known good stations.

Is the reception still poor or not available?

Yes

- Go To [5](#)

No

- Replace the Satellite Audio Antenna in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. ANTENNA CABLE

- Turn the ignition off.
- Disconnect the (special tool #9977-6-SATXM, Antenna, Satellite/Sirius XM) from the Satellite Audio Antenna harness connector.
- Connect the appropriate (special tool #9977-6-4, Jumper) (1) or (special tool #9977-6-2, Jumper) (1) to the Satellite Audio Antenna harness connector (2) at the Antenna.

- Connect the appropriate (special tool #9977-6-1, Adapter) (1) or (special tool #9977-6-3, Adapter) (1) to the Radio C6 harness connector (2).
- Measure the resistance across the tool terminals.

Is the resistance between 47.5 and 52.5 Ohms?

Yes

- The source of the poor reception is not caused by the Radio, Satellite Antenna Cable or Satellite Antenna.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Replace the Satellite Audio Antenna Cable in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

POOR OR NO CELLULAR RECEPTION

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, refer to the appropriate wiring information .

POSSIBLE CAUSES

Possible Causes
CELLULAR ANTENNA CONNECTION CELLULAR ANTENNA CABLE CELLULAR ANTENNA RADIO

DIAGNOSTIC TEST

1. ANTENNA INSPECTION

- Using Service Information locate and verify the antenna is on the vehicle.
- Visually inspect the Antenna for damage.

Is the antenna missing or damaged?

Yes

- Replace the Cellular Antenna in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [2](#)

2. CHECK THE ANTENNA CONNECTIONS

1. Turn the ignition off.
2. Disconnect the Cellular Antenna connector at the Antenna.
3. Disconnect the Cellular Antenna connector at the rear of the Radio.
4. Inspect both of the Cellular Antenna connections and verify the Antenna is torqued to specification.

Were the antenna connections clean and torqued to specification?

Yes

- Go To [3](#)

No

- Clean the Cellular Antenna connection(s) / torque to specification as necessary.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. RADIO

NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Connect the Radio Diagnostic Tool (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) and (special tool #9977-6-CELL-LTE, Adapter, Cellular Antenna Diagnostic) to the Cellular Antenna connection on the back of the Radio.
2. Place the test antenna base on the roof of the vehicle.
3. Turn the ignition on.
4. Drive the vehicle outside to an un-obstructed area.
5. Turn the Radio on.

Is the reception still poor or not available?

Yes

- Replace the Radio in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [4](#)

4. ANTENNA

NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Turn the ignition off.
2. Reconnect the Radio C7 harness connector.
3. Disconnect the Cellular Antenna harness connector.
4. Connect the (special tool #9977-6-CELL-LTE, Adapter, Cellular Antenna Diagnostic) (1) to the Radio C7 component connector.
5. Turn the Radio on and select several different known good APP/ Cellular functions.

Is the reception still poor or not available?

Yes

- Go To [5](#)

No

- Replace the Cellular Antenna in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

5. ANTENNA CABLE

1. Turn the ignition off.
2. Connect the (special tool #9977-6-CELL-LTE, Adapter, Cellular Antenna Diagnostic) (1) to the Radio C7 component connector.
3. Connect the appropriate (special tool #9977-6-4, Jumper) (1) or (special tool #9977-6-2, Jumper) (1) to the Cellular Antenna harness connector (2) at the Antenna.

4. Connect the appropriate (special tool #9977-6-1, Adapter) (1) or (special tool #9977-6-3, Adapter) (1) to the Radio C7 harness connector (2).

5. Measure the resistance across the tool terminals.
- Is the resistance between 47.5 and 52.5 Ohms?
- Yes
- The source of the poor reception is not caused by the Radio, Cellular Antenna Cable or Cellular Antenna.
 - Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).
- No
- Replace the Cellular Antenna Cable in accordance with the Service Information.
 - Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

POOR OR NO GPS RECEPTION

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, refer to the appropriate wiring information .

POSSIBLE CAUSES

Possible Causes
GPS ANTENNA CONNECTION GPS ANTENNA CABLE GPS ANTENNA RADIO

DIAGNOSTIC TEST

1. ANTENNA INSPECTION
1. Using Service Information locate and verify the antenna is on the vehicle.

2. Visually inspect the Antenna for damage.

Is the antenna missing or damaged?

Yes

- Replace the GPS Antenna in accordance with the Service Information.
 - Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [2](#)
2. CHECK THE ANTENNA CONNECTIONS
1. Turn the ignition off.

2. Disconnect the GPS Antenna connector at the Antenna.

3. Disconnect the GPS Antenna connector at the rear of the Radio.

4. Inspect both of the GPS Antenna connections and verify the Antenna is torqued to specification.

Were the antenna connections clean and torqued to specification?

Yes

- Go To [3](#)

No

- Clean the GPS Antenna connection(s) / torque to specification as necessary.
 - Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).
3. RADIO
- NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Connect the Radio Diagnostic Tool (special tool #9977-6-13, Adapter, Long RF RG-58 Fakra) and (special tool #9977-6-GPS-GLO, Antenna, GPS GLONASS) to the GPS Antenna connection on the back of the Radio.

2. Place the test antenna base on the roof of the vehicle.

3. Turn the ignition on.

4. Drive the vehicle outside to an un-obstructed area.

5. Turn the Satellite Radio on and select several different known good stations.

Is the reception still poor or not available?

Yes

- Replace the Radio in accordance with the Service Information.
 - Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [4](#)

4. ANTENNA

NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

1. Turn the ignition off.

2. Reconnect the Radio C7 harness connector.

3. Disconnect the GPS Antenna harness connector.

4. Connect the (special tool #9977-6-GPS-GLO, Antenna, GPS GLONASS) (1) to the Radio C7 component connector.

5. Turn the Radio on.

Is the reception still poor or not available?

Yes

- Go To [5](#)

No

- Replace the GPS Antenna in accordance with the Service Information.
 - Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

5. ANTENNA CABLE

1. Turn the ignition off.
2. Connect the (special tool #9977-6-GPS-GLO, Antenna, GPS GLONASS) (1) to the Radio C7 component connector.
3. Connect the appropriate (special tool #9977-6-4, Jumper) (1) or (special tool #9977-6-2, Jumper) (1) to the GPS Antenna harness connector (2) at the Antenna.

4. Connect the appropriate (special tool #9977-6-1, Adapter) (1) or (special tool #9977-6-3, Adapter) (1) to the Radio C7 harness connector (2).
5. Measure the resistance across the tool terminals.

Is the resistance between 47.5 and 52.5 Ohms?

Yes

- The source of the poor reception is not caused by the Radio, Satellite Antenna Cable or Satellite Antenna.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Replace the GPS Antenna Cable in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

DIAGNOSIS AND TESTING REAR CAMERA WITH RADIO DISPLAY

For a complete BACK UP CAMERA SYSTEM wiring diagram, [refer to the appropriate wiring information](#) .

DIAGNOSIS AND TESTING - REAR CAMERA

The hardwired circuits of the Rear View Camera (RVC) and those between the RVC and the radio may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds. For proper wire repair, and connector repair procedures. Refer to [STANDARD PROCEDURE](#) . and. Refer to [REMOVAL](#) . Refer to [INSTALLATION](#) .

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RVC or the radio. The most reliable, efficient and accurate means to diagnose the electronic controls and communication related to radio operation, as well as the retrieval or erasure of a Diagnostic Trouble Code (DTC) requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbags, airbag curtains, knee blocker, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect the Intelligent Battery Sensor (IBS)/negative battery cable assembly from the negative battery post, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Be certain to confirm the following prior to attempting any additional diagnosis or testing of the RVC. Use a diagnostic scan tool to confirm the rear view camera is setup in the vehicle configuration.

NOTE: Be certain the radio has been configured with the latest software. Many radio issues can be resolved by updating the radio to the latest software.

NOTE: For additional information on diagnosing issues with the RVC, see "DIAGNOSIS AND TESTING REAR CAMERA INOPERATIVE WITH RADIO DISPLAY" test. Refer to [DIAGNOSIS AND TESTING REAR CAMERA INOPERATIVE WITH RADIO DISPLAY](#).

NOTE: Prior to starting rear view camera diagnostics, the following step must be performed: With the scan tool, perform the Reset ECU function for the Radio under the Guided Diagnostics menu in the scan tool.

NOTE: When utilizing RG-174 Coax Cable Adapter 9977-6-8 OR a known good camera, the following step must be adhered to prior to checking camera functionality: With the scan tool, perform the Reset ECU function for the Radio under the Guided Diagnostics menu in the scan tool.

REAR VIEW CAMERA DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
VIDEO IMAGE IS BLURRY OR OBSTRUCTIVE	1. Dirt, smear, fingerprints on RVC lens. 2. Ineffective camera shield circuit in the Low Voltage Differential Signal (LVDS) coaxial cable connection at the Radio or RVC 3. Moisture buildup on the inside of the lens	1. Inspect lens for foreign material, and clean lens as required, using the lens cleaning procedure. 7. Inspect the LVDS coaxial cable for damage to the terminals. Check RVC coaxial connection using . Replace as necessary. For additional diagnosis of the RVC, refer to the "Diagnosis And Testing Camera Inoperative With Display Screen" test. Refer to the appropriate information. 3. Replace the ineffective camera as required.
NO VIDEO DISPLAY IN RADIO AND DOES NOT DISPLAY ANY MESSAGE	1. Incorrect radio software 2. Ineffective radio inputs or outputs 3. Ineffective radio 4. Ineffective radio fuse 5. Ineffective radio ground circuit 6. Ineffective radio feed circuit 7. Ineffective LVDS coaxial connection at RVC or LVDS cable	1. Check to be certain that the radio has the latest software update installed. Install the radio software update, if required. 2. Use a diagnostic scan tool to test the radio inputs and outputs including those received over the Controller Area Network (CAN) data bus. Refer to the appropriate diagnostic information. 3. Use a diagnostic scan tool to test the radio. Refer to the appropriate diagnostic information. 4. Test and replace the radio fuses, if required. 5. Check for loose or damaged wiring connections at the radio. Test and repair the open radio ground circuit, if required. 6. Check for loose or damaged wiring connections at the radio. Test and repair the open radio feed circuit, if required. 7. Check the LVDS coaxial cable center terminal for 10 volts (VP2R radios) or 12 volts (VP4R radios). Check RVC LVDS coaxial connection using . Replace as necessary. For additional diagnosis of the RVC, refer to the "Diagnosis And Testing Camera Inoperative With Display Screen" test. Refer to the appropriate information.
CAMERA IMAGE BUT NO GRIDLINES	1. Setting disabled in Radio 2. Incorrect radio software 3. Ineffective Radio 4. Incorrect Body Control Module (BCM) software 5. Ineffective camera LVDS circuit 6. Ineffective camera	1. Check setting in radio to ensure active guideline is enabled. 2. Check to be certain that the radio has the latest software update installed. Install the radio software update, if required. 3. Use a diagnostic scan tool to test the radio. Refer to the appropriate diagnostic information. 4. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information. 5. Check for loose or damaged wiring connections between the camera and the radio. Refer to the appropriate diagnostic information. Replace the section of harness that is damaged, if required. 6. Replace camera.
NO CAMERA IMAGE IN RADIO VIDEO DISPLAY AND NO BACKUP LAMPS IN REVERSE	1. Backup lamps inoperative. 2. Both backup lamps inoperative. 3. Ineffective BCM inputs or outputs.	1. Test and repair the open backup lamp switch output circuit between the right and left tail lamps if required. 2. Test and repair the open backup lamp switch output circuit between the Body Control Module (BCM) and the tail lamps, if required. 3. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
NO CAMERA IMAGE IN RADIO VIDEO DISPLAY - DOES DISPLAY CHECK ENTIRE SURROUNDINGS MESSAGE BRIEFLY AFTER SHIFTING INTO REVERSE AND BACKUP LAMPS DO OPERATE	1. Ineffective camera LVDS coaxial circuit or shield circuit 6. Ineffective camera.	1. Check the LVDS coaxial cable center terminal for 10 volts (VP2R radios) or 12 volts (VP4R radios). Check for loose or damaged wiring connections between the camera and the radio. Refer to the appropriate diagnostic information. Replace the LVDS cable, if required. 6. Replace the ineffective camera, if required.

DIAGNOSIS AND TESTING REAR CAMERA INOPERATIVE WITH RADIO DISPLAY

For a complete BACK UP CAMERA SYSTEM wiring diagram, [refer to the appropriate wiring information](#) .

THEORY OF OPERATION

The Camera is activated when the ignition switch is in the RUN position. The Fused Run Relay Output circuit supplies power to the camera. The camera sends a video signal (std. NTSC i.e. TV) to the Radio using a Low Voltage Digital Signal (LVDS) cable, which displays on the Radio screen. The screen toggles functions displaying only one kind of image at a time. And in reverse, the rear camera has priority.

WHEN MONITORED

Ignition on, vehicle in reverse.

SET CONDITION

No rear picture is displayed on Radio with the vehicle in reverse.

POSSIBLE CAUSES

Possible Causes
FUSED RUN RELAY OUTPUT CIRCUIT
GROUND CIRCUIT
LVDS CABLE
REAR VIDEO CAMERA

DIAGNOSTIC TEST

1. VERIFY OPERATION OF THE RADIO AND BACKUP LAMPS

1. Verify the operation of the Radio and Backup Lamps.

Do the Radio and Backup Lamps operate correctly?

Yes

- Go To 2

No

- Diagnose any problems with the Radio and Backup Lamps.
- Perform the BODY VERIFICATION TEST. Refer to BODY VERIFICATION TEST .

2. CHECK THE (F923) FUSED RUN RELAY OUTPUT CIRCUIT

- Turn the ignition off.
- Apply the parking brake.
- Disconnect the Rear Video Camera Assembly Harness Connector.
- Turn the ignition on.
- Measure the voltage between the (F923) Fused Run Relay Output circuit and ground.

Is battery voltage present?

Yes

- Go To 3

No

- Repair the (F923) Fused Run Relay Output circuit for an open or short to ground.
- Perform the BODY VERIFICATION TEST. Refer to BODY VERIFICATION TEST .

3. CHECK THE (Z916) GROUND CIRCUIT

- Turn the ignition off.
- Measure the resistance between ground and the (Z916) Ground Circuit.

Is the resistance below 5.0 Ohms?

Yes

- Go To 4

No

- Repair the (Z916) Ground circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to BODY VERIFICATION TEST .

4. CHECK THE (J220) LVDS CABLE

- Disconnect the Central Vision Process Module (CVPM) C4 harness connector.
- Connect test tool cable kit 9977-6-8 to the CVPM and Camera.
- Turn the ignition on.
- Set the parking brake to prevent the vehicle from moving.
- Apply foot to the brake pedal.
- Move the gear selector from PARK to Reverse.
- While maintaining foot pressure on the brake pedal, check the operation of the back up camera on the Radio screen.

Did operation of the camera return to the Radio screen?

Yes

- Replace the LVDS cable.
- Perform the BODY VERIFICATION TEST. Refer to BODY VERIFICATION TEST .

No

- Go To

5. CHECK THE REAR BACK UP CAMERA

- Turn the ignition off.
- Disconnect the vehicle camera from the 9977-6-8 test tool cable kit
- Connect a known good camera.
- Turn the ignition on.
- Make sure the parking brake is set to prevent the vehicle from moving.
- Apply foot to the brake pedal.
- Move the gear selector from PARK to Reverse.
- While maintaining foot pressure on the brake pedal, check the operation of the back up camera on the Radio screen.

Did operation of the camera return to the Radio screen?

Yes

- Replace the Rear View Camera in accordance with Service Information.

No

- Replace the Central Vision Processing Module (CVPM) in accordance with Service Information.
- Perform the BODY VERIFICATION TEST. Refer to BODY VERIFICATION TEST .

DIAGNOSIS-AND-TESTING-SPEAKER

For a complete AUDIO SYSTEM BASE/PREMIUM wiring diagram, refer to the appropriate wiring information .

DIAGNOSIS AND TESTING - SPEAKER

Any diagnosis of the Audio system should begin with the use of a scan tool and the appropriate Diagnostic Service information.

Refer to the appropriate wiring information.

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

CAUTION: The speaker output of the radio is a "floating ground" system. Do not allow any speaker lead to short to ground, as damage to the radio may result.

Speaker Buzz, Squeak, Rattle (BSR) Diagnosis and Testing

1. Begin by verifying the customer complaint. The exact conditions that caused the issue for the customer must be used. Pay close attention to the following details
 1. Type of input (FM, AM, XM, CD)
 2. Volume Level
 3. Audio settings, including bass and treble
2. Once the complaint has been reproduced, clear the map pocket and storage bins of all loose items around the speaker in question.
3. Attempt to reproduce the issue in a non-radio mode, such as CD, BluetoothB®, or Auxiliary Input. This will help determine if it is a speaker issue or a reception issue.
4. If the speaker noise is still present, visit the Tech Connect home page / Service Library Dashboard and follow the instructions to download the Audio Test Files for Speaker Diagnosis to a USB drive.
5. Insert the USB drive in the proper input of the vehicle, and then set the following radio settings:
 1. Bass at maximum
 2. Mid and treble at neutral
 3. Volume at step 30
6. Play all of the frequencies on the USB drive with the recommended settings. When a frequency reproduces the noise, press the interior panels around the speaker to see if the noise subsides. It may be necessary to replace broken trim clips or use foam tape to correct a speaker noise issue. Refer to the service information for additional details.

Electrical Diagnosis and Testing

1. Turn the ignition ON. Using the scan tool confirm the radio and (if equipped) the amplifier are active on the bus. If OK go to **Step 2** . If not OK refer to the NO RESPONSE FROM ECU diagnosis and testing in COMMUNICATION before proceeding further with this test.
2. Using the scan tool confirm the following:
 1. No audio related (radio, amplifier etc.) DTCs.
 2. No configuration, communication DTCs.

If OK go to **Step 3** . If not OK refer to the appropriate DTC test for repairs before proceeding further with this test.

3. Turn the radio ON. Adjust the balance and fader controls to check the performance of each individual speaker.

NOTE: Subwoofer channel will not fade forward or rearward. Use the bass control to check the subwoofer channel output.

What is the audio condition of **all** speaker locations?

1. Audio cannot be heard in any speaker. Go to **Step 16**
 2. Audio can be heard in one or more speaker. Go to **Step 4**
4. Audio configuration of the vehicle.

Does this vehicle have an amplifier?

1. Yes this vehicle has an amplifier Go to **Step 5**
2. No this vehicle does not have an amplifier Go to **Step 11**

5. (from Step 4) **RADIO/AMPLIFIER CONFIGURED VEHICLE**

Turn the radio OFF. Turn the ignition to the OFF position. Disconnect and isolate the battery negative cable. Remove the radio from the instrument panel. Disconnect the corresponding radio wiring harness connector at the amplifier. For each inoperative speaker location, check each speaker feed (+) and return (-) circuits between the radio and amplifier at the radio wire harness connector for the following:

1. Open/High Resistance (there should be continuity / approximately 1 to 1.5 ohms)
2. Short To Ground
3. Short To Voltage
4. Short To Another Circuit

NOTE: In each case, there should be no open or shorts.

If OK, go to **Step 6** . If not OK, repair the open or shorted speaker feed (+) and or return (-) circuit(s) between the radio and amplifier connectors as required.

6. Install the radio. Connect the battery negative cable. Check for battery voltage at the fused B(+) fuse for the amplifier in the Power Distribution Center (PDC). If OK, go to **Step 7** . If not OK, repair the open fused B(+) circuit to the PDC fuse as required.
7. Check for battery voltage at the fused B(+) circuit cavities of the amplifier wire harness connector. If OK, go to **Step 8** . If not OK, repair the open fused B(+) circuit(s) to the amplifier fuse in the junction block as required.
8. Turn the ignition switch to the ON position. Turn the radio ON. Check for battery voltage at the enable signal to amplifier circuit cavity of the amplifier wire harness connector. If OK, go to **Step 9** . If not OK, repair the open enable signal to amplifier circuit to the radio as required.
9. Turn the radio OFF. Turn the ignition switch to the OFF position. Disconnect and isolate the battery negative cable. For each inoperative speaker location, check each amplifier speaker feed (+) circuit and return (-) circuit of the amplifier, between the amplifier and speaker at the amplifier wire harness connectors for the following:
 1. Open/High Resistance (there should be continuity / approximately 1 to 1.5 ohms)
 2. Short To Ground
 3. Short To Voltage
 4. Short To Another Circuit

NOTE: In each case, there should be no open or shorts.

If OK, go to **Step 10** . If not OK, repair the open or shorted speaker feed (+) and or return (-) circuit(s) between the amplifier and speaker connectors as required.

10. For each inoperative speaker location, check the resistance of the speaker. The meter should read between 1 and 10 ohms (speaker resistance).

If OK, replace the amplifier first. **If the condition is still present** replace the radio.

If not OK, replace the faulty speaker.

11. (from Step 4) **RADIO ONLY CONFIGURED VEHICLE**

Turn the radio OFF. Turn the ignition switch to the OFF position. Disconnect and isolate the battery negative cable. For each inoperative speaker location, check each radio speaker feed (+) circuit and return (-) circuit of the radio, between the radio and speaker at the radio wire harness connectors for the following:

1. Open/High Resistance (there should be continuity / approximately 1 to 1.5 ohms)
2. Short To Ground
3. Short To Voltage
4. Short To Another Circuit

NOTE: In each case, there should be no open or shorts.

If OK, go to **Step 12** . If not OK, repair the open or shorted speaker feed (+) and or return (-) circuit(s) between the radio and speaker connectors as required.

12. Check for continuity between the ground circuit cavities of the radio wire harness connector and a good ground. There should be continuity. If OK, go to **Step 13** . If not OK, repair the open ground circuit(s) to ground as required.
13. Install the radio. Connect the battery negative cable. Check for battery voltage at the fused B(+) fuse for the radio in the Power Distribution Center (PDC). If OK, go to **Step 14** . If not OK, repair the open fused B(+) circuit to the PDC fuse as required.
14. Check for battery voltage at the fused B(+) circuit cavities of the radio wire harness connector. If OK, go to **Step 15** . If not OK, repair the open fused B(+) circuit(s) to the amplifier fuse in the junction block as required.
15. For each inoperative speaker location, check the resistance of the speaker. The meter should read between 1 and 10 ohms (speaker resistance).

If OK, replace the faulty radio.

If not OK, replace the faulty speaker.

16. (from Step 3) **AUDIO CANNOT BE HEARD IN ANY SPEAKER**

Check the audio configuration of the vehicle.

Does this vehicle have an amplifier?

1. Yes this vehicle has an amplifier Go to **Step 17**
2. No this vehicle does not have an amplifier Go to **Step 20**

17. (from Step 16) **RADIO/AMPLIFIER CONFIGURED VEHICLE**

Check for battery voltage at ALL power supply fused B(+)/ignition related circuits to the amplifier. If OK, go to **Step 18** . If not OK, repair the circuits for an open or high resistance as required.

18. Check ALL ground related circuits to the amplifier. If OK, go to **Step 19** . If not OK, repair the ground circuit(s) for an open or high resistance as required.

19. Remove the radio from the instrument panel. Disconnect the corresponding radio wiring harness connector at the amplifier. For each inoperative speaker location, check each speaker feed (+) and return (-) circuits between the radio and amplifier at the radio wire harness connector for the following:
1. Open/High Resistance (there should be continuity / approximately 1 to 1.5 ohms)
 2. Short To Ground
 3. Short To Voltage
 4. Short To Another Circuit

NOTE: In each case, there should be no open or shorts.

If OK, replace the amplifier first. **If the condition is still present** replace the radio.

If not OK, repair the open or shorted speaker feed (+) and or return (-) circuit(s) between the radio and amplifier connectors as required.

20. (from Step 16) **RADIO ONLY CONFIGURED VEHICLE**

Check for battery voltage at ALL power supply fused B(+)/ignition related circuits to the Radio. If OK, go to **Step 21** . If not OK, repair the circuits for an open or high resistance as required.

21. Check ALL ground related circuits to the radio. If OK, go to **Step 22** . If not OK, repair the ground circuit(s) for an open or high resistance as required.

22. For each inoperative speaker location, check each speaker feed (+) and return (-) circuits between the radio and speaker at the radio wire harness connector for the following:
1. Open/High Resistance (there should be continuity / approximately 1 to 1.5 ohms)
 2. Short To Ground
 3. Short To Voltage
 4. Short To Another Circuit

NOTE: In each case, there should be no open or shorts.

If OK, then replace the radio.

If not OK, repair the open or shorted speaker feed (+) and or return (-) circuit(s) between the radio and speaker connectors as required.

DIAGNOSIS AND TESTING - REMOTE SWITCHES

Any diagnosis of the Audio system should begin with the use of the scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service information.

For complete circuit diagrams, refer to the appropriate wiring information.

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

1. Disconnect and isolate the negative battery cable. Remove the remote radio switch(es) from the steering wheel. Go to **Step 2** .
2. Use an ohmmeter to check the switch resistances as shown in the Remote Radio Switch Test table below, then Go to **Step 3** .

REMOTE RADIO SWITCH TEST				
Switch	Switch Position	Minimum Resistance (kilo-ohm)	Nominal Resistance (kilo-ohm)	Maximum Resistance (kilo-ohm)
Right (White)	Volume Up	6.732	6.8	6.868
Right (White)	Volume Down	14.850	15	15.151
Right (White)	Mode Advance	0	0	0
Left (Black)	Seek Up	1.188	1.2	1.212
Left (Black)	Seek Down	3.267	3.3	3.333
Left (Black)	Pre-Set Station Advance	0.465	0.47	0.474

3. If the switch resistance checks OK, go to **Step 4** . If not OK, replace the ineffective switch.
4. Check for continuity between the ground circuit cavity of the steering wheel wire harness connectors for the switches and a good ground. There should be continuity. If OK, go to **Step 5** . If not OK, repair the open ground circuit as required.
5. Disconnect the appropriate wire harness connector from the Body Control Module (BCM). Check for continuity between the radio control circuit cavity of the steering wire harness connectors for the switches and a good ground. There should be no continuity. If OK, go to **Step 6** . If not OK, repair the shorted radio control circuit as required.
6. Check for continuity between the radio control circuit cavities of the steering wheel wire harness connectors for the switches and the BCM wire harness connector. There should be continuity. If OK, use a diagnostic scan tool and the appropriate diagnostic procedures to test the BCM, the Radio and the Controller Area Network (CAN) data bus. If not OK, repair the open radio control circuit as required.

MULTI-MEDIA TEST

MULTI-MEDIA TESTING FUNCTION

Any diagnosis of the Audio system should begin with duplicating the customer concern (verify the problem), include checking for applicable Technical Service Bulletins (TSB), Star Online Publications, software updates and the use of a diagnostic scan tool. Check for any Diagnostic Trouble Code (DTC) data. If a DTC is found, refer to - Radio and perform the appropriate diagnostic procedure before proceeding in this information.

The multi-media test was developed to help diagnose and determine the cause of customer concerns with features of the multi-media systems in the vehicle.

There are 9 specific functionality tests available for the multi-media systems:

1. Operation of the AUX port
2. Operation of the USB port for both power and Audio input concerns
3. BluetoothB® phone pairing
4. BluetoothB® hands free calling (send & receive) phone book push test
5. BluetoothB® streaming audio
6. BluetoothB® SMS messaging - send
7. BluetoothB® SMS messaging - receive
8. No BluetoothB® signal available
9. No WiFi signal available

It is important to determine the system features supported by the vehicle's multi-media systems, customer's personal device and their compatibility with another.

The following websites are available to customers and dealership personnel for information on device compatibility, operation and supported features of the vehicle's multi-media systems:

- For device compatibility, refer to <http://www.driveuconnect.com>
- <http://www.dodge.com/en/uconnect>
- <http://www.chrysler.com/en/uconnect>
- <http://www.jeep.com/en/uconnect>
- <http://www.ramtrucks.com/en/uconnect>
- <http://www.fiatusa.com/en/BlueAndMe>

NOTE: Prior to performing any testing of the multi-media systems, the compatibility between the customer's personal device and the vehicle's multi-media systems must be confirmed

When testing the functions of the multi-media systems, it is important to verify whether or not the vehicle is equipped with an internal or external Hands Free Module. In some cases the external Hands Free Module controls the operation of the external AUX and USB ports along with the UconnectB® functions. A WiFi subscription package may be required for purchasing, and the feature activated to function properly on select equipped vehicles. For further details consult the owner manual and <http://www.driveuconnect.com>

The following websites are available to dealership personnel only for further technical information of the vehicle's multi-media systems:

- DealerCONNECT
- Service Library
- STAR Online Publications
- Technical Service Bulletins
- wiTECH™ for radio updates
- FCA PERFORMANCE INSTITUTE

MULTI-MEDIA FUNCTIONALITY TESTS

1. **CONFIRM THE COMPATIBILITY OF THE CUSTOMER'S PERSONAL DEVICE TO THE VEHICLES MULTI-MEDIA SYSTEM**

1. Check the compatibility of the customer's personal device with the website <http://www.driveuconnect.com>.

Is the customer's personal device compatible to the vehicles multi-media system?

Yes

- Go To [2](#)

No

- The customer's device is not compatible with the vehicles multi-media system.
- Check the customer's device for related updates and support.

2. FUNCTIONALITY TESTS FOR THE MULTI-MEDIA SYSTEMS USING A KNOWN GOOD COMPATIBLE SMART PHONE

1. Turn the ignition on.

- NOTE:** The following are required to proceed with testing:
- Confirmation of a compatible smart phone from the website <http://www.driveuconnect.com>
 - The use of a known good compatible smart phone and cable. The known good compatible smart phone will be referred to as "Test Phone A ".

2. AUXILIARY INPUT JACK TEST

- Go To [3](#)

3. USB INPUT/OUTPUT TEST

- Go To [4](#)

4. BLUETOOTH PAIRING

- Go To [11](#)

5. BLUETOOTH HANDS FREE CALLING/PHONEBOOK PUSH TEST

- Go To [12](#)

6. BLUETOOTH STREAMING AUDIO TEST

- Go To [13](#)

7. BLUETOOTH SMS MESSAGING - RECEIVE

- Go To [14](#)

8. BLUETOOTH SMS MESSAGING - SEND

- Go To [15](#)

9. NO BLUETOOTH SIGNAL AVAILABLE

Vehicles built with Sales Code RFV - DISASSOCIATED TOUCHSCREEN DISPLAY using the dual WIFI-BT antenna connections

- Go To [16](#)

10. NO WIFI SIGNAL AVAILABLE

Vehicles built with Sales Code RFV - DISASSOCIATED TOUCHSCREEN DISPLAY using the dual WIFI-BT antenna connections

- Go To [17](#)

3. AUXILIARY INPUT JACK TEST

- NOTE:** This test is designed to validate the ability of the multi-media system to play audio from a customer's device that has been connected to the AUX port on the radio or externally through a UCI (Universal Customer Interface / Multi-Media) port.

- NOTE:** The AUX port cannot supply power to a connected device.

1. Using a known good Auxiliary Cable, connect the Auxiliary Cable to the vehicle's audio port.
2. Connect the Auxiliary Cable to **Test Phone A** .
3. Select an audio file from **Test Phone A** to be heard with the volume all the way up.
4. Using the vehicle controls, place the audio system into AUX (Line In) Mode. (Audio system may automatically enter into AUX Mode.)

Does the Radio play audio from Test Phone A?

Yes

- Audio playback confirms that the Auxiliary Input is working correctly, no system repairs are needed at this time.
- Check the condition of the customer's cords and device being used.
- Check to make sure the customer's device and cables are compatible with each other (i.e. Apple Phone with MFi (Made For iPhone).
- Check the customer's device for output and volume setting concerns.
- Check the customer's device for updates relating to the customer's concern.

No

- If Audio playback does not occur, refer to the appropriate Service Information and repair or replace as needed.
- Check the Multi-Media ports for damaged connection points or debris in the ports.
- Check wiring circuits and connections related to the AUX port for concerns.
- Check for vehicle related system updates, STAR cases and TSBs related to the customer's concern.
- If no updates are available for the concern or wiring problems are found, replace the Radio or Hands Free Module in accordance with the Service Information.

4. USB INPUT/OUTPUT TEST

- NOTE:** This test is designed to validate the ability of the multi-media system to play audio from a customer's device that has been connected to the USB port on the radio or the external USB port (Universal Customer Interface (UCI) / Multi- Media port). By connecting Test Phone A to the USB ports it will also determine if the USB port can provide power to a connected device.

1. Confirm the USB port is not a **Charge only** port.
2. Using a known good USB Cable, connect the USB Cable to the vehicle's USB port.
3. Connect the USB Cable to **Test Phone A** .
4. Select an audio file from **Test Phone A** to be heard with the volume all the way up.
5. Using the vehicle controls, place the audio system into USB Mode. (Audio system may automatically enter into USB Mode.)

Does the Radio play audio from Test Phone A?

Yes

- Audio playback confirms that the USB Input is working correctly, no system repairs are needed at this time.
- Check the condition of the customer's cords and device being used.
- Check to make sure the customer's device and cables are compatible with each other (i.e. Apple Phone with MFi (Made For iPhone).
- Check to make sure the customer's device and cables are compatible with the vehicle system.
- Check the customer's device for output and volume setting concerns.
- Check the customer's device for updates relating to the customer's concern.

No

- Go To [5](#)

5. CHECK THE USB PORT FOR DAMAGE

1. Check the Multi-Media ports for damaged connection points or debris in the ports.

Was damage to the connections point or debris found in the ports?

Yes

- Repair or replace the Multi-Media port as needed.

No

- Go To [6](#)

6. CHECK THE FUNCTION OF THE USB PORT

- NOTE:** Confirm the USB flash drive (with music files i.e. mp3) will play in another known good vehicle and Laptop computer before proceeding.

1. Insert a USB Flash drive (with music files i.e. mp3) in to the Media Port / USB port.

Does the Radio play audio from USB Flash drive?

Yes

- **Audio playback confirms that the USB Input is working correctly, no system repairs are needed at this time.**
- Check the condition of the customer's cords and device being used.
- Check to make sure the customer's device and cables are compatible with each other (i.e. Apple Phone with MFi (Made For iPhone)).
- Check the customer's device for output and volume setting concerns.
- Check the customer's device for updates relating to the customer's concern.

No

- Go To [7](#)

7. CHECKING THE USB PORT

1. Remove the USB Flash drive (with music files i.e. mp3) from the Media Port / USB port
2. Turn the ignition off.
3. Remove the Media Port from the Dash/Console.
4. Disconnect the gray USB cable connector from the Media Port.
5. Using a USB A Male to Mini B cable, connect the Mini B connection to the Media Port and the A Male connection to a Laptop computer.
6. Turn the ignition on.
7. Insert the USB Flash drive (with music file i.e. mp3s) in to the Media Port / USB port
8. Using the Laptop computer, select the flash drive.

Does the Laptop computer recognize the USB Flash drive?

Yes

- Go To [10](#)

No

- Go To [8](#)

8. ISOLATE AND LOAD TEST THE POWER SUPPLY RELATED CIRCUIT TO THE MEDIA PORT FOR A SHORT TO GROUND, OPEN, OR HIGH RESISTANCE

1. Check the fuse for an open. If the fuse is open, make sure to check for a short to ground prior to replacing the fuse.
2. The ignition must be off when performing a load test on a circuit.
3. Isolate the circuit by disconnecting the Media Port and all other harness connectors containing the circuit being tested.
4. Connect the positive lead of the load test tool to the positive side of the Battery (A). Refer to the diagram below.
5. Using an approved back probe tool, connect the negative lead of the load test tool to the circuit being tested at the Media Port connector (B).
6. Using an approved back probe tool and a fused jumper wire, connect the circuit being tested to the negative side of the Battery or a known good ground at the Power Distribution Center (PDC) harness connector (C and D).
7. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuit.

NOTE: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#).

NOTE: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Why perform a Voltage Drop Test? To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#).

WARNING: To avoid possible serious or fatal injury, DO NOT load test any air bag/restraint system components or circuits using the procedures listed here. Refer to the Service Information for proper air bag/restraint system testing procedures.

CAUTION: Do not load test any circuits with components still connected to the circuit.

NOTE: When probing a circuit at an Electronic Control Unit (ECU) harness connector, always use an appropriate back probing tool to prevent any possible damage to the ECU terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [9](#)

No

- Repair the circuit(s) for an open or high resistance.
- Perform the appropriate ECU verification test. If a verification test is not available, perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

9. CHECK THE GROUND CIRCUIT TO THE MEDIA PORT BY LOAD TESTING THE CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. Disconnect the Media Port harness connector to isolate the ground circuit.
2. Connect the positive lead of the load test tool to the positive side of the Battery.
3. Connect the negative lead of the load test tool to the ground circuit at the Media Port harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#).

NOTE: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT LOAD TESTING PROCEDURE for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [CIRCUIT LOAD TESTING PROCEDURES](#).

NOTE: When probing a circuit at the harness connector, always use an appropriate back probing tool to prevent any possible damage to the terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Replace the Media Port in accordance with Service Information.

No

- Repair the ground circuit(s) for an open or high resistance.
- Perform the appropriate ECU verification test. If a verification test is not available, perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

10. CHECKING THE UCI/USB CABLE

1. Turn the ignition off.
2. Remove the USB Flash drive (with music files i.e. mp3) from the Media Port / USB port
3. Disconnect the USB A Male to Mini B cable from the Media Port.
4. Disconnect the UCI/USB cable from connector going from the external Hands Free Module (if equipped) or Radio to the Media port.
5. Connect the (special tool #9977-6-11, Kit, USB Mini-B - 4 and 5 Wire)in to the Hands Free Module (if equipped) or Radio and to the Media port.
6. Turn the ignition on.
7. Insert the USB Flash drive (with music file i.e. mp3s) in to the Media Port / USB port

Does the Radio play audio from USB Flash drive?

Yes

- Replace the UCI/USB cable between the Hands Free Module (if equipped) or Radio and the Media port.

No

- Replace the Hands Free Module (if equipped) or Radio in accordance with Service Information.

11. BLUETOOTH PAIRING (IF EQUIPPED)

NOTE: This test is designed to validate the pairing ability of the vehicles multi-media system. Pairing Test Phone A to the vehicle system will confirm the system operation.

Before testing, it is important to check the total number of devices paired to the vehicles system. Each system has a limit to the number of items that can be paired to the system. For more information on system operation and supported features see the vehicle supporting website "For Owners Page" or the Drive UconnectB® website at <http://www.driveuconnect.com>.

NOTE: If the customer's concern is the vehicle system was working with their device but then stopped working correctly, verify and perform the following:

- Check to see if the device was recently updated.
- Clear the device pairing from the system.
- Reboot the customer's device.
- Re-pair the device to the vehicle system.
- Check the operation.

At times, cell phone providers will update the software or firmware in the customer's device (without the customer knowing) causing it to become out of sync with the vehicle's system.

NOTE: During this test, use the power outlet to supply the power and ground to Test Phone A . This will confirm and demonstrate the BluetoothB® connection without anything connected to the multi-media system ports.

1. Turn on BluetoothB® mode in Test Phone A .
2. Use the vehicle audio controls to place the audio system into ready to PAIR Mode.
3. When prompted, enter the Pairing Pin number.

Does Test Phone A pair to the multi-media system?

Yes

- If the Test Phone A pairs to the system, the Hands Free connection is working correctly, no part replacement is needed.
- Check the total number of devices paired to the customer's device.
- Check to make sure the customer's device and cables are compatible with each other (i.e. Apple Phone with MFi (Made For iPhone).
- Check to see if the customer's device supports the vehicle feature being tested.
- Check the customer's device for concerns related to password locks, phone book transfer settings and data transfer locks/settings.
- For more information on system operation and supported features see the vehicle supporting website "For Owners Page" or the Drive UconnectB® website at <http://www.driveuconnect.com>.
- If Test Phone A does not belong to the customer, delete this paired phone only from the vehicle.

No

- If the vehicle is equipped and pairing does not occur, refer to the appropriate Service Information.
- Check for vehicle related system updates, STAR cases and TSBs related to the customers concern.
- If no updates are available for the concern, replace the Radio or Hands Free Module in accordance with the Service Information.

12. BLUETOOTH HANDS FREE CALLING / PHONE BOOK PUSH TEST

NOTE: This test is designed to validate the ability of the multi-media system to place and receive phone calls.

This test will require the use of Test Phone A and a fully functioning phone. The fully functioning phone will be identified as "Test Phone B " in this diagnostic test step.

Before testing, it is important to check the total number of devices paired to the vehicles system. Each system has a limit to the number of items that can be paired to the system. For more information on system operation and supported features see the vehicle supporting website "For Owners Page" or the Drive UconnectB® website at <http://www.driveuconnect.com>.

NOTE: If the customer's concern is the vehicle system was working with their device but then stopped working correctly, verify and perform the following:

- Check to see if the device was recently updated.
- Clear the device pairing from the system.
- Reboot the customer's device.
- Re-pair the device to the vehicle system.
- Check the operation.

At times, cell phone providers will update the software or firmware in the customer's device (without the customer knowing) causing it to become out of sync with the vehicle's system.

NOTE: During this test use the Power outlet adaptor supplied with the power and ground to Test Phone A . This will confirm and demonstrate the BluetoothB® connection without anything connected to the multi-media system ports.

1. Turn on BluetoothB® mode in Test Phone A .
2. Pair Test Phone A to the vehicle.
3. Create and save the Test Phone B contact information (name and number) into Test Phone A .
4. From Test Phone B , call Test Phone A .
5. The vehicle should announce an incoming call.
6. The media system should display the Test Phone B contact information, confirming a successful push of the phone book.
7. Using the vehicle controls, answer the call.
8. Using the vehicle controls, end the call.

Was the contact information displayed and the call completed?

Yes

- **The system is working correctly; no part replacement is needed.**
- Check the total number of devices paired to the customer's device.
- Check to make sure the customer's device and cables are compatible with each other (i.e. Apple Phone with MFi (Made For iPhone)).
- Check to see if the customer's device supports the feature that the customer is trying to use.
- Check the customer's device for concerns related to password locks, phone book transfer settings and data transfer locks/settings.
- For more information on system operation and supported features see the vehicle supporting website "For Owners Page" or the Drive UconnectB® website at <http://www.driveuconnect.com>.
- **If Test Phone A does not belong to the customer, delete this paired phone only from the vehicle.**

No

- **Reference the appropriate Service Information.**
- Check for vehicle related system updates, STAR cases and TSBs related to the customers concern.
- If no updates are available for the concern, replace the Radio or Hands Free Module in accordance with the Service Information.
- **If Test Phone A does not belong to the customer, delete this paired phone only from the vehicle.**

13. BLUETOOTH STREAMING AUDIO TEST

NOTE: This test is designed to validate the ability of the multi-media system to play streamed audio by a BluetoothB® connected device.

Before testing, it is important to check the total number of devices paired to the vehicles system. Each system has a limit to the number of items that can be paired to the system. For more information on system operation and supported features see the vehicle supporting website "For Owners Page" or the Drive UconnectB® website at <http://www.driveuconnect.com>.

NOTE: If the customer's concern is the vehicle system was working with their device but then stopped working correctly, verify and perform the following:

- **Check to see if the device was recently updated.**
- **Clear the device pairing from the system.**
- **Reboot the customer's device.**
- **Re-pair the device to the vehicle system.**
- **Check the operation.**

At times, cell phone providers will update the software or firmware in the customer's device (without the customer knowing) causing it to become out of sync with the vehicle's system.

NOTE: During this test use the Power outlet to supply the power and ground to Test Phone A . This will confirm and demonstrate the BluetoothB® connection without anything connected to the multi-media system ports.

1. Turn on BluetoothB® mode in **Test Phone A** .
2. Pair **Test Phone A** to the vehicle.
3. Select an audio file from **Test Phone A** to play with the volume all the way up.
4. Using the vehicle controls, place the audio system into BluetoothB® Audio.

Does the Radio play audio from the known good device?

Yes

- **Audio playback will confirm that the BluetoothB® Streaming Audio is working correctly, no system part replacement is needed.**
- Check the total number of devices paired to the customer's device.
- Check to make sure the customer's device and cables are compatible with each other (i.e. Apple Phone with MFi (Made For iPhone)).
- Check to see if the customer's device supports the vehicle feature being tested.
- Check the customer's device for concerns related to password locks, phone book transfer settings and data transfer locks/settings.
- For more information on system operation and supported features see the vehicle supporting website "For Owners Page" or the Drive UconnectB® website at <http://www.driveuconnect.com>.
- **If Test Phone A does not belong to the customer, delete this paired phone only from the vehicle.**

No

- **If Audio playback does not occur, refer to the appropriate Service Information.**
- Check for vehicle related system updates, STAR cases and TSBs related to the customers concern.
- If no updates are available for the concern, replace the Radio or Hands Free Module in accordance with the Service Information.
- **If Test Phone A does not belong to the customer, delete this paired phone only from the vehicle.**

14. BLUETOOTH SMS MESSAGING- RECEIVE

NOTE: This test is designed to validate the ability of the multi-media system to receive a SMS message.

This test will require the use of Test Phone A and a fully functioning phone capable of sending and receiving SMS messaging. The fully functioning phone capable of sending and receiving SMS messaging will be identified as "Test Phone B " in this diagnostic test step.

Before testing, it is important to check the total number of devices paired to the vehicles system. Each system has a limit to the number of items that can be paired to the system. For more information on system operation and supported features see the vehicle supporting website "For Owners Page" or the Drive UconnectB® website at <http://www.driveuconnect.com>.

NOTE: If the customer's concern is the vehicle system was working with their device but then stopped working correctly, verify and perform the following:

- **Check to see if the device was recently updated.**
- **Clear the device pairing from the system.**
- **Reboot the customer's device.**
- **Re-pair the device to the vehicle system.**
- **Check the operation.**

At times, cell phone providers will update the software or firmware in the customer's device (without the customer knowing) causing it to become out of sync with the vehicle's system.

NOTE: During this test use the Power outlet to supply the power and ground to Test Phone A . This will confirm and demonstrate the BluetoothB® connection without anything connected to the multi-media system ports.

1. Turn on BluetoothB® mode in **Test Phone A** .
2. Pair **Test Phone A** to the vehicle.
3. Create and save the **Test Phone B** contact information (name and number) into **Test Phone A** .
4. From **Test Phone B** , create and then send a text message to **Test Phone A** .
5. The vehicle audio system should confirm the receipt of a new message.
6. The media system will display the **Test Phone B** contact information, confirming a successful push of the phone book.
7. Using the vehicle controls, retrieve the message to verify proper functionality.

Does the Radio display the message from Test Phone B?

Yes

- **If functioning correctly, no system part replacement is needed.**
- Check the total number of devices paired to the customer's device.
- Check to make sure the customer's device and cables are compatible with each other (i.e. Apple Phone with MFi (Made For iPhone)).
- Check to see if the customer's device supports the vehicle feature being tested.
- Check the customer's device for concerns related to password locks, phone book transfer settings and data transfer locks/settings.
- For more information on system operation and supported features see the vehicle supporting website "For Owners Page" or the Drive UconnectB® website at <http://www.driveuconnect.com>.
- **If Test Phone A does not belong to the customer, delete this paired phone only from the vehicle.**

No

- **If the Audio system does not display the new message, reference the appropriate Service Information on system operation and supported features. See the vehicle supporting website "For Owners Page" or the Drive UconnectB® website at <http://www.driveuconnect.com>.**
- Check for vehicle related system updates, STAR cases and TSBs related to the customers concern.
- If no updates are available for the concern, replace the Radio or Hands Free Module in accordance with the Service Information.
- **If Test Phone A does not belong to the customer, delete this paired phone only from the vehicle.**

15. BLUETOOTH SMS MESSAGING-SEND

NOTE: This test is designed to validate the ability of the multi-media system to send a SMS message from the list of preset messages.

This test will require the use of Test Phone A and a fully functioning phone capable of sending and receiving SMS messaging. The fully functioning phone capable of sending and receiving SMS messaging will be identified as "Test Phone B " in this diagnostic test step.

Before testing, it is important to check the total number of devices paired to the vehicles system. Each system has a limit to the number of items that can be paired to the system. For more information on system operation and supported features see the vehicle supporting website "For Owners Page" or the Drive UconnectB® website at <http://www.driveuconnect.com>.

NOTE: If the customer’s concern is the vehicle system was working with their device but then stopped working correctly, verify the following:

- Check to see if the device was recently updated.
- Clear the device pairing from the system.
- Reboot the customer’s device.
- Re-pair the device to the vehicle system.
- Check the operation.

At times, cell phone providers will update the software or firmware in the customer’s device (without the customer knowing) causing it to become out of sync with the vehicle’s system.

NOTE: During this test use the Power to supply the power and ground to Test Phone A . This will confirm and demonstrate the BluetoothB® connection without anything connected to the multi-media system ports.

1. Turn on BluetoothB® mode in **Test Phone A** .
2. Pair **Test Phone A** to the vehicle.
3. Create and save the **Test Phone B** contact information (name and number) into **Test Phone A** .
4. Using the vehicle controls, create and then send a text message to **Test Phone B** .
5. The message should display in **Test Phone B** .

Does Test Phone B display the message sent by Test Phone A?

Yes

- **If functioning correctly, no system part replacement is needed.**
- Check the total number of devices paired to the customer’s device.
- Check to make sure the customer's device and cables are compatible with each other (i.e. Apple Phone with MFi (Made For iPhone).
- Check to see if the customer’s device supports the vehicle feature being tested.
- Check the customer’s device for concerns related to password locks, phone book transfer settings and data transfer locks/settings.
- For more information on system operation and supported features see the vehicle supporting website "For Owners Page" or the Drive UconnectB® website at <http://www.driveuconnect.com>.
- **If Test Phone A does not belong to the customer, delete this paired phone only from the vehicle.**

No

- **If Test Phone B does not display the new message, reference the appropriate Service Information on system operation and supported features. See the vehicle supporting website "For Owners Page" or the Drive UconnectB® website at <http://www.driveuconnect.com>.**
- Check for vehicle related system updates, STAR cases and TSBs related to the customers concern.
- If no updates are available for the concern, replace the Radio or Hands Free Module in accordance with the Service Information.
- **If Test Phone A does not belong to the customer, delete this paired phone only from the vehicle.**

16. NO BLUETOOTH SIGNAL AVAILABLE

NOTE: This test is designed to validate the BluetoothB® signal availability in the vehicles multi-media system that are configured with Sales Code RFV - DISASSOCIATED TOUCHSCREEN DISPLAY .

A WiFi subscription package may be required for purchasing, and the feature activated to function properly on select equipped vehicles. For further details consult the owner manual and <http://www.driveuconnect.com>

Before testing, it is important to check the total number of devices paired or linked to the vehicles system. Each system has a limit to the number of items that can be paired to the system. For more information on system operation and supported features see the vehicle supporting website "For Owners Page" or the Drive UconnectB® website at <http://www.driveuconnect.com>.

NOTE: If the customer’s concern is the vehicle system was working with their device but then stopped working correctly, verify the following:

- Check to see if the device was recently updated.
- Clear the device pairing from the system.
- Reboot the customer’s device.
- Re-pair the device to the vehicle system.
- Check the operation.

At times, cell phone providers will update the software or firmware in the customer’s device (without the customer knowing) causing it to become out of sync with the vehicle’s system.

NOTE: During this test use the Power outlet to supply the power and ground to Test Phone A .

1. Confirm that the Bluetooth feature has been turned on in **Test Phone A** .
2. Pair **Test Phone A** to the vehicle.

NOTE: Antenna reception testing

must

be done outside and away from man made structures or natural features to ensure all signals are not obstructed.

3. Disconnect the Radio WiFi / BT Antenna harness connector from the Radio.
4. Connect the (special tool #9977-6-9, Adapter, RG-58 Coax Cable) and the (special tool #9977-6-WiFi-BT, Antenna, WiFi Blue Tooth) to the Radio at the WiFi / BT Antenna connector location.
5. Select an audio file from **Test Phone A** to play with the volume all the way up.
6. Using the vehicle controls, place the audio system into BluetoothB® Audio.

Does the Radio play audio from the known good device?

Yes

- **Audio playback will confirm that the BluetoothB® Streaming Audio is working correctly, no system part replacement is needed.**
- Check the total number of devices paired to the customer’s device.
- Check to make sure the customer's device and cables are compatible with each other (i.e. Apple Phone with MFi (Made For iPhone).
- Check to see if the customer’s device supports the vehicle feature being tested.
- Check the customer’s device for concerns related to password locks, phone book transfer settings and data transfer locks/settings.
- For more information on system operation and supported features see the vehicle supporting website "For Owners Page" or the Drive UconnectB® website at <http://www.driveuconnect.com>.
- **If Test Phone A does not belong to the customer, delete this paired phone only from the vehicle.**

No

- **If Audio playback does not occur, refer to the appropriate Service Information.**
- Check for vehicle related system updates, STAR cases and TSBs related to the customers concern.
- If no updates are available for the concern, replace the Radio in accordance with the Service Information.
- **If Test Phone A does not belong to the customer, delete this paired phone only from the vehicle.**

17. NO WIFI SIGNAL AVAILABLE

NOTE: This test is designed to validate the WiFi signal availability in the vehicles multi-media system that are configured with Sales Code RFV - DISASSOCIATED TOUCHSCREEN DISPLAY .

A WiFi subscription package may be required for purchasing, and the feature activated to function properly on select equipped vehicles. For further details consult the owner manual and <http://www.driveuconnect.com>

Before testing, it is important to check the total number of devices paired or linked to the vehicles system. Each system has a limit to the number of items that can be paired to the system. For more information on system operation and supported features see the vehicle supporting website "For Owners Page" or the Drive UconnectB® website at <http://www.driveuconnect.com>.

NOTE: If the customer’s concern is the vehicle system was working with their device but then stopped working correctly, verify the following:

- Check to see if the device was recently updated.
- Clear the device pairing from the system.
- Reboot the customer’s device.
- Re-pair the device to the vehicle system.
- Check the operation.

At times, cell phone providers will update the software or firmware in the customer’s device (without the customer knowing) causing it to become out of sync with the vehicle’s system.

1. Disconnect the Radio WiFi / BT Antenna harness connector from the Radio.
2. Connect the (special tool #9977-6-9, Adapter, RG-58 Coax Cable) and the (special tool #9977-6-WiFi-BT, Antenna, WiFi Blue Tooth) to the Radio at the WiFi / BT Antenna connector location.
3. Confirm the following:

- A data source is connected to the system for streaming access. Some of these options can be an in-vehicle 4G Wi-Fi hot spot, capable Wi-Fi hot spot from a mobile device, or Wi-Fi from an outside source like a home or a garage.
- To access Fire TV on the front screen, select "Launch Source" on the front radio rear seat screen and then "Fire TV Home" under the Inputs.
- The menu bar for Fire TV will have the options for "Home", "Find", "Library", "Brand", and "Live".
- Below the menu bar will be streaming options linked to your Prime account like "Prime Video".

4. The front radio screen has the following options:

- Power - This will turn Fire TV on or off.
- Screen 1 and Screen 2 Toggle (if equipped) - This toggles between the Rear Screens (for use with front radio screen only).
- Collapse - While viewing on the front radio screen, this will collapse the screen to dashboard view.
- Source Drawer - This will open the "Source Drawer" and the source logo will be displayed on the icon.
- Browse Media - This will open the "Browse Media" pop-up.
- Back - This will let you go back the previous page.
- Fire TV Home - This will take you back to the Fire TV home page.
- Menu - This will open the Fire TV menu.
- Remote icon - This will display the on-screen remote.

NOTE: Front screen viewing and watching can only be done when the vehicle is in PARK. The rear screens will always launch with Fire TV.

NOTE: During this test use the Power outlet to supply the power and ground to Test Phone A . This will confirm and demonstrate the WIFI connection without anything connected to the multi-media system ports.

5. Turn the ignition on.

6. Turn the Radio on and navigate / browse the media using **Test Phone A** .

Does the Radio allow WiFi navigation / browsing from the known good device?

Yes

- **The WiFi navigation / browsing will confirm the system is working correctly, no system part replacement is needed.**
- Check the total number of devices paired to the customer's device.
- Check to make sure the customer's device and cables are compatible with each other (i.e. Apple Phone with MFi (Made For iPhone)).
- Check to see if the customer's device supports the vehicle feature being tested.
- Check the customer's device for concerns related to password locks, phone book transfer settings and data transfer locks/settings.
- For more information on system operation and supported features see the vehicle supporting website "For Owners Page" or the Drive UconnectB® website at <http://www.driveuconnect.com>.
- **If Test Phone A does not belong to the customer, delete this paired phone only from the vehicle.**

No

- **If WiFi navigation / browsing does not occur, refer to the appropriate Service Information.**
 - Check for vehicle related system updates, STAR cases and TSBs related to the customers concern.
 - If no updates are available for the concern, replace the Radio in accordance with the Service Information.
 - **If Test Phone A does not belong to the customer, delete this paired phone only from the vehicle.**
-

2021 ACCESSORIES AND EQUIPMENT

Audio/Video/Entertainment/Connectivity (Service Information) - Gladiator

DESCRIPTION AND OPERATION

DESCRIPTION AND OPERATION

DESCRIPTION

The audio system may include the following components:

COMPONENT INDEX

1.	Refer to <u>ANTENNA MAST, BODY AND CABLE.</u>
2.	Refer to <u>SPEAKERS.</u>
3.	Refer to <u>RADIO.</u>
4.	Refer to <u>DIGITAL AUDIO BROADCAST ANTENNA AND MODULE.</u>
5.	Refer to <u>WIRELESS BLUETOOTH® SPEAKER.</u>
6.	Refer to <u>GLOBAL POSITIONING SYSTEM (GPS) AND SATELLITE DIGITAL AUDIO RADIO SERVICE (SDARS) ANTENNA.</u>
7.	Refer to <u>REAR VIEW CAMERA (RVC)</u> without Front View Camera (FVC).
8.	Refer to <u>REMOTE RADIO SWITCHES.</u>
9.	Refer to <u>MEDIA HUB.</u>
10.	Refer to <u>AMPLIFIER.</u>
11.	Refer to <u>BODY CONTROL MODULE (BCM).</u>

There are three radios, available in this vehicle, each equipped with a touchscreen display. There are four UconnectB® packages available; UconnectB® 3 with 5 inch display, UconnectB® 4 with 7 inch display, UconnectB® 4 NAV with 8.4 inch display, and UconnectB® 4C NAV with 8.4 inch display. Each radio has a distinct chassis design and is identified by a sales code.

With the optional navigation system, the operator has the option of choosing a street address, point of interest, trip itinerary and other features outlined in the operator's manual.

The audio system receives fused battery voltage from a fuse in the Power Distribution Center (PDC) at all times.

OPERATION

NOTE: The Security Gateway Module (SGW) is the Controller Area Network (CAN) gateway between the radio, telematics modules, Data Link Connector (DLC)

and the other vehicle CAN modules. An SGW failure could prevent the radio from powering up, telematics module from communicating or a scan tool from communicating with the vehicle. For additional information on the SGW. Refer to [MODULE, SECURITY GATEWAY \(SGW\), DESCRIPTION AND OPERATION](#) .

The audio system components are designed to provide audio entertainment and information through the reception, tuning and amplification of locally broadcast radio signals in both the Amplitude Modulating (AM) and Frequency Modulating (FM) commercial frequency ranges. If the vehicle is so equipped, the audio system can also receive, amplify or process certain cellular, satellite audio and satellite Global Positioning System (GPS) radio signals. The audio system components operate on battery current received through a fuse in the BCM.

The SGW is in the audio and telematics systems to provide security against certain types of attacks and threats from the scan tool, telematics and entertainment buses, which can put the rest of the vehicle's buses at risk of intrusion. The SGW lies electrically between the vehicle on one side, and the Data Link Connector (DLC), telematics and entertainment systems on the other side. The main function is to gate messages from one bus to another. The SGW monitors the B(+) Feed, switched ignition feed, CAN circuits, software and hardware for any concerns.

The optional navigation radio system receives GPS signals from up to eight satellites to display the position and direction of the vehicle. Map information is supplied through a DVD-ROM. An electronic gyro-sensor and the speed sensor in the vehicle enable the system to display the present vehicle position even in locations where GPS signals may be blocked. When a destination is selected, the navigation system uses information from the map to quickly calculate a route. As the vehicle is driven along the chosen route, the operator is guided with pictorial displays and voice prompts.

AMPLIFIER

Refer to [COMPONENT INDEX](#).

The audio power amplifier receives fused B(+) current from a fuse in the Power Distribution Center (PDC) and is grounded through a circuit of the body wire harness that is secured to the body sheet metal at all times. The internal circuitry of the amplifier switches the amplifier ON or OFF based upon electronic messages that are received over the CAN - Interior High Speed (CAN-IHS) data bus from the BCM whenever the ignition switch status is ON.

The amplifier receives analog sound signal inputs from the front and rear, left and right outputs of the radio, then provides the amplified speaker outputs for each of those channels to the appropriate speakers through dedicated audio output circuits. The amplifier also receives electronic messages from the Body Control Module (BCM) and the radio over the CAN-IHS data bus that communicate the correct channel settings for optimum speaker sound and output.

