TRANSDUCER-A/C PRESSURE - GRAY 4 WAY

The diagram shows a top-down view of a rectangular component with rounded corners and a central square area containing four pins arranged in a 2x2 grid. The pins are labeled with numbers: 1 is at the top right, 2 is at the top left, 3 is at the bottom right, and 4 is at the bottom left. The component has a multi-layered, concentric rectangular border.

Connector/Ground/Splice Location - Liberty

CONNECTOR/GROUND/SPLICE LOCATION

DESCRIPTION

CONNECTOR/GROUND/SPLICE LOCATIONS

This information provides illustrations identifying connector, ground, and splice locations in the vehicle. Connector, ground, and splice indexes are provided. Use the wiring diagrams in each article for connector, ground, and splice identification. For items that are not shown in this information N/S is placed in the FIG. column.

2008 ENGINE

Cooling - Liberty

DESCRIPTION

DESCRIPTION

The cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible, maintains normal operating temperature and prevents overheating.

The cooling system also provides a means of heating the passenger compartment. The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system. A separate and remotely mounted, pressurized coolant tank using a pressure/vent cap is used.

COOLING SYSTEM COMPONENTS

The cooling system consists of:

- Charge Air Cooler (Turbocharged vehicles only)
- 2 Speed Electric Cooling Fan
- Engine driven fan with viscous clutch (Diesel Engine)
- A aluminum-core radiator with plastic side tanks
- Combined Coolant Recover Container/Washer Reservoir (Gas Engine)
- Combined coolant pressure bottle/overflow system with pressure cap
- Radiator
- Water pump
- Combination A/C condenser/transmission oil cooler (automatic transmission)
- Thermostat
- Coolant
- Water pump
- Hoses and hose clamps

The cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible. It also maintains normal operating temperature and prevents overheating.

The cooling system also provides a means of heating the passenger compartment. The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system.

DIAGNOSIS AND TESTING

AERATION

Low coolant level in a cross flow radiator will equalize in both tanks with engine off. With engine running and at operating temperature, the high pressure inlet tank runs full and the low pressure outlet tank drops, resulting in cooling system aeration. Aeration will draw air into the water pump resulting in the following:

High reading shown on the temperature gauge.

Loss of coolant flow through the heater core.

Corrosion in the cooling system.

Water pump seal may run dry, increasing the risk of premature seal failure.

Combustion gas leaks into the coolant can also cause aeration.

DEAERATION

Air can only be removed from the system by gathering under the pressure cap. On the next heat up it will be pushed past the pressure cap into the coolant recovery bottle by thermal expansion of the coolant. It then escapes to the atmosphere in the coolant recovery bottle and is replaced with coolant on cool down.

To effectively deaerate the system, multiple thermal cycles of the system may be required.

NOTE: Deaeration does not occur at engine idle, higher engine speeds are required. Normal driving will deaerate cooling system.

FLOW CHECK-DIESEL

To determine whether coolant is flowing through the cooling system, use the following procedures:

1. If engine is cold, idle engine until normal operating temperature is reached. Then feel the upper radiator hose. If it is hot, coolant is circulating.

WARNING: Do not remove the cooling system pressure cap with the system hot and under pressure because serious burns from coolant can occur.

2. Remove pressure/vent cap when engine is cold, idle engine until thermostat opens, you should observe coolant flow while looking down in the coolant recovery pressure container. Once flow is detected install the pressure/vent cap.

LEAK TESTING

ULTRAVIOLET LIGHT METHOD

Fig. 2: Identifying Ultraviolet Light Method
Courtesy of CHRYSLER LLC

1 - TYPICAL BLACK LIGHT TOOL

A leak detection additive is available through the parts department that can be added to cooling system. The additive is highly visible under ultraviolet light (black light). Pour one ounce of additive into cooling system. Place heater control unit in HEAT position. Start and operate engine until radiator upper hose is warm to touch. Aim the commercially available black light tool at components to be checked. If leaks are present, black light will cause additive to glow a bright green color.

The black light (1) can be used in conjunction with a pressure tester to determine if any external leaks exist.

PRESSURE TESTER METHOD

Fig. 3: Pressure Testing Cooling System - Typical
Courtesy of CHRYSLER LLC

1 - TYPICAL COOLING SYSTEM PRESSURE TESTER
--

The engine should be at normal operating temperature. Recheck the system cold if cause of coolant loss is not located during the warm engine examination.

WARNING: Hot, pressurized coolant can cause injury by scalding.

Carefully remove radiator pressure cap from pressure bottle and check coolant level. Push down on cap to disengage it from stop tabs. Wipe inside of filler neck and examine lower inside sealing seat for nicks, cracks, paint, and dirt. Inspect radiator-to- reserve/overflow tank hose for internal obstructions. Insert a wire through the hose to be sure it is not obstructed.

Inspect cams on outside of filler neck. If cams are damaged, seating of pressure cap valve and tester seal will be affected.

Attach pressure tester (7700 or an equivalent) to radiator filler neck.

Operate tester pump (1) to apply 110 kPa (16 psi) pressure to system. If hoses enlarge excessively or bulges

while testing, replace as necessary. Observe gauge pointer and determine condition of cooling system according to following criteria:

Holds Steady: If pointer remains steady for two minutes, serious coolant leaks are not present in system. However, there could be an internal leak that does not appear with normal system test pressure. If it is certain that coolant is being lost and leaks cannot be detected, inspect for interior leakage or perform **INTERNAL LEAKAGE INSPECTION**.

Drops Slowly: Indicates a small leak or seepage is occurring. Examine all connections for seepage or slight leakage with a flashlight. Inspect radiator, hoses, gasket edges and heater. Seal small leak holes with a Sealer Lubricant (or equivalent). Repair leak holes and inspect system again with pressure applied.

Drops Quickly: Indicates that serious leakage is occurring. Examine system for external leakage. If leaks are not visible, inspect for internal leakage. Large radiator leak holes should be repaired by a reputable radiator repair shop.

INTERNAL LEAKAGE INSPECTION

Remove engine oil pan drain plug and drain a small amount of engine oil. If coolant is present in the pan, it will drain first because it is heavier than oil. An alternative method is to operate engine for a short period to churn the oil. After this is done, remove engine dipstick and inspect for water globules. Also inspect transmission dipstick for water globules and transmission fluid cooler for leakage.

WARNING: With radiator pressure tester tool installed on radiator, do not allow pressure to exceed 124 kPa (18 psi). Pressure will build up quickly if a combustion leak is present. To release pressure, rock tester from side to side. When removing tester, do not turn tester more than 1/2 turn if system is under pressure.

Operate engine without pressure cap on radiator until thermostat opens. Attach a Pressure Tester to filler neck. If pressure builds up quickly it indicates a combustion leak exists. This is usually the result of a cylinder head gasket leak or crack in engine. Repair as necessary.

If there is not an immediate pressure increase, pump the Pressure Tester. Do this until indicated pressure is within system range of 110 kPa (16 psi). Fluctuation of gauge pointer indicates compression or combustion leakage into cooling system.

Because the vehicle is equipped with a catalytic converter, **do not** remove spark plug cables or short out cylinders to isolate compression leak.

If the needle on dial of pressure tester does not fluctuate, race engine a few times to check for an abnormal amount of coolant or steam. This would be emitting from exhaust pipe. Coolant or steam from exhaust pipe may indicate a faulty cylinder head gasket, cracked engine cylinder block or cylinder head.

A convenient check for exhaust gas leakage into cooling system is provided by a commercially available Block Leak Check tool. Follow manufacturers instructions when using this product.

COMBUSTION LEAKAGE TEST - WITHOUT PRESSURE TESTER

DO NOT WASTE reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

WARNING: Do not remove cylinder block drain plugs or loosen radiator draincock with system hot and under pressure. Serious burns from coolant can occur.

Drain sufficient coolant to allow thermostat removal. See **REMOVAL**. Remove accessory drive belt, see **BELT-ACCESSORY DRIVE**.

Add coolant to radiator to bring level to within 6.3 mm (1/4 in) of top of thermostat housing.

CAUTION: Avoid overheating. Do not operate engine for an excessive period of time. Open draincock immediately after test to eliminate boil over.

Start engine and accelerate rapidly three times, to approximately 3000 RPM while observing coolant. If internal engine combustion gases are leaking into cooling system, bubbles will appear in coolant. If bubbles do not appear, internal combustion gas leakage is not present.

ON-BOARD DIAGNOSTICS (OBD)

COOLING SYSTEM RELATED DIAGNOSTICS

The Powertrain Control Module (PCM) has been programmed to monitor certain cooling system components:

If the engine has remained cool for too long a period, such as with a stuck open thermostat, a Diagnostic Trouble Code (DTC) can be set.

If an open or shorted condition has developed in the relay circuit controlling the electric radiator fan, a Diagnostic Trouble Code (DTC) can be set.

If the problem is sensed in a monitored circuit often enough to indicate an actual problem, a DTC is stored. The DTC will be stored in the PCM memory for eventual display to the service technician. Refer to **OPERATION**.

ACCESSING DIAGNOSTIC TROUBLE CODES

To read DTC's and to obtain cooling system data. Refer to **OPERATION**.

ERASING TROUBLE CODES

After the problem has been repaired, use the diagnostic scan tool to erase a DTC. Refer to the appropriate Powertrain Diagnostic Procedures information for operation of the diagnostic scan tool.

PRELIMINARY CHECKS

ENGINE COOLING SYSTEM OVERHEATING

Establish what driving conditions caused the complaint. Abnormal loads on the cooling system such as the following may be the cause:

- Prolonged idle
- Very high ambient temperature
- Slight tail wind at idle
- Slow traffic
- Traffic jams
- High speed or steep grades
- Any accessory that fully or partially blocks grill opening

RECENT SERVICE OR ACCIDENT REPAIR:

- Engine adjustments (incorrect timing)
- Slipping accessory drive belt
- Brakes (possibly dragging)
- Changed parts (incorrect water pump)
- Reconditioned radiator or cooling system refilling (possibly under filled or air trapped in system).

NOTE: **If investigation reveals none of the previous items as a cause for an engine overheating complaint, refer to following Cooling System Diagnosis charts.**

TRAILER TOWING:

Consult Trailer Towing section of owners manual. Do not exceed limits.

These charts are to be used as a quick-reference only.

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READS LOW	1. Has a Diagnostic Trouble Code (DTC) been set indicating a stuck open thermostat? 2. Is the temperature sending unit connected? 3. Is the temperature gauge operating OK? 4. Coolant level low in cold ambient temperatures accompanied with poor heater performance.	1. Refer to <u>OPERATION</u> . Replace thermostat if necessary. 2. Check the temperature sensor connector. See <u>DESCRIPTION</u>. Repair connector if necessary. 3. Check gauge operation. Repair as necessary. 4. Check coolant level in the coolant pressure bottle and the radiator. Inspect system for leaks. Repair leaks as necessary.

	5. Improper operation of internal heater doors or heater controls. 6. Electric fan functioning when not required.	5. Inspect heater and repair as necessary. Refer to <u>DIAGNOSIS AND TESTING (ELECTRICAL DIAGNOSTICS)</u>. Refer to <u>DIAGNOSIS AND TESTING (SERVICE INFORMATION)</u>. 6. Inspect electric fan for proper operation. Refer to <u>FAN-RADIATOR-ELECTRIC</u>.
TEMPERATURE GAUGE READS HIGH OR THE COOLANT WARNING LAMP ILLUMINATES. COOLANT MAY OR MAY NOT BE LOST OR LEAKING FROM THE COOLING SYSTEM.	1. Trailer is being towed, a steep hill is being climbed, vehicle is operated in slow moving traffic, or engine is being idled with very high ambient (outside) temperatures and the air conditioning is on. Higher altitudes could aggravate these conditions. 2. Is the temperature gauge reading correctly? 3. Is the temperature warning illuminating unnecessarily? 4. Coolant low in coolant pressure bottle and radiator? 5. Pressure cap not installed tightly. If cap is loose, boiling point of coolant will be lowered. Also refer to the following Step 6. 6. Poor seals at the radiator cap.	1. This may be a temporary condition and repair is not necessary. Turn off the air conditioning and attempt to drive the vehicle without any of the previous conditions. Observe the temperature gauge. The gauge should return to the normal range. If the gauge does not return to the normal range, determine the cause for overheating and repair. 2. Check gauge. (Refer to <u>INSTRUMENT CLUSTER - ELECTRICAL DIAGNOSTICS</u>). Repair as necessary. 3. Check warning lamp operation. (Refer to <u>INSTRUMENT CLUSTER - ELECTRICAL DIAGNOSTICS</u>). Repair as necessary. 4. Check for coolant leaks and repair as necessary. 5. Tighten cap. 6. (a) Check condition of cap and cap seals. See <u>DIAGNOSIS AND TESTING</u>. (b) Check condition of radiator filler neck. If neck is bent or damaged, replace radiator.

7. Coolant not flowing through system.	7. (a) Check condition of pressure bottle cap and cap seals. See <u>DIAGNOSIS AND TESTING</u> . (b) Check condition of the hose from the radiator to the coolant tank. It should fit tight at both ends without any kinks or tears. Replace hose if necessary. (c) Check pressure bottle/overflow tank and tank's hoses for blockage. Repair as necessary.
8. Incorrect coolant concentration	8. Check coolant. See <u>DESCRIPTION</u> for correct coolant/water mixture ratio.
9. Radiator or A/C condenser fins are dirty or clogged.	9. Remove insects and debris.
10. Radiator core is corroded or plugged.	10. Replace radiator.
11. Fuel or ignition system problems.	11. Refer to <u>FUEL SYSTEM</u> or <u>IGNITION CONTROL - SERVICE INFORMATION</u> for diagnosis.
12. Dragging brakes.	12. Check and correct as necessary. Refer to <u>DIAGNOSIS AND TESTING</u> (BASE - SERVICE INFORMATION). Refer to <u>DIAGNOSIS AND TESTING</u> (ABS - ELECTRICAL DIAGNOSTICS). Refer to <u>DIAGNOSIS AND TESTING</u> (ABS - SERVICE INFORMATION). for correct procedures.
13. Bug screen or cardboard is being used, reducing airflow.	13. Remove bug screen or cardboard.
14. Thermostat partially or completely shut.	14. Check thermostat operation and replace as necessary. See <u>REMOVAL</u> .
15. Viscous fan drive not operating properly.	15. Check fan drive operation and replace as necessary. See <u>DIAGNOSIS AND TESTING</u> .
16. Cylinder head gasket leaking.	16. Check for cylinder head gasket leaks. See <u>DIAGNOSIS</u>

	17. Heater core leaking. 18. Electric fan not functioning.	<u>AND TESTING.</u> For repair, refer to <u>REMOVAL</u> . 17. Check heater core for leaks. Refer to <u>REMOVAL</u> . Repair as necessary. 18. Inspect electric fan for proper operation. See <u>DIAGNOSIS AND TESTING.</u>
TEMPERATURE GAUGE READING IS INCONSISTENT (FLUCTUATES, CYCLES OR IS ERRATIC)	1. During cold weather operation, with the heater blower in the high position, the gauge reading may drop slightly. 2. Temperature gauge or engine mounted gauge sensor defective or shorted. Also, corroded or loose wiring in this circuit. 3. Gauge reading rises when vehicle is brought to a stop after heavy use (engine still running). 4. Gauge reading high after re-starting a warmed up (hot) engine. 5. Coolant level low in cooling system (air build up in the cooling system causing the thermostat to open late). 6. Cylinder head gasket leaking allowing exhaust gas to enter cooling system causing a thermostat to open late. 7. Water pump impeller loose on shaft. 8. Loose accessory drive belt. 9. Air leak on the suction side	1. A normal condition. No correction is necessary. 2. Check operation of gauge and repair if necessary. Refer to <u>INSTRUMENT CLUSTER - ELECTRICAL DIAGNOSTICS</u> . Refer to <u>DIAGNOSIS AND TESTING</u> (SERVICE INFORMATION). 3. A normal condition. No correction is necessary. Gauge should return to normal range after vehicle is driven. 4. A normal condition. No correction is necessary. The gauge should return to normal range after a few minutes of engine operation. 5. Check and correct coolant leaks. See <u>DIAGNOSIS AND TESTING.</u> 6. (a) Check for cylinder head gasket leaks. Refer to engine articles. (b) Check for coolant in the engine oil. Inspect for white steam emitting from the exhaust system. Repair as necessary. 7. Check water pump and replace as necessary. 8. See <u>DIAGNOSIS AND TESTING.</u> Check and correct as necessary. 9. Locate leak and repair as

	of the water pump allows air to build up in cooling system causing thermostat to open late.	necessary.
PRESSURE CAP IS BLOWING OFF STEAM OR COOLANT TO COOLANT RECOVERY CONTAINER. TEMPERATURE GAUGE READING MAY BE ABOVE NORMAL BUT NOT HIGH. COOLANT LEVEL MAY BE HIGH IN COOLANT RECOVERY CONTAINER.	1. Pressure relief valve in radiator pressure cap is defective.	1. Check condition of radiator cap and cap seals. See <u>DIAGNOSIS AND TESTING</u> . Replace cap as necessary.
	2. Overfilled cooling system or extremely low coolant level.	2. Wait for engine to cool and adjust coolant level.
COOLANT LOSS TO THE GROUND WITHOUT PRESSURE CAP BLOWOFF. GAUGE READING HIGH OR HOT	1. Coolant leaks in radiator, cooling system hoses, water pump or engine.	1. Pressure test and repair as necessary. See <u>DIAGNOSIS AND TESTING</u> .
DETONATION OR PRE-IGNITION (NOT CAUSED BY IGNITION SYSTEM). GAUGE MAY OR MAY NOT BE READING HIGH	1. Engine overheating. 2. Freeze point of coolant not correct. Mixture is too rich or too lean.	1. Check reason for overheating and repair as necessary. 2. Check coolant concentration. See <u>DESCRIPTION</u> , and adjust ratio as required.
HOSE OR HOSES COLLAPSE WHILE ENGINE IS RUNNING	1. Vacuum created in cooling system on engine cool-down is not being relieved through coolant reserve/overflow system.	1. (a) Radiator cap relief valve stuck. See <u>DIAGNOSIS AND TESTING</u> . Replace if necessary. (b) Hose between coolant reserve/overflow tank and radiator is kinked. Repair as necessary. (c) Vent at coolant reserve/overflow tank is plugged. Clean vent and repair as necessary. (d) Reserve/overflow tank is internally blocked or plugged. Check for blockage and repair as necessary.
INADEQUATE HEATER PERFORMANCE.	1. Has a Diagnostic Trouble Code (DTC) been set? 2. Coolant level low. 3. Obstructions in heater hose/fittings. 4. Heater hose kinked. 5. Water pump is not pumping	1. Refer to <u>EMISSIONS CONTROL</u> 2. See <u>DIAGNOSIS AND TESTING</u> . 3. Remove heater hoses at both ends and check for obstructions. 4. Locate kinked area and repair as necessary. 5. If a slipping belt is detected,

	water to/through the heater core. When the engine is fully warmed up, both heater hoses should be hot to the touch. If only one of the hoses is hot, the water pump may not be operating correctly or the heater core may be plugged. Accessory drive belt may be slipping causing poor water pump operation.	see <u>BELT-ACCESSORY DRIVE</u>. If heater core obstruction is detected, see <u>STANDARD PROCEDURE</u> for cooling system reverse flushing.
STEAM IS COMING FROM THE FRONT OF VEHICLE NEAR THE GRILLE AREA WHEN WEATHER IS WET, ENGINE IS WARMED UP AND RUNNING, AND VEHICLE IS STATIONARY. TEMPERATURE GAUGE IS IN NORMAL RANGE	1. During wet weather, moisture (snow, ice or rain condensation) on the radiator or condenser will evaporate when the thermostat opens. This opening allows heated water into the radiator. When the moisture contacts the hot radiator or condenser, steam may be emitted. This usually occurs in cold weather with no fan or airflow to blow it away.	1. Occasional steam emitting from this area is normal. No repair is necessary.
COOLANT COLOR	1. Coolant color is not necessarily an indication of adequate corrosion or temperature protection. Do not rely on coolant color for determining condition of coolant.	1. See <u>DESCRIPTION</u> for coolant concentration information. Adjust coolant mixture as necessary.
COOLANT LEVEL CHANGES IN COOLANT RESERVE/OVERFLOW TANK. TEMPERATURE GAUGE IS IN NORMAL RANGE	1. Level changes are to be expected as coolant volume fluctuates with engine temperature. If the level in the tank was between the FULL and ADD marks at normal operating temperature, the level should return to within that range after operation at elevated temperatures.	1. A normal condition. No repair is necessary.
FAN RUNS ALL THE TIME	1. Fan control sensors inoperative. 2. Transmission temperature too high. 3. Engine coolant temperature too high.	1. Check for DTCs. Verify sensor readings. 2. Check for transmission over temp DTC. 3. (a) Check coolant level. Correct level as required. (b) Thermostat stuck. Replace

		thermostat. (c) Water pump failed. Replace water pump. (d) Coolant flow restricted. Clean radiator. (e) Air flow over radiator obstructed. Remove obstruction.
	4. ECM or TIPM defective.	4. Replace ECM or TIPM

STANDARD PROCEDURE

CLEANING/REVERSE FLUSHING

CAUTION: The cooling system normally operates at 97-110 kPa (14-16 psi) pressure. Exceeding this pressure may damage the radiator or hoses.

Reverse flushing of the cooling system is the forcing of water through the cooling system. This is done using air pressure in the opposite direction of normal coolant flow. It is usually only necessary with very dirty systems with evidence of partial plugging.

CHEMICAL CLEANING

If visual inspection indicates the formation of sludge or scaly deposits, use a radiator cleaner (Mopar® Radiator Kleen or equivalent) before flushing. This will soften scale and other deposits and aid the flushing operation.

CAUTION: Be sure instructions on the container are followed.

REVERSE FLUSHING RADIATOR

Disconnect the radiator hoses from the radiator fittings. Attach a section of radiator hose to the radiator bottom outlet fitting and insert the flushing gun. Connect a water supply hose and air supply hose to the flushing gun.

CAUTION: The cooling system normally operates at 97-110 kPa (14 -16 psi) pressure. Exceeding this pressure may damage the radiator or hoses.

Allow the radiator to fill with water. When radiator is filled, apply air in short blasts allowing radiator to refill between blasts. Continue this reverse flushing until clean water flows out through rear of radiator cooling tube passages. For more information, refer to operating instructions supplied with flushing equipment. Have radiator cleaned more extensively by a radiator repair shop.

REVERSE FLUSHING ENGINE

Drain the cooling system. See STANDARD PROCEDURE. Remove the thermostat housing and thermostat.

Install the thermostat housing. Disconnect the radiator upper hose from the radiator and attach the flushing gun to the hose. Disconnect the radiator lower hose from the water pump. Attach a lead away hose to the water pump inlet fitting.

CAUTION: Be sure that the heater control valve is closed (heat off). This is done to prevent coolant flow with scale and other deposits from entering the heater core.

Connect the water supply hose and air supply hose to the flushing gun. Allow the engine to fill with water. When the engine is filled, apply air in short blasts, allowing the system to fill between air blasts. Continue until clean water flows through the lead away hose. For more information, refer to operating instructions supplied with flushing equipment.

Remove the lead away hose, flushing gun, water supply hose and air supply hose. Remove the thermostat housing. See **REMOVAL**. Install the thermostat and housing with a replacement gasket . See **INSTALLATION**. Connect the radiator hoses. Refill the cooling system with the correct antifreeze/water mixture . See **STANDARD PROCEDURE**.

DRAINING

- | |
|---|
| 1 - CYLINDER BLOCK DRAIN PLUG
2 - EXHAUST MANIFOLD AND HEAT SHIELD |
|---|

WARNING: Do not remove the cylinder block drain plugs (1) or loosen the radiator draincock with system hot and under pressure. Serious burns from coolant can occur.

1. DO NOT remove radiator cap first. With engine cold, raise vehicle on a hoist and locate radiator draincock.

NOTE: Radiator draincock is located on the left/lower side of radiator facing to rear of vehicle.

2. Attach one end of a hose to the draincock. Put the other end into a clean container. Open draincock and drain coolant from radiator. This will empty the coolant reserve/overflow tank. The coolant does not have to be removed from the tank unless the system is being refilled with a fresh mixture. When tank is empty, remove radiator cap and continue draining cooling system.

FILLING-DIESEL

1. Tighten the radiator draincock and the cylinder block drain plug(s) (if removed).

CAUTION: Failure to purge air from the cooling system can result in an overheating condition and severe engine damage.

2. Fill cooling system with the antifreeze mixture. Refer to **DESCRIPTION** . Fill pressure bottle to service line and install cap.

NOTE: The engine cooling system will push any remaining air into the coolant bottle within about an hour of normal driving. As a result, a drop in coolant level in the pressure bottle may occur.
If the engine cooling system overheats and pushes coolant into the overflow side of the coolant bottle, this coolant will be sucked back into the cooling system **ONLY IF THE PRESSURE CAP IS LEFT ON THE BOTTLE**. Removing the pressure cap breaks the vacuum path between the two bottle sections and the coolant will not return to cooling system.

3. With heater control unit in the HEAT position, operate engine with pressure bottle cap in place.
4. Add coolant to pressure bottle as necessary. **Only add coolant to the pressure bottle when the engine is cold. Coolant level in a warm engine will be higher due to thermal expansion.**

NOTE: The coolant bottle has two chambers. Coolant will normally only be in the outboard (larger) of the two. The inboard chamber is only to recover coolant in the event of an overheat or after a recent service fill. The inboard chamber should normally be empty. If there is coolant in the overflow side of the coolant bottle (after several warm/cold cycles of the engine) and coolant level is above cold full when cold, disconnect the end of the overflow hose at the fill neck and lower it into a clean container. Allow coolant to drain into the container until emptied. Reconnect overflow hose to fill neck.

ACCESSORY DRIVE

BELT-ACCESSORY DRIVE

DESCRIPTION

DESCRIPTION

The accessory drive belt is a serpentine type belt. Satisfactory performance of these belts depends on belt condition and proper belt tension.

DIAGNOSIS AND TESTING

ACCESSORY DRIVE BELT

J9007-44

Fig. 10: Belt Wear Patterns
Courtesy of CHRYSLER LLC

- | |
|------------------------------------|
| 1 - NORMAL CRACKS BELT OK |
| 2 - NOT NORMAL CRACKS REPLACE BELT |

When diagnosing serpentine drive belts, small cracks (1) that run across ribbed surface of belt from rib to rib, are considered normal. These are not a reason to replace belt. However, cracks running along a rib (not across) are **not** normal. Any belt with cracks running along a rib must be replaced. Also replace belt if it has excessive wear, frayed cords or severe glazing.

SERPENTINE DRIVE BELT DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
-----------	-----------------	------------

RIB CHUNKING (ONE OR MORE RIBS HAS SEPARATED FROM BELT BODY)	1. Foreign objects imbedded in pulley grooves. 2. Installation damage.	1. Remove foreign objects from pulley grooves. Replace belt. 2. Replace belt.
RIB OR BELT WEAR	1. Pulley(s) misaligned. 2. Abrasive environment. 3. Rusted pulley(s). 4. Sharp or jagged pulley groove tips. 5. Rubber deteriorated.	1. Align pulley(s). 2. Clean pulley(s). Replace belt if necessary. 3. Clean rust from pulley(s). 4. Replace pulley. 5. Replace belt.
LONGITUDINAL BELT CRACKING (CRACKS BETWEEN TWO RIBS)	1. Belt has mistracked from pulley groove. 2. Pulley groove tip has worn away rubber to tensile member.	1. Replace belt. 2. Replace belt.
BELT SLIPS	1. Belt slipping because of insufficient tension. 2. Belt routed incorrectly. 3. Incorrect belt. 4. Belt or pulley subjected to substance (belt dressing, oil ethylene glycol) that has reduced friction. 5. Driven component bearing failure. 6. Belt glazed and hardened from heat and excessive slippage.	1. Replace automatic belt tensioner. 2. Verify belt routing. 3. Replace belt. 4. Replace belt and clean pulleys. 5. Replace faulty component bearing. 6. Replace belt.
"GROOVE JUMPING" (BELT DOES NOT MAINTAIN CORRECT POSITION ON PULLEY)	1. Belt tension either too high or too low. 2. Belt routed incorrectly. 3. Incorrect belt. 4. Pulley(s) not within design tolerance. 5. Foreign object(s) in grooves. 6. Pulley misalignment. 7. Belt cord line is broken.	1. Replace automatic belt tensioner. 2. Verify belt routing. 3. Replace belt. 4. Replace pulley(s). 5. Remove foreign objects from grooves. 6. Check and replace. 7. Replace belt.
BELT BROKEN (NOTE: IDENTIFY AND CORRECT PROBLEM BEFORE NEW BELT IS INSTALLED)	1. Excessive tension. 2. Incorrect belt. 3. Tensile member damaged during belt installation. 4. Severe misalignment. 5. Bracket, pulley, or bearing failure.	1. Replace belt and automatic belt tensioner. 2. Replace belt. 3. Replace belt. 4. Check and replace. 5. Replace defective component and belt.
NOISE (OBJECTIONABLE)	1. Belt slippage.	1. Replace belt or automatic belt

TENSIONER-ACCESSORY DRIVE BELT

DESCRIPTION

BELT TENSIONERS-DESCRIPTION

The automatic belt tensioner is a spring loaded arm and pulley assembly. The tensioner assembly is designed to apply constant pressure on the accessory drive belt to maintain proper belt tension.

OPERATION

BELT TENSIONER-OPERATION

WARNING: The automatic belt tensioner assembly is spring loaded. Do not attempt to disassemble the tensioner assembly.

The automatic belt tensioner maintains correct belt tension using a coiled spring within the tensioner housing. The spring applies pressure to the tensioner arm pressing the arm into the belt, tensioning the belt.

If a new belt is being installed, the arrow must be within approximately 3 mm (1/8 in.) of indexing mark. Belt is considered new if it has been used 15 minutes or less. If this specification cannot be met, check for:

The wrong belt being installed (incorrect length/width)

Worn bearings on an engine accessory (A/C compressor, power steering pump, water pump, idler pulley or generator)

A pulley on an engine accessory being loose

Misalignment of an engine accessory

Belt incorrectly routed.

ENGINE

COOLANT

DESCRIPTION

COOLANT-DESCRIPTION

ETHYLENE-GLYCOL MIXTURES

CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.

The required ethylene-glycol (antifreeze) and water mixture depends upon the climate and vehicle operating conditions. The recommended mixture of 50/50 ethylene-glycol and water will provide protection against freezing to -37° C (-35° F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. **If percentage is lower than 44 percent, engine parts may be eroded by cavitation, and cooling system components may be severely damaged by corrosion.** Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7° C (-90° F). A

higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because the specific heat of antifreeze is lower than that of water.

Use of 100 percent ethylene-glycol will cause formation of additive deposits in the system, as the corrosion inhibitive additives in ethylene-glycol require the presence of water to dissolve. The deposits act as insulation, causing temperatures to rise to as high as 149° C (300° F). This temperature is hot enough to melt plastic and soften solder. The increased temperature can result in engine detonation. In addition, 100 percent ethylene-glycol freezes at 22° C (-8° F).

PROPYLENE-GLYCOL MIXTURES

It's overall effective temperature range is smaller than that of ethylene-glycol. The freeze point of 50/50 propylene-glycol and water is -32° C (-26° F). 5° C higher than ethylene-glycol's freeze point. The boiling point (protection against summer boil-over) of propylene-glycol is 125° C (257° F) at 96.5 kPa (14 psi), compared to 128° C (263° F) for ethylene-glycol. Use of propylene-glycol can result in boil-over or freeze-up on a cooling system designed for ethylene-glycol. Propylene glycol also has poorer heat transfer characteristics than ethylene glycol. This can increase cylinder head temperatures under certain conditions.

Propylene-glycol/ethylene-glycol mixtures can cause the destabilization of various corrosion inhibitors, causing damage to the various cooling system components. Also, once ethylene-glycol and propylene-glycol based coolants are mixed in the vehicle, conventional methods of determining freeze point will not be accurate. Both the refractive index and specific gravity differ between ethylene glycol and propylene glycol.

DESCRIPTION

GAS ENGINES

WARNING: Antifreeze is an ethylene glycol based coolant and is harmful if swallowed or inhaled. If swallowed, drink two glasses of water and induce vomiting. If inhaled, move to fresh air area. Seek medical attention immediately. Do not store in open or unmarked containers. Wash skin and clothing thoroughly after coming in contact with ethylene glycol. Keep out of reach of children. Dispose of glycol based coolant properly, contact your government agency for location of collection center in your area. Do not open a cooling system when the engine is at operating temperature or hot under pressure, personal injury can result. Avoid radiator cooling fan when engine compartment related service is performed, personal injury can result.

CAUTION: Use of Propylene Glycol based coolants is not recommended, as they provide less freeze protection and less boiling protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection.

Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769), or the equivalent ethylene glycol based coolant with hybrid organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% Ethylene Glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

The green coolant **MUST NOT BE MIXED** with the orange or magenta coolants. When replacing coolant the complete system flush must be performed before using the replacement coolant.

CAUTION: Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769) may not be mixed with any other type of antifreeze. Doing so will reduce the corrosion protection and may result in premature water pump seal failure. If non-HOAT coolant is introduced into the cooling system in an emergency, it should be replaced with the specified coolant as soon as possible.

DIESEL ENGINE

CAUTION: Use of Propylene Glycol based coolants is not recommended, as they provide less freeze protection and less boiling protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Glysantin G 30-91 Antifreeze/Coolant, 5 Year/150,000 Mile Formula (ASTM D3306), or the equivalent ethylene glycol based coolant. This coolant offers the best engine cooling without corrosion when mixed with 50% coolant and 50% distilled water to obtain a freeze point of -36°C (-34°F). It is dyed purple to distinguish its unique chemistry from traditional green and yellow silicate coolants. If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

The purple coolant **MUST NOT BE MIXED** with the orange, green or magenta coolants. When replacing coolant the complete system flush must be performed before using the replacement coolant.

CAUTION: Glysantin G 30-91 Antifreeze/Coolant, 5 Year/150,00 Mile Formula (ASTM D3306) may not be mixed with any other type of antifreeze. Doing so will reduce the corrosion protection and may result in premature water pump seal failure.

OPERATION

OPERATION

Coolant flows through the engine block absorbing the heat from the engine, then flows to the radiator where the cooling fins in the radiator transfers the heat from the coolant to the atmosphere. During cold weather the ethylene-glycol or coolant prevents water present in the cooling system from freezing within temperatures

indicated by mixture ratio of coolant to water.

DIAGNOSIS AND TESTING

COOLANT-CONCENTRATION TESTING

Coolant concentration should be checked when any additional coolant was added to system or after a coolant drain, flush and refill. The coolant mixture offers optimum engine cooling and protection against corrosion when mixed to a freeze point of -37°C (-34°F) to -46°C (-50°F). The use of a hydrometer or Tool 8266, refractometer can be used to test coolant concentration.

A hydrometer will test the amount of glycol in a mixture by measuring the specific gravity of the mixture. The higher the concentration of ethylene glycol, the larger the number of balls that will float, and higher the freeze protection (up to a maximum of 60% by volume glycol).

A Refractometer Tool 8286 will test the amount of glycol in a coolant mixture by measuring the amount a beam of light bends as it passes through the fluid.

Some coolant manufactures use other types of glycols into their coolant formulations. Propylene glycol is the most common new coolant. However, propylene glycol based coolants do not provide the same freezing protection and corrosion protection and are not recommended.

CAUTION: Do not mix types of coolant - corrosion protection will be severely reduced.

CONTAINER-COOLANT RECOVERY

DESCRIPTION

DESCRIPTION-NON-PRESSURE SYSTEM

This system works on the principal of a closed and completely deaerated system using thermally generated pressure. The bottle acts as a reserve coolant source to keep air out of the system but must have a specified minimum amount of coolant in the bottle at all times. The expansion and contraction of the coolant in the pressurized closed coolant loop allows the reserve bottle to accept and give up excess fluid via a hose from the radiator neck. It provides:

A non-pressurized reserve coolant tank volume for expansion and contraction of coolant.

A pressurized cap on the radiator. This keeps the main loop of the cooling system at an elevated operating pressure and prevents coolant boiling at lower temperatures.

Reserve coolant is included in the non-pressurized tank in enough quantity to account for minor leaks and evaporation or boiling losses, and to keep the return line back to the radiator full at all times. Failure to do so could allow air to be sucked back into the radiator as the engine and engine coolant cool down and the coolant volume contracts.

DESCRIPTION-PRESSURE SYSTEM

This system works on the principal of a closed and deaerated system using thermally generated pressure. The expansion and contraction of the coolant in the pressurized closed system keeps it free of trapped air. It provides:

- A pressurized surge tank volume for expansion and contraction.

- A non-pressurized overflow volume to capture excess coolant expansion and allow for it's return to the pressurized system.

- A pressurized cap on the pressure bottle rather than the radiator. This facilitates deaeration of the system.

- Reserve coolant is included in the pressurized volume to account for minor leaks and evaporation or boiling losses.

- Provides a warning light for low coolant level.

OPERATION

OPERATION-NON PRESSURE SYSTEM

The coolant reserve/overflow system works in conjunction with the radiator pressure cap. It utilizes thermal expansion and contraction of coolant to keep coolant free of trapped air. It provides a volume for expansion and contraction of coolant. It also provides a convenient and safe method for checking coolant level and adjusting level at atmospheric pressure. This is done without removing the radiator pressure cap. The system also provides some reserve coolant to the radiator to cover minor leaks and evaporation or boiling losses.

As the engine cools, a vacuum is formed in the cooling system of both the radiator and engine. Coolant will then be drawn from the coolant tank and returned to a proper level in the radiator.

OPERATION-PRESSURE SYSTEM

As the engine warms, the coolant in the closed system expands. The pressurized bottle accepts the expanding fluid. Then, when the thermostat opens and a high demand for coolant is placed on the system, the pressurized surge tank side of the bottle can supply the temporary additional volume of coolant demanded by the system. Once the water pump catches up with the flow demand, the tank returns to equilibrium. A separate compartment in the bottle accepts the overflow coolant which is then drawn back into the primary side of the bottle when the engine and coolant cool down

The advantage of the pressurized system is that any excess air in the cooling system is routed to the top of the bottle via a vent hose at the thermostat housing to the bottle. This air accumulates at the top of the pressurized volume in the bottle (the highest point in the system) and is forced out of the system through the pressure cap. This keeps the system properly deaerated and maintains pressure in the cooling system to prevent water pump cavitation

The diesel bottle has an additional vent line back to the radiator that is immersed in the coolant bath at the bottle. This also ensures air at the radiator is routed back to bottle for expulsion and that a constant head of liquid is present at the radiator.

HEATER-ENGINE BLOCK

DESCRIPTION

DESCRIPTION

The block heater is operated by ordinary house current (110 Volt A.C.) through a power cord and connector located in the engine compartment. The heater is mounted in a core hole (in place of a core hole plug) in the engine block, with the heating element immersed in coolant.

CAUTION: The power cord must be secured in its retainer clips, and not positioned so it could contact linkages or exhaust manifolds and become damaged.

OPERATION

OPERATION

The block heater element is submerged in the cooling system's coolant. When electrical power (110 volt A.C.) is applied to the element, it creates heat. This heat is transferred to the engine coolant. This provides easier engine starting and faster warm-up when vehicle is operated in areas having extremely low temperatures.

SENSOR-ENGINE COOLANT TEMPERATURE

DESCRIPTION

DESCRIPTION

The Engine Coolant Temperature (ECT) sensor is used to sense engine coolant temperature. The sensor protrudes into an engine water jacket.

The ECT sensor is a two-wire Negative Thermal Coefficient (NTC) sensor. Meaning, as engine coolant temperature increases, resistance (voltage) in the sensor decreases. As temperature decreases, resistance (voltage) in the sensor increases.

OPERATION

OPERATION

At key-on, the Powertrain Control Module (PCM) sends out a regulated 5 volt signal to the ECT sensor. The PCM then monitors the signal as it passes through the ECT sensor to the sensor ground (sensor return).

When the engine is cold, the PCM will operate in Open Loop cycle. It will demand slightly richer air-fuel mixtures and higher idle speeds. This is done until normal operating temperatures are reached.

The PCM uses inputs from the ECT sensor for the following calculations:

- for engine coolant temperature gauge operation through the bus communications

- Injector pulse-width

- Spark-advance curves

- ASD relay shut-down times

- Idle Air Control (IAC) motor key-on steps

- Pulse-width prime-shot during cranking

- O2 sensor closed loop times

- Purge solenoid on/off times

- EGR solenoid on/off times (if equipped)

Leak Detection Pump operation (if equipped)

Radiator fan relay on/off times (if equipped)

The fan (4) is electrically controlled by the Powertrain Control Module (PCM) through the fan control relays. The relays are located in the PDC in the engine compartment.

OPERATION

OPERATION

The electric radiator cooling fan is controlled by the Powertrain Control Module (PCM) through the radiator cooling fan relays. The PCM regulates fan operation based on input from the engine coolant temperature sensor, battery temperature sensor, air conditioning select switch and vehicle speed.

The fan is not energized during engine cranking regardless of the electrical input from the temperature sensors and air conditioning switch. However, if engine operation conditions warrant fan engagement, the fan will run once engine starts.

On vehicles NOT equipped with AC: The relay is energized when the coolant temperature is above 80° C (176° F), or battery temperature sensor above -12° C (10° F). It will then de-energize when coolant temperature drops below 82° C (180° F), or battery temperature sensor below -9° C (16° F).

Vehicles Equipped with AC: In addition to using coolant temperature and battery temperature sensor to control cooling fan operation, the cooling fan will also be engaged when the, air conditioning system is activated. The relay is also energized when air conditioning is selected and coolant temperature is above 95° C (203° F), or, air conditioning is selected and battery temperature sensor is above 41° C (106° F). It will then de-energize when air conditioning is selected and coolant temperature is below 92° C (198° F), or air conditioning is selected and battery temperature is below 38° C (100° F).

|--|

CAUTION: If the viscous fan drive is replaced because of mechanical damage, the cooling fan blades should also be inspected. Inspect for fatigue cracks, loose blades, or loose rivets that could have resulted from excessive vibration. Replace fan blade assembly if any of these conditions are found. Also inspect water pump bearing and shaft assembly for any related damage due to a viscous fan drive malfunction.

The thermal viscous fan drive (1) is a silicone-fluid-filled coupling used to connect the fan blades to the water pump shaft. The coupling allows the fan to be driven in a normal manner. This is done at low engine speeds while limiting the top speed of the fan to a predetermined maximum level at higher engine speeds. See **Fig. 55**.

OPERATION

OPERATION

A thermostatic bimetallic spring coil is located on the front face of the viscous fan drive unit. This spring coil reacts to the temperature of the radiator discharge air. It engages the viscous fan drive for higher fan speed if the air temperature from the radiator rises above a certain point. Until additional engine cooling is necessary, **the fan will remain at a reduced RPM regardless of engine speed. Normally less than 800 RPM.**

Only when sufficient heat is present, will the viscous fan drive engage. This is when the air flowing through the radiator core causes a reaction to the bimetallic coil. It then increases fan speed to provide the necessary additional engine cooling.

Once the engine has cooled, the radiator discharge temperature will drop. The bimetallic coil again reacts and the fan speed is reduced to the previous disengaged speed.

DIAGNOSIS AND TESTING

VISCOUS RADIATOR FAN

If the fan assembly free-wheels without drag (the fan blades will revolve more than five turns when spun by hand), replace the fan drive. This spin test must be performed when the engine is cool.

For the following test, the cooling system must be in good condition. It also will ensure against excessively high coolant temperature.

WARNING: Be sure that there is adequate fan blade clearance before drilling.

1. Drill a 3.18-mm (1/8-in) diameter hole in the top center of the fan shroud.
2. Obtain a dial thermometer with an 8 inch stem (or equivalent). It should have a range of -18° to 105°C (0°

to 220° F). Insert thermometer through the hole in the shroud. Be sure that there is adequate clearance from the fan blades.

3. Connect a tachometer and an engine ignition timing light (timing light is to be used as a strobe light).
4. Block the air flow through the radiator. Secure a sheet of plastic in front of the radiator (or air conditioner condenser). Use tape at the top to secure the plastic and be sure that the air flow is blocked.
5. Be sure that the air conditioner (if equipped) is turned off.

WARNING: Use extreme caution when the engine is operating. Do not stand in a direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing.

6. Start the engine and operate at 2400 RPM. Within ten minutes the air temperature (indicated on the dial thermometer) should be up to 93° C (200° F). Fan drive **engagement** should have started to occur at between 91° to 96° C (195° to 205° F). Engagement is distinguishable by a definite **increase** in fan flow noise (roaring). The timing light also will indicate an increase in the speed of the fan.
7. When the air temperature reaches 93° C (200° F), remove the plastic sheet. Fan drive **disengagement** should have started to occur at between 62° to 85° C (145° to 185° F). A definite **decrease** of fan flow noise (roaring) should be noticed. If not, replace the defective viscous fan drive unit.

9. Remove four bolts securing fan blade assembly to viscous fan drive.

CLEANING

CLEANING

Clean the fan blades using a mild soap and water. Do not use an abrasive to clean the blades.

INSPECTION

INSPECTION

WARNING: Do not attempt to bend or straighten fan blades if fan is not within specifications.

CAUTION: If fan blade assembly is replaced because of mechanical damage, water pump and viscous fan drive should also be inspected. These components could have been damaged due to excessive vibration.

1. Remove fan blade assembly from viscous fan drive unit (four bolts).
2. Lay fan on a flat surface with leading edge facing down. With tip of blade touching flat surface, replace fan if clearance between opposite blade and surface is greater than 2.0 mm (.090 inch). Rocking motion of opposite blades should not exceed 2.0 mm (.090 inch). Test all blades in this manner.
3. Inspect fan assembly for cracks, bends, loose rivets or broken welds. Replace fan if any damage is found.

CAUTION: Do not operate an engine without a thermostat, except for servicing or testing.

A pellet-type thermostat (5) controls the operating temperature of the engine by controlling the amount of coolant flow to the radiator. On all engines the thermostat is closed below 195°F (90°C). Above this temperature, coolant is allowed to flow to the radiator. This provides quick engine warm up and overall temperature control. On the 3.7L engine the thermostat is designed to block the flow of the coolant bypass journal by 50% instead of completely blocking the flow. This design controls coolant temperature more accurately.

The same thermostat is used for winter and summer seasons. An engine should not be operated without a thermostat, except for servicing or testing. Operating without a thermostat causes other problems. These are: longer engine warmup time, unreliable warmup performance, increased exhaust emissions and crankcase condensation. This condensation can result in sludge formation.

OPERATION

OPERATION

The thermostat starts to open at 80°C (176°F). Above this temperature, coolant is allowed to flow to the radiator. This provides quicker engine warmup and overall temperature control.

WARNING: The air conditioning system (if equipped) is under a constant pressure even with the engine off. Refer to refrigerant warnings in, heating and air conditioning before handling any air conditioning component.

NOTE: The radiator and radiator cooling fan can be removed as an assembly. It is not necessary to remove the cooling fan before removing or installing the radiator.

11. Gently lift up and remove radiator from vehicle. Be careful not to scrape the radiator fins against any other component. Also be careful not to disturb the air conditioning condenser (if equipped).

