Fig. 74: Particulate Filter Install S1
Courtesy of CHRYSLER LLC

1. Install the particulate air filter (1) into the filter opening in the HVAC housing (2). Insert the particulate air filter directly into the housing with the arrow on the filter pointing to the floor.

Fig. 75: Removing/Installing Particulate Filter Cover
Courtesy of CHRYSLER LLC

2. Position the particulate air filter cover (2) to the HVAC housing (3) and engage the two retaining tabs (1) that secure the cover to the housing. Make sure the retaining tabs are fully engaged.
3. Install the glove box bin. Refer to **INSTALLATION** .

HOUSING-HVAC

DESCRIPTION

HOUSING-HVAC

NOTE: LHD model shown in illustration. RHD model similar.

Fig. 76: Air Distribution Housing, HVAC Housing & Air Inlet Housing
Courtesy of CHRYSLER LLC

All models are equipped with a common HVAC housing assembly that combines A/C and heating capabilities into a single unit mounted within the passenger compartment. The HVAC housing assembly consists of three separate housings:

Air distribution housing - The air distribution housing (1) is mounted to the top of the HVAC housing (2) and contains the heater core, blend-air and mode-air doors and door linkage.

Air inlet housing - The air inlet housing (3) is mounted to the passenger side end of the HVAC housing. The air inlet housing contains the recirculation-air door and actuator.

HVAC housing - The HVAC housing is mounted to the dash panel behind the instrument panel and contains the A/C evaporator. The HVAC housing consists of a upper and a lower housing that are attached together and has mounting provisions for the air inlet housing, air distribution housing, blower motor and blower motor resistor.

The heating-A/C system is a blend-air type system. The blend-air door controls the amount of conditioned air that is allowed to flow through, or around, the heater core.

The A/C system is designed for the use of a non-CFC, R-134a refrigerant and uses an A/C evaporator to cool and dehumidify the incoming air prior to blending it with the heated air. A temperature control determines the discharge air temperature by operating the temperature control cable, which moves the blend-air door. This allows an almost immediate control of the output air temperature of the system. The mode door cable operates the mode-air doors which direct the flow of the conditioned air out the various air outlets, depending on the mode selected. The recirculation door actuator operates the recirculation-air door which closes off the fresh air intake and recirculates the air already inside the vehicle. The electric recirculation door actuator and the blower motor are connected to the vehicle electrical system by the instrument panel wire harness. The blower motor controls the velocity of air flowing through the HVAC housing assembly by spinning the blower wheel within the HVAC housing at the selected speed by use of the blower motor resistor, which is located in the dash panel in the engine compartment.

The air distribution housing must be removed from the HVAC housing and disassembled for service of the blend-air and mode-air doors. The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door. The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator.

REMOVAL

HOUSING-AIR DISTRIBUTION

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See WARNING and CAUTION. Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The air distribution housing must be removed from the HVAC housing and disassembled for service of the heater core and the blend-air and mode-air doors.

Fig. 77: Air Distribution Housing Remove/Install Components
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Remove the HVAC housing assembly and place it on a workbench. See REMOVAL.

2. Remove the screw (4) that secures the heater core tube flange (3) to the top of the HVAC housing (5).
3. Remove the three screws (6) and three metal clips (7) that secure the air distribution housing (8) to the top of the HVAC housing.
4. Disengage the plastic retaining tab (1) that secures the front driver side of the air distribution housing to the top of the HVAC housing.
5. Tip the rear of the air distribution housing slightly upward to disengage the two plastic retaining tabs (2) that secure the front of the distribution housing to the HVAC housing and remove the distribution housing.
6. If required, disassemble the air distribution housing. See **DISASSEMBLY**.

HOUSING-AIR INLET

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door on all models.

NOTE: On RHD models, the air inlet housing must be removed from HVAC housing for service of the recirculation door actuator.

Fig. 78: Screw, Plastic Retaining Tabs, Air Inlet Housing & HVAC Housing
Courtesy of CHRYSLER LLC

NOTE: **Typical housing shown in illustration. RHD model similar.**

1. Remove the HVAC housing assembly and place it on a workbench. See **REMOVAL**.
2. Remove the screw (1) that helps secure the rear of the air inlet housing (3) to the top of the HVAC housing (4).
3. Carefully pull the rear of the air inlet housing upward to release the inlet housing from the top of the HVAC housing and disengage the inlet housing from the two plastic retaining tabs (2) located at the front of the HVAC housing and remove the inlet housing.
4. If required, disassemble the air inlet housing. See **DISASSEMBLY**.

HOUSING-HVAC

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: **The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator.**

NOTE: **LHD model shown in illustrations. RHD model similar.**

Fig. 79: Suction Line Assembly, Nuts, A/C Expansion Valve, Heater Hoses & Dash Panel
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **STANDARD PROCEDURE**.
3. Partially drain the engine cooling system.
4. Remove the nut (2) that secures the A/C liquid and suction line assembly (1) to the A/C expansion valve (3).
5. Disconnect the A/C liquid and suction line assembly from the A/C expansion valve and remove and discard the O-ring seals.
6. Install plugs in, or tape over the opened refrigerant line fittings and the expansion valve ports.
7. Disconnect the heater hoses (4) from the heater core tubes. Install plugs in, or tape over the opened heater core tubes to prevent coolant spillage during housing removal.
8. Remove the nut (6) that secures the HVAC housing assembly to the engine compartment side of the dash panel (5).

Fig. 80: Removing/Installing Nuts That Secure HVAC Housing Assembly To Passenger Side Of

Dash Panel

Courtesy of CHRYSLER LLC

9. Remove the instrument panel. Refer to **REMOVAL** .
10. Remove the rear floor duct. See **REMOVAL**.
11. Remove the two nuts (1) that secure the HVAC housing assembly (2) to the passenger side of the dash panel (3).

NOTE: Use care to ensure that the interior is covered in case of loss of residual fluids from the heater and evaporator cores.

12. Pull the HVAC housing assembly rearward and remove the housing from the passenger compartment.

SCREEN-AIR INLET

Fig. 81: Air Inlet Screen, Nuts, Cowl Panel & Retaining Studs
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Remove the cowl grille. Refer to **REMOVAL** .
2. Remove the two nuts (2) that secure the air inlet screen (1) to the cowl panel (3).
3. Slide the air inlet screen inward to disengage the screen from the two retaining studs (4) and pull the screen straight up to remove it from the cowl.