Hardwire Inputs

- Radio audio data
- Information 1 audio data
- Information 2 audio data

Hardwire Outputs

- Subwoofer output data
- Speaker output data

CAN-IHS Inputs

- Ignition switch status
- System voltage
- Vehicle speed

- Audio source, type and level controls
- Audio mode for cabin/driver
- Audio mute status
- Park assist chime type/request/rate and volume
- Blind Spot Module (BSM) chime type/request
- Forward Collision Warning (FCW) chime type/request/rate
- Vehicle configuration and status
- Radio configuration and status
- CAN configuration and status
- Removable hard top ON/OFF status from BCM

CAN-IHS Outputs

- Driver select surround status to radio
- Amplifier stored equalization curve to radio
- Surround sound available for selected cabin mode to radio

ANTENNA MAST, BODY AND CABLE

Refer to [COMPONENT INDEX](#).

The most visible component of the AM/FM radio antenna body and cable is the antenna mast, which is located on the right front fender. The antenna body and cable are secured to the inside of the fender by a nut through a prefabricated and dedicated mounting hole in the fender. The primary coaxial antenna cable is then routed to the interior of the vehicle to the right cowl side inner panel. The primary coaxial cable is connected to a secondary instrument panel antenna coaxial cable with an in-line connector that is located behind the right end of the instrument panel. The secondary coaxial cable is then routed behind the instrument panel to the back of the radio.

The factory-installed radio mast antenna consists of the following components:

- **Antenna body** - This is the mating structure between the antenna mast and the primary antenna coaxial cable. A threaded fitting on the top of the antenna body accepts the antenna mast, while a threaded fitting on the side of the antenna body is used to secure the antenna body to the right fender.
- **Antenna cable** - This vehicle uses a two-piece antenna coaxial cable. The primary antenna cable is connected to the antenna body and the secondary antenna cable connects the primary cable to the radio.
- **Antenna Mast** - The antenna mast is used to capture radio frequency signals that are broadcast by local commercial radio stations in both the Amplitude Modulating (AM) and Frequency Modulating (FM) frequency ranges. These electromagnetic radio frequency signals induce small electrical modulations into the antenna as they move past the mast. The antenna mast transfers the weak electromagnetic radio waves induced into it to the antenna body and cable.

The radio antenna body and cable connects the antenna mast to the radio. The radio antenna is an electromagnetic circuit component used to capture radio frequency signals that are broadcast by local commercial radio stations in both the Amplitude Modulating (AM) and Frequency Modulating (FM) frequency ranges. These electromagnetic radio frequency signals induce small electrical modulations into the antenna as they move past the mast.

The antenna body transfers the weak electromagnetic radio waves induced into the rigid antenna mast into the center conductor of the flexible primary antenna coaxial cable. The braided outer shield of the antenna coaxial cable is grounded through both the antenna body and the radio chassis, effectively shielding the radio waves as they are conducted to the radio. The radio then tunes and amplifies the weak radio signals into stronger electrical signals in order to operate the audio system speakers.

The radio antenna body and cable may be diagnosed using conventional diagnostic tools and procedures.

The components of the radio mast antenna cannot be adjusted or repaired. All factory-installed radios automatically compensate for radio antenna trim. Therefore, no antenna trimmer adjustment is required or possible after replacing the antenna mast, body and cable or the radio. If an antenna mast, body and cable component is damaged or ineffective, it must be replaced.

BODY CONTROL MODULE (BCM)

Refer to [COMPONENT INDEX](#).

On vehicles that are equipped with the optional remote radio switches, the BCM receives the Local Interface Network (LIN) input as a digital serial signal from the Steering Column Control Module (SCCM). The remote radio switches on the steering wheel use various analog voltages to represent different states that are then from the left remote radio switch by LIN to the SCCM. The programming in the BCM allows it to process those inputs and send the appropriate electronic command messages to the radio receiver over the CAN-IHS data bus to control the radio volume up or down, station seek up or down, preset station advance, and mode advance functions.

CAN-IHS Outputs

- Ignition switch status
- System voltage
- Removable hard top ON/OFF status
- Remote radio switch requests

DIGITAL AUDIO BROADCAST ANTENNA AND MODULE

Refer to [COMPONENT INDEX](#).

Digital audio broadcast antenna is a digital radio standard for broadcasting digital audio radio services, used in many countries around the world, though not in North American countries. The antenna for digital audio broadcast signals is screened on the windshield and connects to the digital audio broadcast antenna module, which amplifies the digital audio broadcast antenna signals for the radio.

A digital audio broadcast antenna module and antenna are used in the countries that use it in place of an AM/FM antenna to receive digital audio broadcast signals.

The digital audio broadcast antenna module is powered by a 9 volt output from the radio through the coaxial cable whenever the radio receiver is active. The module receives digital audio broadcast Radio Frequency (RF) signals supplied by the on-glass digital audio broadcast antenna grid elements screened to the inside of the windshield glass. The capacitor selectively filters Radio Frequency Interference (RFI) from the received signals, while the module amplifies the received signals. The filtered and amplified signal is then sent through the coaxial cable to the radio digital audio broadcast antenna input.

The hardwired inputs and outputs to the antenna module may be diagnosed using conventional diagnostic tools and procedures. However, the module is diagnosed by substituting a known good external antenna to compare reception performance.

GLOBAL POSITIONING SYSTEM (GPS) AND SATELLITE DIGITAL AUDIO RADIO SERVICE (SDARS) ANTENNA

Refer to [COMPONENT INDEX](#).

If the vehicle is equipped with satellite audio, a combined antenna for satellite and navigation is used.

The audio system components are designed to provide audio entertainment and information through the reception, tuning and amplification of locally broadcast radio signal frequencies received. The system is also capable of receiving SDARS commercial frequency ranges by subscription.

MEDIA HUB

Refer to [COMPONENT INDEX](#).

A media hub allows the audio content of various media devices to be connected to the radio. Once connected, the audio content of the media device may be accessed and played through the audio system components of the vehicle using the radio controls.

The media hub monitors its circuits for excessive temperature and current conditions and will disable the media hub when a fault exists. The media hub will set a Diagnostic Trouble Code (DTC) in the radio when conditions exist for that DTC.

The media hub Universal Serial Bus (USB) ports provide 5 volts at 2.5 amps to charge the media device battery and for up to 60 minutes after the ignition switch is turned OFF. The hub will illuminate whenever a connected device is disconnected, indicating that the port(s) are active and ready to charge a device and incorporates the Apple Carplay and Google Android Auto features for the audio system.

NOTE: For diagnosis and testing of the media hub and USB ports, refer to the **MULTI-MEDIA TEST** in Refer to **MULTI-MEDIA TEST**.

RADIO

Refer to **COMPONENT INDEX**.

The radio becomes operational when it receives a wake up signal over the CAN-IHS data bus indicating the status of the ignition switch is ON or Accessory. For additional information on the operation of the radio or media system in the vehicle, see the heading for the appropriate audio system option in the User Guide or the Owner Manual. See the UconnectB® web site (<https://www.driveuconnect.com/>) for more information, or refer to the **For Owners** link on the vehicle brand web site for copies of those publications.

The Power Distribution Center (PDC) supplies fused B(+) to the radio.

The radio uses a fender mounted antenna for AM/FM signal reception and, depending upon vehicle optional equipment, a roof mounted combination antenna that can receive GPS and satellite radio signals.

Depending upon the audio system options, the radio can play audio from many different media sources. The media can be played by connecting the source to the audio system via a 3.5 millimeter auxiliary (AUX) port, a USB port or through wireless BluetoothB® audio streaming. Refer to the UconnectB® web site (<https://www.driveuconnect.com/>) for compatibility information.

NOTE: USB devices (for example, camera memory USB adaptors, USB drives and others, excluding Apple products) must comply with the Mass Storage Device (MSD) standard. This remote USB port can provide power to the inserted device.

Hardwire Inputs

- Integrated Center Stack (ICS) controls
- Steering wheel switch controls

Hardwire Outputs

- Radio audio data to amp
- Information 1 audio data to amp
- Information 2 audio data to amp

CAN-IHS Inputs

- Ignition switch status
- System voltage
- Vehicle speed
- Driver select surround status from amp

- Amplifier stored equalization curve from amp
- Surround sound available for selected cabin mode from amp
- Park assist chime type/request and volume
- BSM chime type/request
- FCW chime type/request/rate
- Removable hard top ON/OFF status from BCM
- Vehicle configuration and status
- Radio configuration and status
- CAN configuration and status

CAN-IHS Outputs

- Audio source, type and level controls
- Audio mode for cabin/driver
- Audio mute status

For additional information on the radio. Refer to [RADIO, DESCRIPTION AND OPERATION](#) .

REAR VIEW CAMERA (RVC)

Refer to [COMPONENT INDEX](#).

On models that are not equipped with a FVC, the RVC is powered by a ignition feed received through the backup lamp switch output circuit from the BCM so that is only active when the gear selector lever is shifted into the Reverse (**R**) position. The RVC has a path to ground at all times through a take out and eyelet terminal of the body wire harness secured to the body sheet metal. If the camera delay feature is enabled, the RVC will remain active for 10 seconds, up to about 13 km/h (8 mph) or until the touchscreen display is pressed after the gear selector is shifted from (**R**) to Neutral (**N**) or Drive (**D**).

The output of the camera is a digital video signal. The digital video signal is delivered to the radio video display unit through the entire length of the vehicle by camera signal and the camera return circuits that are arranged as a twisted pair, with an additional grounded foil jacket to protect the video signal from corruption due to stray radiated signals within the vehicle environment. The ground shield is terminated only at the video display (radio) end, not at the camera. Portions of these video signal wires are contained within the body wire harness and a jumper harness located between the radio and the body harness connector below the instrument panel at the right cowl side inner panel.

Refer to [COMPONENT INDEX](#).

REMOTE RADIO SWITCHES

Refer to [COMPONENT INDEX](#).

The six switches in the two remote radio switch units are normally open, resistor multiplexed momentary switches using various analog voltages to represent different states that are hardwired to the left steering wheel switch through the steering wheel wire harness and then switch position messages are sent via a LIN data bus to the Steering Column Control Module (SCCM). Once received, these messages are sent from the SCCM to the BCM via a LIN data bus. After the BCM receives the remote radio switch inputs, it then sends the appropriate electronic messages to the Instrument Panel Cluster (IPC) and radio over the CAN-IHS data bus to invoke the requested command.

SPEAKERS

Refer to [COMPONENT INDEX](#).

Two wires connected to each of the eight speakers and six wires in a single wire harness connector to the subwoofer (if equipped), one feed circuit (+) and one return circuit (-), allow the audio output signal electrical current from the amplifier information of the radio or directly from the amplifier (if equipped) to flow through

each speaker voice coil. When equipped with the optional Alpine Premium audio system, a subwoofer is also included.

NOTE: The subwoofer is located behind the rear center seat, secured to the subwoofer housing.

WIRELESS BLUETOOTHB® SPEAKER

Refer to [COMPONENT INDEX](#).

The wireless BluetoothB® speaker is a portable speaker that is capable of connecting with any BluetoothB® compliant device via BluetoothB® 4.0 or earlier protocol versions. The buttons on the top of the speaker turn the speaker ON/OFF, turn the volume UP/DOWN and are used to connect the speaker with a BluetoothB® device. Consult the Owner Information on the use of this device.

The speaker is charged by and stored in the docking station, and when connected with the docking station, it receives an audio signal from the amplifier which allows it to enhance the subwoofer capabilities of the premium sound system.

The USB port on the back of the speaker can be used for charging a device that is connected to the port. However, the port has no communication capability for media on the charging device.

The speaker is powered and charged when the ignition switch is in the RUN or Accessory position. Ground it provided at all times by a eyelet connect to the right C-pillar, near the seat cushion.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AUDIO

Any diagnosis of the Audio system should begin with duplicating the customer concern (verify the problem), include checking for applicable Technical Service Bulletins (TSB), Star Online Publications, software updates and the use of a diagnostic scan tool. Check for any Diagnostic Trouble Code (DTC) data. If a DTC is found, refer to - Radio and perform the appropriate diagnostic procedure before proceeding in this information. Refer to the appropriate wiring information.

Refer to the appropriate wiring information.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbags, airbag curtains, knee blocker, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect the Intelligent Battery Sensor (IBS)/negative battery cable assembly from the negative battery post, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

AUDIO SYSTEM DIAGNOSTIC TABLE

CONDITION	POSSIBLE CAUSES	CORRECTION
RADIO INOPERATIVE	1. Fuse inoperative	Check radio fuse. Check and repair cause of the inoperative fuse, then replace fuse as required.
	2. Open wiring	Check "No Response from ECU". Refer to NO RESPONSE FROM ECU .
	3. Security Gateway Module (SGW) inoperative	Check "Scan Tool Will Not Communicate With Vehicle". Refer to SCAN TOOL WILL NOT COMMUNICATE WITH VEHICLE .

CONDITION	POSSIBLE CAUSES	CORRECTION
NO AUDIO - BUT RADIO LIGHTS UP	1. Antenna problem 2. Radio or Amplifier (if equipped) connector damaged 3. Wiring damaged 4. Radio or Amplifier (if equipped) ground damaged 5. Amplifier (if equipped) inoperative 6. Speakers inoperative	Perform the "Poor or No AM/FM Audio Reception" test. Refer to POOR OR NO AM/FM AUDIO RECEPTION . Check for loose or corroded radio/amplifier connector. Repair as required. Check for shorted or open wires. Repair wiring as required. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground as required. Refer to AMPLIFIER (AMP) - DIAGNOSTIC CODE INDEX . Refer to AUDIO (RADIO) - DIAGNOSTIC CODE INDEX .
NO RADIO DISPLAY	1. Fuse inoperative 2. Radio connector damaged 3. Wiring damaged 4. Radio ground circuit damaged 5. Radio inoperative	Check radio fuse. Check and repair cause of the inoperative fuse, then replace fuse as required. Check for loose or corroded radio connector. Repair as required. Check for battery voltage at radio connector. Repair wiring as required. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground as required. Check "No Response from ECU". Refer to NO RESPONSE FROM ECU .
POOR AM/FM RADIO RECEPTION	1. Antenna inoperative 2. Radio ground damaged 3. Radio inoperative	Perform the "Poor or No AM/FM Audio Reception" test. Refer to POOR OR NO AM/FM AUDIO RECEPTION . Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground as required. Refer to NO RESPONSE FROM ECU or check "No Response from ECU". Refer to DIAGNOSIS AND TESTING .
POOR SATELLITE DIGITAL AUDIO RADIO SERVICE (SDARS) AUDIO RECEPTION	1. SDARS antenna inoperative	Perform the "Poor or No Satellite Audio Reception" test. Refer to NO RESPONSE FROM ECU
SOUND DISTORTION (VIBRATION FROM SPEAKER AREA, BUZZING - HUMMING)	1. Door trim panel loose or missing fasteners 2. Water shield loose or misaligned 3. Items placed in door trim panel map pockets vibrating or moving from side to side	Inspect door trim panel and correct as necessary. Replace any missing fasteners. Inspect watershield and adjust as required. Remove items from door trim panel. Make certain that vibration is no longer present.

ANTENNA, SATELLITE, AUDIO

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SATELLITE ANTENNA

For information on diagnosing the Satellite Digital Audio Radio Services (SDARS) antenna, use the **POOR OR NO SATELLITE AUDIO RECEPTION** test. Refer to [POOR OR NO AM/FM AUDIO RECEPTION](#) .

For information on diagnosing the Global Positioning System (GPS) satellite navigation system, use the **POOR OR NO GPS RECEPTION** test. Refer to [POOR OR NO GPS RECEPTION](#) .

For information on diagnosing the satellite antenna cables using the (special tool #9977-6, Kit, Radio Antenna Diagnostic), and perform the. Refer to [POOR OR NO SATELLITE AUDIO RECEPTION](#) .**POOR OR NO SATELLITE AUDIO RECEPTION** test.

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Disconnect and isolate the negative battery cable(s) Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) .
2. Remove the sport bar speaker pod assembly Refer to [BAR, SPORT, SPEAKER POD, REMOVAL AND INSTALLATION](#) .

3. Disconnect the wire harness connector (1).

4. Remove the antenna mounting retainer (1).

5. From inside the vehicle, using a flat bladed tool, press one of the two plastic retaining tabs on the antenna stud. Push up on one side of the antenna stud, press the other plastic retaining tab and remove the antenna from the sport bar.

INSTALLATION

NOTE: A new silver clip (with four legs) must be used if the same antenna is being re-installed.

1. Insert the wire harness through the hole in sport bar. Press the antenna into position until both retainers on the antenna stud and the locator stud engage into position in the sport bar.
2. Install the antenna mounting fastener and tighten securely.
3. Connect the antenna connector.
4. Install the sport bar speaker pod assembly Refer to [BAR, SPORT, SPEAKER POD, REMOVAL AND INSTALLATION](#) .

5. Connect the negative battery cable(s) Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) .

BODY AND CABLE, ANTENNA

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ANTENNA BODY AND CABLE

The following four tests are used to diagnose the antenna with an ohmmeter:

- **TEST 1** - Mast to ground test
- **TEST 2** - Tip-of-mast to tip-of-conductor test
- **TEST 3** - Body ground to battery ground test
- **TEST 4** - Body ground to antenna coaxial cable shield test.

WARNING:

To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbags, airbag curtains, knee blocker, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect the Intelligent Battery Sensor (IBS)/negative battery cable assembly from the negative battery post, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The ohmmeter test lead connections for each test are shown in the illustration.

NOTE:

This vehicle has a two-piece radio antenna coaxial cable. Tests 2 and 4 must be conducted in two steps to isolate an antenna cable problem. First, test the primary antenna cable (located between the antenna body and the secondary cable) from the coaxial cable connector under the right end of the instrument panel near the right cowl side inner panel to the antenna body. Then, test the secondary antenna cable (instrument panel antenna cable) from the coaxial cable connector under the right end of the instrument panel near the right cowl side inner panel to the coaxial cable connector at the radio.

TEST 1

- Test 1 determines if the antenna mast is insulated from ground. Proceed as follows:

1. Disconnect and isolate the antenna coaxial cable connector under the right end of the instrument panel near the right cowl side inner panel.
2. Touch one ohmmeter test lead to the tip of the antenna mast. Touch the other test lead to the antenna body. Check the ohmmeter reading for continuity.
3. There should be no continuity. If OK, go to **Test 2** . If not OK, replace the shorted antenna body and cable.

TEST 2

- Test 2 checks the antenna conductor components for an open circuit. This test should be performed first on the entire antenna circuit, from the antenna mast to the center conductor of the coaxial cable connector at the radio. If an open circuit is detected, each of the three antenna conductor components (antenna mast, antenna body and primary cable unit, instrument panel antenna secondary cable) should be isolated and tested individually to locate the exact component that is the source of the open circuit. To begin this test, proceed as follows:

1. Disconnect the instrument panel (secondary) antenna cable coaxial connector from the back of the radio.
2. Touch one ohmmeter test lead to the tip of the antenna mast. Touch the other test lead to the center conductor pin of the instrument panel antenna cable coaxial connector for the radio. Check the ohmmeter reading for continuity.
3. There should be continuity. The ohmmeter should register only a fraction of an ohm resistance. High or infinite resistance indicates a damaged or open antenna conductor. If OK, go to **Test 3** . If not OK, isolate and test each of the individual antenna conductor components. Replace only the ineffective antenna conductor component.

TEST 3

- Test 3 checks the condition of the vehicle body ground connection. To begin this test, proceed as follows:

1. This test must be performed with the battery positive cable disconnected from the battery. Disconnect and isolate both battery cables, negative cable first.

2. Reconnect the battery negative cable.
3. Touch one ohmmeter test lead to a good clean ground point on the vehicle right fender panel. Touch the other test lead to the battery negative terminal post. Check the ohmmeter reading for continuity.
4. There should be continuity. The ohmmeter should register less than one ohm resistance. High or infinite resistance indicates a loose, corroded or damaged connection between the battery negative terminal and the vehicle body. If OK, go to **Test 4** . If not OK, check the battery negative cable connection to the vehicle body and the radio noise suppression ground strap connections to the engine and the vehicle body for being loose or corroded. Clean or tighten these connections as required.

TEST 4

- Test 4 checks the condition of the connection between the antenna coaxial cable shield and the vehicle body ground as follows:

1. Disconnect and isolate the antenna coaxial cable connector under the right end of the instrument panel near the right cowl side inner panel.
2. Touch one ohmmeter test lead to a good clean ground point on the vehicle right fender panel. Touch the other test lead to the outer crimp on the antenna coaxial cable connector under the right end of the instrument panel near the right cowl side inner panel. Check the ohmmeter reading for continuity.
3. There should be continuity. The ohmmeter should register less than one ohm resistance. High or infinite resistance indicates a loose, corroded or damaged connection between the antenna body and the vehicle body or between the antenna body and the antenna coaxial cable shield. If not OK, clean the antenna body to right fender panel mating surfaces and tighten the antenna mounting nut to specifications.
4. Check the resistance again with an ohmmeter. If the resistance is still more than one ohm, replace the ineffective antenna body and cable.

For additional diagnosis of an AM/FM reception issue, perform the **POOR OR NO AM/FM AUDIO RECEPTION** test. Refer to [POOR OR NO AM/FM AUDIO RECEPTION](#) .

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

WARNING:

To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbags, airbag curtains, knee blocker, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect the Intelligent Battery Sensor (IBS)/negative battery cable assembly from the negative battery post, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Disconnect and isolate the negative battery cable(s). Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) .
2. Remove the glove box from the instrument panel. Refer to [GLOVE BOX, INSTRUMENT PANEL, REMOVAL AND INSTALLATION](#) .

3. Reach through the instrument panel glove box opening to unplug the antenna coaxial cable connector (1).

4. Unscrew the antenna mast from the antenna body base (1) on the right outer cowl side panel.

5. Using a trim stick C-4755 or equivalent, gently pry the edge of the antenna base trim cover (1) to unsnap it from the antenna body base.

6. Remove the fasteners (1) that secure the antenna body base to the right outer cowl side panel.

7. From inside the passenger compartment, push the coaxial cable grommet on the antenna body half of the coaxial cable out through the hole in the right inner cowl side panel.
8. From the outside of the vehicle, pull the antenna body base and cable assembly out through the hole in the right outer cowl side panel.

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbags, airbag curtains, knee blocker, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect the Intelligent Battery Sensor (IBS)/negative battery cable assembly from the negative battery post, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. From outside the vehicle, feed the antenna cable and base assembly through the outer cowl side panel and into the inner cowl side panel hole.
2. From inside the passenger compartment, pull the cable and grommet into the hole in the inside cowl side panel until the grommet is fully seated.
3. Install the fasteners retaining the antenna body base to right outer cowl side panel. Tighten the fasteners to the proper specifications. Refer to [TORQUE SPECIFICATIONS](#).
4. Snap on the antenna base trim cover to the antenna body base.
5. Install antenna mast. Tighten securely.

NOTE: Make certain that the antenna mast is fully seated on antenna base and that there is no gap between the mast and base.

6. Reach through the glove box opening and connect the antenna coaxial cable inline connector.
7. Install the glove box to the instrument panel. Refer to [GLOVE BOX, INSTRUMENT PANEL, REMOVAL AND INSTALLATION](#).
8. Connect the negative battery cable(s). Refer to [CABLES, BATTERY](#), or [CABLES, BATTERY](#).

CAMERA, REAR

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - REAR CAMERA

The hardwired circuits of the Rear View Camera (RVC) and those between the RVC and the radio may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds. For proper wire repair, and connector repair procedures. Refer to [STANDARD PROCEDURE](#) . Refer to [REMOVAL](#) , and Refer to [INSTALLATION](#) .

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RVC or the radio. The most reliable, efficient and accurate means to diagnose the electronic controls and communication related to radio operation, as well as the retrieval or erasure of a Diagnostic Trouble Code (DTC) requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbags, airbag curtains, knee blocker, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect the Intelligent Battery Sensor (IBS)/negative battery cable assembly from the negative battery post, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Be certain to confirm the following prior to attempting any additional diagnosis or testing of the RVC. Use a diagnostic scan tool to confirm the rear view camera is setup in the vehicle configuration.

NOTE: Be certain the radio has been configured with the latest software. Many radio issues can be resolved by updating the radio to the latest software.

NOTE: For additional information on diagnosing issues with the RVC, see "DIAGNOSIS AND TESTING REAR CAMERA INOPERATIVE WITH RADIO DISPLAY" test. Refer to [DIAGNOSIS AND TESTING REAR CAMERA INOPERATIVE WITH RADIO DISPLAY](#) .

NOTE: Prior to starting rear view camera diagnostics, the following step must be performed: With the scan tool, perform the Reset ECU function for the Radio under the Guided Diagnostics menu in the scan tool.

NOTE: When utilizing RG-174 Coax Cable Adapter 9977-6-8 OR a known good camera, the following step must be adhered to prior to checking camera functionality: With the scan tool, perform the Reset ECU function for the Radio under the Guided Diagnostics menu in the scan tool.

REAR VIEW CAMERA DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
VIDEO IMAGE IS BLURRY OR OBSTRUCTIVE	1. Dirt, smear, fingerprints on RVC lens.	1. Inspect lens for foreign material, and clean lens as required, using the lens cleaning procedure.
	2. Ineffective camera shield circuit in the Low Voltage Differential	7. Inspect the LVDS coaxial cable for damage to the terminals. Check RVC coaxial connection

REAR VIEW CAMERA DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
	Signal (LVDS) coaxial cable connection at the Radio or RVC	using . Replace as necessary. For additional diagnosis of the RVC, refer to the "Diagnosis And Testing Camera Inoperative With Display Screen" test. Refer to the appropriate information.
	3. Moisture buildup on the inside of the lens	3. Replace the ineffective camera as required.
NO VIDEO DISPLAY IN RADIO AND DOES NOT DISPLAY ANY MESSAGE	1. Incorrect radio software	1. Check to be certain that the radio has the latest software update installed. Install the radio software update, if required.
	2. Ineffective radio inputs or outputs	2. Use a diagnostic scan tool to test the radio inputs and outputs including those received over the Controller Area Network (CAN) data bus. Refer to the appropriate diagnostic information.
	3. Ineffective radio	3. Use a diagnostic scan tool to test the radio. Refer to the appropriate diagnostic information.
	4. Ineffective radio fuse	4. Test and replace the radio fuses, if required.
	5. Ineffective radio ground circuit	5. Check for loose or damaged wiring connections at the radio. Test and repair the open radio ground circuit, if required.
	6. Ineffective radio feed circuit	6. Check for loose or damaged wiring connections at the radio. Test and repair the open radio feed circuit, if required.
	7. Ineffective LVDS coaxial connection at RVC or LVDS cable	7. Check the LVDS coaxial cable center terminal for 10 volts (VP2R radios) or 12 volts (VP4R radios). Check RVC LVDS coaxial connection using . Replace as necessary. For additional diagnosis of the RVC, refer to the "Diagnosis And Testing Camera Inoperative With Display Screen" test. Refer to the appropriate information.
CAMERA IMAGE BUT NO GRIDLINES	1. Setting disabled in Radio	1. Check setting in radio to ensure active guideline is enabled.
	2. Incorrect radio software	2. Check to be certain that the radio has the latest software update installed. Install the radio software update, if required.
	3. Ineffective Radio	3. Use a diagnostic scan tool to test the radio. Refer to the appropriate diagnostic information.

REAR VIEW CAMERA DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
	4. Incorrect Body Control Module (BCM) software	4. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
	5. Ineffective camera LVDS circuit	5. Check for loose or damaged wiring connections between the camera and the radio. Refer to the appropriate diagnostic information. Replace the section of harness that is damaged, if required.
NO CAMERA IMAGE IN RADIO VIDEO DISPLAY AND NO BACKUP LAMPS IN REVERSE	6. Ineffective camera	6. Replace camera.
	1. Backup lamps inoperative. 2. Both backup lamps inoperative. 3. Ineffective BCM inputs or outputs.	1. Test and repair the open backup lamp switch output circuit between the right and left tail lamps if required. 2. Test and repair the open backup lamp switch output circuit between the Body Control Module (BCM) and the tail lamps, if required. 3. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
NO CAMERA IMAGE IN RADIO VIDEO DISPLAY - DOES DISPLAY CHECK ENTIRE SURROUNDINGS MESSAGE BRIEFLY AFTER SHIFTING INTO REVERSE AND BACKUP LAMPS DO OPERATE	1. Ineffective camera LVDS coaxial circuit or shield circuit 6. Ineffective camera.	1. Check the LVDS coaxial cable center terminal for 10 volts (VP2R radios) or 12 volts (VP4R radios). Check for loose or damaged wiring connections between the camera and the radio. Refer to the appropriate diagnostic information. Replace the LVDS cable, if required. 6. Replace the ineffective camera, if required.

CLEANING

NOTE: The use of nylon gloves will prevent oil and debris on your hands from being transferred to the camera body or lens surface. While wearing the gloves, care should be taken not to contact exposed body parts such as the forehead, nose and arms. If contact is made accidentally, gloves should be changed to mitigate the risk of contaminant transfer from the surface of the gloves.

1. Using compressed air, blow diagonally across the camera lens.
2. Use a microfiber lens tissue to gently wipe the lens.
3. Examine the lens to verify the cleaning process. Proceed to **Step 4** if the lens still shows signs of oil or debris.
4. Apply a lens cleaning solution to a section of an unused lens tissue.
5. Slowly wipe in a circular motion around the edges of the lens to remove any dirt or contamination from the periphery of the lens before cleaning the center.
6. Let the lens air dry.

7. Examine the lens to verify the cleaning process.

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) .

2. Remove the four fasteners (1) that secure the rear tailgate lower access panel.
3. Remove the lower access panel (2).

4. Disconnect the wire harness connector (1) from the back of the rear camera (2).

5. Grab handle of the rear camera retaining clip (1) and slide it away from the camera to release.

NOTE: The camera must be secured during the next step to keep camera from falling when released from tailgate.

6. Using a small flat blade screwdriver or equivalent, push up to release lower retainer (1), then slide camera (2) down and out to release top retainer. Remove camera from the front of the tailgate.

INSTALLATION

1. Position the rear view camera into the tailgate, insert top in first then lower. Be sure tabs are fully seated in the tailgate.

2. Install the rear camera retainer (1) under the tabs on the rear camera (2) and slide it towards the camera until it locks into place.

3. Connect the wire harness connector (1) to back of the rear camera (2).

4. Position the lower tailgate access plate (2) on the tailgate and install the four fasteners (1) and tighten securely.

ENCLOSURE, SPEAKER

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

PASSENGER SIDE

1. Disconnect and isolate the negative battery cable(s). Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) .
2. Remove the passenger side instrument panel cover. Refer to [COVER, INSTRUMENT PANEL, REMOVAL AND INSTALLATION](#) .

3. Remove the fasteners (1).

4. Disconnect the wire harness connector and remove the passenger side speaker enclosure (2).

DRIVER SIDE

1. Disconnect and isolate the negative battery cable(s). Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) .
2. Remove the driver side instrument panel cover. Refer to [COVER, INSTRUMENT PANEL, REMOVAL AND INSTALLATION](#) .

3. From the bottom of the driver side of the instrument panel (I/P), remove the fastener (1) that secures the horizontal I/P bracket (2) to the left vertical brace.

4. Remove the fasteners (1) from the power inverter bracket.
5. Remove the lower fastener (3) from the driver side speaker enclosure.
6. Remove the fasteners (2) from the horizontal I/P bracket.

7. Position the horizontal I/P bracket (2) downward to retain enough access for the speaker enclosure removal.
8. Remove the fasteners (1) to release the speaker enclosure (3).
9. Slide speaker enclosure (3) down and then out from the I/P.

10. Disconnect the two Security Gateway Module (SGW) wire harness connectors (1) and the speaker enclosure wire harness connector (2). Remove the left speaker enclosure from the vehicle.

INSTALLATION

DRIVER SIDE

1. If removed, position the SGW to the speaker enclosure, then install the fasteners and tighten them securely.

2. Connect the two SGW wire harness connectors (1) and the speaker enclosure wire harness connector (2).

3. Position the driver side speaker enclosure (3) into the instrument panel.
4. Install the fasteners (1) that retain the driver side speaker enclosure and tighten them securely.
5. Position the horizontal bracket to the instrument panel reinforcement beam.

6. Install the fasteners (2) for the horizontal instrument panel bracket and tighten them securely.
7. Install the lower fastener (3) for the driver side speaker enclosure and tighten it securely.
8. Install the fasteners (1) for the power inverter bracket and tighten them securely.

9. From the bottom of the driver side of the instrument panel, install the fastener (1) that secures the horizontal instrument panel bracket (2) to the left vertical brace and tighten it securely.
10. Install the driver side instrument panel cover. Refer to [COVER, INSTRUMENT PANEL, REMOVAL AND INSTALLATION](#) .
11. Connect the negative battery cable(s). Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) .

PASSENGER SIDE

1. Position the passenger side speaker enclosure to the instrument panel and connect the wire harness connector.
2. Install the fasteners (1) that retain the passenger speaker enclosure (2) and tighten them securely.
3. Install the passenger side instrument panel cover. Refer to [COVER, INSTRUMENT PANEL, REMOVAL AND INSTALLATION](#).
4. Connect the negative battery cable(s). Refer to [CABLES, BATTERY](#), or [CABLES, BATTERY](#).

MEDIA HUB

REMOVAL AND INSTALLATION

FLOOR CONSOLE MEDIA HUB

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to [CABLES, BATTERY](#), or [CABLES, BATTERY](#).
2. Remove the floor console end cap. Refer to [CONSOLE, FLOOR, REMOVAL AND INSTALLATION](#), or [CONSOLE, FLOOR, END CAP, REMOVAL AND INSTALLATION](#).

3. Working inside the center console end cap using a trim tool or equivalent, release the four tabs (1) on the center console media hub (2), then remove.

INSTALLATION

1. Install the floor console media hub (2) into the floor console end cap, be sure retaining clips (1) are fully engaged.
2. Install the floor console end cap. Refer to [CONSOLE, FLOOR, REMOVAL AND INSTALLATION](#) , or [CONSOLE, FLOOR, END CAP, REMOVAL AND INSTALLATION](#) .
3. Connect the negative battery cable(s). Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) .

INSTRUMENT PANEL MEDIA HUB

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) .

2. Remove the Integrated Center Stack (ICS). Refer to [MODULE, INTEGRATED CENTER STACK \(ICSM\), REMOVAL AND INSTALLATION](#) .

3. Remove the fastener (1), then using a trim tool or equivalent, release the trim from the instrument panel.

4. Disconnect the wire harness connector (1) from the media hub.

5. Using a trim tool or equivalent tool, disengage the retaining tabs and remove the media hub (1) from the trim panel.

INSTALLATION

1. Install the media hub to the trim panel and verify the retaining tabs are fully engaged.
2. Install the wire harness connector to the media hub.
3. Install the instrument panel trim to the instrument panel, then install the fastener and tighten securely.
4. Install the ICS. Refer to [MODULE, INTEGRATED CENTER STACK \(ICSM\), REMOVAL AND INSTALLATION](#).
5. Connect the negative battery cable(s). Refer to [CABLES, BATTERY](#), or [CABLES, BATTERY](#).

MODULE, DIGITAL AUDIO BROADCASTING ANTENNA

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

NOTE: The Digital Audio Broadcasting Antenna is service with the windshield. If replacing the antenna, refer to the windshield replacement. Refer to [WINDSHIELD, REMOVAL AND INSTALLATION](#).

Removal

1. Disconnect and isolate the negative battery cable(s). Refer to [CABLES, BATTERY](#), or [CABLES, BATTERY](#).
2. Lower the windshield frame. Refer to [FRAME, WINDSHIELD, REMOVAL AND INSTALLATION](#).

3. Disconnect the wire harness connectors (4).
4. Disconnect the antenna harness (3) from the windshield.
5. Remove the fastener (2) and remove the Digital Audio Broadcasting Antenna Module (1).

Installation

1. Position the Digital Audio Broadcasting Antenna Module (1) to the windshield frame.
2. Install the fastener (2) that retains the Digital Audio Broadcasting Antenna Module and tighten securely.
3. Connect the antenna harness (3) to the windshield.
4. Connect the wire harness connectors (4).
5. Raise and install the upper windshield frame. Refer to [FRAME, WINDSHIELD, REMOVAL AND INSTALLATION](#) .
6. Connect the negative battery cable(s). Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) .

SPEAKER

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SPEAKER

WARNING:

To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbags, airbag curtains, knee blocker, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect the Intelligent Battery Sensor (IBS)/negative battery cable assembly from the negative battery post, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

CAUTION:

The speaker output of the radio is a "floating ground" system. Do not allow any speaker lead to short to ground, as damage to the radio may result.

Any diagnosis of the Audio system should begin with duplicating the customer concern (verify the problem), including checking for applicable Technical Service Bulletins (TSBs), Star Online Publications, and the use of a diagnostic scan tool. Check for any Diagnostic Trouble Code (DTC) data. If a DTC is found, refer to - Radio and perform the appropriate diagnostic procedure before proceeding in this information. Refer to the appropriate wiring information.

Speaker Buzz, Squeak, Rattle (BSR) Diagnosis and Testing

1. Begin by verifying the customer complaint. The exact conditions that caused the issue for the customer must be used. Pay close attention to the following details
 1. Type of input (Frequency Modulation/FM, Amplitude Modulation/AM, Satellite Digital Audio Radio Service/SDARS, Digital Audio Broadcast, Universal Serial Bus/USB, Auxiliary/AUX)
 2. Volume Level
 3. Audio settings, including bass and treble
2. Once the complaint has been reproduced, clear the map pocket and storage bins of all loose items around the speaker in question.
3. Attempt to reproduce the issue in a non-radio mode, such as BluetoothB®, or Auxiliary Input. This will help determine if it is a speaker issue or a reception issue.
4. If the speaker noise is still present, consult the Tech Connect home page / Service Library Dashboard and follow the instructions to download the Audio Test Files for Speaker Diagnosis to a USB drive.
5. Insert the USB drive in the proper input of the vehicle and then set the following radio settings:
 1. Bass at maximum
 2. Mid and treble at neutral
 3. Volume at step 30
6. Play all of the frequencies on the USB drive with the recommended settings. When a frequency reproduces the noise, press the interior panels around the speaker to see if the noise subsides. It may be necessary to replace broken trim clips or use foam tape to correct a speaker noise issue. Refer to the service information for additional details.

Electrical Diagnosis and Testing

The hardwired circuits between components related to the audio system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds. For proper wire repair and connector repair procedures. Refer to [**STANDARD PROCEDURE**](#) . Refer to [**REMOVAL**](#) , and Refer to [**INSTALLATION**](#) .

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the radio, the audio amplifier or the electronic controls and communication between modules and other devices that provide some features of the audio system. The most reliable, efficient and accurate means to diagnose the radio, the audio amplifier or the electronic controls and communication related to audio system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

1. If all speakers are inoperative, inspect all of the radio related fuses. If OK, go to **Step 2** . If not OK, repair the shorted circuit or component as required and replace the ineffective fuse.
2. If equipped with an audio amplifier, check the fuse for the amplifier. If OK, go to **Step 3** . If not OK, repair the shorted circuit or component as required and replace the ineffective fuse.
3. Turn the ignition switch to the ON position. Turn the radio ON. Adjust the balance and fader control to check the performance of each individual speaker. Note the speaker locations that are not performing correctly. Go to **Step 4** .
4. Turn the radio OFF. Turn the ignition switch to the OFF position. Disconnect and isolate the negative battery cable(s). Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) . If the vehicle is **not** equipped with an audio amplifier, remove the radio. If the vehicle is equipped with an amplifier, disconnect the wire harness connector at the output side of the amplifier. Go to **Step 5** .
5. Check both the speaker feed (+) circuit and return (-) circuit cavities for the inoperative speaker at the radio wire harness connector for continuity to ground. There should be no continuity. If OK, go to **Step 6** . If not OK, repair the shorted speaker feed (+) and/or return (-) circuit(s) to the speaker as required.
6. Disconnect the wire harness connector at the inoperative speaker. Check for continuity between the speaker feed (+) circuit cavities of the radio wire harness connector or, if equipped, the audio amplifier wire harness connector and the speaker wire harness connector. Repeat the check between the speaker return (-) circuit cavities of the radio wire harness connector and the speaker wire harness connector. In each case, there should be continuity. If OK, replace the ineffective speaker. If not OK, repair the open speaker feed (+) and/or return (-) circuit(s) as required.

REMOVAL AND INSTALLATION

INSTRUMENT PANEL - DRIVER SIDE

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) .
2. Remove the driver side instrument panel cover. Refer to [COVER, INSTRUMENT PANEL, REMOVAL AND INSTALLATION](#) .

3. Remove the speaker fasteners (1).

4. Disconnect the speaker wire harness connector (1).

INSTALLATION

1. Connect the speaker wire harness connector.
2. Position the speaker to the speaker enclosure and install the speaker fasteners. Tighten the fasteners securely.
3. Install the driver side instrument panel cover. Refer to [COVER, INSTRUMENT PANEL, REMOVAL AND INSTALLATION](#) .
4. Connect the negative battery cable(s). Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) .

INSTRUMENT PANEL - PASSENGER SIDE

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) .
2. Remove the passenger side instrument panel cover. Refer to [COVER, INSTRUMENT PANEL, REMOVAL AND INSTALLATION](#) .

3. Remove the speaker fasteners (1).

4. Disconnect the speaker wire harness connector (1).

INSTALLATION

1. Connect the speaker wire harness connector.
2. Install the speaker fasteners.
3. Install the passenger side instrument panel cover. Refer to [COVER, INSTRUMENT PANEL, REMOVAL AND INSTALLATION](#).
4. Connect the negative battery cable(s). Refer to [CABLES, BATTERY](#), or [CABLES, BATTERY](#).

MID SOUND BAR

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to [CABLES, BATTERY](#), or [CABLES, BATTERY](#).

2. Remove the fasteners (1) securing the speaker grille to the sound bar.

3. Remove the fasteners (1) securing the mid-range speaker to the sound bar.

4. Disconnect the wire harness connector (1).

INSTALLATION

1. Connect the wire harness connector.
2. Install the fasteners securing the mid-range speaker to the sound bar and tighten securely.
3. Install the fasteners securing the speaker grille to the sound bar and tighten securely.
4. Connect the negative battery cable(s). Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) .

SUBWOOFER

REMOVAL

1. Remove the rear cab back trim panel. Refer to [PANEL, CAB BACK TRIM, REMOVAL AND INSTALLATION](#) .

2. Disconnect wire harness connector (1), remove four fasteners (2), and remove subwoofer (3).

INSTALLATION

1. Position subwoofer onto mounting studs, connect wire harness connector, and install four fasteners and tighten securely.
2. Install the rear cab back trim panel. Refer to [PANEL, CAB BACK TRIM, REMOVAL AND INSTALLATION](#) .

TWEETER - INSTRUMENT PANEL

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) .

2. Using trim tool or equivalent, gently remove the tweeter speaker grille (1).

3. Remove the fasteners (1) securing the tweeter speaker to the instrument panel.

4. Disconnect the wire harness connector (1).

INSTALLATION

1. Connect the wire harness connector.
2. Install the fasteners securing the tweeter speaker to the instrument panel and tighten securely.
3. Install the tweeter speaker grille to the instrument panel.
4. Connect the negative battery cable(s). Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) .

TWEETER - SOUND BAR

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) .

2. Remove the fasteners (1) securing the speaker grille to the sound bar.

3. Remove the fasteners (1) securing the tweeter speaker to the sound bar.

4. Disconnect the wire harness connector (1).

INSTALLATION

1. Connect the wire harness connector.
2. Install the fasteners securing the tweeter speaker to the sound bar and tighten securely.
3. Install the fasteners securing the speaker grille to the sound bar and tighten securely.
4. Connect the negative battery cable(s). Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) .

WIRELESS

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) .
2. Lower the back of the upper rear seat.

3. Release the bluetooth wireless speaker (2) from the charging carrier by pulling the release handle (1) and remove the speaker from the vehicle.

4. To remove the wireless speaker charging carrier, remove the two screw covers (1) and the screws (2).

5. Using a trim stick or equivalent, release the wireless speaker charging carrier (1) from the rear cab trim panel.

6. Disconnect the wire harness connector (1) and remove the wireless speaker carrier (2).
7. To remove the charging carrier bracket, remove the rear cab back trim panel. Refer to [PANEL, CAB BACK TRIM, REMOVAL AND INSTALLATION](#) .

8. Remove the three fasteners (1) and remove the charging carrier bracket (2).

INSTALLATION

1. If the wireless speaker charging carrier bracket was not removed, go to **Step 4** .
2. If the wireless speaker charging carrier bracket was removed, position the wireless speaker charging carrier bracket to the mounting studs, then install the three fasteners and tighten securely.
3. Install the rear cab back trim panel. Refer to [PANEL, CAB BACK TRIM, REMOVAL AND INSTALLATION](#) .

4. If the charging carrier was removed, position the charging carrier (2) to the rear cab trim and connect the wire harness connector (1).

5. Insert the wireless speaker charging carrier (1) into the rear cab panel trim by pressing the charging carrier to engage the retainer clips.

6. Install the two screws (2) that secure the charging carrier (3) and tighten securely. Install the screw covers (1).

7. Insert the wireless speaker (2) into the charging carrier and raise the rear seat back.
8. Connect the negative battery cable(s). Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) .

SWITCH, REMOTE RADIO

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - REMOTE RADIO SWITCHES

WARNING: On vehicles equipped with airbags, refer to electrical, restraints before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

Any diagnosis of the Audio system should begin with duplicating the customer concern (verify the problem), including checking for applicable Technical Service Bulletins (TSB), Star Online Publications, and the use of a diagnostic scan tool. Check for any Diagnostic Trouble Code (DTC) data. If a DTC is found, refer to - Radio and perform the appropriate diagnostic procedure before proceeding in this information. Refer to the appropriate wiring information.

1. Remove the remote radio switch(es) from the steering wheel. Refer to [SWITCH, REMOTE RADIO, REMOVAL AND INSTALLATION](#).

2. Use an ohmmeter to check the switch resistances at the switch connector while pressing each button. The resistance values must match those shown in the Remote Radio Switch Test chart.
3. If the switch resistance checks OK, go to **Step 4** . If not OK, replace the faulty switch.

REMOTE RADIO SWITCH TEST				
Switch	Switch Position	Minimum Resistance (kilohms)	Nominal Resistance (kilohms)	Maximum Resistance (kilohms)
Right	Volume Up	4.788	5.32	5.852
Right	Volume Down	8.343	9.27	10.197
Right	Mode Advance	0	0	0.05
Left	Seek Up	1.089	1.21	1.331
Left	Seek Down	2.988	3.32	3.652
Left	Pre-Set Station Advance	0.427	0.475	0.522

4. Check for continuity between the ground circuit cavity of the steering wheel wire harness connectors for the switches and a known good ground. There should be continuity. If OK, go to **Step 5** . If not OK, repair the open ground circuit as required.
5. Disconnect the appropriate wire harness connector from the Body Control Module (BCM). Check for continuity between the radio control circuit cavity of the steering wire harness connectors for the switches and ground. There should be no continuity. If OK, go to **Step 6** . If not OK, repair the shorted radio control circuit as required.
6. Check for continuity between the radio control circuit cavities of the steering wheel wire harness connectors for the switches and the BCM wire harness connector. There should be continuity. If OK, use a diagnostic scan tool and the appropriate diagnostic procedures to test the BCM, the radio and the Controller Area Network (CAN) data bus. If not OK, repair the open radio control circuit as required.

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

WARNING:

To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbags, airbag curtains, knee blocker, seat belt tensioner, impact sensor or instrument panel component diagnosis or service.

Disconnect the Intelligent Battery Sensor (IBS)/negative battery cable assembly from the negative battery post, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Disconnect and isolate the negative battery cable(s). Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) .

2. Working from the back of the steering wheel, unsnap and remove the remote radio switch cover (1) from the remote radio switch.

3. Remove the fastener (1) that secures the remote radio switch to the steering wheel spoke armature.
4. Carefully pull the remote radio switch away from the steering wheel spoke armature.

5. Carefully disconnect the remote radio switch connector (1) from the remote radio switch.

INSTALLATION

WARNING:

To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbags, airbag curtains, knee blocker, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect the Intelligent Battery Sensor (IBS)/negative battery cable assembly from the negative battery post, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Working from the back of the steering wheel, connect the remote radio switch connector to the remote radio switch.
 2. Position and carefully install the remote radio switch and wire harness to the steering wheel spoke armature.
 3. Install and securely tighten the fastener for the remote radio switch to the steering wheel.
 4. Install the remote radio switch cover. Be certain that the cover is snapped securely into place.
 5. Connect the negative battery cable(s). Refer to [CABLES, BATTERY](#) , or [CABLES, BATTERY](#) .
-

2021 ACCESSORIES AND BODY, CAB

Body - Interior & Exterior (1 Of 2) - Gladiator

WARNING

USE OF HEAT DURING REPAIR

Be certain to follow guidance and instructions as found in the Use of Heat While Repairing Damaged Structural And Non-Structural Components as found in Service Bulletins/31-Collision Bulletins and Collision Information/Position Statements.

WARNING: Failure to follow these instructions may result in possible serious or fatal injury.

WARNINGS

WARNING: Use an Occupational Safety and Health Administration (OSHA) approved breathing filter, when spraying paint or solvents in a confined area. Failure to follow these instructions may result in possible serious or fatal injury.

- Avoid prolonged skin contact with petroleum or alcohol based cleaning solvents.
- Do not stand under a hoisted vehicle that is not properly supported on safety stands. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: On vehicles equipped with the high voltage system, disconnecting the 12-volt battery negative cable alone will not power down the 12-volt system. You must perform the 12-volt Power Down procedure before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

CAUTION: When holes are drilled or punched in an inner body panel, verify the depth of space to the outer body panel, electrical wiring or other components. Damage to the vehicle can result.

- Do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.
- Always have a fire extinguisher ready for use when welding.
- Disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is off. Damage to electrical system can result.
- Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.
- Do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.
- Do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.

WARNING: There are necessary safety factors to follow when working with components made of magnesium and components made of a combination of materials utilizing magnesium that must be followed.

- Do not grind on the component. The grinding residue is highly combustible.
- In the event of a fire, a D-class rated fire extinguisher is necessary to extinguish.
- Do not expose the component to open flame or temperature in excess of 260B° C. (500B° F).

Failure to follow these instructions may cause serious injury or death.

NOTE:

Due to the usage of magnesium, do not attempt to repair the swing gate inner panel on this vehicle. For further information refer to the Collision Information Swing Gate Inner Panel DO NOT REPAIR (Refer to the appropriate service information).

RESTRAINT WARNINGS

WARNING:

To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the MoparB® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING:

To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS for which there is no MoparB® wiring repair kit. It is important to use ONLY the recommended splicing kit and procedure. For applicable and available MoparB® wiring repair kits, please visit the MoparB® Connection Repair Kit Web Site. Inappropriate repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.

WARNING:

To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING:

To avoid potential physical injury or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the Occupant

Restraint Controller (ORC) capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 12 inches (30 centimeters) of an electronic module or wiring harness, then that module or harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens.

WARNING: To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate or bring into contact with electricity. Do not store at temperatures exceeding 93B° C (200B° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi). Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury when handling a seat belt tensioner retractor. Exercise proper care to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the MoparB® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.

WARNING: To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Anytime a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the MoparB® Parts Catalog.

WARNING: To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down. Failure to follow these instructions may result in possible serious or fatal injury.

DIAGNOSIS AND TESTING

WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or

latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

WATER LEAK TESTS

WARNING: Do not use electric shop lights or tools in water test area. Personal injury can result.

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.
- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.
- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations. Refer to

HOISTING, STANDARD PROCEDURE.

WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to make sure adequate voltage is supplied to the blower. With interior

pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

Water Leak Tech Tips and Repair Videos	1. Refer to A-PILLAR WATER LEAKS DIAGNOSIS AND TESTING VIDEO. 2. Refer to A-PILLAR AND COWL WATER LEAK REPAIR TIPS VIDEO. 3. Refer to B-PILLAR AND COWL WATER LEAK REPAIR TIPS VIDEO. 4. Refer to B-PILLAR AND COWL WATER LEAK REPAIR TIPS VIDEO.	
LOCATION	POSSIBLE CAUSES	CORRECTIONS
Water is on the A-pillar or side of the instrument panel	1. Freedom Panels 2. Header Seal 3. Doors 4. Windshield Frame	1. Refer to FREEDOM PANELS CORRECTIONS. 2. Refer to HEADER SEAL CORRECTIONS. 3. Refer to DOOR CORRECTIONS. 4. Refer to WINDSHIELD FRAME CORRECTIONS.
Water is on the front door trim panel of lower sill trim	1. Doors 2. Freedom Panels	1. Refer to DOOR CORRECTIONS. 2. Refer to FREEDOM PANELS CORRECTIONS.
Water is on the cowl side, floor board, or on the side of the instrument panel	1. Cowl Seal 2. Cowl Grille/Plenum 3. Cowl/Dash Body Side	1. Refer to COWL SEAL CORRECTIONS. 2. Refer to COWL GRILLE/PLENUM CORRECTIONS. 3. Refer to COWL/DASH BODY SIDE CORRECTIONS.
Water is on the center of the instrument panel or center of speaker bar	1. Freedom Panels 2. Hard Top Seal 3. Windshield Frame	1. Refer to FREEDOM PANELS CORRECTIONS. 2. Refer to HARD TOP SEAL CORRECTIONS. 3. Refer to WINDSHIELD FRAME CORRECTIONS.
Water Over Rear Sport Bar or B-pillar	1. Hard Top Seal 2. B-Pillar Mocket 3. Doors 4. Freedom Panel	1. Refer to HARD TOP SEAL CORRECTIONS. 2. Refer to B-PILLAR MUCKET CORRECTIONS. 3. Refer to DOOR CORRECTIONS. 4. Refer to FREEDOM PANELS CORRECTIONS.

B-PILLAR MUCKET CORRECTIONS

Refer to [WATER LEAK CONDITION INDEX](#).

1. Check to verify the super mocket is not sitting too far outboard on the B-pillar. Press in with top fully secured to address this issue.

2. Verify the feathered edge of the super mocket is not rolled underneath the panel or damaged.

3. Verify the sure push pins are fully seated to prevent super mucket from traveling off position.

COWL SEAL CORRECTIONS

Refer to [WATER LEAK CONDITION INDEX](#).

1. Verify the seal (2) is seated down on plenum/baffle and that no abnormal rotation of the seal is observed around the sport bar (1).

2. Check vertical foam strip on top of seal and large foam on side of seal for gaps or damage.

3. Verify the cowl seal pins are fully seated. Pin (1) is seated correctly and pin (2) needs to be corrected. A mallet may be required to make sure pins are fully seated.

COWL/DASH BODY SIDE CORRECTIONS

Refer to [**WATER LEAK CONDITION INDEX**](#).

1. Mastic patch covering body hole found under door sill trim is hidden behind the wire harness. Remove trim and unbolt harness to check patch integrity.
2. Mastic patch on upper driver side inside engine compartment, partially covered by pad. There is also a twist lock plug directly beneath. Both can leak down dash wall if damaged or improperly secured.
3. Several welded studs and plates on dash wall can leak if a gap is present in the weld. Use clear sealer around stud and mastic over plates.

COWL GRILLE/PLENUM CORRECTIONS

Refer to [**WATER LEAK CONDITION INDEX**](#).

1. The two outboard pins on the passenger side can allow water into the HVAC system. Verify the pins are not damaged and gasket is present and undamaged.

2. Any damage to the foil/Mylar mastic patch (2) will create a leak and must be repaired. Verify the patch (1) is not too low on the back wall of plenum and check for holes and gaps around the sport bar.

3. Check baffle cap (1) and make sure it is not damaged, broken, or off location. Replace the butyl chicklet (2) on the top side of the baffle any time the cowl seal is removed.
4. Sealer void at the plenum to dash to cowl interface. Using a paintable repair sealer Part No. 04318026AB or equivalent, repair as needed.

DOOR CORRECTIONS

Refer to [WATER LEAK CONDITION INDEX](#).

1. Adjust the doors to the correct locations, Refer to [GAP AND FLUSH, SPECIFICATIONS](#).

2. Verify the seal is in the proper position and all pins are properly seated.

3. Check for skips, voids, or damage in the seal retainer sealer (1) and using a paintable repair sealer Part No. 04318026AB or equivalent, repair as needed.

4. Verify the drain holes in bottom of seal are present and unobstructed.
5. Check to verify all the carrier plate bolts are properly tightened, Refer to [PLATE, CARRIER, REMOVAL AND INSTALLATION](#).
6. Verify the door pad retainer clips are present and sealing properly.
7. Check wire harness push pins for damage and verify all pins are properly seated and sealed.

FREEDOM PANELS CORRECTIONS

Refer to [WATER LEAK CONDITION INDEX](#).

1. Set freedom panel gap/flush at front receivers, Refer to [REMOVABLE TOP, HARD, STANDARD PROCEDURE](#).
2. Check for missing, damaged, or off location foam, Refer to [REMOVABLE TOP, HARD, STANDARD PROCEDURE](#).

3. Verify the freedom panel center seal is not damaged and in the proper location.

4. The seal end molds will appear rotated if the seal is too far forward or rearward.

HARD TOP SEAL CORRECTIONS

Refer to [**WATER LEAK CONDITION INDEX.**](#)

1. Check alignment of hard top header seal to center seal of freedom panel. Verify the seal is not pinched between the freedom tops.

2. Verify the center seal is flat against the header seal.

3. If B-pillar super mocket leaks from upper feathered edge or over sport bar (water in hard top bolt recess) replace butyl between hard top header seal end mold and hard top.

4. Verify seal is not off location cross car, leaving a large gap between the primary bulb of the seal and the B-pillar mocket. Finesse seal to minimize gap.

HEADER SEAL CORRECTIONS

Refer to [WATER LEAK CONDITION INDEX](#).

1. Left hand spear foam
2. Right hand spear foam
3. 30 mm (1.2 in.)
4. 85 mm (3.4 in.)
5. 15 mm (0.6 in.)
6. 140 mm (5.5 in.)
7. 10 mm (0.4 in.)

Windshield Header Foam/Butyl Replacement (change to spear foam)

- Replaces usage of L-Foam, Butyl Chicklet, and Razer foam
- Improves manufacturability, water sealing, and wind noise capabilities
- 4 mm Ebony ESL 600 material
- Butyl backing (adhesive)
- LH and RH mirrored parts

1. Using a small punch (2) or equivalent, remove the seal rivets (1) and lift the end of the seal out of the way.

2. Remove L shaped foam (1), butyl patch (2) and lower razor foam (3) and clean all surfaces fully prior to installation of the new spear foam.

3. Begin installation by placing the spear foam (2) onto the windshield frame.
 1. Start at the tip of the foam (1).
 2. Place tip into radius of windshield frame (1) as shown in illustration.
 3. Foam corner (3) sits parallel with windshield header bathtub (4).

4. Seat the remaining foam around the header of the windshield frame maintaining a tight even gap to the forward edge of the frame (1).
5. Verify the foam is fully seated to windshield frame along the radius to avoid pocketing under the foam (2) that can allow water to pass.

6. Verify the header seal (1) is positioned evenly side to side (2).

7. Verify the header seal is fully seated in the windshield frame and foam (1) is not visible between frame and seal. If visible, pull end of header seal forward.

8. Install the new rivets (2).

NOTE: A slight bit of the spear foam should protrude from the lower feathered edge of the seal (1) when properly installed.

WINDSHIELD FRAME CORRECTIONS

Refer to [WATER LEAK CONDITION INDEX](#).

1. Check windshield frame panel seam sealer (1) using shop air and soap test. Using a paintable repair sealer Part No. 04318026AB or equivalent, repair as needed.