CLEANING

CLEANING

Clean radiator fins With the engine cold, apply cold water and compressed air to the back (engine side) of the radiator to flush the radiator and/or A/C condenser of debris.

INSPECTION

INSPECTION

The radiator cooling fins should be checked for damage or deterioration. Inspect cooling fins to make sure they are not bent or crushed, these areas result in reduced heat exchange causing the cooling system to operate at higher temperatures. Inspect the plastic end tanks for cracks, damage or leaks.

Inspect the radiator neck for damage or distortion.

 - 8 - OVERFLOW NIPPLE

The cooling system cap is located on the coolant pressure bottle for 3.7L/2.8L. The cap construction includes; stainless steel swivel top, rubber seals and retainer, main spring (1), and a spring loaded valve (5).

OPERATION

OPERATION

The pressure cap allows the cooling system to operate at higher than atmospheric pressure which raises the coolant boiling point, thus allowing increased radiator cooling capacity. The pressure cap releases pressure at some point within a range of 110 kPa ± 14 kPa (16 psi ± 2 psi).

A spring-loaded vent valve in the center of the cap allows the system to pressurize and depressurize without creating a vacuum. If the valve is stuck open, coolant will escape to the overflow hose. There is also a gasket in the cap to seal to the top of the filler neck.

CAUTION: Use only the pressure cap specified for this vehicle. Use of other pressure caps can lead to coolant loss and overheating.

DIAGNOSIS AND TESTING

PRESSURE RELIEF TEST

Fig. 77: Radiator Pressure Cap Filler Neck

- 3 - GASKET RETAINER
- 4 - STAINLESS-STEEL SWIVEL TOP
- 5 - RUBBER SEALS
- 6 - VENT VALVE
- 7 - PRESSURE BOTTLE
- 8 - FILLER NECK

The pressure cap upper gasket (seal) pressure relief can be checked by removing the overflow hose at the radiator filler neck nipple. Attach the Pressure Tester 7700 to the filler neck nipple (1) and pump air into the radiator. Pressure cap upper gasket should relieve at 69-124 kPa (10-18 psi) and hold pressure at 55 kPa (8 psi) minimum.

WARNING: The warning words "do not open hot" on the radiator pressure cap is a safety precaution. When hot, pressure builds up in cooling system. To prevent scalding or injury, the radiator cap should not be removed while the system is hot or under pressure.

There is no need to remove the radiator cap at any time **except** for the following purposes:

1. Check and adjust coolant freeze point.
2. Refill system with new coolant.
3. Conducting service procedures.
4. Checking for vacuum leaks.

WARNING: If vehicle has been run recently, wait 15 minutes before removing cap. Then place a shop towel over the cap and without pushing down rotate counterclockwise to the first stop. Allow fluids to escape through the overflow tube and when the system stops pushing coolant and steam into the crs tank and pressure drops push down and remove the cap completely. Squeezing the radiator inlet hose with a shop towel (to check pressure) before and after turning to the first stop is recommended.

Dip the pressure cap (1) in water. Clean any deposits off the vent valve or its seat and apply cap to end of the Pressure Cap Test Adapter that is included with the Pressure Tester 7700. Working the plunger, bring the pressure to 104 kPa (15 psi) on the gauge. If the pressure cap fails to hold pressure of at least 97 kPa (14 psi), replace the pressure cap.

CAUTION: The Cooling System Tester Tool is very sensitive to small air leaks that will not cause cooling system problems. A pressure cap that does not have a history of coolant loss should not be replaced just because it leaks slowly when tested with this tool. Add water to the tool. Turn tool upside down and recheck pressure cap to confirm that cap is bad.

If the pressure cap tests properly while positioned on Pressure Tester (2), but will not hold pressure or vacuum when positioned on the filler neck. Inspect the filler neck and cap top gasket for irregularities that may prevent the cap from sealing properly.

CLEANING

CLEANING

Clean the radiator pressure cap using a mild soap and water only.

INSPECTION

INSPECTION

Visually inspect the pressure valve gasket on the cap. Replace cap if the gasket is swollen, torn or worn. Inspect the area around radiator filler neck for white deposits that indicate a leaking cap.

The 3.7L engine uses an internal water/coolant bypass system. The design uses galleries in the timing chain cover to circulate coolant during engine warm-up preventing the coolant from flowing through the radiator. The thermostat uses a stub shaft located at the rear of the thermostat to control flow through the bypass gallery.

A centrifugal water pump (5) circulates coolant through the water jackets, passages, intake manifold, radiator core, cooling system hoses and heater core. The pump is driven from the engine crankshaft by a single serpentine drive belt.

The water pump impeller is pressed onto the rear of a shaft that rotates in bearings pressed into the housing. The housing has two small holes to allow seepage to escape. The water pump seals are lubricated by the antifreeze in the coolant mixture. No additional lubrication is necessary.

Both heater hoses are connected to fittings on the timing chain front cover. The water pump is also mounted directly to the timing chain cover and is equipped with an integral pulley.

TRANSMISSION

COOLER-TRANSMISSION

DESCRIPTION

DESCRIPTION

The automatic transmission cooler is located in the front of the condenser and behind the front fascia. The transmission cooler is a heat exchanger that allows heat in the transmission fluid to be transferred to the air passing over the cooler fins.

The transmission oil cooler for the 2.8L Diesel with automatic transmission integrated into the A/C condenser.

The Transmission oil cooler assembly is equipped with quick connect fitting for the transmission oil cooler lines.

REMOVAL

TRANSMISSION OIL COOLER-REMOVAL

1. Remove electric cooling fan. See **REMOVAL**.
2. Position cooling fan out of the way.
3. Remove the transmission cooler line retaining block nut.
4. Remove transmission cooler lines from transmission lines.
5. Using Release Tool 8875A, disconnect transmission cooler tube from the transmission, see **STANDARD PROCEDURE**.
6. Remove the transmission cooler mounting bolts.
7. Remove transmission cooler from vehicle.

INSTALLATION

TRANSMISSION OIL COOLER-INSTALLATION

1. Position transmission cooler in vehicle.
2. Install transmission mounting bolts. Tighten to 14 N.m (123 in. lbs.)
3. Install transmission cooler lines into transmission, see **STANDARD PROCEDURE**.
4. Install locking plate and nut. Tighten nut to 22.5 N.m (200 in. lbs.)
5. Install electric cooling fan. See **INSTALLATION**.

2 - DUST CAP 3 - OIL COOLER LINE 4 - SPECIAL TOOL 8875A

1. Remove dust cap by pulling it straight back off of quick connect fitting (1).
2. Place properly sized Release Tool (4) onto transmission cooler line with the fingers of the tool facing the quick connect fitting.
3. Slide Release Tool down the transmission line and engage the fingers of the tool into the retaining clip. When properly engaged in the clip, the tool will fit flush against the quick connect fitting.
4. Rotate the release tool 60° to expand the retaining clip.
5. While holding the release tool against the quick connect fitting, pull back on the transmission cooler line to remove.
6. If quick connect fitting is damaged or leaking at transmission oil cooler or transmission, remove fitting.

1. If removed, install quick connect fitting into transmission oil cooler or transmission. Tighten fitting to 15 N.m (132 in. lbs.).
2. Align transmission cooler line (3) with quick connect fitting while pushing straight into the fitting.
3. Push in on transmission cooler line until a "click" is heard or felt.
4. Slide dust cap (4) down the transmission cooler line and snap it over the quick connect fitting until it is fully seated and rotates freely. Dust cap will only snap over quick connect fitting when the transmission cooler line is properly installed.

NOTE: **If dust cap will not snap into place, repeat assembly step #2.**

PROPELLER SHAFT VIBRATION

DRIVELINE VIBRATION

Drive Condition	Possible Cause	Correction
Propeller Shaft Noise	1. Undercoating or other foreign material on shaft. 2. Loose propeller shaft. 3. Loose or bent joint or excessive runout. 4. Incorrect driveline angularity. 5. Worn joint. 6. Propeller shaft damaged or out of balance. 7. Broken rear spring. 8. Excessive runout or unbalanced condition. 9. Excessive drive pinion gear shaft runout. 10. Excessive pinion flange deflection. 11. Excessive transfer case runout.	1. Clean exterior of shaft and wash with solvent. 2. Install new screws and tighten to proper torque. 3. Install new propeller shaft. 4. Measure and correct driveline angles. 5. Install new propeller shaft 6. Install new propeller shaft. 7. Install new rear spring. 8. Re-index propeller shaft, test, and evaluate. 9. Re-index propeller shaft and evaluate. 10. Inspect and replace propeller shaft if necessary. 11. Inspect and repair as necessary.
Joint Noise	1. Loose screws. 2. Lack of lubrication.	1. Install new screws and tighten to proper torque. 2. Replace propeller shaft as necessary.

A out of round tire or wheel that is out of balance, will cause a low frequency vibration.

Brake rotors that are unbalanced will cause a harsh, low frequency vibration.

Driveline vibration can be caused by loose or damaged engine mounts.

Propeller shaft vibration increases with vehicle speed. A vibration that occurs at a specific speed is not usually

caused by a out of balance propeller shaft. Worn universal joints or an incorrect propeller shaft angle, can cause such a vibration.

BALANCE

Fig. 1: Identifying Propeller Shaft & Flange

NOTE: Indexing the propeller shaft (1) 90° relative to the flange (2) may eliminate some vibrations.

Fig. 2: Identifying Screw Clamp & Propeller Shaft

1. Raise the vehicle.
2. Clean all the foreign material from the propeller shaft and universal joints.
3. Inspect propeller shaft for missing balance weights, broken welds, and bent areas.

NOTE: If the propeller shaft is bent, it must be replaced.

4. Inspect joints for wear, proper installation and correct alignment with the shaft.
5. Remove wheels and tires and install wheel lug nuts to retain brake drums/rotors.
6. Mark and number the shaft six inches from the pinion flange end at four positions 90 degrees apart.
7. Run and accelerate the vehicle until vibration occurs. Note the intensity and speed the vibration occurred. Stop the engine.
8. Position one screw clamp (1) on the propeller shaft (2) at one of the 90 degree marks.
9. Start the engine and check for vibration. If there is little or no change in vibration, move the clamp to the next mark. Repeat the vibration test. If there is no difference in vibration at the other positions, the source of the vibration may not be propeller shaft.

81a5a140

Fig. 3: Identifying Second Clamp & Propeller Shaft
Courtesy of CHRYSLER LLC

10. If vibration is decreased, install a second clamp (1) in the same position on the propeller shaft (2) and repeat the test.

61a5a147

Fig. 4: Separating Clamps 1/4 Inch
Courtesy of CHRYSLER LLC

11. If the additional clamp causes an additional vibration, separate the clamps (1) 1/4 inch above and below the mark. Repeat the vibration test.
12. Increase distance between the clamps and repeat the test until the amount of vibration is at the lowest level. Bend the slack end of the clamps so the screws will not loosen.
13. If vibration remains unacceptable, repeat the procedure to the front end of the propeller shaft.
14. Install wheel and tires, and lower vehicle.

STANDARD PROCEDURE

PROPELLER SHAFT

61a5989a

Fig. 5: Identifying Yoke Bearing Cap & Inclinometer
Courtesy of CHRYSLER LLC

This procedure applies to the front and rear propeller shaft. To obtain front (output) angle on the C/V front propeller shaft, place Inclinometer 7663 on the machined ring of the pinion flange. To obtain propeller shaft angle measurement transfer case C/V front propeller shaft, place inclinometer on the propeller shaft tube.

1. Raise and support the vehicle at the axles as level as possible. Allow the wheels and propeller shaft to turn.
2. Rotate shaft until transmission/transfer case output yoke bearing cap is facing downward.

NOTE: **Always make measurements from front to rear and from the same side of the vehicle.**

3. Place inclinometer (2) on yoke bearing cap (1) or pinion flange ring parallel to the shaft. Center bubble in sight glass and record measurement. This measurement will give you the transmission or Output Yoke Angle (A).

81a59930

Fig. 6: Identifying Yoke Bearing Cap & Inclinometer
 Courtesy of CHRYSLER LLC

4. Rotate propeller shaft 90 degrees and place inclinometer (2) on yoke bearing cap (1) or propeller shaft tube on C/V propeller shaft, parallel to the shaft. Center bubble in sight glass and record measurement. This measurement can also be taken at the rear end of the shaft. This measurement will give you the propeller shaft angle (C).
5. Subtract smaller figure from larger (C minus A) to obtain transmission output operating angle.

81a5996b

Fig. 7: Identifying Pinion Yoke Bearing Cap & Inclinometer
 Courtesy of CHRYSLER LLC

6. Rotate propeller shaft 90 degrees and place inclinometer (2) on pinion yoke bearing cap (1) parallel to the

shaft. Center bubble in sight glass and record measurement. This measurement will give you the pinion shaft or input yoke angle (B).

7. Subtract smaller figure from larger (C minus B) to obtain axle Input Operating Angle.

RULES

Good cancellation of U-joint operating angles is within 1 degree.

Operating angles less than 4 degrees single cardan U-joint.

Operating angles less than 10 degrees for CV joints.

HALF SHAFT

CAUTION

HALF SHAFT

CAUTION: Never grasp half shaft assembly by the boots. This may cause the boot to pucker or crease and reduce the service life of the boot.

Avoid over angulating or stroking the C/V joints when handling the half shaft.

Half shafts exposed to battery acid, transmission fluid, brake fluid, differential fluid or gasoline may cause the boots to deteriorate. Failure to follow these instructions will result in damage.

DIAGNOSIS AND TESTING

HALF SHAFT

Check inboard and outboard C/V joint for leaking grease. This is a sign of boot or boot clamp damage.

NOISE/VIBRATION IN TURNS

A clicking noise or vibration in turns could be caused by a damaged outer C/V or inner tripod joint seal boot or seal boot clamps. This will result in the loss/contamination of the joint grease, resulting in inadequate lubrication of the joint. Noise could also be caused by another component of the vehicle coming in contact with the half shafts.

CLUNKING NOISE DURING ACCELERATION

This noise may be a damaged or worn C/V joint. A torn boot or loose/missing clamp on the inner/outer joint which has allowed the grease to be lost will damage the C/V joint.

SHUDDER/VIBRATION DURING ACCELERATION

This could be a worn/damaged inner tripod joint or a sticking tripod joint. Improper wheel alignment may also cause a shudder or vibration.

VIBRATION AT HIGHWAY SPEEDS

This problem could be a result of out of balance front tires or tire/wheel runout. Foreign material (mud, etc.) packed on the backside of the wheel(s) will also cause a vibration.

FRONT AXLE - 186FIA

DIAGNOSIS AND TESTING

FRONT AXLE - 186FIA

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, tooth contact, worn/damaged gears or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly check for:

- Insufficient lubricant
- Incorrect ring gear backlash
- Gear damage

Differential side and pinions gears, usually do not cause noise during straight-ahead driving, when the gears are unloaded. The side gears are loaded during turns. A worn pinion mate shaft can also cause a snapping or a knocking noise.

BEARING NOISE

Bearing noise can be either a whining or a growling sound.

Pinion bearings have a constant high pitch noise, because it rotates at a faster rate. This noise changes with vehicle speed. If noise is heard under a load, the rear pinion bearing is the source. If noise is heard during a coast, the front pinion bearing is the source.

Differential bearings usually produce a low pitch noise. The differential bearing noise is constant and varies only with vehicle speed.

Axle shaft bearing noise generally changes when the bearings are loaded. Turn vehicle sharply to the left and the right during a road test. This will load and unload the bearings and change the noise level. If axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 m.p.h.

LOW SPEED KNOCK

Low speed knock is generally caused by:

- Worn U-joints/CV joint
- Worn side-gear thrust washers
- Worn pinion shaft bore

VIBRATION

Vibration at the rear of the vehicle is usually caused by:

- Damaged drive shaft
- Missing drive shaft balance weight(s)
- Worn or out-of-balance wheels
- Loose wheel lug nuts
- Worn U-joints/CV joint
- Loose/broken springs
- Damaged axle shaft bearing(s)
- Loose pinion gear nut
- Excessive pinion yoke run out
- Bent axle shaft(s)

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be an axle vibration. Also look at engine accessories, brackets and drive belts.

NOTE: **All driveline components should be examined before starting any repair.**

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear or the clutch engaged, can be caused by:

- High engine idle speed
- Transmission shift operation
- Loose engine/transmission/transfer case mounts
- Worn U-joints/CV joint
- Loose spring mounts
- Loose pinion gear nut and yoke
- Excessive ring gear backlash
- Excessive side gear to case clearance

To determined the source of a snap/clunk noise, raise vehicle on a hoist with the wheels free to rotate. Have a helper shift the transmission into gear and listen for the noise.

DIAGNOSTIC CHART

Condition	Possible Causes	Correction
Wheel Noise	1. Wheel loose. 2. Worn wheel bearing.	1. Tighten loose nuts. 2. Replace bearing.
Axle Noise	1. Misaligned axle tube. 2. Bent or sprung axle shaft. 3. End-play in pinion bearings.	1. Inspect axle tube alignment. Correct as necessary. 2. Inspect and correct as necessary. 3. Refer to pinion pre-load information and correct as

	4. Excessive gear backlash between the ring gear and pinion. 5. Improper adjustment of pinion gear bearings. 6. Loose pinion yoke nut. 7. Scuffed gear tooth contact surfaces.	necessary. 4. Check adjustment of the ring gear and pinion backlash. Correct as necessary. 5. Adjust the pinion bearings pre-load. 6. Tighten the pinion yoke nut. 7. Inspect and replace as necessary.
Axle Shaft Broke	1. Misaligned axle tube. 2. Vehicle overloaded. 3. Erratic clutch operation. 4. Grabbing clutch.	1. Replace the broken shaft after correcting tube mis-alignment. 2. Replace broken shaft and avoid excessive weight on vehicle. 3. Replace broken shaft and avoid or correct erratic clutch operation. 4. Replace broken shaft and inspect and repair clutch as necessary.
Differential Cracked	1. Improper adjustment of the differential bearings. 2. Excessive ring gear backlash. 3. Vehicle overloaded. 4. Erratic clutch operation.	1. Replace case and inspect gears and bearings for further damage. Set differential bearing pre-load properly. 2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly. 3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight. 4. Replace case and inspect gears and bearings for further damage. Avoid erratic use of clutch.
Differential Gears Scored	1. Insufficient lubrication. 2. Improper grade of lubricant. 3. Excessive spinning of one wheel/tire.	1. Replace scored gears. Fill differential with the correct fluid type and quantity. 2. Replace scored gears. Fill differential with the correct fluid type and quantity. 3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
Loss Of Lubricant	1. Lubricant level too high. 2. Worn axle shaft seals. 3. Cracked differential housing. 4. Worn pinion seal. 5. Worn/scored yoke.	1. Drain lubricant to the correct level. 2. Replace seals. 3. Repair as necessary. 4. Replace seal. 5. Replace yoke and seal.

	6. Axle cover not properly sealed.	6. Remove, clean and seal cover.
Axle Overheating	1. Lubricant level low. 2. Improper grade of lubricant. 3. Bearing pre-loads too high. 4. Insufficient ring gear backlash.	1. Fill differential to correct level. 2. Fill differential with the correct fluid type and quantity. 3. Adjust bearing pre-loads. 4. Adjust ring gear backlash.
Gear Teeth Broke	1. Overloading. 2. Erratic clutch operation. 3. Ice-spotted pavement. 4. Improper adjustments.	1. Replace gears. Examine other gears and bearings for possible damage. 2. Replace gears and examine the remaining parts for damage. Avoid erratic clutch operation. 3. Replace gears and examine remaining parts for damage. 4. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
Axle Noise	1. Insufficient lubricant. 2. Improper ring gear and pinion adjustment. 3. Unmatched ring gear and pinion. 4. Worn teeth on ring gear or pinion. 5. Loose pinion bearings. 6. Loose differential bearings. 7. Ring gear run-out. 8. Loose differential bearing cap bolts. 9. Housing not machined properly.	1. Fill differential with the correct fluid type and quantity. 2. Check ring gear and pinion contact pattern. 3. Replace gears with a matched ring gear and pinion. 4. Replace ring gear and pinion. 5. Adjust pinion bearing pre-load. 6. Adjust differential bearing pre-load. 7. Measure ring gear run-out. Replace components as necessary. 8. Inspect differential components and replace as necessary. Ensure that the bearing caps are torqued to specifications. 9. Replace housing.

ADJUSTMENTS

FRONT AXLE - 186FIA

Fig. 80: Pinion Gear ID Numbers
Courtesy of CHRYSLER LLC

Ring and pinion gears are supplied as matched sets. Gear match numbers (3) for the ring and pinion gear are etched onto each gear. A plus (+) number, minus (-) number or zero (0) is etched into the face of the pinion gear (2). This number is the amount (in thousandths of an inch) the depth varies from the standard depth setting of a pinion etched with a (0).

If installing a new gear, note the depth variance number of the original and replacement pinion. The numbers represent thousands of an inch deviation from the standard. Add or subtract this number from the original depth

shim/oil slinger to compensate for the difference in the depth variances. If the number is negative, add that value to the required thickness of the depth shims. If the number is positive, subtract that value from the thickness of the depth shim.

Compensation for pinion depth variance is achieved with a select shim/oil slinger. The shims are placed between the rear pinion bearing and pinion gear head.

Pinion Gear Depth Variance Chart : Note where Old and New Pinion Marking columns intersect. Intersecting figure represents plus or minus the amount needed.

Measurements are taken with pinion bearing cups and pinion bearings installed in the housing. Take measurements with Pinion Gauge Set and Dial Indicator C-3339A (1).

1. Assemble Pinion Height Block 6739 (3), Pinion Block 8804 (6) and rear pinion bearing onto Screw 6741 (5).
2. Insert height gauge components into the housing through pinion bearing cups.
3. Install front pinion bearing and Cone-nut 6740 (4) onto the screw. Tighten Cone-Nut until Torque To Rotate screw is 1.7 N.m (15 in. lbs.).

6. Assemble Dial Indicator C-3339A into Scooter Block D-115-2 and secure set screw.
7. Position Dial Indicator (1) with Scooter Block (2) flush on the pinion height block. Hold scooter block and zero the dial indicator.
8. Slowly slide the scooter block (2) across the pinion block over to the arbor (3). Move the scooter block till the dial indicator probe crests the arbor (3) and record the highest reading.
9. Select a shim equal to the dial indicator reading plus or minus the pinion depth variance number on the face of the pinion. For example: If the depth variance is -2, add 0.002 in. to the dial indicator reading. If the depth variance is +2, subtract 0.002 in. from the dial indicator reading.

DIFFERENTIAL SIDE BEARING PRELOAD AND GEAR BACKLASH

80a5037a

Fig. 85: Shim Locations
Courtesy of CHRYSLER LLC

Differential bearing preload and gear backlash is achieved with selective shims (2) (4) located between the differential bearing cups and differential housing. Shim thickness is determined using Dummy Bearings D-348 and Dummy Shims 8107 in place of the differential side bearings and preload shims.

Before measuring differential bearing preload and gear backlash, pinion gear depth must be established and pinion gear prepared for installation. Pinion gear depth is essential to establishing gear backlash and tooth contact patterns.

1. Remove differential side bearings from differential case.
2. Install ring gear on differential case and tighten bolts to specification.
3. Install Dummy Bearings D-348 (1) on differential case.
4. Install differential case in the housing.
5. Record thickness of Dummy Shims 8107 (2) then install shims between dummy bearings and differential housing.

NOTE: **Each dummy shim is 3 mm (0.118 in.) thick.**

9. Thread Pilot Stud C-3288-B (2) into rear cover bolt hole below ring gear.
10. Attach a Dial Indicator C-3339A (3) to the Pilot Stud. Position the dial indicator plunger on flat surface between the ring gear bolts.
11. Push and hold differential case to pinion gear side (1) of the housing and zero dial indicator.

Fig. 91: Differential Ring Gear Side

12. Push and hold differential case to ring gear side of the housing (2) and record dial indicator (1) reading.
13. Add dummy shims thickness 6 mm (0.236 in.) plus preload specification 0.152 mm (0.006 in.) to the dial indicator reading. This is the total shim thickness needed to preload the new bearings when the differential is installed.

EXAMPLE: Differential Dial Indicator Reading + Dummy Shims 6 mm (0.236 in.) + Preload Specification 0.152 mm (0.006 in.) = Total Differential Shim

14. Rotate dial indicator out of the way on the pilot stud.
15. Remove differential case and dummy bearings from the housing.

20. Position the dial indicator (1) plunger on a flat surface between the ring gear (3) bolt heads.
21. Push and hold differential case toward pinion gear (2) and zero dial indicator (1).

80c57a31

Fig. 95: Differential Ring Gear Side

22. Push and hold differential case (2) to ring gear side (3) of the housing and record ring gear side dial indicator (1) reading. Add 3 mm (0.118 in.) one dummy shim thickness to ring gear side reading.
23. Subtract backlash specification 0.076 mm (0.003 in.) from total ring gear side reading for ring gear backlash. This is the shim needed on the ring gear side of the differential.

EXAMPLE: Ring Gear Side Dial Indicator Reading + One Dummy Shim 3 mm (0.118 in.) - Backlash Specification 0.076 mm (0.003 in.) = Ring Gear Side Shim

24. Subtract ring gear shim total from preload shim total thickness. The remainder is the shim thickness needed on the pinion side of the differential.

EXAMPLE : Total Differential Shim - Ring Gear Side Shim = Pinion Gear Side Shim

25. Rotate dial indicator out of the way on pilot stud.
26. Remove differential case and dummy bearings from the housing.
27. Install side bearings and cups on differential case.

29. Attach Dial Indicator C-3339 to spreader retainer stud. Load indicator plunger against opposite side of the housing and zero the indicator
30. Spread the differential case 0.34 mm (0.013 in).

CAUTION: Never spread the differential housing over 0.34 mm (0.013 in). Failure to follow these instruction could result in distorting the housing.

31. Install differential case with shims.

GEAR BACKLASH

Fig. 97: Ring Gear Backlash
Courtesy of CHRYSLER LLC

1. Rotate the differential case several times to seat the side bearings.
2. Position the indicator plunger (1) against a ring gear tooth (2).
3. Push and hold ring gear upward while not allowing the pinion gear to rotate.
4. Zero dial indicator face to pointer.
5. Push and hold ring gear downward while not allowing the pinion gear to rotate. Dial indicator reading (backlash) should be between 0.12 - 0.20 mm (0.005 - 0.008 in.).

Fig. 98: Backlash Shim Correction
Courtesy of CHRYSLER LLC

NOTE: If backlash is not within specifications, transfer the necessary shim thickness from one side of the housing to the other.

6. Verify differential case and ring gear runout by measuring ring to pinion gear backlash at eight locations around the ring gear. Readings should not vary more than 0.05 mm (0.002 in.). If readings vary more than specified, the ring gear or the differential case is defective.

After the proper backlash is achieved, perform Gear Contact Pattern Analysis procedure.

GEAR CONTACT PATTERN

810630a0

Fig. 99: Gear Description
Courtesy of CHRYSLER LLC

The ring gear and pinion teeth contact patterns will show if the pinion depth is correct in the housing. It will also show if the ring gear backlash has been adjusted correctly. The backlash can be adjusted within specifications to achieve desired tooth contact patterns.

The TOP LAND (1) of the gear tooth is the top surface of the tooth. The PROFILE (2) of the gear tooth is the depth of the tooth. The TOE (3) of the gear is the portion of the tooth surface at the end towards the center. The HEEL (4) of the gear is the portion of the tooth at the outer-end. The ROOT (5) of the gear tooth is the lowest portion of the tooth.

NOTE: If the PROFILE across the tooth is the same it is a 3 Axis cut gear. If the PROFILE across the tooth is tapered, it is a 2 Axis cut gear.

1. Apply a thin coat of hydrated ferric oxide or equivalent to the drive and coast side of the ring gear teeth.
2. Wrap, twist and hold a shop towel around the pinion yoke to increase the turning resistance of the pinion.

This will provide a more distinct contact pattern.

3. With a boxed end wrench on a ring gear bolt, rotate the differential case one complete revolution in both directions while a load is being applied from shop towel.

The areas on the ring gear teeth with the greatest degree of contact against the pinion teeth will squeegee the compound to the areas with the least amount of contact. Note and compare patterns on the ring gear teeth to Gear Tooth Contact Patterns chart and adjust pinion depth and gear backlash as necessary.

DRIVE SIDE HEEL TOE	CONDITION	COAST SIDE TOE HEEL	CONDITION	ACTION REQUIRED
	Desirable pattern. The drive pattern should be centered on the tooth. There should be some clearance between the pattern and the top of the tooth.		Desirable pattern. The coast pattern should be centered on the tooth, but may be slightly toward the toe. There should be some clearance between the pattern and the top of the tooth.	None

DIFFERENTIAL BEARING PRELOAD CHECK

80c07132

Fig. 101: Pinion Rotation Torque
Courtesy of CHRYSLER LLC

With an inch pound torque wrench (2) measure Total Torque To Rotate (TTTR). This is the final check on the differential assembly before installing the axle shafts. This will verify the correct differential bearing preload.

Total Torque to Rotate is, Pinion Torque To Rotate (PTTR) plus:

Gear Ratio 3.21: 0.34 - 1.24 N.m (3 - 10.9 in. lbs.)

Gear Ratio 3.73: 0.45 - 0.75 N.m (3.9 - 6.6 in. lbs.)

NOTE: If TTTR is high, decrease the shim thickness equally on both sides of the differential and check TTTR again. If TTTR is low, increase the shims thickness equally on both sides of the differential and check TTTR again.

13. Rotate pinion several times to seat bearings and verify pinion (1) rotates smoothly.
14. Slowly tighten the pinion nut in 6.8 N.m (5 ft. lbs.) increments until pinion torque to rotate is achieved. Measure rotating torque frequently to avoid over crushing the collapsible spacer.

15. Measure pinion torque to rotate (PTTR) with an inch pound torque wrench (2).

Pinion Torque To Rotate is:

Original Bearings: 1.0 - 2.2 N.m (10 - 20 in. lbs.).

New Bearings: 1.7 - 2.8 N.m (15 - 25 in. lbs.).

CAUTION: Never loosen pinion gear nut to decrease pinion rotating torque and never exceed specified preload torque. Failure to follow these instructions will result in damage.

16. Invert differential case and start two ring gear bolts. This will provide case-to-ring gear bolt hole

alignment.

17. Invert differential case in the vise. Install **new** ring gear (2) bolts (1) and alternately tighten to 108 N.m (80 ft. lbs.).

CAUTION: Never reuse the ring gear bolts. Failure to follow these instructions will result in damage.

18. Install differential in housing.

Fig. 208: Measuring Pinion Torque To Rotate (PTTR) With An Inch Pound Torque Wrench
Courtesy of CHRYSLER LLC

19. Measure Total Torque to Rotate (TTTR) with an inch pound torque wrench (2). This will verify the correct differential bearing preload.

Total Torque to Rotate (TTTR) is Pinion Torque To Rotate (PTTR) plus:

Gear Ratio 3.21: 0.53 - 0.87 N.m (4.6 - 7.7 in. lbs.)

Gear Ratio 3.73: 0.45 - 0.75 N.m (3.9 - 6.6 in. lbs.)

If TTTR is high, decrease shim thickness equally on both sides of the differential and check TTTR again. If TTTR is low, increase shim thickness equally on both sides of the differential and check TTTR again.

20. Verify differential gear contact pattern.

REAR AXLE - 8 1/4

DIAGNOSIS AND TESTING

REAR AXLE - 8 1/4

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, incorrect pinion depth, tooth contact, worn/damaged gears, or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly check for:

- Insufficient lubricant.

- Incorrect ring gear backlash.

- Gear damage.

Differential side and pinions gears, usually do not cause noise during straight-ahead driving, when the gears are unloaded. The side gears are loaded during turns. A worn pinion mate shaft can also cause a snapping or a knocking noise.

BEARING NOISE

Bearing noise can be either a whining or a growling sound.

Pinion bearings have a constant high pitch noise, because it rotates at a faster rate. This noise changes with vehicle speed. If noise is heard under a load, the rear pinion bearing is the source. If noise is heard during a coast, the front pinion bearing is the source.

Differential bearings usually produce a low pitch noise. The differential bearing noise is constant and varies only with vehicle speed.

Axle shaft bearing noise generally changes when the bearings are loaded. Turn vehicle sharply to the left and the right during a road test. This will load and unload the bearings and change the noise level. If axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 m.p.h.

LOW SPEED KNOCK

Low speed knock is generally caused by:

- Worn U-joints/CV joint.

- Worn side-gear thrust washers.

- Worn pinion shaft bore.

VIBRATION

Vibration at the rear of the vehicle is usually caused by:

- Damaged drive shaft.
- Missing drive shaft balance weight(s).
- Worn or out-of-balance wheels.
- Loose wheel lug nuts.
- Worn U-joints/CV joint.
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent axle shaft(s).

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be an axle vibration. Also look at engine accessories, brackets and drive belts.

NOTE: **All driveline components should be examined before starting any repair.**

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear or the clutch engaged, can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints/CV joint.
- Loose spring mounts.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

To determined the source of a snap/clunk noise, raise vehicle on a hoist with the wheels free to rotate. Have a helper shift the transmission into gear and listen for the noise.

DIAGNOSTIC CHART

Condition	Possible Causes	Correction
Wheel Noise	1. Wheel loose. 2. Worn wheel bearing.	1. Tighten loose nuts. 2. Replace bearing.
Axle Shaft Noise	1. Misaligned axle tube. 2. Bent or sprung axle shaft.	1. Inspect axle tube alignment. Correct as necessary. 2. Inspect and correct as necessary.

Axle Shaft Broke	1. Misaligned axle tube. 2. Vehicle overloaded. 3. Erratic clutch operation. 4. Grabbing clutch.	1. Replace the broken shaft after correcting tube mis-alignment. 2. Replace broken shaft and avoid excessive weight on vehicle. 3. Replace broken shaft and avoid or correct erratic clutch operation. 4. Replace broken shaft and inspect and repair clutch as necessary.
Differential Cracked	1. Improper adjustment of the differential bearings. 2. Excessive ring gear backlash. 3. Vehicle overloaded. 4. Erratic clutch operation.	1. Replace case and inspect gears and bearings for further damage. Set differential bearing pre-load properly. 2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly. 3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight. 4. Replace case and inspect gears and bearings for further damage. Avoid erratic use of clutch.
Differential Gears Scored	1. Insufficient lubrication. 2. Improper grade of lubricant. 3. Excessive spinning of one wheel/tire.	1. Replace scored gears. Fill differential with the correct fluid type and quantity. 2. Replace scored gears. Fill differential with the correct fluid type and quantity. 3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
Loss Of Lubricant	1. Lubricant level too high. 2. Worn axle shaft seals. 3. Cracked differential housing. 4. Worn pinion seal. 5. Worn/scored yoke. 6. Axle cover not properly sealed.	1. Drain lubricant to the correct level. 2. Replace seals. 3. Repair as necessary. 4. Replace seal. 5. Replace yoke and seal. 6. Remove, clean and seal cover.
Axle Overheating	1. Lubricant level low. 2. Improper grade of lubricant. 3. Bearing pre-loads too high. 4. Insufficient ring gear backlash.	1. Fill differential to correct level. 2. Fill differential with the correct fluid type and quantity. 3. Adjust bearing pre-loads. 4. Adjust ring gear backlash.
Gear Teeth Broke	1. Overloading.	1. Replace gears. Examine other gears and bearings for possible

	2. Erratic clutch operation. 3. Ice-spotted pavement. 4. Improper adjustments.	damage. 2. Replace gears and examine the remaining parts for damage. Avoid erratic clutch operation. 3. Replace gears and examine remaining parts for damage. 4. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
Axle Noise	1. Insufficient lubricant. 2. Improper ring gear and pinion adjustment. 3. Unmatched ring gear and pinion. 4. Worn teeth on ring gear or pinion. 5. Loose pinion bearings. 6. Loose differential bearings. 7. Ring gear run-out. 8. Loose differential bearing cap bolts. 9. Housing not machined properly.	1. Fill differential with the correct fluid type and quantity. 2. Check ring gear and pinion contact pattern. Adjust backlash or pinion depth. 3. Replace gears with a matched ring gear and pinion. 4. Replace ring gear and pinion. 5. Adjust pinion bearing pre-load. 6. Adjust differential bearing pre-load. 7. Measure ring gear run-out. Replace components as necessary. 8. Inspect differential components and replace as necessary. Ensure that the bearing caps are torqued to t specifications. 9. Replace housing.

Fig. 223: Pinion ID Numbers
Courtesy of CHRYSLER LLC

Ring gear and pinion are supplied as matched sets. Identifying numbers for the ring gear and pinion are painted onto the pinion gear shaft and the side of the ring gear. A plus (+) number, minus (-) number or zero (0) along with the gear set sequence number (2) (01 to 99) is on each gear. This first number (1) the amount (in thousandths of an inch) the depth varies from the standard depth setting of a pinion marked with a (0). The next two numbers are the sequence number of the gear set. The standard depth provides the best teeth contact pattern.

PINION DEPTH MEASUREMENT

Fig. 225: Pinion Depth Gauge Tools - Typical
Courtesy of CHRYSLER LLC

Measurements are taken with pinion bearing cups and pinion bearings installed in the housing. Take

measurements with Pinion Gauge Set 6730 and Dial Indicator C-3339A (1).

Fig. 226: Pinion Height Block

1. Assemble Pinion Height Block 6739 (2), Pinion Block 8540 (1) and rear pinion bearing onto Screw 6741.
2. Insert assembled height gauge components, rear bearing and screw into housing through pinion bearing cups.

Fig. 227: Gauge Tools In Housing
Courtesy of CHRYSLER LLC

3. Install front pinion bearing and Cone-Nut 6740 on the screw. Tighten Cone-Nut until Torque To Rotate screw is 1.7 N.m (15 in. lbs.).
4. Place Arbor Disc 8541 (1) on Arbor D-115-3 (3) in position in the housing side bearing cradles. Install differential bearing caps on arbor discs and tighten cap bolts to 41 N.m (30 ft. lbs.).

Fig. 228: Assembling Dial Indicator C-3339A Into Scooter Block D-115-2A And Securing Set Screw
Courtesy of CHRYSLER LLC

5. Assemble Dial Indicator C-3339A (3) into Scooter Block D-115-2A (2) and secure set screw.
6. Place Scooter Block/Dial Indicator in position in axle housing so dial probe and scooter block are flush against the rearward surface of the pinion height block. Hold scooter block in place and zero the dial indicator. Tighten dial indicator face lock screw.
7. Slowly slide the dial indicator probe over the edge of the pinion height block.
8. Slide the dial indicator probe across the gap between the pinion height block and the arbor bar (1) with the scooter block against the pinion height block. When dial probe contacts the arbor bar, the dial pointer will turn clockwise. Continue moving the dial probe to the crest of the arbor bar and record the highest reading. If the dial indicator can not achieve a zero reading, the rear bearing cup or the pinion depth gauge set is not installed correctly.
9. Select a shim equal to the dial indicator reading, plus the drive pinion gear depth variance number marked on the shaft of the pinion. If the depth variance is -2, add 0.002 in. to the dial indicator reading. If the depth variance is -2, add 0.002 in. subtract dial indicator reading. Then subtract 0.041 mm (0.0016 in.) from the total measurement. This will be the correct pinion height shim selection.

DIFFERENTIAL BEARING PRELOAD AND GEAR BACKLASH

Fig. 230: Ring Gear Backlash

1. Turn each thread adjuster inward with Wrench C-4164 until differential bearing end-play is eliminate and ring gear backlash is approximately 0.25 mm (0.01 in.). Seat bearing cups by rapidly rotating the pinion gear a half turn back and forth several times.
2. Install Dial Indicator C-3339A (1) with plunger position against drive side of a ring gear (2) tooth. Measure and record backlash at 4 positions, 90 degrees apart around the ring gear.

Mark lowest backlash position on the ring gear and make all backlash measurements at this location.

Fig. 231: Threaded Adjuster Tool
Courtesy of CHRYSLER LLC

3. Loosen left-side adjuster and tighten right-side threaded adjuster with Wrench C-4164 (3) to obtain a backlash of 0.076 - 0.102 mm (0.003 - 0.004 in.).
4. Tighten both adjusters to 14 N.m (10 ft. lbs.). Seat differential bearing cups by rapidly rotating the pinion gear a half turn back and forth several times.
5. Tighten differential bearing cap bolts 95 N.m (70 ft. lbs.).
6. Tighten right-side threaded adjuster to 102 N.m (75 ft. lbs.). Seat differential bearing cups by rapidly rotating the pinion gear a half turn back and forth several times. Continue this procedure until right-side adjuster torque remains a constant 102 N.m (75 ft. lbs.).
7. Measure the ring gear backlash. Backlash should be 0.12 - 0.20 mm (0.005 - 0.008 in.).

If backlash is less than 0.12 (0.005 in.) increase right-side threaded adjuster torque until specified backlash is obtained.

If backlash is more than 0.20 (0.008 in.) repeat procedure from the beginning.

8. Tighten left-side threaded adjuster to 102 N.m (75 ft. lbs.). Seat differential bearing cups by rapidly rotating the pinion gear a half turn back and forth several times. Continue this procedure until left-side adjuster torque remains a constant 102 N.m (75 ft. lbs.).
9. Install threaded adjuster locks and tighten the lock screws to 10 N.m (90 in. lbs.).

10. Measure and backlash at 4 positions, 90 degrees apart around the ring gear. Maximum ring gear backlash variation is 0.076 mm (0.003 in.).

After backlash is achieved, perform Gear Contact procedure.

GEAR CONTACT PATTERN

Fig. 232: Gear Contact Pattern Is Correct
Courtesy of CHRYSLER LLC

1. Wipe clean each tooth of the ring gear.
2. Apply gear marking compound to all of the ring gear teeth.
3. Verify bearing cap bolts are torque specifications.
4. Apply parking brakes lightly to create at 14 N.m (10 ft. lbs.) pinion rotating torque.
5. Rotate the pinion/pinion yoke 4 full revolutions in each directions.
6. Read gear tooth contact pattern.

Gear contact pattern is correct. Backlash and pinion depth is correct.

AXLE SHAFT END-PLAY

Visual inspect differential case, pinion mate shaft, axle shaft end button, C-lock, differential pinion gears, differential side gears and washers for damage or excessive wear. Replace damaged components.

1. Assemble differential and install.
2. Install differential pinion mate shaft locking screw to locate the shaft without torque it down.
3. Mount dial indicator base on the axle tube flange.
4. Push axle shaft inward until its end touches differential pinion mate shaft. Set dial indicator plunger on the end of axle shaft flange surface and zero dial indicator.
5. Pull axle shaft out until it stops and record dial indicator end-play reading. Rotate axle shaft about 180 degrees and record dial indicator end-play reading again. Two readings should be within 0.05 mm (0.002 in.).
6. Conduct the same procedure on the axle shaft on the opposite side.

End-play specifications should be 0.13 - 0.38 mm (0.005 - 0.015 in.). If specifications can not be met, shim side gears and/or replace differential case.

6. Measure pinion torque to rotate (1) with an inch pound torque wrench (2). Pinion torque to rotating should be equal to recorded reading plus an additional 0.56 N.m (5 in. lbs.).

If pinion torque to rotate is low, tighten pinion nut in 6.8 N.m (5 ft. lbs.) increments until pinion torque to rotating is achieved.

CAUTION: Never loosen pinion nut to decrease pinion bearing rotating torque. If pinion torque to rotating is exceeded, a new collapsible spacer must be installed. Failure to follow these instructions will result in damage to the axle.

NOTE: A pinion depth shim is located under the rear pinion bearing. If ring and pinion gears are reused, the original pinion depth shim/oil baffle can be used. Refer to **PINION DEPTH MEASUREMENT** to select the proper shim thickness if ring and pinion gear are replaced.

1. Install rear pinion bearing cup with Installer C-4308 (1) and Handle C-4171 (2).

8. Install pinion flange (1) with Installer C-3718 (2).
9. Install a new nut on the pinion.
10. Holding flange (1) with Holder C-3281 and tighten nut with torque wrench to 285 N.m (210 ft. lbs.).

NOTE: Do not exceed the minimum torque 285 N.m (210 ft. lbs.) when installing the pinion nut at this point.

818ded97

Fig. 331: Measuring Pinion Torque To Rotating With An Inch Pound Torque Wrench
Courtesy of CHRYSLER LLC

11. Measure pinion torque to rotating (1) with an inch pound torque wrench (2). Measure pinion torque to rotating frequently to avoid over over-crushing the collapsible spacer.

Pinion Torque To Rotate is:

Original Bearings 1 - 2.2 N.m (10 - 20 in. lbs.)

New Bearings 1- 5 N.m (10 - 30 in. lbs.)

If pinion torque to rotate is low, tighten pinion nut in 6.8 N.m (5 ft. lbs.) increments until pinion torque to rotate is achieved.

CAUTION: Never loosen pinion nut to decrease pinion bearing rotating torque. If pinion torque to rotating is exceeded a new collapsible spacer must be installed. Failure to follow these instructions will damage the axle.

RING GEAR INSTALLATION - GAS ENGINES

816f133e

Fig. 332: Identifying Ring Gear & Bolts

1. Install ring gear on differential case.
2. Invert differential case in the vise.
3. Install **new** ring gear (2) bolts (1) and alternately tighten to 122 N.m (90 ft. lbs.).

CAUTION: Never reuse the ring gear bolts. Failure to follow these instructions will result in damage.

4. Install differential in axle housing and verify gear mesh refer to **GEAR CONTACT PATTERN**.

RING GEAR INSTALLATION - DIESEL ENGINES

81d3635e

Fig. 333: Heating Ring Gear On Bearing Heater
Courtesy of CHRYSLER LLC

WARNING: Use welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.

CAUTION: A bearing heater is used to install the ring gear on the differential. Use only a bearing heater/hot plate and follow manufacture's instructions. Heat components to 107 - 121 Celsius (225° Min. - 250° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for and extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

1. Heat ring gear (1) on bearing heater (2) to 107 - 121 Celsius (225° Min. - 250° Max Fahrenheit).

2. Turn ring gear over on bearing heater with welding gloves once the temperature has been reached.
3. Install left hand threaded Pins 10126-2 (1) into ring gear (2).

6. Install **new** left hand threaded ring gear (2) bolts (1) and alternately tighten to 27 N.m (20 ft. lbs.). Then with torque angle gauge alternately tighten to 95 degrees $\pm$ 5 degrees.

CAUTION: Never reuse the ring gear bolts. Failure to follow these instructions will result in damage.

7. Install differential in axle housing and verify gear mesh refer to **GEAR CONTACT PATTERN**.

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

The fueling strategy for NGC requires potentially three fuel pulses per cylinder per cycle. The first pulse is delivered starting at a programmed angle soon after the intake valve closes, for specified time duration. This is for two reasons, one to prevent any fuel from this pulse being delivered in the previous cycle and second to allow fueling to begin as early as possible in the current cycle. The second pulse is delivered for a specified time and is set to end at a programmed angle. The pulse must not extend past the end angle. There can be a separate value for each cylinder under the same operating conditions. This is done for two reasons, one to prevent any fuel from this pulse being delivered during the intake/exhaust valve overlap period, which tends to cause elevated emission levels. Also, allowing fuel to enter each cylinder at a slightly different angle tends to reduce any fuel pressure standing waves in the fuel rail. If the desired total fuel pulse-width increases, a third fuel pulse must be delivered. The third pulse, if necessary, is delivered for a specified time and must end at a programmed angle before the valve closes again. The third pulse in the cycle is controlled by its ending angle. This is also for two reasons, one to prevent any fuel from this pulse being delivered in the next cycle and second to allow fueling to end as late as possible in the current cycle. At high engine speeds, one or more of the pulses may be dropped from the fueling strategy.