DISASSEMBLY

HOUSING-AIR DISTRIBUTION

WARNING: The heater core tubes are not serviced separately from the heater core.
The heater core tubes should not be repositioned, loosened or removed

from the heater core. Failure to follow this warning could result in a coolant leak and possible personal injury or death.

NOTE: The air distribution housing must be removed from the HVAC housing and disassembled for service of the heater core and the mode-air and blend-air doors.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 82: HVAC Housing Assembly
Courtesy of CHRYSLER LLC

1. Remove the HVAC housing assembly and place it on a workbench. See **REMOVAL**.
2. Remove the air distribution housing (4) from the HVAC housing. See **REMOVAL**.
3. Remove the screws (3) that secure the mode door actuator (2) and the blend door actuator (6) to the actuator mounting bracket (5) located on the driver side of the air distribution housing and remove the actuators.
4. Remove the three screws (1) that secure the actuator mounting bracket to the air distribution housing and remove the bracket.
5. Remove the two screws (8) that secure the driver side front floor duct (7) to the air distribution housing and remove the duct

Fig. 83: Removing/Installing Defrost Door Lever/Gear Assembly, Mode Door Cam, Panel Door Gear, Blend Door Gear, Blend Door Lever And Blend Door Cam From Driver Side Of Air Distribution Housing

Courtesy of CHRYSLER LLC

6. Remove the defrost door lever and gear assembly (1), mode door cam (2), panel door gear (3), blend door gear (4), blend door lever (6) and the blend door cam (5) from the driver side of the air distribution housing (7).
7. If equipped with the 2.8L diesel engine, remove the electric positive temperature coefficient (PTC) heater unit from the air distribution housing. See **REMOVAL**.

Fig. 84: Air Distribution Housing Assembly

Courtesy of CHRYSLER LLC

8. Remove the two screws (1) that secure the upper front passenger side floor duct (7) to the passenger side of the air distribution housing (8) and remove the duct.

NOTE: If the foam seal for the heater core tube flange is deformed or damaged, it

must be replaced.

9. Carefully remove the foam seal (3) from the heater core tube flange (4). If the seal is deformed or damaged, it must be replaced.
10. Remove the screw (2) that secures the heater core tube flange to the air distribution housing.
11. Disengage the plastic retainer (5) from around the heater core tubes (6) and remove the flange.

Fig. 85: Plastic Retaining Tabs, Heater Core & Air Distribution Housing
Courtesy of CHRYSLER LLC

NOTE: If the foam insulator around the heater core is deformed or damaged, the insulator must be replaced.

12. Disengage the four plastic retaining tabs (1) that secure the heater core (2) to the passenger side of the air distribution housing (3) and carefully remove the heater core from the housing.

Fig. 86: Foam Seal, Parting Line, Air Distribution Housing, Parting Line, Plastic Retaining Tabs &

Screw

Courtesy of CHRYSLER LLC

13. Carefully cut the foam seal (1) along the parting line (2) of the two halves of the air distribution housing (3 and 6). If the seal is deformed or damaged, it must be replaced.
14. Remove the screw (5) that secures the two halves of the air distribution housing together located on the bottom of the housing, near the center.
15. Disengage the four plastic retaining tabs (4) and carefully separate the two halves of the air distribution housing.

818c6355

Fig. 87: Air Deflector Vane Assembly & Air Distribution Housing

Courtesy of CHRYSLER LLC

16. Remove the air deflector vane assembly (1) from the passenger side of the air distribution housing (2). Disengage the two plastic retaining tabs (1) and slide the vane straight out of the housing.

818c6354

Fig. 88: Removing/Installing Floor-Air Door, Blend-Air Door, Panel-Air Door And Defrost-Air Door From Driver Side Of Air Distribution Housing

Courtesy of CHRYSLER LLC

NOTE: If the seal on any air door is deformed or damaged, that air door must be replaced.

17. Remove the floor-air door (1), blend-air door (2), panel-air door (3) and the defrost-air door (4) from the driver side of the air distribution housing (5) as required.

HOUSING-AIR INLET

NOTE: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 89: Air Distribution Housing, HVAC Housing & Air Inlet Housing
Courtesy of CHRYSLER LLC

1. Remove the HVAC housing assembly and place it on a workbench. See **REMOVAL**.
2. Remove the air inlet housing (3) from the HVAC housing (2). See **REMOVAL**.

Fig. 90: Foam Seal, Parting Line, Recirculation-Air Door, Recirculation Door Actuator, Screws & Air Inlet Housing

Courtesy of CHRYSLER LLC

NOTE: If the foam seal on top of the air inlet housing is deformed or damaged, it must be replaced.

3. Carefully cut the foam seal (1) along the parting line (2) of the two halves of the air inlet housing (6 and 7). If the seal is deformed or damaged, it must be replaced.
4. Remove the two screws (5) that secure the recirculation door actuator (4) to the air inlet housing and remove the actuator.

NOTE: If a rubber seal on the recirculation air-door is deformed or damaged, the air-door must be replaced.

5. Carefully disengage the three plastic retaining tabs that secure the two halves of the air inlet housing together and remove the recirculation-air door (3) from the inlet housing. If the seal on the recirculation-air door is deformed or damaged, the air-door must be replaced.

HOUSING-HVAC

NOTE: The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator.

NOTE: LHD model shown in illustrations. RHD model similar.

818c1ee5

Fig. 91: Air Distribution Housing, HVAC Housing & Air Inlet Housing

NOTE: If the foam seal for the flange is deformed or damaged, it must be replaced.

8. Carefully remove the foam seal (1) from the front of the two halves of the HVAC housing (2 and 6). If the seal is deformed or damaged, it must be replaced.

NOTE: Be sure to remove the screws that secure the two halves of the HVAC housing together located at the bottom of the HVAC housing.

9. Remove the seven screws (5) and two metal clips (4) that secure the two halves of the HVAC housing

together.

10. Disengage the four plastic retaining tabs (4) that secure the two halves of the HVAC housing together and separate the housing halves.