2. Check windshield urethane (1) for voids or gaps using soap and air.

3. Check drain tube (1) for damage and make sure boot (2) is secured to drain trough properly.

4. Check drain trough for sealer skips or voids with water bottle test.

5. Inspect the trough end cap for sealer voids, cracks or damage.

SOFT TOP WATER MANAGEMENT DIAGNOSIS AND TESTING

OVERALL WATER LEAKS DIAGNOSIS AND TESTING

WATER LEAK CONDITION INDEX

CONDITION	POSSIBLE CAUSES	CORRECTIONS
Water on rear door trim, rear sport bar, or upper rear door rail	Top cover to door frame trough	Check for correct soft top installation and correct as needed. Refer to FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION .
	Quarter window Velcro	
	Rear door rubber extrusion seal	Refer to REAR DOOR FRAME CORRECTIONS .
Water on C-post trim, carpet, or on inboard surface of rear door rail	Rear door frame rail joint	Refer to REAR DOOR FRAME CORRECTIONS .
Water on J-rail or carpet rear of C-post	Top not latched properly	Check for correct soft top installation and correct as needed. Refer to FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION .
	Canard retainer lower foam	
	Quarter window canards	
	Quarter window Velcro	
	Top cover to door frame trough	

CONDITION	POSSIBLE CAUSES	CORRECTIONS
Water on front door trim, inner surface of front door rail, and inside door rail mocket trough.	Rear door frame mocket	Refer to REAR DOOR FRAME CORRECTIONS .
	C-pillar J-rail mocket	
	Front door frame mocket	Refer to FRONT DOOR FRAME CORRECTIONS .
	Header seal	Refer to HEADER SEAL CORRECTIONS .
	Windshield	Refer to WINDSHIELD FRAME CORRECTIONS .
Water on front door trim, top surface of front door rail, and top surface of sport bar.	Top not latched properly	Check for correct soft top installation and correct as needed. Refer to FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION .
	Top cover to door frame trough	
	Front door frame mocket	Refer to FRONT DOOR FRAME CORRECTIONS .
	Header bow foam	
	B-pillar mocket	
	Header seal	Refer to HEADER SEAL CORRECTIONS .
	Windshield	Refer to WINDSHIELD FRAME CORRECTIONS .
Water on front door trim, top surface of front and rear door rail, and top surface of sport bar	Top not latched properly	Check for correct soft top installation and correct as needed. Refer to FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION .
	Top cover to door frame trough	
	Quarter Window to Top Cover D-Pillar Upper	
	Door frame rails	Check door frame rails for damage and replace if needed, Refer to FRAME, DOOR FRONT, REMOVAL AND INSTALLATION FRAME, DOOR REAR, REMOVAL AND INSTALLATION .
	Front door frame rail foam	Refer to FRONT DOOR FRAME CORRECTIONS .
	B-pillar mocket	

FRONT DOOR FRAME CORRECTIONS

Refer to [WATER LEAK CONDITION INDEX](#).

1. Check if the A-pillar mocket (1) push pin fasteners (2) are fully engaged to door rail

2. Check if foam (1) is attached to front door rail trough and even with the ridge (2).

3. Check that the front door rail foam (1) is present and undamaged.

4. Check the B-pillar mocket seal (3) is installed correctly with no gap at the B-pillar (2) and seated fully up against the door rails.

5. With the top folded back check and replace the foam seal on the header bow.

6. Slide the new foam (1) up under the fabric (2) and seat fully.

REAR DOOR FRAME CORRECTIONS

Refer to [WATER LEAK CONDITION INDEX](#).

1. Rubber extrusion seal damaged or installed incorrectly (if equipped)

2. C-pillar J-rail Mocket Leak, replace if necessary.

3. Remove the bolts (4), lower the brackets (1) and remove the door rail assembly (2).
4. Check the foam seal (3) is present and not damaged, replace if needed.
5. Replace the mucket seal and install the door rail (2).

6. Rear Door Frame Mucket Leak

7. Check if threads are showing from 2 vertical fasteners at rear door rail joint

8. If threads are not showing, check for movement between upper and lower door rail and tighten the screws securely.

9. Check if foam is installed at joint shown in illustration (requires removing 3 fasteners from door rail) repair or replace as necessary.

10. Remove the three J-rail retaining screws (1).

11. Remove the J-rail (1) from the door rail (2) and install new foam on the bottom before installing back.

STIFFENER FOAM CORRECTIONS

Refer to [WATER LEAK CONDITION INDEX](#).

1. If equipped, check if foam is present at bottom of rear window stiffener and replace if needed.

HEADER SEAL CORRECTIONS

Refer to [WATER LEAK CONDITION INDEX](#).

1. Left hand spear foam
2. Right hand spear foam
3. 30 mm (1.2 in)
4. 85 mm (3.4 in)
5. 15 mm (0.6 in)
6. 140 mm (5.5 in)
7. 10 mm (0.4 in)

Windshield Header Foam/Butyl Replacement (change to spear foam)

- Replaces usage of L-Foam, Butyl Chicklet, and Razer foam
- Improves manufacturability, water sealing, and wind noise capabilities
- 4 mm Ebony ESL 600 material
- Butyl backing (adhesive)
- LH and RH mirrored parts

1. Using a small punch (2) or equivalent, remove the seal rivets (1) and lift the end of the seal out of the way.

2. Remove L shaped foam (1), butyl patch (2) and lower razor foam (3) and clean all surfaces fully prior to installation of the new spear foam.

3. Begin installation by placing the spear foam (2) onto the windshield frame.
 1. Start at the tip of the foam (1).
 2. Place tip into radius of windshield frame (1) as shown in illustration.
 3. Foam corner (3) sits parallel with windshield header bathtub (4).

4. Seat the remaining foam around the header of the windshield frame maintaining a tight even gap to the forward edge of the frame (1).
5. Make sure foam is fully seated to windshield frame along the radius to avoid pocketing under the foam (2) that can allow water to pass.

6. Make sure header seal (1) is positioned evenly side to side (2).

7. Make sure header seal is fully seated in the windshield frame and foam (1) is not visible between frame and seal. If visible, pull end of header seal forward.

8. Install the new rivets (2).

NOTE: A slight bit of the spear foam should protrude from the lower feathered edge of the seal (1) when properly installed.

WINDSHIELD FRAME CORRECTIONS

Refer to [WATER LEAK CONDITION INDEX](#).

1. Check windshield frame panel seam sealer (1) using shop air and soap test. Using a paintable repair sealer Part No. 04318026AB or equivalent, repair as needed.

2. Check windshield urethane (1) for voids or gaps using soap and air.

3. Check drain tube (1) for damage and make sure boot (2) is secured to drain trough properly.

4. Check drain trough for sealer skips or voids with water bottle test.

5. Inspect the trough end cap for sealer voids, cracks or damage.

WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high cross winds. Over compensating door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

ROAD TESTING WIND NOISE

1. Drive the vehicle to verify the general location of the wind noise.
2. Apply 50 mm (2.0 in.) masking tape in 150 mm (6.0 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

POSSIBLE CAUSE OF WIND NOISE

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

WIND NOISE DIAGNOSIS AND TESTING

WIND NOISE CONDITION INDEX

LOCATION	POSSIBLE CAUSES	CORRECTIONS
A-pillar	1. A-pillar	1. Refer to A-PILLAR CORRECTIONS .
B-pillar	1. B-pillar Mocket	1. Refer to B-PILLAR CORRECTIONS .
C-pillar	1. C-pillar Mocket	1. Refer to C-PILLAR CORRECTIONS .
Doors	1. Doors	1. Refer to DOOR CORRECTIONS .
Freedom panels	1. Freedom panels	1. Refer to FREEDOM PANELS CORRECTIONS .
Header seal	1. Header Seal 2. Hardtop front seal	1. Refer to HEADER SEAL CORRECTIONS . 2. Refer to HARDTOP FRONT SEAL CORRECTIONS .
Windshield	1. Windshield Frame	1. Refer to WINDSHIELD CORRECTIONS .

A-PILLAR CORRECTIONS

Refer to [WIND NOISE CONDITION INDEX](#).

1. Lower A-pillar - Check the front door cut line lip at the beltline for rolling over when closing door. Replace seal if damaged or deformed.

2. Lower A-pillar - Verify steeple foam at lower A-pillar is hiding frame metal and contacting drain tube foam 2-3 mm overlap beyond metal edge.

3. With the windshield frame lowered no metal should be visible between the foam.

4. The upper foam (1) should sit flush against the lower foam (2) and seal against the frame fully.

5. Lower A-pillar - Check front door flag applique (2) is fully seated to body and outer glass seal. Verify the glass seal and outer belt molding are not pinching each other together (1).

6. Remove and apply foam tape on inner side of applique (1) and reinstall.

B-PILLAR CORRECTIONS

Refer to [WIND NOISE CONDITION INDEX](#).

1. Upper B-pillar - Verify super mocket is not sitting too far outboard on the B-pillar. Press in with top fully secured to address this issue.

2. Upper B-pillar - Verify the feathered edge of the super mocket is not rolled underneath the panel or damaged.

3. Verify the push pins are fully seated to prevent super mocket from traveling off position.

4. Verify the rear outboard freedom panel foam is in correct location, the lower foam (1) is overlapping foam (2) and sealing to mocket.

5. Check that the interior foam above the B-pillar is present and sealed fully to the top.

C-PILLAR CORRECTIONS

Refer to [WIND NOISE CONDITION INDEX](#).

1. Verify C-pillar mocket (2) is in proper position at beltline. Replace if damaged or deformed.
2. Lower C-pillar - Verify there is no gap where C-pillar mocket interfaces with top (1). If a gap exists, raise the top and add foam tape to fill void.

DOOR CORRECTIONS

Refer to [WIND NOISE CONDITION INDEX](#).

1. Adjust the doors to the correct locations, Refer to [GAP AND FLUSH, SPECIFICATIONS](#).

2. Verify the door seal (1) is in the proper position and all pins are properly seated.

3. Check for skips, voids, or damage in the seal retainer sealer (1) and using a paintable repair sealer Part No. 04318026AB or equivalent, repair as needed.

4. Make sure retainer gap foam is present and in good condition and the door seal (2) is seated into the retainers (3) fully.

5. Lower A-pillar - Check the front door cut line lip at the beltline for rolling over when closing door. Replace seal if damaged or deformed.

6. Verify outer door glass seal (1) is fully seated to door glass flange.

7. Verify outer belt seal (1) is pushed back against the seal (2) and seated fully.

8. Check front door inner belt molding fits tight to the front weatherstrip channel - Reposition belt molding forward or replace inner belt molding.

9. Check front door flag applique (2) is fully seated to body and outer glass seal. Verify the glass seal and outer belt molding are not pinching each other together (1).

10. Remove and apply foam tape on inner side of applique (1) and reinstall.

FREEDOM PANELS CORRECTIONS

Refer to [WIND NOISE CONDITION INDEX](#).

1. Set freedom panel gap/flush at front receivers, Refer to [REMOVABLE TOP, HARD, STANDARD PROCEDURE](#).

2. Verify the freedom panel center seal is not damaged and in the proper location. The seal end molds will appear rotated if the seal is too far forward or rearward.

3. Check for missing, damaged, or off location foam, Refer to [**REMOVABLE TOP, HARD, STANDARD PROCEDURE**](#) .

HARDTOP FRONT SEAL CORRECTIONS

Refer to [**WIND NOISE CONDITION INDEX**](#).

1. Check alignment of hard top header seal to center seal of freedom panel. Verify the seal is not pinched between the freedom tops.

2. Verify the center seal is flat against the header seal.

HEADER SEAL CORRECTIONS

Refer to [**WIND NOISE CONDITION INDEX**](#).

1. Verify header seal (1) is positioned evenly side to side (2).

2. Using black RTV (2), seal the front edge of the header seal (1) to the windshield frame.

NOTE:

The RTV needs to be smoothed down so that it does not pucker and push against the header seal, needs to be applied consistently across the entire frame top and smoothed with a finger. Make sure that no RTV gets onto the exterior painted surface.

3. Verify the header seal is fully seated in the windshield frame and foam (1) is not visible between frame and seal. If visible, pull end of header seal forward.

1. Left hand spear foam
2. Right hand spear foam
3. 30 mm (1.2 in.)
4. 85 mm (3.4 in.)
5. 15 mm (0.6 in.)
6. 140 mm (5.5 in.)
7. 10 mm (0.4 in.)

4. Windshield Header Foam/Butyl Replacement (change to spear foam):
- Replaces usage of L-Foam, Butyl Chicklet, and Razer foam
 - Improves manufacturability, water sealing, and wind noise capabilities
 - 4 mm Ebony ESL 600 material
 - Butyl backing (adhesive)

- LH and RH mirrored parts

5. Using a small punch (2) or equivalent, remove the seal rivets and lift the end of the seal out of the way.

6. Remove L shaped foam (1), butyl patch (2) and lower razor foam (3) and clean all surfaces fully prior to installation of the new spear foam.

7. Begin installation by placing the spear foam onto the windshield frame.

1. Start at the tip of the foam (1).
2. Place tip into radius of windshield frame (1) as shown in illustration.
3. Foam corner (3) sits parallel with windshield header bathtub (4).

8. Seat the remaining foam around the header of the windshield frame maintaining a tight even gap to the forward edge of the frame (1).
9. Verify the foam is fully seated to windshield frame along the radius to avoid pocketing under the foam (2) that can allow water to pass.

10. Verify the header seal (1) is positioned evenly side to side (2).

11. Verify the header seal is fully seated in the windshield frame and foam (1) is not visible between frame and seal. If visible, pull end of header seal forward.

12. Install the new rivets (2).

NOTE: A slight bit of the spear foam should protrude from the lower feathered edge of the seal (1) when properly installed.

WINDSHIELD CORRECTIONS

Refer to [WIND NOISE CONDITION INDEX](#).

1. Check windshield urethane (1) for voids or gaps using soap and air.

2. Verify the windshield (1) is positioned correctly and centered in the windshield frame.

3. Check windshield frame panel seam sealer (1) using shop air and soap test. Using a paintable repair sealer Part No. 04318026AB or equivalent, repair as needed.

4. Verify the windshield sits under flush to the windshield frame. Check glass under flush to frame with a straight edge.

5. Verify the lace molding is contacting the windshield frame surround (1) and is centered in frame.

6. With windshield lowered, check for open holes at bottom of frame, near drain tube grommet. Install butyl patches.

STANDARD PROCEDURE

BUZZ, SQUEAKS AND RATTLES

Buzz, Squeaks and Rattles (BSRs) may be caused by any one or more of the following and may be corrected as indicated:

- Loose fasteners should be tightened to specifications.
- Damaged or missing clips should be replaced.
- Damaged trim panels should be replaced.
- Incorrectly installed trim panels should be reinstalled properly.

Many BSR complaints such as loose trim, can be serviced using various tapes or lubricants. Tapes including foam, flock and anti-squeak, can be used to eliminate noises caused by metal, plastic and vinyl components. Long life lubricants and greases can also be used on a variety of components. Refer to the table for materials and usage. Refer to **BUZZ, SQUEAKS AND RATTLES**.

BUZZ, SQUEAKS AND RATTLES

ITEM	FEATURES	APPLICATIONS	SERVICE TEMP
ITCH AND SQUEAK TAPE	An abrasion resistant material thin enough to conform to most irregular surfaces. Stops most itches and squeaks.	Between metal and metal, metal and plastic, metal and vinyl, vinyl and plastic. Interior trim panels. Examples: Trim panels and bezels.	-40B° to 107B°C (-40B° to 225B°F)
BLACK NYLON FLOCK	Nylon Flock with an aggressive acrylic adhesive. Provides for cushioning and compression fit, also isolates components. Water-resistant.	Between metal and metal, metal and plastic, vinyl and plastic. Examples: Pull cups, bezels, clips, ducts, top cover to glass, cowl panel.	-40B° to 82B°C (-40B° to 180B°F)
HIGH DENSITY URETHANE FOAM	Tear resistant, highly resilient and durable.	Between metal and metal, metal and plastic. Water-resistant.	-40B° to 82B°C (-40B° to 180B°F)

ITEM	FEATURES	APPLICATIONS	SERVICE TEMP
		Examples: I/P, heavy metal rattles, isolating brackets.	
OPEN CELL FOAM TAPE	Soft foam conforms to irregular surfaces.	Wire harness and connector wrap. Examples: Seals, gasket, wiring, heat ducts.	-40B° to 82B°C (-40B° to 180B°F)
CLOSED CELL LOW DENSITY FOAM TAPE	Soft, conformable. Water-resistant.	Wherever bulk is needed. Prevents closing flutters and rattles when applied to door watershield. Examples: Door, I/P.	-40B° to 82B°C (-40B° to 180B°F)
NYEB® GREASE 880	Long life.	Suspensions. Examples: Strut bushings, sway bars.	-40B° to 200B°C (-40B° to 390B°F)
KRYTOXB® OIL	Long life. Will not dry out or harm plastics or rubber.	When access is not possible, oil will migrate to condition. Vinyl, rubber, plastic, metal. Examples: Convertible top bushings, pull cups trim panel inserts.	-34B° to 205B°C (-30B° to 400B°F)
KRYTOXB® GREASE	Long life. Will not dry out or harm plastics or rubber.	Vinyl, rubber, plastic, metal, glass. Examples: Weather-strips, backlite and windshield moldings.	-34B° to 205B°C (-30B° to 400B°F)

HEAT STAKING

1. Remove the trim panel.
2. Bend or move the trim panel components at the heat staked joints. Observe the heat staked locations and component seams for looseness.
3. Heat stake the components.
 - a. If the heat staked or component seam location is loose, hold the two components tightly together and using a soldering gun with a flat tip, melt the material securing the components together. Do not over heat the affected area, damage to the exterior of the trim panel may occur.
 - b. If the heat staked material is broken or missing, use a hot glue gun to apply new material to the area to be repaired. The panels that are being heat staked must be held together while the applying the glue. Once the new material is in place, it may be necessary to use a soldering gun to melt the newly applied material. Do not over heat the affected area, damage to the exterior of the trim panel may occur.
4. Allow the repaired area to cool and verify the repair.
5. Install the trim panel.

NET, FORM AND PIERCE REPAIR

CAUTION: Failure to follow these recommendations could result in damage or failure to the part and the related parts.

Net, form and pierce is a manufacturing process which takes place during the original build of the vehicle. The original part will have a beveled platform that will decrease toward the fastener location mounting hole. Replacement parts in these areas may not include bevel (form) or fastener hole (pierce) and will need to be adapted for proper fit and finish.

The primary locations which may utilize net, form and pierce are:

- Fender reinforcement (at front end module mount)
- Fender tower mounts
- Hood hinge (lower half)
- Rear body header (liftgate hinge mounts)
- Strut tower (at upper control arm mount)

NOTE: Shock tower is net, pierce only.

NOTE: The thickness of shims is not to exceed the original thickness of the factory bevel. If more shims are needed damage is still present and must be repaired properly.

If the replacement part did not come with a fastener hole, one of equal size and location will have to be drilled. Body shims should be used in the fender reinforcement to front end module. The hood hinge area, fender tower mounts, and rear body header will utilize washers as spacers where a specific spacer does not exist. The shims and spacers should be sealed between each other and to the stationary surface. Care should be taken when smoothing sealer around washers to give an undetectable repair. Refinish the repair area per the paint manufacturer's recommendations for corrosion resistance and appearance purposes.

PLASTIC BODY PANEL REPAIR

There are many different types of plastics used in today's automotive environment. We group plastics in three different categories: Rigid, Semi-Rigid, and Flexible. Any of these plastics may require the use of an adhesion promoter for repair. These types of plastic are used extensively in automotive applications. Always follow repair material manufacturer's plastic identification and repair procedures.

SAFETY PRECAUTION AND WARNINGS

WARNING: Eye protection should be used when servicing components. Personal injury can result.

Use an OSHA approved breathing mask when mixing epoxy, grinding, and spraying paint or solvents in a confined area. Personal injury can result.

Avoid prolonged skin contact with resin, petroleum, or alcohol based solvents. Personal injury can result.

Do not venture under a hoisted vehicle that is not properly supported on safety stands. Personal injury can result.

CAUTION: When holes must be drilled or cut in body panels, verify locations of internal body components and electrical wiring. Damage to vehicle can result.

Do not use abrasive chemicals or compounds on undamaged painted surfaces around repair areas. Damage to finish can result.

RIGID PLASTICS

Examples of rigid plastic use: fascias and other body panels, which include SMC, ABS, and polycarbonates.

SEMI-RIGID PLASTICS

Examples of semi-rigid plastic use: interior panels, under hood panels, and other body trim panels.

FLEXIBLE PLASTICS

Examples of flexible plastic use: fascias, body moldings, and upper and lower fascia covers.

REPAIR PROCEDURE

The repair procedure for all three categories of plastics is basically the same. The one difference is the material used for the repair. The materials must be specific for each substrate, rigid repair material for rigid plastic repair, semi-rigid repair material for semi-rigid plastic repair and flexible repair material for flexible plastic repair.

ADHESION PROMOTER/SURFACE MODIFIER

Adhesion promoters/surface modifiers are required for certain plastics. All three categories may have plastics that require the use of adhesion promoter/surface modifiers. Always follow repair material manufacturer's plastic identification and repair procedures.

RIGID, SEMI-RIGID, AND FLEXIBLE PLASTIC PARTS TYPES

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION
ASA	Acrylonitrile Styrene Acrylite	Lurans	Consoles, Grilles
ABS	Acrylonitrile Butadiene Styrene	Terluran	A-pillars, Consoles, Grilles
ABS/PC	ABS/PC Alloy	Pulse, Proloy, Bayblend	Doors, Instrument Panels
ABS/PVC	ABS/PV Alloy	Proloy, Pulse, Lustran, Cyclovin	Door Panels, Grilles, Trim
BMC	Bulk Molding Compound	BMC	-
EMA	Ehtylene Methyl Acrylate/Ionomer	Surlyn, EMA, Ionomer	Bumper Guards, Pads
METTON	Metton	Metton	Grilles, Kick Panels, Running Boards
MPPO	Modified Polyphenylene Oxide	MPPO	Spoiler Assembly
PA	Polyamid	Zytel, Vydyne, PA, Minlon	-
PET	Thermoplastic Polyester	Rynite	Trim
PBT/PPO	PBT/PPO Alloy	Germax	Claddings
PBTP	Polybutylene Therephtalate	PBT, PBTP, Pocan, Valox	Wheel Covers, Fenders, Grilles
PBTP/EEBC	Polybutylene Therephtalate/EEBC Alloy	Bexloy, "M", PBTP/EEBC	Fascias, Rocker Panel, Moldings
PC	Polycarbonate	Lexan, Merlon, Calibre, Makrolon PC	Tail Light Lenses, I/P Trim, Valance Panels
PC/ABS	PC/ABS Alloy	Germax, Bay Blends, Pulse	Doors, Instrument Panels
PPO	Polyphenylene Oxide	Azdel, Hostalen, Marlex, Prfax, Noryl, GTX, PPO	Interior Trim, Door Panels, Splash Shields, Steering Column Shroud
PPO/PA	Polyphenylene/Polyamid	PPO/PA, GTX 910	-
PR/FV	Fiberglass Reinforced Plastic	Fiberglass, FV, PR/FV	Body Panels
PS	Polystyrene	Lustrex, Styron, PS	Door Panels, Dash Panels
RTM	Resin Transfer Molding Compound	RTM	Body Panels
SMC	Sheet Molded Compound	SMC	Body Panels
TMC	Transfer Molding Compound	TMC	Grilles
UP	Unsaturated Polyester (Thermosetting)	SMC, BMC, TMC, ZMC, IMC, XSMC, UP	Grille Opening Panel, Liftgates, Flareside Fenders, Fender Extensions
EEBC	Ether/Ester Blocked Co-Polymer	EEBC	Bumpers

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION
EEBC/PBTP	EEBC/Polybutylene Terephthalate	EEBC, PBTP, BEXLOY	Bumper, Rocker Panels
EMPP	Ethylene Modified Polypropylene	EMPP	Bumper Covers
EPDM	Ethylene/Propylene Diene Monomer	EPDM, Nordel, Vistalon	Bumpers
EPM	Ethylene/Propylene Co-Polymer	EPM	-
MPU	Foam Polyurethane	MPU	Spoilers
PE	Polyethylene	Alathon, Dylan, Lupolen, Marlex	-
PP	Polypropylene (Blends)	Noryl, Azdel, Marlox, Dylan, Pravex	Spoilers, Kick Panels, A-Pillars, Door Panels, B-Pillars, Quarter Panels, Sport Bar Trim, Liftgate Trim, Decklid Trim Scuff Plates, Kick Panels, Consoles
PP/EPDM	PP/EPDM Alloy	PP/EPDM	Spoilers, Grilles
PUR	Polyurethane	Colonels, PUR, PU	Fascias, Bumpers
PUR/PC	PUR/PC Alloy	Texin	Bumpers
PVC	Polyvinyl Chloride	Apex, Geon, Vinylite	Body Moldings, Wire Insulation, Steering Wheels
RIM	Reaction Injected Molded Polyurethane	RIM, Bayflex	Front Fascias, Modular Windows
RRIM	Reinforced Reaction Injected Molded	PUR, RRIM	Fascias, Body Panels, Body Trims
TPE	Thermo Polyethylene	TPE, Hytrel, Bexloy-V	Fascias, Bumpers, Claddings
TPO	Thermopolyolefin	Polytrope, Renflex, Santoprene, Visaflex, ETA, Apex, TPO, Shields, Claddings	Bumpers, End Caps, Telcar, Rubber, Strips, Sight, Interior B-Pillar
TPP	Thermo-Polypropylene	TPP	Bumpers
TPU	Thermopolyurethane, Polyester	TPU, Hytrel, Texin, Estane	Bumpers, Body Side, Moldings, Fascias

PANEL SECTIONING

If it is required to section a large panel for a plastic repair, it will be necessary to reinforce the panel. To bond two plastic panels together, a reinforcement must overlap both panels. The panels must be beveled at a 20 degree angle. The area to be reinforced should be washed, then sanded. Be sure to wipe off any excess soap and water when finished. Lightly sand or abrade the plastic with an abrasive pad or sandpaper. Blow off any dust with compressed air or wipe with a clean dry rag.

When bonding plastic panels, follow repair material manufacturers recommendations. Be sure that enough adhesive has been applied to allow squeeze out and to fill the full bond line. Once the pieces have been brought together, do not move them until the adhesive is cured. The assembly can be held together with clamps, rivets, etc. A faster cure can be obtained by heating with a heat lamp or heat gun. After the parts have been bonded and have had time to cure, rough sand the seam and apply the final adhesive filler to the area being repaired. Smooth the filler with a spreader, wooden tongue depressor, or squeegee. For fine texturing, a small amount of water can be applied to the filler surface while smoothing. The cured filler can be sanded as necessary and, as a final step, cleanup can be done with soapy water. Wipe the surface clean with a dry cloth allowing time for the panel to dry before moving on with the repair.

PANEL REINFORCEMENT

Structural repair procedures for rigid panels with large cracks and holes will require a reinforcement backing. Reinforcements can be made with several applications of glass cloth saturated with structural adhesive. Semi-rigid or flexible repair materials should be used for semi-rigid or flexible backing reinforcement. Open meshed fiberglass drywall tape can be used to form a reinforcement. The drywall tape allows the resin to penetrate through and make a good bond between the panel and the adhesive. Structurally, the more drywall tape used, the stronger the repair.

Another kind of repair that can be done to repair large cracks and holes is to use a scrap piece of similar plastic and bond with structural adhesive. The reinforcement should cover the entire break and should have a generous amount of overlap on either side of the cracked or broken area.

When repairing plastic, the damaged area is first "V'd" out, or beveled. Large bonding areas are desirable when repairing plastic because small repairs are less likely to hold permanently. Beveling the area around a crack at a 20 degree angle will increase the bonding surface for a repair. It is recommended that sharp edges be avoided because the joint may show through after the panel is refinished.

- Panel repair for both flexible and rigid panels are basically the same. The primary difference between flexible panel repair and rigid panel repair is in the adhesive materials used.
- The technician should first decide what needs to be done when working on any type of body panel. One should determine if it is possible to return the damaged part to its original strength and appearance without exceeding the value of the replacement part.
- When plastic repairs are required, it is recommended that the part be left on the vehicle whenever possible. That will save time, and the panel will remain stationary during the repair. Misalignment can cause stress in the repair areas and can result in future failure.

VISUAL INSPECTION

Composite materials can mask the severity of an accident. Adhesive bond lines, interior structure of the doors, and steel structures need to be inspected carefully to get a true damage assessment. Close inspection may require partial removal of interior trim or inner panels.

Identify the type of repair: Puncture or Crack - Damage that has penetrated completely through the panel. Damage is confined to one general area; a panel section is not required. However, a backer panel, open fiberglass tape, or matted material must be bonded from behind.

PANEL SURFACE PREPARATION

If a body panel has been punctured, cracked, or crushed, the damaged area must be removed from the panel to achieve a successful repair. All spider web cracks leading away from a damaged area must be stopped or removed. To stop a running crack in a panel, drill a 6 mm (0.250 in.) hole at the end of the crack farthest away from the damage. If spider web cracks can not be stopped, the panel will require replacement. The surfaces around the damaged area should be stripped of paint and freed from wax and oil. Scuff surfaces around repair area with 360 grit wet/dry sandpaper, or equivalent, to insure adhesion of repair materials.

PATCHING PANELS

If a panel that has extensive puncture type damage, the panel can be repaired by cutting out the damaged material. Use a suitable reciprocating saw or cut off wheel to remove the section of the panel that is damaged. The piece cut out can be used as a template to shape the new patch. It is not necessary to have access to the back of the panel to install a patch. Bevel edges of cutout at 20 degrees to expose a larger bonding area on the outer side. This will allow for an increased reinforcement area.

PANEL PATCH FABRICATIONS

A patch can be fabricated from any rigid fiberglass panel that has comparable contour with the repair area. If existing material is not available or compatible, a patch can be constructed with adhesive and reinforcement mesh (drywall tape). Perform the following operation if required:

1. Cover waxed paper or plastic with adhesive backed nylon mesh (drywall tape) larger than the patch required.
2. Tape waxed paper or plastic sheet with mesh to a surface that has a compatible contour to the repair area.
3. Apply a liberal coat of adhesive over the reinforcement mesh. If necessary apply a second or third coat of adhesive and mesh after first coat has cured. The thickness of the patch should be the same as the repair area.
4. After patch has cured, peel waxed paper or plastic from the back of the patch.
5. If desired, a thin film coat of adhesive can be applied to the back of the patch to cover mesh for added strength.

PANEL PATCH INSTALLATION

1. Make a paper or cardboard pattern the size and shape of the cutout hole in the panel.
2. Trim 3 mm (0.125 in.) from edges of pattern so patch will have a gap between connecting surfaces.
3. Using the pattern as a guide, cut the patch to size.
4. Cut scrap pieces of patch material into 50 mm (2.0 in.) squares to use as patch supports to sustain the patch in the cutout.
5. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) in from edge of cutout hole.
6. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) away from edge of patch across from holes drilled around cutout.
7. Drill 3 mm (0.125 in.) holes in the support squares 13 mm (0.5 in.) from the edge in the center of one side.
8. Scuff the backside of the body panel around the cutout hole with a scuff pad or sandpaper.
9. Mix enough adhesive to cover one side of all support squares.
10. Apply adhesive to cover one side of all support squares.
11. Using number 8 sheet metal screws, secure support squares to back side of body panel with adhesive sandwiched between the panel and squares.
12. Position patch in cutout against support squares and adjust patch until the gap is equal along all sides.
13. Drill 3 mm (0.125 in.) holes in the support squares through the pre-drilled holes in the patch.
14. Apply a coat of adhesive to the exposed ends of the support squares.
15. Install screws to hold the patch to support squares. Tighten screws until patch surface is flush with panel surface.
16. Allow adhesive to cure, and remove all screws.
17. Using a 125 mm (5.0 in.) 24 grit disc grinder, grind a 50 mm (2.0 in.) to 75 mm (3.0 in.) wide and 2 mm (0.080 in.) deep path across the gaps around the patch. With compressed air, blow dust from around patch.
18. Apply adhesive backed nylon mesh (drywall tape) over gaps around patch.
19. Mix enough adhesive to cover the entire patch area.
20. Apply adhesive over the mesh around patch, and smooth epoxy with a wide spreader to reduce finish grinding. Use two to three layers of mesh and adhesive to create a stronger repair.

PATCHED PANEL SURFACING

After patched panel is installed, the patch area can be finished using the same methods as finishing other types of body panels. If mesh material is exposed in the patched area, grind surface down, and apply a coat of high quality rigid plastic body filler. Prime, block sand, and paint as required.

TECHNICAL SPECIFICATIONS

BODY LUBRICATION SPECIFICATIONS

LUBRICATION REQUIREMENTS

Body mechanisms and linkages should be inspected, cleaned, and lubricated, as required, to maintain ease of operation and to provide protection against rust and wear. When performing other under hood services, the hood latch release mechanism and safety catch should be inspected, cleaned, and lubricated. During the winter season, external door lock cylinders should be lubricated to help with proper operation when exposed to water and ice.

Prior to the application of any lubricant, the parts concerned should be wiped clean to remove dust and grit. If necessary, a suitable solvent can be used to clean the item to be lubricated. After lubricating a component, any excess oil or grease should be removed.

BODY COMPONENT	LUBRICANT TYPE
Door Hinges	Engine Oil
Hood Hinges	Engine Oil
Liftgate Hinges	Engine Oil
Door Check Straps	MoparB® Spray White Lube or Equivalent
Hood Latches	MoparB® Spray White Lube or Equivalent
Hood and Liftgate Prop Pivots	MoparB® Spray White Lube or Equivalent
Fuel Filler Door Remote Control Latch Mechanism	MoparB® Spray White Lube or Equivalent
Parking Brake Mechanism	MoparB® Spray White Lube or Equivalent
Sliding Seat Tracks	MoparB® Spray White Lube or Equivalent
Liftgate Latch	MoparB® Spray White Lube or Equivalent
All Other Hood Mechanisms	MoparB® Multipurpose Grease or Equivalent
Door Lock Cylinders	MoparB® Lock Cylinder Lubricant or Equivalent
Liftgate Lock Cylinder	MoparB® Lock Cylinder Lubricant or Equivalent

LUBRICANT APPLICATION

DOOR LOCK CYLINDERS

1. Apply a small amount of lubricant directly into the lock cylinder.
2. Apply a small amount of lubricant to the key.
3. Insert key into lock cylinder and cycle the mechanism from the locked to the unlocked position.

NOTE: Do not add more lubricant.

4. Cycle the lock cylinder mechanism several times to allow the lubricant to flow throughout the cylinder.
5. Wipe all lubricant from exterior of lock cylinder and key.

ALL OTHER BODY MECHANISMS

1. Clean component as described above.
2. Apply specified lubricant to all pivoting and sliding contact areas of component.

LUBRICANT USAGE

ENGINE OIL

- Door hinges - hinge pin and pivot contact areas
- Hood hinges - pivot points
- Liftgate hinges

MOPARB® SPRAY WHITE LUBE OR EQUIVALENT

- Door check straps

- Hood latches
- Hood and decklid prop pivots
- Ash receiver
- Fuel filler door remote control latch mechanism
- Parking brake mechanism
- Sliding seat tracks
- Liftgate latch

MOPARB® MULTIPURPOSE GREASE OR EQUIVALENT

- All other hood mechanisms

MOPARB® LOCK CYLINDER LUBRICANT OR EQUIVALENT

- Door lock cylinders
- Liftgate lock cylinder

DECKLID/HATCH/LIFTGATE/TAILGATE/SWING GATE

ACCUATOR, LATCH

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .
2. Remove the covers as needed. Refer to [COVER, TAILGATE, REMOVAL AND INSTALLATION](#).

3. Release the clips (2) and separate the links from the control assembly.
4. Remove the fastener (3).
5. Remove the nuts (1).

6. Remove the control assembly (2) from the handle studs (1).

7. Disconnect the control assembly wire harness connector (1).

INSTALLATION

1. Connect the wire harness connector (1).

2. Install the control assembly (2) into the front of the tailgate onto the handle studs (1).

3. Install the nuts (1) and tighten to the proper Refer to [TORQUE SPECIFICATIONS](#) .
4. Install the fastener (3) and tighten to the proper Refer to [TORQUE SPECIFICATIONS](#) .
5. Install the control rods onto the control assembly and seat the clips (2) fully.
6. Install the covers as needed. Refer to [COVER, TAILGATE, REMOVAL AND INSTALLATION](#).
7. Connect the negative battery cable(s). Refer to the appropriate service information .

CABLE, TAILGATE

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Open the tailgate and locate the tailgate check cable on the left and right of the cargo box below the tailgate striker as necessary.
2. Remove the bolt (1) and remove the tailgate check cable(s) from the cargo box.

3. Remove the bolt (1) that secures the tailgate check cable to the left and right side of the tailgate.
4. Remove the tailgate check cable(s) from the tailgate.

INSTALLATION

1. Position the tailgate check cable onto the left and right side of the tailgate as necessary.
2. Install the bolt (1) that secures the small end of the tailgate check cable(s) to the tailgate and tighten to the proper Refer to **TORQUE SPECIFICATIONS** .

3. Position the tailgate check cable to the left and right side of the cargo box below the tailgate striker as necessary.
4. Install the bolt (1) attaching the cable to the cargo box and tighten to the proper Refer to **TORQUE SPECIFICATIONS**.

COVER, TAILGATE

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

2309144934

REMOVAL

1. Open the tailgate.
2. Remove the fasteners and remove the tailgate liner, if equipped with a bed liner.
3. Remove the eight fasteners (1) that secure the tailgate cover (2) to the inside of the tailgate and remove the cover.

4. Remove the four fasteners (1) that secure the lower tailgate cover (2) to the inside of the tailgate and remove the cover.

INSTALLATION

1. Position the tailgate cover (2) and install the four fasteners (1).
2. Tighten the fasteners (1) to the proper Refer to [TORQUE SPECIFICATIONS](#) .

3. Position the tailgate cover (2) and install the eight fasteners (1).
4. Tighten the fasteners to the proper Refer to [TORQUE SPECIFICATIONS](#) .
5. On vehicles equipped with a bed liner, position the tailgate liner to the tailgate.
6. Insert the fasteners and tighten securely.

CYLINDER, LOCK

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Remove the exterior handle Refer to [HANDLE, LATCH RELEASE, REMOVAL AND INSTALLATION](#).
2. Remove the screws (2) and remove the lock cylinder (1) from the handle (3).

2309144943

INSTALLATION

1. Install the lock cylinder (1) onto the handle assembly (3) and install the screws (2).
2. Tighten the screws to the proper Refer to [TORQUE SPECIFICATIONS](#) .
3. Install the exterior handle Refer to [HANDLE, LATCH RELEASE, REMOVAL AND INSTALLATION](#).

HANDLE, LATCH RELEASE

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .
2. Remove the covers as needed Refer to [COVER, TAILGATE, REMOVAL AND INSTALLATION](#).

2309154800

3. Release the clip (2) and separate the link from the actuator assembly.
4. Remove the fastener (3)
5. Remove the nuts (1) and separate the actuator.

6. From inside the tailgate, release the lower clips (1) to release the handle from the outer skin of the tailgate.

7. Pull the handle assembly out and release the upper tabs (1).
8. Remove the handle assembly (2).

9. Disconnect the center high mounted tail light wire harness connector (1).

INSTALLATION

1. Connect the center high mounted tail light wire harness connector (1).

2. Install the handle assembly (2) into the tailgate at a 45 degree angle and seat the upper tabs (1) fully.
3. Seat the handle assembly (2) into the tailgate at the bottom fully.

4. Position the actuator back into place.
5. Install the nuts (1) and tighten to the proper Refer to [TORQUE SPECIFICATIONS](#) .
6. Install the fastener (3) and tighten to the proper Refer to [TORQUE SPECIFICATIONS](#) .
7. Install the control rod onto the actuator assembly and seat the clip (2) fully.
8. Install the covers as needed Refer to [COVER, TAILGATE, REMOVAL AND INSTALLATION](#).
9. Connect the negative battery cable(s). Refer to the appropriate service information .

LATCH

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .
2. Remove the tailgate cover Refer to [COVER, TAILGATE, REMOVAL AND INSTALLATION](#).

3. Disconnect the control link (1) from the latch being serviced.

4. Remove the bolts (1 and 2) that secure the latch to the tailgate and position the tailgate check cable out of the way.

5. Remove the latch (2) from the tailgate (1).

INSTALLATION

1. Loosely assemble the latch (2) to the tailgate (1).

2. Install the cable and anchor bolt (2) to the latch.
3. Install the bolt (1) securing the latch.
4. Tighten the fasteners to the proper Refer to [TORQUE SPECIFICATIONS](#) .

5. Connect the control link (1) to the latch and seat the clip fully.
6. Install the tailgate cover Refer to [COVER, TAILGATE, REMOVAL AND INSTALLATION](#).
7. Connect the negative battery cable(s). Refer to the appropriate service information .

PROP, GAS

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Remove the tail lamp unit Refer to [LAMP, TAIL STOP TURN, REMOVAL AND INSTALLATION](#) .

2. Using a small flat bladed tool (1) or equivalent, release the retaining clip (2) while pulling the ball socket away from the ball stud.

NOTE: Release the clip (2) only enough to release the ball socket.

3. Remove the support cylinder from the upper (1) and lower (2) ball studs.

INSTALLATION

1. Make sure the retaining clips are seated into the ball sockets fully.
2. Install the support cylinder over the upper (1) and lower (2) ball studs with the thin end connected to the lower ball stud and the retaining clips snapping into place fully.
3. Install the tail lamp unit Refer to [LAMP, TAIL STOP TURN, REMOVAL AND INSTALLATION](#) .

SPOILER

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, release the retaining clips and remove the spoiler (1) from the tailgate (2).

INSTALLATION

1. Position the spoiler (1) to the holes in the top of the tailgate (2).
2. Insert the locating pin into the center of the tailgate top and line up the retaining clips into the holes.
3. Working from the center outward, tap the retaining clips into the holes until fully secured.

STRIKER, LATCH

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Open the tailgate and using a grease pencil or equivalent, mark the location of the tailgate striker (1) being serviced.
2. Remove the tailgate striker from the cargo box (2).

INSTALLATION

1. Position the tailgate striker (1) to the cargo box (2) using the reference mark made during the removal procedure.
2. Tighten the tailgate striker to proper Refer to [TORQUE SPECIFICATIONS](#) .

TAILGATE

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .

2. Open the tailgate and locate the tailgate check cable on the left and right of the cargo box below the tailgate striker as necessary.

3. Remove the bolts (1) and remove the tailgate check cable(s) from the cargo box.

4. Using a trim stick or equivalent, separate the cover plate (2) from the rear cargo box sill panel.

5. Disconnect the wire harness connectors (1), if equipped.

6. Remove the bolt (1) and remove the lock plate (2).

7. Partially close the tailgate so that the notch in the right side tailgate pivot pocket (2) aligns with the flats on the right side tailgate pivot pin.
8. Lift the tailgate upward far enough to disengage the tailgate pivot pocket from the right side tailgate pivot pin.
9. Carefully slide the tailgate to the right far enough to disengage it from the left side tailgate pivot pin (1) and remove the tailgate.

10. If required, remove the bushing (1) from each tailgate pivot pocket (2).

INSTALLATION

1. If removed, install the bushing (1) into each tailgate pivot pocket (2).

2. Position the tailgate to the left side tailgate pivot pin (1).
3. Partially close the tailgate so that the notch in the right side tailgate pivot pocket aligns with the flats on the right side tailgate pivot pin (2).
4. Lower the tailgate to the right side tailgate pivot pin (2).

5. Install the lock plate (2) and install the screw (1)
6. Tighten the screw (1) to the proper Refer to [TORQUE SPECIFICATIONS](#) .

7. Position the tailgate check cable onto the left and right side of the cargo box.
8. Install the bolts (1) that secure the tailgate check cable(s) to the box and tighten to the proper Refer to [TORQUE SPECIFICATIONS](#) .

9. If equipped, connect the wire harness connectors (1) and seat the cover plate (2) back into the cargo box sill and seat fully.
10. Connect the negative battery cable(s). Refer to the appropriate service information .

DOORS - FRONT

STANDARD PROCEDURE

STANDARD PROCEDURE - CLINCH NUT REPAIR

Cross-Threaded Clinch Nut

1. Drill out threads by drilling 6.3 mm (0.25 in.) hole through clinch nut.
2. Tap length of hole for an M6 - 1.0 thread.
3. Install 06101025 (M6 Heli-Coil) so that the Heli-Coil is at or just below surface of clinch nut.
4. Break off tang at end of Heli-Coil.

Missing Clinch Nut

Option 1 - Coupon And Clinch Nut

1. Obtain 1.0 mm (0.04 in.) thick aluminum (MS.50005-AA6000-HF P1 U) coupon (25 mm x 25 mm) (1.0 in. x 1.0 in.).

2. Place coupon over hole area to verify there is enough space to weld coupon onto inner panel.
3. Drill a 10 mm (0.4 in.) hole in center of coupon for installation of clinch nut.
4. Align hole of coupon with hole of inner panel where the clinch nut is missing. TIG weld coupon over hole location.
5. Install 06511973AA (M6 clinch nut) using the clinch nut installation tool.
6. Paint the surrounding areas for corrosion protection as per PSOP 8500.

Option 2 - New Clinch Nut

1. Dip clinch nut in zinc-rich primer (PPG 1808 or MS-PB7-5) and install wet clinch nut 06511973AA using clinch nut installation tool.

CHANNEL, DOOR GLASS

REMOVAL AND INSTALLATION

DOOR GLASS CHANNEL

REMOVAL

1 - Trim

2 - Door Frame

3 - Clip

1. Lower the door glass to the lowest position.
2. Using a trim stick or equivalent, separate the clip and remove the trim from the door frame.
3. Remove the outer belt molding. Refer to **MOLDING, OUTER BELT, REMOVAL AND INSTALLATION**.

1 - Door Glass Channel

4. Starting at the rear of the door, separate the door glass channel from the door. Lift up at the front to remove from the front glass run.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Using soapy water, slide the front of the door glass channel down into the front glass run.
- Starting at the front of the door, install the door glass channel to the door.
- Verify the trim clips are fully seated.

CHECK, DOOR

REMOVAL AND INSTALLATION

DOOR CHECK

REMOVAL

1. Remove the carrier plate. Refer to [PLATE, CARRIER, REMOVAL AND INSTALLATION](#).

1 - Check Arm

2 - Check Arm Bolt

2. Open the door and remove the check arm bolt connecting the check arm to the A-pillar.

1 - Check Strap Nut

3. Remove the nuts securing the check strap to the door.

1 - Check Strap

4. Remove the check strap from the door opening.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Install the nuts and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- Tighten the bolt to the proper. Refer to [TORQUE SPECIFICATIONS](#) .

CYLINDER, DOOR LOCK

REMOVAL AND INSTALLATION

DOOR LOCK CYLINDER

REMOVAL

1 -Tool
2 - Plate Screw
3 - Lock Cylinder

1. Remove the protective tape used to cover the slide plate screw located rearward of the door lock cylinder.
2. Using a suitable tool turn the screw counter-clockwise to move the slide plate forward in the support bracket. **Do not attempt to remove the slide plate screw.**
3. Continue to turn the screw while lightly pulling on the lock cylinder, until the cylinder is removed.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Once properly positioned and while pushing the door lock cylinder against the door, turn the slide plate screw accessible rearward of the lock cylinder and tighten securely.

DOOR

REMOVAL AND INSTALLATION

DOOR

REMOVAL

1 - Wiring Cover

1. Using a trim stick, release and remove the wiring cover.

1 - Support Bracket

2 - Wire Harness Connector

2. Disconnect the wire harness connector and release the wire harness from the support bracket.

1 - Door Check

2 - Door Check Bolt

3. Remove the door check bolt securing the door check.

1 - Hinges
2 - Pins
3 - Door Nuts

4. Remove the door nuts and lift the door up off hinges and remove.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Align pins on door hinges to holes in hinges on body and position door into place.
- Install the nuts and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- Install the door check bolt and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- If necessary, adjust the door. Refer to [GAP AND FLUSH, SPECIFICATIONS](#).
- Verify the wiring cover is fully seated.

GLASS, DOOR

REMOVAL AND INSTALLATION

DOOR GLASS

REMOVAL

1. Remove the front door trim panel. Refer to [PANEL, DOOR TRIM, REMOVAL AND INSTALLATION](#).

1 - Window
2 - Access Holes
3 - Access Hole Plugs

NOTE: Left side shown in illustration, right side similar.

2. Remove the inner belt weatherstrip from the front door.
3. Open the access hole plugs and position aside.
4. Remove the window motor and lower the window until the glass fasteners are visible in both access holes. Refer to [MOTOR, WINDOW REGULATOR, REMOVAL AND INSTALLATION](#).

1 - Glass Fasteners

5. Loosen the glass fasteners

1 - Regulator Lift Plate

2 - Lower Glass Tabs

6. Using a hook-type tool or equivalent, release the lower glass tabs from the regulator lift plates.

1 - Door Glass

2 - Window Opening

WARNING: Use care when removing the door glass to prevent breakage. Do not force the glass out of the door. Failure to follow this warning may result in serious injury.

7. Carefully rotate the door glass within the window opening and remove the glass from the door through the window opening.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- From the outside of the front door, insert the front side of the glass into the top of the door shell first to load the glass into the door.
- Rotate the door glass into position and secure it to the window regulator glass sliders making sure the glass and lift plates are properly seated.
- Tighten the glass fasteners to the proper. Refer to [TORQUE SPECIFICATIONS](#) .

HANDLE, EXTERIOR

REMOVAL AND INSTALLATION

EXTERIOR HANDLE

REMOVAL

NOTE: Left side shown in illustration, right side similar.

1 - Door Handle Cap

2 - Door Handle Gasket

3 - Tool

1. Remove the protective tape used to cover the slide plate screw located rearward of the door handle cap.
2. Using a suitable tool, turn the screw counter-clockwise to move the slide plate forward in the outside door handle bracket. **Do not attempt to remove the slide plate screw.**
3. Continue to turn the screw while lightly pulling on the door handle cap until the cap is removed.

1 - Wire Harness Connector
2 - Door
3 - Door Handle

4. Slide handle rearward and out.

5. Disconnect the wire harness connector and remove the handle.

NOTE: Left side shown in illustration, right side similar.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Slide the handle in and forward.
- Once properly positioned and while pushing the handle cap against the handle gasket, tighten the screw accessible rearward of the handle to the proper and install the protective tape over the fastener opening. Refer to [TORQUE SPECIFICATIONS](#).

HANDLE, INTERIOR

REMOVAL AND INSTALLATION

INTERIOR HANDLE

REMOVAL

1. Remove the front door trim panel. Refer to [PANEL, DOOR TRIM, REMOVAL AND INSTALLATION](#).

1 -Bezel Screws
2 - Interior Handle

2. Disconnect the wire harness connectors as necessary.
3. Remove the bezel screws.
4. Remove the interior handle from the door trim panel.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- All fasteners are tightened securely.

HINGE, DOOR

REMOVAL AND INSTALLATION

DOOR HINGE

REMOVAL

1. Remove the door. Refer to [DOOR, REMOVAL AND INSTALLATION](#).

1 - Body Side Hinge
2 - Door Hinge Body Bolts

2. Using a grease pencil or equivalent, mark the position of the door hinge on the door and on the body to aid installation.
3. Remove the door hinge to body bolts and remove the body side hinge.

1 - Door Hinge Bolts
2 - Door Side Hinge

4. Remove the door hinge to door bolts and remove the door side hinge.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- A suitable body sealant should be used when removing or moving the hinges.
- Position the door hinge and loosely install the door side bolts.
- Align the door hinge to the reference marks made previously and tighten door side bolts.
- Tighten the door side bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- Position the body side door hinge and loosely install the body side bolts.
- Align the door hinge to the reference marks made previously and tighten the door hinge bolts.
- Tighten body side bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- If necessary, adjust the door. Refer to [GAP AND FLUSH, SPECIFICATIONS](#).

LATCH, DOOR

REMOVAL AND INSTALLATION

DOOR LATCH

REMOVAL

1. Remove the carrier plate. Refer to [PLATE, CARRIER, REMOVAL AND INSTALLATION](#).

1 - Wire Harness
2 - Glass Run Channel
3 - Screws

2. Remove the screws for the glass run channel.
3. Separate the wire harness from glass run and handle support.

1 - Latch Presenter
2 - Wire Harness Connector
3 - Control Rod
4 - Latch Cover Tabs

4. Disconnect the control rods.
5. Disconnect the wire harness connector.
6. Release the latch cover tabs and remove the latch presenter.

1 - Lock Cables

7. Disconnect handle and lock cables and remove the latch assembly.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- All fasteners are tightened securely.

MOLDING, OUTER BELT

REMOVAL AND INSTALLATION

OUTER BELT MOLDING

REMOVAL

1 - Flag Trim

2 - Door

3 - Clips

1. Using a trim stick or equivalent, separate the clips and remove the flag trim from the door.

1 - Belt Molding Remover Tool

2 - Outer Belt Molding

2. Lower the door glass fully.
3. Using special tool (special tool #9093, Remover, Belt Moldings) between belt molding and glass, push down on outer belt molding and rotate upper part of tool outward from vehicle approximately 6-8 cm (2.5-3.0 in.) then lift up on molding to disengage from locking tabs.

1 - Belt Molding

2 - Glass Opening Flange

4. Remove the belt molding from the glass opening flange.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Verify all clips are fully secured.

PANEL, DOOR TRIM

REMOVAL AND INSTALLATION

DOOR TRIM PANEL

REMOVAL

1 - Handle Clip

2 - Window Handle Tool

3 - Handle

1. Using a standard window handle tool, release the handle clips and remove the handle from the window lift mechanism, if equipped with a manual regulator.

1 - Door Interior Handle Bolt

2 - Trim Cover

2. Using a small pick type tool or equivalent at the slot, remove the trim cover.
3. Remove the door interior handle bolt.

1 - Lower Screw

2 - Armrest Bolt

4. Remove the lower screws.

5. Remove the armrest bolts.

1 - Push Pin Fasteners

6. Using special tool (special tool #C-4829A, Remover, Trim), separate the push pin fasteners.

1 - Door
2 - Trim Panel Assembly
3 - Inner Door

7. Separate the trim panel assembly from the door.

1 - Cable Barrel Ends
2 - Interior Handle Cables

8. Disconnect the wire harness connectors as necessary.

9. Disconnect the interior handle cables and remove the barrel end from the interior handle.

NOTE: Prior to installing the door trim panel, replace any trim panel retaining clips that may have been damaged during the removal process.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Install the armrest bolts and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- Install the door interior handle bolt under handle trim cover and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .

PLATE, CARRIER

REMOVAL AND INSTALLATION

CARRIER PLATE

REMOVAL

1. Remove the exterior handle. Refer to [HANDLE, EXTERIOR, REMOVAL AND INSTALLATION](#) [HANDLE, INTERIOR, REMOVAL AND INSTALLATION](#).
2. Remove the lock cylinder, if equipped. Refer to [CYLINDER, DOOR LOCK, REMOVAL AND INSTALLATION](#).

1 - Exterior Handle Support Screw
2 - Handle Gasket
3 - Bracket Hook
4 - 2nd Hook

3. Remove the handle gasket.
4. Loosen the exterior handle support screw but do not remove it.
5. Release the bracket hook from the outer panel and slide the handle bracket forward.
6. Remove the front door trim panel. Refer to [PANEL, DOOR TRIM, REMOVAL AND INSTALLATION](#).

1 - Window
2 - Access Holes
3 - Access Plug

7. Open the access plugs and position aside.
8. Remove the window motor and lower the window until the glass fasteners are visible in both access holes. Refer to [MOTOR, WINDOW REGULATOR, REMOVAL AND INSTALLATION](#).

1 - Fasteners
2 - Access Plug

9. Loosen the glass fasteners.

1 - Regulator Lift Plate

2 - Lower Glass Tabs

10. Using a hook-type tool or equivalent, release the lower glass tabs from the regulator lift plates.

11. Secure the window glass into place with a wedge or tape.

1 - Power Mirror Wire Harness

12. Disconnect the power mirror wire harness connector.

1 -Front Door Latch Mounting Screws

13. Remove the front door latch mounting screws.

1 - Wire Cover

14. Using a trim stick, release and remove the wiring cover.

1 - Support Bracket

2 - Wire Harness Connector

15. Disconnect the wire harness connector and release the wire harness from the support bracket.

1 - Screw

2 - Support Clips

3 - Front Door Wire Harness

16. Release the harness support clips.

17. Remove the screws from the front door wire harness bracket from the front of the door.

1 - Door Interior
2 - Carrier Plate Assembly
3 - This bolt hole is a locator used during the trim panel removal and installation. (Do Not Add Bolt.)
4 - Carrier Plate Assembly Bolts
5 - Latch Assembly

18. Remove the carrier plate assembly bolts and separate the carrier plate assembly from the door.
19. Move the assembly forward in the door and remove the latch assembly from the door interior and remove the carrier plate.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

1 - Door Interior

2 - Carrier Plate Assembly
3 - This bolt hole is a locator used during the trim panel removal and installation. (Do Not Add Bolt.)
4 - Carrier Plate Assembly Bolts
5 - Latch Assembly

- Do not add a bolt to hole. This bolt hole is a locator used during the trim panel removal and installation.
- Install the door latch bolts and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- Position the door glass and secure it to the window regulator glass sliders, making sure the glass and lift plates are properly seated.
- Tighten the door glass bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#) .

1 - Exterior Handle Support Screw
2 - Handle Gasket
3 - Bracket Hook
4 - 2nd Hook

- Engage the exterior handle support screw into the slot of the outer panel and engage the bracket hook over the edge of the outer panel.
- Engage the 2nd hook onto the outer panel at the key cylinder hole.
- While pushing the bracket hook rearward, tighten the exterior handle support screw to the proper. Refer to [TORQUE SPECIFICATIONS](#) .

REGULATOR, WINDOW

REMOVAL AND INSTALLATION

WINDOW REGULATOR

REMOVAL

1. Remove the carrier plate. Refer to [PLATE, CARRIER, REMOVAL AND INSTALLATION](#).

1 -Socket
2 - Window Motor Post

2. Use a small socket or equivalent to aid releasing the window motor posts from the carrier plate.

1 - Regulator
2 - Fasteners

3. Remove the fasteners and remove the regulator.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- All fasteners are tightened securely.

STRIKER, DOOR LATCH

REMOVAL AND INSTALLATION

DOOR LATCH STRIKER

REMOVAL

1 - Door Striker Bolt

2 - Door Latch Striker

NOTE: The front door and rear door latch strikers are removed the same way.

1. Using a grease pencil or equivalent, mark the position of the door latch striker to aid installation.
2. Remove the door striker bolts and the door latch striker.

NOTE: If any shims are used between the door latch striker and body, reuse them during installation.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Align the door latch striker with the reference mark made previously and tighten the door latch striker bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- Verify door fit and operation. Adjust the door latch striker if necessary. Refer to [GAP AND FLUSH, SPECIFICATIONS](#).

DOORS - REAR, FULL

STANDARD PROCEDURE

STANDARD PROCEDURE - CLINCH NUT REPAIR

2310131146

Cross-Threaded Clinch Nut

1. Drill out threads by drilling 6.3 mm (0.25 in.) hole through clinch nut.
2. Tap length of hole for an M6 - 1.0 thread.
3. Install 06101025 (M6 Heli-Coil) so that the Heli-Coil is at or just below surface of clinch nut.
4. Break off tang at end of Heli-Coil.

Missing Clinch Nut

Option 1 - Coupon And Clinch Nut

1. Obtain 1.0 mm (0.04 in.) thick aluminum (MS.50005-AA6000-HF P1 U) coupon (25 mm x 25 mm) (1.0 in. x 1.0 in.).
2. Place coupon over hole area to verify there is enough space to weld coupon onto inner panel.
3. Drill a 10 mm (0.4 in.) hole in center of coupon for installation of clinch nut.
4. Align hole of coupon with hole of inner panel where the clinch nut is missing. TIG weld coupon over hole location.
5. Install 06511973AA (M6 clinch nut) using the clinch nut installation tool.
6. Paint the surrounding areas for corrosion protection as per PSOP 8500.

Option 2 - New Clinch Nut

1. Dip clinch nut in zinc-rich primer (PPG 1808 or MS-PB7-5) and install wet clinch nut 06511973AA using clinch nut installation tool.

CHECK, DOOR

REMOVAL AND INSTALLATION

DOOR CHECK

REMOVAL

1 - Door Check

2 - Door Check Strap Bolt

1. Open the door and remove the door check strap bolt connecting the door check to the B-pillar.
2. Remove the carrier plate. Refer to [PLATE, CARRIER, REMOVAL AND INSTALLATION](#).

1 - Door Frame

2 - Foam Stuffer

3. Remove the foam stuffer from the door frame.

1 - Door Check Strap Nut

4. Remove the door check strap nuts securing the door check strap to the door.

1 - Door Check Strap

5. Remove the door check strap from the door opening.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Install the door check strap nuts and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- Tighten the door check strap bolt to the proper. Refer to [TORQUE SPECIFICATIONS](#) .

DOOR, REAR

REMOVAL AND INSTALLATION

REAR DOOR

REMOVAL

1 - B-Pillar Trim Cover

1. Using a trim stick, release and remove the B-pillar trim cover.

1 - Support Bracket

2 - Wire Harness Connector

3 - Wire Harness

2. Disconnect the wire harness connector and release the wire harness from the support bracket.

- | |
|---------------------------|
| 1 - Door Check Strap |
| 2 - Door Check Strap Bolt |

3. Remove the door check strap bolt securing the door check strap.

- | |
|---------------------------|
| 1 - Hinge |
| 2 - Pins |
| 3 - Door Hinge Pivot Nuts |

4. Remove the door hinge pivot nuts and lift the door up off hinges and remove.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Align pins on door hinges to holes in hinges on body and position door into place.

- Install the door hinge pivot nuts and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- Install the door check strap bolt and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- If necessary, adjust the door. Refer to [GAP AND FLUSH, SPECIFICATIONS](#).
- Verify the B-Pillar wiring cover is fully seated.