MONITOR CONDITIONS

When Monitored:

With battery voltage greater than 10 volts. Auto Shutdown Relay energized. Engine speed less than 3000 rpm.

SET CONDITIONS

- Set Condition:**

The PCM monitors the continuity of the injector circuits as well as the voltage spike created by the collapse of the magnetic field in the injector coil. Any condition that reduces the maximum current flow or the magnitude of the voltage spike can cause this DTC to set.

POSSIBLE CAUSES

Possible Causes
(F342) ASD OUTPUT CIRCUIT
(K13) INJECTOR CONTROL NO.3 CIRCUIT OPEN
(K13) INJECTOR CONTROL NO.3 CIRCUIT SHORTED TO GROUND
FUEL INJECTOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. ACTIVE DTC

Turn the ignition on.

With the scan tool, select View DTCs. Record DTC and Freeze Frame information.

Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Review Freeze Frame information. Operate the vehicle under conditions similar to which the DTC was set.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

Fig. 2: Measuring Resistance Of Fuel Injector 3 Circuit From Appropriate Terminal Of Special

Tool #8815 And ASD Relay Connector

Turn the ignition off.

Disconnect the C2 PCM harness connector.

Remove the ASD Relay.

NOTE: **The resistance of the circuit will vary according to the temperature of the injector coil. Use the table below to determine the resistance range of the injector.**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the Fuel Injector 3 circuit from the appropriate terminal of special tool #8815 and the ASD Relay connector.

Fuel Injector Coil Resistance Based on Engine Temperature	
Temperature	Resistance
-20° C (-4° F)	10 ohms (+/-.6 of an ohm)
20° C (68° F)	12 ohms (+/-.6 of an ohm)
60° C (140° F)	14 ohms (+/-.6 of an ohm)
100° C (212° F)	16 ohms (+/-.6 of an ohm)

Is the resistance of the injector within the specified range?

Yes

Go To 7.

No

Go To 3.

3. FUEL INJECTOR 3 WIRING AND CONNECTOR INSPECTION

Turn the ignition off.

Verify that the Fuel Injector 3 is properly connected to the injector. Disconnect the Fuel Injector 3 connector and Inspect the terminals for any condition that would result in a poor connection.

Using the wiring diagram/schematic as a guide, inspect the Fuel Injector 3 wiring and connector.

Look for any chafed, pierced, pinched, or partially broken wires.

Verify that there is good pin to terminal contact in the Injector and Powertrain Control Module connectors.

Look for broken, bent, pushed out or corroded terminals.

Were any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 4.

4. (F342) ASD RELAY OUTPUT CIRCUIT

INJECTOR-
FUEL

Connect the C2 PCM harness connector.

Turn the ignition on.

With the scan tool, actuate the Auto Shutdown (ASD) Relay Control State.

Using a 12-volt test light connected to ground, check the (F342) ASD Relay Output circuit in the Fuel Injector 3 harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes.

Go To 5.

No.

Repair the excessive resistance or short to ground in the (F342) ASD Relay Output circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

5. (K13) INJECTOR 3 CONTROL CIRCUIT OPEN

**INJECTOR-

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Turn the ignition off.

Disconnect the C2 PCM harness connector.

Measure the resistance of the (K13) Injector 3 Control circuit from the Fuel Injector harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

Go To 6.

No

Repair the open in the (K13) Injector 3 Control circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

6. FUEL INJECTOR 3

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Injector 3 and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Verify that there is good pin to terminal contact in the Injector and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace the Fuel Injector 3 in accordance with the Service Information.

Perform **POWERTRAIN VERIFICATION TEST**.

7. **(K13) INJECTOR 3 CONTROL CIRCUIT SHORTED TO GROUND**

**INJECTOR-
FUEL**

81654d74

Fig. 5: Checking Injector Control Circuit For Short To Ground
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the C2 PCM harness connector.

Measure the resistance between ground and the (K13) Injector 3 Control circuit in the Injector harness connector.

Is the resistance below 100 ohms?

Yes

Repair the short to ground in the (K13) Injector 3 Control circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 8.

8. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Injector 3 and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Injector and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

The fueling strategy for NGC requires potentially three fuel pulses per cylinder per cycle. The first pulse is delivered starting at a programmed angle soon after the intake valve closes, for specified time duration. This is for two reasons, one to prevent any fuel from this pulse being delivered in the previous cycle and second to allow fueling to begin as early as possible in the current cycle. The second pulse is delivered for a specified time and is set to end at a programmed angle. The pulse must not extend past the end angle. There can be a separate value for each cylinder under the same operating conditions. This is done for two reasons, one to prevent any fuel from this pulse being delivered during the intake/exhaust valve overlap period, which tends to cause elevated emission levels. Also, allowing fuel to enter each cylinder at a slightly different angle tends to reduce any fuel pressure standing waves in the fuel rail. If the desired total fuel pulse-width increases, a third fuel pulse must be delivered. The third pulse, if necessary, is delivered for a specified time and must end at a programmed angle before the valve closes again. The third pulse in the cycle is controlled by its ending angle. This is also for two reasons, one to prevent any fuel from this pulse being delivered in the next cycle and second to allow fueling to end as late as possible in the current cycle. At high engine speeds, one or more of the pulses may be dropped from the fueling strategy.

MONITOR CONDITIONS

When Monitored:

With battery voltage greater than 10 volts. Auto Shutdown Relay energized. Engine speed less than 3000 rpm.

SET CONDITIONS

- **Set Condition:**

The PCM monitors the continuity of the injector circuits as well as the voltage spike created by the collapse of the magnetic field in the injector coil. Any condition that reduces the maximum current flow or the magnitude of the voltage spike can cause this DTC to set.

POSSIBLE CAUSES

DIAGNOSTIC TEST

1. ACTIVE DTC

NOTE: Diagnose and repair any Throttle Body circuit, system voltage, or sensor supply voltage DTCs before continuing with this test.

Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With the scan tool select View DTCs.

NOTE: If the DTC does not reset it may be necessary to test drive the vehicle.

Is the DTC Active at this time?

Yes

Go To 2.

No

Go To 11.

2. **P0122 ALSO SET**

Was the P0122-TP SENSOR NO.1 VOLTAGE LOW DTC set along with the P0222?

With the scan tool, monitor the TP Sensor No.2 voltage.

Connect a jumper wire between the (K855) 5-volt Supply circuit and the (K122) TP Signal 2 circuit in the Throttle Body harness connector.

NOTE: The sensor voltage should be approximately 5.0 volts (plus or minus .1 volt) with the jumper wire installed.

Does the scan tool display the voltage as described above?

Yes

Verify that there is good pin to terminal contact in the Throttle Body and Powertrain Control Module connectors. If OK, replace the Throttle Body Assembly. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, using a scan tool select the ETC RELEARN function.

Perform **POWERTRAIN VERIFICATION TEST** .

Turn the ignition off.

Disconnect the C2 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (K122) TP Signal 2 circuit from the Throttle Body harness connector to the

appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

Go To 6.

No

Repair the open in the (K122) TP Signal 2 circuit.

Is the resistance below 100 ohms?

Yes

Repair the short to ground in the (K855) 5-volt Supply circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 10.

10. **POWERTRAIN CONTROL MODULE (PCM)**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Throttle Body and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

11. THROTTLE FOLLOWER TEST

Ignition on, engine not running.

With the scan tool, perform the ETC Throttle Follower Test.

Monitor the TP Sensor No.2 voltage while slowly pressing the Throttle pedal down.

Is there a smooth voltage change from approximately 4.3 volts and decrease to approximately 0.7 of a volt?

Yes

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

No

Verify that there is good pin to terminal contact in the Throttle Body and Powertrain Control Module connectors. If OK, replace the Throttle Body Assembly. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, using a scan tool select the ETC RELEARN function.

P0300-MULTIPLE CYLINDER MISFIRE

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

Any time the engine is running, and the adaptive numerator has been successfully updated.

SET CONDITIONS

- Set Condition:**

The threshold to set the fault is application specific; it is tied to the level of misfire that will cause emissions to increase to 1.5 times the standard or in some cases 1%. It is always a two trip fault above the calibrated RPM. It takes 1 soft fail to set a malfunction and two trips to set the MIL. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
(F342), (F344) ASD RELAY OUTPUT CIRCUIT
INJECTOR CONTROL CIRCUIT
COIL CONTROL CIRCUIT
SPARK PLUG
IGNITION COIL
FUEL PUMP INLET STRAINER PLUGGED
RESTRICTED FUEL SUPPLY LINE
FUEL PUMP MODULE
FUEL PRESSURE LEAK DOWN
FUEL INJECTOR
ENGINE MECHANICAL
POWERTRAIN CONTROL MODULE (PCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. ACTIVE DTC

NOTE: Check for any TSBs that apply to a Misfire condition. Review the vehicle repair history for any misfire condition repairs that have been performed.

Diagnose and repair any other active component or circuit DTCs before continuing with this procedure.

Turn the ignition on.

With the scan tool, select View DTCs. Copy DTC and Freeze Frame information.

Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Attempt to operate the vehicle under conditions similar to which the DTC was set.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. VISUAL INSPECTION

NOTE: Anything that affects the speed of the crankshaft can cause a misfire DTC.

NOTE: When a Misfire is detected for a particular cylinder, the PCM will shut down that cylinder's Injector Control circuit.

- Visually inspect the engine for any of the following conditions.

- Worn serpentine belt
- Binding Engine-Driven accessories: A/C Compressor, P/S Pump, Water pump.
- Misalignment of the Water pump, P/S Pump and A/C Compressor pulleys
- Corroded PCM power and ground circuits.
- Improper CKP, CMP, MAP, and TP Sensor mounting
- Poor connector/terminal to component connection. i.e, CKP sensor, Fuel Injector, Ignition coil, etc.
- Vacuum leaks
- Restricted Air Induction system or Exhaust system.
- Internal engine component failures.

Were any of the above conditions present?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 3.

3. (F342), (F344) ASD RELAY OUTPUT CIRCUIT

Turn the ignition off.

Disconnect the Ignition Coil harness connector of the misfiring cylinders.

Disconnect the Fuel Injector harness connector of the misfiring cylinders.

Ignition on, engine not running.

With a scan tool, actuate the ASD Relay.

Using a 12-volt test light connected to ground, probe the (F342), (F344) ASD Relay Output circuit in the Ignition Coil harness connector and Fuel Injector harness connector while the relay is actuating.

Does the test light illuminate brightly?

Yes

Go To 4.

No

Repair the excessive resistance or short to ground in the (F342), (F344) ASD Relay Output circuit.
Perform **POWERTRAIN VERIFICATION TEST** .

4. **IGNITION SYSTEM OPERATION**

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Connect the Ignition Coil harness connector.

Remove the Spark Plug wire/boot from the spark plug of the cylinder being tested.

Leave the Fuel Injector harness connector of the cylinder being tested disconnected.

Install a spark tester on the Spark plug wire/boot.

While cranking the engine observe the spark coming from the spark tester.

NOTE: A crisp blue spark that is able to jump the gap of the spark tester should be generated.

Is good spark present?

Yes

Go To 5.

No

Go To 14.

NOTE: Connect the Fuel Injector harness connector before continuing.

5. **SPARK PLUG**

Turn the ignition off.

Remove the Spark Plug.

Inspect the Spark Plug for the following conditions.

- Cracks
- Carbon Tracking
- Foreign Material
- Gap size out of specifications
- Loose or broken electrode

NOTE: Lightly tap the bottom of the spark plug on a solid surface. The electrode in the spark plug should not move.

Does the Spark Plug have any problems?

Yes

Replace the Spark Plug.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 6.

6. FUEL PRESSURE CHECK

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Install a fuel pressure gauge to the fuel rail.

Start the engine and observe the fuel pressure reading.

NOTE: Fuel pressure specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Choose a conclusion that best matches your fuel pressure reading.

Within Specification

Go To 7.

Below Specification

Go To 12.

Above Specification

Replace the fuel filter/pressure regulator.

Perform **POWERTRAIN VERIFICATION TEST** .

7. FUEL PRESSURE LEAK DOWN

NOTE: Before continuing visually and physically inspect the fuel delivery system for external leaks or damage. Repair/replace as necessary.

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Install special tool #6539 (5/16") or #6631 (3/8") fuel line adapter.

Install the fuel pressure gauge.

Start the engine and allow the fuel system to reach maximum pressure.

Turn the ignition off.

NOTE: Fuel specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Using special tool #C4390, Hose Clamp Pliers, pinch the rubber fuel line between the fuel pressure gauge and the engine.

Monitor the fuel pressure gauge for a minimum of 5 minutes.

NOTE: The pressure should not fall below 241 kPa (35 psi)

Does the pressure fall below the listed specification?

Yes

Replace the leaking Fuel Injector(s).

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 8.

8. FUEL INJECTOR OPERATION

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

CAUTION: After each Fuel Injector actuation, start the engine to clean the cylinder of fuel. Failure to do so could cause engine damage.

Remove special tool #C4390.

Start the engine and allow the fuel pressure to reach maximum pressure.

Ignition on, engine not running.

Using the scan tool, actuate the Fuel Injector for the cylinder that indicated the misfire.

Monitor the fuel pressure gauge.

Does the fuel pressure gauge indicate a drop in fuel pressure?

Yes

Go To 9.

No

Go To 10.

NOTE: Turn the ignition off, remove the Fuel Pressure gauge, and connect the fuel lines before continuing.

9. ENGINE MECHANICAL

Check for any of the following conditions/mechanical problems.

ENGINE VACUUM - must be at least 13 inches in neutral

ENGINE VALVE TIMING - must be within specifications

ENGINE COMPRESSION - must be within specifications

ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks.

ENGINE PCV SYSTEM - must flow freely

TORQUE CONVERTER STALL SPEED - must be within specifications

POWER BRAKE BOOSTER - no internal vacuum leaks

FUEL - must be free of contamination

CAM LOBES - must not be worn excessively

CYLINDER LEAKAGE TEST - must be within specifications

VALVE SPRINGS - cannot be weak or broken

Are there any engine mechanical problems?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 16.

10. FUEL INJECTOR

Turn the ignition off.

Disconnect the Fuel Injector harness connector of one of the cylinders detecting a mis-fire.

Ignition on, engine not running.

NOTE: When a Misfire is detected for a particular cylinder, the PCM will shut down that cylinder's Injector Control circuit.

With the scan tool, erase DTCs.

Install an Injector Noid light.

With the scan tool, actuate the Fuel Injector.

Does the Noid light blink/flicker during the actuation?

Yes

Verify that there is good pin to terminal contact in the related Injector and the Powertrain Control Module connectors. If OK, replace the Fuel Injector.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 11.

11. INJECTOR CONTROL CIRCUIT

Turn the ignition off.

Disconnect the Fuel Injector harness connector.

Disconnect the PCM harness connectors.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Check the Injector Control circuit for an open, short to ground, and short to voltage.

Was a problem found with the Injector Control circuit?

Yes

Repair the excessive resistance or short in the Injector Control circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 16.

12. FUEL SUPPLY LINE RESTRICTED

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module.

Install special tool #6539 (5/16") #6631(3/8") fuel line adapter and the fuel pressure gauge between the fuel supply line and the fuel pump module.

Ignition on, engine not running.

With the scan tool, actuate the ASD Fuel System test and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Is the fuel pressure within specification?

Yes

Repair or replace fuel supply line as necessary.

Perform **POWERTRAIN VERIFICATION TEST**.

No

Go To 13.

13. FUEL PUMP INLET STRAINER

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer.

Is the Fuel Inlet Strainer plugged?

Yes

Replace the Fuel Pump Inlet Strainer.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Before continuing, check the Fuel Pump Module harness connector terminals for corrosion, damage, or terminal push out. Make sure the ground circuit is functional. Repair as necessary. Replace the Fuel Pump Module.

Perform **POWERTRAIN VERIFICATION TEST** .

14. **IGNITION COIL**

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Disconnect the Ignition Coil harness connector.

Using a 12-volt test light connected to 12-volts, probe the Ignition Coil Control circuit.

Crank the engine for 5 seconds while observing the test light.

Does the test light brightly blink/flicker?

Yes

Verify that there is good pin to terminal contact in the related Coil and the Powertrain Control Module connectors. If OK, replace the Ignition Coil.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 15.

15. **COIL CONTROL CIRCUIT**

Turn the ignition off.

Disconnect the Ignition Coil harness connector.

Disconnect the PCM harness connectors.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Check the Coil Control circuit for an open, short to ground, and short to voltage.

Was a problem found with the Coil Control circuit?

Yes

Repair the Coil Control circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 16.

16. **POWERTRAIN CONTROL MODULE (PCM)**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the related Sensor, Coil, Injector, and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related Sensors, Coils, Injectors, and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

2. VISUAL INSPECTION

NOTE: **Anything that affects the speed of the crankshaft can cause this DTC to set.**

NOTE: **When a misfire is detected, the PCM will shut down the injector control circuit for the misfiring cylinder.**

Inspect the engine for any of the following conditions:

- Worn serpentine belt
- Misalignment or binding water pump, P/S pump or A/C compressor pulleys
- Improper CKP, CMP, MAP, or TP Sensor mounting.
- Poor connector/terminal to component connection for CKP sensor, CMP sensor, MAP sensor, TP sensor, fuel injector, ignition coil, etc.
- Corroded PCM power or ground circuits.
- Vacuum leaks.
- Restriction in the air induction or exhaust system.
- Internal engine component malfunction.

NOTE: **Misfire may occur and may not be caused by component failure. Any of**

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Connect the Ignition Coil harness connector.

Remove the Ignition wire/coil from the Cylinder 1 Spark Plug.

Leave the Fuel Injector harness connector of the cylinder being tested disconnected.

Install a spark tester on the Ignition wire.

While cranking the engine observe the spark coming from the spark tester.

NOTE: A crisp blue spark that is able to jump the gap of the spark tester should be generated.

Is good spark present?

Yes

Go To 5.

No

Go To 14.

NOTE: Connect the Fuel Injector harness connector before continuing.

5. SPARK PLUG

Turn the ignition off.

Remove the Spark Plug.

Inspect the Spark Plug for the following conditions.

- Cracks
- Carbon Tracking
- Foreign Material
- Gap size out of specifications
- Loose or broken electrode

NOTE: Lightly tap the bottom of the spark plug on a solid surface. The electrode in the spark plug should not move.

Were any of the above conditions present?

Yes

Replace the Spark Plug.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 6.

6. FUEL PRESSURE CHECK

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Install a fuel pressure gauge to the fuel rail.

Start the engine and observe the fuel pressure reading.

NOTE: Fuel pressure specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Choose a conclusion that best matches your fuel pressure reading.

7. FUEL PRESSURE LEAK DOWN

NOTE: Before continuing visually and physically inspect the fuel delivery system for external leaks or damage. Repair/replace as necessary.

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Install special tool #6539 (5/16") or #6631 (3/8") fuel line adapter.

Install the fuel pressure gauge.

Start the engine and allow the fuel system to reach maximum pressure.

Turn the ignition off.

NOTE: Fuel specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Using special tool #C4390, Hose Clamp Pliers, pinch the rubber fuel line between the fuel pressure gauge and the engine.

Monitor the fuel pressure gauge for a minimum of 5 minutes.

NOTE: The pressure should not fall below 241 kPa (35 psi).

Does the pressure fall below the listed specification?

Yes

Replace the leaking Fuel Injector(s).

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 8.

8. FUEL INJECTOR OPERATION

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

CAUTION: After each Fuel Injector actuation, start the engine to clean the cylinder of fuel. Failure to do so could cause engine damage.

Remove special tool #C4390.

Start the engine and allow the fuel pressure to reach maximum pressure.

Ignition on, engine not running.

Using the scan tool, actuate the No.1 Fuel Injector.

Monitor the fuel pressure gauge.

Does the fuel pressure gauge indicate a drop in fuel pressure?

Yes

Go To 9.

No

Go To 10.

NOTE: Turn the ignition off, remove the Fuel Pressure gauge, and connect the fuel lines before continuing.

9. ENGINE MECHANICAL

Check for any of the following conditions/mechanical problems.

ENGINE VACUUM - must be at least 13 inches in neutral

ENGINE VALVE TIMING - must be within specifications

ENGINE COMPRESSION - must be within specifications

ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks.

ENGINE PCV SYSTEM - must flow freely

TORQUE CONVERTER STALL SPEED - must be within specifications

POWER BRAKE BOOSTER - no internal vacuum leaks

FUEL - must be free of contamination

CAM LOBES - must not be worn excessively

CYLINDER LEAKAGE TEST - must be within specifications

VALVE SPRINGS - cannot be weak or broken

Are there any engine mechanical problems?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 16.

10. FUEL INJECTOR

Turn the ignition off.

Disconnect the No.1 Fuel Injector harness connector.

Ignition on, engine not running.

NOTE: **When a Misfire is detected for a particular cylinder, the PCM will shut down that cylinder's Injector Control circuit.**

With the scan tool, erase DTCs.

Install an Injector Noid light.

With the scan tool, actuate the Fuel Injector.

Does the Noid light blink/flicker during the actuation?

Yes

Verify that there is good pin to terminal contact in the related Injector and the Powertrain Control Module connectors. If OK, replace the Fuel Injector.

12. FUEL SUPPLY LINE RESTRICTED

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module.

Install special tool #6539 (5/16") #6631(3/8") fuel line adapter and the fuel pressure gauge between the fuel supply line and the fuel pump module.

Ignition on, engine not running.

With the scan tool, actuate the ASD Fuel System test and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Is the fuel pressure within specification?

Yes

Repair or replace fuel supply line as necessary.

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer.

Is the Fuel Inlet Strainer plugged?

Yes

Replace the Fuel Pump Inlet Strainer.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Before continuing, check the Fuel Pump Module harness connector terminals for corrosion, damage, or terminal push out. Make sure the ground circuit is functional. Repair as necessary. Replace the Fuel Pump Module.

MONITOR CONDITIONS

When Monitored:

Any time the engine is running, and the adaptive numerator has been successfully updated.

SET CONDITIONS

- **Set Condition:**

The threshold to set the fault is application specific; it is tied to the level of misfire that will cause emissions to increase to 1.5 times the standard or in some cases 1%. It is always a two trip fault above the calibrated RPM. It takes 1 soft fail to set a malfunction and two trips to set the MIL. Three good trips to turn off the MIL.

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

Diagnose and repair any other active component or circuit DTCs before continuing with this procedure.

Turn the ignition on.

With the scan tool, select View DTCs. Copy DTC and Freeze Frame information.

Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Attempt to operate the vehicle under conditions similar to which the DTC

was set.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. VISUAL INSPECTION

NOTE: Anything that affects the speed of the crankshaft can cause this DTC to set.

NOTE: When a misfire is detected, the PCM will shut down the injector control circuit for the misfiring cylinder.

Inspect the engine for any of the following conditions:

- Worn serpentine belt
- Misalignment or binding water pump, P/S pump or A/C compressor pulleys
- Improper CKP, CMP, MAP, or TP Sensor mounting.
- Poor connector/terminal to component connection for CKP sensor, CMP sensor, MAP sensor, TP sensor, fuel injector, ignition coil, etc.
- Corroded PCM power or ground circuits.
- Vacuum leaks.
- Restriction in the air induction or exhaust system.
- Internal engine component malfunction.

NOTE: Misfire may occur and may not be caused by component failure. Any of the following conditions can cause a misfire:

- Moisture on ignition system components
- Insufficient fuel
- Low quality fuel
- Manual transmission bog
- Towing overload

7. FUEL PRESSURE LEAK DOWN

NOTE: Before continuing visually and physically inspect the fuel delivery system for external leaks or damage. Repair/replace as necessary.

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death

Turn the ignition off.

Install special tool #6539 (5/16") or #6631 (3/8") fuel line adapter.

Install the fuel pressure gauge.

Start the engine and allow the fuel system to reach maximum pressure.

Turn the ignition off.

NOTE: Fuel specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Using special tool #C4390, Hose Clamp Pliers, pinch the rubber fuel line between the fuel pressure gauge and the engine.

Monitor the fuel pressure gauge for a minimum of 5 minutes.

NOTE: The pressure should not fall below 241 kPa (35 psi).

Does the pressure fall below the listed specification?

Yes

Replace the leaking Fuel Injector(s).

8. FUEL INJECTOR OPERATION

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

CAUTION: After each Fuel Injector actuation, start the engine to clean the cylinder of fuel. Failure to do so could cause engine damage.

Remove special tool #C4390.

Start the engine and allow the fuel pressure to reach maximum pressure.

Ignition on, engine not running.

Using a scan tool, actuate the No.3 Fuel Injector.

Monitor the fuel pressure gauge.

Does the fuel pressure gauge indicate a drop in fuel pressure?

Yes

NOTE: Turn the ignition off, remove the Fuel Pressure gauge, and connect the fuel lines before continuing.

9. ENGINE MECHANICAL

Check for any of the following conditions/mechanical problems.

ENGINE VACUUM - must be at least 13 inches in neutral

ENGINE VALVE TIMING - must be within specifications

ENGINE COMPRESSION - must be within specifications

ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks.

ENGINE PCV SYSTEM - must flow freely

TORQUE CONVERTER STALL SPEED - must be within specifications

POWER BRAKE BOOSTER - no internal vacuum leaks

FUEL - must be free of contamination

CAM LOBES - must not be worn excessively

CYLINDER LEAKAGE TEST - must be within specifications

VALVE SPRINGS - cannot be weak or broken

Are there any engine mechanical problems?

Yes

Repair as necessary.

No

Go To 16.

10. FUEL INJECTOR

Turn the ignition off.

Disconnect the No.3 Fuel Injector harness connector.

Ignition on, engine not running.

NOTE: **When a Misfire is detected for a particular cylinder, the PCM will shut down that cylinder's Injector Control circuit.**

With the scan tool, erase DTCs.

Install an Injector Noid light.

With the scan tool, actuate the Fuel Injector.

Does the Noid light blink/flicker during the actuation?

Yes

Verify that there is good pin to terminal contact in the related Injector and the Powertrain Control Module connectors. If OK, replace the Fuel Injector.

12. FUEL SUPPLY LINE RESTRICTED

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module.

Install special tool #6539 (5/16") #6631(3/8") fuel line adapter and the fuel pressure gauge between the fuel supply line and the fuel pump module.

Ignition on, engine not running.

With a scan tool, actuate the ASD Fuel System test and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Is the fuel pressure within specification?

Yes

Repair or replace fuel supply line as necessary.

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer.

Is the Fuel Inlet Strainer plugged?

Yes

Replace the Fuel Pump Inlet Strainer.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Before continuing, check the Fuel Pump Module harness connector terminals for corrosion, damage, or terminal push out. Make sure the ground circuit is functional. Repair as necessary. Replace the Fuel Pump Module.

MONITOR CONDITIONS

When Monitored:

Any time the engine is running, and the adaptive numerator has been successfully updated.

SET CONDITIONS

- **Set Condition:**

The threshold to set the fault is application specific; it is tied to the level of misfire that will cause emissions to increase to 1.5 times the standard or in some cases 1%. It is always a two trip fault above the calibrated RPM. It takes 1 soft fail to set a malfunction and two trips to set the MIL. Three good trips to turn off the MIL.

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

Diagnose and repair any other active component or circuit DTCs before continuing with this procedure.

Turn the ignition on.

With the scan tool, select View DTCs. Copy DTC and Freeze Frame information.

Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Attempt to operate the vehicle under conditions similar to which the DTC

was set.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. VISUAL INSPECTION

NOTE: Anything that affects the speed of the crankshaft can cause this DTC to set.

NOTE: When a misfire is detected, the PCM will shut down the injector control circuit for the misfiring cylinder.

Inspect the engine for any of the following conditions:

- Worn serpentine belt
- Misalignment or binding water pump, P/S pump or A/C compressor pulleys
- Improper CKP, CMP, MAP, or TP Sensor mounting.
- Poor connector/terminal to component connection for CKP sensor, CMP sensor, MAP sensor, TP sensor, fuel injector, ignition coil, etc.
- Corroded PCM power or ground circuits.
- Vacuum leaks.
- Restriction in the air induction or exhaust system.
- Internal engine component malfunction.

NOTE: Misfire may occur and may not be caused by component failure. Any of the following conditions can cause a misfire:

- Moisture on ignition system components
- Insufficient fuel
- Low quality fuel
- Manual transmission bog
- Towing overload

Were any problems found?

Yes

12. FUEL SUPPLY LINE RESTRICTED

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module.

Install special tool #6539 (5/16") #6631(3/8") fuel line adapter and the fuel pressure gauge between the fuel supply line and the fuel pump module.

Ignition on, engine not running.

With the scan tool, actuate the ASD Fuel System test and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Is the fuel pressure within specification?

MONITOR CONDITIONS

When Monitored:

Any time the engine is running, and the adaptive numerator has been successfully updated.

SET CONDITIONS

- **Set Condition:**

The threshold to set the fault is application specific; it is tied to the level of misfire that will cause emissions to increase to 1.5 times the standard or in some cases 1%. It is always a two trip fault above the calibrated RPM. It takes 1 soft fail to set a malfunction and two trips to set the MIL. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

Diagnose and repair any other active component or circuit DTCs before continuing with this procedure.

Turn the ignition on.

With the scan tool, select View DTCs. Copy DTC and Freeze Frame information.

Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Attempt to operate the vehicle under conditions similar to which the DTC

was set.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. VISUAL INSPECTION

NOTE: Anything that affects the speed of the crankshaft can cause this DTC to set.

NOTE: When a misfire is detected, the PCM will shut down the injector control circuit for the misfiring cylinder.

Inspect the engine for any of the following conditions:

- Worn serpentine belt
- Misalignment or binding water pump, P/S pump or A/C compressor pulleys
- Improper CKP, CMP, MAP, or TP Sensor mounting.
- Poor connector/terminal to component connection for CKP sensor, CMP sensor, MAP sensor, TP sensor, fuel injector, ignition coil, etc.
- Corroded PCM power or ground circuits.
- Vacuum leaks.
- Restriction in the air induction or exhaust system.
- Internal engine component malfunction.

NOTE: Misfire may occur and may not be caused by component failure. Any of the following conditions can cause a misfire:

- Moisture on ignition system components
- Insufficient fuel
- Low quality fuel
- Manual transmission bog
- Towing overload

Were any problems found?

Yes

Repair as necessary.

4. IGNITION SYSTEM OPERATION

Turn the ignition off.

Connect the Ignition Coil harness connector.

Disconnect the Ignition wire/coil from the spark plug.

Leave the Fuel Injector harness connector of the cylinder being tested disconnected.

Install a spark tester on the Ignition wire.

While cranking the engine observe the spark coming from the spark tester.

NOTE: **A crisp blue spark that is able to jump the gap of the spark tester should be generated.**

Is good spark present?

Yes

Go To 5.

No

Go To 14.

NOTE: **Connect the Fuel Injector harness connector before continuing.**

5. SPARK PLUG

Turn the ignition off.

Remove the Spark Plug.

Inspect the Spark Plug for the following conditions.

- Cracks
- Carbon Tracking
- Foreign Material
- Gap size out of specifications
- Loose or broken electrode

NOTE: **Lightly tap the bottom of the spark plug on a solid surface. The electrode in the spark plug should not move.**

Were any of the above conditions present?

Yes

Replace the Spark Plug.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 6.

6. FUEL PRESSURE CHECK

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

7. FUEL PRESSURE LEAK DOWN

NOTE: Before continuing visually and physically inspect the fuel delivery system for external leaks or damage. Repair/replace as necessary.

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death

Turn the ignition off.

Install special tool #6539 (5/16") or #6631 (3/8") fuel line adapter.

Install the fuel pressure gauge.

Start the engine and allow the fuel system to reach maximum pressure.

Turn the ignition off.

NOTE: Fuel specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Using special tool #C4390, Hose Clamp Pliers, pinch the rubber fuel line between the fuel pressure gauge and the engine.

Monitor the fuel pressure gauge for a minimum of 5 minutes.

NOTE: The pressure should not fall below 241 kPa (35 psi).

Does the pressure fall below the listed specification?

Yes

Replace the leaking Fuel Injector(s).

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 8.

8. FUEL INJECTOR OPERATION

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

CAUTION: After each Fuel Injector actuation, start the engine to clean the cylinder of fuel. Failure to do so could cause engine damage.

Remove special tool #C4390.

Start the engine and allow the fuel pressure to reach maximum pressure.

Ignition on, engine not running.

Using the scan tool, actuate the No.6 Fuel Injector.

Monitor the fuel pressure gauge.

Does the fuel pressure gauge indicate a drop in fuel pressure?

Yes

Go To 9.

No

Go To 10.

NOTE: Turn the ignition off, remove the Fuel Pressure gauge, and connect the fuel lines before continuing.

9. ENGINE MECHANICAL

Check for any of the following conditions/mechanical problems.

ENGINE VACUUM - must be at least 13 inches in neutral

ENGINE VALVE TIMING - must be within specifications

ENGINE COMPRESSION - must be within specifications

ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks.

ENGINE PCV SYSTEM - must flow freely

TORQUE CONVERTER STALL SPEED - must be within specifications

POWER BRAKE BOOSTER - no internal vacuum leaks

FUEL - must be free of contamination

CAM LOBES - must not be worn excessively

CYLINDER LEAKAGE TEST - must be within specifications

VALVE SPRINGS - cannot be weak or broken

Are there any engine mechanical problems?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST**.

No

Go To 16.

10. **FUEL INJECTOR**

Turn the ignition off.

Disconnect the No.6 Fuel Injector harness connector.

Ignition on, engine not running.

NOTE: **When a Misfire is detected for a particular cylinder, the PCM will shut down that cylinder's Injector Control circuit.**

With the scan tool, erase DTCs.

Install an Injector Noid light.

With the scan tool, actuate the Fuel Injector.

Does the Noid light blink/flicker during the actuation?

Yes

Verify that there is good pin to terminal contact in the related Injector and the Powertrain Control Module connectors. If OK, replace the Fuel Injector.

CIRCUIT SCHEMATIC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Knock is the spontaneous auto-ignition of the remaining fuel/air mixture in the engine combustion chamber that occurs after normal combustion has started. It can occur under extreme vehicle operating conditions such as high engine temperature, high MAP, low humidity, and heavy loads to the engine. Knock is caused by excessive spark advance for the given engine operating conditions. Severe, continuous knock may be caused by carbon deposits, bad gasoline, and/or low octane fuel. Avoiding light audible knock is important for customer satisfaction while preventing excessive knock is important to protect engine components. The output voltage from the knock circuit represents the strength of the engine knock and is read by the engine controller. The knock system output voltage is not zero due to engine background noise, even when knock is not present. When the engine is operated under high load conditions where knock is possible, the knock voltage is tested to decide if it exceeds the knock voltage threshold. Knock has occurred when the knock voltage is at or above this knock threshold. When knock is detected a calibrated short term knock spark retard to be subtracted from the spark advance is calculated. The amount of retarded spark advance is based off a calibrated severity of the knock event. This retarded spark advance is used in the next ignition event to prevent further knock events. If knock continues, an additional amount of short term spark advance retard is added. When knock stops, short term knock spark retard is eliminated, the long term knock spark retard is reduced by a calibrated amount to recover some previously retarded spark advance. This decreases spark retard to improve engine performance.

DIAGNOSTIC TEST

1. ACTIVE DTC

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. (K242) KS SIGNAL 2 SHORTED TO VOLTAGE

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the No.2 Knock Sensor harness connector.

Disconnect the C2 PCM harness connector.

Ignition on, engine not running.

Measure the voltage on the (K242) KS Signal 2 circuit in the Knock Sensor harness connector.

Is there any voltage present?

Yes

Repair the short to voltage in the (K242) KS Signal 2 circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 3.

3. (K242) KS SIGNAL 2 CIRCUIT OPEN

Turn the ignition off.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness

connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (K242) KS Signal 2 circuit from the Knock Sensor harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

Go To 4.

No

Repair the open in the (K242) KS Signal 2 circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

4. (K924) KS RETURN 2 CIRCUIT OPEN

Measure the resistance of the (K924) KS Return 2 circuit from the Knock Sensor harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

Go To 5.

No

Repair the open in the (K924) KS Return 2 circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

5. (K242) KS SIGNAL 2 SHORTED TO THE (K924) KS RETURN 2 CIRCUIT

Fig. 78: Checking Knock Sensor No. 1 or 2 Signal Circuit For Short To Knock Sensor No. 1 Return Circuit

Courtesy of CHRYSLER LLC

Measure the resistance between the (K242) KS Return 2 circuit and the (K924) KS Return 2 circuit in the Knock Sensor harness connector.

Is the resistance below 100 ohms?

Yes

Repair the short between the (K242) KS Signal 2 circuit and the (K924) KS Return 2 circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 6.

6. (K242) KS SIGNAL 2 SHORTED TO GROUND

Fig. 79: Checking Knock Sensor No. 1 or 2 Signal Circuit For Short To Ground
Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (K242) KS Signal 2 circuit in the Knock Sensor harness connector.

Is the resistance below 100 ohms?

Yes

Repair the short to ground in the (K242) KS Signal 2 circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 7.

7. KNOCK SENSOR 2

Turn the ignition off.

Verify that there is good pin to terminal contact in the Knock Sensor and Powertrain Control Module connectors.

If the connectors are OK, replace the Knock Sensor 2.

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

With the scan tool, clear DTCs.

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to reset.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

Go to 8.

No

Test complete.

Perform **POWERTRAIN VERIFICATION TEST** .

8. **POWERTRAIN CONTROL MODULE (PCM)**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Knock Sensor 2 and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

14. **ERRATIC CKP SENSOR SIGNAL**

Turn the ignition off.

With a lab scope probe and the Miller special tool #6801, backprobe the (K24) CKP Signal circuit in the CKP harness connector.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Ignition on, engine not running.

Wiggle the related wire harness and lightly tap on the Crankshaft Position Sensor.

Observe the lab scope screen.

Look for any pulses generated by the CKP Sensor.

Allow the engine to idle.

Observe the lab scope screen.

Did the CKP Sensor generate any erratic pulses?

Yes

Verify that there is good pin to terminal contact in the Crank Position Sensor and Powertrain Control Module connectors. Replace the Crank Position Sensor if no problems were found with the connectors.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 15.

15. **ERRATIC CMP SIGNAL**

Turn the ignition off.

With a lab scope probe and the Miller special tool #6801, backprobe the (K44) CMP Signal circuit in the CMP harness connector.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Ignition on, engine not running.

Wiggle the related wire harness and lightly tap on the Cam Position Sensor.

Observe the lab scope screen.

Look for any pulses generated by the CMP Sensor.

Allow the engine to idle.

Observe the lab scope screen.

Did the CMP Sensor generate any pulses?

Yes

Verify that there is good pin to terminal contact in the CMP Sensor and Powertrain Control Module connectors. Replace the Camshaft Position Sensor if no problems were found with the connectors.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

P0401-EGR SYSTEM PERFORMANCE

CIRCUIT SCHEMATIC

Exhaust gas recirculation is a method of reducing emissions of oxides of nitrogen. As the inert exhaust gas is recirculated, the mixture absorbs heat in the combustion chamber without interacting with the fuel/air mixture and reduces the formation of NOx emissions. After the EGR monitor conditions are met, the EGR valve is turned on and off momentarily. The EGR monitor calculated the difference in engine roughness from the EGR off condition to the EGR condition. This engine combustion stability difference as measured by engine roughness is the measure of a functional EGR system.

MONITOR CONDITIONS

When Monitored:

Engine running for greater than two minutes with the Engine Coolant Temp greater than 70° C (158° F).
EGR active. Less than 8500 feet. Ambient temperature greater than -6° C (20° F).

SET CONDITIONS

- **Set Condition:**

The PCM closes the EGR valve while monitoring the O2 Sensor signal. Once a closed EGR fueling sample has been established the PCM then ramps in EGR and additional fueling while monitoring the O2 sensor signal in the open state. A fueling sample is again established. The PCM then compares the different O2 Sensor signal readings (fueling samples). If a larger than expected variation is detected, a soft failure is recorded. Three soft failures set a one trip failure. After two failed trips, a DTC is set and the MIL is illuminated.

POSSIBLE CAUSES

Possible Causes
(Z904) EGR SOLENOID GROUND CIRCUIT OPEN
(K35) EGR SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
(K35) EGR SOLENOID CONTROL CIRCUIT SHORTED TO VOLTAGE

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: **Diagnose and repair any EGR circuit DTCs before continuing with this procedure.**

Turn the ignition on.

With the scan tool, select View DTCs. Copy DTC and Freeze Frame information.

Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Attempt to operate the vehicle under conditions similar to which the DTC was set.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

With a scan tool, select View DTCs.

Is the DTC Active or Pending at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. ROUGH IDLE OR STALLING AT IDLE

Turn the ignition off.

Turn all accessories off.

Start the engine.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Does the engine run rough or stall at idle?

Yes

Go To 3.

No

Go To 5.

3. **EGR VALVE ASSEMBLY CONTROL CIRCUIT**

Turn the ignition off.

Disconnect the EGR Valve Assembly harness connector.

Start the engine.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Does the engine continue to run rough or stall with the EGR Valve Assembly connector disconnected?

Yes

Disconnect the C1 and C2 PCM harness connectors.

Disconnect the EGR Solenoid harness connector.

Ignition on, engine not running.

Measure the voltage on the (K35) EGR Solenoid Control circuit in the EGR Solenoid connector.

Is there any voltage present?

Yes

Repair the short to voltage in the (K35) EGR Solenoid Control circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 9.

5. **EGR SYSTEM TEST**

Turn all accessories off.

Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With the scan tool, perform the EGR System Test.

Turn the ignition off.

Using a 12-volt test light connected to battery voltage, probe the (Z904) EGR Solenoid ground circuit in the EGR Solenoid harness connector.

Does the 12-volt test light illuminate brightly?

Yes

Go To 7.

No

Repair the open in the (Z904) EGR Solenoid ground circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

7. (K35) EGR CONTROL CIRCUIT HIGH RESISTANCE

Turn the ignition off.

Connect the EGR Valve Assembly connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 along with the #8815-1 to perform the diagnosis.

Using a voltmeter, perform a voltage drop test by backprobing the (K35) EGR Control circuit at the EGR Valve Assembly harness connector and probing the appropriate terminal of the special tool #8815. Make sure the voltmeter leads are connected so that positive polarity is displayed on the voltmeter.

Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With the scan tool, perform the EGR System Test.

Select OPEN to open the EGR valve.

Monitor the circuit voltage on the voltmeter.

Is the voltage below 0.5 volts when the valve was opened during the system test?

Yes

Go To 8.

No

Repair the (K35) EGR Control circuit for excessive resistance.

Perform **POWERTRAIN VERIFICATION TEST** .

8. EGR VALVE ASSEMBLY

WARNING: The normal operating temperature of the EGR system is very high. Never work around or attempt to service any part of the EGR system until it has cooled.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EGR Valve Assembly and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Inspect the EGR Valve Assembly for the following:

- Proper mounting, leaking gasket(s)
- Damaged, leaking, or obstructed EGR tube(s)
- Carbon build up on or near the EGR pintle or within passages.

Were any problem found?

Yes

Repair or replace the EGR system components as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace the EGR Valve Assembly.

Perform **POWERTRAIN VERIFICATION TEST** .

9. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EGR Solenoid Assembly and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Solenoid and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace and program the Powertrain Control Module per Service Information.

Using a 12 volt test light connected to 12 volts, check the (Z904) Ground circuit in the EGR Valve Assembly harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

Go to 6.

No

Repair the (Z904) Ground circuit for an open circuit or high resistance.

Perform **POWERTRAIN VERIFICATION TEST** .

6. EGR VALVE ASSEMBLY

Connect the C2 PCM harness connector.

Turn the ignition on.

With the scan tool, actuate the EGR Valve Solenoid Duty Cycle.

Select the Duty Cycle reading of 79.9%

Using a 12 volt test light connected to ground, check the (K35) EGR Control circuit in the EGR Valve Assembly harness connector.

NOTE: If the DTC is active, the actuation test may not be allowed by the PCM. If may be necessary to clear the DTCs before starting the actuation.

NOTE: The voltage supplied to the solenoid circuit during the actuation may be less than battery voltage. The test light should be illuminated, but may not be as bright as a direct connection to the battery.

NOTE: The test light should be illuminated and bright proportional to the maximum duty cycle allowed by the scan tool. For example, if the scan tool allows 100% actuation, the brightness should be as bright as a direct connection to the battery. If the scan tool allows a maximum 25% actuation, the brightness should be 25% as bright as a direct connection to the battery.

Is the test light illuminated during the actuation?

Yes

Verify that there is good pin to terminal contact in the Solenoid and the Powertrain Control Module connectors. If OK, replace the EGR Valve Assembly in accordance with the Service Information.

Using a voltmeter, perform a voltage drop test by backprobing the (K857) 5 Volt Supply circuit at the EGR Valve Assembly harness connector and probing the appropriate terminal of the special tool #8815. Make sure the voltmeter leads are connected so that positive polarity is displayed on the voltmeter.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Start the engine.

Is the voltage below 0.5 volts?

Yes

Go To 3.

No

Repair the excessive resistance in the (K857) 5 Volt Supply circuit.

7. EGR VALVE ASSEMBLY

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EGR Valve Assembly and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Verify that there is good pin to terminal contact in the Solenoid and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

Repair or replace the EGR system components as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace the EGR Valve Assembly.

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. ACTIVE DTC

Start the engine and allow it to idle for at least 60 seconds.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: It may be necessary to test drive the vehicle and operate the speed control in order for this DTC to set.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. **SPEED CONTROL SWITCH**

Turn the ignition off.

Remove and disconnect the Speed Control Switch from the steering wheel per Service Information.

Measure the resistance across each Speed Control Switch.

Monitor the ohmmeter while pressing each function button on the switch.

The following resistance specs are taken between terminals (V71) S/C Signal 1 and (V937) S/C Return circuit of the Switch when holding the switch button in the following position

Not pressing any switch - 20.5k ohms

On/Off - 0.47k ohms

Set - 5.49k ohms

Coast - 2.94k ohms

Cancel - 1.24k ohms

Resume/Accel - 15.4k ohms

Does the function on the Speed Control Switches have the correct resistance value?

Yes

Go To 3.

No

Replace the Speed Control Switch that had the incorrect resistance value.

DIAGNOSTIC TEST

1. ACTIVE DTC

Ignition on, engine not running.

NOTE: This DTC is a two trip fault. If the scan tool indicates a one trip failure, the possible cause may have been the customer pressing the switch in two positions simultaneously. Test drive the vehicle and activate the Speed Control system. If the DTC matures to an active fault a repair is necessary.

Ask the customer if it is possible that button was held in two positions at the same time before this DTC set. If this is the case, no repair is necessary.

Start the engine.

Allow the engine to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. SPEED CONTROL SWITCH

With the scan tool, monitor the Speed Control Switch voltage.

Disconnect the Speed Control Switch harness connector.

NOTE: The sensor voltage should be approximately 5.0 volts (plus or minus .1 volt) with the connector disconnected.