Fig. 95: A/C Evaporator, Foam Insulator, HVAC Housing, Rubber Seal & Tapping Block
Courtesy of CHRYSLER LLC

NOTE: If the foam insulator around the A/C evaporator is deformed or damaged, the insulator must be replaced.

11. Carefully lift the A/C evaporator (1) and the foam insulator (2) out of the lower half of the HVAC housing (3).

NOTE: If the rubber seal around the evaporator tubes and tapping block is deformed or damaged, the seal must be replaced.

12. If required, remove the rubber seal (4) from around the evaporator tubes and tapping block (5).

Fig. 96: Air Deflector Vane, HVAC Housing & Foam Seal
Courtesy of CHRYSLER LLC

13. Disengage the retainers that secure the air deflector vane (1) to the lower half of the HVAC housing (2) and remove the deflector vane.
14. If required, remove the foam seal (3) from around the condensate drain located at the bottom of the HVAC housing.

ASSEMBLY

HOUSING-AIR DISTRIBUTION

WARNING: The heater core tubes are not serviced separately from the heater core. The heater core tubes should not be repositioned, loosened or removed from the heater core. Failure to follow this warning could result in a coolant leak and possible personal injury or death.

NOTE: LHD model shown in illustrations. RHD model similar.

818c6354

Fig. 97: Removing/Installing Floor-Air Door, Blend-Air Door, Panel-Air Door And Defrost-Air Door From Driver Side Of Air Distribution Housing
Courtesy of CHRYSLER LLC

NOTE: If the seal on any air door is deformed or damaged, that air door must be replaced.

1. Install the floor-air door (1), blend-air door (2), panel-air door (3) and the defrost-air door (4) into the driver side of the air distribution housing (5) as required. Align the air door pivot shafts with the holes in the housing.

818c6355

Fig. 98: Air Deflector Vane Assembly & Air Distribution Housing
Courtesy of CHRYSLER LLC

2. Install the air deflector vane assembly (1) into the passenger side of the air distribution housing (2). Slide the vane assembly into the track in the housing and engage the two plastic retaining tabs. Make sure the retaining tabs are fully engaged.

818c6357

Fig. 99: Foam Seal, Parting Line, Air Distribution Housing, Parting Line, Plastic Retaining Tabs & Screw
Courtesy of CHRYSLER LLC

3. Align the air door pivot shafts with the holes in the passenger side of the air distribution housing (3) and carefully install passenger side of the air distribution housing (1) onto the driver side of the housing.
4. Engage the four plastic retaining tabs (4) that secure the two halves of the air distribution housing together. Make sure the retaining tabs are fully engaged.
5. Install the retaining screw (5) that secures the two halves of the air distribution housing together at the bottom of the housing, near the center. Tighten the screw to 1.2 N.m (10 in lbs.).

NOTE: If the foam seal on top of the air distribution housing is deformed or damaged, it must be replaced.

6. Inspect the foam seal (1), especially along the parting line (2) of the two halves of the air distribution housing. Replace the seal if it is deformed or damaged.

Fig. 100: Plastic Retaining Tabs, Heater Core & Air Distribution Housing
Courtesy of CHRYSLER LLC

NOTE: If the foam insulator around the heater core is deformed or damaged, the insulator must be replaced.

7. Carefully install the heater core (2) into the passenger side of the air distribution housing (3) and engage the four plastic retainer tabs (1) that secure the heater core to the housing. Make sure the retaining tabs are fully engaged.

Fig. 101: Air Distribution Housing Assembly
Courtesy of CHRYSLER LLC

8. Position the heater core tube flange (4) over the heater core tubes (6) and onto the to the passenger side of the air distribution housing (8).
9. Engage the plastic retainer (5) around the heater core tubes. Make sure the retainer is fully engaged.
10. Install the screw (2) that secures the heater core tube flange to the air distribution housing. Tighten the screw to 1.2 N.m (10 in lbs.).
11. Install the upper front passenger side floor duct (7) onto the air distribution housing and install the two retaining screws (1). Tighten the screws to 1.2 N.m (10 in lbs.).

NOTE: **If the foam seal for the heater core tube flange is deformed or damaged, it must be replaced.**

12. Install the foam seal (3) onto the heater core tube flange.

618c6353

Fig. 102: Removing/Installing Defrost Door Lever/Gear Assembly, Mode Door Cam, Panel Door Gear, Blend Door Gear, Blend Door Lever And Blend Door Cam From Driver Side Of Air Distribution Housing

Courtesy of CHRYSLER LLC

13. If equipped with the 2.8L diesel engine, install the electric positive temperature coefficient (PTC) heater unit. See **INSTALLATION**.
14. Install the blend door cam (5), blend door lever (6), blend door gear (4), panel door gear (3), mode door cam (2), and the defrost door lever and gear assembly (1) onto the driver side of the air distribution housing (7).

Fig. 103: HVAC Housing Assembly
Courtesy of CHRYSLER LLC

15. Install the driver side front floor duct (7) onto the driver side of the air distribution housing (4) and install the two retaining screws (8). Tighten the screws to 1.2 N.m (10 in lbs.).
16. Position the actuator mounting bracket (5) onto the air distribution housing and install the three retaining screws (1). Tighten the screws to 1.2 N.m (10 in lbs.).
17. Position the mode door actuator (2) and the blend door actuator (6) onto the actuator mounting bracket. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the door linkage.
18. Install the screws (3) that secure the mode and blend door actuators to the actuator mounting bracket. Tighten the screws to 1.2 N.m (10 in lbs.).
19. Install the air distribution housing onto the HVAC housing. See **INSTALLATION**.
20. Install the HVAC housing assembly. See **INSTALLATION**.

HOUSING-AIR INLET

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 104: Foam Seal, Parting Line, Recirculation-Air Door, Recirculation Door Actuator, Screws & Air Inlet Housing

Courtesy of CHRYSLER LLC

NOTE: If a rubber seal on the recirculation air-door is deformed or damaged, the air-door must be replaced.