GLASS, DOOR

REMOVAL AND INSTALLATION

DOOR GLASS

REMOVAL

1. Remove the outer belt molding from the door. Refer to [MOLDING, DOOR BELT, OUTER, REMOVAL AND INSTALLATION](#).
2. Remove the carrier plate. Refer to [PLATE, CARRIER, REMOVAL AND INSTALLATION](#).

1 - Glass
2 - Door Stationary Glass Fastener

NOTE: Left side shown in illustration, right side similar.

3. Slide the glass down to the bottom of the door.
4. Remove the inner belt molding from the door.
5. Remove the door stationary glass fastener securing the fixed glass into the door.

1 - Weather Strip

2 - Stationary Glass

6. Separate the weather strip from the window frame and remove the stationary glass and weather strip from the door.

1 - Door Glass

2 - Window Opening

WARNING: Use care when removing the door glass to prevent breakage. Do not force the glass out of the door. Failure to follow this warning may result in serious injury.

7. Carefully remove the door glass from the window opening.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Carefully lower the glass in through the window opening and rest in the bottom of the door.
- Position the stationary glass and the weather strip into the window frame and seat fully.
- Install the door stationary glass fastener and tighten to the proper. Refer to [**TORQUE SPECIFICATIONS**](#) .

HANDLE, EXTERIOR

REMOVAL AND INSTALLATION

EXTERIOR HANDLE

REMOVAL

NOTE: Left hand shown in illustration, right hand similar.

1 - Slide Plate Screw

2 - Weather strip

1. Position the weather strip aside to access the slide plate screw located rearward of the cap.

1 - Door Handle Cap
2 - Outside Door Handle Gasket
3 - Tool

- Using a suitable tool, turn the screw counter-clockwise to move the slide plate forward in the outside door handle gasket. **Do not attempt to remove the slide plate screw.**
- Continue to turn the screw while lightly pulling on the door handle cap until the cap is removed.

1 - Door
2 - Handle

- Pull the handle out slightly, then slide the handle rearward and out.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Position the handle to the door and gasket.
- Slide the handle in and forward.
- Once properly positioned and while pushing the handle cap against the handle gasket, tighten the screw accessible rearward of the handle to the proper and position the weather strip back into place. Refer to [TORQUE SPECIFICATIONS](#) .

HANDLE, INTERIOR

REMOVAL AND INSTALLATION

INTERIOR HANDLE

REMOVAL

1. Remove the front door trim panel. Refer to [PANEL, DOOR TRIM, REMOVAL AND INSTALLATION](#).

1 - Interior Handle
2 - Bezel Fasteners

2. Disconnect the wire harness connectors as necessary.
3. Remove the bezel fasteners.
4. Remove the interior handle from the door trim panel.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- All fasteners are tightened securely.

HINGE, DOOR

REMOVAL AND INSTALLATION

DOOR HINGE

REMOVAL

1. Remove the door. Refer to [DOOR, REAR, REMOVAL AND INSTALLATION](#).

1 - Body Side Hinge

2 - Door Hinge Body Bolts

2. Using a grease pencil or equivalent, mark the position of the door hinge on the door and on the body to aid installation.

3. Remove the door hinge to body bolts and remove the body side hinge.

1 - Door Hinge Bolts

2 - Door Side Hinge

4. Remove the door hinge to door bolts and remove the door side hinge.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- A suitable body sealant should be used when removing or moving the hinges.
- Position the door hinge and loosely install the door side bolts.
- Align the door hinge to the reference marks made previously and tighten door side bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- Position the body side door hinge and loosely install the body side bolts.
- Align the body side door hinge to the reference marks made previously and tighten the body side door hinge bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- If necessary, adjust the door. Refer to [GAP AND FLUSH, SPECIFICATIONS](#).

LATCH, DOOR

REMOVAL AND INSTALLATION

DOOR LATCH

REMOVAL

1. Remove the carrier plate. Refer to [PLATE, CARRIER, REMOVAL AND INSTALLATION](#).

1 - Fasteners
2 - Handle Bracket
3 - Actuator Rod
4 - Clip

2. Remove the fasteners for the handle bracket.
3. Disconnect the actuator rod.
4. Release the clips and remove the handle bracket from the latch and presenter bracket.

1 - Wire Harness Connector
2 - Latch
3 - Latch Cover Tabs

5. Disconnect the wire harness connector.
6. Release the latch cover tabs and remove the latch from the presenter bracket.

1 - Cable Ends
2 - Handle and Lock Cable

7. Disconnect the handle and lock cables and remove the cable ends from the latch assembly.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- All fasteners are tightened securely.

MOLDING, DOOR BELT, OUTER

REMOVAL AND INSTALLATION

DOOR BELT OUTER MOLDING

REMOVAL

1 - Tool

2 - Outer Belt Molding

1. Lower the door glass fully.
2. Using special tool (special tool #9093, Remover, Belt Moldings) between belt molding and glass, push down on outer belt molding and rotate upper part of tool outward from vehicle approximately 6-8 cm (2.5-3.0 in.) then lift up on molding to disengage from locking tabs.

2311126627

- | |
|--------------------------|
| 1 - Belt Molding |
| 2 - Glass Opening Flange |

3. Remove the belt molding from the glass opening flange.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- All fasteners are tightened securely.

PANEL, REAR DOOR TRIM

REMOVAL AND INSTALLATION

REAR DOOR TRIM PANEL

REMOVAL

- | |
|---------------------------------|
| 1 - Handle Clip |
| 2 - Standard Window Handle Tool |
| 3 - Handle |

1. Using a standard window handle tool, release the handle clips and remove the handle from the window lift mechanism, if equipped with a manual regulator.

Front door shown in illustration, rear door similar.

1 - Door Interior Handle Bolt

2 - Trim Cover

2. Using a small pick type tool or equivalent, inserted into the slot, remove the trim cover.
3. Remove the door interior handle bolt.

1 - Door Armrest Bolt

2 - Fasteners

4. Remove the fasteners and the door armrest bolt.

1 - Push Pin Fasteners

5. Using special tool (special tool #C-4829A, Remover, Trim), separate the six push pin fasteners.

1 -Door

2 - Trim Panel Assembly

6. Separate the trim panel assembly from the door.

1 - Interior Cable Ends
2 - Cable Housings

7. Disconnect the wire harness connectors as necessary.

8. Release the cable housings then disconnect the interior handle cable ends and remove the trim panel assembly.

NOTE: Prior to installing the door trim panel, replace any trim panel retaining clips that may have been damaged during the removal process.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Hand tap panels to seat fully.
- Verify panel alignment and tab engagement.
- Install the door armrest bolt and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- Install the door interior handle bolt and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .

1 - Window Handle Crank Hub
2 - Window Crank Handle Retaining Clip

- If equipped with a manual window regulator, position the window crank handle retaining clip back into place on the window crank handle hub.

1 - Window Handle
2 - Post

NOTE: Front door shown in illustration, rear door similar.

- Position the window handle back onto the post and seat fully.

PLATE, CARRIER

REMOVAL AND INSTALLATION

CARRIER PLATE

REMOVAL

1. Remove the exterior handle. Refer to [HANDLE, EXTERIOR, REMOVAL AND INSTALLATION](#).

1 - Exterior Handle Support Screw

2 - Handle Gasket

3 - Hook

2. Remove the handle gasket.
3. Loosen the exterior handle support screw but do not remove it, and slide the handle bracket forward.
4. Remove the door trim panel. Refer to [PANEL, REAR DOOR TRIM, REMOVAL AND INSTALLATION](#).

1 - Window

2 - Access Hole

3 - Access Plug

5. Open the access plug and position aside.
6. Remove the window motor and lower the window until the door glass bolt is visible in the access hole.
Refer to **MOTOR, WINDOW REGULATOR, REMOVAL AND INSTALLATION**.

1 - Door Glass Bolt

2 - Access Plug

7. Loosen the door glass bolt.

1 - Regulator Lift Plate

2 - Lower Glass Tabs

8. Using a hook-type tool or equivalent, release the lower glass tabs from the regulator lift plates.
9. Secure the window glass into place with a wedge or tape.

1 - Door Latch Mounting Bolts

10. Remove the door latch mounting bolts.

1 - B-Pillar Trim Cover

11. Using a trim stick, release and remove the B-pillar trim cover.

- | |
|----------------------------|
| 1 - Support Bracket |
| 2 - Wire Harness Connector |
| 3 - Wire Harness Strap |

12. Disconnect the wire harness connector and release the wire harness strap from the support bracket.

- | |
|-----------------------|
| 1 - Screw |
| 2 - Door Wire Harness |

13. Release the wire harness support clips.

14. Remove the screw securing the door wire harness bracket to the front of the door.

1 - Door Interior
2 - Carrier Plate Assembly
3 - This bolt hole is a locator used during the trim panel removal and installation. (Do Not Add Bolt.)
4 - Carrier Plate Bolt
5 - Latch Assembly

15. Remove the carrier plate bolts and separate the carrier plate assembly from the door.

16. Move the assembly forward in the door and remove the latch assembly from the door interior and remove the carrier plate.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

1 - Door Interior

2 - Carrier Plate Assembly
3 - This Bolt Hole Is A Locator Used During The Trim Panel Removal And Installation. (Do Not Add Bolt)
4 - Carrier Plate Bolt
5 - Latch Assembly

- Do not add a bolt to hole. This bolt hole is used during the trim panel removal and installation.
- Install the door latch screws and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- Position the door glass and secure it to the window regulator glass sliders, making sure the glass and lift plates are properly seated.
- Tighten the door glass bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#) .

1 - Exterior Handle Support Screw
2 - Handle Gasket
3 - Hook

- While pushing the hook rearward, tighten the exterior handle support screw to the proper. Refer to [TORQUE SPECIFICATIONS](#) .

REGULATOR, WINDOW

REMOVAL AND INSTALLATION

WINDOW REGULATOR

REMOVAL

1. Remove the carrier plate. Refer to [PLATE, CARRIER, REMOVAL AND INSTALLATION](#).

1 - Socket
2 - Window Motor Post

2. Use a small socket or equivalent to aid releasing the window motor posts from the carrier plate.

1 - Regulator
2 - Fasteners

3. Remove the fasteners and remove the regulator.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- All fasteners are tightened securely.

STRIKER, DOOR LATCH

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

NOTE: The front door and rear door latch strikers are removed the same way.

REMOVAL

1. Using a grease pencil or equivalent, mark the position of the door latch striker (2) to aid installation.
2. Remove the bolts (1) and the door latch striker (2).

NOTE: If any shims are used between the door latch striker and body, reuse them during installation.

INSTALLATION

1. Position the door latch striker (2) onto the vehicle and loosely install the bolts (1).

2. Align the door latch striker with the reference mark made previously and tighten the door latch striker bolts to the proper Refer to **TORQUE SPECIFICATIONS** .
 3. Verify door fit and operation. Adjust the door latch striker if necessary Refer to **GAP AND FLUSH, SPECIFICATIONS**.
-

2021 ACCESSORIES AND BODY, CAB

Body - Interior & Exterior (2 Of 2) - Gladiator

EXTERIOR

BOX, PICKUP

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .
2. Disconnect the fuel filler neck from the fuel tank (Refer to the appropriate service information).
3. Disconnect the tail lamp wire harness from the underbody wire harness.
4. If necessary, remove the tail lamp units and wire harness from the cargo box. Refer to [LAMP, TAIL STOP TURN, REMOVAL AND INSTALLATION](#) .
5. If necessary, remove the tailgate. Refer to [TAILGATE, REMOVAL AND INSTALLATION](#) .
6. If necessary, remove the rear bumper. Refer to [BUMPER, REAR, REMOVAL AND INSTALLATION](#) .

7. Using an induction heating type tool, or equivalent, heat up each bolt (2) to soften the thread locking compound on the bolt threads.

CAUTION: DO NOT use power tools to remove or install the fastener(s). If power tools are used, damage to the vehicle or components may occur.

8. Remove and discard the bolts (2) that secure the cargo box (1) to the frame and remove the cargo box.

INSTALLATION

1. Position the cargo box onto the frame and loosely install the bolts.
2. Align the cargo box to the cab and tighten the bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#) .

3. If removed, install tail lamp units and wire harness to the cargo box. Refer to [LAMP, TAIL STOP TURN, REMOVAL AND INSTALLATION](#) .
4. Connect the tail lamp wire harness to the underbody wire harness.
5. If removed, install the tailgate. Refer to [TAILGATE, REMOVAL AND INSTALLATION](#) .
6. If removed, install the rear bumper. Refer to [BUMPER, REAR, REMOVAL AND INSTALLATION](#) .
7. Connect the fuel filler neck at the fuel tank (Refer to the appropriate service information).
8. Connect the negative battery cable(s). Refer to the appropriate service information .

CAB

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

This procedure for use with vehicles equipped with a 3.0L diesel engine.

REMOVAL

1. Secure the steering wheel with the tires in the **straight ahead position** .
2. Using a brake pedal holding tool, depress the brake pedal past its first 25 mm (1.0 in.) of travel and hold it in this position. This will isolate the master cylinder from the brake hydraulic system and will not allow the brake fluid to drain out of the master cylinder reservoir while the lines are disconnected.
3. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .
4. Recover the A/C refrigerant from the refrigerant system

Refer to [PLUMBING, STANDARD PROCEDURE](#) .

5. Remove the coolant reservoir (Refer to the appropriate service information).
6. Remove the floor console. Refer to [CONSOLE, FLOOR, REMOVAL AND INSTALLATION](#) .

7. Loosen the park brake cable adjustment nut (1) to attain slack in the cable in order to disconnect at the wheels.
8. Raise and support the vehicle. Refer to [HOISTING, STANDARD PROCEDURE](#) .
9. Remove the front wheelhouse splash shields. Refer to [SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL AND INSTALLATION](#) .
10. Remove the air dam. Refer to [AIR DAM, FRONT, REMOVAL AND INSTALLATION](#) .

11. Remove the bolts (1) and remove the front skid plate (2).
12. Remove the charge air cooler left hose. Refer to [COOLER AND HOSES, CHARGE AIR, REMOVAL AND INSTALLATION](#) .
13. Remove the air intake assembly and hose. Refer to [BODY, AIR CLEANER, REMOVAL AND INSTALLATION](#) [BODY, AIR CLEANER, REMOVAL AND INSTALLATION](#) . Refer to [HOSE, CLEAN AIR, REMOVAL AND INSTALLATION](#) .

14. Disconnect the tube (1).
15. Remove the upper radiator hose from the radiator.

16. Disconnect the transmission fluid cooler tubes (1) from the transmission fluid cooler.
17. Remove the electric cooling fan (Refer to the appropriate service information).
18. Disconnect the lower radiator hose from the radiator.

19. Remove the A/C suction jumper line (1).
20. Remove the A/C discharge line.

21. Release the retainer(s) (1).

22. Install protective plugs, or tape over the opened refrigerant line fittings and compressor ports.

23. Disconnect the vacuum line (1) and release the retainers.

24. Remove the de-gas hose (1) from the engine and radiator.

25. Release the retainers and position aside the block heater wire harness (1).

26. Disconnect the Powertrain Control Module (PCM) wire harness connector (1) and release it from the wire harness retainers.

27. Remove the nut (3).

28. Release the retainers (1) and position the cable (2) aside.

29. Remove the nuts (1 and 3) the position the cables (2) aside.

30. Release the retainer(s) (1).

31. Disconnect the hose (1).

32. Disconnect the passenger side heater core hose (1).

33. Remove and **DISCARD** the intermediate shaft coupler upper pinch bolt (1) from the steering column end of the steering shaft.
34. Slide the intermediate shaft coupler (2) off of the steering column.

35. Disconnect the wire harness connector (1) located under the air cleaner assembly.

36. Remove the bolt (1) and position the power steering fluid reservoir (2) aside.

37. Disconnect the wire harness connector (1).

38. Disconnect the power steering wire harness connectors (1) and release all harness retainers.

39. Disconnect the wire harness connectors (1) at the front and rear of the right front wheel house.

45. Separate the park brake cables (1) from the support bracket.

46. Remove park brake cable bracket bolts (1).

47. Remove the brake cable end (1) from the brake actuator.

48. Depress the park brake cable tabs and remove the cable (2) from the axle bracket.

49. Pull the park brake cable (1) through the routing bracket and remove the park brake cable (1).

50. If equipped, remove the side steps or rock guards. Refer to **STEP, SIDE, REMOVAL AND INSTALLATION**.

51. Remove the nuts (1) and cover (2).

52. Disconnect the wire harness connectors (3) under the left and right side of the cab.

53. Release the wire harness retainer on the right side of the cab (1).

54. Remove all the body isolator fasteners. Refer to [ISOLATOR, BODY, REMOVAL AND INSTALLATION](#).

NOTE: It is not necessary to remove the isolators to lift the body off the chassis.

55. Disconnect the brake lines (1) from the Hydraulic Control Unit (HCU).

56. Lower the vehicle and reposition the hoist on the lower body flanges.

57. Carefully lift the body off of the chassis.

INSTALLATION

1. Using wheel lift jacks or equivalent, position the chassis under the body.

2. Lower the body onto the isolators.

3. Install all of the body isolator fasteners. Refer to [ISOLATOR, BODY, REMOVAL AND INSTALLATION](#).

4. Connect the brake lines (1). Tighten the brake lines to the proper (Torque Specifications).

5. Install the wire harness retainer on the right side of the cab (1).

6. Connect the wire harness connectors (3) under the left and right side of the cab.
7. Install the cover and tighten the nuts securely.
8. If equipped, install the side steps or rock guards. Refer to [STEP, SIDE, REMOVAL AND INSTALLATION](#).
9. Install the park brake cables. Refer to [CABLE, PARKING BRAKE, REMOVAL AND INSTALLATION](#).

10. Install the park brake cables on the support bracket.

11. Install the cable retainers along the manual park release cable as needed.

12. Install the manual park release cable bracket to the transmission.

13. Install the manual park release cable bracket bolts (1) to the proper (Torque Specifications).

14. Install the cable retainers along the manual park release cable as needed.

15. Install the shift shaft bracket bolts (1) and the nut (2). Tighten the shift shaft bracket bolts and the nut to the proper (Torque Specifications).
16. Connect the shift shaft (3) and install the bracket to the transmission.

17. Connect the wire harness connectors (1) at the front and rear of the right front wheel house.

18. Connect the power steering wire harness connectors (1) and install all wire harness retainers.

19. Connect the wire harness connector (1).

20. Install the power steering fluid reservoir (2) and tighten the power steering fluid reservoir bolt to the proper (Torque Specifications).

21. Connect the wire harness connector (1) located under the air cleaner assembly.

22. Install the intermediate shaft coupler (2) to the steering column.
23. Install a **NEW** intermediate shaft coupler upper pinch bolt (1) to the steering column end of the steering shaft. Tighten the intermediate shaft coupler upper pinch bolt to the proper (Torque Specifications).

24. Connect the passenger side heater core hose (1).

25. Connect the hose (1).

26. Install the retainer(s) (1).

27. Position the cables (2) back to their original location.

28. Install the nuts and tighten to the proper. Refer to the appropriate service information .

29. Install the cable (2) and retainers (1).

30. Install the nut and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .

31. Connect the Powertrain Control Module (PCM) wire harness connector (1) and install the harness retainers.

32. Install the retainers and the block heater wire harness (1).

33. Install the de-gas hose (1) to the engine and radiator.

34. Remove the protective plugs, or tape over the opened refrigerant line fittings and compressor ports.

35. Connect the vacuum line (1) and install the retainers.

36. Install the A/C discharge line. Refer to [LINE, A/C DISCHARGE, REMOVAL AND INSTALLATION](#)

37. Install the A/C suction jumper line. Refer to [LINE, A/C SUCTION JUMPER, REMOVAL AND INSTALLATION](#) .

38. Connect the lower radiator hose at the radiator.

39. Install the retainer(s) (1).

40. Connect the transmission fluid cooler tubes (1).

41. Install the electric cooling fan (Refer to the appropriate service information).

42. Install the upper radiator hose at the radiator.

43. Connect the tube (1).
44. Install the air intake assembly, and hose. Refer to [BODY, AIR CLEANER, REMOVAL AND INSTALLATION](#) [BODY, AIR CLEANER, REMOVAL AND INSTALLATION](#) . Refer to [HOSE, CLEAN AIR, REMOVAL AND INSTALLATION](#) .
45. Install the charge air cooler left hose. Refer to [COOLER AND HOSES, CHARGE AIR, REMOVAL AND INSTALLATION](#) .

46. Install the front skid plate (2) and the bolts (1). Tighten the front skid plate bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
47. Install the air dam. Refer to [AIR DAM, FRONT, REMOVAL AND INSTALLATION](#) .
48. Install the front wheelhouse splash shields. Refer to [SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL AND INSTALLATION](#) .
49. Perform the park brake adjustment procedure. Refer to [STANDARD PROCEDURE](#) .
50. Install the floor console. Refer to [CONSOLE, FLOOR, REMOVAL AND INSTALLATION](#) .
51. Install the coolant reservoir (Refer to the appropriate service information).
52. Charge the A/C refrigerant system. Refer to [PLUMBING, STANDARD PROCEDURE](#) .

53. Bleed the brake system. Refer to [STANDARD PROCEDURE](#) .
54. Connect the negative battery cable(s). Refer to the appropriate service information .

COVER, COWL PANEL

REMOVAL AND INSTALLATION

UPPER COWL PANEL

REMOVAL

1. Remove the wiper arms. Refer to [ARM, WIPER, REMOVAL AND INSTALLATION](#) .

1 - Upper Trim Cover

2. Using a (special tool #C-4755, Trim Stick) or equivalent, release the retaining clips and remove the upper trim cover.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Verify all clips are fully secured.

CROSSMEMBER, RADIATOR, UPPER

REMOVAL AND INSTALLATION

BASE

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .
2. Remove the grille. Refer to [GRILLE, REMOVAL AND INSTALLATION](#).

1 - Fasteners

2 - Closeout Panel

3. Remove the push pin fasteners and remove the closeout panel.

1 - Bolts

2 - Braces

4. Remove the bolts and separate the braces.

1 - Upper Radiator Mount Bolts

5. Remove the upper radiator mount bolts and separate the radiator from the upper crossmember.

1 - Bolts
2 - Upper Crossmember
3 - Wire Harness Connector

6. Disconnect the wire harness connector.
7. Remove the bolts from upper crossmember.

2 - Upper Crossmember

8. Remove the upper crossmember.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle.

TORQUE SPECIFICATIONS

- Install the side and front bolts then tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- Install the upper radiator mount bolts and tighten to the proper. Refer to the appropriate service information .
- Install and tighten the braces bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#) .

FENDER, FRONT

REMOVAL AND INSTALLATION

FRONT FENDER

REMOVAL

1. Remove the upper and side cowl trim panel. Refer to [COVER, COWL PANEL, REMOVAL AND INSTALLATION](#).
2. Remove the wheel opening flare molding. Refer to [MOLDING, FRONT WHEEL OPENING, REMOVAL AND INSTALLATION](#) [MOLDING, REAR WHEEL OPENING, REMOVAL AND INSTALLATION](#).

1 - Fasteners

3. Remove the fasteners securing any accessories to the fender.

1 - Upper Bolt

2 - A-Pillar Bolt

3 - Lower Bolt

4. Remove the lower bolt.

5. Remove the A-pillar bolts.

6. Remove the upper bolts.

1 - Fender

7. Remove the fender.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Position the fender onto the vehicle and install all bolts without tightening.
- Check the fender positioning with the door and the hood. Refer to [GAP AND FLUSH, SPECIFICATIONS](#) .
- Tighten the upper bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- Tighten the A-pillar bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- Tighten the lower bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#) .

GRILLE

REMOVAL AND INSTALLATION

GRILLE

REMOVAL

1 - Push Pins

1. Remove the push pins.

1 - Grille Lower Clip

2. Carefully release the grille lower clips.

1 - Grille

3. Separate and remove the grille.

1 - Camera Wire
2 - Washer Hose

4. Disconnect the camera wire harness connector and washer hose, if equipped.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Verify push pins are fully seated.

HOUSING, FUEL FILL

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .

2. Remove the fuel cap (2) and disconnect the tether.
3. Remove the rear wheelhouse splash shield. Refer to [**SHIELD, SPLASH, REAR WHEELHOUSE, REMOVAL AND INSTALLATION.**](#)

4. From inside the wheelhouse release the four retaining clips (1) rear first followed by the front clips.

5. Separate the housing (1) from the body opening and the fuel filler neck (3).
6. Disconnect the wire harness connector (2) if equipped.

INSTALLATION

1. Connect the wire harness connector (2), if equipped.
2. Position the housing (1) into the body opening and over the fuel filler neck (3).

3. Seat the four clips (1) fully and install the cap and tether (2).
4. Install the rear wheelhouse splash shield. Refer to [SHIELD, SPLASH, REAR WHEELHOUSE, REMOVAL AND INSTALLATION](#).
5. Connect the negative battery cable(s). Refer to the appropriate service information .

ISOLATOR, BODY

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. If removing the front isolators remove the grille. Refer to [GRILLE, REMOVAL AND INSTALLATION](#).

2. Loosen both front isolator nuts (1, 2).

3. Using an induction heating type tool, or equivalent, heat up each bolt to soften the thread locking compound on the bolt threads.

CAUTION: DO NOT use power tools to remove or install the fastener(s). If power tools are used, damage to the vehicle or components may occur.

4. Loosen both front cab isolator bolts (1).

5. Loosen the isolator nuts (1).
6. Using an induction heating type tool, or equivalent, heat up each bolt to soften the thread locking compound on the bolt threads.

CAUTION: DO NOT use power tools to remove or install the fastener(s). If power tools are used, damage to the vehicle or components may occur.

7. Loosen the cab bolts (2).

8. Using an induction heating type tool, or equivalent, heat up each bolt to soften the thread locking compound on the bolt threads.

CAUTION: DO NOT use power tools to remove or install the fastener(s). If power tools are used, damage to the vehicle or components may occur.

9. Loosen the rear isolator bolts (1).

10. Remove the mounting bolts and isolator nuts (1) as necessary.

- 1 - FRONT ISOLATORS (2)
 2 - FRONT CAB ISOLATORS (2)
 3 - REAR ISOLATORS (6)
 4 - REAR CAB ISOLATORS (2)

11. Using a floor jack and wooden block under the body sill, lift the body to gain access to the isolators (1-4) and remove the isolators as necessary.

INSTALLATION

1. Position the rear isolator onto the frame and install the nuts (1).
2. Tighten the nuts (1) to the proper. Refer to [TORQUE SPECIFICATIONS](#).

- 1 - FRONT ISOLATORS (2)
 - 2 - FRONT CAB ISOLATORS (2)
 - 3 - REAR ISOLATORS (6)
- B

3. Position the isolators (1 - 3) under the body as necessary.
4. Lower the cab onto the isolators.

5. Install the mounting bolt (1) and tighten to the proper. Refer to **TORQUE SPECIFICATIONS** .

6. Install the mounting bolt (2) and isolator nuts (1) and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .

7. Install the mounting bolt (1) and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .

8. Install the isolator nuts (1 and 2) tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
9. If removed, install the grille. Refer to [GRILLE, REMOVAL AND INSTALLATION](#).

MIRROR, OUTSIDE REARVIEW

REMOVAL AND INSTALLATION

OUTSIDE REARVIEW MIRROR

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .

1 - Outside Rearview Mirror Bolts

2. Remove the outside rearview mirror bolts.

1 - Mirror Assembly
2 - Wire Harness Connector
3 - Door Opening

3. Separate the mirror assembly and disconnect the wire harness connector.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Install the outside rearview mirror bolts and tighten to the proper. Refer to **TORQUE SPECIFICATIONS** .

MIRROR, OUTSIDE REARVIEW, GLASS

REMOVAL AND INSTALLATION

GLASS OUTSIDE REARVIEW MIRROR

REMOVAL

WARNING: Always wear eye and hand protection when servicing the mirror assembly. Failure to observe these warnings may result in personal injury from broken glass.

1 - Electrical Connector

2 - Mirror Glass

3 - Mirror Assembly

1. Position the mirror glass so that it is facing in toward the vehicle as far as possible.
2. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .
3. Place thumbs behind mirror glass and push out from the mirror assembly. This will release the mirror glass case's snap attachment feature.
4. If equipped, disconnect the electrical connectors and remove the glass.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

NOTE: Pressure must be applied equally over the center portion of the mirror glass to fully engage the mirror glass retaining clips to the mirror motor.

- Using one hand, carefully push the mirror glass onto the mirror motor, while at the same time supporting the mirror housing from the backside with the other hand. Firmly push on the mirror glass holder until all mirror glass retaining clips are seated fully.
- Verify retention of the mirror glass holder by gently pulling outward on the glass.

MOLDING, FRONT WHEEL OPENING

REMOVAL AND INSTALLATION

FRONT WHEEL OPENING MOLDING

REMOVAL

1. Remove the wheelhouse splash shield. Refer to [SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL AND INSTALLATION](#) .

1 - Turn Signal Lamp Wire Harness Connector

2. Disconnect the turn signal lamp wire harness connector.

1 - Mounting Bolts

3. Remove the mounting bolts.

1 - Retaining Clips

4. Using a (special tool #C-4829A, Remover, Trim) or equivalent, release and **DISCARD** the retaining clips.

1 - Flare Molding

5. Remove the flare molding.

1 - Rivet
2 - Flare Extension

6. Remove the rivets and the flare extension, if equipped.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Install and seat the **NEW** retaining clips fully.
- Install the bolts and tighten to the proper. Refer to **TORQUE SPECIFICATIONS** .
- Install **NEW** rivets on to the flare extension, if equipped.

MOLDING, REAR WHEEL OPENING

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Remove the wheelhouse splash shield. Refer to **SHIELD, SPLASH, REAR WHEELHOUSE, REMOVAL AND INSTALLATION**.

2. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, equivalent to release the 15 spring retainers and remove the flare molding (1).

3. It may be necessary to release the clips (2) from the inside using a small socket (1) or equivalent.

INSTALLATION

1. Install the flare molding (1) onto the wheel opening (2) and seat the 15 retaining clips fully.
2. Install the wheelhouse splash shield. Refer to [**SHIELD, SPLASH, REAR WHEELHOUSE, REMOVAL AND INSTALLATION**](#).

NAMEPLATE

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

NOTE: Exterior nameplates are attached to body panels with adhesive tape.

REMOVAL

1. Apply a length of masking tape on the body, parallel to the top edge of the nameplate to use as a guide, if necessary.

2. If temperature is below 21B°C (70B°F), warm emblem with a heat lamp or gun. Do not exceed 52B°C (120B°F) when heating emblem.
3. Insert a plastic trim stick or a hard wood wedge behind the emblem to separate the adhesive backing from the body.
4. Clean adhesive residue from body with MOPARB® Super Kleen solvent or equivalent.

5. Repeat steps 1 - 4 for the rear nameplate.

INSTALLATION

1. Remove carrier from adhesive tape on back of emblem.
2. Position emblem properly on body.
3. Press emblem firmly to body with palm of hand.
4. If temperature is below 21B°C (70B°F), warm emblem with a heat lamp or gun to assure adhesion. Do not exceed 52B°C (120B°F) when heating emblem.

5. Repeat steps 1 - 4 for the side nameplates.

RAILS, UTILITY

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL - SIDE

1. Remove the end fastener (1).

2. Remove the side fasteners (1).

3. Remove the side rail (1) from the box side (2).

REMOVAL - FRONT

1. Remove the fasteners (1).

2. Remove the front rail (1) from the box front (2).

INSTALLATION - SIDE

1. Install the side rail assembly (1) back onto the box side (2).

2. Install the end fastener (1) and tighten to the proper. Refer to [**TORQUE SPECIFICATIONS**](#) .

3. Install the side fasteners (1) and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .

INSTALLATION - FRONT

1. Install the front rail assembly (1) back onto the box front (2).

2. Install the front fasteners (1) and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .

SHIELD, SPLASH, FRONT WHEELHOUSE

REMOVAL AND INSTALLATION

FRONT WHEELHOUSE SPLASH SHIELD

REMOVAL

1. Remove the wheel. Refer to [REMOVAL AND INSTALLATION](#) .

1 - Screws
2 - Rivets
3 - Push Pin Fasteners

2. Remove the screws.
3. Remove and discard the push pin fasteners.
4. Remove the rivets securing the splash shield to the flare molding.
5. Remove the splash shield.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Install the
NEW
rivets.
- Install the
NEW
push pin fasteners.
- Install the screws and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .

SHIELD, SPLASH, REAR WHEELHOUSE

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Remove the rivets (1) securing the splash shield to the flare molding.
2. Remove the five push pin fasteners (2) and remove the splash shield.
3. Remove the three screws (3).

INSTALLATION

1. Install the splash shield and install the five push pin fasteners.
2. Install the three screws.
3. Install new rivets securing the splash shield to the flare molding.

STEP, SIDE

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

NOTE: Side steps and rock rails are similar.

REMOVAL

1. Raise and support the vehicle. Refer to [HOISTING, STANDARD PROCEDURE](#) .

2. Remove the eight nuts (2).
3. Remove the four bolts (1) and remove the side step.

INSTALLATION

1. Install the side step and install the four bolts hand tight.
2. Install the eight nuts and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#).
3. Tighten the bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#).

FOLDING SOFT TOP, 4 DOOR

DESCRIPTION

1 - BRACKET BOW #5 RIGHT	11 - BOW ASSEMBLY #2
2 - COVER ASSEMBLY	12 - BOW ASSEMBLY #3
3 - FRONT GAS PROP RIGHT	13 - FRONT GAS PROP LEFT
4 - BOW SEAL RIGHT	14 - REAR GAS PROP LEFT
5 - LINKAGE ASSEMBLY RIGHT	15 - BOW ASSEMBLY #4
6 - BOW ASSEMBLY #1	16 - BOW ASSEMBLY #5
7 - COMPRESSION PANEL BOW #1	17 - BRACKET BOW #5 LEFT
8 - LATCH BOW #1	18 - REAR GAS PROP RIGHT
9 - BOW SEAL LEFT	19 - TENSION CABLE(S)
10 - LINKAGE ASSEMBLY LEFT	B

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

NOTE:

If the temperature is below 72B°F (24B°C) and/or the top has been folded down for a period of time, the top will appear to have shrunk when you raise it, making it difficult to put up. This is caused by a natural contraction of the vinyl coating on the fabric top.

Place the vehicle in a warm area. Pull steadily on the top fabric. The vinyl will stretch back to its original size and the top can then be installed. If the temperature is 41B°F (5B°C) or below, do not attempt to put the top down or roll the rear or side curtains.

REMOVAL

1. Release the rear window lower corner tabs (1) from the quarter panels (2).

2. Release the rear window lower tab (1) from the center body retainer channel (2).

3. Release the side tabs (2) and release the rear window from the channels in the quarter panels (1).

4. While keeping the rear window (3) level, slide to the left until it is completely separate from its retainer (2). Do not pull downward while removing the rear window. Damage to the retainer could result.

5. Release the Velcro (1) on each of the upper quarter trim panels.

6. Release the quarter trim tabs (1) from the rear door rail channels (2).

7. Separate the lower quarter trim panels tabs (2) from the corner body retainers (1).

8. Release the upper quarter trim panels (2) from the bow brackets (1) and remove the quarter trim panels.

9. Release the header latches (1) from the crossbar (2) by pulling the handle downward. Make sure the hook is disengaged from its receiver.

10. From both the driver and passenger sides, lift up on the #1 Bow of the soft top and pull back to the full open position.

11. Remove the two mounting bolts (1) from each side of the soft top linkages.

12. Remove the soft top (2) from the vehicle and store in a clean, dry location (another person may be needed to help with this operation).

NOTE: If you are doing this alone, use one arm to hold the bundle up, the other to remove the brackets.

13. If needed, remove the side fasteners (1) and the center fasteners (2) and remove the soft top J-rail assembly.

INSTALLATION

1. If needed, install the J-rail assembly (1) and secure the corner guide pins into the slot (2).

2. Install the center fasteners (2) and the side fasteners (1) and tighten to the proper Refer to **TORQUE SPECIFICATIONS** .

3. Lower the linkage assembly studs (1) to the retainers on both sides (on the inside of the sport bar) and slide inward to engage into the bracket.

NOTE: If you are doing this alone, use one arm to hold the soft top up, the other to align the brackets.

4. Loosely install the front bolts (2).

5. Make sure the rear studs (1) are seated into the rear door rail brackets (2) fully.

6. Install the remaining screws (1) and using a #40 Torx head driver and ratchet, tighten the Torx screws (1) to the proper, being careful not to cross-thread the screws or overtighten. Refer to [**TORQUE SPECIFICATIONS**](#) . Repeat on the opposite side.

7. From inside the vehicle, pull the handle (1) on the header latch downward to engage the hook into its receiver (2). Repeat on the other side.
8. Pull the handle (1) back upward while squeezing the hook, locking the latch into place.

9. Guide the upper quarter trim panel (2) into the bow brackets (1) and seat fully.

10. Insert the lower quarter trim panel tab (2) into the slot of the corner body retainer (1) and seat the quarter trim fully.

11. Secure the quarter trim tabs (1) into the rear door rail channels (2).

12. Seat the Velcro (1) fully and repeat the steps for the quarter trim on the other side of the vehicle.

13. Guide the rear window (1) into the retainer (2) from left to right while keeping the window (3) level.

14. Secure the side tabs (2) into the quarter trim channels (1).

15. Secure the lower tab (1) into the center body retainer channel (2).

16. Secure the lower corner tabs (1) into the lower quarter trim channels (2).

17. Make sure the sides of the top fabric are seated into the upper door rails.

BOW, ASSEMBLY, NUMBER 1

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Position the top into the full open position, as needed. Refer to [FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION](#).
2. Remove the screws (2) and the compression panel (1).

3. Release the cover tabs (1) from the seal brackets (2).

4. Disconnect the cables (1) from the seal brackets.

5. Release the cover (2) from the two sided tape (1) on the bow.

6. Remove the four fasteners (6) and separate the bow assembly (5) from the linkage assembly (4).
7. Remove the fasteners (2) and remove the cable brackets (1) and the seals (3) from the bow assembly.

8. Remove the screws (3) and remove the latches (2) from the bow (1).

1. BOW #1
2. BOW #2
3. BOW #3
4. BOW #4
5. BOW #5

NOTE: Each bow has unique fastener lengths. Refer to the illustration for correct fastener locations.

INSTALLATION

1. Install the latch (2) on the bow (1) and install the screws (3).

2. Install the seals (3) and the cable brackets (1) on the bow assembly (5) and install the fasteners (2).
3. Tighten the cable bracket fasteners (2) to the proper Refer to [TORQUE SPECIFICATIONS](#) .
4. Install the #1 bow assembly (5) on the linkage assembly (4) and install the four fasteners (6).

5. Tighten the #1 bow to linkage fasteners (6) to the proper Refer to [TORQUE SPECIFICATIONS](#) .

6. Position the cover (2) on the bow and seat into the two sided tape (1) fully.

7. Connect the cables (1) into the seal brackets.

8. Secure the cover tabs (1) into the seal brackets (2) on each side.

9. Install the compression panel (1) and install the screws (2) securely.

10. Close the top, as needed. Refer to [FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION](#).

BOW, ASSEMBLY, NUMBER 2

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Position the top into the full open position, as needed. Refer to [FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION](#).
2. Remove the screws (1) attaching the bow to the linkage assemblies.

3. Remove the rivets (2) and remove the end caps (1) from one side of the bow.
4. Slide the bow (3) off the soft top support bead and remove the bow.

1. BOW #1
2. BOW #2
3. BOW #3
4. BOW #4
5. BOW #5

NOTE: Each bow has unique fastener lengths. Refer to the illustration for correct fastener locations.

INSTALLATION

1. Slide the bow (3) on the soft top support bead.
2. Install the end cap (1) and install new rivets (2).

3. Install the screws (1) securing the bow to the linkage assembly.
4. Close the top, as needed. Refer to [FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION](#).

BOW, ASSEMBLY, NUMBER 3

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Position the top into the full open position, as needed. Refer to [FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION](#).
2. Remove the rivets (1) and remove the end caps (2).

3. Remove the screws (1) attaching the bow to the linkage assemblies.

4. Slide the bow (2) off the soft top support bead (1) and remove the bow.

1. BOW #1
2. BOW #2
3. BOW #3
4. BOW #4
5. BOW #5

NOTE: Each bow has unique fastener lengths. Refer to the illustration for correct fastener locations.

INSTALLATION

1. Slide the bow (2) on the soft top support bead (1).

2. Install the end caps (2) and install new rivets (1).

3. Install the fasteners (1).

4. Close the top, as needed. Refer to [FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION](#).

BOW, ASSEMBLY, NUMBER 4

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Position the top into the full open position, as needed. Refer to [FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION](#).

2. Remove the rivets (1) and remove the end caps (2).

3. Remove the screws (1) attaching the bow to the linkage assemblies.

4. Slide the bow (2) off the soft top support bead (1) and remove the bow.

1. BOW #1
2. BOW #2
3. BOW #3
4. BOW #4
5. BOW #5

NOTE: Each bow has unique fastener lengths. Refer to the illustration for correct fastener locations.

INSTALLATION

1. Slide the bow (2) on the soft top support bead (1).

2. Install the end caps (2) and install new rivets (1).

3. Install the fasteners (1).
4. Close the top, as needed. Refer to [FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION](#).

BOW, ASSEMBLY, NUMBER 5

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Remove the rear window and rear quarter panels as needed, Refer to [FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION](#).
2. Release the cover tabs (2) from the seal brackets (1).

3. Remove the screws (1) attaching the bow to the bow brackets.

4. Lift cover and bow assemblies (2) up off of the linkages and corner brackets

5. Remove the seven rivets (1) and separate the bow from the cover.

1. BOW #1
2. BOW #2
3. BOW #3
4. BOW #4
5. BOW #5

NOTE: Each bow has unique fastener lengths. Refer to the illustration for correct fastener locations.

INSTALLATION

1. Install the #5 bow on the cover and install seven new rivets (1).

2. Install the screws (1) attaching the bow brackets to the bow and tighten securely.

3. Secure the cover tab (2) into the seal bracket (1).
4. Install the rear window and rear quarter panel as needed, Refer to [**FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION.**](#)

BRACKET, BOW NUMBER 5

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Remove the rear window and rear quarter panel as needed, Refer to [**FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION.**](#)
2. Release the cover tab (2) from the seal bracket (1).

3. Remove the push pin fastener (2) and release the cable (1) from the rear bracket.

4. Remove the fasteners (1) attaching the bracket to the bow.

5. Remove the fastener (1) attaching the bracket to the linkage assembly and remove the bracket.

INSTALLATION

1. Install the bracket to the bow and linkage assembly and install the fastener (1).

2. Install the fasteners (1) attaching the bracket to the bow.

3. Connect the cable (1) to the rear bracket and install the push pin (2).

4. Secure the cover tab (2) into the seal bracket (1).
5. Close the top as needed. Refer to [**FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION**](#).
6. Install the rear window and rear quarter panel as needed, Refer to [**FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION**](#).

CABLE, TENSION

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Remove the rear window and rear quarter panels as needed, Refer to [**FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION**](#).
2. Release the cover tab (1) from the front seal bracket (2).

3. Disconnect the cable (1) from the seal bracket.

4. Release the cover tabs (2) from the seal bracket (1).

5. Remove the push pin fastener (2) and release the cable (1) from the rear bracket.

6. Remove the cable (1) from the pocket sewn into the side of the cover.

INSTALLATION

1. Install the cable (1) into the pocket sewn into the side of the cover.

2. Connect the cable (1) to the rear bracket and install the push pin (2).

3. Secure the cover tab (2) into the seal bracket (2).

4. Connect the cables (1) into the seal bracket.

5. Secure the cover tab (1) into the seal bracket (2).

6. Install the rear window and rear quarter panel as needed, Refer to [FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION](#).

COVER, FOLDING TOP

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Remove the linkage assemblies. Refer to [LINKAGE, REMOVAL AND INSTALLATION](#).

2. Remove the rivets (1) and remove the end caps (2).

3. Slide the cover support beads (1) off of the bows (2) and remove the cover.

INSTALLATION

1. Position the bows onto the cover assembly and slide the support beads (1) into the bows (2).

2. Install the bow end caps (2) and install new rivets (1).
3. Install the linkage assemblies. Refer to [LINKAGE, REMOVAL AND INSTALLATION](#).

FRAME, DOOR FRONT

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Remove the rear door rail Refer to [FRAME, DOOR FRONT, REMOVAL AND INSTALLATION](#) [FRAME, DOOR REAR, REMOVAL AND INSTALLATION](#).
2. Remove the bolts (3) and open the brackets (2).
3. Remove the door frame rail (1).

INSTALLATION

1. Install the door frame rail (1).
2. Close the brackets (2) and install the bolts (3).
3. Install the rear door rail Refer to [FRAME, DOOR REAR, REMOVAL AND INSTALLATION](#).

FRAME, DOOR REAR

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Remove the soft top Refer to [FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION](#).
2. Remove the bolts (4) and open the brackets (1).
3. Remove the door frame rail (2).

INSTALLATION

1. Install a new foam seal (3) if needed.
2. Install the door frame rail (2).
3. Close the brackets (1) and install the bolts (4).
4. Install the soft top Refer to [FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION](#).

PANEL, COMPRESSION, BOW NUMBER 1

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Position the top into the full open position, as needed. Refer to [FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION](#).
2. Remove the screws (2) and separate the edge protector (1).

INSTALLATION

1. Install the edge protector (1) and install the screws (2).
2. Close the top, as needed. Refer to [FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION](#).

LATCH, HEADER

REMOVAL AND INSTALLATION

HEADER LATCH

REMOVAL

- | |
|---------------|
| 1 - #1 Bow |
| 2 - Latch |
| 3 - Fasteners |

1. Position the top into the full open position as needed. Refer to [FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION](#).
2. Remove the fasteners and remove the latch from the #1 Bow.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- All fasteners are tightened securely.

LINKAGE

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Remove the folding top assembly. Refer to [FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION](#).
2. Remove the front bow. Refer to [BOW, ASSEMBLY, NUMBER 1, REMOVAL AND INSTALLATION](#)[BOW, ASSEMBLY, NUMBER 2, REMOVAL AND INSTALLATION](#)[BOW, ASSEMBLY, NUMBER 3, REMOVAL AND INSTALLATION](#)[BOW, ASSEMBLY, NUMBER 4, REMOVAL AND INSTALLATION](#)[BOW, ASSEMBLY, NUMBER 5, REMOVAL AND INSTALLATION](#).
3. Remove the rear bow. Refer to [BOW, ASSEMBLY, NUMBER 1, REMOVAL AND INSTALLATION](#)[BOW, ASSEMBLY, NUMBER 2, REMOVAL AND INSTALLATION](#)[BOW, ASSEMBLY, NUMBER 3, REMOVAL AND INSTALLATION](#)[BOW, ASSEMBLY, NUMBER 4, REMOVAL AND INSTALLATION](#)[BOW, ASSEMBLY, NUMBER 5, REMOVAL AND INSTALLATION](#).

4. Remove the remaining linkage fasteners (1).

5. Remove the linkage assembly (2) off of the bows (1).

6. Remove the gas props. Refer to [PROP, GAS, REMOVAL AND INSTALLATION](#).

INSTALLATION

1. Install the gas props. Refer to [PROP, GAS, REMOVAL AND INSTALLATION](#).
2. Install the linkage assembly (2) to the bows (1).

3. Install the bow fasteners (1) on the three middle bows and tighten securely.
4. Install the rear bow. Refer to [BOW, ASSEMBLY, NUMBER 1, REMOVAL AND INSTALLATION](#) [BOW, ASSEMBLY, NUMBER 2, REMOVAL AND INSTALLATION](#)

ASSEMBLY, NUMBER 3, REMOVAL AND INSTALLATION**BOW, ASSEMBLY, NUMBER 4, REMOVAL AND INSTALLATION****BOW, ASSEMBLY, NUMBER 5, REMOVAL AND INSTALLATION**.

5. Install the front bow. Refer to **BOW, ASSEMBLY, NUMBER 1, REMOVAL AND INSTALLATION****BOW, ASSEMBLY, NUMBER 2, REMOVAL AND INSTALLATION****BOW, ASSEMBLY, NUMBER 3, REMOVAL AND INSTALLATION****BOW, ASSEMBLY, NUMBER 4, REMOVAL AND INSTALLATION****BOW, ASSEMBLY, NUMBER 5, REMOVAL AND INSTALLATION**.
6. Install the folding top assembly. Refer to **FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION**.

PROP, GAS

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

CAUTION: Do not use any type of pliers on the machined surface of the gas prop to assist in supporting the glass. Use a proper device for support, or the help of an assistant.

REMOVAL

1. Open the top to that the prop (1) being worked on is in the fully extended position, as needed. Refer to **FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION**.
2. Using a small flat bladed tool (2) or equivalent, release the retaining clips (1) while pulling the ball sockets away from the ball studs.

3. Remove the support cylinder (1) from the ball studs (2).

INSTALLATION

1. Make sure the retaining clips are seated into the ball socket fully.
2. Install the support cylinder (1) over the ball studs (2) with the thin end connected to the body and the retaining clips snapping into place.
3. Close the top, as needed. Refer to **FOLDING SOFT TOP, 4 DOOR, REMOVAL AND INSTALLATION**.

HOOD

CATCH, HOOD

REMOVAL AND INSTALLATION

HOOD CATCH

- | |
|----------------|
| 1 - Hood Catch |
| 2 - Nut |

REMOVAL

1. Open the hood.
2. Remove the nut and remove the hood catch.

- | |
|------------------------|
| 1 - Nuts |
| 2 - Hood Catch Bracket |

3. Remove the nuts and remove the catch bracket.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Tighten the hood catch bracket nuts to the proper Refer to [TORQUE SPECIFICATIONS](#) .
- Tighten the hood catch nut to the proper Refer to [TORQUE SPECIFICATIONS](#) .

HINGE, HOOD

REMOVAL AND INSTALLATION

HOOD HINGE

REMOVAL

1. Remove the cowl cover, Refer to [COVER, COWL PANEL, REMOVAL AND INSTALLATION](#).

NOTE: It is not necessary to remove the hood to replace the hood hinges. Hood hinges can be replaced one at a time.

1 - Bolts
2 - Hinge
3 - Body

2. Support the hood with a suitable device.
3. Remove the hinge to body bolts.

1 - Bolts

4. Using a grease pencil or equivalent, mark location of hood hinges on hood to aid installation.
5. Remove the hinge to hood bolts and remove the hinge.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- A suitable body sealant should be applied when removing or moving the hinges.
- Line up the hinge with the marks made on the hood during removal and tighten the bolts to the proper Refer to **TORQUE SPECIFICATIONS** .
- Tighten the hood to body bolts to the proper Refer to **TORQUE SPECIFICATIONS** .

HOOD

REMOVAL AND INSTALLATION

HOOD

1 - Bolts

REMOVAL

1. Raise the hood and support the hood.
2. Using a grease pencil or equivalent, mark location of hood hinges on hood to aid installation.
3. Remove the bolts attaching hinges to the hood.
4. With the aid of an assistant, remove hood from vehicle.

NOTE: The Vehicle Emission Control Information (VECI) label(s) must be in place for the life of the vehicle. When replacing the component in which the VECI label is adhered, a new VECI label must also be adhered to the new component.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Align the hinges with installation reference marks made previously and tighten bolts to the proper Refer to **TORQUE SPECIFICATIONS** .
- If required, adjust the hood to the correct position Refer to **GAP AND FLUSH, SPECIFICATIONS** .

LATCH, SAFETY

REMOVAL AND INSTALLATION

SAFETY LATCH

1 - Safety Catch
2 - Bolts

REMOVAL

1. Remove the bolts and remove the safety catch.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Tighten the bolts to the proper Refer to **TORQUE SPECIFICATIONS** .

ROD, HOOD PROP

REMOVAL AND INSTALLATION

HOOD PROP ROD

1 - Bolts

2 - Hood Prop Rod

REMOVAL

1. Open the hood and support with a suitable device.
2. Remove the bolts and remove the hood prop rod.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Tighten the bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#) .

SCREEN, AIR INLET

REMOVAL AND INSTALLATION

AIR INLET SCREEN

REMOVAL

1. Open the hood.

1 - Tabs
2 - Air Inlet Screen

2. Using (special tool #C-4755, Trim Stick) or equivalent remove the hood insulator fasteners then remove the hood insulator, exposing the underside of hood and air inlet screen.
3. Using (special tool #C-4755, Trim Stick) or equivalent, press the retaining tabs securing the air inlet screen to the hood.
4. Remove the air inlet screen from hood.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Verify all retaining tabs are fully seated.

SEAL, HOOD MUCKET

REMOVAL AND INSTALLATION

HOOD MUCKET SEAL

- | |
|-----------------|
| 1 - Fastener |
| 2 - Seal Groove |

REMOVAL

1. Open the hood.
2. Release the push pin fastener and remove the mucket seal.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Install the seal groove over the lip and seat the push pin fastener fully.

SPRING, HOOD POP UP

REMOVAL AND INSTALLATION

HOOD POP-UP SPRING

1 - Hood Spring

2 - Bolt

REMOVAL

1. Remove the bolt and remove the hood spring.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Tighten the hood spring bolt securely.

INSTRUMENT PANEL

BEZEL, INSTRUMENT CLUSTER

REMOVAL AND INSTALLATION

INSTRUMENT CLUSTER BEZEL

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .
2. Remove the instrument panel pad. Refer to **PAD, INSTRUMENT PANEL, REMOVAL AND INSTALLATION.**

1 - Screws

2 - Bezel

3. Remove the screws along the top of bezel.
4. Using a trim stick or equivalent, disengage bezel from lower retaining clips and remove.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Verify all clips are fully secured.
- All fasteners are tightened securely.

COVER, INSTRUMENT PANEL

REMOVAL AND INSTALLATION

PASSENGER SIDE

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .
2. Remove the floor console. Refer to [CONSOLE, FLOOR, REMOVAL AND INSTALLATION](#) .
3. On automatic transmission vehicles, remove the shifter. Refer to [SHIFTER, TRANSMISSION, REMOVAL AND INSTALLATION](#) [SHIFTER, TRANSMISSION, REMOVAL AND INSTALLATION](#) .
4. Remove the transfer case lever. Refer to [LEVER, TRANSFER CASE, REMOVAL AND INSTALLATION](#) [LEVER, TRANSFER CASE, REMOVAL AND INSTALLATION](#) .
5. Remove the A-pillar trim panel. Refer to [PANEL, A-PILLAR TRIM, REMOVAL AND INSTALLATION](#) .

1 - End Cap

6. Using a trim stick or equivalent, remove the right side end cap.
7. Remove the glove box. Refer to [GLOVE BOX, INSTRUMENT PANEL, REMOVAL AND INSTALLATION](#).
8. Remove the center trim. Refer to [PANEL, INSTRUMENT PANEL TRIM, REMOVAL AND INSTALLATION](#).
9. Remove the radio, if necessary. Refer to [RADIO, REMOVAL AND INSTALLATION](#).
10. Remove the passenger grab handle. Refer to [HANDLE, GRAB, REMOVAL AND INSTALLATION](#).
11. Remove the passenger air bag. Refer to [AIR BAG, PASSENGER, REMOVAL AND INSTALLATION](#).
12. Remove the cluster bezel. Refer to [BEZEL, INSTRUMENT CLUSTER, REMOVAL AND INSTALLATION](#).
13. Remove the steering column opening cover. Refer to [COVER, STEERING COLUMN OPENING, REMOVAL AND INSTALLATION](#).
14. Remove the instrument panel passive entry antenna. Refer to [ANTENNA, PASSIVE ENTRY, REMOVAL AND INSTALLATION](#).
15. Route the passive entry antenna wire harness through the instrument panel cover.
16. Remove screws for steering column gap hider and slightly move forward releasing from IP cover.

1 - Bezel

17. Remove the lower instrument panel close out bezel.

1 - Screws

18. Remove the screws securing the right side cover to the IP reinforcement.

19. Disconnect the wire harness connectors and remove any necessary components, then remove the cover.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- All fasteners are tightened securely.

DRIVER SIDE

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .
2. Using a trim stick or equivalent, remove the end cap.
3. Remove the cluster bezel. Refer to [BEZEL, INSTRUMENT CLUSTER, REMOVAL AND INSTALLATION](#).
4. Remove the steering column opening cover. Refer to [COVER, STEERING COLUMN OPENING, REMOVAL AND INSTALLATION](#).
5. Remove the screws for the steering column gap hider and move slightly forward releasing it from retainers and positioning it away from IP cover.

1 - Screws

6. Remove the screws securing the cover to the IP reinforcement, disconnect the wire harness connector and remove the cover.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- All fasteners are tightened securely.

COVER, STEERING COLUMN OPENING

REMOVAL AND INSTALLATION

STEERING COLUMN OPENING COVER

REMOVAL

1 - Steering Column Opening Cover

1. Using a trim stick, separate the steering column opening cover from the IP and remove.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Verify all clips are fully secured.

CYLINDER, GLOVE BOX LOCK

REMOVAL AND INSTALLATION

GLOVE BOX LOCK CYLINDER

REMOVAL

1. Remove the glove box. Refer to [GLOVE BOX, INSTRUMENT PANEL, REMOVAL AND INSTALLATION](#).

2. Position the glove box on a bench. Insert the key into the glove box lock cylinder and rotate to the unlocked position.

1 - Glove Box Handle
2 - Slot

3. Lift the glove box handle and insert a straight pick tool into the slot pushing in on the lock cylinder release tab.

NOTE: The last image in the removal procedure will reference the lock cylinder release tab.

1 - Lock Cylinder

4. While holding the lock cylinder release tab down with the pick tool, rotate the key counterclockwise.

1 - Lock Cylinder Release Tab

5. Remove the tool and pull up on the key. The glove box lock cylinder will come out of the handle with the key.

NOTE: The lock cylinder release tab.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle.

GAP HIDER, STEERING COLUMN SHROUD

REMOVAL AND INSTALLATION

STEERING COLUMN SHROUD GAP HIDER

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .
2. Remove the steering wheel. Refer to [WHEEL, STEERING, REMOVAL AND INSTALLATION](#) .
3. Remove the steering column shroud. Refer to [SHROUD, STEERING COLUMN, REMOVAL AND INSTALLATION](#) .
4. Remove the steering column control module. Refer to [MODULE, STEERING COLUMN CONTROL \(SCCM\), REMOVAL AND INSTALLATION](#) .
5. Remove steering column opening cover. Refer to [COVER, STEERING COLUMN OPENING, REMOVAL AND INSTALLATION](#).
6. Remove the center trim. Refer to [PANEL, INSTRUMENT PANEL TRIM, REMOVAL AND INSTALLATION](#).

1 - Gap Hider

7. Remove the lower gap hider fasteners.
8. Using a trim stick or equivalent disengage gap hider retaining clips and remove.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Verify all clips are fully secured.
- All fasteners are tightened securely.

GLOVE BOX, INSTRUMENT PANEL

REMOVAL AND INSTALLATION

GLOVE BOX

REMOVAL

1 - Glove Box Damper

2 - Glove Box Stop

1. Open the glove box.
2. Disconnect the glove box damper.
3. Push up on glove box stop then rotate the glove box downward and remove.

4. If necessary to service glove box damper, rotate damper clockwise.

5. Remove damper from instrument panel.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle.

GRILLE, DEFROSTER

REMOVAL AND INSTALLATION

DEFROSTER GRILLE

REMOVAL

1. Remove both A-pillar trim panels. Refer to [PANEL, A-PILLAR TRIM, REMOVAL AND INSTALLATION](#).
2. Remove the instrument cluster bezel. Refer to [BEZEL, INSTRUMENT CLUSTER, REMOVAL AND INSTALLATION](#).
3. Remove the passenger grab handle. Refer to [HANDLE, GRAB, REMOVAL AND INSTALLATION](#).
4. Remove the passenger side air bag. Refer to [AIR BAG, PASSENGER, REMOVAL AND INSTALLATION](#).

1 - Upper Storage Bin Mat

5. Remove the upper storage bin mat.
6. Remove the instrument panel speakers. Refer to [SPEAKER, REMOVAL AND INSTALLATION](#).

1 - Grille Defroster Fastener Access Cover

7. Using a trim stick or equivalent, remove the grille defroster fastener access cover.

1 - Bolt
2 - Defroster Grille

8. Remove the bolt from the defroster grille.

1 - Screws
2 - Defroster Grille

9. Remove the screws retaining the defroster grille.

10. Partially pull up on the defroster grille and disconnect the sun sensor wire harness connector. Remove defroster grille.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- All fasteners are tightened securely.

HANDLE, GRAB

REMOVAL AND INSTALLATION

GRAB HANDLE

REMOVAL

- | |
|----------------------------|
| 1 - Upper Center Stack |
| 2 - Grab Handle Trim Cover |

1. Remove the upper center stack. Refer to [PANEL, INSTRUMENT PANEL TRIM, REMOVAL AND INSTALLATION](#).
2. Remove the grab handle trim cover.