Does the scan tool display the voltage as described above?

Yes

Replace the Speed Control Switch.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 3.

3. SPEED CONTROL SWITCHES

Turn the ignition off.

Remove and disconnect the Speed Control Switch from the steering wheel per Service Information.

10. SPEED CONTROL SWITCH VOLTAGE VALUES

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 and #8815-1 to perform diagnosis.

Install Miller Special Tool #8815-1 on the C3 PCM harness connector.

Connect the S/C Switch harness connectors.

Connect the SCCM harness connectors.

Turn the ignition on.

With a scan tool, monitor the S/C Switch voltage readings.

Using a voltmeter check the voltage on the (V37) S/C Signal 1 circuit and the (V38) S/C Signal 2 circuit at the appropriate terminals of the special tool #8815.

Monitor the voltmeter.

With a scan tool, monitor the S/C Switch voltage readings.

MONITOR CONDITIONS

When Monitored:

With the ignition key on.

SET CONDITIONS

• Set Condition:

Cruise switch voltage output is not out of range but it does not equal any of the values for any of the button positions. One trip fault.

POSSIBLE CAUSES

Possible Causes
(V72) S/C SIGNAL 2 CIRCUIT OPEN
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(V937) S/C RETURN CIRCUIT OPEN
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO GROUND

POWERTRAIN CONTROL MODULE (PCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. ACTIVE DTC

NOTE: This DTC is a two trip fault. If the scan tool indicates a one trip failure, the possible cause may have been the customer pressing both switches simultaneously. Test drive the vehicle and activate the Speed Control system. If the DTC matures to an active fault a repair is necessary.

Start the engine.

Allow the engine to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. SPEED CONTROL SWITCHES

Turn the ignition off.

Remove the Speed Control Switch from the steering wheel.

Measure the resistance across the Speed Control Switch.

Monitor the ohmmeter while pressing each function button on the switch.

The following resistance specs are taken between terminals (V72) S/C Signal 2 circuit and (V937) S/C Return circuit of the Switch when holding the switch button in the following position.

Not pressing any switch - 20.5k ohms

On/Off - 8.87k ohms

Set - 0.825k ohms

Coast - 0.47k ohms

Cancel - 3.92k ohms

Resume/Accel - 1.87k ohms

The following resistance specs are taken between terminals (V71) S/C Signal 1 and (V937) S/C Return circuit of the Switch when holding the switch button in the following position

When secondary software determines that TPS 1 and TPS 2 signals do not match for a period of time.
One trip fault. ETC lamp will flash.

POSSIBLE CAUSES

Possible Causes
PCM NEEDS TO BE PROGRAMMED POWERTRAIN CONTROL MODULE (PCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. PROGRAM THE POWERTRAIN CONTROL MODULE

Verify the PCM is at the latest calibration (flash level).

NOTE: **An intermittent loss of power to the PCM without performing an ETC Relearn procedure may cause this DTC to set.**

Flash the Powertrain Control Module per Service Information if any updates are available.

Start the engine.

Allow the engine to reach normal operating temperature.

Operate the accelerator pedal. (do not exceed 3500 rpm)

With a scan tool, select View DTCs.

NOTE: **Diagnose any other DTCs that may have set with the P060E.**

Does this DTC reset by itself?

Yes

Replace and reprogram the Powertrain Control Module per Service Information.
Perform **POWERTRAIN VERIFICATION TEST** .

No

Test Complete.

P0622-GENERATOR FIELD CONTROL CIRCUIT

CIRCUIT SCHEMATIC

MONITOR CONDITIONS

When Monitored:

With the engine running, battery voltage greater than 10.4 volts, and the Generator control active.

SET CONDITIONS

- Set Condition:

When the PCM tries to regulate the generator field with no result during monitoring. One Trip Fault.
Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
(K125) GEN FIELD CONTROL CIRCUIT SHORTED TO VOLTAGE
(K125) GEN FIELD CONTROL CIRCUIT OPEN
(K125) GEN FIELD CONTROL CIRCUIT SHORTED TO GROUND
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding.

DIAGNOSTIC TEST

1. ACTIVE DTC

Turn the ignition on.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Increase engine speed by pressing the accelerator pedal. Do not exceed 3500 rpm.

With the scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. GENERATOR OPERATION

Fig. 53: Probing Generator Field Control Circuit At Generator Field Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Generator Field harness connector.

Using a 12-volt test light connected to ground, probe the (K125) Generator Field Control circuit in the Generator Field harness connector.

Ignition on, engine not running.

NOTE: The DTC needs to be cleared before actuating the Generator Field, if the DTC is not cleared, the Generator Field may not be allowed to actuate.

With the scan tool, actuate the Generator Field Control circuit.

NOTE: The voltage supplied to the solenoid circuit during the actuation will be less than battery voltage. The test light should be illuminated, but not as bright as a direct connection to the battery.

NOTE: The test light should be illuminated and bright proportional to the

maximum duty cycle allowed by the scan tool. For example, if the scan tool allows 100% actuation, the brightness should be as bright as a direct connection to the battery. If the scan tool allows a maximum 25% actuation, the brightness should be 25% as bright as a direct connection to the battery.

Does the test light illuminate accordingly during the actuation?

Yes

Verify that there is good pin to terminal contact in the Generator and Powertrain Control Module connectors. Replace the Generator if no problems were found with the connectors.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 3.

3. (K125) GEN FIELD CIRCUIT SHORTED VOLTAGE

Fig. 54: Checking Generator Field Circuit For Short To Voltage
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the C2 PCM harness connector.

Ignition on, engine not running.

Measure the voltage on the (K125) Gen Field Control circuit in the Generator Field harness connector.

Is there any voltage present?

Yes

Repair the short to voltage in the (K125) Gen Field Control circuit.
Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 4.

4. (K125) GEN FIELD CIRCUIT OPEN

Fig. 55: Checking Generator Field Control Circuit For Open

Turn the ignition off.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (K125) Gen Field Control circuit from the Generator Field harness connector to appropriate terminal of the special tool #8815.

Is the resistance below 5.0 ohms?

Yes

Go To 5.

No

Repair the open in the (K125) Gen Field Control circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

5. (K125) GEN FIELD CIRCUIT SHORTED TO GROUND

Fig. 56: Checking Generator Field Control Circuit For Short To Ground
Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (K125) Gen Field Control circuit in the Generator Field harness connector.

Is the resistance below 100 ohms?

Yes

Repair the short to ground in the (K125) Gen Field Control circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 6.

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Generator

and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Generator and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST**.

No

Replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST**.

2008 ENGINE PERFORMANCE

Electrical Diagnostics - Liberty

P0420-CATALYST EFFICIENCY (BANK 1)

ADDITIONAL WIRING

For complete wiring diagrams refer to SYSTEM WIRING DIAGRAMS .

The State of Change (SOC) catalyst monitor uses the signals from both the upstream and downstream O2 sensors to detect aging of the catalyst. Based on the fact that when a catalyst ages, it loses some of its Oxygen Storage Capacity (OSC). As a result, part of the untreated exhaust gases can breakthrough the catalyst and causes the downstream O2 sensor to deviate from its neutral (Stoichiometric) position. By observing the activities in the downstream O2 signal, the degradation level of catalyst can be detected. In general, the higher the downstream O2 sensor SOC value, the more exhaust gas breakthrough and the lower the OSC of the catalytic converter.

MONITOR CONDITIONS

When Monitored:

The monitor will run at between 1400 and 2300 RPM. It also runs between 40 and 70 kPA.

SET CONDITIONS

DIAGNOSTIC TEST

1. ACTIVE DTC

- NOTE:** A new rear O2 Sensor along with an aging front O2 Sensor may cause the DTC to set. Review the repair history of the vehicle before continuing.
- NOTE:** If an O2 Sensor DTC set along with the Catalytic Converter Efficiency DTC diagnose the O2 Sensor DTC(s) before continuing.
- NOTE:** Check for contaminants that may have damaged the O2 Sensor and Catalytic Converter: contaminated fuel, unapproved silicone, oil and coolant, repair necessary.

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, select View DTCs.

- NOTE:** It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. VISUALLY INSPECT CATALYTIC CONVERTER

Inspect the Catalytic Converter for the following damage.

Damage Catalytic Converter, dents or holes.

Severe discoloration caused by overheating the Catalytic Converter.

Catalytic Converter broke internally.

Inspect both ends of the converter, inlet and outlet.

Is the resistance below 5.0 ohms?

Yes

Go To 9.

No

Repair the open in the (K904) O2 Return Downstream circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

9. **POWERTRAIN CONTROL MODULE (PCM)**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Sensor and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

10. **CHECKING THE EXHAUST SYSTEM FOR LEAKS**

Turn the ignition off.

Raise the vehicle in accordance with the Service Information.

WARNING: The normal operating temperature of the exhaust system is very high. Never work around or attempt to service any part of the exhaust system until it has cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine

operating time.

Connect Exhaust Cone #8404-EC or #8404-EC to Air Pressure Regulator (with hose) #W-18-MIL-1146AS.

CAUTION: The air pressure must not exceed 27.6 kPa (4 psi), otherwise engine damage can occur.

Attach shop air to the air pressure regulator.

Adjust the Air Pressure Regulator to 27.6 kPa (4 psi)

Insert the exhaust cone into the vehicle tail pipe.

If the vehicle is equipped with dual exhaust. Use the #8404-ECT with equipped attached plug, plug one side of the dual exhaust pipe. Pressurize the other as described above.

Apply Mopar® Air Leak Detector PN# 05191804AA (or an equivalent leak finder liquid) to the following areas:

- All welded joints from the exhaust manifold to 152.4 mm (6 inches) behind the downstream O2 sensor
- O2 sensor seal points
- O2 sensor boss welds
- Flange/joint connection(s)
- Exhaust manifold to cylinder head connection(s)
- EGR solenoid gasket base and tube seal points (if equipped)

Watch for the liquid/soapy water to bubble.

Use the following definitions to help determine if system or component repair/replacement is necessary:

Type 1 Leak is defined as a leak where very small foam like bubbles 1 mm (0.04 of an inch) or less appear.

Any Type 1 or greater leaks found in welded joints, O2 sensor seal points or O2 sensor boss welds must be repaired or the component must be replaced.

Type 2 Leak is defined as a leak where larger bubbles pea size, 8 mm (0.3 of an inch) or greater appear.

Any Type 2 or greater leaks found in flange or joint connections, exhaust manifold to cylinder head connections, or EGR gasket and tube seal points must be repaired or the components must be replaced

Leak Location	Repair required if results at 4 psi reveal bubble size:
Welded joints	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor seal points	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor boss welds	Type 1, 1 mm (0.04 of an inch) or greater
Flange / joint connections	Type 2, 8 mm (0.3 of an inch) or greater
Exhaust Manifold to cylinder head connections	Type 2, 8 mm (0.3 of an inch) or greater
EGR gasket and tube seal points	Type 2, 8 mm (0.3 of an inch) or greater

If a leak is found that matches the above definition, repair or replace the component as necessary.

Once the repair is complete, repeat the procedure to verify that all leaks have been repaired.

Were any exhaust leaks found?

Yes

Repair or replace the leaking exhaust parts as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 11.

11. **ENGINE MECHANICAL CONDITION**

Check the exhaust for excessive smoke caused by an internal problem in the engine.

Is an engine mechanical condition present?

Yes

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The State of Change (SOC) catalyst monitor uses the signals from both the upstream and downstream O2 sensors to detect aging of the catalyst. Based on the fact that when a catalyst ages, it loses some of its Oxygen Storage Capacity (OSC). As a result, part of the untreated exhaust gases can breakthrough the catalyst and causes the downstream O2 sensor to deviate from its neutral (Stoichiometric) position. By observing the activities in the downstream O2 signal, the degradation level of catalyst can be detected. In general, the higher the downstream O2 sensor SOC value, the more exhaust gas breakthrough and the lower the OSC of the catalytic converter.

MONITOR CONDITIONS

When Monitored:

The monitor will run at between 1400 and 2300 RPM. It also runs between 40 and 70 KPA.

SET CONDITIONS

- **Set Condition:**

If the final State of Change index is within the calibrated fail threshold. Two trip fault. Three good trips to turn off the MIL.

DIAGNOSTIC TEST

1. ACTIVE DTC

- NOTE:** A new rear O2 Sensor along with an aging front O2 Sensor may cause the DTC to set. Review the repair history of the vehicle before continuing.
- NOTE:** If an O2 Sensor DTC set along with the Catalytic Converter Efficiency DTC diagnose the O2 Sensor DTC(s) before continuing.
- NOTE:** Check for contaminants that may have damaged the O2 Sensor and Catalytic Converter: contaminated fuel, unapproved silicone, oil and coolant, repair necessary.

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, select View DTCs.

- NOTE:** It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

CIRCUIT SCHEMATIC

01902496

Fig. 13: EVAP Purge System Circuit Schematic
Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

The EVAP Purge Monitor tests the integrity of the hoses/tube between the throttle body/intake and the fuel tank. The monitor is a two stage test and runs only after the EVAP system passes the small leak test. Stage one is non-intrusive. The PCM monitors the purge vapor ratio and the ESM switch closed ratio. If the purge vapor ratio is above a calculated value, the monitor passes. If the ESM switch closed ratio is greater than calculated value when purge flow is greater than a minimum value, the monitor passes. Stage two is an intrusive test and runs only if stage one does not pass. The PCM commands the purge solenoid to flow at a specified rate to force the purge vapor ratio to update. The ratio is compared to a calibrated specification. If it is less than specified, a one trip failure is recorded. This test can detect if the purge hose is off, obstructed, or the purge valve is not operational.

MONITOR CONDITIONS

When Monitored:

Engine running after a cold start with the difference between ECT and AAT is less than 10° C (19° F).
Fuel Level between 12% and 88% full. Manifold vacuum greater than a calculated minimum value.
Ambient Temperature between 4° C and 32° C (39° F and 89° F).

SET CONDITIONS

- **Set Condition:**

When the monitor conditions are met, the PCM will ramp in purge flow. If the PCM does not sense an ESM switch closure after a calculated amount of purge flow accumulation, an error is detected. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
EVAP PURGE SOLENOID VACUUM SUPPLY
EVAP PURGE HOSE/TUBE AND FRESH AIR FILTER OBSTRUCTION

EVAP SYSTEM MONITOR SWITCH
EVAP PURGE SOLENOID
POWERTRAIN CONTROL MODULE (PCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. VEHICLE HISTORY AND SERVICE BULLETIN INVESTIGATION

Ignition on, engine not running.

With a scan tool, select View DTCs. Record the related Freeze Frame data if any DTC(s) are present.

Whether or not any DTC(s) are active you will want to check the following items which may assist in repairing the customer's complaint successfully.

Check the vehicle's repair history.

If the vehicle has a repair history that pertains to the customer's current complaint, review the repair.

Inspect the vehicle for any aftermarket accessories that may have been installed incorrectly.

Check for any service bulletin(s) related to the customer's complaint or DTCs.

If a service bulletin applies, follow the instructions per the service bulletin.

Choose the following scenario that best applies.

The service bulletin repaired the customer's complaint.

Testing complete.

A DTC is present, no service bulletins apply, or the service bulletin didn't repair the customer's complaint.

Go To 2.

2. **ACTIVE DTC**

NOTE: Allow the vehicle to reach ambient temperature before continuing with this procedure.

NOTE: A loose gas cap could have caused this DTC to set. Make sure the gas cap is tight and in good condition.

NOTE: If the customer is experiencing an early fuel shut off during the fuel filling process along with P0440, P0441, and P0452 setting, you need to check for restrictions in the EVAP Purge tubes/hoses as well as the Fresh Air Filter before continuing.

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by

reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

Go To 3.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

3. VISUAL AND PHYSICAL INSPECTION

Turn the ignition off.

Perform a visual and physical inspection of the entire Evaporative Emission system.

Check for the following conditions:

- Hoses disconnected or left off
- Holes or cracks
- Loose seal points
- Evidence of damaged components
- Incorrect routing of hoses and tubes
- Fuel Cap left off or bad gasket seal

Were any of the above conditions found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 4.

4. EVAP VACUUM SUPPLY HOSE INSPECTION

Carefully inspect the EVAP Purge Solenoid vacuum supply hose for proper routing.

Check for a pinched or plugged hose from the throttle body or intake manifold to the Purge Solenoid.

Make sure the vacuum port at the throttle body or intake manifold is free from any blockage.

Were any problems found?

Yes

Repair the vacuum supply, hose/tube as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 5.

5. EVAP PURGE SOLENOID

NOTE: To continue testing you will need Miller Tool #8404 Evaporative Emission Leak Detector (EELD).

WARNING: Keep lit cigarettes, sparks, flames, and other ignition sources away from the test area to prevent the ignition of explosive gases, Keep the test area well ventilated.

Connect the red power lead of the EELD to the battery positive terminal and the black ground lead to battery negative terminal.

Disconnect the vacuum hoses at the EVAP Purge Solenoid.

Connect the SMOKE supply tip (black hose) to the "CAN" port on the EVAP Purge Solenoid.

Set the smoke/air control switch to SMOKE.

While still holding the remote smoke/air start button, check to see if smoke is exiting the purge valve. This indicates that there is a leak internal to the purge valve.

NOTE: This is an optional method of checking the purge valve for leaks if the EELD is unavailable.

Disconnect the Smoke supply tip from the vacuum supply hoses at the EVAP Purge Solenoid.

Using a hand vacuum pump, apply 10 in Hg to the "CAN" side of the EVAP Purge Solenoid.

Observe the vacuum gauge for at least 15 seconds.

Is smoke visible from the EVAP Purge Solenoid or NOT hold a vacuum?

Yes

Replace the EVAP Purge Solenoid.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 6.

6. **ESIM SWITCH STATE**

Fig. 14: Checking ESM Switch State
Courtesy of CHRYSLER LLC

Turn the ignition off.

Connect the previously disconnected vacuum hose.

Disconnect the EVAP System Monitor Switch harness connector.

Ignition on, engine not running.

Monitor the ESIM Switch state on the scan tool.

Carefully connect a jumper wire between the (K107) ESM Signal circuit and the (Z913) Ground circuit in the EVAP System Monitor Switch harness connector.

Monitor the ESIM Switch state on the scan tool.

Did the Switch change from OPEN to CLOSED when the jumper wire was installed?

Yes

Go To 9.

No

Go To 7.

7. EXCESSIVE RESISTANCE IN THE (K107) ESM SIGNAL CIRCUIT

Fig. 15: Checking ESM Signal Circuit For Excessive Resistance
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the C3 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (K107) ESM Signal circuit from the ESM harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

Go To 8.

No

Repair the excessive resistance in the (K107) ESM Signal circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

8. EXCESSIVE RESISTANCE IN THE (Z913) GROUND CIRCUIT

Fig. 16: Checking ESM Switch Ground Circuit For Excessive Resistance
Courtesy of CHRYSLER LLC

Using a 12-volt test light connected to B+, probe the (Z913) Ground circuit in the ESM harness connector.

NOTE: The test light should illuminate brightly. Compare the brightness to that of a direct connection to B- (ground).

Does the test light illuminate brightly?

Yes

Go To 14.

No

Repair the excessive resistance in the (Z913) Ground circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

9. VERIFY EVAPORATIVE EMISSION LEAK

WARNING: Keep lit cigarettes, sparks, flames, and other ignition sources away from the test area to prevent the ignition of explosive gases. Keep the test area well ventilated.

Turn the ignition off.

To continue testing you will need Miller Tool #8404 Evaporative Emission Leak Detector (EELD).

NOTE: The fuel tank should have between 20% and 80% of fuel tank capacity to properly test the EVAP system.

Connect the red power lead of EELD to the battery positive terminal and the black ground lead to battery negative terminal.

Block the vent hose of the EVAP Canister.

Connect shop air to the EELD.

Set the smoke/air control switch to AIR.

Insert the tester's AIR supply tip (clear hose) into the .040 orifice on the tester's control panel.

Press the remote smoke/air start button.

Position the red flag on the air flow meter so it is aligned with the indicator ball.

When the calibration is complete, release the remote button. The EELD flow meter is now calibrated in liters per minute.

Install the service port adapter #8404-14 on the vehicle's service port (if equipped) or install the #8404-ADP into the filter line.

Connect the Air supply hose from the EELD to the service port (if equipped) or to the #8404-ADP adapter.

Press the remote button to activate AIR flow.

Compare the flow meter indicator ball reading to the red flag.

ABOVE the red flag indicates a leak present.

BELOW the red flag indicates a sealed system.

Is the indicator ball above the red flag?

Yes

Go To 10.

No

Go To 12.

10. **EVAPORATIVE EMISSION LEAK DETECTION**

NOTE: A thorough visual inspection of the EVAP system hoses, tubes, and connections may save time in your diagnosis. Look for any physical damage or signs of wetness at connections. The strong smell of fuel vapors may aid diagnosis also.

Remove the Air supply hose from the service port or the #8404-ADP adapter.

Connect the SMOKE supply tip (black hose) to the service port (if equipped) or to the #8404-ADP adapter.

Set the smoke/air control switch to SMOKE.

NOTE: The flow meter indicator ball will not move at this point.

Press the remote smoke/air start button.

NOTE: Make sure that smoke has filled the EVAP system by continuing to press the remote smoke/air start button, remove the vehicle fuel cap, and wait for the smoke to exit. Once smoke is indicated reinstall the fuel cap.

NOTE: For optimal performance, introduce smoke into the system for an additional 60 seconds; continue introducing smoke at 15 second intervals, as necessary.

While still holding the remote smoke/air start button, use the white light (#8404-CLL) to follow the EVAP system path, and look for the source of the leak indicated by exiting smoke.

If a leak is concealed from view (i.e, top of fuel tank), release the remote smoke/air start button, and use the ultraviolet (UV) black light #8404-UVL and the yellow goggles 8404-20 to look for residual traces of dye that are left behind by the smoke.

The exiting smoke deposits a residual fluid that is either bright green or bright yellow in color when viewed with a UV light.

NOTE: The EVAP System is divided into three zones. A leak from any of these zones can cause this DTC to set. The lists below specify the possible leak points in that specific zone. For further assistance see the Zone Identification below.

NOTE: Carefully inspect the vent side of the EVAP Canister. Due to the filtering system in the canister the smoke or dye may or may not be visible. Introducing smoke into the filtered side of the canister may assist in locating the leak.

Select the appropriate response from the list below:

A leak was found at the gas cap or fuel filler tube.

Go To 11.

A leak was found in one or more of the EVAP System zones.

If the leak is at a hose connection, remove the hose then reconnect the hose and check for a leak again. All other leaks repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No leaks were detected.

Go To 12.

11. LEAK AT GAS CAP

Remove the SMOKE supply tip (black hose) from the service port (if equipped) or to the #8404-ADP adapter.

Install gas cap adapter, Miller Tool #8382 (1/4 turn cap) or #6922 (screw cap) and #8399 (secondary seal depressor) and repeat test 5.

NOTE: The gas cap adapter is being used as a known good cap.

Was a leak found at the gas cap adapter?

Yes

Replace the Fuel Filler tube assembly.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace the gas cap.

Perform **POWERTRAIN VERIFICATION TEST** .

12. **EVAP PURGE HOSE/TUBE AND FRESH AIR FILTER OBSTRUCTION**

Inspect the EVAP Purge hose/tube for proper routing and installation between the EVAP Purge Solenoid and the Fuel Tank between the Fuel Tank and the EVAP Purge Canister

Make sure the hose/tube and fresh air filter are not damaged, kinked, and free from any obstructions.

Were any problems found?

Yes

Repair or replace as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 13.

13. **EVAP SYSTEM MONITOR SWITCH**

Use the wiring diagram/schematic as a guide, inspect the wiring and connections between the EVAP System Monitor Switch and the PCM.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for any broken, bent, pushed out, or corroded terminals.

Verify that there is good pin to terminal contact in the ESIM Switch and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

The EVAP Purge Monitor tests the integrity of the hoses/tube between the throttle body/intake and the fuel tank. The monitor is a two stage test and runs only after the EVAP system passes the small leak test. Stage one is non-intrusive. The PCM monitors the purge vapor ratio and the ESM switch closed ratio. If the purge vapor ratio is above a calculated value, the monitor passes. If the ESM switch closed ratio is greater than calculated value when purge flow is greater than a minimum value, the monitor passes. Stage two is an intrusive test and runs only if stage one does not pass. The PCM commands the purge solenoid to flow at a specified rate to force the purge vapor ratio to update. The ratio is compared to a calibrated specification. If it is less than specified, a one trip failure is recorded. This test can detect if the purge hose is off, obstructed, or the purge valve is not operational.

MONITOR CONDITIONS

When Monitored:

After the EVAP System small leak test has passed, with the engine running, ambient temperature between 4° C (39° F) and 35° (95° F), with the engine at idle after a calibrated amount of drive time has accumulated.

SET CONDITIONS

- **Set Condition:**

If the PCM detects that the purge vapor ratio and the ESM switch closed ratio are below a calculated value, the PCM commands the purge solenoid to flow at a specified rate to update the purge vapor ratio. If the ratio remains below a specified value, a one trip failure is recorded. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
EVAP PURGE SOLENOID VACUUM SUPPLY
EVAP PURGE HOSE/TUBE AND FRESH AIR FILTER OBSTRUCTION
EVAP PURGE SOLENOID
POWERTRAIN CONTROL MODULE (PCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. VEHICLE HISTORY AND SERVICE BULLETIN INVESTIGATION

Ignition on, engine not running.

With a scan tool, select View DTCs. Record the Freeze Frame data if any DTCs are present.

Whether or not any DTC(s) are Active you will want to check the following items which may assist in repairing the customer's complaint successfully.

Check the vehicle's repair history.

If the vehicle has a repair history that pertains to the customer's current complaint, review the repair.

Inspect the vehicle for any aftermarket accessories that may have been installed incorrectly.

Check for any service bulletin(s) related to the customer's complaint or DTC(s).

If a service bulletin applies, follow the instructions per the service bulletin.

Choose the following scenario that best applies.

The service bulletin repaired the customer's complaint.

Testing complete.

A DTC is present, no service bulletins apply, or the service bulletin didn't repair the customer's complaint.

Go To 2.

2. ACTIVE DTC

NOTE: If P0443 is set along with this DTC, perform the diagnostic procedure for P0443 before continuing with this test.

NOTE: If the customer is experiencing an early fuel shut off during the fuel filling process along with P0440, P0441, and P0452 setting, you need to check for restrictions in the EVAP Purge tubes/hoses as well as the Fresh Air Filter before continuing.

Start the engine.

Allow the engine to idle.

Using the scan tool, perform the ESIM FORCED MONITOR TEST. Allow the test to complete.

With a scan tool, select View DTCs.

NOTE: If any other DTC sets, active or pending, perform the diagnostic procedure for that DTC before proceeding with this test.

Is the DTC Active at this time?

Yes

Go To 3.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

3. VISUAL INSPECTION

Inspect the EVAP System for any of the following conditions:

- Holes or cracks
- Loose seal points
- Damaged or missing components
- Incorrect routing of hoses and tubes
- Loose or missing Fuel Cap
- Damaged or missing Fuel Cap seal
- Improper installation of the Fuel Cap
- Damaged Locking tabs on the Fuel Cap and/or filler tube
- Damaged seal points on the Fuel Cap and/or filler tube

Were any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 4.

4. INSUFFICIENT VACUUM SUPPLY TO THE EVAP PURGE SOLENOID

Turn the ignition off.

Carefully inspect the EVAP Purge Solenoid vacuum supply hose for proper routing.

Check for a pinched or plugged hose from the throttle body or intake manifold to the Purge Solenoid.

Inspect the vacuum port at the throttle body or intake manifold for any damage or obstructions.

Were any problems found?

Yes

Repair the vacuum supply hose/tube as necessary.
Perform **POWERTRAIN VERIFICATION TEST** .

No

Go to 5.

5. EVAP PURGE HOSE/TUBE AND FRESH AIR FILTER OBSTRUCTION

Inspect the EVAP Purge hose/tube for proper routing and installation between the EVAP Purge Solenoid and the Fuel Tank and between the Fuel Tank and the EVAP Purge Canister.

Make sure the hose/tube and fresh air filter are not damaged, kinked, and free from any obstructions.

Were any problems found?

Yes

Repair or replace as necessary.
Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 6.

6. EVAP PURGE SOLENOID

NOTE: **After disconnecting the EVAP Purge Solenoid vacuum connections, inspect the lines and solenoid for signs of contamination.**

Using a hand vacuum pump, apply 10 in Hg to the "CAN" side of the EVAP Purge Solenoid.

NOTE: **The solenoid should hold vacuum for a minimum of 15 seconds.**

Ignition on, engine not running.

With the scan tool, actuate the EVAP Purge Solenoid to the ON position.

NOTE: **The vacuum should drop when the solenoid is actuated.**

Does the solenoid function as described above?

Yes

Go To 7.

No

Replace the EVAP Purge Solenoid.

Perform **POWERTRAIN VERIFICATION TEST** .

7. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EVAP Purge Solenoid Assembly, ESIM Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Switch, Solenoid, and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

NOTE: **The DTC needs to be cleared before actuating the Purge Solenoid, if the DTC is not cleared, the Solenoid may not be allowed to actuate.**

With the scan tool, actuate the EVAP Purge Solenoid control to the ON (100%) position.

Using a 12-volt test light connected to ground, probe the (K52) EVAP Purge Control circuit in the EVAP Purge Solenoid harness connector.

NOTE: The test light should be illuminated and bright proportional to the maximum duty cycle allowed by the scan tool. For example, if the scan tool allows 100% actuation, the brightness should be as bright as a direct connection to the battery. If the scan tool allows a maximum 25% actuation, the brightness should be 25% as bright as a direct connection to the battery.

Does the test light illuminate accordingly?

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

With the engine running, during a cold start test with the fuel level above 12%, ambient temperature between 4° C and 32° C (39° F and 89° F) and the fuel system in closed loop. The test runs when the small leak test is maturing.

SET CONDITIONS

- **Set Condition:**

The PCM activates the EVAP Purge Solenoid to pull the EVAP system into a vacuum to close the ESM switch. Once the ESM switch is closed, the PCM turns the EVAP Purge solenoid off to seal the EVAP system. If the ESM switch reopens before the calibrated amount of time, a large leak error is detected. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes

DIAGNOSTIC TEST

1. VEHICLE HISTORY AND SERVICE BULLETIN INVESTIGATION

Ignition on, engine not running.

With a scan tool, select View DTCs and record the related Freeze Frame data if any DTC(s) are present.

Whether or not any DTC(s) are Active you will want to check the following items which may assist in repairing the customer's complaint successfully.

Check the vehicle's repair history.

If the vehicle has a repair history that pertains to the customer's current complaint, review the repair.

Inspect the vehicle for any aftermarket accessories that may have been installed incorrectly.

Check for any service bulletin(s) related to the customer's complaint or DTC(s).

Choose the following scenario that best applies.

The service bulletin repaired the customer's complaint.

Testing complete.

A DTC is present, no service bulletins apply, or the service bulletin didn't repair the customer's complaint.

Go To 2.

2. ACTIVE DTC

NOTE: Since a hot vehicle can conceal a leak, it is best to perform this test at room temperature.

NOTE: A loose gas cap could have caused this DTC to set. Make sure gas cap is tight and in good condition. Make sure the gas cap meets OEM specifications.

Start the engine.

Allow the engine to idle.

Using the scan tool, perform the ESIM FORCED MONITOR TEST. Allow the test to complete.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

Go To 3.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

3. EVAPORATIVE SYSTEM INSPECTION

Perform a visual and physical inspection of the entire Evaporative Emission system.

Check for the following conditions:

- Holes or cracks
- Loose seal points

- Evidence of damaged components
- Incorrect routing of hoses and tubes
- Loose or missing Fuel Filler Cap
- Improper installation of the Fuel Fill Cap
- Damaged Locking tabs on Cap and/or fill tube
- Damaged seal points on Cap and/or fill tube
- Fuel cap gasket seal

Were any of the above conditions found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 4.

4. VERIFY EVAPORATIVE EMISSION LEAK

WARNING: Keep lit cigarettes, sparks, flames, and other ignition sources away from the test area to prevent the ignition of explosive gases. Keep the test area well ventilated.

To continue testing you will need Miller Tool #8404A Evaporative Emission Leak Detector (EELD).

NOTE: The fuel tank should have between 20% and 80% of fuel tank capacity to properly test the EVAP system.

Connect the red power lead of the EELD to the battery positive terminal and the black ground lead to battery negative terminal.

Block the vent hose of the canister if using the service port.

Connect shop air to the EELD.

Set the smoke/air control switch to AIR.

Insert the tester's AIR supply tip (clear hose) into the appropriate calibration orifice on the tester's control panel (based on DTC leak size).

Press the remote smoke/air start button.

Position the red flag on the air flow meter so it is aligned with the indicator ball.

When the calibration is complete, release the remote button. The EELD flow meter is now calibrated in liters per minute to the size leak indicated by the DTC set in the PCM.

Install the service port adapter #8404-14 on the vehicle's service port and block the vent hose of the EVAP Canister (if equipped) or install the #8404-ADP service adapter into the filter line.

Connect the Air supply hose from the EELD to the service port (if equipped) or to the #8404-ADP adapter.

Press the remote button to activate AIR flow.

NOTE: Larger volume fuel tanks, lower fuel levels or if the vehicle is equipped with a Flow Management Valve may indicate high flow and will require 4 to 5 minutes to fill.

Compare the flow meter indicator ball reading to the red flag.

ABOVE the red flag indicates a leak present.

BELOW the red flag indicates a sealed system.

Is the indicator ball above the red flag?

Yes

Go To 5.

No

Refer to the Freeze Frame data recorded in step 1. If the data indicates that the vehicle was in motion when the DTC was set, verify that all hoses are properly connected.

Perform **POWERTRAIN VERIFICATION TEST** .

5. EVAPORATIVE EMISSION LEAK DETECTION

NOTE: A thorough visual inspection of the EVAP system hoses, tubes, and connections may save time in your diagnosis. Look for any physical damage or signs of wetness at connections. The strong smell of fuel vapors may aid diagnosis also.

To continue testing, you will need Miller Tool #8404A Evaporative Emissions Leak Detector (EELD).

Remove the Air supply hose from the service port (if equipped) or from the #8404-ADP adapter.

Connect the SMOKE supply tip (black hose) to the service port (if equipped) or to the #8404-ADP adapter.

Set the smoke/air control switch to SMOKE.

NOTE: **The flow meter indicator ball will not move in the smoke mode.**

Press the remote smoke/air start button.

NOTE: **Make sure that smoke has filled the EVAP system by continuing to press the remote smoke/air start button, remove the vehicle fuel cap, and wait for the smoke to exit. Once smoke is indicated reinstall the fuel cap.**

NOTE: **For optimal performance, introduce smoke into the system for an additional 60 seconds; continue introducing smoke at 15 second intervals, as necessary.**

While still holding the remote smoke/air start button, use the white light (#8404-CLL) to follow the EVAP system path, and look for the source of the leak indicated by exiting smoke.

If a leak is concealed from view (i.e, top of fuel tank), release the remote smoke/air start button, and use the ultraviolet (UV) black light #8404-UVL and the yellow goggles 8404-20 to look for residual traces of dye that is left behind by the smoke.

The exiting smoke deposits a residual fluid that is either bright green or bright yellow in color when viewed with a UV light.

NOTE: **The EVAP System is divided into three zones. A leak from any of these zones can cause this DTC to set. The lists below specify the possible leak points in that specific zone. For further assistance see the Zone Identification below.**

NOTE: Carefully inspect the vent side of the EVAP Canister. Due to the filtering system in the canister the smoke may not be as thick. Introducing smoke into the filtered side of the canister may assist in locating the leak.

Select the appropriate response from the list below:

A leak was found at the gas cap or fuel filler tube

Go To 6.

6. LEAK AT GAS CAP

Remove the SMOKE supply tip (black hose) from the service port (if equipped) or to the #8404-ADP adapter.

Install gas cap adapter, Miller Tool #8382 (1/4 turn cap) or #6922 (screw cap) and #8399 (secondary seal depressor) and repeat test 5.

NOTE: The gas cap adapter is being used as a known good cap.

Was a leak found at the gas cap adapter?

Yes

Replace the Fuel Filler tube assembly.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace the gas cap.

Perform **POWERTRAIN VERIFICATION TEST** .

7. **EVAP PURGE SOLENOID OPERATION**

NOTE: **After disconnecting the EVAP Purge Solenoid vacuum connections, inspect the lines and solenoid for any signs of contamination from the EVAP Canister.**

Turn the ignition off.

Disconnect the EVAP Purge Solenoid Vacuum hose at the Throttle Body.

NOTE: **You are disconnecting the vacuum line at the Throttle Body so you are not disturbing the vacuum connection at the EVAP Purge Solenoid.**

Press the remote smoke/air start button on the EELD.

While holding the remote smoke/air start button, check to see if smoke is exiting the EVAP Purge Solenoid Vacuum hose at the Throttle Body. This indicates that there is a leak internal to the purge valve.

NOTE: **Below is an optional method of checking the purge valve for leaks if the EELD is unavailable.**

Turn the ignition off.

Disconnect the vacuum hoses at the EVAP Purge Solenoid.

Using a hand vacuum pump, apply 10 in HG to the "CAN" of the EVAP Purge Solenoid.

NOTE: **Monitor the vacuum gauge for at least 15 seconds.**

Is smoke visible from the EVAP Purge Solenoid Vacuum hose if using the EELD, or will it not hold a vacuum?

Yes

Replace the EVAP Purge Solenoid.

Perform **POWERTRAIN VERIFICATION TEST** .

No

CIRCUIT SCHEMATIC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

With the ignition off, fuel level less than 88%, ambient temperature between 4° C and 43° C (39° F and 109° F), and the fuel system in closed loop.

SET CONDITIONS

- **Set Condition:**

As temperatures change, a vacuum is created in the fuel tank and EVAP system. With the EVAP system sealed, the PCM monitors the ESM switch. If the ESM switch does not close within a calibrated time, an error is detected by the PCM. One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
EVAP PURGE SYSTEM LEAK
EVAP PURGE SOLENOID
EVAP SYSTEM MONITOR SWITCH

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. VEHICLE HISTORY AND SERVICE BULLETIN INVESTIGATION

Ignition on, engine not running.

With a scan tool, select View DTCs and record the related Freeze Frame data if any DTC(s) are present.

Whether or not any DTC(s) are Active you will want to check the following items which may assist in repairing the customer's complaint successfully.

Check the vehicle's repair history.

If the vehicle has a repair history that pertains to the customer's current complaint, review the repair.

Inspect the vehicle for any aftermarket accessories that may have been installed incorrectly.

Check for any service bulletin(s) related to the customer's complaint or DTC(s).

If a service bulletin applies, follow the instructions per the service bulletin.

Choose the following scenario that best applies.

The service bulletin repaired the customer's complaint.

Testing complete.

A DTC is present, no service bulletins apply, or the service bulletin didn't repair the customer's complaint.

Go To 2.

2. ACTIVE DTC

NOTE: Since a hot vehicle can conceal a leak, it is best to perform this test at room temperature.

NOTE: A loose gas cap could have caused this DTC to set. Make sure gas cap is tight and in good condition. Make sure the gas cap meets OEM specifications.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

Go To 3.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

3. VISUAL AND PHYSICAL INSPECTION

Perform a visual and physical inspection of the entire Evaporative Emission system.

Check for the following conditions:

- Holes or cracks
- Loose seal points
- Evidence of damaged components
- Incorrect routing of hoses and tubes
- Loose or missing Fuel Filler Cap

- Improper installation of the Fuel Fill Cap
- Damaged Locking tabs on Cap and/or fill tube
- Damaged seal points on Cap and/or fill tube
- Fuel cap gasket seal

Were any of the above conditions found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST**.

No

Go To 4.

4. VERIFY EVAPORATIVE EMISSION LEAK

WARNING: Keep lit cigarettes, sparks, flames, and other ignition sources away from the test area to prevent the ignition of explosive gases. Keep the test area well ventilated.

To continue testing you will need Miller Tool #8404A Evaporative Emission Leak Detector (EELD).

NOTE: The fuel tank should have between 20% and 80% of fuel tank capacity to properly test the EVAP system.

Connect the red power lead of the EELD to the battery positive terminal and the black ground lead to battery negative terminal.

Block the vent hose of the canister if using the service port.

Connect shop air to the EELD.

Set the smoke/air control switch to AIR.

Insert the tester's AIR supply tip (clear hose) into the appropriate calibration orifice on the tester's control panel (based on DTC leak size).

Press the remote smoke/air start button.

Position the red flag on the air flow meter so it is aligned with the indicator ball.

When the calibration is complete, release the remote button. The EELD flow meter is now calibrated in

liters per minute to the size leak indicated by the DTC set in the PCM.

Install the service port adapter #8404-14 on the vehicle's service port and block the vent hose of the EVAP Canister (if equipped) or install the #8404-ADP service adapter into the filter line.

Connect the Air supply hose from the EELD to the service port (if equipped) or to the #8404-ADP adapter.

Press the remote button to activate AIR flow.

NOTE: **Larger volume fuel tanks, lower fuel levels or if the vehicle is equipped with a Flow Management Valve may indicate high flow and will require 4 to 5 minutes to fill.**

Compare the flow meter indicator ball reading to the red flag.

ABOVE the red flag indicates a leak present.

BELOW the red flag indicates a sealed system.

Is the indicator ball above the red flag?

Yes

Go To 5.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

5. EVAPORATIVE EMISSION LEAK DETECTION

NOTE: **A thorough visual inspection of the EVAP system hoses, tubes, and connections may save time in your diagnosis. Look for any physical damage or signs of wetness at connections. The strong smell of fuel vapors may also aid diagnosis.**

To continue testing, you will need Miller Tool #8404A Evaporative Emissions Leak Detector (EELD).

Remove the Air supply hose from the service port (if equipped) or from the #8404-ADP adapter.

Connect the SMOKE supply tip (black hose) to the service port (if equipped) or to the #8404-ADP adapter.

Set the smoke/air control switch to SMOKE.

NOTE: **The flow meter indicator ball will not move in the smoke mode.**

Press the remote smoke/air start button.

NOTE: **Make sure that smoke has filled the EVAP system by continuing to press the remote smoke/air start button, remove the vehicle fuel cap, and wait for the smoke to exit. Once smoke is indicated reinstall the fuel cap.**

NOTE: **For optimal performance, introduce smoke into the system for an additional 60 seconds; continue introducing smoke at 15 second intervals, as necessary.**

While still holding the remote smoke/air start button, use the white light (#8404-CLL) to follow the EVAP system path, and look for the source of the leak indicated by exiting smoke.

If a leak is concealed from view (i.e, top of fuel tank), release the remote smoke/air start button, and use the ultraviolet (UV) black light #8404-UVL and the yellow goggles 8404-20 to look for residual traces of dye that is left behind by the smoke.

The exiting smoke deposits a residual fluid that is either bright green or bright yellow in color when viewed with a UV light.

NOTE: **The EVAP System is divided into three zones. A leak from any of these zones can cause this DTC to set. The lists below specify the possible leak points in that specific zone. For further assistance see the Zone Identification below.**

NOTE: Carefully inspect the vent side of the EVAP Canister. Due to the filtering system in the canister the smoke may not be as thick. Introducing smoke into the filtered side of the canister may assist in locating the leak.

Select the appropriate response from the list below:

A leak was found at the gas cap or fuel filler tube

Go To 6.

A leak was found in one or more of the EVAP System zones

If the leak is at a hose connection, remove the hose then reconnect the hose and check for a leak again. All other leaks repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No leaks were detected

Go To 7.

6. LEAK AT GAS CAP

Remove the SMOKE supply tip (black hose) from the service port (if equipped) or to the #8404-ADP adapter.

Install gas cap adapter, Miller Tool #8382 (1/4 turn cap) or #6922 (screw cap) and #8399 (secondary seal depressor) and repeat test 5.

NOTE: The gas cap adapter is being used as a known good cap.

Was a leak found at the gas cap adapter?

Yes

Replace the Fuel Filler tube assembly.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace the gas cap.

Perform **POWERTRAIN VERIFICATION TEST** .

7. **EVAP PURGE SOLENOID**

NOTE: **After disconnecting the EVAP Purge Solenoid vacuum connections, inspect the lines and solenoid for any signs of contamination from the EVAP Canister. This may indicate a faulty check valve. Replace/repair as necessary.**

Turn the ignition off.

Disconnect the EVAP Purge Solenoid Vacuum hose at the Throttle Body.

NOTE: **You are disconnecting the vacuum line at the Throttle Body so you are not disturbing the vacuum connection at the EVAP Purge Solenoid.**

Press the remote smoke/air start button on the EELD.

While holding the remote smoke/air start button, check to see if smoke is exiting the EVAP Purge Solenoid Vacuum hose at the Throttle Body. This indicates that there is a leak internal to the purge valve.

NOTE: **Below is an optional method of checking the purge valve for leaks if the EELD is unavailable.**

Turn the ignition off.

Disconnect the vacuum supply hose at the EVAP Purge Solenoid.

Using a hand vacuum pump, apply 10 in HG to the "CAN" of the EVAP Purge Solenoid.

NOTE: **Monitor the vacuum gauge for at least 15 seconds.**

Is smoke visible from the EVAP Purge Solenoid if using the EELD, or not hold a vacuum?

Yes

Replace the EVAP Purge Solenoid.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 8.

8. EVAP SYSTEM MONITOR SWITCH

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EVAP System Monitor Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Verify that there is good pin to terminal contact in the Switch and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace the EVAP System Monitor Switch per Service Information.

P0457-LOOSE FUEL CAP

CIRCUIT SCHEMATIC

01962496

Fig. 39: EVAP Purge System Circuit Schematic
Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Fuel level is recorded when the ignition key is turned off and is compared to the fuel level when the ignition key is turned back on. The PCM recognizes an increase in fuel level and will fail the Medium leak test because the fuel cap is broken or not installed properly. GAS CAP will be displayed in odometer to inform the owner that the cap is off of loose.

MONITOR CONDITIONS

When Monitored:

Ignition on. Ambient Temperature between 4° C and 32° C (39° F and 89° F). Close Loop fuel system. Test runs after the medium leak test is inconclusive and the PCM has senses a fuel increase.

SET CONDITIONS

- **Set Condition:**

If a leak greater than.090" is detected by the PCM for two consecutive cold start trips after a significant fuel level change, this DTC will set. One good trip turns off the MIL.

POSSIBLE CAUSES

Possible Causes
LOOSE OR MISSING FUEL CAP

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. DTC IS ACTIVE

- NOTE:**

If DTC P0455-EVAP SYSTEM LARGE LEAK is set along with this DTC, perform the diagnostic procedure for P0455 before continuing with this test.
- NOTE:**

Do not replace the gas cap for DTC P0457-EVAP SYSTEM - LOOSE FUEL CAP.

With a scan tool, select View DTCs.

Is the status Active for DTC P0455-EVAP SYSTEM LARGE LEAK along with this DTC?

Yes

Perform the diagnostic procedure for P0455-EVAP SYSTEM LARGE LEAK.

No

No repair is necessary. Verify that the gas cap is in place and tight. Clear DTCs and follow the directions outlined in the service information under Instrument Cluster on resetting the odometer or message center display.