1. Install the recirculation-air door (3) into the two halves of the air inlet housing (6 and 7). Align the air door pivot shaft with the holes in the housing halves.
2. Carefully install the two halves of the air inlet housing together and engage the three plastic retaining tabs. Make sure the retaining tabs are fully engaged.
3. Position the recirculation door actuator (4) to the air inlet housing. Make sure the actuator output shaft is properly aligned to the recirculation door pivot shaft. If necessary, rotate the actuator slightly to engage the splines on the output shaft with those in the pivot shaft.
4. Install the two screws (5) that secure the recirculation door actuator to the air inlet housing. Tighten the screws to 1.2 N.m (10 in lbs.).

NOTE: If the foam seal on top of the air inlet housing is deformed or damaged, it must be replaced.

5. Inspect the foam seal (1), especially along the parting line (2) of the two halves of the air inlet housing. Replace the seal if it is deformed or damaged.

Fig. 105: Air Distribution Housing, HVAC Housing & Air Inlet Housing
Courtesy of CHRYSLER LLC

6. Install the air inlet housing (3) onto the HVAC housing (2). See **INSTALLATION**.
7. Install the HVAC housing assembly. See **INSTALLATION**.

HOUSING-HVAC

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See **STANDARD PROCEDURE**. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** chart to determine how much oil should be added to the refrigerant system. See **STANDARD PROCEDURE**.

NOTE: If the A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 106: Air Deflector Vane, HVAC Housing & Foam Seal
 Courtesy of CHRYSLER LLC

1. If removed, install the foam seal (3) onto the condensate drain located at the bottom of the HVAC housing (2).
2. Install the air deflector vane (1) into the lower half of the HVAC housing. Make sure the retainers are fully engaged.

Fig. 107: A/C Evaporator, Foam Insulator, HVAC Housing, Rubber Seal & Tapping Block
 Courtesy of CHRYSLER LLC

NOTE: Make sure the rubber seal for the evaporator tubes and tapping block is properly positioned in the HVAC housing opening.

3. If removed, install the rubber seal (4) over the evaporator tubes and tapping block (5).

NOTE: Make sure that the foam insulator around the A/C evaporator is properly positioned within the HVAC housing.

- Carefully install the A/C evaporator (1) and foam insulator (2) into the lower half of the HVAC housing (3).

Fig. 108: Foam Seal, HVAC Housing, Screws, Plastic Retaining Tabs & Metal Clips
Courtesy of CHRYSLER LLC

- Install the two halves of the HVAC housing (2 and 6) together and engage the four plastic retaining tabs (4). Make sure the retaining tabs are fully engaged.

NOTE: Be sure to install the screws that secure the two halves of the HVAC housing together located at the bottom of the HVAC housing.

- Install the seven screws (5) and two metal clips (3) that secure the two halves of the HVAC housing together. Tighten the screws to 1.2 N.m (10 in lbs.). Make sure the metal clips are fully engaged to the housing halves.
- Install the foam seal (1) onto the front of the two HVAC housing halves.

Fig. 109: Removing/Installing Evaporator Temperature Sensor From Front Of HVAC Housing

9. Position the blower motor (4) into the bottom of the HVAC housing (2) and install the three retaining screws (3). Tighten the screws to 1.2 N.m (10 in. lbs.).
10. Position the blower motor resistor (5) into the HVAC housing and install the two retaining screws (1). Tighten the screws to 1.2 N.m (10 in. lbs.).

Fig. 111: Air Distribution Housing, HVAC Housing & Air Inlet Housing
Courtesy of CHRYSLER LLC

11. Install the air inlet housing (3) onto the HVAC housing (2). See **INSTALLATION**.
12. Install the air distribution housing (1) onto the HVAC housing. See **INSTALLATION**.

13. Install the passenger side lower front floor duct. See **INSTALLATION**.

NOTE: **If the heater core is being replaced, flush the cooling system. Refer to STANDARD PROCEDURE .**

14. Install the HVAC housing assembly. See **INSTALLATION**.

15. If the A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. See **STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

INSTALLATION

HOUSING-AIR DISTRIBUTION

Fig. 112: Air Distribution Housing Remove/Install Components
Courtesy of CHRYSLER LLC

NOTE: **LHD model shown in illustration. RHD model similar.**

1. Position the air distribution housing (8) onto the top of the HVAC housing (5) and engage the two plastic retaining tabs (2) that secure the front of the distribution housing to the HVAC housing.
2. Engage the plastic retaining tab (1) that secures the front driver side of the air distribution housing to the HVAC housing. Make sure the passenger side floor ducts are properly connected to each other.
3. Install the three metal retaining clips (7) and three screws (6) that secure the air distribution housing to the HVAC housing. Tighten the screws to 1.2 N.m (10 in. lbs.).

NOTE: **If the foam seal for the heater core tube flange is deformed or damaged, it must be replaced.**

4. Install the screw (4) that secures the heater core tube flange (3) to the top of the HVAC housing. Tighten the screw to 1.2 N.m (10 in. lbs.).

NOTE: If the heater core is being replaced, flush the cooling system. Refer to **STANDARD PROCEDURE** .

5. Install the HVAC housing assembly. See **INSTALLATION**.

HOUSING-AIR INLET

Fig. 113: Screw, Plastic Retaining Tabs, Air Inlet Housing & HVAC Housing
Courtesy of CHRYSLER LLC

NOTE: Typical housing shown in illustration. RHD model similar.

1. Position the air inlet housing (3) to the top of the HVAC housing (4) and engage the front of the inlet housing to the two plastic retaining tabs (2) located on the top of the HVAC housing.
2. Firmly push down on the rear of the air inlet housing and engage the inlet housing to the HVAC housing. Make sure the two housings are fully engaged to each other.
3. Install the screw (1) that helps secure the rear of the air inlet housing to the HVAC housing. Tighten the screw to 1.2 N.m (10 in. lbs.).
4. Install the HVAC housing assembly. See **INSTALLATION**.

HOUSING-HVAC

NOTE: LHD model shown in illustrations. RHD model similar.

818d3ce3

Fig. 114: Removing/Installing Nuts That Secure HVAC Housing Assembly To Passenger Side Of Dash Panel

Courtesy of CHRYSLER LLC

1. Position the HVAC housing assembly (2) to the passenger side of the dash panel (3). Be certain that the housing is correctly located over the two dash panel mounting studs.
2. Install the two nuts (1) that secure the HVAC housing assembly to the dash panel. Tighten the nuts to 4.5 N.m (40 in. lbs.).
3. Install the rear floor duct. See **INSTALLATION**.
4. Install the instrument panel. Refer to **INSTALLATION**.