1 - Bolts

3. Remove the grab handle mounting bolts and remove handle.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Bolts are tightened securely.

PAD, INSTRUMENT PANEL

REMOVAL AND INSTALLATION

INSTRUMENT PANEL PAD

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .
2. Remove the upper center stack. Refer to PANEL, INSTRUMENT PANEL TRIM, REMOVAL AND INSTALLATION.

1 - Screws

2 - Radio Bezel

3. Remove the screws then use a trim stick or equivalent to release the radio bezel and remove.

1 - Screw
2 - Dash Pad

4. Remove the screw then use a trim stick or equivalent to release the retaining clips for the dash pad and pull forward and out.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- All screws are tightened securely.

PANEL, INSTRUMENT

REMOVAL AND INSTALLATION

INSTRUMENT PANEL

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .
2. Remove the floor console. Refer to [CONSOLE, FLOOR, REMOVAL AND INSTALLATION](#)[CONSOLE, FLOOR, END CAP, REMOVAL AND INSTALLATION](#).
3. On automatic transmission vehicles, remove the shifter. Refer to [SHIFTER, TRANSMISSION, REMOVAL AND INSTALLATION](#) [SHIFTER, TRANSMISSION, REMOVAL AND INSTALLATION](#) .
4. Remove the transfer case lever. Refer to [LEVER, TRANSFER CASE, REMOVAL AND INSTALLATION](#) [LEVER, TRANSFER CASE, REMOVAL AND INSTALLATION](#) .
5. Remove the manual park release assembly. Refer to [LEVER, MANUAL PARK RELEASE, REMOVAL AND INSTALLATION](#) [LEVER, MANUAL PARK RELEASE, REMOVAL AND INSTALLATION](#) .
6. Remove the A-pillar trim. Refer to [PANEL, A-PILLAR TRIM, REMOVAL AND INSTALLATION](#).

1 - Wire Harness Connector

2 - Wire Harness Retainer

NOTE: Left side as shown in illustration, right side similar.

7. Disconnect the wire harness connector and release the harness retainer from the A-pillar.
8. Remove the instrument panel center trim. Refer to [PANEL, INSTRUMENT PANEL TRIM, REMOVAL AND INSTALLATION](#).
9. Remove steering column. Refer to [COLUMN, REMOVAL AND INSTALLATION](#).

1 - End Cap

NOTE: Right side as shown in illustration, left side similar.

10. Using a trim stick or equivalent, remove the end caps.

11. Remove the front cowl trim panel. Refer to [PANEL, COWL TRIM, REMOVAL AND INSTALLATION](#).

1 - Wire Harness Connectors

2 - Ground Wires

NOTE: Left side as shown in illustration, right side similar.

12. Disconnect the wire harness connectors at the floor on both left and right sides of the vehicle.
13. Remove the ground wires on left and right sides.

1 - Antenna Connector

14. Disconnect the antenna connector on right side near the floor.

1 - Brake Light Switch Wire Harness Connector

2 - Accelerator Pedal Wire Harness Connector

15. Disconnect the accelerator pedal wire harness connector.
16. Disconnect the brake light switch wire harness connector.

1 - Ground Wire

2 - Wire Harness Connectors

17. Disconnect the center IP wire harness connectors and ground wire.
18. Recover the refrigerant. Refer to [PLUMBING, STANDARD PROCEDURE](#) .
19. Drain the coolant (Refer to the appropriate service information).
20. Remove the engine cover. Refer to [COVER, ENGINE, REMOVAL AND INSTALLATION COVER, ENGINE, REMOVAL AND INSTALLATION](#) .

1 - Quick Disconnect Hoses
2 - Nut

21. Disconnect the quick connect hoses from the tubes. Install plugs in, or tape over the opened heater core tubes to prevent coolant spillage during the HVAC housing removal.
22. Remove the nut securing the A/C liquid line and A/C suction line to the A/C expansion valve.
23. Disconnect the A/C liquid and suction lines from the A/C expansion valve.
24. Install plugs in or tape over the open refrigerant line fittings and the expansion valve ports.

NOTE:

Not necessary to completely remove the washer reservoir and coolant reservoir, just to reposition to gain access.

25. Remove the coolant bottle fasteners and reposition coolant bottle. Refer to [BOTTLE, PRESSURIZED COOLANT, REMOVAL AND INSTALLATION](#) [BOTTLE, PRESSURIZED COOLANT, REMOVAL AND INSTALLATION](#).
26. If equipped with 3.0L diesel, remove the washer reservoir fasteners and reposition the washer reservoir. Refer to [RESERVOIR, WINDSHIELD WASHER, REMOVAL AND INSTALLATION](#).

1 - Bolt on Passenger Side
2 - Bolt by Heater Core Lines
3 - Bolt next to Brake Booster
4 - Bolt under the Brake Booster

27. Remove the bolt on passenger side of the engine compartment.
28. Remove the bolt by the heater core lines.
29. Remove the bolt located next to the brake booster.
30. Remove the bolt under the brake booster.

1 - Trim Cap
2 - Bolt

31. Remove the trim cap and remove the fenceline bolt.

1 - Bolts
2 - Center Support Brackets

NOTE: Left side as shown in illustration, right side similar.

32. Remove the bolt and nut for the center support brackets and then remove bracket.
33. Remove the side support bolts and position the IP assembly.
34. Remove the IP and HVAC housing from the vehicle.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Position the IP assembly into the vehicle and support the rear of the IP.
- Position the IP assembly and carefully push the heater core lines and expansion valve through the cowl.
- Position the IP over the fenceline and loosely install bolt.
- Loosely install the side support bolts.
- Install the center support brackets over the studs and install the bolts and nuts and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- Tighten the side support bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- Tighten the fenceline bolts to the proper and install the bolt cover. Refer to [TORQUE SPECIFICATIONS](#) .
- Install the bulkhead to instrument panel bolts and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- Install the nut that secures the A/C liquid and suction lines to the A/C expansion valve. Tighten the nut to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- Tighten all other fasteners securely.
- Fill the cooling system (Refer to 09 - Engine/Cooling Systems/Low Temp Cooling/Standard Procedure).
- Charge the refrigerant system. Refer to [PLUMBING, STANDARD PROCEDURE](#) .

PANEL, INSTRUMENT PANEL TRIM

REMOVAL AND INSTALLATION

CENTER TRIM

REMOVAL

1. Remove the Integrated Center Stack (ICS) and upper instrument panel center trim as an assembly. Refer to **MODULE, INTEGRATED CENTER STACK (ICSM), REMOVAL AND INSTALLATION** .

1 - Screw

2. Remove the screw from the lower instrument panel center trim, then firmly grab the lower trim and carefully pull the trim back to release the retaining clips.

- | |
|--|
| 1 - Power Outlet Wire Harness Connector |
| 2 - Power Window Switch Wire Harness Connector |
| 3 - Media Hub Wire Harness Connectors |
| 4 - Auxiliary Switch Bank Wire Harness Connector |

3. Disconnect the power outlet wire harness connector.
4. Disconnect the power window switch wire harness connector.
5. Disconnect the media hub wire harness connectors.
6. If equipped, disconnect the auxiliary switch bank wire harness connector.
7. If equipped, disconnect the Off Road Switch wire harness connector.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Verify all clips are fully secured.
- All fasteners are tightened securely.

RIGHT SIDE TRIM

Right side trim panel is removed as a assembly with passenger side air bag. Refer to [AIR BAG, PASSENGER, REMOVAL AND INSTALLATION](#) .

RETAINER, INSTRUMENT PANEL

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .
2. Remove the driver side and passenger side Instrument Panel (IP) covers. Refer to [COVER, INSTRUMENT PANEL, REMOVAL AND INSTALLATION](#).

3. Remove the screws (1) from the IP retainer (3).
4. Remove the screws (2) that retain the air ducts to the IP retainer (3).
5. Remove the IP retainer (3) from vehicle.

INSTALLATION

2315154963

1. Position the Instrument Panel (IP) retainer (3) to the IP carrier
2. Install the screws (1) for the IP retainer and tighten securely.
3. Install the screws (2) for the air duct and tighten securely.
4. Install the driver side and passenger side IP covers. Refer to [COVER, INSTRUMENT PANEL, REMOVAL AND INSTALLATION](#).
5. Connect the negative battery cable(s). Refer to the appropriate service information .

INTERIOR

ARMREST, FRONT CENTER CONSOLE

REMOVAL AND INSTALLATION

ARMREST

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .
2. Remove the floor console end cap. Refer to [CONSOLE, FLOOR, END CAP, REMOVAL AND INSTALLATION](#).

1 - Screws

3. Remove the two screws and the HVAC outlet duct.

1 - Screws
2 - Wire Harness Retaining Clip

4. Disconnect the wire harness retaining clip and position the wire harness aside.
5. Remove the five screws at the rear of the armrest and remove.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Tighten the screws securely.

BAR, SPORT, SPEAKER POD

REMOVAL AND INSTALLATION

SPORT BAR SPEAKER POD

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .
2. Remove the dome lamp. Refer to [LAMP, DOME, REMOVAL AND INSTALLATION](#) .

- | |
|--------------------------------|
| 1 - Front Door Sport Bar Cover |
| 2 - Rear Door Sport Bar Cover |
| 3 - Center Sports Bar Cover |
| 4 - Sport Bar Cover |

3. Remove the screws from the driver and passenger side front door sport bar covers. Remove both trim covers from vehicle.
4. Remove the screws from the driver and passenger side rear door sport bar covers. Remove both trim covers from vehicle.
5. Remove the screws from the center sport bar cover. Remove center sport bar cover from vehicle.
6. Remove the wire harness fasteners.
7. Remove the screw and plastic fastener from the driver and passenger side sport bar cover. Using a trim stick of equivalent, remove both trim covers from vehicle.

1 - Wire Harness Connector

2 - Bolts

8. Disconnect the wire harness connector, remove the bolts and lower the speaker pod.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- All fasteners are tightened securely.

BEZEL, SHIFTER

REMOVAL AND INSTALLATION

SHIFTER BEZEL

1 - Gear Shifter Boot

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .
2. Using a trim tool, separate the gear shifter boot from the bezel.

1 - Screw

3. Position the gear shifter boot so you can remove the screw, then remove the gear shift knob and boot assembly.

1 - Shifter Bezel

4. Using a trim tool, separate the shifter bezel from the floor console.
5. Lift the shifter bezel, disconnect the wire harness connector and remove the shifter bezel.

INSTALLATION

- The screw is tightened securely.

REMOVAL AND INSTALLATION

REMOVAL

WITHOUT LID

-

- WITH LID

3. Raise the rear lower seat.

4. Lift up on both handles to release the storage bin lids.

5. Remove both storage bin liners (1).

6. Remove the four fasteners (1) that secure the storage bin and remove the storage bin.

INSTALLATION

WITHOUT LID

1. Position the storage bin (2) on the floor panel and install the four fasteners (1) and tighten to the proper. Refer to **TORQUE SPECIFICATIONS**.
2. Lower the rear seat.

WITH LID

3. Position the storage bin on the floor panel and install the four fasteners (1) and tighten to the proper. Refer to **TORQUE SPECIFICATIONS** .
4. Install the storage bin liners.
5. Close the storage bin lid and lower the rear seat.

FASTENER

REMOVAL

1. Lift up the rear lower seat.

2. The fastener storage bin (2) is located under driver side rear lower seat.

3. Lift up on the storage bin lid strap to open bin and remove the fastener insert (1) from the storage bin.

4. Remove the two nuts (1), release the center retainer and remove the fastener bin (2).

INSTALLATION

2316154930

1. Position the storage bin (2) to the floor panel pressing the bin until the center retaining clip is fully inserted into the storage bin.
2. Install the two nuts (1) and tighten them securely.

2316147057

3. Install the fastener insert (1) into the storage bin.
4. Close the fastener storage bin lid and lower the rear seat.

CARPET, FRONT FLOOR

REMOVAL AND INSTALLATION

FRONT CARPET

NOTE:

The front floor carpet is two pieces, and can be serviced individually.

The right side carpet is shown in this procedure, and is similar steps for the left side carpet.

REMOVAL

1. Remove the front seat for the side being serviced. Refer to [SEAT, FRONT, REMOVAL AND INSTALLATION](#) .
2. Slide out the carpet from underneath the floor console.
3. Slide out the carpet from underneath the cowl trim panel for the side being worked on.
4. Slide out the carpet from underneath the lower B-pillar trim panel.

1 - Stud Caps
2 - Carpet

5. Remove the stud caps and remove the carpet.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle.

CARPET, REAR FLOOR

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Remove the front seats. Refer to [SEAT, FRONT, REMOVAL AND INSTALLATION](#) [SEAT, SECOND ROW, REMOVAL AND INSTALLATION](#).
2. Raise the rear lower seats.
3. Remove the rear storage bin. Refer to [BIN, STORAGE, REMOVAL AND INSTALLATION](#).
4. Remove the fastener bin. Refer to [BIN, STORAGE, REMOVAL AND INSTALLATION](#).
5. Remove the jack assembly.
6. Slide the rear carpet out from under the rear cab panel trim, quarter trim, lower B-pillar trim, and the floor console.

7. Remove the stud caps (1) and remove the rear carpet (2).

INSTALLATION

1. Install the rear carpet and stud caps.
2. Tuck the rear carpet under the rear cab panel trim, quarter trim, lower B-pillar trim, and the floor console.
3. Install the fastener bin. Refer to [BIN, STORAGE, REMOVAL AND INSTALLATION](#).
4. Install the rear storage bin. Refer to [BIN, STORAGE, REMOVAL AND INSTALLATION](#).
5. Install the jack assembly.
6. Lower the rear seats.
7. Install the front seats. Refer to [SEAT, FRONT, REMOVAL AND INSTALLATION](#) .

CONSOLE, FLOOR

REMOVAL AND INSTALLATION

FLOOR CONSOLE

REMOVAL

1. Remove the transfer case shifter handle. Refer to [HANDLE, REMOVAL AND INSTALLATION](#) [HANDLE, REMOVAL AND INSTALLATION](#) .

1 - Transfer Case Shifter Bezel

2. Using a trim tool or equivalent, release the retaining clips and remove the transfer case shifter bezel.

NOTE: Be sure not to pry on the parking brake gap hider, it is molded to the console and not part of the transfer case shifter bezel.

3. Remove the shifter bezel. Refer to [BEZEL, SHIFTER, REMOVAL AND INSTALLATION](#).

1 - Bolt

4. Remove the front bolt covers and the bolts on both sides of the console.
5. Move the front seats to the full forward position.

1 - Bolt

6. Remove the rear bolt covers and the bolts on both sides of the console.
7. Remove the front fasteners and loosen the rear fasteners from the front passenger seat to rock the seat back to gain access to the wire harness connectors.

1 - Wire Harness Connectors

8. Disconnect the wire harness connectors under the front passenger seat.

NOTE: Be careful when removing the floor console to avoid damage to neighboring components.

9. Remove the console from the vehicle with the shifter in the neutral position and lift from the back and slide out towards rear of vehicle.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle.

- Verify all clips are fully secured.
- All fasteners are tightened securely.

CONSOLE, FLOOR, END CAP

REMOVAL AND INSTALLATION

FLOOR CONSOLE END CAP

REMOVAL

1 - Fasteners

1. Open armrest and console lid, and remove the fasteners.

1 - Console End Cap

2. Using a trim stick or equivalent, partially remove the floor console end cap.

1 - Console End Cap

3. Disconnect the wire harness connectors and remove floor console end cap from vehicle.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Verify all clips are fully secured.
- All fasteners are tightened securely.

CYLINDER, ARMREST LOCK

REMOVAL AND INSTALLATION

ARMREST LOCK CYLINDER

REMOVAL

1. Open the armrest on the center console.

1 - Hinge Fastener Cover

2 - Armrest

2. Using a trim stick or equivalent, release the hinge fastener cover from the armrest and remove the cover.

1 - Screws

2 - Armrest

3 - Armrest Hinge

3. Remove the screws that secure the armrest to the armrest hinge and remove the armrest.

1 - Armrest Trim Panel
2 - Armrest

4. Using a trim stick or equivalent, remove the inner armrest trim panel from the armrest.

1 - Screws
2 - Armrest Latch Assembly
3 - Armrest

5. Remove the screws that secure the armrest latch assembly to the armrest and remove latch assembly.

1 - Key
2 - Cylinder Release Lever
3 - Latch Assembly

6. Working from the top side of the latch assembly, insert the key into the armrest latch lock cylinder.
7. Using a small flat blade screwdriver, push down on the cylinder release lever.

1 - Key
2 - Cylinder Release Lever
3 - Latch Assembly

8. With release lever held down, rotate the key counter clockwise.

- | |
|--------------------|
| 1 - Lock Cylinder |
| 2 - Latch Assembly |

9. Remove the lock cylinder by pulling out on the key. The lock cylinder will come out from the latch assembly with the key.

INSTALLATION

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Verify all clips are fully secured.
- All screws are tightened securely.

MIRROR, REARVIEW

REMOVAL AND INSTALLATION

REARVIEW MIRROR

REMOVAL

1. Remove the header panel. Refer to [PANEL, HEADER, REMOVAL AND INSTALLATION](#).

NOTE: If not equipped with the Drivers Assistance System Module (DASM) skip to step 4.

1 - Retaining Tabs
2 - DASM Rear Trim Cover

2. Using a trim stick or equivalent, release the retaining tabs and remove the DASM rear trim cover.

1 - Fasteners
2 - DASM Front Trim Cover

3. Remove the fasteners and remove the DASM front trim cover.

- | |
|---------------------------------|
| 1 - Lower Tab |
| 2 - Top Tabs |
| 3 - Rearview Mirror Cover Panel |
| 4 - Rearview Mirror |

4. Using a flat blade screwdriver or equivalent, release the lower tab on the rearview mirror cover panel and slide it down to disengage the top tabs to remove the cover panel from the rearview mirror.

- | |
|----------------------------|
| 1 - Wire Harness Connector |
| 2 - Rearview Mirror |

5. Disconnect wire harness connector from the rearview mirror.

1 - Rearview Mirror

6. Holding the rearview mirror, turn it counter clockwise to release it from the base.

1 - Rearview Mirror

7. Lower the rearview mirror and remove it from the vehicle.

1 - Retaining Clips
2 - Rearview Mirror Base Cover
3 - Header Panel

8. With the header panel dropped out of the way release the retaining clips and remove the rearview mirror base cover.

1 - Screws
2 - Rearview Mirror Base

9. Remove the screws and the rear view mirror base from vehicle.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Install the rearview mirror base screws and tighten to the proper

Refer to **TORQUE SPECIFICATIONS** .

- Verify all clips are fully secured.

PANEL, A-PILLAR TRIM

REMOVAL AND INSTALLATION

A-PILLAR TRIM PANEL

REMOVAL

1 - Speaker Cover Grille

1. Remove the speaker cover grille.

1 - Bolt Covers

2. Using a trim stick or equivalent, carefully open the bolt covers.

1 - Bolts

3. Remove the bolts, then pull up and out on the A-pillar trim panel to release it from the instrument panel.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Install the A-pillar trim panel bolts and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .

PANEL, B-PILLAR TRIM, LOWER

REMOVAL AND INSTALLATION

LOWER B-PILLAR TRIM PANEL

REMOVAL

1 - Cowl Trim Panel

1. Using a trim stick or equivalent, loosen the rear of the cowl trim panel.

1 - B-pillar Extension Panel

2 - Seat Belt Access Cover

2. Using a trim stick or equivalent, remove the B-pillar extension panel and the seat belt access cover.

1 - Lower B-Pillar Trim Panel

2 - Split

3. Using a trim stick or equivalent, release the retaining clips and loosen the lower B-pillar trim panel.
4. Guide the seat belt through the split in the trim panel.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Verify all clips are fully secured.

PANEL, B-PILLAR TRIM, UPPER

REMOVAL AND INSTALLATION

UPPER B-PILLAR TRIM PANEL

REMOVAL

1 - B-Pillar Extension

1. Move the front seat to the full forward position.
2. Spread the bottom of the B-pillar extension, then pull out to release the retaining clips and remove.
3. Remove the seat belt turning loop. Refer to [**ADJUSTER, SEAT BELT TURNING LOOP, REMOVAL AND INSTALLATION**](#) .

1 - Bolts

4. Using a trim stick or equivalent, remove the grab handle bolt covers then the bolts.
5. Pull at the bottom of the upper B-pillar trim panel to release the retaining clips and remove.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Install the grab handle bolts and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- Verify all clips are fully secured.

PANEL, COWL TRIM

REMOVAL AND INSTALLATION

COWL TRIM PANEL

REMOVAL

1 - Cover Panel

2 - Cowl Trim Panel

NOTE: Left side as shown in illustration, right side similar.

1. Using a trim stick or equivalent, release the cover panel from the cowl trim panel.

1 - Nut

NOTE: Right side as shown in illustration, left side similar.

2. Remove the nut that secures cowl panel to body.
3. Using a trim stick or equivalent, separate the front of the lower B-pillar trim panel from the cowl trim panel.
4. Disconnect the door check strap and the electrical connector.
5. Lift the cowl trim panel at the rear, then gently pull rearward and remove.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Verify all clips are fully secured.
- All fasteners are tightened securely.

PANEL, D-PILLAR TRIM

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Remove the rear seat belt retractor turning loop. Refer to [RETRACTOR, SEAT BELT, REMOVAL AND INSTALLATION](#) .

2. Remove the four screws from the rear door sport bar trim (2) and remove from vehicle.

3. Remove the five screws (1) and remove the D-pillar trim (2).

INSTALLATION

1. Position the D-pillar trim (2) to the sport bar.
2. Install the five screws (1) that retain the trim panel and tighten them securely.

3. Position the rear door sport bar trim (2) to the sport bar.
4. Install the four screws that retain the trim and tighten them securely.
5. Install the rear seat belt retractor turning loop. Refer to [RETRACTOR, SEAT BELT, REMOVAL AND INSTALLATION](#).

PANEL, QUARTER TRIM

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Remove the rear cab panel trim. Refer to [PANEL, CAB BACK TRIM, REMOVAL AND INSTALLATION](#).

2. Using a trim stick or equivalent, remove the quarter panel trim lower seat belt closeout (1).

3. Using a trim stick or equivalent, disengage the retainer clips and lift in and up to remove the quarter panel trim (1) from vehicle.
4. If necessary, disconnect the wire harness connectors.

INSTALLATION

1. If necessary, connect the wire harness connectors.
2. Position the quarter panel trim into place and press in to engage retaining clips to install the trim panel.
3. Install the seat belt closeout to the quarter trim panel trim.
4. Install the rear cab panel trim. Refer to [PANEL, CAB BACK TRIM, REMOVAL AND INSTALLATION](#).

PANEL, HEADER

REMOVAL AND INSTALLATION

FRONT HEADER PANEL

REMOVAL

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .
2. Remove both of the A-pillar trim panels. Refer to [PANEL, A-PILLAR TRIM, REMOVAL AND INSTALLATION](#).
3. Remove both of the visors. Refer to [VISOR, REMOVAL AND INSTALLATION](#).
4. Remove both of the visor supports. Refer to [SUPPORT, VISOR, REMOVAL AND INSTALLATION](#).

1 - Header Panel

5. Using a trim stick or equivalent tool, disengage the retaining clips lowering the header panel slightly.
6. Disconnect the wire harness connectors and remove the header panel.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle.

PANEL, CAB BACK TRIM

REMOVAL AND INSTALLATION

WITH SUBWOOFER

REMOVAL

1. Remove the rear seats. Refer to [SEAT, SECOND ROW, REMOVAL AND INSTALLATION](#).

NOTE: If equipped with the bluetooth wireless speaker skip to step 4.

2. Using a small flat blade screwdriver, remove the two screw covers (1), then remove the two screws (2) from the rear cab trim upper storage bin.

3. Using a trim stick or equivalent, release the rear cab trim upper storage bin (1) from the rear cab trim panel.

4. If equipped with the bluetooth wireless speaker, release the wireless speaker (2) from carrier by pulling release handle (1) and remove.

5. Using a small flat blade screwdriver, remove the two screw covers (1), then remove the two screws (2) from the wireless speaker carrier (3).

6. Using a trim stick or equivalent, release the wireless speaker carrier (1) from the rear cab trim panel.

7. Disconnect the wire harness connector (1) and remove the wireless speaker carrier (2).

NOTE: The retaining clips across the top of the rear cab trim panel are metal and may require more force.

8. Using a trim stick or equivalent release the retaining clips around the edges of the rear cab trim panel and remove it from rear cab.

9. To remove the rear cab trim panel lower storage bin (2), remove the storage bin liner. Remove the two fasteners (1), then using a trim stick or equivalent release the retaining clips from the rear of the bin and remove storage bin from rear cab panel.

INSTALLATION

1. Position the rear cab panel lower storage bin (2) into place and engaging retainer clips to the rear cab panel. Install the two fasteners (1), tighten securely and install storage bin liner.

2. Position rear cab trim panel to the rear cab panel, insert the retaining clips and press trim panel until all retaining clips are fully engaged into the rear cab panel.

NOTE: If equipped with bluetooth wireless speaker skip to step 5.

3. Insert the rear cab trim panel upper storage bin (1) to the rear cab trim panel making sure the retaining clips are fully seated into the rear cab trim panel.

4. Install the two screws (2) and tighten securely. Install the two screw covers (1).

5. If equipped with bluetooth wireless speaker, connect wire harness connector (1) and insert the wireless speaker carrier (2) into the rear cab panel trim by pressing carrier to engage retainer clips.

6. Install the two screws (2) and tighten securely. Install the two screw covers (1).
7. Install wireless speaker into carrier (3).
8. Install the rear seats. Refer to [SEAT, SECOND ROW, REMOVAL AND INSTALLATION](#).

WITHOUT SUBWOOFER

REMOVAL

1. Remove the rear seats. Refer to [SEAT, SECOND ROW, REMOVAL AND INSTALLATION](#).

2. Using a trim stick or equivalent, release the retaining clips around the edges of the rear cab trim panel (1) and remove it from rear cab.

3. To remove the rear cab trim panel lower storage bin (2), remove the storage bin liner and remove the four fasteners (1).
4. Using a trim stick or equivalent, release the retaining clips from the rear of the bin and remove storage bin from rear cab panel.

INSTALLATION

1. Positioning the rear cab storage bin (2) into place and engage the retaining clips to the rear cab panel. Install the four fasteners (1), tighten them securely. Install storage bin liner.

2. Position the rear cab trim panel (1) to the rear cab panel and install it by inserting retaining clips fully into the rear cab panel.
3. Install the rear seats. Refer to [SEAT, SECOND ROW, REMOVAL AND INSTALLATION](#).

SUPPORT, VISOR

REMOVAL AND INSTALLATION

VISOR SUPPORT

REMOVAL

1 - Screw

1. Remove the screw, and the sun visor support.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Install the sun visor support screw and tighten securely.

VISOR

REMOVAL AND INSTALLATION

VISOR

REMOVAL

1 - Sport Bar Cover

1. Remove the four screws from the front door sport bar cover and remove cover from vehicle.

NOTE: If equipped with power sliding top, open the top and use a straight driver to remove the upper fasteners.

1 - Wire Harness Connector

2. Disconnect wire harness connector for the visor.

1 - Screws

2 - Support

3. Release the visor from the support.
4. Remove the screws and the visor.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- All screws are tightened securely.

PAINT

TECHNICAL SPECIFICATIONS

SPECIFICATIONS

Because of late model changes to the available paint colors for each vehicle the current color codes can be found on the Vehicle Certification Label. Refer to VEHICLE CERTIFICATION LABEL, DESCRIPTION.

NOTE: Exterior color codes are shown in the chart as the option code. The code on the Vehicle Certification Label is a three digit code but the first digit will be designated as a "P" for primary color or "Q" for secondary color.

PAINT COLOR INFORMATION	INFORMATION LOCATION

REMOVABLE TOP, HARD

STANDARD PROCEDURE

FREEDOM PANEL FIT INSTRUCTIONS

	2022300230 - Gauges, Clearance Measurement, Non-Metallic
--	--

The following procedure provides instructions to properly fit the FREEDOM PANELS, also called (LH and RH) modular top panels.

This procedure will require a MOPAR essential tool (2022300230)

Disassemble the gauges, then reassemble to have only 8mm of gauges (1) as shown in illustration.

This graphic shows Freedom Panels (1) that do not meet the gap specification of 8mm.

This graphic shows Freedom Panels that do meet the gap specification of 8mm at the four areas of measurement.

1. Review the adjustment video for greater detail.
2. Remove the LH modular top panel.

3. Lower the RH visor (2), unhook and swing it forward to access the front receiver.
4. Open the RH receiver clamp (3).
5. Remove the felt patches from the bolt heads on the RH front receiver bracket, then **LOOSEN** the two receiver bracket bolts (1). Feel the bracket by hand to make sure it will move for adjustment.

NOTE: Save the felt patches to put back on the bolt heads.

6. Open the remaining clamps (1) on the RH modular top panel.

7. Position the RH modular top panel (2) till the 8mm gap gauges (1) will fit firmly between the rear hard top panel and the RH modular top panel, on the RH side of the vehicle just above the B-pillar and at the center of the vehicle.
8. When the 8mm gap has been achieved, close all the clamps, **EXCEPT** the front center clamp. Check that the panel did not move.

9. Tighten the **OUTBOARD** hard top front receiver bracket bolt to the proper. Refer to [**TORQUE SPECIFICATIONS**](#) .
10. Tighten the **INBOARD** hard top front receiver bracket bolt to the proper. Refer to [**TORQUE SPECIFICATIONS**](#) .
11. Close the front center RH modular top clamp (3).

12. Install the LH modular top panel onto the vehicle, **do not close any clamps** .
13. Lower the LH visor (1), unhook and swing it forward to access the front receiver.
14. Remove the felt patches from the bolt heads on the LH front receiver bracket, then **LOOSEN** the two receiver bracket bolts (2). Feel the bracket by hand to make sure it will move for adjustment.

NOTE: **Save the felt patches to put back on the bolt heads.**

15. Position the LH modular top panel (2) till the 8mm gap gauges (1) will fit firmly between the rear hard top panel and the LH modular top panel, on the LH side of the vehicle just above the B-pillar and at the center of the vehicle.

16. When the 8mm gap has been achieved, close all the clamps (1), **EXCEPT** the front center clamp (2). Check that the panel did not move.

17. Tighten the **OUTBOARD** hard top front receiver bracket bolt to the proper. Refer to [**TORQUE SPECIFICATIONS**](#) .
18. Tighten the **INBOARD** hard top front receiver bracket bolt to the proper. Refer to [**TORQUE SPECIFICATIONS**](#) .
19. Close the front center LH modular top clamp (3).
20. Place the felt patches over the bolt heads.
21. Return the visors to the original position.
22. Using an 8mm gap gauge, verify the gaps. If the gaps are not correct, repeat the procedure.

FREEDOM PANEL FLUSHNESS INSTRUCTIONS

The following procedure provides instructions to properly adjust the FREEDOM PANELS, also called (left hand and right hand) modular top panels.

This graphic shows Freedom Panels (1) that do not meet the flushness specification at front to windshield (Panel to Panel).

1. Remove the left hand modular top panel.
2. Lower the left hand visor (2), unhook and swing forward.

3. Remove the right hand modular top panel.
4. Lower the right hand visor (3), unhook and swing forward.

5. Pull down trim (1) covering the front center receivers (2).

NOTE: Do not pull trim all the way off from the vehicle. Just enough to disengage the attachment clips (1) on each side.

6. Loosen the two receiver bracket bolts (1). Feel the bracket by hand to make sure it will move for adjustment.

NOTE: Do not remove screws from the bracket, loosen only.

7. Adjust receiver (1) down. Do not adjust receiver all the way down to the bottom (2). The panels will over compress the windshield seal and increase latching at the front.

8. Tighten bolts (2) on the front receiver. Make sure the bracket (1) stays level and does not rotate.

9. Install the right hand and left hand modular panels and verify flushness between the panels and to the front windshield.

10. Remove both the right hand and left hand modular panels to secure trim (1).

11. Install the right hand and left hand modular panels return visors to the original position.

NOTE: Be careful not to bend the clips when installing trim (see Step 5). Pull trim down and line up clips prior to securing.

FREEDOM PANEL FOAM INSTALLATION

A-PILLAR FOAM

1. Remove the Freedom Panel and place it on a padded working surface.

2. Remove the foam pads (3 and 4) from the Freedom Panel and remove any glue residue with a glue removing solvent.

3. Identify the foam pad (3) in the foam service parts.

4. Locate the corner of the **NEW** foam pad (3) at the part corner as shown in illustration, then press (1) to engage the adhesive.

5. Roll the foam down on the flat surface and press (1), then push down along the flat surface and into the corner to engage the adhesive.
6. Press (2), then push down along the radius to engage the adhesive.

NOTE: It is acceptable if the foam rolls over the surface edge (3), but not necessary.

7. Firmly rub the entire foam pad to promote full adhesion.

8. Identify the foam pad (4) in the foam service parts.

9. Using a scale, measure 52 mm from the part edge (2) and mark a line (1) to start the placement of the foam pad.

10. Locate the **NEW** foam pad (4) at the mark (1), then press (2) to engage the adhesive.

11. Roll the foam pad up the edge and press (3) first, then press (2) to engage the adhesive.

NOTE: The end (1) of the foam pad will hang over the edge.

12. Roll the end (2) down the edge and press (3), then push down along the flat surface to engage the adhesive.

NOTE:

Prevent the foam from bunching at the corner (1).

The foam pad (4) should overlap the foam pad (3) if installed correctly.

B-PILLAR OUTSIDE FOAM

1. Remove the Freedom Panel and place it on a padded working surface.

2. Remove the foam pad (1) from the Freedom Panel and remove any glue residue with a glue removing solvent.

3. Identify the foam pad (1) in the foam service parts.

4. Locate the **NEW** foam pad (1) along the paint line (4) and the edge of the part (3), then press (2) to engage the adhesive.

5. Roll the foam pad down the edge and press (1) to engage the adhesive.

6. Push the foam pad into the corner, lay it on the flat surface and press (1) to engage the adhesive.

7. Firmly rub the entire foam pad to promote full adhesion.

B-PILLAR INSIDE FOAM

1. Remove the Freedom Panel and place it on a padded working surface.

2. Remove the foam pad (2) from the Freedom Panel and remove any glue residue with a glue removing solvent.

3. Identify the foam pad (2) in the foam service parts.

4. Locate the **NEW** foam pad (2) using the dimensions as shown in illustration.
5. Lay the foam pad and press to engage the adhesive. Firmly rub the entire foam pad to promote full adhesion.

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

CAUTION: Be certain all fasteners are removed. Failure to follow these instructions will result in hardtop damage.

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .
2. From inside the vehicle, release the left (1) and right (2) clamps.
3. Release the front top clamps (3).

4. From the hardtop left rear corner, of the interior, remove the trim cover (2), disconnect the hardtop wire harness connector (1).

5. Remove the modular tops (1) and (2).
6. Remove the two front bolts (3).

CAUTION: Lifting the main hard top on or off will require the assistance of four people, one in each corner. Failure to lift the top as instructed may result in hard top damage.

7. Remove the two side bolts (6)
8. Remove the four rear bolts (5). Remove the main hard top (4) by lifting evenly, steadily and without flexing.

INSTALLATION

NOTE: To prevent water leaks, the seals and freedom top should be clear of dust and debris before installation.

1. Install the main hard top (4) by lifting evenly, steadily and without flexing. Place onto the vehicle while lining up the alignment pins.

CAUTION: Verify the B and C-pillar seals are not folded up and are positioned correctly.

2. Install the two side bolts (6)
3. Install the four rear bolts (5).
4. Install the two front bolts (3).
5. Tighten the bolts to the proper Refer to [TORQUE SPECIFICATIONS](#) .

NOTE: Make sure all modular top latches are in the open position.

6. Position the modular tops (1) and (2) onto the vehicle with the right side top (1) being installed before the left side (2).

7. With the modular tops installed correctly onto the alignment pins, secure the front latches (3).
8. Secure the right side clamps (2) fully.
9. Secure the left side clamps (1) fully.

10. Connect the wire harness connector (1) and install the trim cover (2).

11. Connect the negative battery cable(s). Refer to the appropriate service information .

TUBE, REMOVABLE TOP DRAIN

REMOVAL AND INSTALLATION

REMOVABLE TOP DRAIN TUBES

FRONT

REMOVAL

1. Remove the Freedom Tops, if equipped Refer to [REMOVABLE TOP, HARD, REMOVAL AND INSTALLATION](#).
2. Open the soft top if equipped.
3. Remove the wiper arms Refer to [ARM, WIPER, REMOVAL AND INSTALLATION](#) .

1 - Bolts

4. Remove the bolts securing the upper windshield frame to the header.

1 - Windshield

5. Fold the windshield down onto the hood.

1 - Drain

2 - Seal

3 - Retaining Clips

6. Release the tube from the drain.

7. Separate the retaining clips and remove the tube from the seal.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Verify all clips are fully secured.

- Tighten the bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#) .

REAR

REMOVAL

1. Remove the B-pillar trim. Refer to [PANEL, B-PILLAR TRIM, LOWER, REMOVAL AND INSTALLATION](#)[PANEL, B-PILLAR TRIM, UPPER, REMOVAL AND INSTALLATION](#).

1 - Drain

2 - Retaining Clips

2. Release the tube from the drain.
3. Separate the retaining clips.

1 - Tube

2 - Grommet

4. Release the grommet from the floor board.
5. Separate the retaining clips and remove the tube.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Verify all clips are fully secured.

SEATS, FIRST ROW

WARNING

WARNING:

To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbags, airbag curtains, knee blocker, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect the Intelligent Battery Sensor (IBS)/negative battery cable assembly from the negative battery post, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING:

During and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler MoparB® parts catalog. Failure to follow these instructions may result in personal injury or death.

WARNING:

To avoid personal injury or death, the fasteners, screws, and bolts originally used for the restraint system components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the restraint system. Anytime a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the FCA US LLC MoparB® parts catalog. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING:

Never strike or drop the Occupant Restraint Controller (ORC), as it can damage the impact sensor or affect its calibration. The occupant restraint controller contains the impact sensor, which enables the system to deploy the supplemental restraints. If an airbag control module is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper supplemental restraint deployment and serious or fatal injury.

COVER, SEAT BACK

REMOVAL AND INSTALLATION

WARNING:

Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to [SEATS, FIRST ROW, WARNING.](#)
2. Remove the front seat back. Refer to [SEAT BACK, FRONT, REMOVAL AND INSTALLATION.](#)
3. Remove the headrest from the seat back.

1 - J-hook Retainer
2 - Zipper

4. Open the zippers on each side of the seatback cover and release the J-hook strip (1).

- | |
|--------------------|
| 1 - Seat Back Trim |
| 2 - Side Retainers |

5. Lift the seat back trim slightly and release the side retainers.

- | |
|----------------------|
| 1 - J-hook Retainers |
| 2 - Wire Harness |
| 3 - J-hook Retainer |

6. Release the J-hook retainers for the seat back cover.
7. Unclip the wire harness.

1 - Flat Bladed Tool
2 - Headrest Sleeve
3 - Tab

8. Pull the foam back, then using a flat bladed tool, push the tab and pull out the headrest sleeves.
9. Remove the seat air bag from the seat back frame, following all warnings and cautions. Refer to [AIR BAG, SEAT, REMOVAL AND INSTALLATION](#).
10. Remove the seat air bag from the chute and set aside.
11. Remove the seat back foam and seat back cover as an assembly, from the seat back frame.

1 - Hook and Loop Fasteners
2 - Hog Rings
3 - Seat Back Cover

12. Pull the seat back cover away from the seat foam, releasing the hook and loop fasteners first.
13. Cut the hog rings and remove the seat back cover from the foam.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Position the seat cover on the seat foam and install **NEW** hog rings.

UP LEVEL

WARNING: Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to [SEATS, FIRST ROW, WARNING](#).
2. Remove the front seat. Refer to [SEAT, FRONT, REMOVAL AND INSTALLATION](#).
3. Remove the front seat back. Refer to [SEAT BACK, FRONT, REMOVAL AND INSTALLATION](#).
4. Remove the seat back panel. Refer to [PANEL, SEAT BACK, SECOND ROW, REMOVAL AND INSTALLATION](#).
5. Remove the headrest from the seat back.

6. Release the J-hooks (1 and 2) first then release the upper J-hook (3).

7. Unclip the wire harness from the seat frame.

8. Pull the foam back, then using a flat bladed tool, push the tab (1) and pull out the headrest sleeves (2).

9. Remove the seat air bag from the seat back frame, following all warnings and cautions. Refer to [**AIR BAG, SEAT, REMOVAL AND INSTALLATION**](#) .

10. Remove the seat air bag from the chute and set aside.

11. Remove the seat back foam and seat back cover as an assembly, from the seat back frame.

12. Pull the seat back cover (3) away from the seat foam, releasing the hook and loop fasteners (1) first.
13. Cut the hog rings (2) and remove the seat back cover from the foam.

INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to [SEATS, FIRST ROW, WARNING](#).
2. Position the seat cover on the seat foam and install **NEW** hog rings.
3. Pull the seat cover tight and engage the hook and loop fasteners.
4. Position the seat back foam assembly on the seat back frame.
5. Install the seat air bag in the chute and connect the wire harness connector.
6. Install the seat air bag in the seat back frame, following all warnings and cautions. Refer to [AIR BAG, SEAT, REMOVAL AND INSTALLATION](#).
7. Install the headrest sleeves.
8. Route the wire harness and clip it to the seat frame.
9. Fasten the side J-hooks and then the four lower J-hooks.
10. Install the head rest.
11. Install the seat back panel. Refer to [PANEL, SEAT BACK, SECOND ROW, REMOVAL AND INSTALLATION](#).
12. Install the front seat back. Refer to [SEAT BACK, FRONT, REMOVAL AND INSTALLATION](#).
13. Install the front seat. Refer to [SEAT, SECOND ROW, REMOVAL AND INSTALLATION](#).

COVER, SEAT CUSHION

REMOVAL AND INSTALLATION

FOUR DOOR SEAT CUSHION COVER

WARNING:

Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: The Occupant Classification System (OCS) is used in the passenger side front seat of vehicles manufactured for domestic markets. Vehicles manufactured for export markets use the Occupant Detection Sensor (ODS) instead of the OCS on the passenger side front seat.

NOTE: All of the components of the OCS including the Occupant Classification Module (OCM), the Seat Weight Sensor (SWS), the plastic insulator SWS pad, the passenger seat cushion foam, the passenger seat cushion trim, the electronic pressure sensor, the OCS pressure hose, and the heat mat and vent bag (if equipped), are serviced only as a factory-calibrated and assembled unit. Any time any one of these components requires replacement for any reason, the entire calibrated OCS must be replaced and re-zeroed. Refer to the appropriate diagnostic information.

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to [SEATS, FIRST ROW, WARNING.](#)

1 - Push Fastener
2 - Cover

2. Unhook the cover on both sides of the seat back and remove the push fastener.

1 - Cover
2 - Screw
3 - Lumbar Knob

3. Using a small flat bladed tool, remove the cover, then remove the screw and the lumbar knob.

1 - Front J-Clips
2 - Seat Cushion Cover Side J-Clips
3 - Rear J-Clips
4 - Wire Harness Connector Retainer
5 - Wire Harness Connector

4. Using a trim tool, release the side J-clips of the seat cushion cover.

5. Unhook the cover J-clips at the front and rear of the cushion.

6. Disconnect the wire harness connector for the seat heater, if equipped, and unclip the wire harness from the seat frame.

7. Remove the seat cushion foam and seat cushion cover as an assembly, from the seat frame.

1 - Hook and Loop Strip

8. Release the hook and loop strip.

1 - Hog Rings
2 - Seat Cover

9. Pull the seat cover away from the seat foam, cut the hog rings and remove the cover.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- For passenger seat equipped with OCS, position the **NEW** seat foam assembly on the seat frame.

- Refer to specific instructions related to OCS installation. Refer to [MODULE, OCCUPANT CLASSIFICATION \(OCM\), REMOVAL AND INSTALLATION](#) .
- For a driver seat equipped with a Drivers Presence Protection Module (DPPM), inspect it for damage. If damaged replace the foam assembly.
- For driver seat: Position the seat cover on the seat foam, install new hog rings, fasten the hook and loop strips and position the foam assembly on the seat frame.
- Tighten lumbar knob screw securely.
- If servicing the passenger seat, do not connect the negative battery cable at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to [STANDARD PROCEDURE](#) .
- Following successful completion of the SRS Verification Test procedure, perform the OCM System Verification Test procedure found in the diagnostic scan tool under Miscellaneous Functions. Refer to the appropriate diagnostic procedures.
- If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

PANEL, SEAT BACK, FRONT

REMOVAL AND INSTALLATION

SEAT BACK PANEL

WARNING: Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to [SEATS, FIRST ROW, WARNING](#).

2 - Screws

2. Unhook the two lower straps from the bottom of the seat, then remove the two screws.

1 - Hooks

2 - Seat Back Panel

3 -

3. Pull downward slightly on the seat back panel, then release the hooks on one side of the panel and remove.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Push up on the seat back panel to fully engage the top hooks, then push to engage the side hooks.
- Install the two screws at the bottom and tighten securely.

SEAT, FRONT

REMOVAL AND INSTALLATION

FRONT SEAT

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **SEATS, FIRST ROW, WARNING**.
2. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.

1 - Rear Seat Bolts

3. Position the seat in the full forward position, and remove the rear seat bolts.
4. Move the seat to the rearward position.

1 - Front Seat Bolts

5. Remove the front seat bolts.
6. Tilt the seat up and disconnect the wire harness connectors, then remove the seat.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Install the front seat bolts loose.

- Move the seat forward and install the rear seat bolts and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- Move seat rearward and tighten the front seat bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
- The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component. Refer to [STANDARD PROCEDURE](#) .

SEAT BACK, FRONT

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

WARNING:

Disable the airbag system before attempting any component diagnosis or service of the front seats, when equipped with front seat air bags. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

REMOVAL

1. Remove the front seat side shields. Refer to [SIDE SHIELDS, SEAT CUSHION, FRONT, REMOVAL AND INSTALLATION](#).

2. Unhook the cover (2) on both sides of the seat back and remove the push fastener (1).

3. Using a small flat bladed tool, remove the cover (1), then remove the screw (2) and the lumbar knob (3), if equipped.

4. Under the seat, open the hook and loop straps (2).
5. Disconnect the seat heater harness connector (1) and unclip the wire harness from the seat frame, if equipped.
6. Unclip the seat air bag wire harness (3) from the seat frame.

7. Using a trim stick, release the push fasteners (1) on the side of the cushion trim.
8. Remove the screws (2) and loosen the lumbar controls (3), then unclip the cable (4) from the seat frame.

9. Remove the bolts (1) on both sides of the seat back (2), and remove the seat back.

INSTALLATION

1. Position the seat back and install the two front seat back bolts on each side of the seat. Tighten the front seat back bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#).
2. Route the lumbar cable and fasten the lumbar controls.
3. Fasten the seat cushion trim to the frame and hook the sides near the seat back pivot.
4. From under the seat, route the seat back heater harness and connect the wire harness connector, if equipped.
5. From under the seat, route the seat air bag wire harness and clip it to the seat frame.
6. Fasten the hook and loop strips.
7. Install the lumbar knob.

8. Install the front seat side shields. Refer to [SIDE SHIELDS, SEAT CUSHION, FRONT, REMOVAL AND INSTALLATION](#).

SIDE SHIELDS, SEAT CUSHION, FRONT

REMOVAL AND INSTALLATION

SEAT CUSHION SIDE SHIELDS

NOTE: The front seat does not need to be removed in order to service only the outer side shield. The seat will need to be removed to continue any additional service on the seat.

WARNING: Disable the airbag system before attempting any component diagnosis or service of the front seats, when equipped with front seat air bags. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

REMOVAL

1. If necessary, remove the front seat. Refer to [SEAT, FRONT, REMOVAL AND INSTALLATION](#).

1 - Outer Side Shield Cover

2. Remove outer side shield cover fastener.
3. Using a trim tool, remove the outer side shield cover.

1 - Lift Lever
2 - Lift Lever Fasteners
3 - Rear Outboard Side Shield Fastener
4 - Outboard Side Shield
5 - Outboard Side Shield Fastener

4. Remove the two fasteners and the lift lever.
5. Remove the fastener at the back of the outboard side shield.
6. Remove the fastener, then the outboard side shield.

1 - Rear Fasteners
2 - Side Fastener
3 - Inboard Side Shield

7. Remove the fasteners at the rear of the seat and fastener at the side of seat on inboard side shield.
8. Remove the inboard side shield.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- All fasteners are tightened securely.

SLEEVE, HEADREST, FRONT

REMOVAL AND INSTALLATION

FOUR DOOR HEADREST SLEEVE

WARNING: Disable the airbag system before attempting any component diagnosis or service of the front seats, when equipped with front seat side air bags. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to [SEATS, FIRST ROW, WARNING](#).
2. Remove the front seat back. Refer to [SEAT BACK, FRONT, REMOVAL AND INSTALLATION](#).
3. If equipped with uplevel trim remove the seat back panel. Refer to [PANEL, SEAT BACK, SECOND ROW, REMOVAL AND INSTALLATION](#).
4. Remove the headrest from the seat back.

1 - J-hook Retainer
2 - Zipper

5. Open the zippers on each side of the seatback cover and release the J-hook strip (1).

1 - Seat Back Trim

2 - Side Retainers

6. Lift the seat back trim slightly and release the side retainers.

1 - J-hook Retainers

2 - Wire Harness

3 - J-hook Retainer

7. Release the J-hook retainers for the seat back cover.

8. Unclip the wire harness.

1 - Flat Bladed Tool
2 - Headrest Sleeve
3 - Tab

9. Pull the foam back, then using a flat bladed tool, push the tab and pull out the headrest sleeves.

1. INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle.

SUPPORT, LUMBAR

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

WARNING: Disable the airbag system before attempting any component diagnosis or service of the front seats, when equipped with front seat air bags. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to [SEATS, FIRST ROW, WARNING](#).
2. Remove the seat from the vehicle. Refer to [SEAT, FRONT, REMOVAL AND INSTALLATION](#) [SEAT, SECOND ROW, REMOVAL AND INSTALLATION](#).
3. If equipped with uplevel trim remove the seat back panel. Refer to [PANEL, SEAT BACK, FRONT, REMOVAL AND INSTALLATION](#) [PANEL, SEAT BACK, SECOND ROW, REMOVAL AND INSTALLATION](#).
4. Remove the front seat back. Refer to [SEAT BACK, FRONT, REMOVAL AND INSTALLATION](#).

5. With base trim open the zippers (2) on each side of the seatback cover and release the J-hook strip (1).

6. Lift the seat back trim and unclip the cable (1).

7. Remove the screw (2).

8. Unhook the lumbar support ends (4) and remove the lumbar support (3).

INSTALLATION

1. Install the lumbar support and install the retainer screw.

2. Route the cable and clip it to the seat back frame.

3. Fasten the seat back cover J-hook retainers.

4. with base trim close the side zippers and fasten the lower J-hook retainers.

5. Install the front seat back. Refer to [SEAT BACK, FRONT, REMOVAL AND INSTALLATION](#).

6. With uplevel trim install the seat back panel. Refer to [PANEL, SEAT BACK, FRONT, REMOVAL AND INSTALLATION](#)[PANEL, SEAT BACK, SECOND ROW, REMOVAL AND INSTALLATION](#).

SEATS, SECOND ROW

ARMREST, SECOND ROW

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Fold the 40% seat forward in the flat position.
2. Using a trim tool, remove the armrest pivot cover (1).

3. Remove the screw (2) and the plastic guide (1).
4. Using a small flat bladed tool, remove the retainer (3).

5. Unhook the armrest pivot (2) from the slot, then push inward and rotate the armrest (3) to remove.
6. Remove the inner armrest trim, if necessary.

INSTALLATION

1. Install the inner armrest trim to the armrest bracket, if necessary.
2. Position the armrest to the seat opening and to the armrest pivot.
3. Push inward while rotating the armrest and hook the armrest pivot to the slot.
4. Install the retainer.
5. Position the plastic guide and install the screw securely.
6. Install the armrest pivot cover.

CABLE, RELEASE, FOLD FLAT, SPLIT SEAT

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

NOTE: The 40% split seat configuration procedure as shown in illustration, 60% split seat configuration similar.

REMOVAL

1. Remove the seat back foam and seat back cover as an assembly, from the seat back frame. Refer to COVER, SEAT BACK, REMOVAL AND INSTALLATIONCOVER, SEAT BACK SECOND ROW 40%, REMOVAL AND INSTALLATIONCOVER, SEAT BACK SECOND ROW 60%, REMOVAL AND INSTALLATION.
2. Remove the seat back panel. Refer to PANEL, SEAT BACK, FRONT, REMOVAL AND INSTALLATIONPANEL, SEAT BACK, SECOND ROW, REMOVAL AND INSTALLATION.

3. Remove the cable (1) from the seat frame (2).
4. Remove the cable end and the screws (3) from the seat back release system.

5. Remove the screws (1) securing the release handle to the seat frame.

INSTALLATION

1. Install the release handle to seat frame and install the screws. Tighten the screws securely.
2. Install the seat back release system to the seat frame with the screws. Tighten the screws securely.
3. Route the cable and install the cable ends to the latch.
4. Clip the cable to the seat frame.
5. Verify the function of the release cable.
6. Install the seat back cover. Refer to [COVER, SEAT BACK, REMOVAL AND INSTALLATION](#)[COVER, SEAT BACK SECOND ROW 40%, REMOVAL AND INSTALLATION](#)[COVER, SEAT BACK SECOND ROW 60%, REMOVAL AND INSTALLATION](#).

COVER, SEAT BACK SECOND ROW 40%

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Remove the 40% rear seat. Refer to [SEAT, FRONT, REMOVAL AND INSTALLATION](#) [SEAT, SECOND ROW, REMOVAL AND INSTALLATION](#).

2. Remove the two seat pivot cover screws (2), and remove the pivot cover (1).

3. Remove the seat pivot bolts (1).
4. Remove the seat back from the seat cushion.

5. Release the J-hook (2) and open the zippers (1).

6. Lift the rear of the seat cover and release the hook and loop pads (1) by the seat latch.

7. Remove the seat back panel. Refer to [PANEL, SEAT BACK, FRONT, REMOVAL AND INSTALLATION](#)[PANEL, SEAT BACK, SECOND ROW, REMOVAL AND INSTALLATION](#).

8. Using a trim stick, remove the seat release strap bezel cover (1).

9. Remove the push clips (1) for the seat cover, located under the bezel.

10. Remove the headrest. Refer to [HEADREST, SECOND ROW, REMOVAL AND INSTALLATION](#).

11. Remove the seat back foam and seat back cover as an assembly from the seat back frame.
12. Pull the hook and loop strip (1), on seat cover, apart from the seat foam and cut the front hog rings.
13. Pull the seat back cover away from the seat foam and cut the rear cover hog rings and remove the cover.

INSTALLATION

1. Position the seat back cover to the seat back foam.
2. Pull the seat cover tight to the foam and install **NEW** hog rings.
3. Position the seat back cover and foam assembly to the seat back frame.
4. Install the headrest and headrest tubes. Refer to [HEADREST, SECOND ROW, REMOVAL AND INSTALLATION](#).
5. Install the seat back panel to the seat frame. Refer to [PANEL, SEAT BACK, FRONT, REMOVAL AND INSTALLATION](#)[PANEL, SEAT BACK, SECOND ROW, REMOVAL AND INSTALLATION](#).
6. Close the J-hook and close the zippers.
7. Install the push clips for the seat cover, located under the release strap bezel.
8. Install the release strap bezel.
9. Install the seat back to the seat cushion and install the seat pivot bolts.
10. Tighten the seat pivot bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
11. Install the seat pivot cover and screws.
12. Install the 40% rear seat. Refer to [SEAT, FRONT, REMOVAL AND INSTALLATION](#)[SEAT, SECOND ROW, REMOVAL AND INSTALLATION](#).

COVER, SEAT BACK SECOND ROW 60%

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Remove the 60% rear seat. Refer to [SEAT, FRONT, REMOVAL AND INSTALLATION](#)[SEAT, SECOND ROW, REMOVAL AND INSTALLATION](#).

2. Remove the two seat pivot cover screws (2) and remove the pivot cover (1).

3. Remove the center seat belt retractor nut (1) from lower seat frame.

4. Remove the seat pivot bolts (1).
5. Remove the seat back from the seat cushion.
6. If equipped, remove the armrest. Refer to [ARMREST, SECOND ROW, REMOVAL AND INSTALLATION](#).

7. Open the zippers (1) on each side of the seat back cover and release the J-hook strip (2).

8. Disengage the seat belt guide (1) at the top of the seat back (2) and remove from the seat belt (3) through the slit in the seat belt guide.

9. Using a trim stick, remove the seat release strap bezel cover (1).

10. Remove the push clips (1) for the seat cover, located under the bezel.

11. Lift the rear of the seat cover and release the hook and loop pads (1) by the seat latch.
12. Remove the seat back panel. Refer to [PANEL, SEAT BACK, FRONT, REMOVAL AND INSTALLATION](#)[PANEL, SEAT BACK, SECOND ROW, REMOVAL AND INSTALLATION](#).
13. Remove the headrests and the headrest tubes. Refer to [HEADREST, SECOND ROW, REMOVAL AND INSTALLATION](#).

14. Lift the seat back cover, and release the J-hook straps and release the hook and loop strap (1).

15. Cut the hog ring (1) holding the seat back cover to the seat back foam.

16. Remove the seat back foam and seat back cover as an assembly from the seat back frame.

17. Pull the seat back cover away from the seat foam and cut the hog rings (1).
18. Remove the push clips (2).
19. Release the seat cover from the hook and loop strip and pull the seat back cover away from the seat foam.

INSTALLATION

1. Position the seat back cover to the seat back foam.
2. Pull the seat cover tight and install **NEW** hog rings.
3. Install the push clips.
4. Position the seat back foam assembly to the seat back frame.
5. Install NEW hog ring on the rear cover and close hook and loop strap to frame.
6. Install the seat back panel. Refer to **PANEL, SEAT BACK, FRONT, REMOVAL AND INSTALLATION****PANEL, SEAT BACK, SECOND ROW, REMOVAL AND INSTALLATION.**
7. Pull the cover tight and close the J-hook straps.
8. Close the rear seat cover J-hooks and zippers.
9. Install the seat cover push clips under the bezel.
10. Install the seat strap release bezel.
11. Install the seat belt guide.
12. If equipped, install the armrest. Refer to **ARMREST, SECOND ROW, REMOVAL AND INSTALLATION.**
13. Install the headrest and headrest tubes. Refer to **HEADREST, SECOND ROW, REMOVAL AND INSTALLATION.**
14. Install the seat to the seat cushion and install the pivot bolts.
15. Tighten the seat pivot bolts to the proper. Refer to **TORQUE SPECIFICATIONS .**
16. Install the center row seat belt retractor nut and tighten to the proper. Refer to **TORQUE SPECIFICATIONS .**
17. Install the seat pivot cover, and the screws.
18. Install the 60% rear seat. Refer to **SEAT, FRONT, REMOVAL AND INSTALLATION****SEAT, SECOND ROW, REMOVAL AND INSTALLATION.**

COVER, REAR SEAT CUSHION, 40%

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

NOTE: The seat cushion and cover can be removed in vehicle.

REMOVAL

1. Fold the seat cushion down.
2. Using a trim tool, remove the seat tether bezels (1).
3. Lift the seat cushion to the up position.

4. Lift up on the rear flaps (3).
5. Release the J-hook (2) then open the zippers (1).

6. Open the rear of the cover and release the J-hook straps (1).

- 7. Remove the J-hook (1) on the outboard seat cover.
- 8. Remove the seat cover and foam from the seat frame.

9. Pull the seat cover away from the foam and release the hook and loop strip (1).
10. Cut the hog rings (2).

11. Release the hook and loop strap (1) at rear of cover and remove from the seat foam.

INSTALLATION

1. Position the cushion cover to the cushion foam and close the hook and loop strap at rear of cover.
2. Pull seat cover tight and install **NEW** hog rings.
3. Position the seat foam assembly to the seat frame.
4. Pull the seat cover down over foam and clip J-hook straps.
5. Fasten the outside seat cover J-hook.
6. Close the zippers and fasten the J-hooks.
7. Close the rear flaps.
8. Lower the seat bottom and install seat tether bezels.

COVER, REAR SEAT CUSHION, 60%

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

NOTE: The seat cushion and cover can be removed in the vehicle.

REMOVAL

1. Lower the seat cushion.
2. Using a trim tool, remove the seat tether bezels (1).

3. Raise the lower seat cushion and release the lower seat cover flaps (3).
4. Release the J-hook (2) and open the zippers (1).
5. Lift the rear cover and release the J-hook straps.

6. Release the outside J-hook (1) and fold the cover up from the sides.
7. Remove the seat cover and cushion from the frame.