P0461-FUEL LEVEL SENSOR 1 PERFORMANCE

CIRCUIT SCHEMATIC

The fuel level rationality will set a fault for a fuel level reading that does not change over an accumulated mileage threshold to keep stuck high or stuck low fuel levels from disabling OBD monitors. If the vehicle is fitted with a saddle tank fuel system this feature includes diagnostics for both of the sending units and diagnostics for a siphon tube that has become disconnected or plugged. The power up test looks to see a large enough fuel level voltage change from the last key-off to the following engine run. The engine run test looks to see a fuel level voltage change over an accumulated mileage.

MONITOR CONDITIONS

When Monitored:

TEST No.1: With the ignition on, the fuel level is compared to the previous key down after a 20 second delay. TEST No.2: The PCM monitors the fuel level at ignition on.

SET CONDITIONS

- **Set Condition:**

TEST No.1: If the PCM does not see a difference in fuel level of greater than 0.1 volt the test will fail.
TEST No.2: If the PCM does not see a change in the fuel level of .1765 over a set amount of miles the test will fail. Two trip fault. Three good trips to turn off the MIL.

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

The vehicle speed sensor rationality is a continuous test that monitors the vehicle speed sensor for lack of activity. The rationality will not run if a limp-in exists for MAP, Throttle Position, and Engine Coolant Temperature. If vehicle speed sensor is below a minimum threshold for a period of time after the vehicle is operated at a sufficient load, a failure will be indicated.

MONITOR CONDITIONS

When Monitored:

With the engine running, transmission not in park or neutral, brakes not applied, and engine RPM greater than 1500.

SET CONDITIONS

- **Set Condition:**

This code will set if no vehicle speed signal is received from the ABS Module up to 120 seconds for 2 consecutive trips. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
ACTIVE BUS OR COMMUNICATION DTCS
TIRE CIRCUMFERENCE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. **ACTIVE DTC**

Ignition on, engine not running.

NOTE: Check for any Bus Communication DTCs. If no Bus or Communication DTCs are set, check for active DTCs stored in the Anti-Lock Brake Module. Any bus or communication DTCs or VSS DTCs in the Anti-Lock Brake Module must be properly diagnosed before continuing.

Start the engine.

Allow the engine to idle.

NOTE: It may be necessary to drive the vehicle for the fault to become Active.

With a scan tool, select View DTCs.

Is the status Active or Pending for this DTC?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. VISUAL INSPECTION

NOTE: **This code can set due to tire circumference differences and from the front or rear wheels being on a slippery surface while the opposite tires are not.**

This code may also set on a hard acceleration on loose gravel or during other off road driving conditions.

Check tire pressure of all the tires.

Check tire wear on all the tires.

Ask the customer what the road and driving conditions were like when the fault set.

Were any problems found?

Yes

Repair as necessary. If the code set during a front OR rear wheel spin condition, no repair is necessary.

P0506-IDLE SPEED PERFORMANCE LOWER THAN EXPECTED

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The objective of the Idle Speed Rationality is to monitor the ability to achieve and maintain a steady idle condition. The monitor will judge the functionality of the idle speed control system by monitoring RPM during idle. If RPM does not come within a calibrated deadband of target idle speed, a timer is started. If the timer reaches its maximum threshold without any sign of the RPM trending towards control, a soft failure is generated.

MONITOR CONDITIONS

When Monitored:

With the engine idling in drive, the brake applied, engine run time above a minimum calibrated value, and no VSS, MAF/MAP, ECT, TPS, ETC, CKP Sensor, fuel system, or injector DTCs present.

SET CONDITIONS

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Spark adjustment during a cold start is intended to provide quick response to idle speed variations. The spark adjust diagnostics monitors spark advance on a cold start over a period of time, then compares the average spark advance to a threshold.

MONITOR CONDITIONS

When Monitored:

Cold start condition. Ambient Air temperature between -7° C and 50 ° C (19.4° F and 122° F). Engine Coolant temperature between -7° C and 50 ° C (19.4° F and 122° F). The difference between the Ambient Air temp and ECT temp at Start is equal to or less than 10° C (50° F). Engine running at idle only.

SET CONDITIONS

- **Set Condition:**

Engine RPM is 50 RPM or more (depending on vehicle specifications), below idle speed for at least 3 seconds and the average spark advance is above the threshold, too much spark advance, for a specified time limit. Two trip fault. Three good trips to turn off the MIL.

DIAGNOSTIC TEST

1. **ACTIVE DTC**

Ignition on, engine not running.

NOTE: **Low battery voltage can also cause excessive current draw, in very hot and very cold ambient temperatures. Make sure the battery can pass a load test before continuing.**

With a scan tool, select View DTCs.

Diagnose any other PCM DTCs before continuing.

Start the engine.

Allow the engine to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With a scan tool, select View DTCs.

Is the DTC Active or Pending at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. THROTTLE PLATE INSPECTION

Turn the ignition off.

Remove the Air Cleaner Assembly from the Throttle Body.

Check for any signs of a foreign material (ice, dirt, or excessive carbon build up) on the Throttle Plate or in the bore causing the Throttle Plate to stick.

Were any signs of foreign material or scoring of the throttle plate or bore found?

Yes

Remove the debris if possible or replace the Throttle Body Assembly. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function.

Perform **POWERTRAIN VERIFICATION TEST** .

4. CONTAMINATED FUEL

Inspect the Fuel for contamination. (Dirt, water, or other foreign material)

Is the fuel contaminated?

Yes

Drain the Fuel from the fuel tank into an approved gas holding tank and add clean fuel. Refer to **STANDARD PROCEDURE** .

No

Go To 5.

5. EXCESSIVE RESISTANCE IN THE (K124) ETC MOTOR (+) CIRCUIT

Turn the ignition off.

Disconnect the C2 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 along with the #8815-1 to perform the diagnosis.

Using a voltmeter perform a voltage drop test. Backprobe the (K124) ETC Motor (+) circuit at the Throttle Body harness connector and probe the appropriate terminal of the special tool #8815. Make sure the voltmeter leads are connected so a positive polarity is displayed on the voltmeter.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Start the engine and allow it to reach normal operating temperature.

Monitor the voltmeter.

P050D-COLD START ROUGH IDLE

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The objective of the Dynamic Crankshaft Fuel Control is to reduce the fuel as much as possible during a cold start. The DCFC begins subtracting fuel from a high limit upon a cold start and keeps removing fuel in an attempt to get to a calibrated lean limit. DCFC stops removing fuel when rough idle is detected or the lean limit is reached.

MONITOR CONDITIONS

When Monitored:

Cold start condition. Ambient Air temperature between -7° C and 50° C (19.4° F and 122° F). Engine Coolant temperature between -7° C and 50° C (19.4° F and 122° F). The difference between the Ambient Air temp and ECT temp at Start is equal to or less than 10° C (50° F). Engine running at idle only.

SET CONDITIONS

- Set Condition:**

If a rough idle is detected and the Dynamic Crankshaft Fuel Control remains or returns to the high limit window for a calibrated time. Two trip fault.

DIAGNOSTIC TEST

1. CHECKING FOR CYLINDER MISFIRE CONDITION PRESENT

- NOTE:**

Check for any TSBs that apply to a Misfire condition. Review the vehicle repair history for any misfire condition repairs that have been performed.
- NOTE:**

Reviewing the vehicle repair history may aid in the repair of the misfire condition.

Start the engine.

Allow the engine to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With a scan tool, select View DTCs.

Is P0300 or any other Misfire DTCs set along with the P050D.

Is there a misfire present at this time?

Yes

Refer to the appropriate Cylinder Misfire Diagnostic procedure.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 2.

2. ACTIVE DTC

Diagnose all other trouble codes before continuing.

NOTE: Check for contaminants that may have damaged an O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

Go To 3.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

3. CHECKING FUEL PRESSURE

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Install a fuel pressure gauge to the fuel rail.

Ignition on, engine not running.

With a scan tool, actuate the ASD Fuel System test and observe the fuel pressure gauge.

NOTE: The DTC needs to be cleared before actuating the System Test, if the DTC is not cleared, the System Test may not be allowed to actuate.

NOTE: Fuel pressure specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Turn the ignition off.

Choose a conclusion that best matches your fuel pressure reading.

Within Specification

Go To 4.

Above Specification

Replace the fuel filter/pressure regulator.

Perform **POWERTRAIN VERIFICATION TEST** .

Below Specification

Go To 13.

CAUTION: Stop All Actuations.

4. O2 SENSOR OPERATION

Start the engine.

Allow the engine to reach normal operating temperature.

NOTE: If one of the O2 Sensor's Signal or Return circuit is shorted to ground the scan tool will display all O2 Sensor voltage readings low. The O2 Sensor that is shorted to ground will display a voltage reading near or at 0 volts.

NOTE: If one of the O2 Sensor Signal or Return circuits are shorted to voltage, the scan tool will display all O2 Sensor voltage readings high.

NOTE: After the repairs have been made, verify proper O2 Sensor operation. If all the O2 Sensor voltage readings have not returned to normal, follow the diagnostic procedure for the remaining O2 Sensors.

With a scan tool, monitor all of the O2 Sensor voltage readings.

Is the voltage switching between 2.5 and 3.4 volts for all the O2 Sensors?

Yes

Go To 5.

No

Go To 9.

5. 1/1 O2 SENSOR HEATER OPERATION

Turn the ignition off.

NOTE: Wait a minimum of 10 minutes to allow the O2 Sensor to cool down before continuing the test. Allow the O2 Sensor voltage to stabilize at 5.0 volts.

Ignition on, engine not running.

With a scan tool, actuate the 1/1 O2 Heater Test.

NOTE: The DTC needs to be cleared before actuating the Heater Test, if the DTC is not cleared, the Heater Test may not be allowed to actuate.

With the scan tool, monitor 1/1 O2 Sensor voltage for at least 2 minutes.

Does the voltage stay above 4.5 volts?

Yes

Verify that there is good pin to terminal contact in the 1/1 O2 Sensor and the Powertrain Control Module connectors. Replace the 1/1 O2 Sensor if no problems were found in the connectors.
Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 6.

6. MAP SENSOR OPERATION

Turn the ignition off.

Connect a Vacuum Gauge to a Manifold Vacuum source.

Start the engine.

Allow the engine to idle.

NOTE: If engine will not idle, maintain a constant RPM above idle.

With the scan tool, read the MAP Sensor vacuum value.

Is the scan tool reading within 1" of Hg on the Vacuum Gauge reading?

Yes

Go To 7.

No

Verify that there is good pin to terminal contact in the MAP Sensor and the Powertrain Control Module connectors. Replace the MAP Sensor if no problems were found in the connectors.
Perform **POWERTRAIN VERIFICATION TEST** .

7. ECT SENSOR OPERATION

NOTE: For this test to be valid, the thermostat must be operating correctly.

NOTE: This test works best if performed on a cold engine (cold soak)

Ignition on, engine not running.

With a scan tool, read the Engine Coolant Temperature (ECT) Sensor value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the ambient temperature.

NOTE: If engine coolant temperature is above 82° C (180° F), allow the engine to

cool until 65° C (150° F) is reached.

Start the Engine.

During engine warm-up, monitor the ECT Sensor value. The temperature value change should be a smooth transition from start up to normal operating temperature 82° C (180° F). The value should reach at least 82° C (180° F).

Did the ECT value increase smoothly and did it reach at least 82° C (180° F)?

Yes

Go To 8.

No

Verify that there is good pin to terminal contact in the ETC Sensor and the Powertrain Control Module connectors. Replace the Engine Coolant Temperature Sensor if no problems were found in the connectors.

Perform **POWERTRAIN VERIFICATION TEST** .

8. ENGINE MECHANICAL PROBLEM

Turn the ignition off.

Check for any of the following conditions/mechanical problems.

AIR INDUCTION SYSTEM - must be free from leaks.

ENGINE VACUUM - must be at least 13 inches in neutral

ENGINE VALVE TIMING - must be within specifications

ENGINE COMPRESSION - must be within specifications

ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks.

ENGINE PCV SYSTEM - must flow freely

TORQUE CONVERTER STALL SPEED - must be within specifications

POWER BRAKE BOOSTER - no internal vacuum leaks

FUEL - must be free of contamination

FUEL INJECTOR - plugged or restricted injector; control wire not connected to correct injector

Are there any engine mechanical problems?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 12.

Turn the ignition off.

Disconnect the 1/1 O2 Sensor harness connector.

Ignition on, engine not running.

With a scan tool, monitor the 1/1 O2 Sensor voltage.

O2 Sensor voltage should read between 4.1 and 5.0 volts on the scan tool with the connector disconnected.

Connect a jumper wire between the (K41) O2 1/1 Signal circuit and the (K902) O2 Return Upstream circuit in the O2 Sensor harness connector.

NOTE: **The voltage should drop from between 4.1 and 5.0 volts to 2.5 volts with the jumper wire in place.**

Did the O2 Sensor voltage change from between 4.1 and 5.0 volts to 2.5 volts with the jumper wire installed?

Yes

Verify that there is good pin to terminal contact in the related Sensors and the Powertrain Control Module connectors. Replace the 1/1 O2 Sensor.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 10.

NOTE: **Remove the jumper wire before continuing.**

10. (K41) O2 SENSOR 1/1 SIGNAL CIRCUIT

With a scan tool, monitor the 1/1 O2 Sensor voltage reading with the jumper wire removed.

NOTE: **The scan tool will display all O2 Sensor voltage readings approximately 5.0 volts when only one O2 Sensor's Signal circuit is shorted to voltage.**

NOTE: **The scan tool will display one O2 Sensor voltage close to zero and the others will read lower than normal when one O2 Sensor Signal circuit contains excessive resistance.**

Is the voltage between 4.1 and 5.0 volts?

Yes

Go To 11.

No

Check the (K41) O2 Sensor 1/1 Signal circuit for a short to ground, open, or short to voltage. Inspect the O2 Sensor connector and the PCM harness connector. If OK, replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

11. **(K902) O2 RETURN UPSTREAM CIRCUIT**

**SENSOR-
OXYGEN**

Fig. 61: Checking O2 Sensor Return Upstream & Downstream Circuits
Courtesy of CHRYSLER LLC

Measure the voltage on the (K902) O2 Return Upstream circuit in the O2 Sensor harness connector.

Is the voltage at 2.5 volts?

Yes

Go To 12.

No

Check the O2 Return circuit for a short to ground, open, or short to voltage. Inspect the O2 Sensor connector and the PCM harness connector. If OK, replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

12. **POWERTRAIN CONTROL MODULE (PCM)**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the related Sensors and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out, or corroded terminals. Verify that there is good pin to terminal contact in the related Sensors and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

13. **RESTRICTED FUEL SUPPLY LINE**

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module.

Install special 5/16 fuel line adapter tool #6539 between disconnected fuel line and the fuel pump module.

Attach a fuel pressure test gauge to the T fitting on tool #6539.

Ignition on, engine not running.

With a scan tool, actuate the ASD Fuel System test and observe the fuel pressure gauge.

NOTE: The DTC needs to be cleared before actuating the System Test, if the DTC is not cleared, the System Test may not be allowed to actuate.

NOTE: Fuel pressure specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Is the fuel pressure within specification?

Yes

Repair or replace fuel supply line as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 14.

CAUTION: Stop All Actuations.

14. FUEL PUMP INLET STRAINER

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.

Turn the ignition off.

Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer.

Is the Fuel Inlet Strainer plugged?

Yes

Replace the Fuel Pump Inlet Strainer.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 15.

15. **FUEL PUMP MODULE**

If there are no possible causes remaining, view repair.

Repair

Verify that there is good pin to terminal contact in the Fuel Pump Module, Relay, Cluster, and Powertrain Control Module connectors. Replace the Fuel Pump Module if no problems were found in the connectors.

Perform **POWERTRAIN VERIFICATION TEST** .

P0513-INVALID SKIM KEY

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

Ignition on.

SET CONDITIONS

- **Set Condition:**

The PCM detects an invalid SKIM key. One Trip Fault.

POSSIBLE CAUSES

Possible Causes
INCORRECT VIN PROGRAMMED IN THE PCM
NO COMMUNICATION WITH SKIM
NO VIN PROGRAMMED IN THE PCM
IGNITION KEY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. **ACTIVE DTC**

Ignition on, engine not running.

With the scan tool, select View PCM DTCs.

Is the DTC Active at this time?

Yes

Go To 2.

No

Go To 6.

2. NO COMMUNICATION WITH SKIM

With the scan tool, attempt to communicate with the SKIM.

Can the scan tool communicate with the SKIM?

Yes

Go To 3.

No

Refer to **VEHICLE THEFT SECURITY - ELECTRICAL DIAGNOSTICS** and perform the appropriate Diagnostic Procedure.

Perform **SKREEM/SKIM VERIFICATION TEST** .

3. SKIM TROUBLE CODES SET

With the scan tool, check for SKIM DTCs.

Are any DTCs present in the SKIM?

Yes

Refer to **VEHICLE THEFT SECURITY - ELECTRICAL DIAGNOSTICS** and perform the appropriate Diagnostic Procedure.

Perform **SKREEM/SKIM VERIFICATION TEST** .

No

Go To 4.

4. VIN PROGRAMMED INTO PCM

With the scan tool, display the VIN that is programmed in the PCM.

Has a VIN been programmed into the PCM?

Yes

Go To 5.

No

Program the correct VIN into the PCM and retest.

Perform **SKREEM/SKIM VERIFICATION TEST** .

5. POWERTRAIN CONTROL MODULE (PCM)

Turn the ignition off.

Replace and program the SKIM per Service Information.

Ignition on, engine not running.

With the scan tool, erase all SKIM and PCM DTCs.

Attempt to start and idle the engine.

With the scan tool, select View PCM DTCs.

Does the scan tool display this code?

Yes

NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary. Replace and program the Powertrain Control Module per Service Information.

Perform **SKREEM/SKIM VERIFICATION TEST** .

No

Test Complete.

6. IGNITION KEY

NOTE: You must obtain the SKIM pin number.

NOTE: This DTC could have been set if the SKIM harness connector was disconnected, or if the SKIM was replaced recently.

NOTE: All keys that the customer uses for this vehicle must be tested to verify they are operating properly.

Ignition on, engine not running.

Verify the correct VIN is programmed into the PCM and SKIM.

Turn the ignition off.

With the next customer key turn the ignition key on and crank the engine to start.

With the scan tool, read the PCM DTCs. Look for P0513.

Is the DTC P0513 still active?

Yes

Replace the Ignition Key.

Perform **SKREEM/SKIM VERIFICATION TEST** .

No

Test Complete.

NOTE: If this DTC cannot be reset, it could have been an actual theft attempt.

MONITOR CONDITIONS

When Monitored:

With the ignition key on and battery voltage above 10.4 volts.

SET CONDITIONS

• Set Condition:

The PCM detects that the Engine Oil Pressure Sensor input voltage is below the minimum acceptable value. One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
(G6) OIL PRESSURE SIGNAL CIRCUIT OPEN
(G6) OIL PRESSURE SIGNAL CIRCUIT SHORTED TO VOLTAGE
(G6) OIL PRESSURE SIGNAL CIRCUIT SHORTED TO GROUND
OIL PRESSURE SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding.

DIAGNOSTIC TEST

1. ACTIVE DTC

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Diagnose and repair any system voltage or sensor supply voltage DTCs before continuing with this test.

With the scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

Go To 2.

No

Refer to the INTERMITTENT CONDITION Diagnostic Procedure.

2. OIL PRESSURE SWITCH

Fig. 63: Locating Oil Pressure Switch Signal Circuit At Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Oil Pressure Switch harness connector.

Ignition on, engine not running.

With the scan tool monitor the Oil Pressure Switch state.

Connect a jumper wire to the (G6) Oil Pressure Signal circuit in the Sensor harness connector.

Touch the other end of the jumper wire to a known good Ground several times.

Did the Oil Pressure Switch state change from High to Low when connecting and disconnecting the jumper wire to ground?

Yes

Verify that there is good pin to terminal contact in the Oil Pressure Switch and the Powertrain Control Module connectors. If OK, replace the Engine Oil Pressure Switch.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 3.

NOTE: Remove the jumper wire before continuing.

3. (G6) OIL PRESSURE SIGNAL CIRCUIT SHORTED TO VOLTAGE

**SWITCH-

81336a11

Fig. 64: Checking Oil Pressure Switch Signal Circuit For Short To Voltage
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the C1 PCM harness connector.

Ignition on, engine not running.

Measure the voltage on the (G6) Oil Pressure Signal circuit in the Switch harness connector.

Is there any voltage present?

Yes

Repair the short to voltage on the (G6) Oil Pressure Signal circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 4.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (G6) Oil Pressure Signal circuit from the Oil Pressure Switch harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

Go To 5.

No

Repair the open in the (G6) Oil Pressure Signal circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

5. (G6) SIGNAL CIRCUIT SHORTED TO GROUND

**SWITCH-
OIL PRESSURE**

81336a15

Fig. 66: Checking Oil Pressure Switch Signal Circuit For Short To Ground

Measure the resistance between a known good ground and the (G6) Oil Pressure Signal circuit in the Switch connector.

Is the resistance below 100 ohms?

Yes

Repair the short to ground in the (G6) Oil Pressure Signal circuit.
Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 6.

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the related Oil Pressure Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Oil Pressure Switch and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. ACTIVE DTC

NOTE: Diagnose any CAN - C Communication DTCs before continuing.

NOTE: Make sure the A/C refrigerant System is properly charged per Service Information.

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Diagnose and repair any system voltage or sensor supply voltage DTCs

before continuing with this test.

With the scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. (C818) 5-VOLT SUPPLY CIRCUIT

Measure the resistance of the (C18) A/C Pressure Signal circuit from the A/C Pressure Transducer harness connector to C1 TIPM harness connector.

Is the resistance below 5.0 ohms?

Yes

Go To 6.

No

Repair the excessive resistance in the (C18) A/C Pressure Signal circuit.

Perform **POWERTRAIN VERIFICATION TEST**.

6. A/C PRESSURE TRANSDUCER

Connect the C1 TIPM harness connector.

Turn the ignition on.

With the scan tool, monitor the A/C Pressure Transducer voltage.

NOTE: The sensor voltage should be approximately 5.0 volts (plus or minus .1 volt) with the connector disconnected.

Does the scan tool display the voltage as described above?

Yes

Verify that there is good pin to terminal contact in the A/C Pressure Transducer and the Powertrain Control Module connectors. If OK, replace the A/C Pressure Transducer.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 9.

7. (C818) 5-VOLT SUPPLY CIRCUIT OPEN

9. TOTALLY INTEGRATED POWER MODULE

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the related A/C Pressure Transducer and the Totally Integrated Power Module (TIPM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the A/C Pressure Transducer and the Totally Integrated Power Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace the Totally Integrated Power Module per Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. ACTIVE DTC

- NOTE:

Make sure the Battery is in good condition. Using the Midtronics Battery Tester, test the Battery before continuing.
- NOTE:

Inspect the vehicle for after market accessories that may exceed the Generator System output.
- NOTE:

Make sure the generator drive belt is in good operating condition.
- NOTE:

Inspect the fuses in the TIPM. If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.

Start the engine.

Allow the engine to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. BATTERY

NOTE: Make sure the Battery is in good condition. Using the Midtronics Battery Tester or an equivalent Battery tester, test the Battery before continuing.

Does the Battery pass the load test for this specific application?

Yes

Go To 3.

No

Replace the Battery per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

3. (A801) B+ CIRCUIT HIGH RESISTANCE

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Make sure all wires are clear of the engine's moving parts.

Measure the voltage between the (A801) B+ Terminal at the Generator and the Battery + Post.

Start the engine.

Is the voltage above 0.4 of a volt?

Yes

Repair the excessive resistance in the (A801) B+ circuit between the Generator and Battery.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 4.

4. GENERATOR CASE GROUND HIGH RESISTANCE

Allow the engine to reach normal operating temperature.

NOTE: Make sure all wires are clear of the engine's moving parts.

Measure the voltage between the Generator case and Battery ground post.

Is the voltage above 0.1 of a volt?

Yes

Repair excessive resistance in the Generator Ground between the Generator Case and Battery ground side.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 5.

5. GENERATOR OPERATION

Fig. 82: Probing Generator Field Control Circuit At Generator Field Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Generator Field harness connector.

Using a 12-volt test light connected to ground, probe the (K125) Generator Field Control circuit in the Generator Field harness connector.

NOTE: Make sure the test light is probing the circuit before actuating the Test or a DTC may set and not allow the actuation.

Ignition on, engine not running.

With a scan tool, actuate the Generator Field Driver.

NOTE: The test light should be illuminated and bright proportional to the maximum duty cycle allowed by the scan tool. For example, if the scan tool allows 100% actuation, the brightness should be as bright as a direct connection to the battery. If the scan tool allows a maximum 25% actuation, the brightness should be 25% as bright as a direct connection to the battery.

Does the test light illuminate accordingly during the actuation?

Yes

Verify that there is good pin to terminal contact in the Generator and Powertrain Control Module connectors. Replace the Generator if no problems were found with the connectors.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 6.

6. **(K125) GENERATOR FIELD CONTROL CIRCUIT OPEN**

Fig. 83: Checking Generator Field Control Circuit For Open

Turn the ignition off.

Disconnect the C2 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (K125) Gen Field Control circuit from the Generator harness connector to the appropriate terminal of the special tool #8815.

Is the resistance below 5.0 ohms?

Yes

Go To 7.

No

Repair the open in the (K125) Gen Field Control circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

7. (K125) GENERATOR FIELD CONTROL CIRCUIT SHORTED TO GROUND

Fig. 84: Checking Generator Field Control Circuit For Short To Ground
Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (K125) Gen Field Control circuit in the Generator Field harness connector.

Is the resistance below 100 ohms?

Yes

MONITOR CONDITIONS

When Monitored:

With the ignition on. Engine RPM greater than 1000 RPM. With no other charging system codes set.

SET CONDITIONS

- Set Condition:

Battery voltage is 1 volt greater than desired voltage for more than 10 seconds. Battery voltage greater than 15.75 volts. One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
(K125) GENERATOR FIELD CONTROL CIRCUIT SHORTED TO VOLTAGE GENERATOR POWERTRAIN CONTROL MODULE (PCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. ACTIVE DTC

- NOTE:

Make sure the Battery is in good condition. Using the Midtronics Battery Tester, test the Battery before continuing.
- NOTE:

Inspect the vehicle for after market accessories that may exceed the Generator System output.
- NOTE:

Inspect the fuses in the TIPM. If a fuse is open use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.

Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With the scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. **GENERATOR OPERATION**

Turn the ignition off.

Disconnect the Generator Field harness connector.

Using a 12-volt test light connected to ground, probe the (K125) Generator Field Control circuit in the Generator Field harness connector.

Ignition on, engine not running.

With a scan tool, actuate the Generator Field Driver.

NOTE: The test light should be illuminated and bright proportional to the maximum duty cycle allowed by the scan tool. For example, if the scan tool allows 100% actuation, the brightness should be as bright as a direct connection to the battery. If the scan tool allows a maximum 25% actuation, the brightness should be 25% as bright as a direct connection

to the battery.

Does the test light illuminate accordingly during the actuation?

Yes

Verify that there is good pin to terminal contact in the Generator and Powertrain Control Module connectors. Replace the Generator if no problems were found with the connectors.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Turn the ignition off.

Connect the C1 and C3 PCM harness connectors and the C5 TIPM harness connector.

Ignition on, engine not running.

Using the scan tool in the PCM, actuate the ASD.

With a 12-volt test light connected to ground, probe the (K51) ASD Control circuit at the C2 TIPM terminal connection.

Does the test light illuminate brightly and flash on an off during the actuation?

Yes

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

If OK, replace the TIPM in accordance with the Service Information.

Perform **POWERTRAIN VERIFICATION TEST**.

P0850-PARK/NEUTRAL SWITCH PERFORMANCE

CIRCUIT SCHEMATIC

01940010

Fig. 42: Park/Neutral Switch Circuit Schematic
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The Park Neutral switch rationality test is enabled only for vehicles equipped with a 4/5 speed automatic transmission. This diagnostic checks if the park/neutral switch is incorrectly stuck in the neutral position during driving conditions by comparing Vehicle Speed, Engine Speed, Throttle Position, and Pressure Ratio to the fail thresholds and by looking at the state of the Park/Neutral Switch. The stuck in drive condition is not explicitly checked as the starter relay does not energize and therefore render the vehicle inoperable.

MONITOR CONDITIONS

When Monitored:

Continuously with the transmission in Park, Neutral, or Drive and NOT in Limp-in mode.

SET CONDITIONS

- **Set Condition:**

This code will set if the PCM detects an irrational Park/Neutral switch state for at least one minute. Two trip fault. Three good trips to turn off the MIL.

P1115-GENERAL TEMPERATURE RATIONALITY

CIRCUIT SCHEMATIC

Fig. 46: Thermostat Circuit Schematic
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

The General Temperature Rationality looks at the outputs of the three temperature sensors and compare them under cold start conditions. Following a start to run delay time, the outputs of the ambient, engine coolant, and intake air temperature sensors will be compared. If two sensors agree but not the third, the third sensor is declared as irrational. If all three sensors are irrational the General Temperature Sensor Rationality is failed.

MONITOR CONDITIONS

When Monitored:

Engine off time is greater than 480 minutes and the vehicle has been driven for one minute over 35 mph.
Ambient temperature is greater than -64° C (-83° F).

SET CONDITIONS

- **Set Condition:**

Once the vehicle is soaked for a calibrated engine off time and then driven over calibrated speed and load conditions for some calibrated time, the PCM compares the ambient air, engine coolant, and intake air temperature sensor values. If the values of all the three sensors disagree with one another, a general temperature sensor irrationality is declared. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
EXCESSIVE RESISTANCE IN THE SENSOR SIGNAL CIRCUIT
EXCESSIVE RESISTANCE IN THE SENSOR GROUND CIRCUIT
SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. ACTIVE DTC

Turn the ignition off.

If possible, allow the vehicle to sit with the ignition off for more than 480 minutes in an environment where the temperature is consistent and above -7° C (19.4° F).

Test drive the vehicle. The vehicle must exceed 48 km/h (30 mph) during the test drive. Do not cycle the ignition off when the test drive is completed.

With a scan tool, select View the DTCs.

NOTE: All ECT, Intake Air, and Ambient Air Temperature Sensor codes must be diagnosed and repaired before continuing.

NOTE: In cold weather, this DTC could be set by a high powered block heater and no repair would be required.

Is the DTC Active or Pending at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. TEMPERATURE SENSOR READINGS

Turn the ignition off.

Allow the vehicle to sit with the ignition off in an environment where the temperature is consistent and above -7° C (19.4° F) until the engine coolant temperature is equal to ambient temperature.

Turn the ignition on.

With a scan tool, compare the AAT, ECT, and IAT sensor values.

Are all of the temperature sensor values within a range of 10° C (18° F)?

Yes

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

No

Go To 3.

3. TEMPERATURE SENSOR

Ignition on, engine not running.

Disconnect the suspected faulty sensor.

Connect a jumper wire between the Sensor Signal circuit and the Sensor ground circuit.

With the scan tool, read the voltage of the suspected Sensor.

Did the voltage reading start at 4.8 to 5.0 volts and decrease to 0 volts when the jumper wire was

installed?

Yes

Verify that there is good pin to terminal contact in the related Sensor and Powertrain Control Module connectors. Replace the Sensor if no problems were found in the connectors.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 4.

NOTE: Remove the jumper wire before continuing.

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding.

DIAGNOSTIC TEST

1. ACTIVE DTC

Diagnose all other trouble codes before continuing.

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by

reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. CHECKING FUEL PRESSURE

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Install a fuel pressure gauge to the fuel rail.

Ignition on, engine not running.

With a scan tool, actuate the ASD Fuel System test and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Turn the ignition off.

Choose a conclusion that best matches your fuel pressure reading.

Within Specification

Go To 3.

Above Specification

Replace the fuel filter/pressure regulator.

Perform **POWERTRAIN VERIFICATION TEST** .

Below Specification

Go To 12.

CAUTION: Stop All Actuations.

3. O2 SENSOR OPERATION

Start the engine.

Allow the engine to reach normal operating temperature.

NOTE: If one of the O2 Sensor's Signal or Return circuit is shorted to ground the scan tool will display all O2 Sensor voltage readings low. The O2 Sensor that is shorted to ground will display a voltage reading near or at 0 volts.

NOTE: If one of the O2 Sensor Signal or Return circuits are shorted to voltage, the scan tool will display all O2 Sensor voltage readings high.

NOTE: After the repairs have been made, verify proper O2 Sensor operation. If all the O2 Sensor voltage readings have not returned to normal, follow the diagnostic procedure for the remaining O2 Sensors.

With a scan tool, monitor all of the O2 Sensor voltage readings.

Is the voltage switching between 2.5 and 3.4 volts for all the O2 Sensors?

Yes

Go To 4.

No

Go To 8.

4. 1/1 O2 SENSOR HEATER OPERATION

Turn the ignition off.

NOTE: Wait a minimum of 10 minutes to allow the O2 Sensor to cool down before continuing the test. Allow the O2 Sensor voltage to stabilize at 5.0 volts.

Ignition on, engine not running.

With a scan tool, actuate the 1/1 O2 Heater Test.

With the scan tool, monitor 1/1 O2 Sensor voltage for at least 2 minutes.

Does the voltage stay above 4.5 volts?

Yes

Verify that there is good pin to terminal contact in the 1/1 O2 Sensor and Powertrain Control Module connectors. If OK, replace the 1/1 O2 Sensor.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 5.

5. MAP SENSOR OPERATION

Turn the ignition off.

Connect a Vacuum Gauge to a Manifold Vacuum source.

Start the engine.

Allow the engine to idle.

NOTE: If engine will not idle, maintain a constant RPM above idle.

With the scan tool, read the MAP Sensor vacuum value.

Is the scan tool reading within 1 inch of HG on the Vacuum Gauge reading?

Yes

Go To 6.

No

Verify that there is good pin to terminal contact in the MAP Sensor and Powertrain Control Module connectors. If OK, replace the MAP Sensor.

Perform **POWERTRAIN VERIFICATION TEST** .

6. ECT SENSOR OPERATION

NOTE: For this test to be valid, the thermostat must be operating correctly.

NOTE: This test works best if performed on a cold engine (cold soak)

Ignition on, engine not running.

With a scan tool, read the Engine Coolant Temperature (ECT) Sensor value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the ambient temperature.

NOTE: If engine coolant temperature is above 82° C (180° F), allow the engine to cool until 65° C (150° F) is reached.

Start the Engine.

During engine warm-up, monitor the ECT Sensor value. The temperature value change should be a smooth transition from start up to normal operating temperature 82° C (180° F). The value should reach at least 82° C (180° F).

Did the ECT value increase smoothly and did it reach at least 82° C (180° F)?

Yes

Go To 7.

No

Verify that there is good pin to terminal contact in the ECT Sensor and Powertrain Control Module connectors. If OK, replace the Engine Coolant Temperature Sensor.

Perform **POWERTRAIN VERIFICATION TEST** .

7. **ENGINE MECHANICAL PROBLEM**

Turn the ignition off.

Check for any of the following conditions/mechanical problems.

AIR INDUCTION SYSTEM - must be free from leaks.

ENGINE VACUUM - must be at least 13 inches in neutral

ENGINE VALVE TIMING - must be within specifications

ENGINE COMPRESSION - must be within specifications

ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks.

ENGINE PCV SYSTEM - must flow freely

TORQUE CONVERTER STALL SPEED - must be within specifications

POWER BRAKE BOOSTER - no internal vacuum leaks

FUEL - must be free of contamination

FUEL INJECTOR - plugged or restricted injector; control wire not connected to correct injector

Are there any engine mechanical problems?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 11.

8. 1/1 O2 SENSOR

81653cbb

Fig. 59: Checking O2 Sensor Return Upstream & Downstream Circuits
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the 1/1 O2 Sensor harness connector.

Ignition on, engine not running.

With a scan tool, monitor the 1/1 O2 Sensor voltage.

O2 Sensor voltage should read between 4.1 and 5.0 volts on the scan tool with the connector disconnected.

Connect a jumper wire between the (K41) Signal circuit and the (K902) O2 Return Upstream circuit in the O2 Sensor harness connector.

NOTE: **The voltage should drop from between 4.1 and 5.0 volts to 2.5 volts with the jumper wire in place.**

Did the O2 Sensor voltage change from between 4.1 and 5.0 volts to 2.5 volts with the jumper wire installed?

Yes

Verify that there is good pin to terminal contact in the 1/1 O2 Sensor and Powertrain Control Module connectors. If OK, replace the 1/1 O2 Sensor.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 9.

NOTE: **Remove the jumper wire before continuing.**

9. (K41) O2 SENSOR 1/1 SIGNAL CIRCUIT

With a scan tool, monitor the 1/1 O2 Sensor voltage reading with the jumper wire removed.

NOTE: **The scan tool will display all O2 Sensor voltage readings approximately 5.0 volts when only one O2 Sensor's Signal circuit is shorted to voltage.**

NOTE: **The scan tool will display one O2 Sensor voltage close to zero and the others will read lower than normal when one O2 Sensor Signal circuit contains excessive resistance.**

Is the voltage between 4.1 and 5.0 volts?

Yes

Go To 10.

No

Check the (K41) O2 Sensor 1/1 Signal circuit for a short to ground, open, or short to voltage. Inspect the O2 Sensor connector and the PCM harness connector. If OK, replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

Measure the voltage on the (K902) O2 Return Upstream circuit in the O2 Sensor harness connector.

Is the voltage at 2.5 volts?

Yes

Go To 11.

No

Check the O2 Return circuit for a short to ground, open, or short to voltage. Inspect the O2 Sensor connector and the PCM harness connector. If OK, replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

11. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the related Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related Sensor and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

12. RESTRICTED FUEL SUPPLY LINE

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module.

Install special 5/16 fuel line adapter tool #6539 between disconnected fuel line and the fuel pump module.

Attach a fuel pressure test gauge to the T fitting on tool #6539.

Ignition on, engine not running.

With a scan tool, actuate the ASD Fuel System test and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Is the fuel pressure within specification?

Yes

Repair or replace fuel supply line as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 13.

CAUTION: Stop All Actuations.

13. FUEL PUMP INLET STRAINER

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.

Turn the ignition off.

Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer.

Is the Fuel Inlet Strainer plugged?

Yes

Replace the Fuel Pump Inlet Strainer.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 14.

14. FUEL PUMP MODULE

If there are no possible causes remaining, view repair.

Repair

Verify that there is good pin to terminal contact in the Fuel Pump Module, Relay, and Powertrain Control Module connectors. If OK, replace the Fuel Pump Module.

P129C-INVERTER CONTROL CIRCUIT HIGH (TIPM)

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

With the ignition on. Battery voltage greater than 10 volts. Once the inverter switch has been turned on, the CCN sends a request to the TIPM to turn on the Inverter.

SET CONDITIONS

- **Set Condition:**

An open or shorted high condition has been detected in the Inverter Control output circuit by the TIPM. One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
(P805) INVERTER CONTROL OUTPUT CIRCUIT OPEN
(P805) INVERTER CONTROL OUTPUT CIRCUIT SHORTED TO VOLTAGE

DIAGNOSTIC TEST

1. ACTIVE DTC

Ignition on, engine not running.

NOTE: Low battery voltage can also cause excessive current draw, in very hot and very cold ambient temperatures. Make sure the battery can pass a load test before continuing.

With a scan tool, select View DTCs.

Look closely at the temperatures at which this DTC set.

Is the DTC Active at this time?

Yes

Go To 2.

P1404-EGR POSITION SENSOR RATIONALITY CLOSED

CIRCUIT SCHEMATIC

810042a

Fig. 73: EGR Position Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

The EGR valve has a position sensor and the EGR position rationality is designed to make sure that the valve moves freely within its operating range. Closed valve position reference check verifies that the valve is within its allowable upper and lower limits. The EGR position rationality test looks for a sustained error relative to commanded valve position.

MONITOR CONDITIONS

When Monitored:

Engine running.

SET CONDITIONS

- **Set Condition:**

The EGR flow or valve movement is not what is expected. A rationality error has been detected for the EGR Open Position Performance. Two trip fault.

POSSIBLE CAUSES

Possible Causes
EXCESSIVE RESISTANCE IN THE (K857) 5-VOLT SUPPLY CIRCUIT
(K35) EGR SOLENOID CONTROL CIRCUIT OPEN
(K34) EGR SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(Z904) GROUND CIRCUIT OPEN
EGR SOLENOID ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: **Diagnose and repair any EGR signal circuit high or low DTCs before continuing with this procedure.**

Turn the ignition on.

With the scan tool, select View DTCs. Record DTC and Freeze Frame information.

Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose fitting clothing. Failure to follow these instructions can result

in personal or fatal injury.

WARNING: The normal operating temperature of the EGR system is very high. Never work around or attempt to service any part of the EGR system until it has cooled.

NOTE: Attempt to operate the vehicle under conditions similar to which the DTC was set.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

With a scan tool, select View DTCs.

Is the DTC Active or Pending at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. EXCESSIVE RESISTANCE IN THE (K857) 5-VOLT SUPPLY CIRCUIT

Turn the ignition off.

Disconnect the EGR Solenoid harness connector.

Disconnect the C1 and C2 PCM harness connectors.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (K857) 5-volt Supply circuit from the EGR Solenoid harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

Go To 3.

No

Repair the excessive resistance in the (K857) 5-volt Supply circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

3. (K35) EGR SOLENOID CONTROL CIRCUIT OPEN

No

Go To 5.

5. **(Z904) GROUND CIRCUIT OPEN OR HIGH RESISTANCE**

8134651e

Fig. 77: Checking EGR Solenoid Ground Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the EGR Valve Assembly harness connector.

Using a 12 volt test light connected to the 12 volts, check the (Z904) Ground circuit in the EGR Valve Assembly harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

Go to 6.

No

Repair the (Z904) Ground circuit for an open circuit of high resistance.

Perform **POWERTRAIN VERIFICATION TEST** .

6. **(K35) EGR CONTROL CIRCUIT HIGH RESISTANCE**

Turn the ignition off.

Connect the EGR Valve Assembly connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 along with the #8815-1 to perform the diagnosis.

Using a voltmeter, perform a voltage drop test by backprobing the (K35) EGR Control circuit at the EGR Valve Assembly harness connector and probing the appropriate terminal of the special tool #8815. Make sure the voltmeter leads are connected so that positive polarity is displayed on the voltmeter.

Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With the scan tool, perform the EGR System Test.

Select OPEN to open the EGR valve.

Monitor the circuit voltage on the voltmeter.

Is the voltage below 0.5 volts when the valve was opened during the system test?

Yes

Go to 7.

No

Repair the (K35) EGR Control circuit for excessive resistance.

Perform **POWERTRAIN VERIFICATION TEST** .

7. EGR SOLENOID ASSEMBLY

Turn the ignition off.

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

With the scan tool, actuate the EGR Valve Solenoid Duty Cycle.

Select the Duty Cycle reading of 79.9%

Using a 12 volt test light connected to ground, check the (K35) EGR Control circuit in the EGR Valve Assembly harness connector.

NOTE: If the DTC is active, the actuation test may not be allowed by the PCM. If may be necessary to clear the DTCs before starting the actuation.

NOTE: The voltage supplied to the solenoid circuit during the actuation may be less than battery voltage. The test light should be illuminated, but may not be as bright as a direct connection to the battery.

NOTE: The test light should be illuminated and bright proportional to the maximum duty cycle allowed by the scan tool. For example, if the scan tool allows 100% actuation, the brightness should be as bright as a direct connection to the battery. If the scan tool allows a maximum 25% actuation, the brightness should be 25% as bright as a direct connection to the battery.

Does the test light illuminate accordingly during the actuation?

Yes

Go To 8.

No

Verify that there is good pin to terminal contact in the Solenoid and the Powertrain Control Module connectors. If OK, replace the EGR Solenoid Assembly per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

8. **POWERTRAIN CONTROL MODULE (PCM)**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EGR Solenoid Assembly and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Solenoid and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

S/C SWITCH SIGNAL CIRCUITS SHORTED TO GROUND
SPEED CONTROL SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. ACTIVE DTC

Ignition on, engine not running.

NOTE: This DTC is a two trip fault. If the scan tool indicates a one trip failure, the possible cause may have been the customer pressing the switch in two positions simultaneously. Test drive the vehicle and activate the Speed Control system. If the DTC matures to an active fault a repair is necessary.

Ask the customer if it is possible that button was held in two positions at the same time before this DTC set. If this is the case, no repair is necessary.

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. SPEED CONTROL SWITCH

With the scan tool, monitor the Speed Control Switch voltage.

Disconnect the Speed Control Switch harness connector.

Did the voltage change to above 4.8 volts?

Yes

Replace the Speed Control Switch.

P1607-PCM INTERNAL SHUTDOWN TIMER RATIONALITY

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The PCM compares actual shutdown time to a calculated shutdown time value. The calculated shut down time value is based on the amount the ECT should drop after a completely warmed up engine is shut down for a minimum of 8 hours. If the difference between actual shutdown time and the calculated shut down time is greater than a maximum value, a one trip failure will set. The shutdown time is measured again after 1 hour of ignition off time following the next engine warm up cycle. The PCM compares the shutdown time to a calculated value. If the difference is greater than a maximum value, the MIL is illuminated and a DTC will set.

MONITOR CONDITIONS

When Monitored:

Ignition on and battery voltage greater than 10 volts.

SET CONDITIONS

- **Set Condition:**

This DTC sets if the engine coolant temp does not drop enough or drops too much during engine off time. This DTC may also set if the controller timer is inaccurate. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes

ENGINE COOLING CONDITIONS THAT MAY SET THIS DTC ENGINE COOLANT LEVEL PCM INTERNAL TIMER

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. ENGINE COOLANT INSPECTION

NOTE: This DTC will set if the engine cools quicker than is should compared to engine off times. If the customer washed a hot engine with the engine off, a One Trip Failure will set. If the vehicle is parked in a highly ventilated area or has a large fan blowing on it which might cause the engine to cool quicker than expected this DTC may set.

WARNING: Do not remove or loosen the radiator cap with the system hot and under pressure. Serious burns from coolant can occur.

Turn the ignition off.

Allow the engine to cool enough to allow the pressure in the coolant system to drop enough to safely remove the radiator cap.

Check the coolant level and condition.

Is the engine coolant level filled to the proper level?

Yes

Go To 2.

No

Add the appropriate type and amount of engine coolant. Refer to **STANDARD PROCEDURE** .
Perform **POWERTRAIN VERIFICATION TEST** .

2. POWERTRAIN CONTROL MODULE (PCM)

Turn the ignition on.

With the scan tool under PCM/NGC Data Display, locate the Ignition Off Time value.

While monitoring a stop watch, turn the Ignition off for 10 minutes, watch the stop watch for those 10 minutes, and then turn the Ignition on.

With the scan tool under Data Functions, check the Ignition Off Time value again.

Does the Ignition Time Off value on the scan tool match the actual time you had the Ignition off on the stop watch?

Yes

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

No

Replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

P2072-ELECTRONIC THROTTLE CONTROL SYSTEM - ICE BLOCKAGE

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

Ignition on.

SET CONDITIONS

• **Set Condition:**

The PCM recognizes the Throttle plate is stuck during extremely cold Ambient Temperature operation. The throttle plate goes through a de-icing procedure. If the throttle blade still doesn't move this fault sets. The MIL will not illuminate. The vehicle will be in Limp home condition, limiting rpm and vehicle speed.