818c5aa1

Fig. 115: Suction Line Assembly, Nuts, A/C Expansion Valve, Heater Hoses & Dash Panel

Courtesy of CHRYSLER LLC

5. Install the nut (6) that secures the HVAC housing assembly to the engine compartment side of the dash panel (5). Tighten the nut to 4.5 N.m (40 in. lbs.).
6. Remove the previously installed plugs or caps and connect the heater hoses (4) to the heater core tubes.

7. Remove the tape or plugs from the refrigerant line fittings and the expansion valve ports.
8. Lubricate new rubber O-rings with clean refrigerant oil and install them onto the liquid and suction line fittings. Use only the specified O-ring seals as they are made of special materials compatible to the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
9. Connect the A/C liquid and suction line assembly (1) to the A/C expansion valve (3).
10. Install the nut (2) that secures the A/C liquid and suction line assembly to the A/C expansion valve. Tighten the nut to 23 N.m (17 ft. lbs.).
11. Reconnect the negative battery cable.
12. If the heater core is being replaced, flush the cooling system. Refer to **STANDARD PROCEDURE** .
13. Refill the engine cooling system. Refer to **STANDARD PROCEDURE** .
14. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
15. Charge the refrigerant system. See **STANDARD PROCEDURE**.
16. Initiate the Actuator Calibration function using a scan tool. See **DIAGNOSIS AND TESTING**.

SCREEN-AIR INLET

Fig. 116: Air Inlet Screen, Nuts, Cowl Panel & Retaining Studs
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Position the air inlet screen (1) into the cowl panel (3) and fully engage the screen onto the two retaining studs (4).
2. Install the air inlet screen onto the cowl panel and install the two retaining nuts (4). Tighten the nuts to 2.3 N.m (20 in. lbs.).
3. Install the cowl grille. Refer to **INSTALLATION** .

MOTOR-BLOWER

DESCRIPTION

MOTOR-BLOWER

Fig. 117: Identifying Blower Motor
Courtesy of CHRYSLER LLC

NOTE: Typical blower motor shown in graphic,

The blower motor (1) is a 12-volt, direct current (DC) motor mounted within a plastic housing with three integral mounting tabs (4), an integral wire harness connector (3) and a squirrel cage-type blower wheel (2) that is secured to the blower motor shaft. The blower motor wheel is positioned within the HVAC air inlet housing, which is mounted to the passenger side end of the HVAC housing.

The blower motor can be accessed for service from underneath the instrument panel.

OPERATION

MOTOR-BLOWER

The blower motor is used to control the velocity of air moving through the HVAC housing by spinning the blower wheel within the HVAC air inlet housing at the selected speed.

The blower motor will operate whenever the ignition switch is in the Run position and the blower motor control is in any position except Off. The blower motor receives battery current through the totally integrated power module (TIPM) whenever the ignition switch is in the Run position.

Blower motor speed is controlled by regulating the ground path through or around the blower motor resistor and through the blower motor control located within the A/C-heater control.

The blower motor can be accessed for service from underneath the instrument panel.

NOTE: The blower motor is supplied with a 12V feed from the TIPM, through the blower motor resistor, whenever the ignition switch is in the RUN position. Due to an open circuit condition within the blower motor control switch the TIPM is

UNABLE to detect an OPEN circuit for the blower motor.

The blower motor control system is diagnosed using a scan tool (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

The blower motor and blower motor wheel are factory balanced as an assembly and cannot be adjusted or repaired and must be replaced if found inoperative or damaged.

DIAGNOSIS AND TESTING

MOTOR-BLOWER

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: The blower motor is supplied with a 12V feed from the TIPM, through the blower motor resistor, whenever the ignition switch is in the RUN position. Due to an open circuit condition within the blower motor control switch the TIPM is **UNABLE to detect an OPEN circuit for the blower motor.**

To determine if an open condition exists within the blower motor circuit wiring, it is necessary to disconnect the negative battery cable and check for continuity within the blower motor circuits using an ohmmeter.

OPERATION

Possible causes of an inoperative blower motor include:

- Open fuse
- Inoperative blower motor resistor
- Inoperative blower motor switch
- Inoperative blower motor
- Inoperative blower motor circuit wiring or wire harness connectors

NOISE

To determine if the blower motor is the source of the noise, simply switch the blower motor from Off to On. To verify that the blower motor is the source of the noise, unplug the blower motor wire harness connector and operate the heater-A/C system. If the noise goes away, possible causes include:

- Foreign material on fresh air inlet screen
- Foreign material in blower wheel

Foreign material in HVAC housing
Improper blower motor mounting
Deformed or damaged blower wheel
Worn blower motor bearings or brushes

VIBRATION

Possible causes of a blower motor vibration include:

Improper blower motor mounting
Foreign material in blower wheel
Deformed or damaged blower wheel
Worn blower motor bearings

REMOVAL

MOTOR-BLOWER

NOTE: The blower motor is located on the bottom of the passenger side of the HVAC housing. The blower motor can be removed from the vehicle without having to remove the HVAC housing.

Fig. 118: HVAC Housing, Screws, Instrument Panel Wire Harness Connector & Blower Motor
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. If equipped, remove the silencer from below the passenger side of the instrument panel. Refer to **REMOVAL** .

3. From underneath the instrument panel, disconnect the instrument panel wire harness connector (3) from the blower motor (4).
4. Remove the three screws (2) that secure the blower motor to the bottom of the HVAC housing (1) and remove the blower motor.

INSTALLATION

MOTOR-BLOWER

Fig. 119: HVAC Housing, Screws, Instrument Panel Wire Harness Connector & Blower Motor
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Position the blower motor (4) into the bottom of the HVAC housing (1).
2. Install the three screws (2) that secure the blower motor to the HVAC housing. Tighten the screws to 1.2 N.m (10 in. lbs.).
3. Connect the instrument panel wire harness connector (3) to the blower motor.
4. If equipped, install the silencer below the passenger side of the instrument panel. Refer to **INSTALLATION**.
5. Reconnect the negative battery cable.