8. Cut the hog rings (2) and release the hook and loop strip (1).

9. Remove the rear seat cover J-hook (1) strap and remove the seat cover from the seat foam.

INSTALLATION

1. Position the seat cushion cover to the seat cushion foam and install **NEW** hog rings.
2. Install the rear J-hook strap at the rear of the cushion cover under the foam.
3. Position the seat cover and seat foam assembly to the seat frame and reinstall the J-hook at the outside of the cover.
4. Pull the seat cover over the sides of the seat foam and clip the seat cover J-hook straps.
5. Close the zippers and fasten the J-clips retainers at the bottom of the seat cushion.
6. Lower the rear seat cushion.

MECHANISM, FOLDING

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

For more information about the seat folding mechanism. Refer to **FRAME, SEAT CUSHION REAR, REMOVAL AND INSTALLATION**.

FRAME, SEAT BACK, REAR

REMOVAL AND INSTALLATION

40% SPLIT SEAT

REMOVAL

1. Remove the second row seat. Refer to **SEAT, SECOND ROW, REMOVAL AND INSTALLATION**.
2. Remove the seat back cover. Refer to **COVER, SEAT BACK, REMOVAL AND INSTALLATIONCOVER, SEAT BACK SECOND ROW 40%, REMOVAL AND INSTALLATIONCOVER, SEAT BACK SECOND ROW 60%, REMOVAL AND INSTALLATION**.
3. Remove the rear seat back panel. Refer to **PANEL, SEAT BACK, FRONT, REMOVAL AND INSTALLATIONPANEL, SEAT BACK, SECOND ROW, REMOVAL AND INSTALLATION**.
4. Remove the seat release cable. Refer to **CABLE, RELEASE, FOLD FLAT, SPLIT SEAT, REMOVAL AND INSTALLATION**.

5. If necessary, remove the seat pivot inner trim from the seat back frame (1).

INSTALLATION

1. If necessary, install the seat frame pivot inner trim.
2. Install the seat release cable. Refer to [CABLE, RELEASE, FOLD FLAT, SPLIT SEAT, REMOVAL AND INSTALLATION](#).
3. Install the seat back cover. Refer to [COVER, SEAT BACK, REMOVAL AND INSTALLATIONCOVER, SEAT BACK SECOND ROW 40%, REMOVAL AND INSTALLATIONCOVER, SEAT BACK SECOND ROW 60%, REMOVAL AND INSTALLATION](#).
4. Install the rear seat back panel. Refer to [PANEL, SEAT BACK, FRONT, REMOVAL AND INSTALLATIONPANEL, SEAT BACK, SECOND ROW, REMOVAL AND INSTALLATION](#).
5. Position the seat back frame and install the second row seat pivot bolts and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#).
6. Install the second row seat. Refer to [SEAT, FRONT, REMOVAL AND INSTALLATIONSEAT, SECOND ROW, REMOVAL AND INSTALLATION](#).

60% SPLIT SEAT

REMOVAL

1. Remove the second row seat. Refer to [SEAT, FRONT, REMOVAL AND INSTALLATIONSEAT, SECOND ROW, REMOVAL AND INSTALLATION](#).
2. Remove the seat back cover. Refer to [COVER, SEAT BACK, REMOVAL AND INSTALLATIONCOVER, SEAT BACK SECOND ROW 40%, REMOVAL AND INSTALLATIONCOVER, SEAT BACK SECOND ROW 60%, REMOVAL AND INSTALLATION](#).
3. Remove the center second row seat belt retractor. Refer to [RETRACTOR, SEAT BELT, REMOVAL AND INSTALLATION](#).
4. Remove the rear seat back panel. Refer to [PANEL, SEAT BACK, FRONT, REMOVAL AND INSTALLATIONPANEL, SEAT BACK, SECOND ROW, REMOVAL AND INSTALLATION](#).
5. Remove the seat release cable. Refer to [CABLE, RELEASE, FOLD FLAT, SPLIT SEAT, REMOVAL AND INSTALLATION](#).

6. If necessary, remove the seat pivot inner trim from the seat back frame (1).

INSTALLATION

1. If necessary, install the seat pivot inner trim to the seat back.
2. Install the release cable. Refer to [CABLE, RELEASE, FOLD FLAT, SPLIT SEAT, REMOVAL AND INSTALLATION](#).
3. Install the center second row seat belt retractor. Refer to [RETRACTOR, SEAT BELT, REMOVAL AND INSTALLATION](#).
4. Install the seat back cover. Refer to [COVER, SEAT BACK, REMOVAL AND INSTALLATION](#)[COVER, SEAT BACK SECOND ROW 40%, REMOVAL AND INSTALLATION](#)[COVER, SEAT BACK SECOND ROW 60%, REMOVAL AND INSTALLATION](#).
5. Install the seat back panel. Refer to [PANEL, SEAT BACK, FRONT, REMOVAL AND INSTALLATION](#)[PANEL, SEAT BACK, SECOND ROW, REMOVAL AND INSTALLATION](#).
6. Position the seat back frame to the lower seat frame cushion, and install the second row seat pivot bolts.
7. Tighten the second row seat pivot bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#).
8. Install the second row seat. Refer to [SEAT, FRONT, REMOVAL AND INSTALLATION](#)[SEAT, SECOND ROW, REMOVAL AND INSTALLATION](#).

FRAME, SEAT CUSHION REAR

REMOVAL AND INSTALLATION

40% SPLIT SEAT

REMOVAL

1. Remove the second row seat. Refer to [SEAT, FRONT, REMOVAL AND INSTALLATION](#)[SEAT, SECOND ROW, REMOVAL AND INSTALLATION](#).

2. Remove the two seat pivot cover screws (2) and remove the pivot cover (1).

3. Remove the seat pivot side bolts (1).
4. Remove the seat back from the lower seat cushion.
5. Remove the lower seat cushion cover and foam from the seat frame. Refer to [COVER, SEAT CUSHION, REMOVAL AND INSTALLATION](#)[COVER, REAR SEAT CUSHION, 40%, REMOVAL AND INSTALLATION](#)[COVER, REAR SEAT CUSHION, 60%, REMOVAL AND INSTALLATION](#).

6. If necessary, remove the inner seat pivot trim from the seat frame (1).
7. Remove the seat belt buckle. Refer to [BUCKLE, SEAT BELT, REMOVAL AND INSTALLATION](#) .

INSTALLATION

1. If necessary, install the inner seat pivot trim to the seat frame.
2. Install the seat belt buckle to the seat frame. Refer to [BUCKLE, SEAT BELT, REMOVAL AND INSTALLATION](#) .
3. Install the seat cover and foam assembly to the seat frame. Refer to [COVER, SEAT CUSHION, REMOVAL AND INSTALLATIONCOVER, REAR SEAT CUSHION, 40%, REMOVAL AND INSTALLATIONCOVER, REAR SEAT CUSHION, 60%, REMOVAL AND INSTALLATION](#).
4. Position the seat cushion and frame assembly to the seat back frame and cushion assembly.
5. Install the second row seat pivot bolts and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
6. Install the outer seat pivot covers and tighten the screws.
7. Install the second row seat. Refer to [SEAT, FRONT, REMOVAL AND INSTALLATIONSEAT, SECOND ROW, REMOVAL AND INSTALLATION](#).

60% SPLIT SEAT

REMOVAL

1. Remove the second row seat. Refer to [SEAT, FRONT, REMOVAL AND INSTALLATIONSEAT, SECOND ROW, REMOVAL AND INSTALLATION](#).

2. Remove the two seat pivot cover screws (2) and remove the pivot cover (1).

3. Remove the seat pivot bolts (1).

4. Remove the seat back frame from the cushion frame.

5. Remove the seat cushion foam and seat cushion cover as an assembly from the seat frame. Refer to [COVER, SEAT BACK, REMOVAL AND INSTALLATION](#)[COVER, SEAT BACK SECOND ROW 40%, REMOVAL AND INSTALLATION](#)[COVER, SEAT BACK SECOND ROW 60%, REMOVAL AND INSTALLATION](#).

6. If necessary, remove the inner seat pivot trim from the seat cushion frame (1).
7. Remove the seat belt buckle. Refer to [BUCKLE, SEAT BELT, REMOVAL AND INSTALLATION](#) .

INSTALLATION

1. Install the seat belt buckle to the seat frame. Refer to [BUCKLE, SEAT BELT, REMOVAL AND INSTALLATION](#) .
2. If necessary, install the inner seat pivot trim to the seat cushion frame.
3. Install the seat cushion cover and seat foam as an assembly to the seat frame. Refer to [COVER, SEAT BACK, REMOVAL AND INSTALLATIONCOVER, SEAT BACK SECOND ROW 40%, REMOVAL AND INSTALLATIONCOVER, SEAT BACK SECOND ROW 60%, REMOVAL AND INSTALLATION](#).
4. Position the seat cushion and frame assembly to the seat back frame and cushion assembly.
5. Install the second row seat pivot bolts and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .
6. Install the outer seat pivot covers and tighten the screws.
7. Install the second row seat. Refer to [SEAT, FRONT, REMOVAL AND INSTALLATIONSEAT, SECOND ROW, REMOVAL AND INSTALLATION](#).

HEADREST, SECOND ROW

REMOVAL AND INSTALLATION

CENTER HEADREST

2319154552

REMOVAL

1. Fold down the 60% seat back.
2. Open the zippers (1) and release the J-hook (2) on the seat back.
3. Lift the rear seat back cover.
4. Remove the center headrest and note the orientation of the tubes.

2319153901

5. Access the holes in the rear seat back panel under head rest.
6. Locate the tabs at the bottom of the headrest tubes (1).

7. Using a suitable tool (1), release the tabs on the headrest tubes and remove the tubes from the seat.

INSTALLATION

1. Install the headrest tubes in the seat in the proper orientation, as noted in the removal. Be certain the tabs have engaged fully.
2. Install the headrest into the head rest tubes.
3. Position the rear seat back cover.
4. Close the seat back cover by fastening the zippers and J-hook.

OUTBOARD HEADREST

NOTE: This procedure only applies to the outboard headrests.

REMOVAL

1. Remove the seat back panel. Refer to [PANEL, SEAT BACK, FRONT, REMOVAL AND INSTALLATION](#) [PANEL, SEAT BACK, SECOND ROW, REMOVAL AND INSTALLATION](#).

2. Remove the headrest and note the orientation of the headrest sleeves.
3. Lift up on rear seat foam and remove the clips (1) at top of the headrest tube.

4. Squeeze the tabs (1) and pull out the headrest with the headrest sleeves.

INSTALLATION

1. Install the headrest sleeves with the headrest in the correct orientation, as noted in the removal.
2. Install the clips at top of headrest sleeves.
3. Install the seat back panel. Refer to **PANEL, SEAT BACK, FRONT, REMOVAL AND INSTALLATION****PANEL, SEAT BACK, SECOND ROW, REMOVAL AND INSTALLATION.**

PANEL, SEAT BACK, SECOND ROW

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

NOTE: Right side as shown in illustration, left side similar.

REMOVAL

1. Fold the seat back down.
2. Release the J-hook strip (2) at the bottom of the seat back cover.
3. Open the zippers (1) on each side of the seat back cover.

4. Remove the hook and loop fasteners (1) that secures the seat back cover to the seat back panel.
5. Separate the hook and loop straps at the bottom of the seat cover.
6. Remove the screw securing the seat back panel to the seat back frame.

7. Remove the nine push fasteners (1) that secure the seat back panel (2) to the seat back frame.

INSTALLATION

1. Position the seat back panel to the seat frame.
2. Install the nine push fasteners that secure the seat back panel to the seat back frame.
3. Install the screw securing the seat back panel to the seat back frame and tighten securely.
4. Fasten the hook and loop straps at the bottom of the seat cover.
5. Fasten the hook and loop fasteners that secures the seat back cover to the seat back panel.
6. Close the zippers on each side of the seat back cover.
7. Fasten the J-hook strip at the bottom of the seat back cover.

SEAT, SECOND ROW

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

NOTE: The 40% and 60% rear seats are removed and installed similarly.

2319153566

REMOVAL

1. Raise the seat cushion on the driver side rear seat.
2. Remove the bolts (1) from seat frame (2) on the 40% side of the seat.
3. Remove the screws for the trim between the center seat bolts and remove the trim.

2319153563

4. Remove the bolts (1) from the seat lower frame (2).
5. Lift and remove the seat from the vehicle.

INSTALLATION

1. Position the seat in the vehicle.
2. Install the bolts loosely in the seat frame on the 40% side.
3. Install the second row seat bolts and tighten to the proper. Refer to [**TORQUE SPECIFICATIONS**](#).
4. Position the center seat bolts trim and install the screws. Tighten the screws securely.

5. Tighten the bolts that hold the 40% seat frame 60% seat frame and tighten to the proper. Refer to [TORQUE SPECIFICATIONS](#) .

STATIONARY GLASS

WARNING

WARNING:

Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly in an accident.

- Urethane adhesives are applied as a system. Use glass cleaner, glass prep solvent, glass primer, PVC (vinyl) primer and pinch weld (fence) primer provided by the adhesive manufacturer. If not, structural integrity could be compromised.
- FCA US LLC does not recommend glass adhesive by brand. Technicians should review product labels and technical data sheets, and use only adhesives that their manufactures warrant will restore a vehicle to the requirements of FMVSS 212. Technicians should also insure that primers and cleaners are compatible with the particular adhesive used.
- Be sure to refer to the urethane manufacturer's directions for curing time specifications, and do not use adhesive after its expiration date.
- Vapors that are emitted from the urethane adhesive or primer could cause personal injury. Use them in a well-ventilated area.
- Skin contact with urethane adhesive should be avoided. Personal injury may result.
- Always wear eye and hand protection when working with glass.

CAUTION:

Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.

BACKLITE

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

CAUTION:

It is difficult to salvage the backlite during the removal operation. The urethane bonding used to secure the glass to the fence is difficult to cut or clean from any surface. Since the molding is set in urethane, it is unlikely it would be salvaged. Before removing the backlite, check the availability from the parts supplier.

NOTE:

Take care using any tools to avoid top damage in the location indicated by the illustration.

NOTE:

The backlite is attached to the window frame with urethane adhesive. The urethane adhesive is applied cold and seals the surface area between the window opening and the glass. The primer adheres the urethane adhesive to the backlite.

1. Disconnect and isolate the negative battery cable(s). Refer to the appropriate service information .

2. Remove the rear header panel. Refer to [PANEL, CAB BACK TRIM, REMOVAL AND INSTALLATION](#).
3. Disconnect the electronic backlite grid connectors (1) from both sides of the glass, if equipped.

4. Bend the top tabs (1) down out of the way.

5. From inside the vehicle, separate the top adhesive using a pull knife (1) or equivalent, to aid installation of the wire removal tool.

6. Install the nylon cable (2) out through the opening in the adhesive made previously and position around the perimeter of the glass as indicated.
7. Using an assistant and a windshield Rotating Wire Removal System tool (3), cut and separate the urethane adhesive securing the glass to the fence and stopping at the support pins (4). Use a trim stick or equivalent to aid in guiding the nylon cable around the glass channels as needed.

8. From inside the vehicle, separate the lower adhesive (1) using a pull knife (2) or equivalent. This will aid in gaining access to the lower support pins.

9. Position the glass (1) back to expose the support pins (2) at the bottom.
10. Using a small flat bladed tool or equivalent, separate the two sided tape securing the support pins (2) to the glass.

11. Reposition the nylon cable (4) through the glass opening to cut the remaining adhesive at the bottom (3) of the glass as indicated.
12. Using an assistant and a windshield Rotating Wire Removal System tool (1), cut and separate the remaining urethane adhesive (3) securing the bottom of the glass to the fence and remove the glass. Use a trim stick or equivalent to aid in guiding the nylon cable around the glass channels (2) as needed.

13. Separate glass (1) from vehicle.

WARNING: Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly if the vehicle is in an accident.

CAUTION: To help prevent water leaks, partially roll down the left and right door glass before installing the windshield. This avoids pressurizing the passenger compartment if a door is slammed before the urethane is cured.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

NOTE: The glass fence should be cleaned of most of its old urethane adhesive. A small amount of old urethane, approximately 1 mm in height should remain on the fence. Do not completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected.

NOTE: Do not use solvent based glass cleaners to clean the backlite before applying glass prep and primer or poor glass adhesion may result.

INSTALLATION

1. With a sharp flat bladed tool (2) equipped with an appropriate width blade, trim the remaining bead of adhesive (1) down to approximately 1 mm (0.04 in). Use care not to damage the edge of the top (3). Do not completely remove all old urethane from the frame, the paint finish and bonding strength will be adversely affected.
2. Clean the inside of the glass with an ammonia based glass cleaner and a lint-free cloth.
3. Apply glass prep adhesion promoter 25 mm (1 in.) wide around the perimeter of the glass and 5 mm (0.2 in.) from the edge of the glass and let air dry without wiping.
4. Apply glass primer 25 mm (1 in.) wide around the perimeter of the glass and 5 mm (0.2 in.) from the edge of the glass. Allow at least three minutes drying time.
5. Using a flashlight, verify that the primer is completely and evenly installed along the perimeter of the glass.
6. Re-prime any area that is not fully and evenly primed.

7. Clean the glass fence with an ammonia based glass cleaner and a lint-free cloth.
8. With the use of the applicator (2), apply pinch weld primer 25 mm (1 in.) wide (1) around the glass fence. Allow at least three minutes drying time.
9. Using a flashlight, verify that the primer is completely and evenly installed along the glass fence.
10. Re-prime any area that is not fully and evenly primed.

ADHESIVE WIDTH 7 mm (0.275 in)
ADHESIVE HEIGHT 13 mm (0.50 in)

CAUTION: Always apply bead of adhesive to the backlite. Always install the backlite within 5 minutes after applying adhesive.

NOTE: If the original urethane adhesive has been exposed for more than 12 hours, the entire adhesive area will need to be re-primed prior to installing new adhesive.

Apply bead of adhesive (1) with a triangular nozzle directly on the glass.

11. Apply approximately a 7 mm (0.3 in.) wide and 13 mm (0.5 in.) tall bead of adhesive (1) with a triangular nozzle approximately 6 mm (0.230 in.) from the edge of the glass (2) starting at the bottom center of the glass.

NOTE: Make sure the bead of adhesive is placed on the primer fully.

12. Run the end of the adhesive bead (1) on the glass parallel to the start of the bead and smooth the ends flush.

NOTE: Make sure there are no gaps present in the adhesive bead and ends.

WARNING: Allow the urethane at least 24 hours to cure before returning the vehicle to use.

NOTE: Roll down the left and right front door glass before installing backlite. This is to avoid pressurizing the passenger compartment if a door is slammed before the urethane is cured. The potential for water leaks can result.

13. Locate the glass assembly (1) to the backlight opening. Align the pins on the glass assembly with the holes (2) in the bottom corners of the backlight opening.
14. Apply hand pressure to the outside glass surface, around the entire periphery, to assure proper seating of the glass to the backlight opening. The glass must be seated to the rest blocks.

15. Connect the electronic backlite grid connectors (1) to both sides, if equipped.
16. Install the rear cab header panel. Refer to **PANEL, CAB BACK TRIM, REMOVAL AND INSTALLATION**.
17. Connect the negative battery cable(s). Refer to the appropriate service information .

GLASS REMOVAL TOOLS

Common Glass Tools Needed to Remove Stationary Glass

- 1 - ExtractorB® Express™ or equivalent, equipped with flat blade
- 2 - Rotating Wire Removal System
- 3 - Two handled wire type cut-out tool
- 4 - Cold knife equipped with a 25 mm (1.0 in.) blade or a 38 mm (1.5 in.) blade
- 5 - Long knife

BACKLITE, SLIDING

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL

1. Open the center glass approximately 8 cm (3 in).

1 - Heated Glass Wire Harness Connector

2. Disconnect the heated glass wire harness connector on the sliding glass.

1 - Electrical Connector
2 - Stationary Glass
3 - Fasteners
4 - Lower Window Track Stops

3. Disconnect the electrical connector along with the two sided tape and snaps from the stationary glass.
4. Remove the fasteners from both lower window track stops.
5. Remove both lower window track stops.

1 - Fastener

2 - Window Latch Stop

6. Remove the fasteners from the window latch stop on the stationary glass.
7. Slide window all the way towards passenger side.

1 - Lower Track

8. Lift and slide lower track towards driver side.

1 - Window Frame

2 - Sliding Glass

9. Lift the sliding glass upward and pull the bottom out of the lower channel.
10. Remove the sliding glass out of the window frame on the passenger side.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- Verify proper operation of the glass.

FRAME, WINDSHIELD

REMOVAL AND INSTALLATION

WINDSHIELD FRAME

REMOVAL

1. On vehicles equipped with a power top assembly, remove the top (Refer to the appropriate service information).
2. If equipped, remove the Freedom Tops. Refer to [REMOVABLE TOP, HARD, REMOVAL AND INSTALLATION](#).
3. Open the soft top, if equipped.
4. Remove the wiper arms. Refer to [ARM, WIPER, REMOVAL AND INSTALLATION](#).

1 - Bolts

5. Remove the bolts securing the upper windshield frame to the header.

6. Remove the cowl trim. Refer to [COVER, COWL PANEL, REMOVAL AND INSTALLATION](#).

1 - Bolts

2 - Hinge to Body Marking

7. Using a suitable marking device, mark the position of the hinges on the body to aid installation.

8. Remove the bolts and with the aid of a helper, remove the windshield frame assembly.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

- A suitable body sealant should be applied when removing or moving the hinges.
- Align the hinges to the reference marks made previously and tighten the hinge to body bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#).
- Tighten the windshield frame to header bolts to the proper. Refer to [TORQUE SPECIFICATIONS](#).

WINDSHIELD

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

CAUTION: Be careful not to damage painted surfaces when removing moldings or cutting urethane around the windshield.

REMOVAL

1. Remove the wiper arms Refer to [ARM, WIPER, REMOVAL AND INSTALLATION](#) .
2. If equipped, remove the Driver Assist System Module (DASM). Refer to [MODULE, DRIVERS ASSISTANCE SYSTEM \(DASM\), REMOVAL AND INSTALLATION](#) .

1 - Cut-Out Tool

3. Using an assistant and a windshield cut-out tool, cut and separate the urethane adhesive securing the windshield to the windshield frame.

- | |
|----------------------|
| 1 - Windshield |
| 2 - Windshield Frame |

4. Carefully remove the windshield from the vehicle.

INSTALLATION

Follow the removal procedure in reverse for general reassembly of the components on the vehicle. The steps listed below are calling out specific procedures that should be followed during installation.

WARNING: Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly if the vehicle is in an accident.

CAUTION: To help prevent water leaks, partially roll down the left and right door glass before installing the windshield. This avoids pressurizing the passenger compartment if a door is slammed before the urethane is cured.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

- | |
|-----------------------|
| 1 - Windshield |
| 2 - Razor Knife |
| 3 - Original Urethane |

- If the windshield is being reused, remove as much original urethane as possible from the glass surface using a razor knife.

NOTE: To prevent corrosion, do not damage paint on windshield frame when removing original urethane.

NOTE: The windshield frame should be cleaned of most of its old urethane adhesive. A small amount of old urethane, approximately 1 mm in height should remain on the frame. Do not completely remove all old urethane from the frame, the paint finish and bonding strength will be adversely affected.

1 - Razor Knife

2 - Windshield Frame

3 - Original Urethane

- Using a razor knife, level the original bead of urethane on the windshield frame to a thickness of approximately 1 mm (0.04 in.) and remove the loose adhesive.

1 - Windshield

2 - Windshield Frame

- Using an assistant, position the windshield into the windshield opening and against the windshield frame.
- Verify the windshield lays evenly against the frame at the top, bottom and sides of the opening. If not, the frame must be formed to the shape of the windshield.
- Mark the windshield and the windshield frame with pieces of masking tape to use as a reference for installation.

- Using an assistant, remove the windshield from the windshield opening and place it on a suitable padded work surface.

1 - Adhesion Promoter/Glass Primer
2 - Windshield Perimeter

- Clean the inside of the windshield with an ammonia based glass cleaner and a lint-free cloth.
- Apply glass prep adhesion promoter 25 mm (1 in.) wide around the perimeter of the windshield and 5 mm (0.2 in.) from the edge of the glass and wipe dry with a clean lint-free cloth until no streaks are visible.
- Apply glass primer 25 mm (1 in.) wide around the perimeter of the windshield and 5 mm (0.2 in.) from the edge of the glass. Allow at least three minutes drying time.
- Using a flashlight, verify that the primer is completely and evenly installed along the perimeter of the windshield.
- Re-prime any area that is not fully and evenly primed.

1 - Primer

2 - Windshield Frame

- Clean the windshield frame with an ammonia based glass cleaner and a lint-free cloth.
- Apply pinch weld primer 25 mm (1 in.) wide around the windshield frame. Allow at least three minutes drying time.
- Using a flashlight, verify that the primer is completely and evenly installed along the windshield frame.
- Re-prime any area that is not fully and evenly primed.

1 - Adhesive

2 - Glass

CAUTION: Always apply the bead of adhesive to the windshield. Always install the windshield within 5 minutes after applying the adhesive.

NOTE: If the original urethane adhesive has been exposed for more than 12 hours, the entire adhesive area will need to be re-primed prior to installing new adhesive.

- Apply approximately a 7 mm (0.3 in.) wide and 13 mm (0.5 in.) tall bead of adhesive with a triangular nozzle approximately 6 mm (0.230 in.) from the edge of the glass starting at the bottom center of the windshield.

NOTE: Make sure the bead of adhesive is placed on the primer fully.

1 - Adhesive Bead End

- Run the end of the adhesive bead on the windshield parallel to the start of the bead and smooth the ends flush.

NOTE: Make sure there are no gaps present in the adhesive bead and ends.

1 - Windshield
2 - Windshield Frame

- Using an assistant, position the windshield over the windshield opening.
- Using the tape as reference points, align the windshield to the opening.
- Carefully lower the windshield onto the windshield frame. Guide the windshield into its proper location.
- Push the windshield inward until the windshield comes into contact with the location pins located on each side of the upper windshield frame.

1 - A-pillars
2 - Glass

- Seat the windshield glass firmly starting at the top and the bottom A-pillars and working inward to the center on the top and bottom until the standoff bottoms out onto the frame. Hold in position until the glass feels solid and make sure glass is underflush around the entire frame.
- Slowly add pressure inboard and press the center of the glass underflush as far as possible.
- Make sure the glass is in the center of the frame opening and that the lips of the lace molding are not gapping and seated equally around the perimeter of the glass.

GLASS REMOVAL TOOLS

Common Glass Tools Needed to Remove Stationary Glass

- 1 - ExtractorB® Express™ or equivalent, equipped with flat blade
- 2 - Rotating Wire Removal System
- 3 - Two handled wire type cut-out tool
- 4 - Cold knife equipped with a 25 mm (1.0 in.) blade or a 38 mm (1.5 in.) blade
- 5 - Long knife

WEATHERSTRIP/SEALS

CAUTION

Some body mounted weatherstrips are sealed to the body using a white mastic compound.

CAUTION: Door and Liftgate weatherstrip seals that use a white mastic sealant must be replaced with a new weatherstrip and any mastic must be cleaned from attachment flanges whenever the weatherstrip is removed.

CAUTION: Failure to follow these recommendations could result in damage or failure to the part and the related parts.

WEATHERSTRIP, HEADER, ROOF

REMOVAL AND INSTALLATION

HEADER WEATHERSTRIP

For Header Seal Weatherstrip service. Refer to [DIAGNOSIS AND TESTING](#) .

2021 ACCESSORIES AND BODY, CAB

Body Control Module (BCM) - Communication Diagnostic Procedure & Body Verification Test - Gladiator

STANDARD PROCEDURE

COMMUNICATION DIAGNOSTIC PROCEDURE

1. CHECK FOR POSSIBLE CAUSES

1. This Communication Diagnostic Procedure is intended to provide the technician with a common starting point.

NOTE: For an in-depth explanation of the Controller Area Network (CAN) Bus system operation. Refer to COMMUNICATION, DESCRIPTION AND OPERATION .

NOTE: For intermittent communication issues, or if multiple communication related DTCs are set in other Electronic Control Modules (ECUs), check the suspected ECU power and ground circuits, including at the body sheet-metal, for loose or poor connections. Performing a load test on these circuits will verify the circuit is capable of carrying the amperage needed to perform properly, along with confirming that excessive resistance does not exist in the circuit(s) being tested. For additional information on CIRCUIT LOAD TESTING PROCEDURES. Refer to STANDARD PROCEDURE . The vehicle communication systems may be diagnosed with the Mopar Scope. Refer to DIAGNOSIS AND TESTING .

2. Check the Battery for proper State of Charge (SOC) and the Charging System for proper operation. Refer to the appropriate service information .
3. With the scan tool, check all Electronic Control Modules (ECUs) for battery and ignition voltage related DTCs and record on the repair order.
4. Check for and perform all Service Bulletins that could be related to the customer's concern.
5. Check aftermarket accessories for proper installation. (Check for improper electrical connections and fasteners that may be contacting wire harnesses)
6. With the scan tool, check all ECUs for software updates that are related to the customer's concern. Update ECU(s) as necessary.
7. Check related wire harnesses for collision related damage.

Were any problems found?

Yes

- Repair the problem as necessary.
- With the scan tool, erase DTCs from the related ECUs and perform the appropriate VERIFICATION TEST. If a VERIFICATION TEST is not available for an ECU, perform the BCM VERIFICATION TEST. Refer to STANDARD PROCEDURE.

No

- Go To 2

2. CHECK ELECTRONIC CONTROL MODULES FOR VEHICLE CONFIGURATION DTCS

NOTE:

A Configuration DTC indicates that an ECU is not programmed with information that is specific to the vehicle (VIN, mileage, etc.). If an ECU is not configured properly, serial data communication failures may exist. The following list includes, but is not limited to, DTC descriptors that indicate a Configuration DTC.

- ECU Configuration Mismatch - Not Configured
- ECU Unable To Configure
- Implausible/Missing ECU Network Configuration Data
- Implausible/Missing Vehicle Configuration Data
- Implausible Vehicle Configuration
- Incorrect Variant/Configuration
- PROXI Not Programmed (If applicable)
- Restore Vehicle Configuration
- Vehicle Configuration Mismatch
- Vehicle Configuration Not Programmed

TYPES OF CAN BUS FAULTS	
LOSS OF COMMUNICATION	will set by an active receiving/reporting ECU on a CAN Bus network that detects no communication from another ECU on the same CAN Bus network. Insufficient power, ground, bus voltage, or inaccurate vehicle configuration will cause a loss of communication.
IMPLAUSIBLE MESSAGE	will set by an active receiving/reporting ECU, when it determines the data sent from the active transmitting/offending ECU is missing part of the message, or the message is an irrational value over the CAN Bus.
MISSING MESSAGE	will set by an active receiving/reporting ECU, when it determines a data message to be missing partial information when sent from the active transmitting/offending ECU over the CAN Bus network.
BUS OFF	set by an ECU that has experienced approximately 32 transmit errors, this can be caused by ECU internal faults as well as external bus faults like shorts or plugging and unplugging test tools to the diagnostic connector.
PHYSICAL	is only detectable by an ECU that has a transceiver that is able to detect shorts on the bus. If the ECU does not, it generally will set bus off faults due to shorted bus lines.

NOTE:

A Vehicle Scan Report can be helpful if online/phone assistance is needed.

1. With the scan tool, generate a Vehicle Scan Report and record on the repair order.
2. With the scan tool, check all ECUs for Configuration DTCs.

Are any Configuration DTCs set?

Yes

- Configure the ECU(s) as necessary in accordance with the Service Information.
- Perform the appropriate VERIFICATION TEST. If a VERIFICATION TEST is not available for an ECU, perform the BCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To [3](#)

3. CHECK ELECTRONIC CONTROL MODULES FOR ACTIVE COMMUNICATION RELATED DTCS

1. Refer to the scan tool DTCS.

Are any Communication related DTCS active?

Yes

- Go To [4](#)

No

- Go To [5](#)

4. CHECK ACTIVE DTCS

1. Refer to the scan tool DTCS.

NOTE: Diagnose Lost Communication DTCS (not to be confused with CAN Bus Off or Can Bus Performance DTCS) before diagnosing other CAN related DTCS.

Which type of Communication DTC is active?

Lost Communication

- Go To [7](#)

Implausible Data, Implausible Signal, Missing Message or Invalid Data

- Go To [9](#)

5. CHECK STORED DTCS

1. Refer to the scan tool DTCS.

NOTE: Diagnose all Lost Communication DTCS before diagnosing other CAN related DTCS.

Which type of Communication DTC is stored?

Lost Communication

- Perform the STORED LOST COMMUNICATION DTCS procedure. Refer to [DIAGNOSIS AND TESTING](#) . The vehicle communication systems may be diagnosed with the Mopar Scope. Refer to [DIAGNOSIS AND TESTING](#) .

Implausible Data, Implausible Signal, Missing Message or Invalid Data

- Go To [6](#)

6. CHECK THE 'SENDING CONTROL MODULE' FOR DTCS

NOTE: The 'Sending Control Module' is the ECU that the Implausible Data, Implausible Signal, Missing Message or Invalid Data is set against. Below is a list of some items (depending on vehicle configuration) a 'Sending Control Module' may provide as a bussed out to one or more "Reporting Control Module".

- **Sensors**
 - Adjustable Pedal
 - Air Temperature

- **Battery**
- **Blind Spot**
- **Crankshaft**
- **Impact**
- **Park Assist**
- **Passive Entry**
- **Rain**
- **Ride Height**
- **Seat**
- **Sun**
- **Tire Pressure**
- **Wheel Speed**
- **Switches**
 - **Audio**
 - **Brake / Stop Lamp**
 - **Door Ajar**
 - **Hazard**
 - **Heated**
 - **Hood**
 - **Ignition**
 - **Lighting**
 - **Multifunction**
 - **Power Seat**
 - **PRNDL**
 - **SOS Console**
 - **Speed Control**

TYPES OF CAN BUS FAULTS	
LOSS OF COMMUNICATION	will set by an active receiving/reporting ECU on a CAN Bus network that detects no communication from another ECU on the same CAN Bus network. Insufficient power, ground, bus voltage, or inaccurate vehicle configuration will cause a loss of communication.
IMPLAUSIBLE MESSAGE	will set by an active receiving/reporting ECU, when it determines the data sent from the active transmitting/offending ECU is missing part of the message, or the message is an irrational value over the CAN Bus.
MISSING MESSAGE	will set by an active receiving/reporting ECU, when it determines a data message to be missing partial information when sent from the active transmitting/offending ECU over the CAN Bus network.
BUS OFF	set by an ECU that has experienced approximately 32 transmit errors, this can be caused by ECU internal faults as well as external bus faults like shorts or plugging and unplugging test tools to the diagnostic connector.
PHYSICAL	is only detectable by an ECU that has a transceiver that is able to detect shorts on the bus. If the ECU does not, it generally will set bus off faults due to shorted bus lines.

1. Refer to the scan tool DTCs.

Are any DTCs set in the 'Sending Control Module'?

Yes

- Refer to the appropriate diagnostic procedure.

No

- Go To [11](#)

7. CHECK FOR MULTIPLE LOST COMMUNICATION DTCS

1. Refer to the scan tool DTCS.

Choose the scenario that best describes the condition of the vehicle from the list below:

One ECU is reporting a Lost Communication DTC against a single ECU.

- Go To [8](#)

Multiple ECUs are reporting a Lost Communication DTC against a single ECU.

- Perform the NO RESPONSE or NO RESPONSE FROM ECU diagnostic procedure for the ECU that is not communicating. Refer to [DIAGNOSIS AND TESTING](#) . The vehicle communication systems may be diagnosed with the Mopar Scope. Refer to [DIAGNOSIS AND TESTING](#) .

8. CONFIRM THE TYPE OF LOST COMMUNICATION

NOTE:

Some Lost Communication DTC's may set by a "Reporting Control Module" when it does not receive a message or signal from the "Sending Control Module" when both ECUs are actively communicating on the same network. Below is a list of some items (depending on vehicle configuration) a 'Sending Control Module' may provide as a bussed out to one or more "Reporting Control Module".

- **Sensors**
 - Adjustable Pedal
 - Air Temperature
 - Battery
 - Blind Spot
 - Crankshaft
 - Impact
 - Park Assist
 - Passive Entry
 - Rain
 - Ride Height
 - Seat
 - Sun
 - Tire Pressure
 - Wheel Speed
- **Switches**
 - Audio
 - Brake / Stop Lamp
 - Door Ajar
 - Hazard
 - Heated

- Hood
- Ignition
- Lighting
- Multifunction
- Power Seat
- PRNDL
- SOS Console
- Speed Control

NOTE: **Reminder some ECUs are connected to multiple networks.**

1. Using the Service Information, refer to the wiring information and **STOP** the "Sending Control Module" from communicating on the associated CAN. Disconnecting the ECU or removing the power being fed to the ECU, for example, will **STOP** an ECU from communicating on a CAN.
2. Turn the ignition off for 5 seconds.
3. Turn the ignition on.
4. With the scan tool, check for all communication DTCs.
5. Confirm the "Sending Control Module" is no longer communicating with the scan tool.
6. Confirm multiple modules show a lost communication DTC against the "Sending Control Module".

Choose the scenario that best describes the condition of the vehicle from the list below:

Multiple ECUs are reporting a Lost Communication DTC against the "Sending Control Module"

- Turn the ignition off.
- Restore communication to the "Sending Control Module".
- Turn the ignition on.
- With the scan tool, confirm communication with the "Sending Control Module" on the associated CAN has returned.
- With the scan tool, erase DTCs.
- With the scan tool read the "Sending Control Module" for DTCs and perform the necessary repairs for any DTCs (active, stored, or pending) according to Service Information before proceeding.
- **IF** the "Sending Control Module" has no DTCs (active, stored, or pending) that are current or ongoing, then replace the " **Sending Control Module** " in accordance with Service Information.
- Perform the appropriate VERIFICATION TEST. If a VERIFICATION TEST is not available for an ECU, perform the BCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

Only the "Reporting Control Module" is reporting a Lost Communication DTC against the "Sending Control Module"

- Turn the ignition off.
- Restore communication to the "Sending Control Module".
- Turn the ignition on.
- With the scan tool, confirm communication with the "Sending Control Module" on the associated CAN has returned.
- With the scan tool, erase DTCs.

- With the scan tool read the "Sending Control Module" for DTCs and perform the necessary repairs for any DTCs (active, stored, or pending) according to Service Information before proceeding.
- At this time, there is no indication of an issue with the "Sending Control Module". **IF** the "Sending Control Module" has no DTCs (active, stored, or pending) that are current or ongoing, then replace the " **Reporting Control Module** " in accordance with Service Information.
- Perform the appropriate VERIFICATION TEST. If a VERIFICATION TEST is not available for an ECU, perform the BCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

9. CHECK THE 'SENDING CONTROL MODULE' FOR DTCs

NOTE:

The 'Sending Control Module' is the ECU that the Implausible Data, Implausible Signal, Missing Message or Invalid Data DTC is set against. Below is a list of some items (depending on vehicle configuration) a 'Sending Control Module' may provide as a bus connected to one or more 'Reporting Control Module'.

- **Sensors**
 - Adjustable Pedal
 - Air Temperature
 - Battery
 - Blind Spot
 - Crankshaft
 - Impact
 - Park Assist
 - Passive Entry
 - Rain
 - Ride Height
 - Seat
 - Sun
 - Tire Pressure
 - Wheel Speed
- **Switches**
 - Audio
 - Brake / Stop Lamp
 - Door Ajar
 - Hazard
 - Heated
 - Hood
 - Ignition
 - Lighting
 - Multifunction
 - Power Seat
 - PRNDL
 - SOS Console
 - Speed Control

TYPES OF CAN BUS FAULTS	
LOSS OF COMMUNICATION	will set by an active receiving/reporting ECU on a CAN Bus network that detects no communication from another ECU on the same CAN Bus network. Insufficient power, ground, bus voltage, or inaccurate vehicle configuration will cause a loss of communication.
IMPLAUSIBLE MESSAGE	will set by an active receiving/reporting ECU, when it determines the data sent from the active transmitting/offending ECU is missing part of the message, or the message is an irrational value over the CAN Bus.
MISSING MESSAGE	will set by an active receiving/reporting ECU, when it determines a data message to be missing partial information when sent from the active transmitting/offending ECU over the CAN Bus network.
BUS OFF	set by an ECU that has experienced approximately 32 transmit errors, this can be caused by ECU internal faults as well as external bus faults like shorts or plugging and unplugging test tools to the diagnostic connector.
PHYSICAL	is only detectable by an ECU that has a transceiver that is able to detect shorts on the bus. If the ECU does not, it generally will set bus off faults due to shorted bus lines.

1. Refer to the scan tool DTCs.
2. With the scan tool, check the 'Sending Control Module' for non-U-code DTCs that are related to the U-code that is set, or related to the customer's concern if the U-code DTC name is not clear about which signal is faulted.

Is a related non U-code DTC set in the 'Sending Control Module'.

Yes

- Refer to the appropriate diagnostic procedure.

No

- Go To [10](#)

10. CHECK OTHER ELECTRONIC CONTROL MODULES FOR RELATED NON U-CODE DTCs

NOTE:

IMPORTANT: Some ECUs simply pass information from one ECU to the other. In some cases, a U-code DTC may be set that implicates the "pass-through" ECU that sent the information. For example, if an Engine Coolant Temperature (ECT) Sensor DTC is set in the Powertrain Control Module (PCM), the HVAC Module may set an "Implausible Data from BCM" DTC because the BCM is the ECU that normally passes that information from the PCM to the HVAC Module. However, the BCM may not set any DTCs related to the faulted ECT Sensor because the BCM does not use the ECT information. In this case, the PCM ECT DTC should be diagnosed before the Implausible Data DTC. If you suspect a scenario like this, diagnose the non U-code DTC(s) before diagnosing any Implausible Data, Implausible Signal, Missing Message or Invalid Data DTCs. Below are some further examples of different sensors and switches:

- **Sensors**
 - Adjustable Pedal
 - Air Temperature
 - Battery
 - Blind Spot
 - Crankshaft
 - Impact

- Park Assist
- Passive Entry
- Rain
- Ride Height
- Seat
- Sun
- Tire Pressure
- Wheel Speed
- Switches
 - Audio
 - Brake / Stop Lamp
 - Door Ajar
 - Hazard
 - Heated
 - Hood
 - Ignition
 - Lighting
 - Multifunction
 - Power Seat
 - PRNDL
 - SOS Console
 - Speed Control

1. With the scan tool, check all other ECUs for non-U-code DTCs that are related to the U-code that is set, or related to the customer's concern if the U-code DTC name is not clear about which signal is faulted.

Is a related non U-code DTC set in another ECU?

Yes

- Diagnose the related DTC. Refer to the appropriate Diagnostic Procedure. The vehicle communication systems may be diagnosed with the Mopar Scope. Refer to **DIAGNOSIS AND TESTING**.

No

- Replace the 'Sending Control Module' in accordance with the Service Information.
- Perform the appropriate VERIFICATION TEST. If a VERIFICATION TEST is not available for an ECU, perform the BCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

11. CHECK THE 'SENDING CONTROL MODULE' RELATED WIRE HARNESS CONNECTIONS

1. Disconnect all 'Sending Control Module' related wire harness connectors.
2. Disconnect all related in-line wire harness connections (if equipped).
3. Inspect wire harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks
 - Corrosion
 - Signs of water intrusion.

- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

4. Connect all 'Sending Control Module' related wire harness connectors. Be certain that all wire harness connectors are fully seated and the connector locks are fully engaged.
5. Connect all in-line wire harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
6. With the scan tool, erase DTCs.
7. Operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

Did the DTC return?

Yes

- If there is a history of this DTC setting multiple times, replace the 'Sending Control Module' in accordance with the Service Information.
- Perform the appropriate VERIFICATION TEST. If a VERIFICATION TEST is not available for an ECU, perform the BCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Perform the appropriate VERIFICATION TEST. If a VERIFICATION TEST is not available for an ECU, perform the BCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
- Test Complete.

BODY VERIFICATION TEST

Perform the Body Verification Test

1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
2. Make sure all accessories are turned off.
3. Make sure the battery is fully charged.
4. Turn the ignition on.
5. With the scan tool, record and erase Diagnostic Trouble Codes (DTC)s from all modules.
6. If any repairs were performed to the Radio Frequency (RF-Hub) system, with the scan tool, select "Diagnostic Procedures", "Reset ECU", "RFH" and perform the routine.
7. If an electronic control module was replaced, select the applicable module from the scan tool. If the module has programmable features, program as necessary.
8. **Export Only:** If the Intrusion Transceiver Module (ITM) or Siren was replaced, select the ITM from the scan tool and perform the applicable replacement procedure.
9. Turn the ignition off, wait 10 seconds, and then turn the ignition on.
10. Operate all functions of the system that caused the original concern.
11. If a power window repair or module replacement was completed, perform the following:
 - De-normalize the module by lowering the window all the way down and stall it for two seconds.

- Press and release the down switch once again.
- Operate the motor to the full up position and stall it for two seconds.

12. With the scan tool, view all the modules and check for DTCs.

Are DTCs present in any of the modules or is the original condition still present?

Yes

- The repair is not complete. Perform the appropriate diagnostic procedure for the DTC or symptom that is still present.

No

- The repair is complete.
-

DTC TROUBLESHOOTING

B10B3-12-CABIN HEATER 1 CONTROL-CIRCUIT SHORT TO BATTERY

For a complete CABIN HEATER SYSTEM wiring diagram, **Refer to the appropriate wiring information .**

THEORY OF OPERATION - RELAYS

In diesel applications there are three Positive Temperature Coefficient (PTC) Relays, located in the Power Distribution Center (PDC) Assembly, are used for the PTC Cabin Heater System. The PTC Relays are used to supply fused battery voltage directly to the heating elements of the Cabin Heater. When the Body Control Module (BCM) receives a PTC Cabin Heater System activation CAN Bus message from the Powertrain Control Module (PCM), the BCM provides a ground signal, through the PTC Relay Control circuits, to activate the PTC Relays. When the PTC Relays are activated, a voltage output is sent to the Cabin Heater through the Fused Cabin Heater Supply circuits.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the PTC 1 Relay Output transitions from Off to On and the Body Control Module (BCM) detects a short to voltage on the PTC 1 Relay Control circuit for greater than 20 milliseconds.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

POSSIBLE CAUSES

Possible Causes
PTC 1 RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
PTC 1 RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.
Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. SUBSTITUTE THE PTC 1 RELAY - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: When removing a relay from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.

NOTE: Additional DTCs may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. CHECK FOR VOLTAGE ON THE (K360) PTC 1 RELAY CONTROL CIRCUIT AT THE PTC 1 RELAY TERMINAL

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the relay terminal in the PDC Assembly.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [4](#)

No

- Go To [6](#)

4. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (K360) PTC 1 RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the Power Distribution Center (PDC) Assembly harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit at the PDC Assembly harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [5](#)

5. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.

7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [**CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

6. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B10B3-14-CABIN HEATER 1 CONTROL-CIRCUIT SHORT TO GROUND OR OPEN

For a complete CABIN HEATER SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION - RELAYS

In diesel applications there are three Positive Temperature Coefficient (PTC) Relays, located in the Power Distribution Center (PDC) Assembly, are used for the PTC Cabin Heater System. The PTC Relays are used to supply fused battery voltage directly to the heating elements of the Cabin Heater. When the Body Control Module (BCM) receives a PTC Cabin Heater System activation CAN Bus message from the Powertrain Control Module (PCM), the BCM provides a ground signal, through the PTC Relay Control circuits, to activate the PTC Relays. When the PTC Relays are activated, a voltage output is sent to the Cabin Heater through the Fused Cabin Heater Supply circuits.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Body Control Module (BCM) PTC 1 Relay Output is Off and the BCM detects less than 1.5 volts on the PTC 1 Relay Control circuit for greater than one second.

POSSIBLE CAUSES

Possible Causes
PTC 1 RELAY CONTROL CIRCUIT OPEN, HIGH RESISTANCE OR SHORTED TO GROUND
FUSED B(+) CIRCUIT OPEN, HIGH RESISTANCE OR SHORTED TO GROUND
OPEN FUSE
PTC 1 RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding.
Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
3. With the scan tool, erase all DTCS.
4. Turn the ignition off for a minimum of 10.0 seconds.

5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- **Only DTC B10B3-14 is Active:** Go To [2](#)
- **DTCs B10B3-14, B10B7-14 and B1137-14 are Active:** Go To [7](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. SUBSTITUTE THE PTC 1 RELAY - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: When removing a relay from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.

NOTE: Additional DTCs may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (K360) PTC 1 RELAY CONTROL CIRCUIT FOR CONTINUITY TO GROUND AT THE PTC 1 RELAY TERMINAL

1. The ignition must be off when checking a circuit for continuity to ground.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.

3. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
4. Connect the negative lead of the DVOM to a known good ground.
5. Connect the positive lead of the DVOM to the circuit being tested, at the relay terminal in the Power Distribution Center (PDC) Assembly, and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Go To [4](#)

No

- Go To [5](#)

4. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (K360) PTC 1 RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Power Distribution Center (PDC) Assembly harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the PDC Assembly harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [8](#)

5. CHECK THE (K360) PTC 1 RELAY CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BETWEEN THE BCM AND THE PTC 1 RELAY TERMINAL

1. The ignition must be off when checking the resistance of a circuit.

2. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
3. Connect one lead of the DVOM to the circuit being tested at the relay terminal in the Power Distribution Center (PDC) Assembly.
4. Connect the other lead to the circuit being tested at the Electronic Control Unit (ECU) harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Go To [6](#)

No

- Go To [2](#)

6. DISCONNECT THE PDC ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (K360) PTC 1 RELAY CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Isolate the circuit by disconnecting the Power Distribution Center (PDC) Assembly harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the PDC Assembly harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [8](#)

7. CHECK FUSE 1 (50A) FOR AN OPEN

NOTE: When removing fuses from the PDC Assembly, do not rock or wiggle the fuse sideways during removal. Lift the fuse upward, using fingers or suitable pliers, at the middle of the fuse body and inspect the fuse terminals for proper contact.

1. Turn the ignition off.
2. Remove the indicated fuse from the Power Distribution Center (PDC) Assembly.

3. Check the fuse for an open.

Is the fuse open?

Yes

- Replace the fuse and check the system operation. If the fuse continues to open, repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Install the fuse. Repair the circuit for an open or high resistance. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

8. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to **CENTER, POWER DISTRIBUTION (PDC), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

9. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. CHECK FOR VOLTAGE ON THE (K361) PTC 2 RELAY CONTROL CIRCUIT AT THE PTC 2 RELAY TERMINAL

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the relay terminal in the PDC Assembly.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [4](#)

No

- Go To [6](#)

4. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (K361) PTC 2 RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the Power Distribution Center (PDC) Assembly harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit at the PDC Assembly harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [5](#)

5. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.

9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

6. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to [MODULE, BODY CONTROL \(BCM\), REMOVAL AND INSTALLATION](#) .

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

B10B7-14-CABIN HEATER 2 CONTROL-CIRCUIT SHORT TO GROUND OR OPEN

POSSIBLE CAUSES

Possible Causes
PTC 2 RELAY CONTROL CIRCUIT OPEN, HIGH RESISTANCE OR SHORTED TO GROUND
FUSED B(+) CIRCUIT OPEN, HIGH RESISTANCE OR SHORTED TO GROUND
OPEN FUSE
PTC 2 RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- **Only DTC B10B7-14 is Active:** Go To [2](#)
- **DTCs B10B3-14, B10B7-14 and B1137-14 are Active:** Go To [7](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **[STANDARD PROCEDURE](#)**.

2. SUBSTITUTE THE PTC 2 RELAY - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: When removing a relay from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.

NOTE: Additional DTCs may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.
- Perform the BODY VERIFICATION TEST. Refer to **[BODY VERIFICATION TEST](#)**.

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (K361) PTC 2 RELAY CONTROL CIRCUIT FOR CONTINUITY TO GROUND AT THE PTC 2 RELAY TERMINAL

1. The ignition must be off when checking a circuit for continuity to ground.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
4. Connect the negative lead of the DVOM to a known good ground.
5. Connect the positive lead of the DVOM to the circuit being tested, at the relay terminal in the Power Distribution Center (PDC) Assembly, and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Go To [4](#)

No

- Go To [5](#)

4. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (K361) PTC 2 RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Power Distribution Center (PDC) Assembly harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the PDC Assembly harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [8](#)

5. CHECK THE (K361) PTC 2 RELAY CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE BETWEEN THE BCM AND THE PTC 2 RELAY TERMINAL

1. The ignition must be off when checking the resistance of a circuit.
2. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
3. Connect one lead of the DVOM to the circuit being tested at the relay terminal in the Power Distribution Center (PDC) Assembly.
4. Connect the other lead to the circuit being tested at the Electronic Control Unit (ECU) harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Go To [6](#)

No

- Go To [9](#)

6. DISCONNECT THE PDC ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (K361) PTC 2 RELAY CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Isolate the circuit by disconnecting the Power Distribution Center (PDC) Assembly harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the PDC Assembly harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [8](#)

7. CHECK FUSE 2 (50A) FOR AN OPEN

NOTE: When removing fuses from the PDC Assembly, do not rock or wiggle the fuse sideways during removal. Lift the fuse upward, using fingers or suitable pliers, at the middle of the fuse body and inspect the fuse terminals for proper contact.

1. Turn the ignition off.
2. Remove the indicated fuse from the Power Distribution Center (PDC) Assembly.
3. Check the fuse for an open.

Is the fuse open?

Yes

- Replace the fuse and check the system operation. If the fuse continues to open, repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look

for any in-line connectors to help isolate the location of the short.

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Install the fuse. Repair the circuit for an open or high resistance. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

8. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [**CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

- Test complete.

9. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B10CA-12-FRONT DEFROST CONTROL CIRCUIT-CIRCUIT SHORT TO BATTERY

For a complete DEFOGGER SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Windshield Heater Relay Output transitions from Off to On and the Body Control Module (BCM) detects a short to voltage on the Windshield Heater Relay Control circuit for greater than 20 milliseconds.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

POSSIBLE CAUSES

Possible Causes
WINDSHIELD HEATER RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
WINDSHIELD HEATER RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. SUBSTITUTE THE WINDSHIELD HEATER RELAY - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: When removing a relay from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.

NOTE: Additional DTCs may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.

3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. CHECK FOR VOLTAGE ON THE (C902) WINDSHIELD HEATER RELAY CONTROL CIRCUIT AT THE WINDSHIELD HEATER RELAY TERMINAL

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the relay terminal in the PDC Assembly.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [4](#)

No

- Go To [6](#)

4. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (C902) WINDSHIELD HEATER RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the Power Distribution Center (PDC) Assembly harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit at the PDC Assembly harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [5](#)

5. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [**CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

6. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B10CA-14-FRONT DEFROST CONTROL CIRCUIT-CIRCUIT SHORT TO GROUND OR OPEN

For a complete DEFOGGER SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Body Control Module (BCM) Windshield Heater Relay Output is Off and the BCM detects less than 1.5 volts on the Windshield Heater Relay Control circuit for greater than one second.

POSSIBLE CAUSES

Possible Causes
WINDSHIELD HEATER RELAY CONTROL CIRCUIT OPEN, HIGH RESISTANCE OR SHORTED TO GROUND
FUSED B(+) CIRCUIT OPEN, HIGH RESISTANCE OR SHORTED TO GROUND
OPEN FUSE
WINDSHIELD HEATER RELAY
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK FUSE F44 (10A) FOR AN OPEN

NOTE: When removing fuses from the PDC Assembly, do not rock or wiggle the fuse sideways during removal. Lift the fuse upward, using fingers or suitable pliers, at the middle of the fuse body and inspect the fuse terminals for proper contact.

1. Turn the ignition off.
2. Remove the indicated fuse from the Power Distribution Center (PDC) Assembly.
3. Check the fuse for an open.

Is the fuse open?

Yes

- Replace the fuse and check the system operation. If the fuse continues to open, repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Install the fuse and Go To [3](#)

3. SUBSTITUTE THE WINDSHIELD HEATER RELAY - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: When removing a relay from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.

NOTE: Additional DTCs may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [4](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (C902) WINDSHIELD HEATER RELAY CONTROL CIRCUIT FOR CONTINUITY TO GROUND AT THE WINDSHIELD HEATER RELAY TERMINAL

1. The ignition must be off when checking a circuit for continuity to ground.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
4. Connect the negative lead of the DVOM to a known good ground.
5. Connect the positive lead of the DVOM to the circuit being tested, at the relay terminal in the Power Distribution Center (PDC) Assembly, and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Go To [5](#)

No

- Go To [6](#)

5. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (C902) WINDSHIELD HEATER RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Power Distribution Center (PDC) Assembly harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the PDC Assembly harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [8](#)

6. CHECK THE (C902) WINDSHIELD HEATER RELAY CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BETWEEN THE BCM AND THE WINDSHIELD HEATER RELAY TERMINAL

1. The ignition must be off when checking the resistance of a circuit.
2. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
3. Connect one lead of the DVOM to the circuit being tested at the relay terminal in the Power Distribution Center (PDC) Assembly.
4. Connect the other lead to the circuit being tested at the Electronic Control Unit (ECU) harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Go To [7](#)

No

- Go To [9](#)

7. DISCONNECT THE PDC ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (C902) WINDSHIELD HEATER RELAY CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Isolate the circuit by disconnecting the Power Distribution Center (PDC) Assembly harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the PDC Assembly harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [8](#)

8. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.

- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).
- Test complete.

9. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.

6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1137-12-CABIN HEATER 3 CONTROL-CIRCUIT SHORT TO BATTERY

For a complete CABIN HEATER SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION - RELAYS

In diesel applications there are three Positive Temperature Coefficient (PTC) Relays, located in the Power Distribution Center (PDC) Assembly, are used for the PTC Cabin Heater System. The PTC Relays are used to supply fused battery voltage directly to the heating elements of the Cabin Heater. When the Body Control Module (BCM) receives a PTC Cabin Heater System activation CAN Bus message from the Powertrain Control Module (PCM), the BCM provides a ground signal, through the PTC Relay Control circuits, to activate the PTC Relays. When the PTC Relays are activated, a voltage output is sent to the Cabin Heater through the Fused Cabin Heater Supply circuits.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the PTC 3 Relay Output transitions from Off to On and the Body Control Module (BCM) detects a short to voltage on the PTC 3 Relay Control circuit for greater than 20 milliseconds.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

POSSIBLE CAUSES

Possible Causes
PTC 3 RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
PTC 3 RELAY
AUXILIARY POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.
Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. SUBSTITUTE THE PTC 3 RELAY - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: When removing a relay from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.

NOTE: Additional DTCs may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCs.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. CHECK FOR VOLTAGE ON THE (K363) PTC 3 RELAY CONTROL CIRCUIT AT THE PTC 3 RELAY TERMINAL

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the relay terminal in the PDC Assembly.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [4](#)

No

- Go To [6](#)

4. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (K363) PTC 3 RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the Power Distribution Center (PDC) Assembly harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit at the PDC Assembly harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [5](#)

5. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.

- Damaged connector locks.
- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to **CENTER, POWER DISTRIBUTION (PDC), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

6. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.

- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1137-14-CABIN HEATER 3 CONTROL-CIRCUIT SHORT TO GROUND OR OPEN

For a complete CABIN HEATER SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION - RELAYS

In diesel applications there are three Positive Temperature Coefficient (PTC) Relays, located in the Power Distribution Center (PDC) Assembly, are used for the PTC Cabin Heater System. The PTC Relays are used to supply fused battery voltage directly to the heating elements of the Cabin Heater. When the Body Control Module (BCM) receives a PTC Cabin Heater System activation CAN Bus message from the Powertrain Control Module (PCM), the BCM provides a ground signal, through the PTC Relay Control circuits, to activate the PTC Relays. When the PTC Relays are activated, a voltage output is sent to the Cabin Heater through the Fused Cabin Heater Supply circuits.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Body Control Module (BCM) PTC 3 Relay Output is Off and the BCM detects less than 1.5 volts on the PTC 3 Relay Control circuit for greater than one second.

POSSIBLE CAUSES

Possible Causes
PTC 3 RELAY CONTROL CIRCUIT OPEN, HIGH RESISTANCE OR SHORTED TO GROUND
FUSED B(+) CIRCUIT OPEN, HIGH RESISTANCE OR SHORTED TO GROUND
OPEN FUSE
PTC 3 RELAY

Possible Causes
POWER DISTRIBUTION CENTER (PDC) ASSEMBLY
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
3. With the scan tool, erase all DTCS.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCS.

Did the DTC return?

Yes

- **Only DTC B1137-14 is Active:** Go To [2](#)
- **DTCS B10B3-14, B10B7-14 and B1137-14 are Active:** Go To [7](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. SUBSTITUTE THE PTC 3 RELAY - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

NOTE: When removing a relay from the PDC Assembly, do not rock or wiggle the relay sideways during removal. Lift the relay upward, using fingers or suitable pliers, at the middle of the relay body and inspect the relay terminals for proper contact.