POSSIBLE CAUSES

Possible Causes

DIAGNOSTIC TEST

1. THROTTLE BODY INSPECTION

Ignition on, engine not running.

With a scan tool, select View DTCs and record the related Freeze Frame data.

NOTE: This DTC sets in extreme cold Ambient Temperatures with the throttle plate stuck by the time the vehicle gets to the dealership the condition may be corrected.

NOTE: P2110 will set with P2072. P2118 may also set and the customer will experience a Limp-in condition. If either of these two faults are set, it indicates that the ice blockage software has run and no repair is necessary.

NOTE: Diagnose any other DTCs that may also be set before continuing.

Turn the ignition off.

Remove the Air Cleaner Assembly from the Throttle Body.

Check for any signs of a foreign material (ice or dirt) on the Throttle Plate or in the bore causing the Throttle Plate to stick.

Is the throttle blade still stuck because it is frozen?

Yes

Allow the Throttle Body to thaw naturally in a room temperature climate.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Test Complete.

MONITOR CONDITIONS

When Monitored:

With the engine running in closed loop mode, the ambient/battery temperature above -6.7° C (20° F) and altitude below 2590.8 m (8500 ft).

SET CONDITIONS

- **Set Condition:**

The conditions that cause this diagnostic to fail is when the upstream O2 sensor becomes biased from an exhaust leak, O2 sensor contamination, or some other extreme operating condition. The downstream O2 sensor is considered to be protected from extreme environments by the catalyst. The PCM monitors the downstream O2 sensor feedback control, called downstream fuel trim, to detect any shift in the upstream O2 sensor target voltage from nominal target voltage. The value of the downstream fuel trim is compared with the lean thresholds. Every time the value exceeds the calibrated threshold, a fail timer is incremented and mass flow through the exhaust is accumulated. If the fail timer and accumulated mass flow exceed the fail thresholds, the test fails and the diagnostic stops running for that trip. If the test fails on consecutive trips, a DTC is set.

POSSIBLE CAUSES

Possible Causes
EXHAUST LEAK FUEL DELIVERY SYSTEM O2 SENSOR, WIRING, OR CONNECTORS ENGINE MECHANICAL SYSTEM POWERTRAIN CONTROL MODULE (PCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. ACTIVE DTC

NOTE: Check the vehicle repair history. If the 1/2 O2 has been replaced make sure that the O2 sensor was properly installed and meets OEM specification.

NOTE: Check for contaminants that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. CHECKING THE EXHAUST SYSTEM FOR LEAKS

NOTE: A thorough exhaust leak test must be completed before removing an O2 Sensor or any other part from the exhaust system. Do not remove any parts before an exhaust leak check has been completed.

NOTE: An exhaust leak may cause downstream fuel adaptives to rail out, resulting in a false O2 Sensor failure

Turn the ignition off.

Raise the vehicle in accordance with the Service Information.

WARNING: The normal operating temperature of the exhaust system is very high. Never work around or attempt to service any part of the exhaust system until it has cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operating time

Connect Exhaust Cone #8404-EC or #8404-EC to Air Pressure Regulator (with hose) #W-18-MIL-1146AS.

CAUTION: The air pressure must not exceed 27.6 kPa (4 psi), otherwise engine damage can occur.

Attach shop air to the air pressure regulator.

Adjust the Air Pressure Regulator to 27.6 kPa (4 psi)

Insert the exhaust cone into the vehicle tail pipe.

If the vehicle is equipped with dual exhaust. Use the #8404-ECT with equipped attached plug, plug one side of the dual exhaust pipe. Pressurize the other as described above.

Apply Mopar® Air Leak Detector PN# 05191804AA (or an equivalent leak finder liquid) to the following areas:

- All welded joints from the exhaust manifold to 152.4 mm (6 inches) behind the downstream O2 sensor
- O2 sensor seal points
- O2 sensor boss welds
- Flange/joint connection(s)
- Exhaust manifold to cylinder head connection(s)
- EGR solenoid gasket base and tube seal points (if equipped)

Watch for the liquid/soapy water to bubble.

Use the following definitions to help determine if system or component repair/replacement is necessary:

Type 1 Leak is defined as a leak where very small foam like bubbles 1 mm (0.04 of an inch) or less appear.

Any Type 1 or greater leaks found in welded joints, O2 sensor seal points or O2 sensor boss welds must be repaired or the component must be replaced.

Type 2 Leak is defined as a leak where larger bubbles pea size, 8 mm (0.3 of an inch) or greater appear.

Any Type 2 or greater leaks found in flange or joint connections, exhaust manifold to cylinder head connections, or EGR gasket and tube seal points must be repaired or the components must be replaced

Leak Location	Repair required if results at 27.6 kPa (4 psi) reveal bubble size:
Welded joints	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor seal points	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor boss welds	Type 1, 1 mm (0.04 of an inch) or greater
Flange / joint connections	Type 2, 8 mm (0.3 of an inch) or greater
Exhaust Manifold to cylinder head connections	Type 2, 8 mm (0.3 of an inch) or greater
EGR gasket and tube seal points	Type 2, 8 mm (0.3 of an inch) or greater

If a leak is found that matches the above definition, repair or replace the component as necessary.

DIAGNOSTIC TEST

1. ACTIVE DTC

Ignition on, engine not running.

NOTE: When this DTC is Active the engine speed, torque, and vehicle speed are limited to a Limp in mode.

NOTE: If the P2100 is intermittent, it is possible that the controller is overheating in extreme hot temperatures, and this is considered a normal protection operation. No repair is necessary.

NOTE: Low battery voltage can also cause excessive current draw, in very hot and very cold ambient temperatures. Make sure the battery can pass a

load test before continuing.

With a scan tool, select View DTCs.

Look closely at the temperatures at which this DTC set.

Is the DTC Active at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. THROTTLE PLATE INSPECTION

Turn the ignition off.

Remove the Air Cleaner Assembly from the Throttle Body.

Check for any signs of a foreign material (ice or dirt) on the Throttle Plate or in the bore causing the Throttle Plate to stick.

Were any signs of foreign material or scoring of the throttle plate or bore found?

Yes

Remove the debris if possible or replace the Throttle Body Assembly. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 3.

3. (K124) ETC MOTOR (+) SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Throttle Body harness connector.

Disconnect the C2 PCM harness connector.

Ignition on, engine not running.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform the diagnostics.

Measure the voltage on the (K124) ETC Motor (+) at the appropriate terminal of special tool #8815.

Is there any voltage present?

Yes

Connect the Throttle Body harness connector.

Measure the resistance of the ETC Motor between the (K124) ETC Motor (+) and the (K126) ETC Motor (-) at the appropriate terminals of special tool #8815.

Is the resistance between 2.5 and 25 ohms at closed throttle?

Yes

Go To 11.

No

Verify that there is good pin to terminal contact in the Throttle Body and the Powertrain Control Module connectors. If OK, replace the Throttle Body Assembly. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function.

Perform **POWERTRAIN VERIFICATION TEST**.

11. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Throttle Body and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

DIAGNOSTIC TEST

1. ACTIVE DTC

NOTE: When this DTC is Active the engine speed, torque, and vehicle speed are limited to a Limp in mode.

NOTE: Before continuing visually inspect the throttle blade and bore for any obstructions. Icing of the throttle body may have caused this code to set.

NOTE: Low battery voltage can also cause excessive current draw, in very hot and very cold ambient temperature. Make sure the battery can pass a load test before continuing.

NOTE: Diagnose any 5-Volt Supply, Battery, and TP Sensor DTCs before continuing.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. THROTTLE POSITION WITHIN 2° DEGREES OF DESIRED THROTTLE POSITION

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, monitor the Actual Throttle Position and Desired Throttle Position.

Compare the Actual Throttle Position and the Set Point Throttle Position.

Is the Actual Throttle Position within 2° degrees of the Desired Throttle Position?

Yes

POWERTRAIN CONTROL MODULE NEEDS TO BE REPROGRAMMED

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. **REPROGRAM THE POWERTRAIN CONTROL MODULE**

Check for any related TSBs.

Verify the PCM is at the latest calibration (flash level).

NOTE: **An intermittent loss of power to the PCM without performing an ETC Relearn procedure may cause this DTC to set.**

Flash the Powertrain Control Module per Service Information if any updates are available.

Start the engine.

Allow the engine to reach normal operating temperature.

Operate the accelerator pedal. (do not exceed 3500 rpm)

Test drive the vehicle for 10 miles on a flat road surface.

Does this DTC reset?

Yes

Replace and reprogram the Powertrain Control Module per Service Information.

APPS No.1 has failed to achieve the required minimum value during In Plant testing. One trip fault and the code will set within 5 seconds. Engine will only idle. ETC light is illuminated.

POSSIBLE CAUSES

Possible Causes
IN PLANT TEST FAILURE APPS RELEARN

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. IN PLANT TEST FAILURE

Ignition on, engine not running.

NOTE: This DTC is set when the APP Sensors are learned in plant but do not reach the Minimum or Maximum voltage range.

With a scan tool, select View DTCs.

With the scan tool, erase DTCs.

Start the engine.

With the scan tool, view DTCs.

NOTE: Diagnose any APPS out of Range and 5-Volt Supply DTCs before continuing.

Is the DTC Active at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. **APPS RELEARN**

With a scan tool select the ETC RELEARN function.

Next, erase DTCs.

Start the engine.

Does the DTC return?

Yes

Replace the APPS Assembly per Service Information. After installation is complete, use a scan tool and select the ETC RELEARN function.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Test Complete.

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. ACTIVE DTC

NOTE: When this DTC is Active the engine speed, torque, and vehicle speed are limited to a Limp in mode.

NOTE: If P2072 is also set, this indicates that the cold weather ice blockage routine has run. No repair action is necessary.

NOTE: If the P2118 is intermittent, it is possible that the controller is overheating in extreme hot temperatures, and this is considered a normal protection operation. No repair is necessary.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Look closely at the temperatures at which this DTC set.

Is the DTC Active at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. THROTTLE PLATE INSPECTION

Turn the ignition off.

Remove the Air Cleaner Assembly from the Throttle Body.

Check for any signs of a foreign material (ice or dirt) on the Throttle Plate or in the bore causing the Throttle Plate to stick.

Were any signs of foreign material or scoring of the throttle plate or bore found?

Yes

Remove the debris if possible or replace the Throttle Body Assembly. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 3.

NOTE: Take the following measurement using special tool #8815 to avoid possible damage to the Throttle Body harness connector.

Connect the Throttle Body harness connector.

Measure the resistance of the ETC Motor between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit at the appropriate terminals of special tool #8815.

Is the resistance between 2.5 and 25 ohms at closed throttle?

Yes

Go To 11.

No

Verify that there is good pin to terminal contact in the Throttle Body and the Powertrain Control Module connectors. If OK, replace the Throttle Body Assembly. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function.

Perform **POWERTRAIN VERIFICATION TEST**.

11. **POWERTRAIN CONTROL MODULE (PCM)**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Throttle Body and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

Repair as necessary.

DIAGNOSTIC TEST

1. ACTIVE DTC

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Diagnose and repair any system voltage or sensor supply voltage DTCs before continuing with this test.

NOTE: If you are viewing data recorder information or Freeze Frame data the APP Sensor No. 2 is pulled low by the PCM as part of its system testing. This test happens every 320 milliseconds and may not show up on the scan

tool but may show up on a data recorder or lab scope. It is acceptable to see the voltage close to zero with a normal sensor when using a data recorder/lab scope.

With the scan tool, select View DTCs.

Connect the PCM harness connectors.

Ignition on, engine not running.

Connect a jumper wire between the (K857) 5-volt Supply circuit and the (K29) APP Signal 2 circuit in the Sensor harness connector.

With a scan tool, monitor the APP Sensor 2 voltage.

NOTE: The sensor voltage should be approximately 5.0 volts (plus or minus.1 volt) with the jumper wire installed.

Does the scan tool display the voltage as described above?

Yes

Verify that there is good pin to terminal contact in the APPS and the Powertrain Control Module connectors. If OK, replace the APP Sensor Assembly per Service Information. After installation is complete, use a scan tool and select the ETC RELEARN function to relearn the APPS values.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 10.

NOTE: Remove the jumper wire before continuing.

8. (K857) 5-VOLT SUPPLY CIRCUIT OPEN

10. **POWERTRAIN CONTROL MODULE (PCM)**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the APPS and the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

11. **APP SENSOR SWEEP**

Ignition on, engine not running.

With a scan tool, monitor the APP Sensor No.2 voltage.

Slowly press the Accelerator pedal down.

Does voltage start at approximately 0.22 of a volt and go above 2.31 volts with a smooth transition?

Yes

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

No

Verify that there is good pin to terminal contact in the APPS and the Powertrain Control Module connectors. If OK, replace the APP Sensor Assembly per Service Information. After installation is complete, use a scan tool and select the ETC RELEARN function to relearn the APPS values.

Perform **POWERTRAIN VERIFICATION TEST** .

DIAGNOSTIC TEST

1. ACTIVE DTC

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Diagnose and repair any system voltage or sensor supply voltage DTCs before continuing with this test.

NOTE: If you are viewing data recorder information or Freeze Frame data the APP Sensor No. 2 is pulled low by the PCM as part of its system testing. This test happens every 320 milliseconds and will not show up on the scan tool

but may show up on a data recorder. It is acceptable to see the voltage close to zero with a normal sensor when using a data recorder.

With the scan tool, select View DTCs.

Is the DTC Active at this time?

Set up a lab scope in a way that you can view two graphs simultaneously.

Backprobe the (K23) APP Signal 1 circuit using Channel 1 at the APP Sensor harness connector.

Backprobe the (K29) APP Signal 2 circuit using Channel 2 at the APP Sensor harness connector.

Slowly press and release the Accelerator Pedal while monitoring the lab scope screen.

Does the scope pattern show any missing or erratic signals?

Yes

Verify that there is good pin to terminal contact in the APPS and the Powertrain Control Module connectors. If OK, replace the APP Sensor Assembly per Service Information. After installation is complete, use a scan tool and select the ETC RELEARN function to relearn the APPS values.

Perform **POWERTRAIN VERIFICATION TEST** .

MONITOR CONDITIONS

When Monitored:

Ignition on and engine running with no MAP Sensor DTCs.

SET CONDITIONS

• Set Condition:

A large vacuum leak has been detected or both of the TP Sensors have failed based on their position being 2.5 volts and the calculated MAP value is less than the actual MAP minus an Offset value. One trip fault and the code will set within 5 seconds. ETC light will flash.

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. ACTIVE DTC

- NOTE:

The most likely cause of this DTC is a vacuum leak.
- NOTE:

This fault code could be present if any Cam/Crank DTCs are set. No repair is necessary for P2172 if any Cam or Crank DTCs are set.
- NOTE:

Diagnose any 5-Volt Supply, TP Sensor, Fuel System Lean or Rich, or MAP Sensor DTCs before continuing.

NOTE: **The throttle plate should be free from binding and carbon build up.**

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. VACUUM LEAK

NOTE: **This code is enabled on engines with a plastic intake manifold and is intended to limit the maximum engine speed if a large crack occurs.**

NOTE: **A large vacuum leak is most likely the cause of this DTC.**

Inspect the Intake Manifold and Throttle body for leaks and cracks.

Inspect the Power Brake Booster for any vacuum leaks.

Inspect the PCV system for proper operation or any vacuum leaks.

Inspect the MAP Sensor for proper installation.

Were any vacuum leaks found?

Yes

Repair the vacuum leak as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 3.

3. MAP SENSOR OPERATION

Start the engine.

With a scan tool, monitor the MAP Sensor voltage.

Snap the Accelerator pedal.

Does the MAP Sensor voltage vary from below 2.0 volts at idle to above 3.5 volts at Wide Open Throttle?

Yes

Go To 4.

No

Go To 13.

4. TP SENSOR OPERATION

Ignition on, engine not running.

With a scan tool, perform the ETC Throttle Follower Test.

TP Sensor No.1 should start at approximately 0.7 of a volt and increase to 4.3 volts.

TP Sensor No.2 should start at approximately 4.3 volts and decrease to 0.7 of a volt.

Is the voltage transition smooth between the appropriate values?

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. ACTIVE DTC

- NOTE:

The most likely cause of this DTC is a plugged intake air system or dirty Throttle Body. Check for any TSBs before continuing.
- NOTE:

Diagnose any 5-Volt Supply, TP Sensor, Oxygen Sensor, Fuel related or MAP Sensor DTCs before continuing.
- NOTE:

The throttle plate should be free from binding and carbon build up.

NOTE: Question the customer about weather conditions, as ICE build up on the blade can cause this fault when ambient is around -10 to +4°C (14 to 39° F) range.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. RESTRICTED AIR INLET SYSTEM

Turn the ignition off.

Remove the Air Cleaner Assembly.

Remove the Air Filter.

Inspect the Throttle Body opening for signs of any foreign materials.

Check the intake tube/air cleaner for obstructions - include snow packing questions to customer.

Were any restrictions found?

Yes

Repair the restriction as necessary.

MONITOR CONDITIONS

When Monitored:

Ignition on, Engine running, and no ECT DTCs present.

SET CONDITIONS

• Set Condition:

PCM recognizes that the ECT has failed its self coherence test. The coolant temp should only change at a certain rate, if this rate is too slow or too fast this fault will set. Two trip fault. Three good trips to clear MIL. The MIL and ETC light will illuminate.

POSSIBLE CAUSES

Possible Causes
LOW COOLANT LEVEL (K2) ECT SIGNAL CIRCUIT SHORTED TO VOLTAGE (K2) ECT SIGNAL CIRCUIT OPEN (K900) SENSOR GROUND CIRCUIT OPEN (K2) ECT SIGNAL CIRCUIT SHORTED TO GROUND (K2) ECT SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT THERMOSTAT ENGINE COOLANT TEMPERATURE SENSOR POWERTRAIN CONTROL MODULE (PCM)

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding.

DIAGNOSTIC TEST

1. ACTIVE DTC

Ignition on, engine not running.

NOTE: If this code sets during extreme ambient temperatures, improper installation of a block heater could be the cause of this DTC.

With a scan tool, read DTCs.

Diagnose all other ECT and Cooling System codes before continuing.

Is the DTC Active at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. **LOW COOLANT LEVEL**

NOTE: If a Engine Coolant Temperature (ECT) DTC is set along with this code, diagnose the ECT DTC first.

NOTE: Inspect the ECT terminals and related PCM terminals. Ensure the terminals are free from corrosion and damage.

NOTE: The best way to diagnose this DTC is to allow the vehicle to sit overnight outside in order to have a totally cold soaked engine.

NOTE: Extremely cold outside ambient temperatures may have caused this DTC to set.

NOTE: Need to make sure that no Cooling System DTCs are set or changes that would make the warm up much slower or much faster: broken water pump can set this, addition of aftermarket auxiliary cooler can set this DTC.

WARNING: Never open the cooling system when the engine is hot. The system is under pressure. Failure to follow these instructions can result in personal injury or death. Allow the engine to cool before opening the cooling system.

Inspect the coolant system for proper level and condition.

Is the coolant level and condition OK?

Yes

Go To 3.

No

Inspect the vehicle for a coolant leak and add the necessary amount of coolant.

Perform **POWERTRAIN VERIFICATION TEST** .

3. **THERMOSTAT**

NOTE: This test works best if performed on a cold engine (cold soak).

Ignition on, engine not running.

With a scan tool, read the Eng Coolant Tmp Deg value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the ambient temperature.

NOTE: **If engine coolant temperature is above 82° C (180° F), allow the engine to cool until 65° C (150° F) is reached.**

Start the Engine.

During engine warm-up monitor the Eng Coolant Tmp Deg value. The temp deg value change should be a smooth transition from start up to normal operating temp 82° C (180° F). Also monitor the actual coolant temperature with a thermometer.

NOTE: **As the engine warms up to operating temperature, the actual coolant temperature (thermometer reading) and the Eng Coolant Tmp Deg on the scan tool should stay relatively close to each other.**

Using the appropriate service information, determine the proper opening temperature of the thermostat.

Did the thermostat open at the proper temperature?

Yes

Go To 4.

No

Replace the thermostat.

Perform **POWERTRAIN VERIFICATION TEST** .

4. ECT SENSOR

Fig. 67: Checking ECT Sensor
Courtesy of CHRYSLER LLC

Connect a jumper between the (K2) ECT Signal circuit and the (K900) Sensor ground circuit in the ECT Sensor harness connector.

Turn the ignition off.

Disconnect the ECT Sensor harness connector.

With a scan tool, read the ECT voltage.

NOTE: The sensor voltage should be approximately 0.0 volts (plus or minus.1 volt) with the jumper wire in place.

Does the scan tool display the voltage as described above?

Yes

Verify that there is good pin to terminal contact in the ECT Sensor and Powertrain Control Module connectors. If OK, replace the Engine Coolant Temperature Sensor.

CIRCUIT SCHEMATIC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

Ignition on. No Break or APPS faults present.

SET CONDITIONS

• Set Condition:

The PCM recognizes a brake application following the APPS showing a fixed pedal opening. Temporary or permanent. Internally the PCM will reduce throttle opening below driver demand. One trip fault and the code will be set within 5 seconds. ETC light will illuminate, the light will only stay illuminated while DTC is active.

POSSIBLE CAUSES

Possible Causes
CUSTOMER PRESSING ACCELERATOR PEDAL, THEN PRESSING BRAKE PEDAL, AND CONTINUES HOLDING THEM DOWN SIMULTANEOUSLY STOP LAMP SWITCH APP SENSOR

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding.

DIAGNOSTIC TEST

1. DTC INFORMATION

- NOTE:

If a pedal assembly becomes mechanically stuck the voltage output will stay fixed, if this is also Followed by a long application of the brakes this code will set.
- NOTE:

When this code sets the pedal position in the PCM software will ramp to idle. If the Pedal voltage changes OR the brake pedal is released, the pedal position in the PCM software will ramp up to the pedal position and the ETC light will go out.

With a scan tool, read DTCs and record the related Freeze Frame data.

Diagnose all other Stop Lamp Switch and APP Sensor codes before continuing.

This code can be set by a driver who uses both feet while driving, one for the Accelerator Pedal and the other for the Brake Pedal.

- NOTE:

The most likely cause of this DTC is caused by the customer Brake

Torquing the engine by pressing the Accelerator pedal and the pressing the Brake Pedal.

Ask the driver of the vehicle if these conditions apply to their driving habits.

Are the listed conditions part of the customers driving habits?

Yes

Advise the customer of what caused the DTC. This is normal operation of a ETC equipped vehicle because of safety issues.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 2.

2. STOP LAMP SWITCH OPERATION

With a scan tool, read both Stop Lamp Switch statuses while pressing and releasing the Brake Pedal.

Does the scan tool display the Pressed and Released while pressing and releasing the Pedal?

Yes

Go To 3.

No

Check the Stop Lamp Switch for proper installation and check the related circuits for opens and shorts using the appropriate wiring diagram. If OK, replace the Stop Lamp Switch assembly.

Perform **POWERTRAIN VERIFICATION TEST** .

3. APP SENSOR SWEEP

Ignition on, engine not running.

With a scan tool, monitor both APP Sensor voltage readings.

Slowly press the accelerator pedal from idle until it reaches the end stop near the floor.

APPS No.1 voltage should start at approximately 0.45 of a volt and increase to approximately 4.6 volts with a smooth transition.

APPS No.2 voltage should start at approximately 0.22 of a volt and increase to approximately 2.31 volts with a smooth transition.

Does the voltage for the appropriate sensor follow the list specification?

Yes

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

No

Check the Signal and Sensor Ground circuits for opens and shorts. If OK, Replace the APP Sensor Assembly per Service Information. After installation is complete, with a scan tool select the ETC RELEARN function to relearn the APPS values.

Perform **POWERTRAIN VERIFICATION TEST** .

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

Engine running and battery voltage greater than 10 volts.

SET CONDITIONS

• Set Condition:

If PCM detects that the secondary ignition burn time is incorrect, too short, or not present, an error is detected. One Trip Fault. Three good trips to turn off the MIL.

Using a 12-volt test light connected to ground, probe (K125) Generator Field Control circuit in the Generator Field harness connector.

Ignition on, engine not running.

With a scan tool, actuate the Generator Field Driver.

NOTE: The DTC needs to be cleared before actuating the Solenoid, if the DTC is not cleared, the Solenoid may not be allowed to actuate.

NOTE: The test light should be illuminated and bright proportional to the maximum duty cycle allowed by the scan tool. For example, if the scan tool allows 100% actuation, the brightness should be as bright as a direct connection to the battery. If the scan tool allows a maximum 25% actuation, the brightness should be 25% as bright as a direct connection to the battery.

Does the test light illuminate accordingly during the actuation?

Yes

Verify that there is good pin to terminal contact in the Generator and Powertrain Control Module connectors. Replace the Generator if no problems were found with the connectors.

P2610-PCM INTERNAL SHUTDOWN TIMER RATIONALITY TOO FAST

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The PCM compares actual shutdown time to a calculated shutdown time value. The calculated shut down time value is based on the amount of shutdown time necessary for the ECT to drop a specific amount after a completely warmed up engine is shut down. If the difference between actual shutdown time and the calculated shut down time is greater than a maximum value, a one trip failure will set. The shutdown time is measured again after 1 hour of ignition off time following the next engine warm up cycle. The PCM compares the shutdown time to a calculated value. If the difference is greater than a maximum value, the MIL is illuminated and a DTC will set.

MONITOR CONDITIONS

When Monitored:

With the engine running after a cycle when a complete engine warm up was achieved, the difference between engine coolant temperature and ambient air temperature greater than 10° C (50° F), after a minimum temperature drop of 10° C (50° F) during ignition off, and battery voltage greater than 10 volts.

SET CONDITIONS

- **Set Condition:**

The PCM detects that the engine coolant temperature drops a specified amount during the measured engine off time. Two trip fault. Three good trips to turn off the MIL.

2008 ENGINE PERFORMANCE

Electrical Diagnostics - Liberty

P0128-THERMOSTAT RATIONALITY

CIRCUIT SCHEMATIC

Fig. 1: Thermostat Circuit Schematic
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

The PCM predicts what the engine coolant temperature should be, based on the engine coolant temperature at start-up, ambient temperature and how the vehicle is subsequently driven. The predicted engine coolant temperature is compared to the Engine Coolant Temperature Sensor reading. The error between the two is calculated and integrated with respect to time. When the Thermostat diagnostic runs, the integrated error is compared to a calibrated threshold and pass/fail is determined. Separate pass and fail thresholds are used in order to improve accuracy of the diagnostic.

MONITOR CONDITIONS

When Monitored:

With the engine running, ambient temperature between -8° C (17.6° F) and 50° C (122° F), start up coolant temperature less than 50° C (122° F), and average vehicle speed greater than 16 kph (10 mph) until coolant temperature reaches 85° C (185° F).

SET CONDITIONS

- Set Condition:**

The PCM detects that the actual engine coolant temperature falls too far below the predicted engine coolant temperature and the predicted coolant temperature reaches the predicted target value before the actual coolant temperature reaches the actual coolant temperature target value. Two trip fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
LOW COOLANT LEVEL
THERMOSTAT OPERATION
SIGNAL CIRCUIT SHORTED TO VOLTAGE
TEMPERATURE SENSOR
SIGNAL CIRCUIT OPEN
SENSOR GROUND CIRCUIT OPEN
SIGNAL CIRCUIT SHORTED TO GROUND
SIGNAL CIRCUIT SHORTED TO THE (K900), (G931) SENSOR GROUND CIRCUIT
OTHER POSSIBLE CAUSES
POWERTRAIN CONTROL MODULE (PCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. ACTIVE DTC

NOTE: If any ECT, AAT, CMP or CKP sensor DTCs have set along with P0128, diagnose them before continuing.

NOTE: Make sure that the Pinion Factor has been programmed correctly into the PCM.

NOTE: Diagnose any CAN - C Communication DTCs before continuing.

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. LOW COOLANT LEVEL

NOTE: If an Engine Coolant Temperature (ECT) DTC is set along with this code, diagnose the ECT DTC first.

NOTE: Inspect the ECT terminals and related PCM terminals. Make sure the terminals are free from corrosion and damage.

NOTE: The best way to diagnose this DTC is to allow the vehicle to sit overnight outside in order to have a totally cold soaked engine.

NOTE: Extremely cold outside ambient temperatures may have caused this DTC to set.

WARNING: Never open the cooling system when the engine is hot. The system is under pressure. Failure to follow these instructions can result in personal injury including extreme burns, scalding, or death. Allow the engine to cool before opening the cooling system.

Check the coolant system to make sure that the coolant is in good condition and at the proper level.

Is the coolant level and condition OK?

Yes

Go To 3.

No

Inspect the vehicle for a coolant leak and add the necessary amount of coolant.

Perform **POWERTRAIN VERIFICATION TEST** .

3. THERMOSTAT OPERATION

NOTE: **This test works best if performed on a cold engine (cold soak).**

Ignition on, engine not running.

With a scan tool, read the ECT Deg value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the ambient temperature.

NOTE: **If engine coolant temperature is above 82° C (180° F), allow the engine to cool until 65° C (150° F) is reached.**

Start the Engine.

During engine warm-up, monitor the ECT Deg value. The temp deg value change should be a smooth transition from start up to normal operating temp 82° C (180° F). Also monitor the actual coolant temperature with a thermometer.

NOTE: **As the engine warms up to operating temperature, the actual coolant temperature (thermometer reading) and the scan tool, ECT Temperature value should stay relatively close to each other.**

Using the appropriate service information, determine the proper opening temperature of the thermostat.

Did the thermostat open at the proper temperature?

Yes

Go To 4.

No

Replace the thermostat.

Perform **POWERTRAIN VERIFICATION TEST** .

4. AMBIENT AIR TEMP SENSOR OPERATION

Ignition on, engine not running.

With a scan tool, read and record the AAT Sensor Temperature value.

Using the DRB Temperature Probe #CH7050, or an equivalent temperature measuring tool, measure the ambient air temperature near the AAT Sensor.

Is the AAT Sensor value with -15° C (5° F) of the temperature probe reading?

Yes

Go To 5.

No

Go To 7.

5. ECT SENSOR OPERATION

WARNING: Make sure the engine cooling system is cool before removing the pressure cap or any hose. The cooling system is pressurized when hot. Failure to follow these instructions can result in personal injury including extreme burns, scalding, or death.

With a scan tool, read and record the ECT Sensor Temperature value.

Use the DRB Temperature Probe #CH7050, or an equivalent temperature measuring tool, measure the engine coolant temperature.

Is the ECT Sensor value with -15° C (5° F) of the temperature probe reading?

Yes

Go To 6.

No

Go To 7.

6. OTHER POSSIBLE CAUSES

Inspect the Temperature Sensors for any physical damage.

Inspect the engine coolant. Make sure the coolant is at the proper level. Refer to **COOLING** .

Make sure the Temperature Sensors are properly installed.

Make sure the CMP and CKP sensors are installed properly. Check the connectors for any signs of

damage.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Refer to any Technical Service Bulletins (TSBs) that may apply.

With the engine running at normal operating temperature, monitor the Temperature sensor parameters while wiggling the wire harness. Look for parameter values to change.

Visually inspect the related wire harness. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Inspect and clean all PCM, engine, and chassis grounds.

Were any problems found during the above inspections?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Test Complete, the conditions that set this DTC are not present at this time.

P0133-O2 SENSOR 1/1 SLOW RESPONSE

CIRCUIT SCHEMATIC

91902414

Fig. 34: O2 Sensor 1/1 Circuit Schematic
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

For an aged O2 sensor, the response rate to the air/fuel change is slower than when it was new. The O2 sensor tends to move less with the same air/fuel changes in a given time frame. Therefore by observing the activity of voltage readings from the upstream O2 sensor, the quality of the O2 sensor can be detected.

MONITOR CONDITIONS

When Monitored:

With the ECT above 70° C (158° F), engine RPM between 1400 and 2300, vehicle speed between 64 and 96 kph (40 and 60 mph), and engine run time greater than 3 minutes.

SET CONDITIONS

- **Set Condition:**

The PCM detects that the oxygen sensor signal does not switch adequately during monitoring. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
EXHAUST LEAK (K41) O2 1/1 SIGNAL CIRCUIT (K902) O2 RETURN UPSTREAM CIRCUIT 1/1 O2 SENSOR

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. **ACTIVE DTC**

- NOTE:**

Check for contaminants that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.
- NOTE:**

After the repairs have been made, verify proper O2 Sensor operation. If all the O2 Sensor voltage readings have not returned to normal, follow the diagnostic procedure for the remaining O2 Sensors.

Start the engine.

Allow the engine to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear

loose clothing. Failure to follow these instructions can result in personal injury or death.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. CHECKING THE EXHAUST SYSTEM FOR LEAKS

Turn the ignition off.

Raise the vehicle in accordance with the Service Information.

WARNING: The normal operating temperature of the exhaust system is very high. Never work around or attempt to service any part of the exhaust system until it has cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operating time

Connect Exhaust Cone #8404-EC or #8404-EC to Air Pressure Regulator (with hose) #W-18-MIL-1146AS.

CAUTION: The air pressure must not exceed 27.6 kPa (4 psi), otherwise engine damage can occur.

Attach shop air to the air pressure regulator.

Adjust the Air Pressure Regulator to 27.6 kPa (4 psi)

Insert the exhaust cone into the vehicle tail pipe.

If the vehicle is equipped with dual exhaust. Use the #8404-ECT with equipped attached plug, plug one side of the dual exhaust pipe. Pressurize the other as described above.

Apply Mopar® Air Leak Detector PN# 05191804AA (or an equivalent leak finder liquid) to the following areas:

- All welded joints from the exhaust manifold to 152.4 mm (6 inches) behind the downstream O2 sensor
- O2 sensor seal points
- O2 sensor boss welds
- Flange/joint connection(s)
- Exhaust manifold to cylinder head connection(s)
- EGR solenoid gasket base and tube seal points (if equipped)

Watch for the liquid/soapy water to bubble.

Use the following definitions to help determine if system or component repair/replacement is necessary:

Type 1 Leak is defined as a leak where very small foam like bubbles 1 mm (0.04 of an inch) or less appear.

Any Type 1 or greater leaks found in welded joints, O2 sensor seal points or O2 sensor boss welds must be repaired or the component must be replaced.

Type 2 Leak is defined as a leak where larger bubbles pea size, 8 mm (0.3 of an inch) or greater appear.

Any Type 2 or greater leaks found in flange or joint connections, exhaust manifold to cylinder head connections, or EGR gasket and tube seal points must be repaired or the components must be replaced

Leak Location	Repair required if results at 27.6 kPa (4 psi) reveal bubble size:
Welded joints	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor seal points	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor boss welds	Type 1, 1 mm (0.04 of an inch) or greater
Flange / joint connections	Type 2, 8 mm (0.3 of an inch) or greater
Exhaust Manifold to cylinder head connections	Type 2, 8 mm (0.3 of an inch) or greater
EGR gasket and tube seal points	Type 2, 8 mm (0.3 of an inch) or greater

If a leak is found that matches the above definition, repair or replace the component as necessary.

Once the repair is complete, repeat the procedure to verify that all leaks have been repaired.

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

This diagnostic provides a continuous check of the O2 heater circuit during operation. The heater circuit is momentarily disabled to allow a resistance measurement to be taken to infer heater temperature. The current delivery to the heater is duty cycled to maintain a specific target temperature. The error from the target temperature is continuously monitored to assess heater performance.

MONITOR CONDITIONS

When Monitored:

Continuously during O2 sensor heater operation with battery voltage between 10.4 and 15.75 volts and no O2 sensor circuit DTCs present.

SET CONDITIONS

- **Set Condition:**

The PCM detects no temperature change in the O2 sensor heater element when the heater circuit is active. The heater temperature is obtained by measuring the heater resistance and calculating the heater temperature. Two trip fault. Three good trips to turn off the MIL.

DIAGNOSTIC TEST

1. O2 SENSOR HEATER OPERATION

Turn the ignition off.

NOTE: **Wait a minimum of 8 minutes to allow the O2 Sensor to cool down before continuing the test. Allow the O2 Sensor voltage to stabilize between 4.6 and 5.0 volts.**

Ignition on, engine not running.

With a scan tool, perform the 1/1 O2 Sensor Heater Test.

With the scan tool, monitor 1/1 O2 Sensor voltage for at least 2 minutes.

Does the voltage stay above 4.5 volts?

Yes

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The downstream O2 Sensor is located in the exhaust path behind the catalytic converter, is monitored for proper response to assure optimum catalytic converter efficiency. The downstream O2 response monitor is intended to diagnose a downstream O2 sensor that is not moving or stuck in a voltage window and to insure accurate information for catalyst monitor diagnosis.

MONITOR CONDITIONS

When Monitored:

With the engine running, vehicle speed between 32 and 88 kph (20 and 55 mph), throttle open for a minimum of 120 seconds, ECT greater than 70° C (158° F), Catalytic Converter Temperature greater than 600° C (1112° F) and EVAP Purge active

SET CONDITIONS

- **Set Condition:**

The PCM detects that the oxygen sensor signal switches from lean to rich less than 16 times within 20 seconds during monitoring. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
EXHAUST LEAK (K141) O2 1/2 SIGNAL CIRCUIT (K904) O2 RETURN DOWNSTREAM CIRCUIT 1/2 O2 SENSOR

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. **ACTIVE DTC**

- NOTE:

Check for contaminants that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.
- NOTE:

After the repairs have been made, verify proper O2 Sensor operation. If all the O2 Sensor voltage readings have not returned to normal, follow the diagnostic procedure for the remaining O2 Sensors.

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. CHECKING THE EXHAUST SYSTEM FOR LEAKS

Turn the ignition off.

Raise the vehicle in accordance with the Service Information.

WARNING: The normal operating temperature of the exhaust system is very high. Never work around or attempt to service any part of the exhaust system until it has cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operating time

Connect Exhaust Cone #8404-EC or #8404-EC to Air Pressure Regulator (with hose) #W-18-MIL-1146AS.

CAUTION: The air pressure must not exceed 27.6 kPa (4 psi), otherwise engine damage can occur.

Attach shop air to the air pressure regulator.

Adjust the Air Pressure Regulator to 27.6 kPa (4 psi)

Insert the exhaust cone into the vehicle tail pipe.

If the vehicle is equipped with dual exhaust. Use the #8404-ECT with equipped attached plug, plug one side of the dual exhaust pipe. Pressurize the other as described above.

Apply Mopar® Air Leak Detector PN# 05191804AA (or an equivalent leak finder liquid) to the following areas:

- All welded joints from the exhaust manifold to 152.4 mm (6 inches) behind the downstream O2 sensor

- O2 sensor seal points
- O2 sensor boss welds
- Flange/joint connection(s)
- Exhaust manifold to cylinder head connection(s)
- EGR solenoid gasket base and tube seal points (if equipped)

Watch for the liquid/soapy water to bubble.

Use the following definitions to help determine if system or component repair/replacement is necessary:

Type 1 Leak is defined as a leak where very small foam like bubbles 1 mm (0.04 of an inch) or less appear.

Any Type 1 or greater leaks found in welded joints, O2 sensor seal points or O2 sensor boss welds must be repaired or the component must be replaced.

Type 2 Leak is defined as a leak where larger bubbles pea size, 8 mm (0.3 of an inch) or greater appear.

Any Type 2 or greater leaks found in flange or joint connections, exhaust manifold to cylinder head connections, or EGR gasket and tube seal points must be repaired or the components must be replaced

Leak Location	Repair required if results at 27.6 kPa (4 psi) reveal bubble size:
Welded joints	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor seal points	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor boss welds	Type 1, 1 mm (0.04 of an inch) or greater
Flange / joint connections	Type 2, 8 mm (0.3 of an inch) or greater
Exhaust Manifold to cylinder head connections	Type 2, 8 mm (0.3 of an inch) or greater
EGR gasket and tube seal points	Type 2, 8 mm (0.3 of an inch) or greater

If a leak is found that matches the above definition, repair or replace the component as necessary.

Once the repair is complete, repeat the procedure to verify that all leaks have been repaired.

Were any exhaust leaks found?

WARNING: The normal operating temperature of the exhaust system is very high. Never work around or attempt to service any part of the exhaust system until it has cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operating time

Connect Exhaust Cone #8404-EC or #8404-EC to Air Pressure Regulator (with hose) #W-18-MIL-1146AS.

CAUTION: The air pressure must not exceed 27.6 kPa (4 psi), otherwise engine damage can occur.

Attach shop air to the air pressure regulator.

Adjust the Air Pressure Regulator to 27.6 kPa (4 psi)

Insert the exhaust cone into the vehicle tail pipe.

If the vehicle is equipped with dual exhaust. Use the #8404-ECT with equipped attached plug, plug one side of the dual exhaust pipe. Pressurize the other as described above.

Apply Mopar® Air Leak Detector PN# 05191804AA (or an equivalent leak finder liquid) to the following areas:

- All welded joints from the exhaust manifold to 152.4 mm (6 inches) behind the downstream O2 sensor
- O2 sensor seal points
- O2 sensor boss welds
- Flange/joint connection(s)
- Exhaust manifold to cylinder head connection(s)
- EGR solenoid gasket base and tube seal points (if equipped)

Watch for the liquid/soapy water to bubble.

Use the following definitions to help determine if system or component repair/replacement is necessary:

Type 1 Leak is defined as a leak where very small foam like bubbles 1 mm (0.04 of an inch) or less appear.

Any Type 1 or greater leaks found in welded joints, O2 sensor seal points or O2 sensor boss welds must be repaired or the component must be replaced.

Type 2 Leak is defined as a leak where larger bubbles pea size, 8 mm (0.3 of an inch) or greater appear.

Any Type 2 or greater leaks found in flange or joint connections, exhaust manifold to cylinder head connections, or EGR gasket and tube seal points must be repaired or the components must be replaced

Leak Location	Repair required if results at 27.6 kPa (4 psi) reveal bubble size:
Welded joints	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor seal points	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor boss welds	Type 1, 1 mm (0.04 of an inch) or greater
Flange / joint connections	Type 2, 8 mm (0.3 of an inch) or greater
Exhaust Manifold to cylinder head connections	Type 2, 8 mm (0.3 of an inch) or greater
EGR gasket and tube seal points	Type 2, 8 mm (0.3 of an inch) or greater

If a leak is found that matches the above definition, repair or replace the component as necessary.

Once the repair is complete, repeat the procedure to verify that all leaks have been repaired.

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The downstream O2 Sensor is located in the exhaust path behind the catalytic converter, is monitored for proper response to assure optimum catalytic converter efficiency. The downstream O2 response monitor is intended to diagnose a downstream O2 sensor that is not moving or stuck in a voltage window and to insure accurate information for catalyst monitor diagnosis.

MONITOR CONDITIONS

When Monitored:

With the engine running, vehicle speed above 96 kph (60 mph), throttle open for a minimum of 120 seconds, ECT greater than 70° C (158° F), catalytic converter temperature greater than 600° C (1112° F), and downstream oxygen sensor in a rich state. During a decel fuel shutoff event, the downstream oxygen sensor should switch from rich to lean within a specific time.

SET CONDITIONS

- Set Condition:**

The PCM monitors the downstream O2 sensor. If the PCM does not detect a rich to lean switch within a specific time during a decel fuel shutoff event, the monitor will fail. One trip fault. Three good trips to turn off the MIL.

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

This diagnostic provides a continuous check of the O2 heater circuit during operation. The heater circuit is momentarily disabled to allow a resistance measurement to be taken to infer heater temperature. The current delivery to the heater is duty cycled to maintain a specific target temperature. The error from the target temperature is continuously monitored to assess heater performance.

MONITOR CONDITIONS

When Monitored:

Continuously during O2 sensor heater operation with battery voltage between 10.4 and 15.75 volts and no O2 sensor circuit DTCs present.

SET CONDITIONS

- **Set Condition:**

The PCM detects no temperature change in the O2 sensor heater element when the heater circuit is active. The heater temperature is obtained by measuring the heater resistance and calculating the heater temperature. Two trip fault. Three good trips to turn off the MIL.

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

For an aged O2 sensor, the response rate to the air/fuel change is slower than when it was new. The O2 sensor tends to move less with the same air/fuel changes in a given time frame. Therefore by observing the activity of voltage readings from the upstream O2 sensor, the quality of the O2 sensor can be detected.

MONITOR CONDITIONS

When Monitored:

With the ECT above 70 °C (158 °F), engine RPM between 1400 and 2300, vehicle speed between 64 and 96 kph (40 and 60 mph), and engine run time greater than 3 minutes.

After the repairs have been made, verify proper O2 Sensor operation. If all the O2 Sensor voltage readings have not returned to normal, follow the diagnostic procedure for the remaining O2 Sensors.

Start the engine.

Allow the engine to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear

loose clothing. Failure to follow these instructions can result in personal injury or death.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. CHECKING THE EXHAUST SYSTEM FOR LEAKS

Turn the ignition off.

Raise the vehicle in accordance with the Service Information.

WARNING: The normal operating temperature of the exhaust system is very high. Never work around or attempt to service any part of the exhaust system until it has cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operating time

Connect Exhaust Cone #8404-EC or #8404-EC to Air Pressure Regulator (with hose) #W-18-MIL-1146AS.

CAUTION: The air pressure must not exceed 27.6 kPa (4 psi), otherwise engine damage can occur.

Attach shop air to the air pressure regulator.

Adjust the Air Pressure Regulator to 27.6 kPa (4 psi)

Insert the exhaust cone into the vehicle tail pipe.

If the vehicle is equipped with dual exhaust. Use the #8404-ECT with equipped attached plug, plug one side of the dual exhaust pipe. Pressurize the other as described above.

Apply Mopar® Air Leak Detector PN# 05191804AA (or an equivalent leak finder liquid) to the following areas:

- All welded joints from the exhaust manifold to 152.4 mm (6 inches) behind the downstream O2 sensor
- O2 sensor seal points
- O2 sensor boss welds
- Flange/joint connection(s)
- Exhaust manifold to cylinder head connection(s)
- EGR solenoid gasket base and tube seal points (if equipped)

Watch for the liquid/soapy water to bubble.

Use the following definitions to help determine if system or component repair/replacement is necessary:

Type 1 Leak is defined as a leak where very small foam like bubbles 1 mm (0.04 of an inch) or less appear.

Any Type 1 or greater leaks found in welded joints, O2 sensor seal points or O2 sensor boss welds must be repaired or the component must be replaced.

Type 2 Leak is defined as a leak where larger bubbles pea size, 8 mm (0.3 of an inch) or greater appear.

Any Type 2 or greater leaks found in flange or joint connections, exhaust manifold to cylinder head connections, or EGR gasket and tube seal points must be repaired or the components must be replaced

Leak Location	Repair required if results at 27.6 kPa (4 psi) reveal bubble size:
Welded joints	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor seal points	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor boss welds	Type 1, 1 mm (0.04 of an inch) or greater
Flange / joint connections	Type 2, 8 mm (0.3 of an inch) or greater
Exhaust Manifold to cylinder head connections	Type 2, 8 mm (0.3 of an inch) or greater
EGR gasket and tube seal points	Type 2, 8 mm (0.3 of an inch) or greater

If a leak is found that matches the above definition, repair or replace the component as necessary.

Once the repair is complete, repeat the procedure to verify that all leaks have been repaired.

Were any exhaust leaks found?

Yes

Repair or replace the leaking exhaust parts as necessary.