OUTLET-AIR

DESCRIPTION

OUTLET-AIR

81064e6c

Fig. 120: Instrument Panel Air Outlet Locations
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

There are two defroster air outlets (1) located on the top of the instrument panel (4). The airflow from the defroster outlets is directed by fixed vanes and cannot be adjusted. The defroster air outlets are serviced with the defroster grilles (2). Refer to **REMOVAL** .

There are two side window demister air outlets (3). One located at each end of the instrument panel near the A-pillars. The airflow from the side window demister air outlets is directed by fixed vanes and cannot be adjusted. The side window demister air outlets are integral to the left and right side instrument panel air outlets and cannot be serviced separately.

There are four instrument panel air outlets (5). One air outlet is located near each outboard end of the instrument panel facing the rear of the vehicle and the other two outlets are located near the top of the instrument panel center bezel. The driver side instrument panel air outlet is serviced with the instrument cluster bezel and the center air outlets are service with the center bezel (refer to **INSTRUMENT PANEL** for further information).

Each of the instrument panel air outlets contain an air outlet grille (6) that is used to direct or shut off the flow of the conditioned air leaving the instrument panel.

REMOVAL

OUTLET-AIR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible serious or fatal injury.

NOTE: The driver side instrument panel air outlet is serviced with the instrument cluster bezel and the center air outlets are service with the center bezel (refer to INSTRUMENT PANEL for further information).

Fig. 121: Passenger Side Air Outlet Grille
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the passenger side defroster grille. Refer to REMOVAL .
3. Remove the passenger side air bag. Refer to REMOVAL .
4. Remove the passenger side A-pillar trim molding. Refer to REMOVAL .
5. Remove the screw (1) that secures the top of the air outlet (2) to the instrument panel (4).
6. Using a trim stick C-4755 or equivalent (3), gently pry the lower portion of the air outlet rearward to disengage the two metal retaining clips from the instrument panel and remove the outlet.
7. If required, carefully disengage the plastic retaining tabs that secure the air outlet grille to the back of air outlet and remove the grille from the outlet.

INSTALLATION

OUTLET-AIR

NOTE: The driver side instrument panel air outlet is serviced with the instrument cluster bezel and the center air outlets are service with the center bezel (refer to INSTRUMENT PANEL for further information).

Fig. 122: Passenger Side Air Outlet Grille
 Courtesy of CHRYSLER LLC

1. If removed, carefully install the air outlet grille onto the back of air outlet and engage the plastic retaining tabs that secure grille to the outlet. Make sure the retaining tabs are fully engaged.
2. Position the instrument panel air outlet to the instrument panel and engage the two metal retaining clips to the instrument panel. Make sure the retainers are fully engaged.
3. Install the screw (1) that secures the top of the air outlet (2) to the instrument panel (4). Tighten the screw to 1.2 N.m (10 in. lbs.).
4. Install the A-pillar trim molding. Refer to **INSTALLATION** .
5. Install the passenger side air bag. Refer to **INSTALLATION** .
6. Install the defroster grille. Refer to **INSTALLATION** .
7. Reconnect the negative battery cable.

PLUMBING

DESCRIPTION

REFRIGERANT LINES

The A/C refrigerant lines and hoses are used to carry the refrigerant between the various A/C system components. The refrigerant lines and hoses for the R-134a A/C system consist of a barrier-hose design with a nylon tube sandwiched between rubber layers. The nylon tube helps to contain the R-134a refrigerant, which has a small molecular structure. The ends of the refrigerant lines are made from lightweight aluminum with brazed fittings.

Any kinks or sharp bends in the refrigerant lines and hoses will reduce the capacity of the entire A/C system and can reduce the flow of refrigerant within the system.

OPERATION

REFRIGERANT LINES

High pressures are produced in a refrigerant system when the A/C compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

Depending on vehicle, model and market application, refrigerant lines are connected to each other or other A/C system components with block-type or quick-connect type fittings. To ensure the integrity of the refrigerant system, O-rings and/or gaskets may be used to seal the refrigerant system connections.

The refrigerant lines and hoses cannot be repaired and must be replaced if leaking or damaged.

WARNING

WARNING

WARNING: The A/C system contains refrigerant under high pressure. Repairs should only be performed by qualified service personnel. Serious or fatal injury may result from improper service procedures.

WARNING: Avoid breathing the refrigerant and refrigerant oil vapor or mist. Exposure may irritate the eyes, nose, and/or throat. Wear eye protection when servicing the A/C refrigerant system. Serious eye injury can result from direct contact with the refrigerant. If eye contact occurs, seek medical attention immediately.

WARNING: Do not expose the refrigerant to open flame. Poisonous gas is created when refrigerant is burned. An electronic leak detector is recommended. Serious or fatal injury may result from improper service procedures.

WARNING: If accidental A/C system discharge occurs, ventilate the work area before resuming service. Large amounts of refrigerant released in a closed work area will displace the oxygen and cause suffocation and serious or fatal injury.

WARNING: The evaporation rate of R-134a refrigerant at average temperature and altitude is extremely high. As a result, anything that comes in contact with the refrigerant will freeze. Always protect the skin or delicate objects from direct contact with the refrigerant.

WARNING: The R-134a service equipment or the vehicle refrigerant system should not be pressure tested or leak tested with compressed air. Some mixtures of air and R-134a have been shown to be combustible at elevated pressures. These mixtures are potentially dangerous, and may result in fire or explosion causing property damage and serious or fatal injury.

WARNING: The engine cooling system is designed to develop internal pressures up to 145 kilopascals (21 pounds per square inch). Do not remove or loosen the coolant pressure cap, cylinder block drain plugs, radiator drain, radiator hoses, heater hoses, or hose clamps while the engine cooling system is hot and under pressure. Allow the vehicle to cool for a minimum of 15 minutes before opening the cooling system for service. Failure to observe this warning can result in serious burns from the heated engine coolant.

CAUTION

CAUTION

CAUTION: Never add R-12 to a refrigerant system designed to use R-134a. Do not use R-12 equipment or parts on an R-134a A/C system. These refrigerants are not compatible and damage to the A/C system will result.

CAUTION: Never use R-12 refrigerant oil in an A/C system designed to use R-134a refrigerant oil. These refrigerant oils are not compatible and damage to the A/C system will result.