NOTE: Additional DTCS may set in other Electronic Control Units (ECUs) when substituting relays in the PDC Assembly.

1. Turn the ignition off.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Substitute the relay with a similar known good relay in the PDC Assembly.
4. Turn the ignition on.
5. With the scan tool, erase DTCS.
6. Using the Environmental Data or When Monitored Conditions above, operate the vehicle within the conditions that set the DTC.
7. With the scan tool, read BCM DTCS.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the relay that caused the fault. With the scan tool, erase any additional DTCs that may have set when the relays were substituted.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (K363) PTC 3 RELAY CONTROL CIRCUIT FOR CONTINUITY TO GROUND AT THE PTC 3 RELAY TERMINAL

1. The ignition must be off when checking a circuit for continuity to ground.
2. Remove the relay, for the circuit being tested, from the Power Distribution Center (PDC) Assembly.
3. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
4. Connect the negative lead of the DVOM to a known good ground.
5. Connect the positive lead of the DVOM to the circuit being tested, at the relay terminal in the Power Distribution Center (PDC) Assembly, and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Go To [4](#)

No

- Go To [5](#)

4. DISCONNECT THE POWER DISTRIBUTION CENTER (PDC) ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (K363) PTC 3 RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting the Power Distribution Center (PDC) Assembly harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the PDC Assembly harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [8](#)

5. CHECK THE (K363) PTC 3 RELAY CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BETWEEN THE BCM AND THE PTC 3 RELAY TERMINAL

1. The ignition must be off when checking the resistance of a circuit.
2. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
3. Connect one lead of the DVOM to the circuit being tested at the relay terminal in the Power Distribution Center (PDC) Assembly.
4. Connect the other lead to the circuit being tested at the Electronic Control Unit (ECU) harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Go To [6](#)

No

- Go To [9](#)

6. DISCONNECT THE PDC ASSEMBLY HARNESS CONNECTOR(S) AND CHECK THE (K363) PTC 3 RELAY CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Isolate the circuit by disconnecting the Power Distribution Center (PDC) Assembly harness connector containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the PDC Assembly harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [8](#)

7. CHECK FUSE 3 (50A) FOR AN OPEN

NOTE: When removing fuses from the PDC Assembly, do not rock or wiggle the fuse sideways during removal. Lift the fuse upward, using fingers or suitable pliers, at the middle of the fuse body and inspect the fuse terminals for proper contact.

1. Turn the ignition off.
2. Remove the indicated fuse from the Power Distribution Center (PDC) Assembly.
3. Check the fuse for an open.

Is the fuse open?

Yes

- Replace the fuse and check the system operation. If the fuse continues to open, repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Install the fuse. Repair the circuit for an open or high resistance. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

8. DISCONNECT RELATED PDC ASSEMBLY HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all PDC Assembly harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all PDC Assembly harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Power Distribution Center (PDC) Assembly in accordance with the Service Information. Refer to [CENTER, POWER DISTRIBUTION \(PDC\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

9. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.

9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1208-11-ANTI-THEFT INDICATOR-CIRCUIT SHORT TO GROUND

For a complete MESSAGE SYSTEMS wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Vehicle Theft Alarm (VTA) Warning Indicator is located in the Instrument Panel Cluster (IPC). The Body Control Module (BCM) sends a voltage signal to the IPC, via the VTA Warning Indicator circuit, in order to illuminate the Anti-Theft Indicator when the following conditions are met:

- The BCM receives a Controller Area Network (CAN) message from the RF Hub (RFH) indicating all immobilizer requirements have been met.
- The ignition is off.
- The hood ajar status is set to off.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Vehicle Theft Alarm (VTA) Warning Indicator output is On and the Body Control Module (BCM) detects a short to ground on the VTA Warning Indicator circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The VTA Warning Indicator is always on or inoperative.

POSSIBLE CAUSES

Possible Causes
VTA WARNING INDICATOR CIRCUIT SHORTED TO GROUND
INSTRUMENT PANEL CLUSTER (IPC)
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. CHECK THE INSTRUMENT PANEL CLUSTER (IPC) FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the IPC harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Instrument Panel Cluster (IPC) in accordance with the Service Information. Refer to [MODULE, INSTRUMENT PANEL CLUSTER \(IPC\), REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. DISCONNECT THE BCM HARNESS CONNECTOR AND CHECK THE (G84) VTA WARNING INDICATOR CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect the all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.

4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [4](#)

4. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to [MODULE, BODY CONTROL \(BCM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

B1208-15-ANTI-THEFT INDICATOR-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete MESSAGE SYSTEMS wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Vehicle Theft Alarm (VTA) Warning Indicator is located in the Instrument Panel Cluster (IPC). The Body Control Module (BCM) sends a voltage signal to the IPC, via the VTA Warning Indicator circuit, in order to illuminate the Anti-Theft Indicator when the following conditions are met:

- The BCM receives a Controller Area Network (CAN) message from the RF Hub (RFH) indicating all immobilizer requirements have been met.
- The ignition is off.
- The hood ajar status is set to off.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Vehicle Theft Alarm (VTA) Warning Indicator output is Off and the Body Control Module (BCM) detects a short to voltage on the VTA Warning Indicator circuit for greater than 180 milliseconds.

DEFAULT ACTION

- The VTA Warning Indicator is inoperative.

POSSIBLE CAUSES

Possible Causes
VTA SECURITY WARNING CIRCUIT SHORTED TO VOLTAGE INSTRUMENT PANEL CLUSTER (IPC) BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. **READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN**

NOTE: This DTC only detects a short to voltage. An open circuit is not supported.

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. DISCONNECT THE INSTRUMENT PANEL CLUSTER (IPC) HARNESS CONNECTOR - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. Turn the ignition off.
2. Disconnect the component harness connector(s) containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the Instrument Panel Cluster (IPC) in accordance with the Service Information. Refer to **MODULE, INSTRUMENT PANEL CLUSTER (IPC), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (G84) VTA WARNING INDICATOR CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage of the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .
- Test complete.

B1609-11-PANEL DIMMER INPUT-CIRCUIT SHORT TO GROUND

For a complete INTERIOR LIGHTING SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Dimmer Switch is integral to the Headlamp Switch. The Dimmer Switch is used to control the brightness of components that receive backlighting, such as the Instrument Panel Cluster (IPC), along with other various backlit components.

The Body Control Module (BCM) supplies and monitors a 5.0 volt reference voltage to the Headlamp/Dimmer Switch, through the Panel Lamps Driver circuit or Panel Lamps Dimmer Switch MUX Signal circuit. Based on the Headlamp/Dimmer Switch position, the BCM sets and adjusts the illumination output for the various backlit components.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects less than 50.0 Ohms, or 0.281 volts, on the Panel Lamps Driver circuit for greater than 10 seconds.

DEFAULT ACTION

- The Panel Lamps are always on.

POSSIBLE CAUSES

Possible Causes
PANEL LAMPS DRIVER CIRCUIT SHORTED TO GROUND
HEADLAMP SWITCH
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.

4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. CHECK THE HEADLAMP SWITCH FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Headlamp Switch harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Headlamp Switch in accordance with the Service Information. Refer to [SWITCH, HEADLAMP, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (E2) PANEL LAMPS DRIVER CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect the all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To **4**

4. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1609-15-PANEL DIMMER INPUT-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete INTERIOR LIGHTING SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Dimmer Switch is integral to the Headlamp Switch. The Dimmer Switch is used to control the brightness of components that receive backlighting, such as the Instrument Panel Cluster (IPC), along with other various backlit components.

The Body Control Module (BCM) supplies and monitors a 5.0 volt reference voltage to the Headlamp/Dimmer Switch, through the Panel Lamps Driver circuit or Panel Lamps Dimmer Switch MUX Signal circuit. Based on the Headlamp/Dimmer Switch position, the BCM sets and adjusts the illumination output for the various backlit components.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects greater than 100k Ohms, or 4.687 volts, on the Panel Lamps Driver circuit for greater than 10 seconds.

DEFAULT ACTION

- The Panel Lamps are always on.

POSSIBLE CAUSES

Possible Causes
PANEL LAMPS DIMMER SIGNAL CIRCUIT SHORTED TO VOLTAGE
PANEL LAMPS DIMMER SIGNAL CIRCUIT OPEN
HEADLAMP SWITCH
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCS in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCS.
3. With the scan tool, erase all DTCS.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCS.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. DISCONNECT THE HEADLAMP SWITCH HARNESS CONNECTOR AND CHECK THE (E2) PANEL LAMPS DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect the all component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [3](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (E2) PANEL LAMPS DRIVER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect the all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A FUSED JUMPER WIRE BETWEEN GROUND AND THE (E2) PANEL LAMPS DRIVER CIRCUIT - CHECK FOR ADDITIONAL DTCS

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Connect a fused jumper wire between ground and the circuit being tested at the ECU harness connector. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. With the scan tool, read the BCM DTCS.

Is DTC: B1609-11-PANEL DIMMER INPUT - CIRCUIT SHORT TO GROUND active?

Yes

- Replace the Headlamp Switch in accordance with the Service Information. Refer to [**SWITCH, HEADLAMP, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [5](#)

5. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCS.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCS.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B161E-11-READING LAMP CONTROL-CIRCUIT SHORT TO GROUND

For a complete INTERIOR LIGHTING SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) provides a battery voltage output through the Reading Lamps Driver circuit to the Reading Lamps. When a Reading Lamp is activated, the Reading Lamp provides a path to ground, to the body sheet metal, and the Reading Lamp illuminates.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- When the Body Control Module (BCM) detects greater than 10.3 amps on the Reading Lamps Driver circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The Reading Lamps are inoperative.

POSSIBLE CAUSES

Possible Causes
READING LAMPS DRIVER CIRCUIT SHORTED TO GROUND
CENTER CONSOLE LAMP
LEFT VANITY LAMP
RIGHT VANITY LAMP
REAR CARGO LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.

2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. CHECK THE CENTER CONSOLE LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Center Console Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Center Console Lamp in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. CHECK THE LEFT VANITY LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Left Vanity Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [4](#)

No

- Replace the Left Vanity Lamp in accordance with the Service Information. Refer to [VISOR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

4. CHECK THE RIGHT VANITY LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Right Vanity Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [5](#)

No

- Replace the Right Vanity Lamp in accordance with the Service Information. Refer to [VISOR, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. CHECK THE REAR CARGO LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Rear Cargo Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [6](#)

No

- Replace the Rear Cargo Lamp in accordance with the Service Information. Refer to [LAMP, CARGO, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

6. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (M27) READING LAMPS DRIVER CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect the all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.

4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [7](#)

7. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B162A-11-LEFT LOW BEAM CONTROL-CIRCUIT SHORT TO GROUND

For a complete HEADLAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

Incandescent Low Beam Lamps: When Low Beam Lamp illumination is requested, the Headlamp Switch sends an input to the Body Control Module (BCM). The BCM provides a Pulse Width Modulated (PWM) voltage, through the Left and Right Low Beam Driver circuits, to the Left and Right Front Lamp Assemblies. A separate ground circuit is provided to the Left and Right Front Lamp Assemblies through the wiring harness.

LED Low Beam Lamps: When Low Beam Lamp illumination is requested, the Headlamp Switch sends an input to the Body Control Module (BCM). The BCM provides a voltage signal, through the Left and Right Low Beam Driver circuits, to the Left and Right Front Lamp Assemblies. When this voltage signal is received, the Left and Right Front Lamp Assemblies provide the Pulse Width Modulated (PWM) voltage to activate the Left and Right Low Beams. A separate ground circuit is provided to the Left and Right Front Lamp Assemblies through the wiring harness.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- **Bulb Equipped:** When the Low Beam Lamps are active and the Body Control Module (BCM) detects greater than 9.1 amps on the Left Low Beam Driver circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.
- **LED Equipped:** When the Low Beam Lamps are active and the Body Control Module (BCM) detects greater than 12.6 amps on the Left Low Beam Driver circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The Low Beam Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT LOW BEAM DRIVER CIRCUIT SHORTED TO GROUND
LEFT LOW BEAM LAMP
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. CHECK THE LEFT LOW BEAM LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Left Low Beam Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Left Low Beam Lamp in accordance with the Service Information. Refer to [UNIT, HEADLAMP, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L43) LEFT LOW BEAM DRIVER CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B162A-15-LEFT LOW BEAM CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete HEADLAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

Incandescent Low Beam Lamps: When Low Beam Lamp illumination is requested, the Headlamp Switch sends an input to the Body Control Module (BCM). The BCM provides a Pulse Width Modulated (PWM) voltage, through the Left and Right Low Beam Driver circuits, to the Left and Right Front Lamp Assemblies. A separate ground circuit is provided to the Left and Right Front Lamp Assemblies through the wiring harness.

LED Low Beam Lamps: When Low Beam Lamp illumination is requested, the Headlamp Switch sends an input to the Body Control Module (BCM). The BCM provides a voltage signal, through the Left and Right Low Beam Driver circuits, to the Left and Right Front Lamp Assemblies. When this voltage signal is received, the Left and Right Front Lamp Assemblies provide the Pulse Width Modulated (PWM) voltage to activate the Left and Right Low Beams. A separate ground circuit is provided to the Left and Right Front Lamp Assemblies through the wiring harness.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- When the Low Beam Lamps are active and the Body Control Module (BCM) detects less than 1.0 amps on the Left Low Beam Driver circuit for greater than five seconds.

DEFAULT ACTION

- The Low Beam Lamp is always on or inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT LOW BEAM DRIVER CIRCUIT OPEN
LEFT LOW BEAM DRIVER CIRCUIT SHORTED TO VOLTAGE
GROUND CIRCUIT OPEN
LEFT LOW BEAM LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. DISCONNECT THE LEFT FRONT LAMP ASSEMBLY HARNESS CONNECTOR AND CHECK FOR VOLTAGE ON THE (L43) LEFT LOW BEAM DRIVER CIRCUIT

NOTE: **Make sure the Headlamps are off when performing this step.**

1. Turn the ignition off.
2. Disconnect the component harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: **When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.**

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L43) LEFT LOW BEAM DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [7](#)

4. CHECK THE LEFT FRONT LAMP ASSEMBLY GROUND CIRCUIT(S) FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#).**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#).

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L43) LEFT LOW BEAM DRIVER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To **6**

6. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A 12-VOLT TEST LIGHT BETWEEN GROUND AND THE (L43) LEFT LOW BEAM DRIVER CIRCUIT - CHECK THE BCM OUTPUT

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Using a 12-volt test light, connect the test light lead to a known good ground.
3. With the 12-volt test light, probe the circuit being tested at the component harness connector.
4. Turn the ignition on.
5. Activate the system or ECU output for the circuit being tested.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace the Left Low Beam Lamp in accordance with the Service Information. Refer to **UNIT, HEADLAMP, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To **7**

7. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B162E-11-RIGHT LOW BEAM CONTROL-CIRCUIT SHORT TO GROUND

For a complete HEADLAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

Incandescent Low Beam Lamps: When Low Beam Lamp illumination is requested, the Headlamp Switch sends an input to the Body Control Module (BCM). The BCM provides a Pulse Width Modulated (PWM) voltage, through the Left and Right Low Beam Driver circuits, to the Left and Right Front Lamp Assemblies. A separate ground circuit is provided to the Left and Right Front Lamp Assemblies through the wiring harness.

LED Low Beam Lamps: When Low Beam Lamp illumination is requested, the Headlamp Switch sends an input to the Body Control Module (BCM). The BCM provides a voltage signal, through the Left and Right Low Beam Driver circuits, to the Left and Right Front Lamp Assemblies. When this voltage signal is received, the Left and Right Front Lamp Assemblies provide the Pulse Width Modulated (PWM) voltage to activate the Left and Right Low Beams. A separate ground circuit is provided to the Left and Right Front Lamp Assemblies through the wiring harness.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- **Bulb Equipped:** When the Low Beam Lamps are active and the Body Control Module (BCM) detects greater than 9.1 amps on the Right Low Beam Driver circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.
- **LED Equipped:** When the Low Beam Lamps are active and the Body Control Module (BCM) detects greater than 12.6 amps on the Right Low Beam Driver circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The Low Beam Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
RIGHT LOW BEAM DRIVER CIRCUIT SHORTED TO GROUND
RIGHT LOW BEAM LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE RIGHT LOW BEAM LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Right Low Beam Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Right Low Beam Lamp in accordance with the Service Information. Refer to [UNIT, HEADLAMP, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L44) RIGHT LOW BEAM DRIVER CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.

6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B162E-15-RIGHT LOW BEAM CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete HEADLAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

Incandescent Low Beam Lamps: When Low Beam Lamp illumination is requested, the Headlamp Switch sends an input to the Body Control Module (BCM). The BCM provides a Pulse Width Modulated (PWM) voltage, through the Left and Right Low Beam Driver circuits, to the Left and Right Front Lamp Assemblies. A separate ground circuit is provided to the Left and Right Front Lamp Assemblies through the wiring harness.

LED Low Beam Lamps: When Low Beam Lamp illumination is requested, the Headlamp Switch sends an input to the Body Control Module (BCM). The BCM provides a voltage signal, through the Left and Right Low Beam Driver circuits, to the Left and Right Front Lamp Assemblies. When this voltage signal is received, the Left and Right Front Lamp Assemblies provide the Pulse Width Modulated (PWM) voltage to activate the Left and Right Low Beams. A separate ground circuit is provided to the Left and Right Front Lamp Assemblies through the wiring harness.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- When the Low Beam Lamps are active and the Body Control Module (BCM) detects less than 1.0 amps on the Right Low Beam Driver circuit for greater than five seconds.

DEFAULT ACTION

- The Low Beam Lamp is always on or inoperative.

POSSIBLE CAUSES

Possible Causes
RIGHT LOW BEAM DRIVER CIRCUIT OPEN
RIGHT LOW BEAM DRIVER CIRCUIT SHORTED TO VOLTAGE

Possible Causes
GROUND CIRCUIT OPEN
RIGHT LOW BEAM LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. DISCONNECT THE RIGHT FRONT LAMP ASSEMBLY HARNESS CONNECTOR AND CHECK FOR VOLTAGE ON THE (L44) RIGHT LOW BEAM DRIVER CIRCUIT

NOTE: **Make sure the Headlamps are off when performing this step.**

1. Turn the ignition off.
2. Disconnect the component harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: **When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.**

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L44) RIGHT LOW BEAM DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

4. CHECK THE RIGHT FRONT LAMP ASSEMBLY GROUND CIRCUIT(S) FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage

drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to **STANDARD PROCEDURE**.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L44) RIGHT LOW BEAM DRIVER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.

3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. CONNECT THE BCM HARNESS CONNECTOR - CONNECT A 12-VOLT TEST LIGHT BETWEEN GROUND AND THE (L44) RIGHT LOW BEAM DRIVER CIRCUIT - CHECK THE BCM OUTPUT

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Using a 12-volt test light, connect the test light lead to a known good ground.
3. With the 12-volt test light, probe the circuit being tested at the component harness connector.
4. Turn the ignition on.
5. Activate the system or ECU output for the circuit being tested.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace the Right Low Beam Lamp in accordance with the Service Information. Refer to [UNIT, HEADLAMP, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

7. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:

- Proper connector installation.
- Damaged connector locks.
- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1632-11-LEFT HIGH BEAM CONTROL-CIRCUIT SHORT TO GROUND

For a complete HEADLAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

Incandescent High Beam Lamps: When High Beam Lamp illumination is requested, a communication network message from the Steering Column Control Module (SCCM), or the Forward Facing Camera (FFC) Module/Driver Assistance System Module (DASM), if equipped, is sent to the Body Control Module (BCM). When this message is received, the BCM provides a Pulse Width Modulated (PWM) voltage, through the Left and Right High Beam Driver circuits, to the Left and Right Front Lamp Assemblies. A separate ground circuit is provided to the Left and Right Front Lamp Assemblies through the wiring harness.

LED High Beam Lamps: When High Beam Lamp illumination is requested, a communication network message from the Steering Column Control Module (SCCM), or the Forward Facing Camera (FFC) Module/Driver Assistance System Module (DASM), if equipped, is sent to the Body Control Module (BCM). When this message is received, the BCM provides a voltage signal, through the Left and Right High Beam Driver circuits, to the Left and Right Front Lamp Assemblies. When this voltage signal is received, the Left and

Right Front Lamp Assemblies provide the Pulse Width Modulated (PWM) voltage to activate the Left and Right High Beams. A separate ground circuit is provided to the Left and Right Front Lamp Assemblies through the wiring harness.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- **Bulb Equipped:** When the High Beam Lamps are active and the Body Control Module (BCM) detects greater than 9.1 amps on the Left High Beam Driver circuit for greater than 1.28 seconds.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.
- **LED Equipped:** When the High Beam Lamps are active and the Body Control Module (BCM) detects greater than 12.6 amps on the Left High Beam Driver circuit for greater than 1.28 seconds.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The High Beam Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT HIGH BEAM DRIVER CIRCUIT SHORTED TO GROUND
LEFT HIGH BEAM LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [**PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**](#) .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [**STANDARD PROCEDURE**](#) .

2. CHECK THE LEFT HIGH BEAM LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Left High Beam Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Left High Beam Lamp in accordance with the Service Information. Refer to [UNIT, HEADLAMP, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L33) LEFT HIGH BEAM DRIVER CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:

- Proper connector installation.
- Damaged connector locks.
- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1632-15-LEFT HIGH BEAM CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete HEADLAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

Incandescent High Beam Lamps: When High Beam Lamp illumination is requested, a communication network message from the Steering Column Control Module (SCCM), or the Forward Facing Camera (FFC) Module/Driver Assistance System Module (DASM), if equipped, is sent to the Body Control Module (BCM). When this message is received, the BCM provides a Pulse Width Modulated (PWM) voltage, through the Left and Right High Beam Driver circuits, to the Left and Right Front Lamp Assemblies. A separate ground circuit is provided to the Left and Right Front Lamp Assemblies through the wiring harness.

LED High Beam Lamps: When High Beam Lamp illumination is requested, a communication network message from the Steering Column Control Module (SCCM), or the Forward Facing Camera (FFC) Module/Driver Assistance System Module (DASM), if equipped, is sent to the Body Control Module (BCM). When this message is received, the BCM provides a voltage signal, through the Left and Right High Beam Driver circuits, to the Left and Right Front Lamp Assemblies. When this voltage signal is received, the Left and

Right Front Lamp Assemblies provide the Pulse Width Modulated (PWM) voltage to activate the Left and Right High Beams. A separate ground circuit is provided to the Left and Right Front Lamp Assemblies through the wiring harness.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the High Beam Lamps are active and the Body Control Module (BCM) detects less than 0.35 amps on the Left High Beam Driver circuit for greater than five seconds.

DEFAULT ACTION

- The High Beam Lamp is always on or inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT HIGH BEAM DRIVER CIRCUIT OPEN
LEFT HIGH BEAM DRIVER CIRCUIT SHORTED TO VOLTAGE
GROUND CIRCUIT OPEN
LEFT HIGH BEAM LAMP
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#).

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. DISCONNECT THE LEFT FRONT LAMP ASSEMBLY HARNESS CONNECTOR AND CHECK FOR VOLTAGE ON THE (L33) LEFT HIGH BEAM DRIVER CIRCUIT

NOTE: Make sure the Headlamps are off when performing this step.

1. Turn the ignition off.
2. Disconnect the component harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L33) LEFT HIGH BEAM DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [7](#)

4. CHECK THE LEFT FRONT LAMP ASSEMBLY GROUND CIRCUIT(S) FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L33) LEFT HIGH BEAM DRIVER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [6](#)

6. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A 12-VOLT TEST LIGHT BETWEEN GROUND AND THE (L33) LEFT HIGH BEAM DRIVER CIRCUIT - CHECK THE BCM OUTPUT

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Using a 12-volt test light, connect the test light lead to a known good ground.
3. With the 12-volt test light, probe the circuit being tested at the component harness connector.
4. Turn the ignition on.
5. Activate the system or ECU output for the circuit being tested.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace the Left High Beam Lamp in accordance with the Service Information. Refer to [UNIT, HEADLAMP, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

7. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to [MODULE, BODY CONTROL \(BCM\), REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

- Test complete.

B1636-11-RIGHT HIGH BEAM CONTROL-CIRCUIT SHORT TO GROUND

For a complete HEADLAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information .**

THEORY OF OPERATION

Incandescent High Beam Lamps: When High Beam Lamp illumination is requested, a communication network message from the Steering Column Control Module (SCCM), or the Forward Facing Camera (FFC) Module/Driver Assistance System Module (DASM), if equipped, is sent to the Body Control Module (BCM). When this message is received, the BCM provides a Pulse Width Modulated (PWM) voltage, through the Left and Right High Beam Driver circuits, to the Left and Right Front Lamp Assemblies. A separate ground circuit is provided to the Left and Right Front Lamp Assemblies through the wiring harness.

LED High Beam Lamps: When High Beam Lamp illumination is requested, a communication network message from the Steering Column Control Module (SCCM), or the Forward Facing Camera (FFC) Module/Driver Assistance System Module (DASM), if equipped, is sent to the Body Control Module (BCM). When this message is received, the BCM provides a voltage signal, through the Left and Right High Beam Driver circuits, to the Left and Right Front Lamp Assemblies. When this voltage signal is received, the Left and Right Front Lamp Assemblies provide the Pulse Width Modulated (PWM) voltage to activate the Left and Right High Beams. A separate ground circuit is provided to the Left and Right Front Lamp Assemblies through the wiring harness.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- **Bulb Equipped:** When the High Beam Lamps are active and the Body Control Module (BCM) detects greater than 9.1 amps on the Right High Beam Driver circuit for greater than 1.28 seconds.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.
- **LED Equipped:** When the High Beam Lamps are active and the Body Control Module (BCM) detects greater than 12.6 amps on the Right High Beam Driver circuit and for greater than 1.28 seconds.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The High Beam Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
RIGHT HIGH BEAM DRIVER CIRCUIT SHORTED TO GROUND
RIGHT HIGH BEAM LAMP
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. CHECK THE RIGHT HIGH BEAM LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Right High Beam Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Right High Beam Lamp in accordance with the Service Information. Refer to [UNIT, HEADLAMP, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L34) RIGHT HIGH BEAM DRIVER CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

- Test complete.

B1636-15-RIGHT HIGH BEAM CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete HEADLAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information .**

THEORY OF OPERATION

Incandescent High Beam Lamps: When High Beam Lamp illumination is requested, a communication network message from the Steering Column Control Module (SCCM), or the Forward Facing Camera (FFC) Module/Driver Assistance System Module (DASM), if equipped, is sent to the Body Control Module (BCM). When this message is received, the BCM provides a Pulse Width Modulated (PWM) voltage, through the Left and Right High Beam Driver circuits, to the Left and Right Front Lamp Assemblies. A separate ground circuit is provided to the Left and Right Front Lamp Assemblies through the wiring harness.

LED High Beam Lamps: When High Beam Lamp illumination is requested, a communication network message from the Steering Column Control Module (SCCM), or the Forward Facing Camera (FFC) Module/Driver Assistance System Module (DASM), if equipped, is sent to the Body Control Module (BCM). When this message is received, the BCM provides a voltage signal, through the Left and Right High Beam Driver circuits, to the Left and Right Front Lamp Assemblies. When this voltage signal is received, the Left and Right Front Lamp Assemblies provide the Pulse Width Modulated (PWM) voltage to activate the Left and Right High Beams. A separate ground circuit is provided to the Left and Right Front Lamp Assemblies through the wiring harness.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the High Beam Lamps are active and the Body Control Module (BCM) detects less than 0.35 amps on the Right High Beam Driver circuit for greater than five seconds.

DEFAULT ACTION

- The High Beam Lamp is always on or inoperative.

POSSIBLE CAUSES

Possible Causes
RIGHT HIGH BEAM DRIVER CIRCUIT OPEN
RIGHT HIGH BEAM DRIVER CIRCUIT SHORTED TO VOLTAGE
GROUND CIRCUIT OPEN
RIGHT HIGH BEAM LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.

4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. DISCONNECT THE RIGHT FRONT LAMP ASSEMBLY HARNESS CONNECTOR AND CHECK FOR VOLTAGE ON THE (L34) RIGHT HIGH BEAM DRIVER CIRCUIT

NOTE: **Make sure the Headlamps are off when performing this step.**

1. Turn the ignition off.
2. Disconnect the component harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: **When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.**

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L34) RIGHT HIGH BEAM DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) and component harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: **When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.**

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

4. CHECK THE RIGHT FRONT LAMP ASSEMBLY GROUND CIRCUIT(S) FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load

testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L34) RIGHT HIGH BEAM DRIVER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A 12-VOLT TEST LIGHT BETWEEN GROUND AND THE (L34) RIGHT HIGH BEAM DRIVER CIRCUIT - CHECK THE BCM OUTPUT

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Using a 12-volt test light, connect the test light lead to a known good ground.
3. With the 12-volt test light, probe the circuit being tested at the component harness connector.
4. Turn the ignition on.
5. Activate the system or ECU output for the circuit being tested.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace the Right High Beam Lamp in accordance with the Service Information. Refer to [UNIT, HEADLAMP, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [7](#)

7. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.

7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

B163A-11-FRONT LEFT TURN LAMP CONTROL - CIRCUIT SHORT TO GROUND

For a complete TURN SIGNAL LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information**.

THEORY OF OPERATION

The Body Control Module (BCM) receives CAN Bus messages from the Steering Column Control Module (SCCM), requesting Left or Right Turn Lamp illumination. When the BCM receives this CAN Bus message, the BCM provides a Pulse Width Modulated (PWM) output, through the Left or Right Front Turn Lamp Driver circuit, to the Left or Right Front Lamp Assembly. A ground path for the Left and Right Front Lamp Assemblies is provided through the wiring harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Left Turn Lamps are activated and the Body Control Module (BCM) detects a short to ground on the Left Front Turn Lamp Driver circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The Left Front Turn Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT TURN LAMP DRIVER CIRCUIT SHORTED TO GROUND
LEFT FRONT TURN LAMP
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE.**

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. CHECK THE LEFT FRONT TURN LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Left Front Turn Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Left Front Turn Lamp in accordance with the Service Information. Refer to [LAMP, PARK AND TURN SIGNAL, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L61) LEFT FRONT TURN LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting all Electronic Control Unit (ECU) and component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B163A-15-FRONT LEFT TURN LAMP CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN - HALOGEN LAMPS

For a complete TURN SIGNAL LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) receives CAN Bus messages from the Steering Column Control Module (SCCM), requesting Left or Right Turn Lamp illumination. When the BCM receives this CAN Bus message, the BCM provides a Pulse Width Modulated (PWM) output, through the Left or Right Front Turn Lamp Driver circuit, to the Left or Right Front Lamp Assembly. A ground path for the Left and Right Front Lamp Assemblies is provided through the wiring harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Left Turn Lamps are activated and the Body Control Module (BCM) detects an open or short to voltage on the Left Front Turn Lamp Driver circuit for greater than five seconds.

DEFAULT ACTION

- The Left Front Turn Lamp is always activated or inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT TURN LAMP DRIVER CIRCUIT OPEN
LEFT FRONT TURN LAMP DRIVER CIRCUIT SHORTED TO VOLTAGE
GROUND CIRCUIT OPEN
LEFT FRONT TURN LAMP
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .**

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.

4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [**STANDARD PROCEDURE**](#) .

2. DISCONNECT THE LEFT FRONT LAMP ASSEMBLY HARNESS CONNECTOR AND CHECK THE VOLTAGE ON THE (L61) LEFT FRONT TURN LAMP DRIVER CIRCUIT

NOTE: **Make sure the Turn Lamps are off when performing this step.**

1. Turn the ignition off.
2. Disconnect the component harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: **When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.**

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L61) LEFT FRONT TURN LAMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) and component harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: **When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.**

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

4. CHECK THE LEFT FRONT LAMP ASSEMBLY GROUND CIRCUIT(S) FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load

testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L61) LEFT FRONT TURN LAMP DRIVER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
3. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
4. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A 12-VOLT TEST LIGHT BETWEEN GROUND AND THE (L61) LEFT FRONT TURN LAMP DRIVER CIRCUIT - CHECK THE BCM OUTPUT

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Using a 12-volt test light, connect the test light lead to a known good ground.
3. With the 12-volt test light, probe the circuit being tested at the component harness connector.
4. Turn the ignition on.
5. Activate the system or ECU output for the circuit being tested.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the test light to that of a direct connection to Battery.

Is the test light illuminated and bright with the system or ECU output activated?

Yes

- Replace the Left Front Turn Lamp in accordance with the Service Information. Refer to [LAMP, PARK AND TURN SIGNAL, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

7. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.

8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B163A-15-FRONT LEFT TURN LAMP CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN - LED LAMPS

For a complete TURN SIGNAL LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

When the ignition is on, the Body Control Module (BCM) provides a 12-volt signal, on the Left and Right Lighting Fault Sense circuits, to the Left and Right Front Lamp Assemblies, and the Left and Right Tail Lamp Assemblies. When the Left or Right Turn Lamp is activated, the Body Control Module (BCM) provides a 12-volt signal on the Left or Right Front Turn Lamp Driver circuit, or the Left or Right Rear Turn Lamp Driver circuit, indicating the Turn Lamps have been requested.

When the Left or Right Turn Lamp is activated, an internal driver in the Front and Tail Lamp Assemblies pulls the Lighting Fault Sense circuit voltage signal low (below 6 volts), in sequence with the Turn Lamp flash. When the Turn Lamps are Off, the BCM maintains the Lighting Fault Sense circuit voltage signal high (above 8 volts).

A failure in the Lighting Fault Sense circuit may be caused by one of the following conditions:

- When the Left or Right Turn Lamps are ON, and the voltage on the Lighting Fault Sense circuit is constantly 12 volts (system voltage), may indicate the Lighting Fault Sense circuit is open or shorted to voltage, the Ground circuit is open, a poor connection or an inoperative Lamp Assembly.
- When the Left or Right Turn Lamps are OFF, the Lamp Assembly is not disconnected and the voltage on the Lighting Fault Sense circuit is below 6 volts, may indicate a short to ground on the Lighting Fault Sense circuit, an internally shorted Lamp Assembly, or water/corrosion at a harness connector/terminal.
- When a Lamp Assembly is disconnected, the Lighting Fault Sense circuit is not shorted to ground, and the voltage on the Lighting Fault Sense circuit is below 6 volts, may indicate the BCM is not supplying the 12-volt signal on the Lighting Fault Sense circuit.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- When the Left Turn Lamps are activated and the Body Control Module (BCM) receives a signal from the Left Front Lamp Assembly, through the Lighting Fault Lamp circuit, indicating a fault exists.

DEFAULT ACTION

- The Left Front Turn Lamp is always on or inoperative.

POSSIBLE CAUSES

Possible Causes
GROUND CIRCUIT OPEN OR HIGH RESISTANCE
LEFT FRONT TURN LAMP DRIVER CIRCUIT OPEN OR HIGH RESISTANCE
LEFT FRONT LIGHTING FAULT SENSE CIRCUIT OPEN OR HIGH RESISTANCE
LEFT FRONT LIGHTING FAULT SENSE CIRCUIT SHORTED TO VOLTAGE
LEFT FRONT LAMP ASSEMBLY
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. CHECK FOR AN ACTIVE DTC

NOTE: After a Fault Sense circuit repair is completed, or the Lamp Assembly is replaced, the Left Turn Lamps must be activated for at least 20 cycles, in order for the DTC status to change from Active to Stored. After the DTC status has changed to Stored, the DTC can be erased.

1. With the scan tool, read Body Control Module (BCM) DTCs and record on the repair order.
2. Record the Environmental Data.
3. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR INTERMITTENT CONDITIONS procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

2. CHECK THE BCM LIGHTING FAULT SENSE VOLTAGE OUTPUT

NOTE: Make sure the Turn Lamps are off when performing this step.

1. Turn the Left Turn Lamps off.
2. Turn the ignition off.
3. Disconnect the Left Front Lamp Assembly harness connector.
4. Turn the ignition on.
5. Measure the voltage on the (L551) Left Front Lighting Fault Sense circuit at the Left Front Lamp Assembly harness connector.

Is the voltage approximately 12 volts (system voltage)?

Yes

- Go To [3](#)

No

- Go To [7](#)

3. CHECK FOR VOLTAGE ON THE (L61) LEFT FRONT TURN LAMP DRIVER CIRCUIT

1. Turn the Left Turn Lamps on.
2. Measure the voltage on the (L61) Left Front Turn Lamp Driver circuit at the Left Front Lamp Assembly harness connector.

Is the voltage approximately 12 volts (system voltage)?

Yes

- Go To [4](#)

No

- Go To [8](#)

4. CHECK THE LEFT FRONT LAMP ASSEMBLY GROUND CIRCUIT(S) FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

NOTE: If a load test tool needs to be created, follow the steps in Tech Tips/Engineering Notes.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to **STANDARD PROCEDURE** .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for

information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to **STANDARD PROCEDURE** .

1. Turn the Turn Lamps off.
2. Turn the ignition off.
3. Connect the positive lead of the load test tool to a 12 volt circuit at the Front Lamp harness connector.
4. Connect the negative lead of the load test tool to the Ground circuit(s) at the Front Lamp harness connector (A). **Note:** refer to the diagram below.

NOTE: The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuit(s).

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the open or high resistance in the Front Lamp Ground circuit(s).
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. CHECK FOR VOLTAGE ON THE (L551) LEFT FRONT LIGHTING FAULT SENSE CIRCUIT

1. Reconnect the Left Front Lamp Assembly harness connector.
2. Turn the ignition on.
3. Turn the Left Turn Lamps on.

NOTE: To avoid damage to the terminals, insulation or weather-proof seals of the connector, use only approved connector back-probe tools when back-probing a connector.

4. Back-probing at the Left Front Lamp Assembly harness connector, measure the voltage on the (L551) Left Front Lighting Fault Sense circuit.

Does the voltage cycle from approximately 12 volts (system voltage) to below 6 volts, in sequence with Turn Lamp flashes?

Yes

- Go To [6](#)

No

- Go To [2](#)

6. CHECK THE OPERATION OF THE LEFT FRONT TURN LAMP

1. With the Left Turn Lamps on, inspect the illumination of the Left Front Turn Lamp.

Does the Left Front Turn Lamp illuminate?

Yes

- Go To [10](#)

No

- Disconnect and check the Left Front Lamp Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, replace the Left Front Lamp Assembly in accordance with the Service Information. Refer to [UNIT, HEADLAMP, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

7. CHECK THE (L551) LEFT FRONT LIGHTING FAULT SENSE CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. Turn the ignition off.
2. Disconnect the BCM C6/F harness connector.
3. Measure the resistance of the (L551) Left Front Lighting Fault Sense circuit between the Left Front Lamp Assembly harness connector and the BCM C6/F harness connector.

Is the resistance above 3.0 Ohms?

Yes

- Repair the open or high resistance in the (L551) Left Front Lighting Fault Sense circuit.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [10](#)

8. CHECK THE (L61) LEFT FRONT TURN LAMP DRIVER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. Turn the ignition off.
2. Disconnect the BCM C4/D harness connector.
3. Measure the resistance of the (L61) Left Front Turn Lamp Driver circuit between the Left Front Lamp Assembly harness connector and the BCM C4/D harness connector.

Is the resistance above 3.0 Ohms?

Yes

- Repair the open or high resistance in the (L61) Left Front Turn Lamp Driver circuit.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [10](#)

9. CHECK THE (L551) LEFT FRONT LIGHTING FAULT SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT IN THE HARNESS CONNECTOR

NOTE: The ignition may not turn on when the BCM harness connector, containing the circuit being tested, is disconnected. Therefore, this step can help determine if the circuit being tested is shorted to another voltage circuit in any of the related harness connectors.

1. Disconnect the BCM C6/F harness connector.
2. Check for continuity between the (L551) Left Front Lighting Fault Sense circuit and all other circuits on the Left Front Lamp Assembly harness connector.
3. Check for continuity between the (L551) Left Front Lighting Fault Sense circuit and all other circuits on the BCM C6/F harness connector.

Is there continuity between the (L551) Left Front Lighting Fault Sense circuit and any other circuit(s)?

Yes

- Repair the short between the (L551) Left Front Lighting Fault Sense circuit and the circuit that has continuity.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Inspect the (L551) Left Front Lighting Fault Sense circuit for a short to voltage between the Left Front Lamp Assembly harness connector and the BCM C6/F harness connector. Repair, if needed. If no problems are found, replace the Left Front Lamp Assembly in accordance with the Service Information. Refer to [**UNIT, HEADLAMP, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

10. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.

6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B163E-11-FRONT RIGHT TURN LAMP CONTROL - CIRCUIT SHORT TO GROUND

For a complete TURN SIGNAL LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) receives CAN Bus messages from the Steering Column Control Module (SCCM), requesting Left or Right Turn Lamp illumination. When the BCM receives this CAN Bus message, the BCM provides a Pulse Width Modulated (PWM) output, through the Left or Right Front Turn Lamp Driver circuit, to the Left or Right Front Lamp Assembly. A ground path for the Left and Right Front Lamp Assemblies is provided through the wiring harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Right Turn Lamps are activated and the Body Control Module (BCM) detects a short to ground on the Right Front Turn Lamp Driver circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The Right Front Turn Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT TURN LAMP DRIVER CIRCUIT SHORTED TO GROUND
RIGHT FRONT TURN LAMP
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .**

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. CHECK THE RIGHT FRONT TURN LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Right Front Turn Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Right Front Turn Lamp in accordance with the Service Information. Refer to [LAMP, PARK AND TURN SIGNAL, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L60) RIGHT FRONT TURN LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Isolate the circuit by disconnecting all Electronic Control Unit (ECU) and component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.

4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B163E-15-FRONT RIGHT TURN LAMP CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN - HALOGEN LAMPS

For a complete TURN SIGNAL LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) receives CAN Bus messages from the Steering Column Control Module (SCCM), requesting Left or Right Turn Lamp illumination. When the BCM receives this CAN Bus message, the BCM provides a Pulse Width Modulated (PWM) output, through the Left or Right Front Turn Lamp Driver circuit, to the Left or Right Front Lamp Assembly. A ground path for the Left and Right Front Lamp Assemblies is provided through the wiring harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Right Turn Lamps are activated and the Body Control Module (BCM) detects an open or short to voltage on the Right Front Turn Lamp Driver circuit for greater than five seconds.

DEFAULT ACTION

- The Right Front Turn Lamp is always activated or inoperative.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT TURN LAMP DRIVER CIRCUIT OPEN
RIGHT FRONT TURN LAMP DRIVER CIRCUIT SHORTED TO VOLTAGE
GROUND CIRCUIT OPEN
RIGHT FRONT TURN LAMP
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .**

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.

3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. DISCONNECT THE RIGHT FRONT LAMP ASSEMBLY HARNESS CONNECTOR AND CHECK THE VOLTAGE ON THE (L60) RIGHT FRONT TURN LAMP DRIVER CIRCUIT

NOTE: **Make sure the Turn Lamps are off when performing this step.**

1. Turn the ignition off.
2. Disconnect the component harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: **When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.**

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L60) RIGHT FRONT TURN LAMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) and component harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: **When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.**

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

4. CHECK THE RIGHT FRONT LAMP ASSEMBLY GROUND CIRCUIT(S) FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load

testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L60) RIGHT FRONT TURN LAMP DRIVER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A 12-VOLT TEST LIGHT BETWEEN GROUND AND THE (L60) RIGHT FRONT TURN LAMP DRIVER CIRCUIT - CHECK THE BCM OUTPUT

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Using a 12-volt test light, connect the test light lead to a known good ground.
3. With the 12-volt test light, probe the circuit being tested at the component harness connector.
4. Turn the ignition on.
5. Activate the system or ECU output for the circuit being tested.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the test light to that of a direct connection to Battery.

Is the test light illuminated and bright with the system or ECU output activated?

Yes

- Replace the Right Front Turn Lamp in accordance with the Service Information. Refer to [LAMP, PARK AND TURN SIGNAL, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [7](#)

7. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.

7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B163E-15-FRONT RIGHT TURN LAMP CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN - LED LAMPS

For a complete TURN SIGNAL LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

When the ignition is on, the Body Control Module (BCM) provides a 12-volt signal, on the Left and Right Lighting Fault Sense circuits, to the Left and Right Front Lamp Assemblies, and the Left and Right Tail Lamp Assemblies. When the Left or Right Turn Lamp is activated, the Body Control Module (BCM) provides a 12-volt signal on the Left or Right Front Turn Lamp Driver circuit, or the Left or Right Rear Turn Lamp Driver circuit, indicating the Turn Lamps have been requested.

When the Left or Right Turn Lamp is activated, an internal driver in the Front and Tail Lamp Assemblies pulls the Lighting Fault Sense circuit voltage signal low (below 6 volts), in sequence with the Turn Lamp flash. When the Turn Lamps are Off, the BCM maintains the Lighting Fault Sense circuit voltage signal high (above 8 volts).

A failure in the Lighting Fault Sense circuit may be caused by one of the following conditions:

- When the Left or Right Turn Lamps are ON, and the voltage on the Lighting Fault Sense circuit is constantly 12 volts (system voltage), may indicate the Lighting Fault Sense circuit is open or shorted to voltage, the Ground circuit is open, a poor connection or an inoperative Lamp Assembly.
- When the Left or Right Turn Lamps are OFF, the Lamp Assembly is not disconnected and the voltage on the Lighting Fault Sense circuit is below 6 volts, may indicate a short to ground on the Lighting Fault Sense circuit, an internally shorted Lamp Assembly, or water/corrosion at a harness connector/terminal.
- When a Lamp Assembly is disconnected, the Lighting Fault Sense circuit is not shorted to ground, and the voltage on the Lighting Fault Sense circuit is below 6 volts, may indicate the BCM is not supplying the 12-volt signal on the Lighting Fault Sense circuit.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- When the Right Turn Lamps are activated and the Body Control Module (BCM) receives a signal from the Right Front Lamp Assembly, through the Lighting Fault Lamp circuit, indicating a fault exists.

DEFAULT ACTION

- The Right Front Turn Lamp is always on or inoperative.

POSSIBLE CAUSES

Possible Causes
GROUND CIRCUIT OPEN OR HIGH RESISTANCE
RIGHT FRONT TURN LAMP DRIVER CIRCUIT OPEN OR HIGH RESISTANCE
RIGHT FRONT LIGHTING FAULT SENSE CIRCUIT OPEN OR HIGH RESISTANCE
RIGHT FRONT LIGHTING FAULT SENSE CIRCUIT SHORTED TO VOLTAGE
RIGHT FRONT LAMP ASSEMBLY
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. CHECK FOR AN ACTIVE DTC

NOTE: After a Fault Sense circuit repair is completed, or the Lamp Assembly is replaced, the Right Turn Lamps must be activated for at least 20 cycles, in order for the DTC status to change from Active to Stored. After the DTC status has changed to Stored, the DTC can be erased.

1. With the scan tool, read Body Control Module (BCM) DTCs and record on the repair order.
2. Record the Environmental Data.
3. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR INTERMITTENT CONDITIONS procedure. Refer to [TESTING FOR AN INTERMITTENT CONDITION](#).

2. CHECK THE BCM LIGHTING FAULT SENSE VOLTAGE OUTPUT

NOTE: Make sure the Turn Lamps are off when performing this step.

1. Turn the Right Turn Lamps off.
2. Turn the ignition off.
3. Disconnect the Right Front Lamp Assembly harness connector.
4. Turn the ignition on.
5. Measure the voltage on the (L552) Right Front Lighting Fault Sense circuit at the Right Front Lamp Assembly harness connector.

Is the voltage approximately 12 volts (system voltage)?

Yes

- Go To [3](#)

No

- Go To [7](#)

3. CHECK FOR VOLTAGE ON THE (L60) RIGHT FRONT TURN LAMP DRIVER CIRCUIT

1. Turn the Right Turn Lamps on.
2. Measure the voltage on the (L60) Right Front Turn Lamp Driver circuit at the Right Front Lamp Assembly harness connector.

Is the voltage approximately 12 volts (system voltage)?

Yes

- Go To [4](#)

No

- Go To [8](#)

4. CHECK THE RIGHT FRONT LAMP ASSEMBLY GROUND CIRCUIT(S) FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

NOTE: If a load test tool needs to be created, follow the steps in Tech Tips/Engineering Notes.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit

makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to **STANDARD PROCEDURE** .

1. Turn the Turn Lamps off.
2. Turn the ignition off.
3. Connect the positive lead of the load test tool to a 12 volt circuit at the Front Lamp harness connector.
4. Connect the negative lead of the load test tool to the Ground circuit(s) at the Front Lamp harness connector (A). **Note:** refer to the diagram below.

NOTE: The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuit(s).

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the open or high resistance in the Front Lamp Ground circuit(s).
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. CHECK FOR VOLTAGE ON THE (L552) RIGHT FRONT LIGHTING FAULT SENSE CIRCUIT

1. Reconnect the Right Front Lamp Assembly harness connector.
2. Turn the ignition on.
3. Turn the Right Turn Lamps on.

NOTE: To avoid damage to the terminals, insulation or weather-proof seals of the connector, use only approved connector back-probe tools when back-probing a connector.

4. Back-probing at the Right Front Lamp Assembly harness connector, measure the voltage on the (L552) Right Front Lighting Fault Sense circuit.

Does the voltage cycle from approximately 12 volts (system voltage) to below 6 volts, in sequence with Turn Lamp flashes?

Yes

- Go To [6](#)

No

- Go To [9](#)

6. CHECK THE OPERATION OF THE RIGHT FRONT TURN LAMP

1. With the Right Turn Lamps on, inspect the illumination of the Right Front Turn Lamp.

Does the Right Front Turn Lamp illuminate?

Yes

- Go To [10](#)

No

- Disconnect and check the Right Front Lamp Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, replace the Right Front Lamp Assembly in accordance with the Service Information. Refer to **UNIT, HEADLAMP, REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

7. CHECK THE (L552) RIGHT FRONT LIGHTING FAULT SENSE CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. Turn the ignition off.
2. Disconnect the BCM C6/F harness connector.
3. Measure the resistance of the (L552) Right Front Lighting Fault Sense circuit between the Right Front Lamp Assembly harness connector and the BCM C6/F harness connector.

Is the resistance above 3.0 Ohms?

Yes

- Repair the open or high resistance in the (L552) Right Front Lighting Fault Sense circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [10](#)

8. CHECK THE (L60) RIGHT FRONT TURN LAMP DRIVER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. Turn the ignition off.
2. Disconnect the BCM C1/A harness connector.
3. Measure the resistance of the (L60) Right Front Turn Lamp Driver circuit between the Right Front Lamp Assembly harness connector and the BCM C1/A harness connector.

Is the resistance above 3.0 Ohms?

Yes

- Repair the open or high resistance in the (L60) Right Front Turn Lamp Driver circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [10](#)

9. CHECK THE (L552) RIGHT FRONT LIGHTING FAULT SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT IN THE HARNESS CONNECTOR

NOTE: The ignition may not turn on when the BCM harness connector, containing the circuit being tested, is disconnected. Therefore, this step can help determine if the circuit being tested is shorted to another voltage circuit in any of the related harness connectors.

1. Disconnect the BCM C6/F harness connector.
2. Check for continuity between the (L552) Right Front Lighting Fault Sense circuit and all other circuits on the Right Front Lamp Assembly harness connector.
3. Check for continuity between the (L552) Right Front Lighting Fault Sense circuit and all other circuits on the BCM C6/F harness connector.

Is there continuity between the (L552) Right Front Lighting Fault Sense circuit and any other circuit(s)?

Yes

- Repair the short between the (L552) Right Front Lighting Fault Sense circuit and the circuit that has continuity.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Inspect the (L552) Right Front Lighting Fault Sense circuit for a short to voltage between the Right Front Lamp Assembly harness connector and the BCM C6/F harness connector. Repair, if needed. If no problems are found, replace the Right Front Lamp Assembly in accordance with the Service Information. Refer to [UNIT, HEADLAMP, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

10. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1642-11-REAR LEFT TURN LAMP CONTROL-CIRCUIT SHORT TO GROUND

For a complete TURN SIGNAL LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Body Control Module (BCM) receives CAN Bus messages from the Steering Column Control Module (SCCM), requesting Left or Right Turn Lamp illumination. A ground path for the Left and Right Tail Lamp Assemblies is provided through the wiring harness to the body sheet metal.

When requested, the BCM provides a Pulsed Width Modulated (PWM) voltage signal output to the Left or Right Rear Turn Lamp.

INCANDESCENT LAMPS: When a Left or Right Turn Lamp activation is requested, the BCM provides the PWM output @ 100Hz on the associated driver circuit.

LED LAMPS:

When a Left or Right Turn Lamp activation is requested, the BCM provides the PWM output @ 200Hz with a voltage signal between 0 - 12 volts to the selected Tail Lamp Assembly through one of the associated driver circuits (as equipped):

- Rear Turn Lamp Driver circuit
- Stop Lamp Driver circuit
- Stop/Turn Lamp Driver circuit

With the ignition on, the BCM provides a diagnostic voltage output to the Left and Right Tail Lamp Assemblies through the Left and Right Lighting Fault Sense circuits. When the Left or Right Turn Lamp is activated, the internal driver of the Tail Lamp Assemblies pulls the Lighting Fault Sense circuit voltage signal low when the Turn Lamps are illuminated. When the Turn Lamps are Off, the Lighting Fault Sense circuit voltage signal from the BCM is above 4 volts.

A failure in the Rear Lighting Fault Sense circuit may be caused by one of the following conditions:

- When the Left or Right Turn Lamps are ON and the voltage on the Lighting Fault Sense circuit is a constant voltage may indicate:
 - A poor connection in the harness connector.
 - The Lighting Fault Sense circuit is open.
 - The Tail Lamp Assembly ground circuit is open.
 - The Tail Lamp Assembly is inoperative.
- When the Tail Lamp Assembly harness connector is **connected** (back-probing), the Left or Right Turn Lamps are OFF and the voltage on the Lighting Fault Sense circuit is below 4 volts may indicate:
 - The Lighting Fault Sense circuit is shorted to ground.
 - The Tail Lamp Assembly is internally shorted.
 - Water or corrosion in the harness connector/terminal.
- When the Tail Lamp Assembly harness connector is **disconnected** and the voltage on Lighting Fault Sense circuit is below 4 volts (with none of the above faults are present) may indicate the BCM is not supplying the diagnostic voltage signal on the Lighting Fault Sense circuit.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- **Bulb Equipped:** When the Left Turn Lamps are activated and the Body Control Module (BCM) detects greater than 7.86 amps on the Left Rear Turn Lamp Driver circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.
- **LED Equipped:** When the Left Turn Lamps are activated and the Body Control Module (BCM) detects greater than 3.0 amps on the Left Rear Turn Lamp Driver circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The Left Front Turn Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT REAR TURN LAMP DRIVER CIRCUIT SHORTED TO GROUND
LEFT REAR TURN LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.

2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. CHECK THE LEFT REAR TURN LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Left Rear Turn Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Left Rear Turn Lamp in accordance with the Service Information. Refer to [LAMP, TAIL STOP TURN, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L63) LEFT REAR TURN LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) and component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B1642-15-REAR LEFT TURN LAMP CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete TURN SIGNAL LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information .**

THEORY OF OPERATION

When the ignition is on, the Body Control Module (BCM) provides a 12-volt signal, on the Left and Right Lighting Fault Sense circuits, to the Left and Right Front Lamp Assemblies, and the Left and Right Tail Lamp Assemblies. When the Left or Right Turn Lamp is activated, the Body Control Module (BCM) provides a 12-volt signal on the Left or Right Front Turn Lamp Driver circuit, or the Left or Right Rear Turn Lamp Driver circuit, indicating the Turn Lamps have been requested.

When the Left or Right Turn Lamp is activated, an internal driver in the Front and Tail Lamp Assemblies pulls the Lighting Fault Sense circuit voltage signal low (below 6 volts), in sequence with the Turn Lamp flash. When the Turn Lamps are Off, the BCM maintains the Lighting Fault Sense circuit voltage signal high (above 8 volts).

A failure in the Lighting Fault Sense circuit may be caused by one of the following conditions:

- When the Left or Right Turn Lamps are ON, and the voltage on the Lighting Fault Sense circuit is constantly 12 volts (system voltage), may indicate the Lighting Fault Sense circuit is open or shorted to voltage, the Ground circuit is open, a poor connection or an inoperative Lamp Assembly.
- When the Left or Right Turn Lamps are OFF, the Lamp Assembly is not disconnected and the voltage on the Lighting Fault Sense circuit is below 6 volts, may indicate a short to ground on the Lighting Fault Sense circuit, an internally shorted Lamp Assembly, or water/corrosion at a harness connector/terminal.
- When a Lamp Assembly is disconnected, the Lighting Fault Sense circuit is not shorted to ground, and the voltage on the Lighting Fault Sense circuit is below 6 volts, may indicate the BCM is not supplying the 12-volt signal on the Lighting Fault Sense circuit.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.
- The operating range is between 9 to 16 Volts.

SET CONDITION

- **Incandescent Lamps:** When the Left Rear Turn Lamps are activated and the Body Control Module (BCM) detects less than 0.1 amperes on the Left Rear Turn Lamp Driver circuit for greater than five seconds.
- **LED Lamps:** When the Body Control Module (BCM) detects that either an internal fault or a circuit fault exists for the Left Tail Lamp Assembly.

DEFAULT ACTION

- The Left Rear Turn Lamp is always activated or inoperative.

POSSIBLE CAUSES

Possible Causes
GROUND CIRCUIT OPEN
LEFT REAR TURN LAMP DRIVER CIRCUIT OPEN OR SHORTED TO VOLTAGE (IF EQUIPPED)
LEFT STOP LAMP DRIVER CIRCUIT OPEN OR SHORTED TO VOLTAGE (IF EQUIPPED)
LEFT STOP/TURN LAMP DRIVER CIRCUIT OPEN OR SHORTED TO VOLTAGE (IF EQUIPPED)
LEFT REAR LIGHTING FAULT SENSE CIRCUIT OPEN (IF EQUIPPED)
LEFT REAR TURN LAMP (BASE LAMP)
LEFT TAIL LAMP ASSEMBLY (PREMIUM LAMP)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. CHECK FOR AN ACTIVE DTC

NOTE: **LED LAMPS ONLY:** After any Fault Sense circuit repair or replacement is completed, the Turn Lamps must be activated at least 20 cycles for the DTC status to change from Active to Stored. After the DTC status has been changed to Stored, the DTC can be erased from the internal memory of the Body Control Module (BCM).

1. With the scan tool, read Body Control Module (BCM) DTCs and record on the repair order.
2. With the scan tool, perform an ECU reset to the BCM, and then erase DTCs.
3. Turn the ignition off for a minimum of 10.0 seconds.
4. Turn the ignition on.
5. Record the Environmental Data.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR INTERMITTENT CONDITIONS procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE LEFT TAIL LAMP GROUND CIRCUIT FOR AN OPEN

1. Turn the ignition off.
2. Disconnect the Left Tail Lamp Assembly harness connector.
3. Measure the resistance between ground and the Tail Lamp Ground circuit at the Left Tail Lamp Assembly harness connector.

Is the resistance above 1 Ohm?

Yes

- Repair the open in the Ground circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- **Incandescent Lamps:** Go To [3](#)
- **LED Lamps:** Go To Refer to [6](#).

3. CHECK FOR VOLTAGE ON THE (L63) LEFT REAR TURN LAMP DRIVER CIRCUIT

NOTE: Make sure the Turn Lamps are off when performing this step.

1. Turn the ignition on.
2. Measure the voltage on the (L63) Left Rear Turn Lamp Driver circuit at the Left Tail Lamp Assembly harness connector.

Is there any voltage present?

Yes

- Repair the (L63) Left Rear Turn Lamp Driver circuit for an short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. CHECK THE BCM (L63) LEFT REAR TURN LAMP OUTPUT FOR PROPER OPERATION

1. Turn the Left Turn Lamps on.
2. Connect a 12-volt test light between ground and the (L63) Left Rear Turn Lamp Driver circuit at the Left Tail Lamp Assembly harness connector.

Does the test light illuminate on and off in sequence?

Yes

- Replace the Left Rear Turn Lamp in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

5. CHECK THE (L63) LEFT REAR TURN LAMP DRIVER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. Turn the ignition off.
2. Disconnect the BCM C6/F harness connector.
3. Measure the resistance of the (L63) Left Rear Turn Lamp Driver circuit between the Left Tail Lamp Assembly harness connector and the BCM C6/F harness connector.

Is the resistance above 1 Ohm?

Yes

- Repair the (L63) Left Rear Turn Lamp Driver circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [10](#)

6. CHECK FOR VOLTAGE ON THE LEFT TURN LAMP DRIVER CIRCUIT

NOTE: Depending on the vehicle, and how it is equipped, the circuit being tested may be listed as the (L63) Left Rear Turn Lamp Driver circuit, the (L52) Left Stop Lamp Driver circuit, or the (L9) Left Stop/Turn Lamp Feed circuit.