This diagnostic provides a continuous check of the O2 heater circuit during operation. The heater circuit is momentarily disabled to allow a resistance measurement to be taken to infer heater temperature. The current delivery to the heater is duty cycled to maintain a specific target temperature. The error from the target temperature is continuously monitored to assess heater performance.

MONITOR CONDITIONS

When Monitored:

Continuously during O2 sensor heater operation with battery voltage between 10.4 and 15.75 volts and no O2 sensor circuit DTCs present.

SET CONDITIONS

- **Set Condition:**

The PCM detects no temperature change in the O2 sensor heater element when the heater circuit is active. The heater temperature is obtained by measuring the heater resistance and calculating the heater temperature. Two trip fault. Three good trips to turn off the MIL.

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. O2 SENSOR HEATER ELEMENT

Turn the ignition off.

NOTE: Allow the O2 sensor to cool down to room temperature.

Disconnect the 2/1 O2 Sensor harness connector.

Measure the resistance of the O2 Heater Element across the O2 Sensor connector between the O2 Heater Control terminal and the O2 Heater ground terminal.

NOTE: O2 Heater Element resistance values should be measured at 21.1° C (70° F). The resistance value will vary with different temperature values.

Is the resistance of the O2 Sensor Heater Element between 2.0 and 30.0 ohms?

Yes

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The downstream O2 Sensor is located in the exhaust path behind the catalytic converter, is monitored for proper response to assure optimum catalytic converter efficiency. The downstream O2 response monitor is intended to diagnose a downstream O2 sensor that is not moving or stuck in a voltage window and to insure accurate information for catalyst monitor diagnosis.

MONITOR CONDITIONS

When Monitored:

Vehicle is started and driven between 32 and 88.5 km/h (20 and 55 mph) with the Throttle open for a minimum of 120 seconds. Coolant greater than 70° C (158° F). Catalytic Converter Temp greater than 600° C (1112° F) and EVAP Purge is active.

SET CONDITIONS

The oxygen sensor signal voltage switches less than 16 times from lean to rich within 20 seconds during monitoring. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
EXHAUST LEAK (K243) O2 2/2 SIGNAL CIRCUIT (K904) O2 RETURN DOWNSTREAM CIRCUIT 2/2 O2 SENSOR

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Check for contaminants that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.

NOTE: After the repairs have been made, verify proper O2 Sensor operation. If all the O2 Sensor voltage readings have not returned to normal, follow the diagnostic procedure for the remaining O2 Sensors.

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. CHECKING THE EXHAUST SYSTEM FOR LEAKS

Turn the ignition off.

Raise the vehicle in accordance with the Service Information.

WARNING: The normal operating temperature of the exhaust system is very high. Never work around or attempt to service any part of the exhaust system until it has cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operating time

Connect Exhaust Cone #8404-EC or #8404-EC to Air Pressure Regulator (with hose) #W-18-MIL-1146AS.

CAUTION: The air pressure must not exceed 27.6 kPa (4 psi), otherwise engine damage can occur.

Attach shop air to the air pressure regulator.

Adjust the Air Pressure Regulator to 27.6 kPa (4 psi)

Insert the exhaust cone into the vehicle tail pipe.

If the vehicle is equipped with dual exhaust. Use the #8404-ECT with equipped attached plug, plug one side of the dual exhaust pipe. Pressurize the other as described above.

Apply Mopar® Air Leak Detector PN# 05191804AA (or an equivalent leak finder liquid) to the following areas:

- All welded joints from the exhaust manifold to 152.4 mm (6 inches) behind the downstream O2 sensor

- O2 sensor seal points
- O2 sensor boss welds
- Flange/joint connection(s)
- Exhaust manifold to cylinder head connection(s)
- EGR solenoid gasket base and tube seal points (if equipped)

Watch for the liquid/soapy water to bubble.

Use the following definitions to help determine if system or component repair/replacement is necessary:

Type 1 Leak is defined as a leak where very small foam like bubbles 1 mm (0.04 of an inch) or less appear.

Any Type 1 or greater leaks found in welded joints, O2 sensor seal points or O2 sensor boss welds must be repaired or the component must be replaced.

Type 2 Leak is defined as a leak where larger bubbles pea size, 8 mm (0.3 of an inch) or greater appear.

Any Type 2 or greater leaks found in flange or joint connections, exhaust manifold to cylinder head connections, or EGR gasket and tube seal points must be repaired or the components must be replaced

Leak Location	Repair required if results at 27.6 kPa (4 psi) reveal bubble size:
Welded joints	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor seal points	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor boss welds	Type 1, 1 mm (0.04 of an inch) or greater
Flange / joint connections	Type 2, 8 mm (0.3 of an inch) or greater
Exhaust Manifold to cylinder head connections	Type 2, 8 mm (0.3 of an inch) or greater
EGR gasket and tube seal points	Type 2, 8 mm (0.3 of an inch) or greater

If a leak is found that matches the above definition, repair or replace the component as necessary.

Once the repair is complete, repeat the procedure to verify that all leaks have been repaired.

Were any exhaust leaks found?

SET CONDITIONS

- **Set Condition:**

The PCM detects no temperature change in the O2 sensor heater element when the heater circuit is active. The heater temperature is obtained by measuring the heater resistance and calculating the heater temperature. Two trip fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
(K399) O2 2/2 HEATER CONTROL CIRCUIT OPEN (Z933) O2 2/2 HEATER GROUND CIRCUIT OPEN 2/2 O2 SENSOR POWERTRAIN CONTROL MODULE (PCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. O2 SENSOR HEATER OPERATION

Turn the ignition off.

NOTE: **Wait a minimum of 8 minutes to allow the O2 Sensor to cool down before continuing the test. Allow the O2 Sensor voltage to stabilize between 4.6 and 5.0 volts.**

Ignition on, engine not running.

With a scan tool, perform the 2/2 O2 Sensor Heater Test.

With a scan tool, monitor 2/2 O2 Sensor voltage for at least 2 minutes.

Does the voltage stay above 4.5 volts?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. O2 SENSOR HEATER ELEMENT

Turn the ignition off.

NOTE: Allow the O2 sensor to cool down to room temperature.

Disconnect the 2/2 O2 Sensor harness connector.

Measure the resistance of the 2/2 O2 Heater Element, between the O2 Heater Control terminal and the O2 Heater ground terminal in the O2 Sensor connector.

NOTE: O2 Heater Element resistance values should be measured at 21.1° C (70° F). The resistance value will vary with different temperature values.

Is the resistance of the O2 Sensor Heater Element between 2.0 and 30.0 ohms?

Yes

Go To 3.

No

Verify that there is good pin to terminal contact in the Oxygen Sensor and Powertrain Control Module connectors. If OK, replace the 2/2 O2 Sensor.

Perform **POWERTRAIN VERIFICATION TEST** .

3. (K399) O2 2/2 HEATER CONTROL CIRCUIT OPEN

81a283c4

Fig. 98: Checking O2 2/2 Heater Control Circuit For Open Or Excessive Resistance
Courtesy of CHRYSLER LLC

Disconnect the C3 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (K399) O2 2/2 Heater Control circuit from the O2 harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 0.5 of an ohm?

Yes

Go To 4.

No

Repair the excessive resistance in the (K399) O2 2/2 Heater Control circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

4. (Z933) O2 2/2 HEATER GROUND CIRCUIT OPEN

81994b07

Fig. 99: Checking O2 Sensor Ground Circuit
 Courtesy of CHRYSLER LLC

Using a 12 volt test light connected to 12 volts, check the (Z933) Ground circuit in the 2/2 Oxygen Sensor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

Go To 5.

No

Repair the excessive resistance in the (Z933) O2 2/2 Heater ground circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

5. **POWERTRAIN CONTROL MODULE (PCM)**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor 2/2 and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the 2/2 Oxygen Sensor and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The fuel feedback system will maintain a stoichiometric fuel/air mixture, 14.7:1, by modifying the injector pulsewidth according to the oxygen content of the exhaust gas. The PCM makes short term and long term fuel corrections to maintain stoichiometric fuel/air ratio for best catalytic converter efficiency. Short term fuel correction is based on upstream O2 sensor output and is designed for quick engine response. The long term fuel correction compensated for variations in the engine specifications, sensor tolerances and component aging and is designed to correct rich and lean conditions over a longer period of time.

MONITOR CONDITIONS

When Monitored:

With the engine running in closed loop mode, the ambient/battery temperature above -6.7° C (20° F) and altitude below 2590.8 m (8500 ft).

SET CONDITIONS

- **Set Condition:**

If the PCM multiplies short term compensation by long term adaptive and a certain percentage is exceeded for two trips, a freeze frame is stored, the MIL illuminates and a trouble code is stored. Two Trip Fault. Three good trips to turn off the MIL

POSSIBLE CAUSES

Possible Causes
RESTRICTED FUEL SUPPLY LINE
FUEL PUMP INLET STRAINER PLUGGED
FUEL PUMP MODULE

ENGINE MECHANICAL PROBLEM
FUEL FILTER/PRESSURE REGULATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. **ACTIVE DTC**

Diagnose all other trouble codes before continuing.

NOTE: **Check for contaminants that may have damaged an O2 Sensor:**

contaminated fuel, unapproved silicone, oil and coolant.

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. CHECKING FUEL PRESSURE

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Install a fuel pressure gauge.

Ignition on, engine not running.

With a scan tool, actuate the ASD Fuel System test and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Turn the ignition off.

Choose a conclusion that best matches your fuel pressure reading.

Within Specification

Go To 3.

Above Specification

Replace the fuel filter/pressure regulator.

Perform **POWERTRAIN VERIFICATION TEST**.

Below Specification

Go To 13.

CAUTION: Stop All Actuations.

3. CHECKING THE EXHAUST SYSTEM FOR LEAKS

Turn the ignition off.

Raise the vehicle in accordance with the Service Information.

WARNING: The normal operating temperature of the exhaust system is very high. Never work around or attempt to service any part of the exhaust system until it has cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operating time

Connect Exhaust Cone #8404-EC or #8404-EC to Air Pressure Regulator (with hose) #W-18-MIL-1146AS.

CAUTION: The air pressure must not exceed 27.6 kPa (4 psi), otherwise engine damage can occur.

Attach shop air to the air pressure regulator.

Adjust the Air Pressure Regulator to 27.6 kPa (4 psi)

Insert the exhaust cone into the vehicle tail pipe.

If the vehicle is equipped with dual exhaust. Use the #8404-ECT with equipped attached plug, plug one side of the dual exhaust pipe. Pressurize the other as described above.

Apply Mopar® Air Leak Detector PN# 05191804AA (or an equivalent leak finder liquid) to the following areas:

- All welded joints from the exhaust manifold to 152.4 mm (6 inches) behind the downstream O2 sensor

- O2 sensor seal points
- O2 sensor boss welds
- Flange/joint connection(s)
- Exhaust manifold to cylinder head connection(s)
- EGR solenoid gasket base and tube seal points (if equipped)

Watch for the liquid/soapy water to bubble.

Use the following definitions to help determine if system or component repair/replacement is necessary:

Type 1 Leak is defined as a leak where very small foam like bubbles 1 mm (0.04 of an inch) or less appear.

Any Type 1 or greater leaks found in welded joints, O2 sensor seal points or O2 sensor boss welds must be repaired or the component must be replaced.

Type 2 Leak is defined as a leak where larger bubbles pea size, 8 mm (0.3 of an inch) or greater appear.

Any Type 2 or greater leaks found in flange or joint connections, exhaust manifold to cylinder head connections, or EGR gasket and tube seal points must be repaired or the components must be replaced

Leak Location	Repair required if results at 27.6 kPa (4 psi) reveal bubble size:
Welded joints	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor seal points	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor boss welds	Type 1, 1 mm (0.04 of an inch) or greater
Flange / joint connections	Type 2, 8 mm (0.3 of an inch) or greater
Exhaust Manifold to cylinder head connections	Type 2, 8 mm (0.3 of an inch) or greater
EGR gasket and tube seal points	Type 2, 8 mm (0.3 of an inch) or greater

If a leak is found that matches the above definition, repair or replace the component as necessary.

Once the repair is complete, repeat the procedure to verify that all leaks have been repaired.

Were any exhaust leaks found?

Yes

Repair or replace the leaking exhaust parts as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 4.

4. O2 SENSOR OPERATION

Start the engine.

Allow the engine to reach normal operating temperature.

NOTE: If one of the O2 Sensor's Signal or Return circuit is shorted to ground the scan tool will display all O2 Sensor voltage readings low. The O2 Sensor that is shorted to ground will display a voltage reading near or at 0 volts.

NOTE: If one of the O2 Sensor Signal or Return circuits are shorted to voltage, the scan tool will display all O2 Sensor voltage readings high.

NOTE: After the repairs have been made, verify proper O2 Sensor operation. If all the O2 Sensor voltage readings have not returned to normal, follow the diagnostic procedure for the remaining O2 Sensors.

With a scan tool, monitor all of the O2 Sensor voltage readings.

Is the voltage switching between 2.5 and 3.4 volts for all the O2 Sensors?

Yes

Go To 5.

No

Go To 9.

5. 1/1 O2 SENSOR HEATER OPERATION

Turn the ignition off.

NOTE: Wait a minimum of 10 minutes to allow the O2 Sensor to cool down before continuing the test. Allow the O2 Sensor voltage to stabilize at 5.0 volts.

Ignition on, engine not running.

With a scan tool, actuate the 1/1 O2 Heater Test.

With the scan tool, monitor 1/1 O2 Sensor voltage for at least 2 minutes.

Does the voltage stay above 4.5 volts?

Yes

Verify that there is good pin to terminal contact in the O2 Sensor and Powertrain Control Module connectors. Replace the 1/1 O2 Sensor if no problems were found with the connectors.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 6.

6. MAP SENSOR OPERATION

Ignition on, engine not running.

With a scan tool, read the Barometric Pressure.

NOTE: **The Barometric Pressure should be approximately equal to the actual barometric pressure. If necessary, compare the Barometric Pressure value of this vehicle to the value of a known good vehicle of a similar make and model.**

Turn the ignition off.

Connect a Vacuum Gauge to a Manifold Vacuum source.

Start the engine.

Allow the engine to idle.

NOTE: **If engine will not idle, maintain a constant RPM above idle.**

With the scan tool, read the MAP Sensor vacuum value.

Is the scan tool reading for MAP Vacuum within 1 inch of Hg on the Vacuum Gauge and is the Barometric Pressure reading of the vehicle the approximately the same as actual Barometric Pressure?

Yes

Go To 7.

No

Verify that there is good pin to terminal contact in the MAP Sensor and Powertrain Control Module connectors. Replace the MAP Sensor if no problems were found with the connectors.

Perform **POWERTRAIN VERIFICATION TEST** .

7. ECT SENSOR OPERATION

NOTE: For this test to be valid, the thermostat must be operating correctly.

NOTE: This test works best if performed on a cold engine (cold soak)

Ignition on, engine not running.

With a scan tool, read the Engine Coolant Temperature (ECT) Sensor value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the ambient temperature.

NOTE: If engine coolant temperature is above 82° C (180° F), allow the engine to cool until 65° C (150° F) is reached.

Start the Engine.

During engine warm-up, monitor the ECT Sensor value. The temperature value change should be a smooth transition from start up to normal operating temperature 82° C (180° F). The value should reach at least 82° C (180° F).

Did the ECT value increase smoothly and did it reach at least 182° C (180° F)?

Yes

Go To 8.

No

Verify that there is good pin to terminal contact in the ECT Sensor and Powertrain Control Module connectors. Replace the ECT Sensor if no problems were found with the connectors.

Perform **POWERTRAIN VERIFICATION TEST** .

8. ENGINE MECHANICAL PROBLEM

Turn the ignition off.

Check for any of the following conditions/mechanical problems.

AIR INDUCTION SYSTEM - must be free from leaks.

ENGINE VACUUM - must be at least 13 inches in neutral

ENGINE VALVE TIMING - must be within specifications

ENGINE COMPRESSION - must be within specifications

ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks.

ENGINE PCV SYSTEM - must flow freely

TORQUE CONVERTER STALL SPEED - must be within specifications

POWER BRAKE BOOSTER - no internal vacuum leaks

FUEL - must be free of contamination

FUEL INJECTOR - plugged or restricted injector; control wire not connected to correct injector

Are there any engine mechanical problems?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 12.

9. **1/1 O2 SENSOR**

**SENSOR-
OXYGEN**

Fig. 101: Checking O2 Sensor Return Upstream & Downstream Circuits
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the 1/1 O2 Sensor harness connector.

Ignition on, engine not running.

With a scan tool, monitor the 1/1 O2 Sensor voltage.

O2 Sensor voltage should read between 4.1 and 5.0 volts on the scan tool with the connector disconnected.

Connect a jumper wire between the (K41) Signal circuit and the (K902) O2 Return Upstream circuit in the O2 Sensor harness connector.

NOTE: The voltage should drop from between 4.1 and 5.0 volts to 2.5 volts with the jumper wire in place.

Did the O2 Sensor voltage change from 5.0 volts to 2.5 volts with the jumper wire installed?

Yes

Verify that there is good pin to terminal contact in the O2 Sensor and Powertrain Control Module connectors. Replace the 1/1 O2 Sensor if no problems were found with the connectors.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 10.

NOTE: Remove the jumper wire before continuing.

10. (K41) O2 SENSOR 1/1 SIGNAL CIRCUIT

With a scan tool, monitor the 1/1 O2 Sensor voltage reading with the jumper wire removed.

NOTE: The scan tool will display all O2 Sensor voltage readings approximately 5.0 volts when only one O2 Sensor's Signal circuit is shorted to voltage.

NOTE: The scan tool will display one O2 Sensor voltage close to zero and the others will read lower than normal when one O2 Sensor Signal circuit contains excessive resistance.

Is the voltage between 4.1 and 5.0 volts?

Yes

Go To 11.

No

Check the (K41) O2 Sensor 1/1 Signal circuit for a short to ground, open, or short to voltage.
Inspect the O2 Sensor connector and the PCM harness connector. If OK, replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

11. **(K902) O2 RETURN UPSTREAM CIRCUIT**

**SENSOR-
OXYGEN**

81653c98

Fig. 102: Checking O2 Sensor Return Upstream & Downstream Circuits
Courtesy of CHRYSLER LLC

Disconnect the 1/1 O2 Sensor harness connector.

Measure the voltage on the (K902) O2 Return Upstream circuit in the O2 Sensor harness connector.

Is the voltage at 2.5 volts?

Yes

Go To 12.

No

Check the O2 Return Upstream circuit for a short to ground, open, or short to voltage. Inspect the O2 Sensor connector and the PCM harness connector. If OK, replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

12. **POWERTRAIN CONTROL MODULE (PCM)**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Sensors and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Sensor and Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

13. **RESTRICTED FUEL SUPPLY LINE**

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module.

Install special 5/16 fuel line adapter tool #6539 between disconnected fuel line and the fuel pump module.

Attach a fuel pressure test gauge to the T fitting on tool #6539.

Ignition on, engine not running.

With a scan tool, actuate the ASD Fuel System test and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Is the fuel pressure within specification?

Yes

Repair or replace fuel supply line as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 14.

CAUTION: Stop All Actuations.

14. FUEL PUMP INLET STRAINER

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.

Turn the ignition off.

Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer.

Is the Fuel Inlet Strainer plugged?

Yes

Replace the Fuel Pump Inlet Strainer.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 15.

15. FUEL PUMP MODULE

If there are no possible causes remaining, view repair.

Repair

Verify that there is good pin to terminal contact in the Fuel Pump Module, TIPM, and Powertrain Control Module connectors. Replace the Fuel Pump Module if no problems were found with the connectors.

Perform **POWERTRAIN VERIFICATION TEST** .

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The fuel feedback system will maintain a stoichiometric fuel/air mixture, 14.7:1, by modifying the injector pulse width according to the oxygen content of the exhaust gas. The PCM makes short term and long term fuel corrections to maintain stoichiometric fuel/air ratio for best catalytic converter efficiency. Short term fuel correction is based on upstream O2 sensor output and is designed for quick engine response. The long term fuel correction compensated for variations in the engine specifications, sensor tolerances and component aging and is designed to correct rich and lean conditions over a longer period of time.

MONITOR CONDITIONS

When Monitored:

With the engine running in closed loop mode, the ambient/battery temperature above -6.7° C (20° F) and altitude below 2590.8 m (8500 ft).

SET CONDITIONS

- **Set Condition:**

If the PCM multiplies short term compensation by long term adaptive and a certain percentage is exceeded for two trips, a freeze frame is stored, the MIL illuminates and a trouble code is stored. Two Trip Fault. Three good trips to turn off the MIL.

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. **ACTIVE DTC**

Diagnose all other trouble codes before continuing.

NOTE: Check for contaminants that may have damaged an O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. CHECKING FUEL PRESSURE

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Install a fuel pressure gauge to the fuel rail.

Ignition on, engine not running.

With the scan tool, actuate the ASD Fuel System test and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Turn the ignition off.

Choose a conclusion that best matches your fuel pressure reading.

Within Specification

Go To 3.

Above Specification

Replace the fuel filter/pressure regulator.

Perform **POWERTRAIN VERIFICATION TEST**.

Below Specification

Go To 13.

CAUTION: Stop All Actuations.

3. CHECKING THE EXHAUST SYSTEM FOR LEAKS

Turn the ignition off.

Raise the vehicle in accordance with the Service Information.

WARNING: The normal operating temperature of the exhaust system is very high. Never work around or attempt to service any part of the exhaust system until it has cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operating time

Connect Exhaust Cone #8404-EC or #8404-EC to Air Pressure Regulator (with hose) #W-18-MIL-1146AS.

CAUTION: The air pressure must not exceed 27.6 kPa (4 psi), otherwise engine damage can occur.

Attach shop air to the air pressure regulator.

Adjust the Air Pressure Regulator to 27.6 kPa (4 psi)

Insert the exhaust cone into the vehicle tail pipe.

If the vehicle is equipped with dual exhaust. Use the #8404-ECT with equipped attached plug, plug one side of the dual exhaust pipe. Pressurize the other as described above.

Apply Mopar® Air Leak Detector PN# 05191804AA (or an equivalent leak finder liquid) to the following areas:

- All welded joints from the exhaust manifold to 152.4 mm (6 inches) behind the downstream O2 sensor

- O2 sensor seal points
- O2 sensor boss welds
- Flange/joint connection(s)
- Exhaust manifold to cylinder head connection(s)
- EGR solenoid gasket base and tube seal points (if equipped)

Watch for the liquid/soapy water to bubble.

Use the following definitions to help determine if system or component repair/replacement is necessary:

Type 1 Leak is defined as a leak where very small foam like bubbles 1 mm (0.04 of an inch) or less appear.

Any Type 1 or greater leaks found in welded joints, O2 sensor seal points or O2 sensor boss welds must be repaired or the component must be replaced.

Type 2 Leak is defined as a leak where larger bubbles pea size, 8 mm (0.3 of an inch) or greater appear.

Any Type 2 or greater leaks found in flange or joint connections, exhaust manifold to cylinder head connections, or EGR gasket and tube seal points must be repaired or the components must be replaced

Leak Location	Repair required if results at 27.6 kPa (4 psi) reveal bubble size:
Welded joints	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor seal points	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor boss welds	Type 1, 1 mm (0.04 of an inch) or greater
Flange / joint connections	Type 2, 8 mm (0.3 of an inch) or greater
Exhaust Manifold to cylinder head connections	Type 2, 8 mm (0.3 of an inch) or greater
EGR gasket and tube seal points	Type 2, 8 mm (0.3 of an inch) or greater

If a leak is found that matches the above definition, repair or replace the component as necessary.

Once the repair is complete, repeat the procedure to verify that all leaks have been repaired.

Were any exhaust leaks found?

Yes

Repair or replace the leaking exhaust parts as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 4.

4. O2 SENSOR OPERATION

Start the engine.

Allow the engine to reach normal operating temperature.

NOTE: If one of the O2 Sensor's Signal or Return circuit is shorted to ground the scan tool will display all O2 Sensor voltage readings low. The O2 Sensor that is shorted to ground will display a voltage reading near or at 0 volts.

NOTE: If one of the O2 Sensor Signal or Return circuits are shorted to voltage, the scan tool will display all O2 Sensor voltage readings high.

NOTE: After the repairs have been made, verify proper O2 Sensor operation. If all the O2 Sensor voltage readings have not returned to normal, follow the diagnostic procedure for the remaining O2 Sensors.

With the scan tool, monitor the 2/1 O2 Sensor voltage reading.

Is the voltage switching between 2.5 and 3.4 volts?

Yes

Go To 5.

No

Go To 9.

5. 2/1 O2 SENSOR HEATER OPERATION

Turn the ignition off.

NOTE: Wait a minimum of 10 minutes to allow the O2 Sensor to cool down before continuing the test. Allow the O2 Sensor voltage to stabilize at 5.0 volts.

NOTE: Perform the following test on all O2 Sensors.

Ignition on, engine not running.

With a scan tool, actuate the 2/1 O2 Heater Test.

With the scan tool, monitor 2/1 O2 Sensor voltage for at least 2 minutes.

Does the voltage stay above 4.5 volts?

Yes

Verify that there is good pin to terminal contact in the O2 Sensor and Powertrain Control Module connectors. Replace the 2/1 O2 Sensor if no problems were found with the connectors.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 6.

6. MAP SENSOR OPERATION

Ignition on, engine not running.

With a scan tool, read the Barometric Pressure.

NOTE: **The Barometric Pressure should be approximately equal to the actual barometric pressure. If necessary, compare the Barometric Pressure value of this vehicle to the value of a known good vehicle of a similar make and model.**

Turn the ignition off.

Connect a Vacuum Gauge to a Manifold Vacuum source.

Start the engine.

Allow the engine to idle.

NOTE: **If engine will not idle, maintain a constant RPM above idle.**

With the scan tool, read the MAP Sensor vacuum value.

Is the scan tool reading for MAP Vacuum within 1 inch of Hg on the Vacuum Gauge and is the Barometric Pressure reading of the vehicle the approximately the same as actual Barometric Pressure?

Yes

Go To 7.

No

Verify that there is good pin to terminal contact in the MAP Sensor and Powertrain Control Module connectors. Replace the MAP Sensor if no problems were found with the connectors.

Perform **POWERTRAIN VERIFICATION TEST** .

7. ECT SENSOR OPERATION

NOTE: For this test to be valid, the thermostat must be operating correctly.

NOTE: This test works best if performed on a cold engine (cold soak).

Ignition on, engine not running.

With the scan tool, read the Engine Coolant Temperature (ECT) Sensor value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the ambient temperature.

NOTE: If engine coolant temperature is above 82° C (180° F), allow the engine to cool until 65° C (150° F) is reached.

Start the Engine.

During engine warm-up, monitor the ECT Sensor value. The temperature value change should be a smooth transition from start up to normal operating temperature 82° (180° F). The value should reach at least 82° C (180° F).

Did the ECT value increase smoothly and did it reach at least 82° (180° F)?

Yes

Go To 8.

No

Verify that there is good pin to terminal contact in the ECT Sensor and Powertrain Control Module connectors. Replace the Engine Coolant Temperature Sensor if no problems were found with the connectors.

Perform **POWERTRAIN VERIFICATION TEST** .

8. ENGINE MECHANICAL PROBLEM

Turn the ignition off.

Check for any of the following conditions/mechanical problems.

AIR INDUCTION SYSTEM - must be free from leaks.

ENGINE VACUUM - must be at least 13 inches in neutral

ENGINE VALVE TIMING - must be within specifications

ENGINE COMPRESSION - must be within specifications

ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks.

ENGINE PCV SYSTEM - must flow freely

TORQUE CONVERTER STALL SPEED - must be within specifications

POWER BRAKE BOOSTER - no internal vacuum leaks

FUEL - must be free of contamination

FUEL INJECTOR - plugged or restricted injector; control wire not connected to correct injector

Are there any engine mechanical problems?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 12.

9. O2 SENSOR

Turn the ignition off.

Disconnect the 2/1 O2 Sensor harness connector.

Ignition on, engine not running.

With the scan tool, monitor the 2/1 O2 Sensor voltage.

O2 Sensor voltage should read between 4.1 and 5.0 volts on the scan tool with the connector disconnected.

Connect a jumper wire between the (K43) O2 Sensor 2/1 Signal circuit and the (K902) O2 Return Upstream circuit in the O2 Sensor harness connector.

NOTE: **The voltage should drop from between 4.1 and 5.0 volts to 2.5 volts with the jumper wire in place.**

Did the O2 Sensor voltage change from between 4.1 and 5.0 volts to 2.5 volts when the jumper wire was installed?

Yes

Verify that there is good pin to terminal contact in the O2 Sensor and Powertrain Control Module connectors. Replace the 2/1 O2 Sensor if no problems were found with the connectors.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 10.

NOTE: **Remove the jumper wire before continuing.**

10. O2 SENSOR SIGNAL CIRCUIT

With the scan tool, monitor all the O2 Sensor voltage reading with the jumper wire removed.

NOTE: **The scan tool will display all O2 Sensor voltage readings approximately 5.0 volts when only one O2 Sensor's Signal circuit is shorted to voltage.**

NOTE: **The scan tool will display one O2 Sensor voltage close to zero and the others will read lower than normal when one O2 Sensor Signal circuit contains excessive resistance.**

Is the voltage between 4.1 and 5.0 volts?

Yes

Go To 11.

No

Check all the O2 Signal circuits for a short to ground, open, or short to voltage. Inspect the O2 Sensor connector and the PCM harness connector. If OK, replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

Disconnect the 2/1 O2 Sensor harness connector.

Measure the voltage on the (K902) O2 Return Upstream circuit in the O2 Sensor harness connector.

Is the voltage at 2.5 volts?

Yes

Go To 12.

No

Check the (K902) O2 Return Upstream circuit for a short to ground, open, or short to voltage. Inspect the O2 Sensor connector and the PCM harness connector. If OK, replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

12. **POWERTRAIN CONTROL MODULE (PCM)**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Sensors and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Sensor and Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

13. **RESTRICTED FUEL SUPPLY LINE**

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module.

Install special 5/16 fuel line adapter tool #6539 between disconnected fuel line and the fuel pump module.

Attach a fuel pressure test gauge to the T fitting on tool #6539.

Ignition on, engine not running.

With the scan tool, actuate the ASD Fuel System test and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Is the fuel pressure within specification?

Yes

Repair or replace fuel supply line as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 14.

CAUTION: Stop All Actuations.

14. FUEL PUMP INLET STRAINER

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.

Turn the ignition off.

Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer.

Is the Fuel Inlet Strainer plugged?

Yes

Replace the Fuel Pump Inlet Strainer.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 15.

15. FUEL PUMP MODULE

If there are no possible causes remaining, view repair.

Repair

Verify that there is good pin to terminal contact in the Fuel Pump Module, TIPM, and Powertrain Control Module connectors. Replace the Fuel Pump Module if no problems were found with the connectors.

Perform **POWERTRAIN VERIFICATION TEST** .

CIRCUIT SCHEMATIC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

The fueling strategy for NGC requires potentially three fuel pulses per cylinder per cycle. The first pulse is delivered starting at a programmed angle soon after the intake valve closes, for specified time duration. This is for two reasons, one to prevent any fuel from this pulse being delivered in the previous cycle and second to allow fueling to begin as early as possible in the current cycle. The second pulse is delivered for a specified time and is set to end at a programmed angle. The pulse must not extend past the end angle. There can be a separate value for each cylinder under the same operating conditions. This is done for two reasons, one to prevent any fuel from this pulse being delivered during the intake/exhaust valve overlap period, which tends to cause elevated emission levels. Also, allowing fuel to enter each cylinder at a slightly different angle tends to reduce any fuel pressure standing waves in the fuel rail. If the desired total fuel pulse-width increases, a third fuel pulse must be delivered. The third pulse, if necessary, is delivered for a specified time and must end at a programmed angle before the valve closes again. The third pulse in the cycle is controlled by its ending angle. This is also for two reasons, one to prevent any fuel from this pulse being delivered in the next cycle and second to allow fueling to end as late as possible in the current cycle. At high engine speeds, one or more of the pulses may be dropped from the fueling strategy.

MONITOR CONDITIONS

When Monitored:

With battery voltage greater than 10 volts. Auto Shutdown Relay energized. Engine speed less than 3000 rpm.

SET CONDITIONS

- **Set Condition:**

The PCM monitors the continuity of the injector circuits as well as the voltage spike created by the collapse of the magnetic field in the injector coil. Any condition that reduces the maximum current flow or the magnitude of the voltage spike can cause this DTC to set.

POSSIBLE CAUSES

Possible Causes
(F342) ASD OUTPUT CIRCUIT
(K11) INJECTOR 1 CONTROL CIRCUIT OPEN
(K11) INJECTOR 1 CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. DTC IS ACTIVE

Turn the ignition on.

With the scan tool, select View DTCs. Record DTC and Freeze Frame information.

Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Review Freeze Frame information. Operate the vehicle under conditions similar to which the DTC was set.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. FUEL INJECTOR 1 CIRCUIT RESISTANCE

Fig. 115: Measuring Resistance Of Fuel Injector 1 Circuit From Appropriate Terminal Of Special

Tool #8815 And ASD Relay Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the C2 PCM harness connector.

Remove the ASD Relay.

NOTE: **The resistance of the circuit will vary according to the temperature of the injector coil. Use the table below to determine the resistance range of the injector.**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals, resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the Fuel Injector 1 circuit from the appropriate terminal of special tool #8815 and the ASD Relay connector.

Fuel Injector Coil Resistance Based on Engine Temperature	
Temperature	Resistance
-20° C (-4° F)	10 ohms (+/-.6 of an ohm)
20° C (68° F)	12 ohms (+/-.6 of an ohm)
60° C (140° F)	14 ohms (+/-.6 of an ohm)
100° C (212° F)	16 ohms (+/-.6 of an ohm)

Is the resistance of the injector within the specified range?

Yes

Go To 7.

No

Go To 3.

3. FUEL INJECTOR 1 WIRING AND CONNECTOR INSPECTION

Turn the ignition off.

Verify that the Fuel Injector 1 is properly connected to the injector. Disconnect the Fuel Injector 1 connector and Inspect the terminals for any condition that would result in a poor connection.

Using the wiring diagram/schematic as a guide, inspect the Fuel Injector 1 wiring and connector.

Look for any chafed, pierced, pinched, or partially broken wires.

Verify that there is good pin to terminal contact in the Injector and Powertrain Control Module connectors.

CIRCUIT SCHEMATIC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

The fueling strategy for NGC requires potentially three fuel pulses per cylinder per cycle. The first pulse is delivered starting at a programmed angle soon after the intake valve closes, for specified time duration. This is for two reasons, one to prevent any fuel from this pulse being delivered in the previous cycle and second to allow fueling to begin as early as possible in the current cycle. The second pulse is delivered for a specified time and is set to end at a programmed angle. The pulse must not extend past the end angle. There can be a separate value for each cylinder under the same operating conditions. This is done for two reasons, one to prevent any fuel from this pulse being delivered during the intake/exhaust valve overlap period, which tends to cause elevated emission levels. Also, allowing fuel to enter each cylinder at a slightly different angle tends to reduce any fuel pressure standing waves in the fuel rail. If the desired total fuel pulse-width increases, a third fuel pulse must be delivered. The third pulse, if necessary, is delivered for a specified time and must end at a programmed angle before the valve closes again. The third pulse in the cycle is controlled by its ending angle. This is also for two reasons, one to prevent any fuel from this pulse being delivered in the next cycle and second to allow fueling to end as late as possible in the current cycle. At high engine speeds, one or more of the pulses may be dropped from the fueling strategy.

MONITOR CONDITIONS

When Monitored:

With battery voltage greater than 10 volts. Auto Shutdown Relay energized. Engine speed less than 3000 rpm.

SET CONDITIONS

- **Set Condition:**

The PCM monitors the continuity of the injector circuits as well as the voltage spike created by the collapse of the magnetic field in the injector coil. Any condition that reduces the maximum current flow or the magnitude of the voltage spike can cause this DTC to set.

POSSIBLE CAUSES

Possible Causes
(F342) ASD RELAY OUTPUT CIRCUIT
(K12) INJECTOR 2 CONTROL CIRCUIT OPEN
(K12) INJECTOR 2 CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. ACTIVE DTC

Turn the ignition on.

With the scan tool, select View DTCs. Record DTC and Freeze Frame information.

Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Review Freeze Frame information. Operate the vehicle under conditions similar to which the DTC was set.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. FUEL INJECTOR 2 CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the C2 PCM harness connector.

Remove the ASD Relay.

NOTE: **The resistance of the circuit will vary according to the temperature of the injector coil. Use the table below to determine the resistance range of the injector.**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the Fuel Injector 2 circuit from the appropriate terminal of special tool #8815 and the ASD Relay connector.

Fuel Injector Coil Resistance Based on Engine Temperature	
Temperature	Resistance
-20° C (-4° F)	10 ohms (+/-.6 of an ohm)
20° C (68° F)	12 ohms (+/-.6 of an ohm)
60° C (140° F)	14 ohms (+/-.6 of an ohm)

***CHECKING THE EXHAUST SYSTEM FOR LEAKS**

DIAGNOSTIC TEST

1. CHECKING THE EXHAUST SYSTEM FOR LEAKS

Turn the ignition off.

Raise the vehicle in accordance with the Service Information.

WARNING: The normal operating temperature of the exhaust system is very high. Never work around or attempt to service any part of the exhaust system until it has cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operating time

Connect Exhaust Cone #8404-EC or #8404-EC to Air Pressure Regulator (with hose) #W-18-MIL-1146AS.

CAUTION: The air pressure must not exceed 27.6 kPa (4 psi), otherwise engine damage can occur.

Attach shop air to the air pressure regulator.

Adjust the Air Pressure Regulator to 27.6 kPa (4 psi)

Insert the exhaust cone into the vehicle tail pipe.

If the vehicle is equipped with dual exhaust. Use the #8404-ECT with equipped attached plug, plug one side of the dual exhaust pipe. Pressurize the other as described above.

Apply Mopar® Air Leak Detector PN# 05191804AA (or an equivalent leak finder liquid) to the following areas:

- All welded joints from the exhaust manifold to 152.4 mm (6 inches) behind the downstream O2 sensor
- O2 sensor seal points
- O2 sensor boss welds
- Flange/joint connection(s)
- Exhaust manifold to cylinder head connection(s)

- EGR solenoid gasket base and tube seal points (if equipped)

Watch for the Mopar® Air Leak Detector PN# 05191804AA (or the equivalent leak finder liquid) to bubble.

Use the following definitions to help determine if system or component repair/replacement is necessary:

Type 1 Leak is defined as a leak where very small foam like bubbles 1 mm (0.04 of an inch) or less appear.

Any Type 1 or greater leaks found in welded joints, O2 sensor seal points or O2 sensor boss welds must be repaired or the component must be replaced.

Type 2 Leak is defined as a leak where larger bubbles pea size, 8 mm (0.3 of an inch) or greater appear.

Any Type 2 or greater leaks found in flange or joint connections, exhaust manifold to cylinder head connections, or EGR gasket and tube seal points must be repaired or the components must be replaced

Leak Location	Repair required if results at 27.6 kPa (4 psi) reveal bubble size:
Welded joints	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor seal points	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor boss welds	Type 1, 1 mm (0.04 of an inch) or greater
Flange / joint connections	Type 2, 8 mm (0.3 of an inch) or greater
Exhaust Manifold to cylinder head connections	Type 2, 8 mm (0.3 of an inch) or greater
EGR gasket and tube seal points	Type 2, 8 mm (0.3 of an inch) or greater

If a leak is found that matches the above definition, repair or replace the component as necessary.

Once the repair is complete, repeat the procedure to verify that all leaks have been repaired.

Were any exhaust leaks found?

Yes

Repair or replace the leaking exhaust parts as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Test complete.

DIAGNOSTIC TEST

1. FUEL PUMP OPERATION

Ignition on, engine not running.

With a scan tool, actuate the Fuel System test.

NOTE: **It may be necessary to use a mechanics stethoscope in the next step.**

Listen for fuel pump operation at the fuel tank.

Does the Fuel Pump operate?

Yes

Go To step 2.

No

Go To step 5.

CAUTION: Stop All Actuations.

2. FUEL PRESSURE

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line,

the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Install a fuel pressure gauge at the engine.

Ignition on, engine not running.

With the scan tool, actuate the ASD Fuel System test and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 KPa +/- 34 KPa (59 psi +/- 5 psi).

Choose a conclusion that best matches your fuel pressure reading.

Below Specification

Go To step 3.

Within Specification

Check for contamination/water in the fuel. Make sure the fuel being used in this vehicle meets manufactures Fuel Requirement, refer to the service information.

Above Specification

Replace the fuel filter/fuel pressure regulator.

Perform **POWERTRAIN VERIFICATION TEST** .

CAUTION: Stop All Actuations.

3. RESTRICTED FUEL SUPPLY LINE

WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.

Turn the ignition off.

Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module.

Install special tool #6539 (5/16") or #6631(3/8") fuel line adapter and the fuel pressure gauge between the fuel supply line and the fuel pump module.

Ignition on, engine not running.

With the scan tool, actuate the ASD Fuel System test and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 KPa +/- 34 KPa (59 psi +/- 5 psi).

Is the fuel pressure within specification now?

Yes

Repair/replace fuel supply line as necessary.

Perform **POWERTRAIN VERIFICATION TEST**.

No

Go To step 4.

CAUTION: Stop All Actuations.

4. CHECKING FUEL INLET STRAINER

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer.

Is the Fuel Inlet Strainer plugged?

Yes

Replace the Fuel Pump Inlet Strainer.

Perform **POWERTRAIN VERIFICATION TEST**.

No

Replace the Fuel Pump Module.

Perform **POWERTRAIN VERIFICATION TEST**.

5. FUEL PUMP CONTROL OPERATION FROM THE PCM

Fig. 14: Using 12-Volt Test Light Connected To B+ To Probe K31 Fuel Pump Control Circuit In C1 TIPM Harness Connector
Courtesy of CHRYSLER LLC

Stop the Fuel Pump actuation.

Turn the ignition off.

Disconnect the C1 TIPM harness connector.

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Ignition on, engine not running.

Using a 12-volt test light connected to B+ probe the (K31 Fuel Pump Control circuit in the C1 TIPM harness connector.

Using a scan tool actuate the Fuel Pump under the PCM actuations.

Does the test light illuminate brightly during the actuation?

Yes

Go To step 8.

No

Go To step 6.

6. (K31) FUEL PUMP CONTROL CIRCUIT OPEN

Fig. 15: Measuring Resistance Of (K31) Fuel Pump Control Circuit From C1 TIPM Harness Connector To Appropriate Terminal Of Special Tool #8815
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the C3 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (K31) Fuel Pump Control circuit from the C1 TIPM harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

Go To step 7.

No

Repair the open in the (K31) Fuel Pump Control circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

7. (K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO GROUND

Fig. 16: Measuring Resistance Between Ground And Fuel Pump Control Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (K31) Fuel Pump Control circuit in the TIPM C1 harness connector.

Is the resistance below 100 ohms?

Yes

Repair the short to ground in the (K31) Fuel Pump Control circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To step 11.

8. (N1) FUEL PUMP OUTPUT CIRCUIT OPEN

Fig. 17: Measuring Resistance Of (N1) Fused Fuel Pump Output Circuit From C5 TIPM Harness Connector And Fuel Pump Module Harness Connector

Turn the ignition off.

Disconnect the C5 TIPM harness connector.

Disconnect the Fuel Pump Module harness connector.

Measure the resistance of the (N1) Fused Fuel Pump Output circuit from the C5 TIPM harness connector and the Fuel Pump Module harness connector.

Is the resistance above 5.0 ohms?

Yes

Repair the open in the (N1) Fused Fuel Pump Output circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To step 9.

9. (N1) FUEL PUMP OUTPUT CIRCUIT SHORTED TO GROUND

Fig. 18: Measuring Resistance Between Ground And (N1) Fused Fuel Pump Output Circuit At Fuel Pump Module Harness Connector

Measure the resistance between ground and the (N1) Fused Fuel Pump Output circuit at the Fuel Pump Module harness connector.

Is the resistance below 100 ohms?

Yes

Repair the short to ground in the (N1) Fused Fuel Pump Output circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To step 10.

10. FUEL PUMP MODULE/TIPM

Fig. 19: Using 12-Volt Test Light Connected To Ground To Probe (N1) Fused Fuel Pump Output Circuit At Fuel Pump Module Harness Connector
Courtesy of CHRYSLER LLC

Connect the C3 PCM harness connector.

Connect the C1 and C5 TIPM harness connectors.

Turn the ignition on.

Using a scan tool actuate the Fuel Pump Module.

Using a 12-volt test light connected to ground, probe the (N1) Fused Fuel Pump Output circuit at the Fuel Pump Module harness connector.

Does the test light illuminate?

Yes

Replace the Fuel Pump Module in accordance with the Service Information. Refer to **REMOVAL** .
Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace the Totally Integrated Power Module in accordance with the Service Information. Refer to **REMOVAL** .

Perform **POWERTRAIN VERIFICATION TEST** .

11. PCM

NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

***CHECKING THE OXYGEN SENSOR OPERATION**

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

DIAGNOSTIC TEST

1. OXYGEN SENSOR, WIRING, OR CONNECTORS

NOTE: Diagnose and repair any O2 sensor or rationality DTCs before proceeding with this test.

NOTE: When performing this procedure as part of another diagnostic process, it may be necessary to repeat this test for all of the oxygen sensors on the vehicle.

Turn the ignition off.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen sensor and the PCM.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Turn the ignition on.

Monitor the scan tool data relative to the sensor and wiggle test the wiring and connectors.

Look for the data to change or for a DTC to set during the wiggle test. If necessary, check each sensor circuit for high resistance or a shorted condition.

Were any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go to step 2.

2. OXYGEN SENSOR VOLTAGE

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With a scan tool, monitor all O2 Sensor voltage readings.

Is the voltage switching between 2.5 and 3.4 volts for all O2 sensors?

Yes

Go to step 3.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go to step 4.

3. O2 SENSOR HEATER OPERATION

Turn the ignition off.

NOTE: Wait a minimum of 10 minutes to allow the O2 Sensor to cool down before

continuing the test. Allow the O2 Sensor voltage to stabilize at 5.0 volts.

Turn the ignition on.

With a scan tool, actuate the O2 Sensor heater.

With the scan tool, monitor O2 Sensor voltage for at least 2 minutes.

Does the voltage stay above 4.5 volts?

Yes

Go to step 4.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Test complete.

4. O2 SENSOR

Turn the ignition off.

NOTE: **Check for contaminants that may cause improper O2 Sensor operation, such as contaminated fuel, unapproved silicone, or evidence of oil or coolant.**

Disconnect the O2 Sensor harness connector.

Turn the ignition on.

With a scan tool, monitor the O2 Sensor voltage.

NOTE: **The voltage should be approximately 5.0 volts with the connector disconnected.**

Connect a jumper wire between the signal circuit and the return circuit in the O2 Sensor harness connector.

NOTE: **The voltage should drop from 5.0 volts to 2.5 volts with the jumper wire in place.**

Is the O2 Sensor voltage displayed on the scan tool as described?

Yes

Replace the O2 Sensor.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go to step 5.

5. O2 SENSOR SIGNAL CIRCUIT

Using the wiring diagram/schematic as a guide, inspect the O2 Sensor Signal circuit and connectors between the O2 sensor and the PCM.