CAUTION: The use of A/C system sealers may result in damage to A/C refrigerant recovery/evacuation/recharging equipment and/or A/C system. Many federal, state/provincial and local regulations prohibit the recharge of A/C systems with known leaks. DaimlerChrysler recommends the detection of A/C system leaks through the use of approved leak detectors and fluorescent leak detection dyes. Vehicles found with A/C system sealers should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners voids the warranty for the A/C system.

CAUTION: Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: If equipped, do not remove the secondary retention clip from any spring-lock coupler connection while the refrigerant system is under pressure. Recover the refrigerant before removing the secondary retention clip. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: The internal parts of the A/C system will remain stable as long as moisture-free refrigerant and refrigerant oil is used. Abnormal amounts of dirt, moisture or air can upset the chemical stability. This may cause

operational troubles or even serious damage if present in more than very small quantities. Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system. Keep service tools and the work area clean. Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug. This will prevent contamination from entering the A/C system.

CAUTION: Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.

CAUTION: Do not overcharge the refrigerant system. Overcharging will cause excessive compressor head pressure and can cause compressor noise and A/C system failure.

DIAGNOSIS AND TESTING

REFRIGERANT SYSTEM LEAKS

WARNING: R-134a service equipment or vehicle A/C system should not be pressure tested or leak tested with compressed air. Mixture of air and R-134a can be combustible at elevated pressures. These mixtures are potentially dangerous and may result in fire or explosion causing property damage and possible serious or fatal injury.

Avoid breathing A/C refrigerant and lubricant vapor or mist. Exposure may irritate eyes, nose and throat. Use only approved service equipment meeting SAE requirements to discharge an R-134a system. If accidental system discharge occurs, ventilate work area before resuming service.

NOTE: If the A/C system refrigerant charge is empty or low, a leak in the A/C system is likely. Visually inspect all A/C lines, fittings and components for an oily residue. Oil residue can be an indicator of an A/C system leak location.

NOTE: The only way to correctly determine if the A/C system is fully charged with refrigerant to perform the A/C Performance Test. See **DIAGNOSIS AND TESTING**.

Connect a suitable manifold gauge set and determine if the static A/C system pressure is above or below 345 kPa (50 psi). See **STANDARD PROCEDURE**. If less than 345 kPa (50 psi), proceed to **SYSTEM EMPTY**. If greater than 345 kPa (50 psi), go to **SYSTEM LOW**.

SYSTEM EMPTY

1. Evacuate the refrigerant system to the lowest degree of vacuum possible (approximately -88 kPa (- 26 in. Hg) or greater vacuum). See **STANDARD PROCEDURE**. Determine if the system holds a vacuum for 15 minutes. If the refrigerant system will not maintain vacuum level, proceed to step 2. If vacuum is held, a leak is probably not present.
2. Prepare and dispense 0.284 kilograms (10 ounces) of R-134a refrigerant into the evacuated refrigerant system. See **STANDARD PROCEDURE**, and proceed to step 1 of the System Low procedure.

SYSTEM LOW

1. Position the vehicle in a wind-free work area. This will aid in detecting small leaks.
2. Operate the heating-A/C system with the engine at idle under the following conditions for at least 5 minutes.
 - Doors or windows open
 - Transmission in Park or Neutral with the parking brake set (depending on transmission application)
 - A/C compressor engaged with A/C-heater controls set to Recirculation mode (max-A/C), full cool, panel mode and high speed blower.

CAUTION: A leak detector only designed for R-12 refrigerant will not detect leaks in an R-134a refrigerant system.

3. Shut the vehicle Off and wait 2-7 minutes. Then use an electronic leak detector that is designed to detect R-134a refrigerant and search for leaks. Fittings, lines or components that appear to be oily usually indicate a refrigerant leak. To inspect the A/C evaporator for leaks, insert the leak detector probe into the passenger side floor duct. A dye for R-134a is available to aid in leak detection. Use only Chrysler approved refrigerant dye.

STANDARD PROCEDURE

REFRIGERANT SYSTEM CHARGE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See WARNING and CAUTION. Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The Underhood HVAC Specification Label contains the refrigerant fill specification of the vehicle being serviced.

After all refrigerant system leaks have been repaired and the refrigerant system has been evacuated, a refrigerant charge can be injected into the system. See **STANDARD PROCEDURE**.

An R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to charge the refrigerant system with R-134a refrigerant. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

CHARGING PROCEDURE

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you **MUST** replenish any oil lost during the recovery process. Refer the equipment manufacturer instructions for more information.

1. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
2. Connect an R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2210 to the refrigerant system.
3. Refer to **A/C SYSTEM** or the Underhood HVAC Specification Label for the proper amount of the refrigerant charge.
4. Measure the proper amount of refrigerant charge and heat it to 52° C (125° F) with the charging station. See the operating instructions supplied by the equipment manufacturer for proper use of this equipment.
5. Open both the suction and discharge valves, then open the charge valve to allow the heated refrigerant to flow into the system.
6. When the transfer of refrigerant has stopped, close both the suction and discharge valves.
7. If all of the refrigerant charge did not transfer from the dispensing device, open all of the windows in the vehicle and set the heating-A/C system controls so that the A/C compressor is engaged and the blower motor is operating at its lowest speed setting. Run the engine at a steady high idle (about 1400 rpm). If the A/C compressor does not engage, test the compressor clutch circuits and repair as required.

WARNING: Take care not to open the discharge (high pressure) valve at this time. Failure to follow this warning may result in serious or fatal injury.

8. Open the low-side valve to allow the remaining refrigerant to transfer to the refrigerant system.
9. Disconnect the charging station from the refrigerant system service ports.
10. Reinstall the caps onto the refrigerant system service ports.

REFRIGERANT SYSTEM EVACUATE

NOTE: Special effort must be used to prevent moisture from entering the A/C system oil. Moisture in the oil is very difficult to remove and will cause a reliability problem with the A/C compressor.

If an A/C compressor designed to use R-134a refrigerant is left open to the atmosphere for an extended period of time. It is recommended that the refrigerant oil be drained and replaced with new oil or a new A/C compressor be used. This will eliminate the possibility of contaminating the refrigerant system.