NOTE: Make sure the Turn Lamps and Stop Lamps are off when performing this step.

1. Turn the ignition on.
2. Measure the voltage on the equipped Left Turn Lamp Driver circuit at the Left Tail Lamp Assembly harness connector.

Is there any voltage present?

Yes

- Repair the equipped Left Turn Lamp Driver circuit for an short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [7](#)

7. CHECK FOR VOLTAGE ON THE (L563) LEFT LIGHTING FAULT SENSE CIRCUIT

1. Measure the voltage on the (L563) Left Lighting Fault Sense circuit at the Left Tail Lamp Assembly harness connector.

Is the voltage below 4.0 volts?

Yes

- Go To [9](#)

No

- Go To [8](#)

8. CHECK THE EQUIPPED LEFT TURN LAMP DRIVER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

NOTE: The circuit being tested may be listed as the (L63) Left Rear Turn Lamp Driver circuit, the (L52) Left Stop Lamp Driver circuit, or the (L9) Left Stop/Turn Feed Driver circuit.

1. Turn the ignition off.
2. Disconnect the BCM C6/F harness connector.
3. Measure the resistance of the equipped Left Turn Lamp Driver circuit between the Left Tail Lamp Assembly harness connector and the BCM C6/F harness connector.

Is the resistance above 1 Ohm?

Yes

- Repair the Left Turn Lamp Driver circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [10](#)

9. CHECK THE (L563) LEFT LIGHTING FAULT SENSE CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. Turn the ignition off.
2. Disconnect the BCM C6/F harness connector.
3. Measure the resistance of the (L563) Left Lighting Fault Sense circuit between the Left Tail Lamp Assembly harness connector and the BCM C6/F harness connector.

Is the resistance above 1 Ohm?

Yes

- Repair the (L563) Left Front Lighting Fault Sense circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [10](#)

10. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, perform an ECU reset to the BCM, and then erase DTCs.
9. Turn the ignition off for a minimum of 10.0 seconds.
10. Turn the ignition on.
11. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
12. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

- Test complete.

B1646-11-REAR RIGHT TURN LAMP CONTROL-CIRCUIT SHORT TO GROUND

For a complete TURN SIGNAL LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information**.

THEORY OF OPERATION

The Body Control Module (BCM) receives CAN Bus messages from the Steering Column Control Module (SCCM), requesting Left or Right Turn Lamp illumination. A ground path for the Left and Right Tail Lamp Assemblies is provided through the wiring harness to the body sheet metal.

When requested, the BCM provides a Pulsed Width Modulated (PWM) voltage signal output to the Left or Right Rear Turn Lamp.

INCANDESCENT LAMPS: When a Left or Right Turn Lamp activation is requested, the BCM provides the PWM output @ 100Hz on the associated driver circuit.

LED LAMPS:

When a Left or Right Turn Lamp activation is requested, the BCM provides the PWM output @ 200Hz with a voltage signal between 0 - 12 volts to the selected Tail Lamp Assembly through one of the associated driver circuits (as equipped):

- Rear Turn Lamp Driver circuit
- Stop Lamp Driver circuit
- Stop/Turn Lamp Driver circuit

With the ignition on, the BCM provides a diagnostic voltage output to the Left and Right Tail Lamp Assemblies through the Left and Right Lighting Fault Sense circuits. When the Left or Right Turn Lamp is activated, the internal driver of the Tail Lamp Assemblies pulls the Lighting Fault Sense circuit voltage signal low when the Turn Lamps are illuminated. When the Turn Lamps are Off, the Lighting Fault Sense circuit voltage signal from the BCM is above 4 volts.

A failure in the Rear Lighting Fault Sense circuit may be caused by one of the following conditions:

- When the Left or Right Turn Lamps are ON and the voltage on the Lighting Fault Sense circuit is a constant voltage may indicate:
 - A poor connection in the harness connector.
 - The Lighting Fault Sense circuit is open.
 - The Tail Lamp Assembly ground circuit is open.
 - The Tail Lamp Assembly is inoperative.
- When the Tail Lamp Assembly harness connector is **connected** (back-probing), the Left or Right Turn Lamps are OFF and the voltage on the Lighting Fault Sense circuit is below 4 volts may indicate:
 - The Lighting Fault Sense circuit is shorted to ground.
 - The Tail Lamp Assembly is internally shorted.
 - Water or corrosion in the harness connector/terminal.
- When the Tail Lamp Assembly harness connector is **disconnected** and the voltage on Lighting Fault Sense circuit is below 4 volts (with none of the above faults are present) may indicate the BCM is not supplying the diagnostic voltage signal on the Lighting Fault Sense circuit.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- **Bulb Equipped:** When the Right Turn Lamps are activated and the Body Control Module (BCM) detects greater than 7.86 amps on the Right Rear Turn Lamp Driver circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.
- **LED Equipped:** When the Right Turn Lamps are activated and the Body Control Module (BCM) detects greater than 3.0 amps on the Right Rear Turn Lamp Driver circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The Right Rear Turn Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
RIGHT REAR TURN LAMP DRIVER CIRCUIT SHORTED TO GROUND RIGHT REAR TURN LAMP BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. CHECK THE RIGHT REAR TURN LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Right Rear Turn Lamp harness connector.

3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Right Rear Turn Lamp in accordance with the Service Information. Refer to **LAMP, TAIL STOP TURN, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L62) RIGHT REAR TURN LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) and component harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).

- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

B1646-15-REAR RIGHT TURN LAMP CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete TURN SIGNAL LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information**.

THEORY OF OPERATION

When the ignition is on, the Body Control Module (BCM) provides a 12-volt signal, on the Left and Right Lighting Fault Sense circuits, to the Left and Right Front Lamp Assemblies, and the Left and Right Tail Lamp Assemblies. When the Left or Right Turn Lamp is activated, the Body Control Module (BCM) provides a 12-volt signal on the Left or Right Front Turn Lamp Driver circuit, or the Left or Right Rear Turn Lamp Driver circuit, indicating the Turn Lamps have been requested.

When the Left or Right Turn Lamp is activated, an internal driver in the Front and Tail Lamp Assemblies pulls the Lighting Fault Sense circuit voltage signal low (below 6 volts), in sequence with the Turn Lamp flash. When the Turn Lamps are Off, the BCM maintains the Lighting Fault Sense circuit voltage signal high (above 8 volts).

A failure in the Lighting Fault Sense circuit may be caused by one of the following conditions:

- When the Left or Right Turn Lamps are ON, and the voltage on the Lighting Fault Sense circuit is constantly 12 volts (system voltage), may indicate the Lighting Fault Sense circuit is open or shorted to voltage, the Ground circuit is open, a poor connection or an inoperative Lamp Assembly.
- When the Left or Right Turn Lamps are OFF, the Lamp Assembly is not disconnected and the voltage on the Lighting Fault Sense circuit is below 6 volts, may indicate a short to ground on the Lighting Fault

Sense circuit, an internally shorted Lamp Assembly, or water/corrosion at a harness connector/terminal.

- When a Lamp Assembly is disconnected, the Lighting Fault Sense circuit is not shorted to ground, and the voltage on the Lighting Fault Sense circuit is below 6 volts, may indicate the BCM is not supplying the 12-volt signal on the Lighting Fault Sense circuit.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.
- The operating range is between 9.0 and 16.0 volts.

SET CONDITION

- **Incandescent Lamps:** When the Right Rear Turn Lamp is activated and the Body Control Module (BCM) detects less than 0.1 amperes on the Right Rear Turn Lamp Driver circuit for greater than five seconds.
- **LED Lamps:** When the Body Control Module (BCM) detects that either an internal fault or a circuit fault exists for the Right Tail Lamp Assembly.

DEFAULT ACTION

- The Right Rear Turn Lamp is always activated or inoperative.

POSSIBLE CAUSES

Possible Causes
GROUND CIRCUIT OPEN
RIGHT REAR TURN LAMP DRIVER CIRCUIT OPEN OR SHORTED TO VOLTAGE (IF EQUIPPED)
RIGHT STOP LAMP DRIVER CIRCUIT OPEN OR SHORTED TO VOLTAGE (IF EQUIPPED)
RIGHT STOP/TURN LAMP DRIVER CIRCUIT OPEN OR SHORTED TO VOLTAGE (IF EQUIPPED)
RIGHT REAR LIGHTING FAULT SENSE CIRCUIT OPEN (IF EQUIPPED)
RIGHT REAR TURN LAMP (BASE LAMP)
RIGHT TAIL LAMP ASSEMBLY (PREMIUM LAMP)
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to [**PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**](#) .

DIAGNOSTIC TEST

1. CHECK FOR AN ACTIVE DTC

NOTE: **LED LAMPS ONLY:** After any Fault Sense circuit repair or replacement is completed, the Turn Lamps must be activated at least 20 cycles for the DTC status to change from Active to Stored. After the DTC status has been changed to Stored, the DTC can be erased from the internal memory of the Body Control Module (BCM).

1. With the scan tool, read Body Control Module (BCM) DTCs and record on the repair order.
2. With the scan tool, perform an ECU reset to the BCM, and then erase DTCs.
3. Turn the ignition off for a minimum of 10.0 seconds.
4. Turn the ignition on.
5. Record the Environmental Data.

6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the TESTING FOR INTERMITTENT CONDITIONS procedure. Refer to **TESTING FOR AN INTERMITTENT CONDITION** .

2. CHECK THE RIGHT TAIL LAMP GROUND CIRCUIT FOR AN OPEN

1. Turn the ignition off.
2. Disconnect the Right Tail Lamp Assembly harness connector.
3. Measure the resistance between ground and the Tail Lamp Ground circuit at the Right Tail Lamp Assembly harness connector.

Is the resistance above 1 Ohm?

Yes

- Repair the open in the Ground circuit.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- **Incandescent Lamps:** Go To [3](#)
- **LED Lamps:** Go To Refer to [6](#).

3. CHECK FOR VOLTAGE ON THE (L62) RIGHT REAR TURN LAMP DRIVER CIRCUIT

NOTE: **Make sure the Turn Lamps are off when performing this step.**

1. Turn the ignition on.
2. Measure the voltage on the (L62) Right Rear Turn Lamp Driver circuit at the Right Tail Lamp Assembly harness connector.

Is there any voltage present?

Yes

- Repair the (L62) Right Rear Turn Lamp Driver circuit for an short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. CHECK THE BCM (L62) RIGHT REAR TURN LAMP OUTPUT FOR PROPER OPERATION

1. Turn the Right Turn Lamps on.
2. Connect a 12-volt test light between ground and the (L62) Right Rear Turn Lamp Driver circuit at the Right Tail Lamp Assembly harness connector.

Does the test light illuminate on and off in sequence?

Yes

- Replace the Right Rear Turn Lamp in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [5](#)

5. CHECK THE (L62) RIGHT REAR TURN LAMP DRIVER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. Turn the ignition off.
2. Disconnect the BCM C5/E harness connector.
3. Measure the resistance of the (L62) Right Rear Turn Lamp Driver circuit between the Right Tail Lamp Assembly harness connector and the BCM C5/E harness connector.

Is the resistance above 1 Ohm?

Yes

- Repair the (L62) Right Rear Turn Lamp Driver circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [10](#)

6. CHECK FOR VOLTAGE ON THE RIGHT TURN LAMP DRIVER CIRCUIT

NOTE: Depending on the vehicle, and how it is equipped, the circuit being tested may be listed as the (L62) Right Rear Turn Lamp Driver circuit, the (L54) Right Stop Lamp Driver circuit, or the (L6) Right Stop/Turn Lamp Feed circuit.

NOTE: Make sure the Turn Lamps and Stop Lamps are off when performing this step.

1. Turn the ignition on.
2. Measure the voltage on the equipped Right Turn Lamp Driver circuit at the Right Tail Lamp Assembly harness connector.

Is there any voltage present?

Yes

- Repair the equipped Right Turn Lamp Driver circuit for an short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [7](#)

7. CHECK FOR VOLTAGE ON THE (L562) RIGHT LIGHTING FAULT SENSE CIRCUIT

1. Measure the voltage on the (L562) Right Lighting Fault Sense circuit at the Right Tail Lamp Assembly harness connector.

Is the voltage below 4.0 volts?

Yes

- Go To [9](#)

No

- Go To [8](#)

8. CHECK THE EQUIPPED RIGHT TURN LAMP DRIVER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

NOTE: The circuit being tested may be listed as the (L62) Right Rear Turn Lamp Driver circuit, the (L54) Right Stop Lamp Driver circuit, or the (L6) Right Stop/Turn Feed Driver circuit.

1. Turn the ignition off.
2. Disconnect the BCM harness connector containing the circuit being tested.
3. Measure the resistance of the equipped Right Turn Lamp Driver circuit between the Right Tail Lamp Assembly harness connector and the BCM harness connector.

Is the resistance above 1 Ohm?

Yes

- Repair the Right Turn Lamp Driver circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [10](#)

9. CHECK THE (L562) RIGHT LIGHTING FAULT SENSE CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. Turn the ignition off.
2. Disconnect the BCM C6/F harness connector.
3. Measure the resistance of the (L562) Right Lighting Fault Sense circuit between the Right Tail Lamp Assembly harness connector and the BCM C6/F harness connector.

Is the resistance above 1 Ohm?

Yes

- Repair the (L562) Right Front Lighting Fault Sense circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [10](#)

10. CHECK RELATED HARNESS CONNECTIONS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.

- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Reconnect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Reconnect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Reconnect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, perform an ECU reset to the BCM, and then erase DTCs.
9. Turn the ignition off for a minimum of 10.0 seconds.
10. Turn the ignition on.
11. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
12. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B165C-11-RIGHT SIGNATURE LAMP CONTROL-CIRCUIT SHORT TO GROUND

For a complete PARK LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Left and Right Front Signature Lamps are integral to the Left and Right Front Lamp Assemblies and use Light Emitting Diodes (LEDs) for illumination. When the Body Control Module (BCM) receives a hardwired input from the Headlamp Switch, requesting Park Lamp illumination, the BCM provides a voltage output, through the Left and Right Front Park Lamp Driver circuits, to integral controllers within the Left and Right Front Lamp Assemblies. The integral controllers then provide an internal Pulse Width Modulation (PWM) voltage to the Left and Right Front Signature Lamps. A ground path for the Left and Right Front Signature Lamps is present through the wiring harnesses of the Left and Right Front Lamp Assemblies, to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Park Lamps are activated and the Body Control Module (BCM) detects greater than 3.015 amps on the Right Front Park Lamp Driver circuit.

- Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- Right Front Signature Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT PARK LAMP DRIVER CIRCUIT SHORTED TO GROUND
RIGHT FRONT SIGNATURE LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. CHECK THE RIGHT FRONT SIGNATURE LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Right Front Signature Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Right Front Signature Lamp in accordance with the Service Information. Refer to **LAMP, PARK AND TURN SIGNAL, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L118) RIGHT FRONT PARK LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. DISCONNECT RELATED BCM HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B165D-11-LEFT SIGNATURE LAMP CONTROL-CIRCUIT SHORT TO GROUND

For a complete PARK LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Left and Right Front Signature Lamps are integral to the Left and Right Front Lamp Assemblies and use Light Emitting Diodes (LEDs) for illumination. When the Body Control Module (BCM) receives a hardwired input from the Headlamp Switch, requesting Park Lamp illumination, the BCM provides a voltage output, through the Left and Right Front Park Lamp Driver circuits, to integral controllers within the Left and Right Front Lamp Assemblies. The integral controllers then provide an internal Pulse Width Modulation (PWM) voltage to the Left and Right Front Signature Lamps. A ground path for the Left and Right Front Signature Lamps is present through the wiring harnesses of the Left and Right Front Lamp Assemblies, to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Park Lamps are activated and the Body Control Module (BCM) detects greater than 3.015 amps on the Left Front Park Lamp Driver circuit.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- Left Front Signature Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT PARK LAMP DRIVER CIRCUIT SHORTED TO GROUND

Possible Causes
LEFT FRONT SIGNATURE LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE LEFT FRONT SIGNATURE LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Left Front Signature Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Left Front Signature Lamp in accordance with the Service Information. Refer to **LAMP, PARK AND TURN SIGNAL, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L117) LEFT FRONT PARK LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.

9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B168E-11-FRONT FOG LAMP SWITCH-CIRCUIT SHORT TO GROUND

For a complete FOG LAMPS SYSTEM wiring diagram, Refer to the appropriate wiring information .

THEORY OF OPERATION

Incandescent Front Fog Lamps: The Front Fog Lamp Switch is integral to the Headlamp Switch. When the Body Control Module (BCM) receives an input signal from the Headlamp Switch, requesting Front Fog Lamp illumination, the BCM provides a Pulse Width Modulated (PWM) voltage output, through the Left and Right Front Fog Lamp Control Circuits, to the Left and Right Front Fog Lamps. A separate ground circuit is provided to the Left and Right Front Fog Lamps through the wiring harness to the body sheet metal.

LED Front Fog Lamps: The Fog Lamp Switch is integral to the Headlamp Switch. When the Body Control Module (BCM) receives an input signal from the Headlamp Switch, requesting Front Fog Lamp illumination, the BCM provides a voltage signal, through the Left and Right Front Fog Lamp Control Circuits, to activate the Left and Right Front Fog Lamps. A separate ground circuit is provided to the Left and Right Front Fog Lamps through the wiring harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Body Control Module (BCM) detects less than 50.0 Ohms on the Headlamp/Fog Lamp Switch Signal circuit for greater than 20.0 seconds.

DEFAULT ACTION

- The Front Fog Lamps are inoperative.

POSSIBLE CAUSES

Possible Causes
HEADLAMP/FOG LAMP SWITCH SIGNAL CIRCUIT SHORTED TO GROUND
HEADLAMP SWITCH
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. DISCONNECT THE HEADLAMP SWITCH HARNESS CONNECTOR - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. Turn the ignition off.
2. Disconnect the component harness connector(s) containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Go To [3](#)

No

- Replace the Headlamp Switch in accordance with the Service Information. Refer to [SWITCH, HEADLAMP, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L116) HEADLAMP/FOG LAMP SWITCH SIGNAL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.

4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B168E-15-FRONT FOG LAMP SWITCH-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete FOG LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

Incandescent Front Fog Lamps: The Front Fog Lamp Switch is integral to the Headlamp Switch. When the Body Control Module (BCM) receives an input signal from the Headlamp Switch, requesting Front Fog Lamp illumination, the BCM provides a Pulse Width Modulated (PWM) voltage output, through the Left and Right Front Fog Lamp Control Circuits, to the Left and Right Front Fog Lamps. A separate ground circuit is provided to the Left and Right Front Fog Lamps through the wiring harness to the body sheet metal.

LED Front Fog Lamps: The Fog Lamp Switch is integral to the Headlamp Switch. When the Body Control Module (BCM) receives an input signal from the Headlamp Switch, requesting Front Fog Lamp illumination, the BCM provides a voltage signal, through the Left and Right Front Fog Lamp Control Circuits, to activate the Left and Right Front Fog Lamps. A separate ground circuit is provided to the Left and Right Front Fog Lamps through the wiring harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- When the Body Control Module (BCM) detects greater than 100k Ohms on the Headlamp/Fog Lamp Switch Signal circuit for greater than 20.0 seconds.

DEFAULT ACTION

- The Front Fog Lamps are always on or inoperative.

POSSIBLE CAUSES

Possible Causes
HEADLAMP/FOG LAMP SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE
HEADLAMP/FOG LAMP SWITCH SIGNAL CIRCUIT OPEN
HEADLAMP SWITCH
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .**

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.

2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. DISCONNECT THE HEADLAMP SWITCH HARNESS CONNECTOR AND CHECK THE VOLTAGE ON THE (L116) HEADLAMP/FOG LAMP SWITCH SIGNAL CIRCUIT

1. Turn the ignition off.
2. Disconnect the component harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L116) HEADLAMP/FOG LAMP SWITCH SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

4. CHECK THE (Z911) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load

testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L116) HEADLAMP/FOG LAMP SWITCH SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A FUSED JUMPER WIRE BETWEEN GROUND AND THE (L116) HEADLAMP/FOG LAMP SWITCH SIGNAL CIRCUIT - CHECK FOR ADDITIONAL DTCS

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Connect a fused jumper wire between ground and the circuit being tested at the component harness connector. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. With the scan tool, read the BCM DTCs.

Is DTC B168E-11-FRONT FOG LAMP SWITCH-CIRCUIT SHORT TO GROUND active?

Yes

- Replace the Headlamp Switch in accordance with the Service Information. Refer to [SWITCH, HEADLAMP, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

7. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.

10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B168E-2A-FRONT FOG LAMP SWITCH-STUCK

For a complete FOG LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

Incandescent Front Fog Lamps: The Front Fog Lamp Switch is integral to the Headlamp Switch. When the Body Control Module (BCM) receives an input signal from the Headlamp Switch, requesting Front Fog Lamp illumination, the BCM provides a Pulse Width Modulated (PWM) voltage output, through the Left and Right Front Fog Lamp Control Circuits, to the Left and Right Front Fog Lamps. A separate ground circuit is provided to the Left and Right Front Fog Lamps through the wiring harness to the body sheet metal.

LED Front Fog Lamps: The Fog Lamp Switch is integral to the Headlamp Switch. When the Body Control Module (BCM) receives an input signal from the Headlamp Switch, requesting Front Fog Lamp illumination, the BCM provides a voltage signal, through the Left and Right Front Fog Lamp Control Circuits, to activate the Left and Right Front Fog Lamps. A separate ground circuit is provided to the Left and Right Front Fog Lamps through the wiring harness to the body sheet metal.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- The ignition is on.
- The battery voltage is between 10.0 and 16.0 volts.

SET CONDITION

- When the Body Control Module (BCM) detects a continuous Fog Lamp Switch input for greater than 20 seconds.

DEFAULT ACTION

- The Front Fog Lamps are inoperative.

POSSIBLE CAUSES

Possible Causes
HEADLAMP/FOG LAMP SWITCH SIGNAL CIRCUIT SHORTED TO GROUND
HEADLAMP SWITCH

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. CHECK IF AN ADDITIONAL DTC IS SET IN THE BCM

1. With the scan tool, read the Body Control Module (BCM) DTCs.

Does the scan tool display DTC B168E-11-FRONT FOG LAMP SWITCH-CIRCUIT SHORT TO GROUND as active?

Yes

- Perform the appropriate diagnostic test.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Inspect the Fog Lamp Switch for any debris or foreign material that could cause a sticking condition. If no problem is found, replace the Headlamp Switch in accordance with the Service Information. Refer to [SWITCH, HEADLAMP, REMOVAL AND INSTALLATION](#) .
 - Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

Body Control Module (BCM) - DTCS B16Af-11 To B1792-11 - Gladiator

DTC TROUBLESHOOTING

B16AF-11-LEFT STOP LAMP CONTROL-CIRCUIT SHORT TO GROUND

For a complete STOP LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information .**

THEORY OF OPERATION

The Brake Pedal Travel Sensor is a hardwired input to the Anti-lock Brake System (ABS) Module. When the brake pedal is pressed, the Brake Pedal Travel Sensor sends an input signal to the ABS Module. The ABS Module sends an input signal through the Brake Signal 1 circuit, along with a redundant CAN C Bus message, to the Body Control Module (BCM), indicating the Brake Pedal is applied. The BCM provides a voltage output through the Left and Right Stop Lamp Driver circuit to the Left and Right Stop Lamps and through the Brake Lamp Switch Output circuit to the Center High Mounted Stop Lamp (CHMSL).

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- **Bulb Equipped:** When the Brake Pedal is applied and the Body Control Module (BCM) detects greater than 7.68 amperes on the Left Stop Lamp Driver circuit for greater than four seconds.
- After four consecutive failed retry attempts the BCM will disable the output for the remainder of the ignition cycle.
- **LED Equipped:** When the Brake Pedal is applied and the Body Control Module (BCM) detects greater than 3.0 amperes on the Left Stop Lamp Driver circuit for greater than four seconds.
- After four consecutive failed retry attempts the BCM will disable the output for the remainder of the ignition cycle.

DEFAULT ACTION

- The Stop Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT STOP LAMP DRIVER CIRCUIT SHORTED TO GROUND
LEFT STOP LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.
Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after wiring repair or module replacement:**

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power

Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. CHECK THE LEFT TAIL LAMP ASSEMBLY FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Left Tail Lamp Assembly harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Left Stop Lamp Bulb or Tail Lamp Assembly in accordance with the Service Information. Refer to [LAMP, TAIL STOP TURN, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L9) LEFT STOP/TURN FEED CIRCUIT OR (L52) LEFT STOP LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).
- Test complete.

B16AF-15-LEFT STOP LAMP CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete STOP LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information**.

THEORY OF OPERATION

The Brake Pedal Travel Sensor is a hardwired input to the Anti-lock Brake System (ABS) Module. When the brake pedal is pressed, the Brake Pedal Travel Sensor sends an input signal to the ABS Module. The ABS Module sends an input signal through the Brake Signal 1 circuit, along with a redundant CAN C Bus message, to the Body Control Module (BCM), indicating the Brake Pedal is applied. The BCM provides a voltage output through the Left and Right Stop Lamp Driver circuit to the Left and Right Stop Lamps and through the Brake Lamp Switch Output circuit to the Center High Mounted Stop Lamp (CHMSL).

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- When the Brake Pedal is applied and the Body Control Module (BCM) detects less than 0.35 amperes on the Left Stop Lamp Driver circuit for greater than five seconds.

DEFAULT ACTION

- The Stop Lamp is always on or inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT STOP LAMP DRIVER CIRCUIT OPEN
LEFT STOP LAMP DRIVER CIRCUIT SHORTED TO VOLTAGE
GROUND CIRCUIT OPEN
LEFT STOP LAMP
BODY CONTROL MODULE (BCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to [PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE](#).

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#) .

2. DISCONNECT THE LEFT TAIL LAMP ASSEMBLY HARNESS CONNECTOR AND CHECK FOR VOLTAGE ON THE (L9) LEFT STOP/TURN FEED CIRCUIT OR (L52) LEFT STOP LAMP DRIVER CIRCUIT

NOTE: **Make sure the Stop Lamps are off when performing this step.**

1. Turn the ignition off.
2. Disconnect the component harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: **When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.**

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L9) LEFT STOP/TURN FEED CIRCUIT OR (L52) LEFT STOP LAMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) and component harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: **When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.**

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

4. CHECK THE LEFT TAIL LAMP GROUND CIRCUIT(S) FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L9) LEFT STOP/TURN FEED CIRCUIT OR (L52) LEFT STOP LAMP DRIVER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A 12-VOLT TEST LIGHT BETWEEN GROUND AND THE (L9) LEFT STOP/TURN FEED CIRCUIT OR (L52) LEFT STOP LAMP DRIVER CIRCUIT - CHECK THE BCM OUTPUT

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Using a 12-volt test light, connect the test light lead to a known good ground.
3. With the 12-volt test light, probe the circuit being tested at the component harness connector.
4. Turn the ignition on.
5. Activate the system or ECU output for the circuit being tested.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace the Left Stop Lamp or Tail Lamp Assembly in accordance with the Service Information. Refer to **LAMP, TAIL STOP TURN, REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Go To **7**

7. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.

7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

B16B3-11-RIGHT STOP LAMP CONTROL-CIRCUIT SHORT TO GROUND

For a complete STOP LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information**.

THEORY OF OPERATION

The Brake Pedal Travel Sensor is a hardwired input to the Anti-lock Brake System (ABS) Module. When the brake pedal is pressed, the Brake Pedal Travel Sensor sends an input signal to the ABS Module. The ABS Module sends an input signal through the Brake Signal 1 circuit, along with a redundant CAN C Bus message, to the Body Control Module (BCM), indicating the Brake Pedal is applied. The BCM provides a voltage output through the Left and Right Stop Lamp Driver circuit to the Left and Right Stop Lamps and through the Brake Lamp Switch Output circuit to the Center High Mounted Stop Lamp (CHMSL).

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- **Bulb Equipped:** When the Brake Pedal is applied and the Body Control Module (BCM) detects greater than 7.68 amperes on the Right Stop Lamp Driver circuit for greater than four seconds.
- After four consecutive failed retry attempts the BCM will disable the output for the remainder of the ignition cycle.
- **LED Equipped:** When the Brake Pedal is applied and the Body Control Module (BCM) detects greater than 3.0 amperes on the Right Stop Lamp Driver circuit and for greater than four seconds.
- After four consecutive failed retry attempts the BCM will disable the output for the remainder of the ignition cycle.

DEFAULT ACTION

- The Stop Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
RIGHT STOP LAMP DRIVER CIRCUIT SHORTED TO GROUND
RIGHT STOP LAMP

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR** - Perform after wiring repair or module replacement:

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. CHECK THE RIGHT TAIL LAMP ASSEMBLY FOR AN INTERNAL SHORT

NOTE: **Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.**

1. Turn the ignition off.
2. Disconnect the Right Tail Lamp Assembly harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Right Stop Lamp Bulb or Tail Lamp Assembly in accordance with the Service Information. Refer to **LAMP, TAIL STOP TURN, REMOVAL AND INSTALLATION**.

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

3. **DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L6) RIGHT STOP/TURN FEED CIRCUIT OR (L54) RIGHT STOP LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND**

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [4](#)

4. **DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS**

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.

6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B16B3-15-RIGHT STOP LAMP CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete STOP LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Brake Pedal Travel Sensor is a hardwired input to the Anti-lock Brake System (ABS) Module. When the brake pedal is pressed, the Brake Pedal Travel Sensor sends an input signal to the ABS Module. The ABS Module sends an input signal through the Brake Signal 1 circuit, along with a redundant CAN C Bus message, to the Body Control Module (BCM), indicating the Brake Pedal is applied. The BCM provides a voltage output through the Left and Right Stop Lamp Driver circuit to the Left and Right Stop Lamps and through the Brake Lamp Switch Output circuit to the Center High Mounted Stop Lamp (CHMSL).

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- When the Brake Pedal is applied and the Body Control Module (BCM) detects less than 0.35 amperes on the Right Stop Lamp Driver circuit for greater than five seconds.

DEFAULT ACTION

- The Stop Lamp is always on or inoperative.

POSSIBLE CAUSES

Possible Causes
RIGHT STOP LAMP DRIVER CIRCUIT OPEN
RIGHT STOP LAMP DRIVER CIRCUIT SHORTED TO VOLTAGE
GROUND CIRCUIT OPEN
RIGHT STOP LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. DISCONNECT THE RIGHT TAIL LAMP ASSEMBLY HARNESS CONNECTOR AND CHECK FOR VOLTAGE ON THE (L6) RIGHT STOP/TURN FEED CIRCUIT OR (L54) RIGHT STOP LAMP DRIVER CIRCUIT

NOTE: Make sure the Stop Lamps are off when performing this step.

1. Turn the ignition off.
2. Disconnect the component harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L6) RIGHT STOP/TURN FEED CIRCUIT OR (L54) RIGHT STOP LAMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [7](#)

4. CHECK THE RIGHT TAIL LAMP GROUND CIRCUIT(S) FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [**STANDARD PROCEDURE**](#) .**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L6) RIGHT STOP/TURN FEED CIRCUIT OR (L54) RIGHT STOP LAMP DRIVER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.

4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [6](#)

6. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A 12-VOLT TEST LIGHT BETWEEN GROUND AND THE (L6) RIGHT STOP/TURN FEED CIRCUIT OR (L54) RIGHT STOP LAMP DRIVER CIRCUIT - CHECK THE BCM OUTPUT

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Using a 12-volt test light, connect the test light lead to a known good ground.
3. With the 12-volt test light, probe the circuit being tested at the component harness connector.
4. Turn the ignition on.
5. Activate the system or ECU output for the circuit being tested.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace the Right Stop Lamp or Tail Lamp Assembly in accordance with the Service Information. Refer to [LAMP, TAIL STOP TURN, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [7](#)

7. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.

- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

B16B7-11-CENTER STOP LAMP CONTROL-CIRCUIT SHORT TO GROUND

For a complete STOP LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information**.

THEORY OF OPERATION

The Brake Pedal Travel Sensor is a hardwired input to the Anti-lock Brake System (ABS) Module. When the brake pedal is pressed, the Brake Pedal Travel Sensor sends an input signal to the ABS Module. The ABS Module sends an input signal through the Brake Signal 1 circuit, along with a redundant CAN C Bus message, to the Body Control Module (BCM), indicating the Brake Pedal is applied. The BCM provides a voltage output through the Left and Right Stop Lamp Driver circuit to the Left and Right Stop Lamps and through the Brake Lamp Switch Output circuit to the Center High Mounted Stop Lamp (CHMSL).

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- When the Brake Pedal is applied and the Body Control Module (BCM) detects greater than 2.5 amperes on the Brake Lamp Switch Output circuit for greater than four seconds.

- After four consecutive failed retry attempts the BCM will disable the output for the remainder of the ignition cycle.

DEFAULT ACTION

- The Center High Mounted Stop Lamp (CHMSL) is inoperative.

POSSIBLE CAUSES

Possible Causes
BRAKE LAMP SWITCH OUTPUT CIRCUIT SHORTED TO GROUND CENTER HIGH MOUNTED STOP LAMP (CHMSL) BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after wiring repair or module replacement:**

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. CHECK THE CENTER HIGH MOUNTED STOP LAMP (CHMSL) FOR AN INTERNAL SHORT

NOTE: **Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.**

1. Turn the ignition off.
2. Disconnect the Center High Mounted Stop Lamp (CHMSL) harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Center High Mounted Stop Lamp Bulb or Assembly in accordance with the Service Information. Refer to [LAMP, CENTER HIGH MOUNTED STOP, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L51) BRAKE LAMP SWITCH OUTPUT CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L51) BRAKE LAMP SWITCH OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE

NOTE: Make sure the brake pedal is not applied while performing this step.

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) and component harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

4. CHECK THE CHMSL GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load

test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE:

Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE:

When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE:

Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L51) BRAKE LAMP SWITCH OUTPUT CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [6](#)

6. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A 12-VOLT TEST LIGHT BETWEEN GROUND AND THE (L51) BRAKE LAMP SWITCH OUTPUT CIRCUIT - CHECK THE BCM OUTPUT

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Using a 12-volt test light, connect the test light lead to a known good ground.
3. With the 12-volt test light, probe the circuit being tested at the component harness connector.
4. Turn the ignition on.
5. Activate the system or ECU output for the circuit being tested.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace the Center High Mounted Stop Lamp (CHMSL) or Tail Lamp Assembly in accordance with the Service Information. Refer to [**LAMP, CENTER HIGH MOUNTED STOP, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [7](#)

7. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B16CF-11-LEFT DRL LAMP CONTROL - CIRCUIT SHORT TO GROUND

For a complete HEADLAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Daytime Running Lamps (DRLs) illuminate when the Engine is running, the Park Brake is released and the Headlamp Switch is in the OFF or AUTO position. When the Body Control Module (BCM) receives a CAN message from the PCM, indicating the engine is running, a hard-wired input from the Headlamp Switch,

indicating the Headlamp Switch is Off or in the AUTO position, and a hard-wired input from the Park Brake Switch, indicating that the Park Brake is released, the BCM provides a voltage output to the DRLs through the Right and Left DRL Lamp Driver circuits.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- When the Daytime Running Lamps (DRL) are active and the Body Control Module (BCM) detects greater than 3.015 amps on the Left DRL Lamp Driver circuit for greater than 1.28 seconds.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The Daytime Running Lamps (DRL) is inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT DRL LAMP DRIVER CIRCUIT SHORTED TO GROUND
LEFT DAYTIME RUNNING LAMP (DRL)
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE LEFT DAYTIME RUNNING LAMP (DRL) FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Left Daytime Running Lamp (DRL) harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Left Daytime Running Lamp (DRL) in accordance with the Service Information. Refer to [UNIT, HEADLAMP, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L58) LEFT DRL LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.

- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.
- Test complete.

B16CF-15-LEFT DRL LAMP CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete HEADLAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information**.

THEORY OF OPERATION

The Daytime Running Lamps (DRLs) illuminate when the Engine is running, the Park Brake is released and the Headlamp Switch is in the OFF or AUTO position. When the Body Control Module (BCM) receives a CAN message from the PCM, indicating the engine is running, a hard-wired input from the Headlamp Switch, indicating the Headlamp Switch is Off or in the AUTO position, and a hard-wired input from the Park Brake Switch, indicating that the Park Brake is released, the BCM provides a voltage output to the DRLs through the Right and Left DRL Lamp Driver circuits.

WHEN MONITORED

- This diagnostic runs continuously when continuously when the ignition is on.

SET CONDITION

- When the Daytime Running Lamps (DRLs) transition from Off to On and the Body Control Module (BCM) detects an open or short to voltage on the Left DRL Lamp Control circuit for greater than 1.28 seconds.

POSSIBLE CAUSES

Possible Causes
LEFT DRL LAMP CONTROL CIRCUIT OPEN
LEFT DRL LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
GROUND CIRCUIT OPEN
LEFT DAYTIME RUNNING LAMP (DRL)
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to [STANDARD PROCEDURE](#).

2. DISCONNECT THE LEFT FRONT LAMP ASSEMBLY HARNESS CONNECTOR AND CHECK THE VOLTAGE ON THE (L58) LEFT DRL LAMP DRIVER CIRCUIT

NOTE: Make sure the Daytime Running Lamps are off when performing this step.

1. Turn the ignition off.
2. Disconnect the component harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L58) LEFT DRL LAMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

4. CHECK THE LEFT FRONT LAMP ASSEMBLY GROUND CIRCUIT(S) FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage

drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L58) LEFT DRL LAMP DRIVER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.

3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A 12-VOLT TEST LIGHT BETWEEN GROUND AND THE (L58) LEFT DRL LAMP DRIVER CIRCUIT - CHECK THE BCM OUTPUT

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Using a 12-volt test light, connect the test light lead to a known good ground.
3. With the 12-volt test light, probe the circuit being tested at the component harness connector.
4. Turn the ignition on.
5. Activate the system or ECU output for the circuit being tested.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the test light to that of a direct connection to Battery.

Is the test light illuminated and bright with the system or ECU output activated?

Yes

- Replace the Left Daytime Running Lamp (DRL) in accordance with the Service Information. Refer to [UNIT, HEADLAMP, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

7. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:

- Proper connector installation.
- Damaged connector locks.
- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B16D3-11-RIGHT DRL LAMP CONTROL - CIRCUIT SHORT TO GROUND

For a complete HEADLAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

The Daytime Running Lamps (DRLs) illuminate when the Engine is running, the Park Brake is released and the Headlamp Switch is in the OFF or AUTO position. When the Body Control Module (BCM) receives a CAN message from the PCM, indicating the engine is running, a hard-wired input from the Headlamp Switch, indicating the Headlamp Switch is Off or in the AUTO position, and a hard-wired input from the Park Brake Switch, indicating that the Park Brake is released, the BCM provides a voltage output to the DRLs through the Right and Left DRL Lamp Driver circuits.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- When the Daytime Running Lamps (DRL) are active and the Body Control Module (BCM) detects greater than 3.015 amps on the Right DRL Lamp Driver circuit for greater than 1.28 seconds.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The Daytime Running Lamps (DRL) is inoperative.

POSSIBLE CAUSES

Possible Causes
RIGHT DRL LAMP DRIVER CIRCUIT SHORTED TO GROUND
RIGHT DAYTIME RUNNING LAMP (DRL)
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. CHECK THE RIGHT DAYTIME RUNNING LAMP (DRL) FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Right Daytime Running Lamp (DRL) harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Right Daytime Running Lamp (DRL) in accordance with the Service Information. Refer to [UNIT, HEADLAMP, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L59) RIGHT DRL LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

Possible Causes
RIGHT DRL LAMP CONTROL CIRCUIT OPEN
RIGHT DRL LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
GROUND CIRCUIT OPEN
RIGHT DAYTIME RUNNING LAMP (DRL)

DIAGNOSTIC TEST**1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN**

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. DISCONNECT THE RIGHT FRONT LAMP ASSEMBLY HARNESS CONNECTOR AND CHECK THE VOLTAGE ON THE (L59) RIGHT DRL LAMP DRIVER CIRCUIT

NOTE: Make sure the Daytime Running Lamps are off when performing this step.

1. Turn the ignition off.
2. Disconnect the component harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L59) RIGHT DRL LAMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [7](#)

4. CHECK THE RIGHT FRONT LAMP ASSEMBLY GROUND CIRCUIT(S) FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#).

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.

- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to **STANDARD PROCEDURE** .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L59) RIGHT DRL LAMP DRIVER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [6](#)

6. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A 12-VOLT TEST LIGHT BETWEEN GROUND AND THE (L59) RIGHT DRL LAMP DRIVER CIRCUIT - CHECK THE BCM OUTPUT

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Using a 12-volt test light, connect the test light lead to a known good ground.
3. With the 12-volt test light, probe the circuit being tested at the component harness connector.
4. Turn the ignition on.
5. Activate the system or ECU output for the circuit being tested.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the test light to that of a direct connection to Battery.

Is the test light illuminated and bright with the system or ECU output activated?

Yes

- Replace the Right Daytime Running Lamp (DRL) in accordance with the Service Information. Refer to [UNIT, HEADLAMP, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [7](#)

7. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).

- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B16D7-11-LEFT TAILLAMP 1 CONTROL-CIRCUIT SHORT TO GROUND

For a complete PARK LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

When the Body Control Module (BCM) receives an input from the Headlamp Switch, requesting Park Lamp illumination, the BCM provides a voltage output to the Left and Right Front Lamp Assemblies, Front Signature Lamps, Tail Lamp Assemblies, License Plate Lamp and Side Marker Lamps, through the appropriate Lamp Driver circuit. A ground path is provided to the Lamp Assemblies through the wiring harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- When the Park Lamps are active and the Body Control Module (BCM) detects greater than 4.6 amperes on the Left Park Lamp Driver circuit for greater than four seconds.
- After four consecutive failed retry attempts the BCM will disable the output for the remainder of the ignition cycle.

DEFAULT ACTION

- The Left Rear Park Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT REAR PARK LAMP DRIVER CIRCUIT SHORTED TO GROUND
LEFT REAR PARK LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after wiring repair or module replacement:**

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. CHECK THE LEFT TAIL LAMP ASSEMBLY FOR AN INTERNAL SHORT

NOTE: **Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.**

1. Turn the ignition off.
2. Disconnect the Left Tail Lamp Assembly harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Left Park Lamp Bulb or Tail Lamp Assembly in accordance with the Service Information. Refer to [**LAMP, TAIL STOP TURN, REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L71) LEFT REAR PARK LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.

6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B16D7-15-LEFT TAILLAMP 1 CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete PARK LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

When the Body Control Module (BCM) receives an input from the Headlamp Switch, requesting Park Lamp illumination, the BCM provides a voltage output to the Left and Right Front Lamp Assemblies, Front Signature Lamps, Tail Lamp Assemblies, License Plate Lamp and Side Marker Lamps, through the appropriate Lamp Driver circuit. A ground path is provided to the Lamp Assemblies through the wiring harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- When the Park Lamps are active and the Body Control Module (BCM) detects less than 0.16 amperes on the Left Rear Park Lamp Driver circuit for greater than five seconds.

DEFAULT ACTION

- The Left Rear Park is always on or inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT REAR PARK LAMP DRIVER CIRCUIT SHORTED TO VOLTAGE
LEFT REAR PARK LAMP DRIVER CIRCUIT OPEN
GROUND CIRCUIT OPEN
LEFT REAR PARK LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. DISCONNECT THE LEFT TAIL LAMP ASSEMBLY HARNESS CONNECTOR AND CHECK FOR VOLTAGE ON THE (L71) LEFT REAR PARK LAMP DRIVER CIRCUIT

NOTE: Make sure the Park Lamps are off when performing this step.

1. Turn the ignition off.
2. Disconnect the component harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L71) LEFT REAR PARK LAMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) and component harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [7](#)

4. CHECK THE LEFT TAIL LAMP ASSEMBLY GROUND CIRCUITS FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
3. Connect the negative lead of the load test tool to the ground circuits at the component harness connectors (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#).

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.

- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to **STANDARD PROCEDURE** .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright for both connections?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L71) LEFT REAR PARK LAMP DRIVER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A 12-VOLT TEST LIGHT BETWEEN GROUND AND THE (L71) LEFT REAR PARK LAMP DRIVER CIRCUIT - CHECK THE BCM OUTPUT

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Using a 12-volt test light, connect the test light lead to a known good ground.
3. With the 12-volt test light, probe the circuit being tested at the component harness connector.
4. Turn the ignition on.
5. Activate the system or ECU output for the circuit being tested.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly for both connections?

Yes

- Replace the appropriate Left Rear Park Lamp Bulb or Tail Lamp Assembly in accordance with the Service Information. Refer to [LAMP, TAIL STOP TURN, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

7. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).

- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to [**MODULE, BODY CONTROL \(BCM\), REMOVAL AND INSTALLATION**](#) .
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .

No

- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#) .
- Test complete.

B16DF-11-RIGHT TAILLAMP 1 CONTROL-CIRCUIT SHORT TO GROUND

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L72) RIGHT REAR PARK LAMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [**BODY VERIFICATION TEST**](#).

No

- Go To [7](#)

4. CHECK THE RIGHT TAIL LAMP ASSEMBLY GROUND CIRCUITS FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
3. Connect the negative lead of the load test tool to the ground circuits at the component harness connectors (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: **Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [**STANDARD PROCEDURE**](#).**

NOTE: **Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.**

NOTE: **Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage drop test across the 3156 Bulb of the load test tool. To do so perform the following:**

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.

- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to **STANDARD PROCEDURE** .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright for both connections?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L72) RIGHT REAR PARK LAMP DRIVER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [6](#)

6. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A 12-VOLT TEST LIGHT BETWEEN GROUND AND THE (L72) RIGHT REAR PARK LAMP DRIVER CIRCUIT - CHECK THE BCM OUTPUT

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Using a 12-volt test light, connect the test light lead to a known good ground.
3. With the 12-volt test light, probe the circuit being tested at the component harness connector.
4. Turn the ignition on.
5. Activate the system or ECU output for the circuit being tested.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly for both connections?

Yes

- Replace the appropriate Right Rear Park Lamp Bulb or Tail Lamp Assembly in accordance with the Service Information. Refer to [LAMP, TAIL STOP TURN, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

7. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.

- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B16E7-11-LICENSE PLATE LAMP CONTROL-CIRCUIT SHORT TO GROUND

For a complete PARK LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

When the Body Control Module (BCM) receives an input from the Headlamp Switch, requesting Park Lamp illumination, the BCM provides a voltage output to the Left and Right Front Lamp Assemblies, Front Signature Lamps, Tail Lamp Assemblies, License Plate Lamp and Side Marker Lamps, through the appropriate Lamp Driver circuit. A ground path is provided to the Lamp Assemblies through the wiring harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- When the Park Lamps are active and the Body Control Module (BCM) detects greater than 1.3 amperes on the License Plate Lamp Driver circuit for greater than four seconds.
- After four consecutive failed retry attempts the BCM will disable the output for the remainder of the ignition cycle.

DEFAULT ACTION

- The License Plate Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
LICENSE PLATE LAMP DRIVER CIRCUIT SHORTED TO GROUND
LICENSE PLATE LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: **CLEARING THE DTC AFTER MAKING A REPAIR - Perform after wiring repair or module replacement:**

Before the DTC can be erased from the Body Control Module (BCM), the BCM must detect an ignition ON/OFF/ON cycle, making sure the Power Accessory Delay (PAD) is deactivated after the ignition transitions to OFF, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE LICENSE PLATE LAMP FOR AN INTERNAL SHORT

NOTE: **Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.**

1. Turn the ignition off.
2. Disconnect the License Plate Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the License Plate Lamp Bulb in accordance with the Service Information. Refer to [LAMP, LICENSE PLATE, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L3) LICENSE PLATE LAMP CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B16E7-15-LICENSE PLATE LAMP CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete PARK LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

When the Body Control Module (BCM) receives an input from the Headlamp Switch, requesting Park Lamp illumination, the BCM provides a voltage output to the Left and Right Front Lamp Assemblies, Front Signature Lamps, Tail Lamp Assemblies, License Plate Lamp and Side Marker Lamps, through the appropriate Lamp Driver circuit. A ground path is provided to the Lamp Assemblies through the wiring harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- **Bulb Equipped:** When the Park Lamps are active and the Body Control Module (BCM) detects less than 1.6 amps on the License Plate Lamp Driver circuit for greater than five seconds.
- **LED Equipped:** When the Park Lamps are active and the Body Control Module (BCM) detects less than 5.0 milliamps on the License Plate Lamp Driver circuit for greater than five seconds.

DEFAULT ACTION

- The License Plate Lamp is always on or inoperative.

POSSIBLE CAUSES

Possible Causes
LICENSE PLATE LAMP DRIVER CIRCUIT OPEN
LICENSE PLATE LAMP DRIVER CIRCUIT SHORTED TO VOLTAGE

Possible Causes
GROUND CIRCUIT OPEN
LICENSE PLATE LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA - ERASE DTCS AND CHECK FOR THE DTC TO RETURN

1. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
2. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
3. With the scan tool, erase all DTCs.
4. Turn the ignition off for a minimum of 10.0 seconds.
5. Turn the ignition on.
6. Using the recorded Environmental Data and the When Monitored Conditions above, operate the vehicle in the conditions that set the DTC.
7. With the scan tool, read Body Control Module (BCM) DTCs.

Did the DTC return?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. DISCONNECT THE LEFT TAIL LAMP ASSEMBLY HARNESS CONNECTOR AND CHECK FOR VOLTAGE ON THE (L3) LICENSE PLATE LAMP CONTROL CIRCUIT

NOTE: Make sure the Park Lamps are off when performing this step.

1. Turn the ignition off.
2. Disconnect the component harness connector for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Go To [3](#)

No

- Go To [4](#)

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L3) LICENSE PLATE LAMP CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

1. Turn the ignition off.
2. Disconnect all Electronic Control Unit (ECU) and component harness connectors for the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Turn the ignition on.
4. Using a DVOM, measure the voltage on the circuit being tested at the component harness connector.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is there any voltage present?

Yes

- Repair the circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [7](#)

4. CHECK THE LICENSE PLATE LAMP GROUND CIRCUITS FOR AN OPEN OR HIGH RESISTANCE BY LOAD TESTING THE CIRCUIT

1. Turn the ignition off.
2. Connect the positive lead of the load test tool to a 12 volt circuit at the component harness connector.
3. Connect the negative lead of the load test tool to the ground circuit at the component harness connector (A). **Note:** refer to the diagram below.
4. The bulb on the load test tool should be illuminated and bright if there is no resistance in the circuitry.

NOTE: Note: Why load test a circuit? A load test is used to determine if a circuit is capable of carrying the amperage needed to perform properly. The 3156 Bulb in the load tool illustrated, is a simple but effective method of testing circuit functionality. A 3156 Bulb has approximately 6.0 Ohms of resistance when the bulb is powered and draws approximately 2.0 amps of current. Read the CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: Note: A 12-volt test light can be substituted for the load test tool, but only if the test light draws enough current to effectively load test the circuit. Many high impedance test lights draw very little amperage (less than 0.1 amps) and are not reliable to load test a circuit. To perform a proper load test of a circuit, the tool being used should draw more than approximately 0.75 amps.

NOTE: Note: Why perform a Voltage Drop Test: To verify with certainty there is not any resistance in the circuit being tested, perform a simple voltage

drop test across the 3156 Bulb of the load test tool. To do so perform the following:

- 1. Connect the leads of a DVOM to the alligator clips on the load test tool while the load test tool is connected in series with the circuit.
- 2. Compare the voltage drop across the bulb to the voltage reading across the Battery terminals.
- 3. The voltage dropped across the bulb should be equal to the voltage reading across the Battery terminals if there is no resistance in the circuit being tested.

Example: 2.0 Ohms of resistance in the circuit being tested will cause the voltage measurement across the bulb to be 25% less than when compared to Battery voltage. The reason for this is that the 2.0 Ohms in the circuit makes up 25% of the total circuit resistance of 8.0 Ohms. Read the **CIRCUIT VOLTAGE DROP AND LOAD TESTING PROCEDURES** for information on building a simple load test tool and for additional load testing information and alternative methods of load testing or voltage drop testing a circuit. Refer to [STANDARD PROCEDURE](#) .

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: Compare the brightness of the bulb in the load test tool to that of a direct connection to Battery.

Is the load test bulb illuminated and bright?

Yes

- Go To [5](#)

No

- Repair the ground circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

5. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L3) LICENSE PLATE LAMP CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

1. The ignition must be off when checking the resistance of a circuit.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.

3. Before measuring the resistance of any circuit, first measure the resistance between the two leads of the DVOM. **Note:** The meter leads can add resistance to the measurement value.
4. Connect one lead of the DVOM to the circuit being tested at the component harness connector.
5. Connect the other lead to the circuit being tested at the ECU harness connector and measure the resistance of the circuit.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

Is the resistance above 3.0 Ohms?

Yes

- Repair the circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [6](#)

6. CONNECT THE BCM HARNESS CONNECTOR(S) - CONNECT A 12-VOLT TEST LIGHT BETWEEN GROUND AND THE (L3) LICENSE PLATE LAMP CONTROL CIRCUIT - CHECK THE BCM OUTPUT

1. Connect the Electronic Control Unit (ECU) harness connector(s) for the circuit being tested.
2. Using a 12-volt test light, connect the test light lead to a known good ground.
3. With the 12-volt test light, probe the circuit being tested at the component harness connector.
4. Turn the ignition on.
5. Activate the system or ECU output for the circuit being tested.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace the License Plate Lamp Bulb in accordance with the Service Information. Refer to [LAMP, LICENSE PLATE, REMOVAL AND INSTALLATION](#).
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#).

No

- Go To [7](#)

7. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:

- Proper connector installation.
- Damaged connector locks.
- Corrosion.
- Other signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B16EF-11-LEFT PARK LAMP 1 CONTROL-CIRCUIT SHORT TO GROUND

For a complete PARK LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

When the Body Control Module (BCM) receives an input from the Headlamp Switch, requesting Park Lamp illumination, the BCM provides a voltage output to the Left and Right Front Lamp Assemblies, Front Signature Lamps, Tail Lamp Assemblies, License Plate Lamp and Side Marker Lamps, through the appropriate Lamp Driver circuit. A ground path is provided to the Lamp Assemblies through the wiring harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- When the Park Lamps are active and the Body Control Module (BCM) detects greater than 2.9 amps on the Left Front Park Lamp Driver circuit for greater than four seconds.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The Left Front Park Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT PARK LAMP DRIVER CIRCUIT SHORTED TO GROUND
LEFT FRONT PARK LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. CHECK THE LEFT FRONT PARK LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Left Front Park Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Left Front Park Lamp in accordance with the Service Information. Refer to [UNIT, HEADLAMP, REMOVAL AND INSTALLATION](#) .
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L77) LEFT FRONT PARK LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to [BODY VERIFICATION TEST](#) .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.

- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.
9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B16F3-11-RIGHT PARK LAMP 1 CONTROL-CIRCUIT SHORT TO GROUND

For a complete PARK LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

When the Body Control Module (BCM) receives an input from the Headlamp Switch, requesting Park Lamp illumination, the BCM provides a voltage output to the Left and Right Front Lamp Assemblies, Front Signature Lamps, Tail Lamp Assemblies, License Plate Lamp and Side Marker Lamps, through the appropriate Lamp Driver circuit. A ground path is provided to the Lamp Assemblies through the wiring harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- When the Park Lamps are active and the Body Control Module (BCM) detects greater than 2.9 amps on the Right Front Park Lamp Driver circuit for greater than four seconds.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The Right Front Park Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT PARK LAMP DRIVER CIRCUIT SHORTED TO GROUND

Possible Causes
RIGHT FRONT PARK LAMP
BODY CONTROL MODULE (BCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** .

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** .

2. CHECK THE RIGHT FRONT PARK LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Right Front Park Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Right Front Park Lamp in accordance with the Service Information. Refer to **UNIT, HEADLAMP, REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L78) RIGHT FRONT PARK LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.
2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.

9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL (BCM), REMOVAL AND INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
- Test complete.

B16F7-11-FRONT LEFT FOG LAMP CONTROL-CIRCUIT SHORT TO GROUND

For a complete FOG LAMPS SYSTEM wiring diagram, **Refer to the appropriate wiring information** .

THEORY OF OPERATION

Incandescent Front Fog Lamps: The Front Fog Lamp Switch is integral to the Headlamp Switch. When the Body Control Module (BCM) receives an input signal from the Headlamp Switch, requesting Front Fog Lamp illumination, the BCM provides a Pulse Width Modulated (PWM) voltage output, through the Left and Right Front Fog Lamp Control Circuits, to the Left and Right Front Fog Lamps. A separate ground circuit is provided to the Left and Right Front Fog Lamps through the wiring harness to the body sheet metal.

LED Front Fog Lamps: The Fog Lamp Switch is integral to the Headlamp Switch. When the Body Control Module (BCM) receives an input signal from the Headlamp Switch, requesting Front Fog Lamp illumination, the BCM provides a voltage signal, through the Left and Right Front Fog Lamp Control Circuits, to activate the Left and Right Front Fog Lamps. A separate ground circuit is provided to the Left and Right Front Fog Lamps through the wiring harness to the body sheet metal.

WHEN MONITORED

- This diagnostic runs continuously with the ignition on.

SET CONDITION

- **Bulb Equipped:** When the Front Fog Lamps are active and the Body Control Module (BCM) detects greater than 7.86 amps on the Left Front Fog Lamp Control circuit for greater than four seconds.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.
- **LED Equipped:** When the Front Fog Lamps are active and the Body Control Module (BCM) detects greater than 3.0 amps on the Left Front Fog Lamp Control circuit for greater than four seconds and four retry attempts have failed.
 - Four consecutive BCM output retry attempts have failed within the same ignition cycle.

DEFAULT ACTION

- The Fog Lamp is inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT FOG LAMP CONTROL CIRCUIT SHORTED TO GROUND
LEFT FRONT FOG LAMP

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding. Refer to **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE**.

DIAGNOSTIC TEST

1. READ AND RECORD DTCS AND ENVIRONMENTAL DATA

NOTE: To erase this DTC from the module's internal memory, the Body Control Module (BCM) must detect an ignition OFF/ON cycle, along with the normal operation of the system associated with this DTC.

1. Turn the ignition on.
2. With the scan tool, read DTCs in all Electronic Control Units (ECUs) and record on the repair order.
3. With the scan tool, run a vehicle Scan Report, or record the Environmental Data related to the DTCs.
4. With the scan tool, read Body Control Module (BCM) DTCs.

Is the DTC Active?

Yes

- Go To [2](#)

No

- Perform the appropriate INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

2. CHECK THE LEFT FRONT FOG LAMP FOR AN INTERNAL SHORT

NOTE: Additional DTCs may set when the harness connector is disconnected and the ignition is positioned on. After all repairs are completed, make sure to erase any additional DTCs that may have set.

1. Turn the ignition off.
2. Disconnect the Left Front Fog Lamp harness connector.
3. Turn the ignition on.
4. With the scan tool, read BCM DTCs.

Is the DTC Active?

Yes

- Go To [3](#)

No

- Replace the Left Front Fog Lamp in accordance with the Service Information. Refer to **LAMP, FOG, REMOVAL AND INSTALLATION**.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST**.

3. DISCONNECT THE BCM HARNESS CONNECTOR(S) AND CHECK THE (L89) LEFT FRONT FOG LAMP CONTROL CIRCUIT FOR A SHORT TO GROUND

1. The ignition must be off when checking a circuit for continuity to ground.

2. Disconnect all Electronic Control Unit (ECU) harness connectors containing the circuit being tested. **Note:** Use the wiring diagram as a guide to follow the path of the circuit.
3. Connect the negative lead of the DVOM to a known good ground.
4. Connect the positive lead of the DVOM to the circuit being tested at the ECU or component harness connector and check for continuity between the circuit and ground.

NOTE: When probing a circuit at any harness connector, always use an appropriate probing tool to prevent any possible damage to the harness connector terminals.

NOTE: There should be no continuity between ground and the circuit being tested.

Is there continuity between ground and the circuit being tested?

Yes

- Repair the circuit for a short to ground. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors to help isolate the location of the short.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To [4](#)

4. DISCONNECT RELATED MODULE HARNESS CONNECTIONS AND INSPECT FOR PROBLEMS

1. Disconnect all BCM harness connectors.
2. Disconnect all related in-line harness connections (if equipped).
3. Disconnect the related component harness connectors.
4. Inspect harness connectors, component connectors, and all male and female terminals for the following conditions:
 - Proper connector installation.
 - Damaged connector locks.
 - Corrosion.
 - Other signs of water intrusion.
 - Weather seal damage (if equipped).
 - Bent terminals.
 - Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
 - Terminals that have been pushed back into the connector cavity.
 - Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

5. Connect all BCM harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
6. Connect all in-line harness connectors (if equipped). Be certain that all connectors are fully seated and the connector locks are fully engaged.
7. Connect all related component harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
8. With the scan tool, erase DTCs.

9. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
10. With the scan tool, read BCM DTCs.

Did the DTC return?

Yes