Check the O2 Sensor signal circuit for a short to ground, open circuit, short to voltage, or high resistance.

Were any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go to step 6.

6. O2 SENSOR RETURN CIRCUIT

Using the wiring diagram/schematic as a guide, inspect the O2 Sensor Return circuit and connectors between the O2 sensor and the PCM.

Check the O2 Sensor return circuit for a short to ground, open circuit, short to voltage or high resistance.

Were any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go to step 7.

7. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the O2 sensor and the PCM.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to the components tested in this procedure and wiggle test the wiring and connectors.

Look for the data to change or for a DTC to set during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

***CHECKING THE PCM POWER AND GROUND CIRCUITS**

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

DIAGNOSTIC TEST

1. PCM WIRING OR CONNECTORS

Turn the ignition off.

Using the wiring diagram/schematic as a guide, inspect the wiring and each connector at the PCM.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Were any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To step 2.

2. CHECKING THE PCM GROUND CIRCUITS

Fig. 20: Using 12 Volt Test Light Connected To 12 Volts To Check PCM Ground Circuits
Courtesy of CHRYSLER LLC

Turn the ignition off.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Using a 12 volt test light connected to 12 volts, check the PCM ground circuits.

Wiggle test each circuit during the test to check for an intermittent open in the circuit.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

Go To step 3.

No

Repair the PCM ground circuit(s) for an open circuit or high resistance.

Perform **POWERTRAIN VERIFICATION TEST** .

3. CHECKING THE PCM FUSED IGNITION CIRCUITS

**PCM PINOUT
BOX 8815**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Turn the ignition on.

Using a 12 volt test light connected to ground, check the PCM Fused Ignition circuits.

Check each circuit with the ignition on, engine running position, and during cranking.

Wiggle test each circuit during the test to check for an intermittent open in the circuit.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

Go To step 4.

No

Repair the open or short to ground in the PCM Fused Ignition circuits.

Perform **POWERTRAIN VERIFICATION TEST** .

4. CHECKING THE PCM FUSED B+ CIRCUITS

Fig. 22: Checking Fused B+ Circuits For Open Or Short To Ground

Courtesy of CHRYSLER LLC

Turn the ignition off.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Using a 12 volt test light connected to Ground, check the PCM Fused B+ circuits.

Wiggle test each circuit during the test to check for an intermittent open in the circuit.

NOTE: The test light should be illuminated and bright with the ignition on and not illuminated with the ignition off. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated as described above?

Yes

Test complete.

No

Repair the open or short to ground in the PCM Fused B+ circuit(s) for as necessary.
Perform **POWERTRAIN VERIFICATION TEST** .

DIAGNOSTIC TEST

1. NO START PRE-TEST

NOTE: **Verify no codes are set in the Occupant Restraint Controller. If codes are present, they may be the cause of a No Start condition.**

NOTE: **The following list of items must be checked before continuing with any no start tests.**

The battery must be fully charged and in good condition. A low charged battery may produce invalid test results. If the battery is low, charge the battery and then attempt to start the vehicle by cranking the engine for 15 seconds, 3 consecutive times. This will allow any DTCs to set that may have been erased due to a dead battery.

Try to communicate with PCM using a scan tool. If communication between the scan tool and PCM is not allowed inspect fuses. If the PCM reports a No Response condition, refer to appropriate Engine ELECTRICAL DIAGNOSTICS article.

Make sure the PCM Power and Ground circuits are OK.

Read the PCM DTCs with the scan tool. If any DTCs are present, they must be repaired before continuing with any other No Start diagnostic tests. Refer to **DIAGNOSTIC CODE INDEX** for the related P-code that is reported by the PCM.

Make sure that the Bus is functional. Attempt to communicate with the Instrument Cluster and VTSS, If you are unable to establish communications refer to appropriate Engine ELECTRICAL DIAGNOSTICS article for the proper Diagnostic procedures.

The Sentry Key Immobilizer System must be operating properly. Check for proper communication with the scan tool and check for DTCs that may be stored in the WCM/Sentry Key Immobilizer Module (SKREEM). Repair the DTC(s) before continuing.

If no DTCs are found, using the scan tool, select Clear PCM (BATT Disconnect).

Crank the engine several times. Using the scan tool, View DTCs. If a DTC is present perform the DTC diagnostics before continuing.

Were any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To step 2.

2. OPEN FUSE

Check for any open fuses in the TIPM or Junction Block that may be related to the No Start condition.

Are any of the fuses open?

Yes

Replace the open fuse and check the related circuit(s) for a short to ground.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To step 3.

3. CRANKSHAFT POSITION SENSOR

Turn the ignition off.

Disconnect the CKP Sensor.

Attempt to start the engine.

Does the engine start?

Yes

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To step 4.

4. CAMSHAFT POSITION SENSOR

Turn the ignition off.

Connect the CKP Sensor.

Disconnect the CMP Sensor.

Attempt to start the engine.

Does the engine start?

Yes

Replace the Camshaft Position Sensor in accordance with the Service Information.
Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To step 5.

5. (A209) FUSED B+ CIRCUIT CHECK

Fig. 23: Checking Fused B+ Circuits For Open Or Short To Ground
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the C1 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Using a 12-volt test light connected to ground probe the (A209) Fused B+ circuits.

Does the test light illuminate brightly?

Yes

Go To step 6.

No

Repair the open or short to ground in the (A209) Fused B+ circuit between the TIPM and PCM.
Perform **POWERTRAIN VERIFICATION TEST** .

6. **(F342) FUSED ASD RELAY OUTPUT CIRCUIT OPEN**

Disconnect the C5 TIPM harness connector

Disconnect the C3 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (F342) ASD Relay Output circuit from the C5 TIPM harness connector to the appropriate terminals of special tool #8815, Ignition coils, and the Fuel injectors.

Is the resistance below 5.0 ohms for each measurement?

Yes

Go To step 7.

No

Repair the open in the (F342) Fused ASD Relay Output circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

7. **FUEL PUMP DELIVERY**

Verify that the Fuel tank is not empty before continuing.

Follow the diagnostics for Checking the Fuel Delivery System in the appropriate Engine ELECTRICAL DIAGNOSTICS article.

Was the No Start condition solved after following the Checking the Fuel Delivery System diagnostic procedure?

Yes

Test Complete.

No

Go To step 8.

8. **ENGINE MECHANICAL**

Check for any of the following conditions/mechanical problems.

ENGINE COMPRESSION - must be within specifications

ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks.

ENGINE VALVE TIMING - must be within specifications, check for broken timing components

Are there any engine mechanical problems?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To step 9.

9. **POWERTRAIN CONTROL MODULE (PCM)**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors at the Powertrain

Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

***ETC INTERMITTENT NO CRANK CONDITION**

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

POSSIBLE CAUSES

Possible Causes
ETC STARTER INHIBIT

DIAGNOSTIC TEST

1. ETC STARTER INHIBIT

NOTE: This ETC equipped engine will try to relearn ETC position when the key is left in the on position for an extended period of time and will not allow the starter to crank during this procedure. This procedure can take up to 2.5 seconds.

To verify the cause of the no crank condition or delayed crank use the scan tool, and read the ETC Starter Inhibit mileage.

The controller will store the mileage at which the no start condition occurred because of the ETC testing procedure.

This is considered normal operation for a vehicle equipped with an Electronic Throttle Control System and no repairs are necessary.

Is a mileage stored under the ETC Starter Inhibit?

Yes

Test Complete.

No

Refer to the appropriate diagnostic procedure for further assistance if any other DTC's are set.

POSSIBLE CAUSES

Possible Causes
FAULTY FUEL PUMP MODULE FUEL INJECTOR(S)

DIAGNOSTIC TEST

1. FUEL PUMP MODULE

NOTE: Before continuing visually and physically inspect the fuel delivery system for external leaks or damage. Repair/replace as necessary.

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Install special tool #6539 (5/16") or #6631 (3/8") fuel line adapter.

Install the fuel pressure gauge.

Start the engine and allow the fuel system to reach maximum pressure.

Turn the ignition off.

NOTE: Fuel specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Using special tool #C4390, Hose Clamp Pliers, pinch the rubber fuel line between the fuel pressure gauge and the engine.

Monitor the fuel pressure gauge for a minimum of 5 minutes.

NOTE: The pressure should not fall below 241 kPa (35 psi)

Does the fuel pressure drop?

Yes

Replace Fuel Pump Module.

Perform **POWERTRAIN VERIFICATION TEST**.

No

Go To step 2.

2. FUEL INJECTOR(S)

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Remove special tool #C4390.

Start the engine and allow the fuel system to reach maximum pressure.

Turn the ignition off.

NOTE: Fuel specification is 407 kPa +/- 34 kPa (59 psi +/- 5 psi).

Move special tool #C4390, Hose Clamp Pliers, from between the fuel pressure gauge and the engine to between the fuel pressure gauge and fuel pump module.

Monitor the fuel pressure gauge for a minimum of 5 minutes.

NOTE: The pressure should not fall below 241 kPa (35 psi)

Does the fuel pressure drop?

Yes

Replace the leaking fuel injectors.

DIAGNOSTIC TEST

1. MECHANICAL CONDITION

NOTE: Verify the battery is fully charged and capable of passing a load test before continuing.

WARNING: Make sure the battery is disconnected, then wait two minutes before proceeding. Failure to do so may result in personal injury or possible death.

Turn the engine over by hand to make sure the engine is not seized.

Is the engine able to turn over?

Yes

Go To step 2.

No

Repair the mechanical condition preventing the starter motor from cranking.
Perform **POWERTRAIN VERIFICATION TEST** .

2. PCM FUSED B+ CIRCUITS

Fig. 27: Checking Fused B+ Circuits For Open Or Short To Ground
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the C1 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Using a 12-volt test light connected to ground, probe the Fused B+ circuits at the appropriate terminals of special too #8815.

Does the test light illuminate brightly?

Yes

Go To step 3.

No

Repair the open or short to ground in the PCM Fused B+ circuits.

Perform **POWERTRAIN VERIFICATION TEST** .

3. TRANSMISSION RANGE SENSOR

Fig. 28: Measuring Resistance In Transmission Range Sensor Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the TRS harness connectors.

Move the Gear selector through all gear positions, from Park to 1st and back.

While moving the gear selector through each gear, measure the resistance between ground and the TRS (T41) Sense (P/N Sense) circuit at the TRS connector.

NOTE: The circuit is grounded in Park and Neutral and open in the other positions.

Did the resistance change from above 100 kohms (open) to below 10.0 ohms (grounded) ?

Yes

Go To step 4.

No

Replace the Transmission Range Sensor.

Perform **POWERTRAIN VERIFICATION TEST** .

4. EXCESSIVE RESISTANCE IN THE BATTERY CIRCUIT

Turn the ignition off.

Check the Battery Cables for excessive resistance using the service information procedure.

Did either Battery Cable have a voltage drop greater than 0.2 of a volt?

Yes

Repair the excessive resistance in the Battery circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To step 5.

5. STARTER

CAUTION: The Parking Brake must be on and the Transmission must be in park for a vehicle equipped with an automatic transmission.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Turn ignition off.

Disconnect the Starter Solenoid harness connector.

NOTE: **The Stater Solenoid harness connector must remain disconnected at this time.**

Have an assistant turn the ignition key to the CRANK position.

Using a 12-volt test light connected ground, probe the (T750) Stater Relay Output circuit in the Starter Solenoid harness connector while the ignition key is in the CRANK position.

Does the test light illuminate brightly?

Yes

Replace the Starter per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To step 6.

6. (T752) STARTER RELAY CONTROL CIRCUIT CHECK

Fig. 30: Checking Starter Relay Control Circuit

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the C2 TIPM harness connector.

Use a 12-volt test light connected to ground and probe the (T752) Starter Relay Control circuit in the C2 TIPM harness connector.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Have an assistant turn the key to the CRANK position.

Does the test light illuminate brightly when the key is turned to the crank condition?

Yes

Go To step 7.

No

Repair the excessive resistance or short to ground in the (T752) Starter Relay Control circuit between the PCM and TIPM.

Perform **POWERTRAIN VERIFICATION TEST** .

7. (T750) STARTER CONTROL OUTPUT CIRCUIT OPEN

Fig. 31: Measuring Resistance Of Starter Control Output Circuit
 Courtesy of CHRYSLER LLC

Disconnect the Starter Solenoid connector.

Measure the resistance of the (T750) Starter Control Output circuit between the Starter Solenoid harness connector and the C2 TIPM harness connector.

Is the resistance below 5.0 ohms?

Yes

Go To step 8.

No

Repair the open in the (T750) Starter Control Output circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

Is the resistance below 100 ohms?

Yes

Repair the short to ground in the (T750) Starter Relay Output circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To step 9.

9. TOTALLY INTEGRATED POWER MODULE (TIPM)

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.

Pay particular attention to all Power and Ground circuits.

Were any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace the Totally Integrated Power Module in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

NOTE: The scan tool and cable must be operating properly for the results of this test to be valid.

NOTE: Make sure the ignition switch was on while trying to communicate with the PCM.

Turn the ignition off.

Disconnect the C1 PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Using a 12-volt test light connected to ground probe the appropriate terminal of special tool #8815.

Does the test light illuminate brightly?

Yes

Go To step 2.

No

Repair the open or short to ground in the (A209) Fused B+ circuit. Inspect and replace fuses as

Turn the ignition off.

Disconnect the Throttle Body harness connector.

Ignition on, engine not running.

Measure the voltage on the (K855) 5-volt Supply circuit.

Disconnect all the sensors that use the (K855) 5-volt Supply circuit.

Did the voltage return to 4.5 to 5.2 volts when disconnecting any of the sensors.

Yes

Replace the sensor that is pulling down the (K855) 5-volt supply.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To step 7.

7. (K855) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect PCM harness connectors.

Disconnect all the sensors that share the (K855) 5-volt Supply circuit.

Measure the resistance between ground and the (K855) 5-volt Supply circuit at one of the sensor harness connectors.

Is the resistance below 100 ohms?

Yes

Repair the short to ground in the (K855) 5-volt Supply circuit.
Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To step 8.

8. (K857) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Disconnect all the sensors that share the (K857) 5-volt Supply circuit.

Measure the resistance between ground and the (K857) 5-volt Supply circuit at one of the sensor harness connectors.

Is the resistance below 100 ohms?

Yes

Repair the short to ground in the (K857) 5-volt Supply circuit.
Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To step 9.

9. POWERTRAIN CONTROL MODULE (PCM)

NOTE: **Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

DIAGNOSTIC TEST

1. CHECKING DTCS

- NOTE:

Before continuing with this procedure, review the TSBs that mat be related to a start and stall condition.
- NOTE:

It may be helpful to review Secondary Indicators, if a two trip DTC(s) is present, drive the vehicle to try and mature the DTC to Active.

Ignition on, engine not running.

With a scan tool, read DTCs.

Are any DTCs present?

Yes

Refer to the appropriate Diagnostic Procedure.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To step 2.

2. CHECKING VEHICLE THEFT DTCS

NOTE: **If you are unable to communicate with the SKIM/SKREEM, refer to the VEHICLE THEFT SECURITY - ELECTRICAL DIAGNOSTICS and perform the appropriate diagnostics.**

With the scan tool, read the SKIM/SKREEM codes.

Are there any SKIM/SKREEM DTCs?

Yes

Refer to the **SKREEM/SKIM VERIFICATION TEST** .

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To step 3.

3. CAM/CRANK VERIFICATION

Using a scan tool, under OBDII Monitors, read and record the Cam Crank Synchronization Event Monitors.

4. SPARK PLUG(S)

NOTE: Inspect the ignition coil for damage, carbon tracking on the coil or a damaged spark plug insulator boot. If a problem is found, replace the ignition coil.

Turn the ignition off.

Remove the spark plug.

Inspect the spark plug for any of the following conditions:

- Cracks or damage
- Carbon tracking
- Foreign material
- Gap not within specification
- Loose or broken electrode

NOTE: **Lightly tap the bottom of the spark plug on a solid surface. The electrode in the spark plug should not move.**

Were any problems found?

Yes

Replace the spark plug.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To step 5.

5. POSSIBLE CAUSES OF START AND STALL CONDITION

The following items should be checked as a possible cause for a start and stall condition.

Refer to any Technical Service Bulletins (TSBs) that may apply to the symptom.

The exhaust system must be free of any restrictions.

The engine compression must be within specifications.

The engine valve timing must be within specifications.

The engine must be free from vacuum leaks.

The throttle body must be free of carbon buildup and dirt.

Cracked spark plugs, carbon track on spark plugs, coil and coil boot.

Do any of the above conditions exist?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To step 6.

6. FUEL PUMP DELIVERY

Verify that the Fuel tank is not empty before continuing.

Follow the diagnostics for Checking Fuel Delivery in this article.

Was the No Start condition solved after following the above diagnostic test?

Yes

Test Complete.

No

Check for contamination/water in the fuel. Ensure the fuel being used in this vehicle meets OEM Fuel Requirement, refer to the service information.

Perform **POWERTRAIN VERIFICATION TEST** .

7. 5 VOLT SUPPLY CIRCUIT VOLTAGE (CMP)

Turn the ignition off.

Disconnect the Camshaft Position Sensor connector.

Turn the ignition on.

Measure the voltage of the 5 Volt Supply circuit in the Camshaft Position Sensor harness connector.

Is the voltage 5.0 volts?

Yes

Go to step 8.

No

Repair the 5 Volt Supply.

NOTE: **A battery disconnect must be performed to clear the Cam Crank Synchronization Events.**

Perform **POWERTRAIN VERIFICATION TEST** .

8. SENSOR GROUND CIRCUIT TEST

Turn the ignition off.

Using a 12 volt test light connected to 12 volts, probe the Sensor Ground circuit in the Camshaft Position Sensor harness connector.

NOTE: **The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

Is the test light illuminated and bright?

Yes

Go to step 9.

No

Repair the Ground Circuit

NOTE: A battery disconnect must be performed to clear the Cam Crank Synchronization Events.

Perform **POWERTRAIN VERIFICATION TEST** .

9. CMP SIGNAL

Turn the ignition on.

Measure the voltage of the CMP Signal circuit in the Camshaft Position Sensor harness connector.

Is the voltage between 4.7 and 5.0 volts?

Yes

Go to step 13.

No

Go to step 10.

10. CMP SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Powertrain Control Module connector.

Turn the ignition on.

Measure the voltage of the CMP Signal circuit in the Camshaft Position Sensor harness connector.

Is there any voltage present?

Yes

Repair the CMP Signal circuit for a short to voltage.

NOTE: A battery disconnect must be performed to clear the Cam Crank Synchronization Events.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go to step 11.

11. CMP SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the CMP Signal circuit in the Camshaft Position Sensor harness connector.

Is the resistance above 100 ohms?

Yes

Go to step 12.

No

Repair the CMP Signal circuit for a short to ground.

NOTE: A battery disconnect must be performed to clear the Cam Crank Synchronization Events.

Perform **POWERTRAIN VERIFICATION TEST** .

12. CMP SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals, resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the CMP Signal circuit between the Camshaft Position Sensor harness connector and the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

Go to step 24.

No

Repair the CMP Signal circuit for an open circuit or high resistance.

NOTE: A battery disconnect must be performed to clear the Cam Crank Synchronization Events.

Perform **POWERTRAIN VERIFICATION TEST** .

Turn the ignition off.

Fig. 39 is a depiction of typical scope patterns of the Cam (1) and Crank (2) sensors for 4, 6, and 8 cylinder engines. The square wave patterns are uniform and are identical to one another. The patterns must be evenly spread apart and at the same height. The larger gap pattern (signature) after the shorter wave forms are used for cylinder identification (Crank signal) and the distance between the series of slots (trigger) on the camshaft pulley (cam signal). Any variation of the pattern will indicate an issue with the sensor, wiring, or trigger (target) wheel.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 along with the #8815-1 to perform the diagnosis.

With a lab scope, probe the CMP Signal circuit in the appropriate terminal of the special tool #8815.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Start and allow the engine to run.

Observe the lab scope screen.

Compare the scope pattern with the ones in **Fig. 40**.

1. Pattern indicates a clean (good) square wave form that is identical to what the cam and crank should be. The square wave patterns are uniformed and are identical to one another.
2. Two pulses joined together in the same spot on target. Indicates damage to the target (trigger) on the flexplate or broke tooth, runout in the target or large airgap between the sensor and the target wheel.
3. Wide airgap or intermittent connection.
4. Early signature, predominately at high speed. Large airgap between the sensor and the target wheel.
5. Missed pulse. Possible burr or light damage to target or incorrect lateral position of the crank sensor to target (trigger).

NOTE: If any of the above (except pattern 1) is displayed on the lab scope repair as necessary.

Was the square wave found to match any of the above except pattern 1?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace the Camshaft Position Sensors.

NOTE: **A battery disconnect must be performed to clear the Cam Crank Synchronization Events.**

Perform **POWERTRAIN VERIFICATION TEST** .

14. 5 VOLT SUPPLY CIRCUIT VOLTAGE (CKP)

Turn the ignition off.

Disconnect the Crankshaft Position Sensor connector.

Turn the ignition on.

Measure the voltage of the 5 Volt Supply circuit in the Crankshaft Position Sensor harness connector.

Is the voltage 5.0 volts?

Yes

Go to step 15.

No

Repair the 5 Volt Supply.

NOTE: **A battery disconnect must be performed to clear the Cam Crank Synchronization Events.**

Perform **POWERTRAIN VERIFICATION TEST** .

15. SENSOR GROUND CIRCUIT TEST

Turn the ignition off.

Using a 12 volt test light connected to 12 volts, check the Sensor Ground circuit in the Crankshaft Position Sensor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

Go to step 16.

No

Repair the Ground Circuit.

NOTE: A battery disconnect must be performed to clear the Cam Crank Synchronization Events.

Perform **POWERTRAIN VERIFICATION TEST** .

16. CKP SIGNAL

Turn the ignition on.

Measure the voltage of the CKP Signal circuit in the Crankshaft Position Sensor harness connector.

Is the voltage between 4.7 and 5.0 volts?

Yes

Go to step 20.

No

Go to step 17.

17. CKP SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the CKP Signal circuit in the Crankshaft Position Sensor harness connector.

Is there any voltage present?

Yes

Repair the CKP Signal circuit for a short to voltage.

NOTE: A battery disconnect must be performed to clear the Cam Crank Synchronization Events.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go to step 18.

18. CKP SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the CKP Signal circuit in the Crankshaft Position Sensor harness connector.

Is the resistance above 100 ohms?

Yes

Go to step 19.

No

Repair the CMP Signal circuit for a short to ground.

NOTE: A battery disconnect must be performed to clear the Cam Crank Synchronization Events.

Perform **POWERTRAIN VERIFICATION TEST** .

19. CKP SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals, resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the CKP Signal circuit between the Camshaft Position Sensor harness connector and the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

Go to step 24.

No

Repair the CMP Signal circuit for an open circuit or high resistance.

NOTE: A battery disconnect must be performed to clear the Cam Crank Synchronization Events.

Perform POWERTRAIN VERIFICATION TEST .

Start and allow the engine to run.

Observe the lab scope screen.

Compare the scope pattern with the ones in **Fig. 42**.

1. Pattern indicates a clean (good) square wave form that is identical to what the cam and crank should be. The square wave patterns are uniform and are identical to one another.

2. Two pulses joined together in the same spot on target. Indicates damage to the target (trigger) on the flexplate or broke tooth, runout in the target or large airgap between the sensor and the target wheel.
3. Wide airgap or intermittent connection.
4. Early signature, predominately at high speed. Large airgap between the sensor and the target wheel.
5. Missed pulse. Possible burr or light damage to target or incorrect lateral position of the crank sensor to target (trigger).

NOTE: **If any of the above (except pattern 1) is displayed on the lab scope repair as necessary.**

Was the square wave found to match any of the above except pattern 1?

Yes

Repair as necessary.

NOTE: **A battery disconnect must be performed to clear the Cam Crank Synchronization Events.**

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace the Crankshaft Position Sensor.

NOTE: **A battery disconnect must be performed to clear the Cam Crank Synchronization Events.**

Perform **POWERTRAIN VERIFICATION TEST** .

21. **VALVE TIMING**

Ensure the valve timing is within specification. Refer to **VALVE TIMING** .

Was the valve timing within specification?

Yes

Go to step 22.

No

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

22. 5 VOLT SUPPLY CIRCUIT VOLTAGE (CMP/CKP)

NOTE: The 5 Volt Supply circuit must be present at both CMP and CKP Sensors.

Turn the ignition off.

Disconnect the Camshaft Position Sensor connector.

Turn the ignition on.

Measure the voltage of the 5 Volt Supply circuit in the Camshaft Position Sensor harness connector.

Repeat the above test at the Crankshaft Position Sensor (Crankshaft Position Sensor harness connector measure).

Is the voltage 5.0 volts at each sensor?

Yes

Go to step 23.

No

Repair the 5 Volt Supply circuit(s) as necessary.

NOTE: A battery disconnect must be performed to clear the Cam Crank Synchronization Events.

Perform **POWERTRAIN VERIFICATION TEST** .

23. SENSOR GROUND CIRCUIT

NOTE: The Ground circuit must be present at both CMP and CKP Sensors.

Turn the ignition off.

Using a 12 volt test light connected to 12 volts, probe the Sensor Ground circuit in the Camshaft Position Sensor harness connector.

Repeat the above test at the Crankshaft Position Sensor (Crankshaft Position Sensor harness connector measure).

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

Replace both the Camshaft Position Sensor and Crankshaft Position Sensor in accordance with the Service Information.

NOTE: **A battery disconnect must be performed to clear the Cam Crank Synchronization Events.**

Perform **POWERTRAIN VERIFICATION TEST** .

No

Repair the Ground Circuit(s) as necessary.

NOTE: **A battery disconnect must be performed to clear the Cam Crank Synchronization Events.**

Perform **POWERTRAIN VERIFICATION TEST** .

24. **POWERTRAIN CONTROL MODULE (PCM)**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Camshaft Position Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

Repair as necessary.

NOTE: **A battery disconnect must be performed to clear the Cam Crank Synchronization Events.**

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.

1. NO RESPONSE

Make sure the scan tool will communicate with the appropriate modules.

Are you currently experiencing a NO RESPONSE condition?

Yes

The NO RESPONSE condition must be properly diagnosed before continuing.

Refer to the appropriate BUS Communication test in appropriate Engine ELECTRICAL DIAGNOSTICS article.

No

Go To step 2.

2. NO START

Is the customer complaint a NO START condition?

Yes

Check the vehicle for any NO START related PCM DTCs or Vehicle Theft Security related DTCs.

If no Theft related DTCs are present, refer to the Non DTC Diagnostic Procedures that relate to Fuel and Starting.

No

Go To step 3.

3. VEHICLE HISTORY AND TSB(s)

Continue by reading PCM DTCs and record the related Freeze Frame data if any DTCs are present.

Whether or not any DTCs are present you will want to check the following items which may assist in repairing the customers complaint successfully.

Check the vehicle's repair history.

If the vehicle has a repair history that pertains to the customer's current complaint, review the repair.

Inspect the vehicle for any aftermarket accessories that may have been installed incorrectly.

Check for any TSBs related to the customer's complaint or DTCs.

If a TSB applies, follow the instructions per the TSB.

Choose the following scenario that best applies.

The TSB repaired the customer's complaint.

Testing complete.

A DTC is present, no TSB applies, or the TSB didn't repair the customer's complaint.

Go To step 4.

No DTCs are present.

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

4. **WIRE HARNESS INSPECTION**

Clear the DTCs.

Attempt to duplicate the customer complaint.

Whether the customer complaint can be duplicated or not, make a quick wire harness inspection related to the DTCs that were previously cleared.

Check the Powertrain Control Module connectors, the suspected component connection, in-line connectors, wire harness splices, PCM power and ground circuits, and any related fuses.

If the DTCs are fuel or air related, check the fuel level and quality.

Were any repairs made that fixed the customer's complaint?

Yes

Testing complete.

No

Refer to the diagnostic test procedure related to the DTC.

INTERMITTENT CONDITION

DIAGNOSTIC TEST

1. INTERMITTENT CONDITION

NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Refer to any Technical Service Bulletins (TSBs) that may apply.

Review the scan tool Freeze Frame information. If possible, try to duplicate the conditions under which the DTC set.

With the engine running at normal operating temperature, monitor the scan tool parameters related to the DTC while wiggling the wire harness. Look for parameter values to change and/or a DTC to set.

Turn the ignition off.

Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals. Verify correct connector pin fit at the related connectors.

Perform a voltage drop test on the related circuits between the suspected inoperative component and the PCM.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Inspect and clean all PCM, engine, and chassis grounds that are related to the most current DTC.

If numerous trouble codes were set, use a wire schematic and look for any common ground or supply circuits.

For any Relay DTCs, actuate the Relay with the scan tool and wiggle the related wire harness to try to interrupt the actuation.

For intermittent Evaporative Emission trouble codes perform a visual and physical inspection of the related parts including hoses and the Fuel Filler cap.

For intermittent Misfire DTCs check for restrictions in the Intake and Exhaust system, proper installation of Sensors, vacuum leaks, and binding components that are run by the accessory drive belt.

Use the scan tool to perform a System Test if one applies to failing component.

A co-pilot, data recorder, and/or lab scope should be used to help diagnose intermittent conditions.

Were any problems found during the above inspections?

Yes

Perform the necessary repairs.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Test Complete.

DIAGNOSTIC TEST

1. ACTIVE DTC

Turn the ignition on.

With the scan tool select View DTCs.

Record the related Freeze Frame data.

With the scan tool clear DTCs.

Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With the scan tool select View DTCs.

NOTE: If the DTC does not reset it may be necessary to test drive the vehicle.

Is the DTC Active at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. CAMSHAFT POSITION SENSOR CIRCUIT WIRING OR CONNECTORS

Turn the ignition off.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Camshaft Position Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Inspect the Camshaft Position Sensor for conditions such as loose mounting screws, damage, or cracks.

Turn the ignition off.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Camshaft Position Sensor and the Powertrain Control Module (PCM) and between the Crankshaft Position Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Turn the ignition on.

With the scan tool clear DTCs.

Start the engine.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

P0071-AMBIENT AIR TEMPERATURE SENSOR PERFORMANCE

CIRCUIT SCHEMATIC

Fig. 34: Thermostat Circuit Schematic
Courtesy of CHRYSLER LLC

THEORY OF OPERATION

Ambient Air Temperature Sensor performance looks at the outputs of three temperature sensors and compares

them under cold start conditions. Following a start to run delay time, the outputs of the ambient, engine coolant, and intake air temperature sensors will be compared. If the engine coolant and intake air temperature sensors agree and the ambient air temperature does not agree, the ambient air temperature sensor is declared as irrational. If declared irrational a second comparison will be done after a short drive cycle.

MONITOR CONDITIONS

When Monitored:

Engine off time is greater than 480 minutes and the vehicle has been driven for one minute over 35 mph.
Ambient temperature is greater than -64° C (-83° F).

SET CONDITIONS

- Set Condition:**

The PCM compares the ambient, engine coolant, and intake air temperature sensor values. If engine coolant and intake air temperature sensors agree with each other but ambient air temperature does not agree with them, the ambient air temperature sensor is declared as irrational. Two Trip Fault. Three good trips to turn off the MIL.

P0111-INTAKE AIR TEMPERATURE SENSOR RATIONALITY

CIRCUIT SCHEMATIC

Fig. 61: Thermostat Circuit Schematic
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Intake Air Temperature Sensor performance looks at the outputs of three temperature sensors and compares them under cold start conditions. Following a start to run delay time, the outputs of the ambient, engine coolant, and intake air temperature sensors will be compared. If the engine coolant and ambient air temperature sensors agree and the intake air temperature does not agree, the intake air temperature sensor is declared as irrational. If declared irrational a second comparison will be done after a short drive cycle.

MONITOR CONDITIONS

When Monitored:

Engine off time is greater than 480 minutes and the vehicle has been driven for one minute over 35 mph.
Ambient temperature is greater than -64° C (-83° F).

SET CONDITIONS

- **Set Condition:**

Once the vehicle is soaked for a calibrated engine off time and then driven over calibrated speed and load conditions for some calibrated time, the PCM compares the ambient, engine coolant, and intake air temperature sensor values. If engine coolant and ambient air temperature sensors agree with each other but intake air temperature does not agree with them, the intake air temperature sensor is declared as irrational. Two Trip Fault. Three good trips to turn off the MIL.

DIAGNOSTIC TEST

1. **ACTIVE DTC**

Turn the ignition off.

If possible, allow the vehicle to sit with the ignition off for more than 480 minutes in an environment where the temperature is consistent and above -7° C (19.4° F).

Test drive the vehicle. The vehicle must exceed 48 km/h (30 mph) during the test drive. Do not cycle the

ignition off when the test drive is completed.

With a scan tool, select View DTCs.

Yes

Go To 3.

No

Go To 2.

2. INTAKE AIR TEMPERATURE

Turn the ignition off.

Allow the vehicle to sit with the ignition off in an environment where the temperature is consistent and above -7° C (19.4° F) until the engine coolant temperature is equal to ambient temperature.

Turn the ignition on.

With a scan tool, compare the AAT, ECT, and IAT sensor values.

Is the Intake Air Temperature Sensor value within 10° C (18° F) of the other two sensor values?

Yes

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

No

Go To 3.

3. IAT SENSOR VOLTAGE

Turn the ignition off.

Disconnect the Intake Air Temperature Sensor harness connector.

Turn the ignition on.

DIAGNOSTIC TEST

1. ACTIVE DTC

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Diagnose and repair any system voltage DTCs before continuing with this test.

With the scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

Go To 2.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2. **IAT SENSOR**

Turn the ignition off.

Disconnect the IAT Sensor harness connector.

Ignition on, engine not running.

With a scan tool, read IAT voltage.

NOTE: **The sensor voltage should be approximately 5.0 volts (plus or minus .1 volt) with the connector disconnected.**

Does the scan tool display the voltage as described above?

Yes

Verify that there is good pin to terminal contact in the IAT Sensor and Powertrain Control Module connectors. If OK, replace the Intake Air Temperature Sensor.

Perform **POWERTRAIN VERIFICATION TEST** .

No

P0116-ENGINE COOLANT TEMPERATURE SENSOR PERFORMANCE

CIRCUIT SCHEMATIC

Fig. 75: Thermostat Circuit Schematic
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Engine Coolant Temperature Sensor performance looks at the outputs of three temperature sensors and compares them under cold start conditions. Following a start to run delay time, the outputs of the ambient, engine coolant, and intake air temperature sensors will be compared. If the intake air and ambient air temperature sensors agree and the intake air temperature does not agree, the engine coolant temperature sensor is declared as irrational.

MONITOR CONDITIONS

When Monitored:

Engine off time is greater than 480 minutes and the vehicle has been driven for one minute over 35 mph.
Ambient temperature is greater than -64° C (-83° F).

SET CONDITIONS

- **Set Condition:**

Once the vehicle is soaked for a calibrated engine off time and then driven over calibrated speed and load conditions for some calibrated time, the PCM compares the ambient, engine coolant, and intake air temperature sensor values. If ambient air and intake air temperature sensors agree with each other but engine coolant temperature does not agree with them, the engine coolant temperature sensor is declared as irrational. Two Trip Fault. Three good trips to turn off the MIL.

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: **Diagnose any CAN - C Communication DTCs before continuing.**

Turn the ignition off.

If possible, allow the vehicle to sit with the ignition off for more than 480 minutes in an environment where the temperature is consistent and above -7° C (19.4° F).

Test drive the vehicle. The vehicle must exceed 48 km/h (30 mph) during the test drive. Do not cycle the ignition off when the test drive is completed.

With a scan tool, select View DTCs.

2. ENGINE COOLANT TEMPERATURE

Turn the ignition off.

Allow the vehicle to sit with the ignition off in an environment where the temperature is consistent and above -7° C (19.4° F) until the engine coolant temperature is equal to ambient temperature.

Turn the ignition on.

With a scan tool, compare the AAT, ECT, and IAT sensor values.

Is the Engine Coolant Temperature Sensor value within 10° C (18° F) of the other two sensor values?

Yes

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

No

Go To 3.

3. ECT SENSOR VOLTAGE

Turn the ignition off.

Disconnect the Engine Coolant Temperature Sensor harness connector.

Turn the ignition on.

With a scan tool, read the Engine Coolant Temperature Sensor voltage.

5. EXCESSIVE RESISTANCE IN THE (K922) TP SENSOR GROUND CIRCUIT

Turn the ignition off.

Move the voltmeter leads to backprobe the (K922) TP Sensor Ground circuit at the Throttle Body harness connector and to probe the appropriate terminal of the special tool #8815. Make sure the voltmeter leads are connected so a positive polarity is displayed on the voltmeter.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Start the engine and allow it to reach normal operating temperature.

Monitor the voltmeter.

Is the voltage below 0.5 volts?

Yes

Go To 6.

No

Repair the excessive resistance in the (K922) TP Sensor Ground circuit.

Connect the C2 PCM harness connector.

Ignition on, engine not running.

With a scan tool, monitor the TP Sensor No.1 and No.2 voltage.

Connect a jumper wire between the (K922) TP Sensor Ground circuit and the (K22) TP Signal 1 circuit.

NOTE: TP Sensor No.1 voltage should change from approximately 4.5 volts to less than 0.5 of a volt.

For TP Sensor No.2, connect a jumper wire between (K855) 5-volt supply circuit and the (K122) TP Signal 2 circuit.

NOTE: TP Sensor No.2 voltage should change from approximately 0 volts to 5.0 volts?

Is the voltage reading within the listed specification when the jumper wire is installed?

Yes

Verify that there is good pin to terminal contact in the Throttle Body and Powertrain Control Module connectors. If OK, replace the Throttle Body Assembly. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 8.

NOTE: Remove the jumper wire before continuing.

8. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Throttle Body and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

9. **THROTTLE FOLLOWER TEST**

Ignition on, engine not running.

With a scan tool, perform the ETC Throttle Follower Test and monitor the TP Sensor No.1 or No.2 voltage.

Slowly press the throttle pedal down.

The voltage for TP Sensor No.1 should start at approximately 0.7 of a volt and increase to approximately 4.3 volts.

The voltage for TP Sensor No.2 should start at approximately 4.3 volts and decrease to approximately 0.7 of a volt.

Is the voltage within the range of the listed specification for the appropriate Sensor?

Yes

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

No

Verify that there is good pin to terminal contact in the Throttle Body and Powertrain Control Module connectors. If OK, replace the Throttle Body Assembly. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function.

Perform **POWERTRAIN VERIFICATION TEST** .

P0125-INSUFFICIENT COOLANT TEMPERATURE FOR CLOSED-LOOP FUEL CONTROL

CIRCUIT SCHEMATIC

8100000

Fig. 106: Engine Coolant Temperature Sensor Circuit Schematic
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The engine coolant temperature sensor is a negative temperature coefficient thermistor-type sensor whose resistance varies inversely with temperature. At cold temperatures the sensor resistance is high so the voltage is high. As the coolant temperature increases the resistance decreases and the voltage becomes low. The INSUFFICIENT COOLANT TEMP FOR CLOSED-LOOP FUEL CONTROL determines if the engine coolant temperature will reach the closed loop fueling control temperature limit in a regulated time after start.

MONITOR CONDITIONS

When Monitored:

With the ignition on, battery voltage greater than 10.4 volts, and no ECT sensor circuit DTCs present.

SET CONDITIONS

- Set Condition:**

The engine temperature does not go above -10° C (15° F). Failure time depends on start-up coolant temperature and ambient temperature. (i.e. 2 minutes for a start temp of -10° C (15° F) or up to 10 minutes for a vehicle with a start-up temp of -28° C (5° F). Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
LOW COOLANT LEVEL THERMOSTAT ECT SENSOR

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. CHECKING COOLANT LEVEL AND CONDITION

NOTE: If a Engine Coolant Temperature (ECT) DTC is set along with this code, diagnose the ECT DTC first.

NOTE: Inspect the ECT terminals and related PCM terminals. Make sure the terminals are free from corrosion and damage.

NOTE: The best way to diagnose this DTC is to allow the vehicle to sit overnight outside in order to have a totally cold soaked engine.

NOTE: Extremely cold outside ambient temperatures may have caused this DTC to set.

WARNING: Never open the cooling system when the engine is hot. The system is under pressure. Extreme burns or scalding may result. Failure to follow these instructions can result in personal injury or death. Allow the engine to cool before opening the cooling system.

Inspect the coolant system for proper level and condition.

Is the coolant level and condition OK?

Yes

Go To 2.

No

Inspect the vehicle for a coolant leak, make the appropriate repairs, and add the correct amount of coolant.

Perform **POWERTRAIN VERIFICATION TEST** .

2. THERMOSTAT OPERATION

NOTE: This test works best if performed on a cold engine (cold soak)

Ignition on, engine not running.

With a scan tool, read the Eng Coolant Tmp Deg value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the ambient temperature.

NOTE: If engine coolant temperature is above 82° C (180° F), allow the engine to cool until 65° C (150° F) is reached.

Start the Engine.

During engine warm-up monitor the Eng Coolant Tmp Deg value. The temp deg value change should be a smooth transition from start up to normal operating temp 82° C (180° F). Also monitor the actual coolant temperature with a thermometer.

NOTE: As the engine warms up to operating temperature, the actual coolant temperature (thermometer reading) and the scan tool Eng Coolant Tmp Deg values should stay relatively close to each other.

Using the appropriate service information, determine the proper opening temperature of the thermostat.

Did the thermostat open at the proper temperature?

Yes

Go To 3.

No

Replace the thermostat.

Perform **POWERTRAIN VERIFICATION TEST** .

3. **ECT SENSOR OPERATION**

Ignition on, engine not running.

With a scan tool, read the Eng Coolant Tmp Deg value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the ambient temperature.

NOTE: **If engine coolant temperature is above 82° C (180° F), allow the engine to cool until 65° C (150° F) is reached.**

Start the Engine.

During engine warm-up monitor the Eng Coolant Tmp Deg value. The temp deg value change should be a smooth transition from start up to normal operating temp 82° C (180° F). Also monitor the actual coolant temperature with a thermometer.

NOTE: **As the engine warms up to operating temperature, the actual coolant temperature (thermometer reading) and the scan tools Eng Coolant Tmp Deg value should stay relatively close to each other.**

Is the thermometer reading relatively close to the scan tool ECT reading?

Yes

The conditions that set this DTC are no longer present. Test Complete. Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

No

Replace the Engine Coolant Temperature Sensor.

Perform **POWERTRAIN VERIFICATION TEST** .

STANDARD PROCEDURE

PCM/ECM PROGRAMMING - GAS

PCM / TCM FLASH REPROGRAMMING

This procedure will need to be done when one or more of the following situations are true:

1. A vehicle's Powertrain control module (PCM) has been replaced.
2. A diagnostic trouble code (DTC) is set "P1602 - PCM Not Programmed."
3. An updated calibration or software release is available for either the PCM or TCM ECUs.

This procedure assumes that the StarSCAN® and StarMOBILE® devices are configured to your dealership's network with either a wired or wireless connection. The StarSCAN® and StarMOBILE® must also be running at the latest operating system and software release level. For more help on how to network your StarSCAN® or StarMOBILE® reference the StarSCAN® / StarMOBILE® Quick Start Networking Guide available on 'DealerCONNECT > Service > StarSCAN® and StarMOBILE® Tools > Online Documentation' or at www.dcctools.com, under the Download Center.

Table of contents

1. **SECTION 1 - PCM / TCM FLASH PROCEDURE.**
2. **REQUIRED TOOLS/EQUIPMENT:.**
3. **TECH TIPS and INFORMATION:.**
4. **PARTS REQUIRED.**

SECTION 1 - PCM / TCM FLASH PROCEDURE

If using StarSCAN® or StarMOBILE® Desktop Client. Go to **REPAIR PROCEDURE - Using StarSCAN® or StarMOBILE® Desktop Client.**

If using StarMOBILE® Standalone Diagnostic Mode. Go To **REPAIR PROCEDURE - Using StarMOBILE® Standalone Diagnostic Mode.**

REPAIR PROCEDURE - Using StarSCAN® or StarMOBILE® Desktop Client

NOTE: If this flash process is interrupted or aborted, the flash should be restarted.

1. Open the hood of the vehicle and install a battery charger. Verify that the charging rate provides a continuous charge of 13.2 - 13.5 volts.
2. Connect the StarSCAN® or StarMOBILE® to the vehicle data link connector located under the steering column and turn the ignition key to the "RUN" position.

3. Power on the StarSCAN® or StarMOBILE®. If the StarMOBILE® is being used, launch the StarMOBILE® Desktop Client and connect to the appropriate StarMOBILE® device.
4. Retrieve the old ECU part number. From the tool's Home screen,
 - a. Select "ECU View"
 - b. Select "PCM"
 - c. Select "More Options"
 - d. Select "ECU Flash"
 - e. Record the part number at the top of the Flash PCM screen for later reference.
5. Program the ECU as follows:
 - Using the StarSCAN® / StarMOBILE® at the Home screen, select "ECU View"
 - Select "PCM"
 - Select "More Options"
 - Select "ECU Flash"
 - Select "Browse for New File" and follow the on screen instructions.
 - Highlight the appropriate calibration based on the part number recorded in Step 4e, or by using Year/Model/Engine and appropriate emissions selection for the vehicle being worked on.

NOTE: If you are not connected to the vehicle, you may also search for flash files by selecting the "Flash Download" button from the Home screen.

- Select "Download to Scantool"
- Once the download is complete, select "Close" and then "Back"
- Highlight the listed calibration, select "Update Controller" and follow the on screen instructions.
- When the PCM update is complete, select "OK"
- Verify that the part number at the top of the Flash PCM screen has updated to the new part number.

NOTE: If this flash process is interrupted or aborted, the flash should be restarted.

6. Continue to **SECTION 2 - ADDITIONAL PCM / TCM REPLACEMENT PROCEDURES** to complete the process if the ECU has been replaced.
7. Type the necessary information on the "Authorized Modification Label" (p/n 04275086AB) and attach near the VECI label (See **SECTION 3 - AUTHORIZED MODIFICATION LABEL** for details).

REPAIR PROCEDURE - Using StarMOBILE® Standalone Diagnostic Mode

NOTE: StarMOBILE® Standalone Mode is an efficient way to flash ECUs without having direct access to a network connection. It involves first copying the flash file to the StarMOBILE® device which DOES require a network connection. Once the file has been copied to the StarMOBILE® device, it can be used in a Standalone mode to flash the ECU WITHOUT a network connection.

NOTE: StarMOBILE® does not need to be connected to a vehicle when retrieving a flash file for Standalone Mode.

1. Power on the StarMOBILE®. Launch the StarMOBILE® Desktop Client and connect to the tool.
2. At the Home screen, select "ECU View"
 - Select "PCM"
 - Select "More Options"
 - Select "ECU Flash"
 - Select "Browse for New File" and follow the on screen instructions.
 - Highlight the appropriate calibration based on the current ECU part number, or by using Year/Model/Engine and appropriate emissions selection for the vehicle being worked on.

NOTE: If you are not connected to the vehicle, you may also search for flash files by selecting the "Flash Download" button from the Home screen.

3. From the Flash File List, select the appropriate calibration for the PCM and select "Download to Client"
4. Once the download is complete, hit "OK" and then "Manage Files"

Fig. 1: Identifying StarMOBILE(R) Manage Files Screen (1 Of 2)