If the refrigerant system has been open to the atmosphere, it must be evacuated before the system can be filled. Moisture and air mixed with the refrigerant will raise the compressor head pressure above acceptable operating levels. This will reduce the performance of the A/C system and damage the A/C compressor. Moisture will boil at near room temperature when exposed to vacuum. To evacuate the refrigerant system:

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

1. Recover the refrigerant system. See STANDARD PROCEDURE.
2. Connect a suitable charging station, refrigerant recovery machine or a manifold gauge set with vacuum pump and refrigerant recovery equipment. See STANDARD PROCEDURE.
3. Open the suction and discharge valves and start the vacuum pump. The vacuum pump should run a minimum of 45 minutes prior to charge to eliminate all moisture in system. When the suction gauge reads to the lowest degree of vacuum possible (approximately -88 kPa (- 26 in. Hg) or greater) for 30 minutes, close all valves and turn off vacuum pump. If the system fails to reach specified vacuum, the refrigerant system likely has a leak that must be corrected. If the refrigerant system maintains specified vacuum for at least 30 minutes, start the vacuum pump, open the suction and discharge valves. Then allow the system to evacuate an additional 10 minutes.
4. Close all valves. Turn off and disconnect the vacuum pump.
5. Charge the refrigerant system. See STANDARD PROCEDURE.

REFRIGERANT SYSTEM RECOVERY

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See WARNING and CAUTION. Failure to follow the warnings and cautions may result in serious or fatal injury.

Fig. 123: Identifying R-134a Refrigerant Recovery/Recycling/Charging Station
 Courtesy of CHRYSLER LLC

An R-134a refrigerant recovery/recycling/charging station (1) that meets SAE standard J2210 must be used to recover the refrigerant from the R-134a refrigerant system. Refer to the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.

REFRIGERANT SYSTEM SERVICE EQUIPMENT

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

WARNING: Eye protection must be worn when servicing an air conditioning refrigerant system. Turn off (rotate clockwise) all valves on the equipment being used, before connecting to or disconnecting from the refrigerant system. Failure to observe these warnings may result in personal injury or death.

Fig. 124: Identifying R-134a Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER LLC

When servicing the A/C system, a R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2210 must be used (1). Contact an automotive service equipment supplier for refrigerant recovery/recycling/charging equipment. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

80add30c

Fig. 125: Manifold Gauge Set - Typical
Courtesy of CHRYSLER LLC

A manifold gauge set (1) may be needed with some recovery/recycling/charging equipment. The manifold gauge set should have manual shut-off valves (2 and 6), or automatic back-flow valves located at the service port connector end of the manifold gauge set hoses (4 and 5). This will prevent refrigerant from being released into the atmosphere.

MANIFOLD GAUGE SET CONNECTIONS

CAUTION: Do not use an R-12 manifold gauge set on an R-134a system. The refrigerants are not compatible and system damage will result.

LOW PRESSURE GAUGE HOSE - The low pressure hose (Blue with Black stripe) attaches to the low-side service port. This port is located on the A/C suction line near the rear of the engine compartment.

HIGH PRESSURE GAUGE HOSE - The high pressure hose (Red with Black stripe) attaches to the high-side service port. This port is located on the A/C liquid line near the front of the engine compartment.

RECOVERY, RECYCLING, EVACUATION AND CHARGING HOSE - The center manifold hose (Yellow, or White, with Black stripe) is used to recover, evacuate, and charge the refrigerant system. When the low or high pressure valves on the manifold gauge set are opened, the refrigerant in the system will escape through this hose.

COMPRESSOR-A/C

DESCRIPTION

COMPRESSOR-A/C

812c0f81

Fig. 126: Denso 10S17 Compressor
Courtesy of CHRYSLER LLC

The A/C system on models equipped with the 3.7L engine use a Visteon HS-18 A/C compressor (1). This A/C compressor is a 10 cylinder reciprocating swash plate-type compressor that uses an electrically operated clutch to engage and disengage the A/C compressor from the engine accessory drive belt.

The HS-18 A/C compressor has a fixed displacement of 180 cubic centimeters (10.9 cubic inches) and has the suction and discharge ports (2) located on the compressor cylinder head (3) at the rear of the compressor and a label which identifies the use of R-134a refrigerant.

COMPRESSOR-A/C

Fig. 127: A/C Compressor Components
Courtesy of CHRYSLER LLC

The A/C system on models equipped with the 2.8L and 4.0L engine use a Zexel DKS-17DS A/C compressor (1). This A/C compressor is a ten cylinder, double-acting swash plate-type compressor that uses an electrically operated clutch (2) to engage and disengage the A/C compressor from the engine accessory drive belt.

The DKS-17DS A/C compressor has a fixed displacement of 175.5 cubic centimeters (10.7 cubic inches) and has the suction and discharge ports (6) located on the compressor cylinder block (3). This A/C compressor also has an integral high pressure relief valve (4) located on the cylinder head (5) and a label which identifies the use of R-134a refrigerant.

VALVE-HIGH PRESSURE RELIEF-A/C COMPRESSOR

A high pressure relief valve is located on the A/C compressor. This mechanical valve is designed to vent refrigerant from the A/C system to protect against damage to the A/C compressor and other A/C system components, caused by condenser air flow restriction or an overcharge of refrigerant.

OPERATION

COMPRESSOR-A/C

The A/C compressor is driven by the engine through an electric clutch, drive pulley and belt arrangement. The A/C compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the

refrigerant.

The A/C compressor draws in low-pressure refrigerant vapor from the A/C evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the A/C condenser through the compressor discharge port.

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. See STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level can prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

The A/C compressor cannot be repaired and must be replaced if inoperative or damaged. The compressor clutch, pulley and bearing assembly, and clutch field coil are available for service. If an internal failure of the A/C compressor has occurred, the A/C receiver/drier must also be replaced. See REMOVAL.

VALVE-HIGH PRESSURE RELIEF-A/C COMPRESSOR

The high pressure relief valve vents refrigerant from the A/C system when a discharge pressure of 3430 to 3930 kPa (497 to 570 psi) or above is reached. The high pressure relief valve closes with a minimum discharge pressure of 2990 kPa (4370 psi) is reached.

The high pressure relief valve vents only enough refrigerant to reduce the A/C system pressure, and then re-seats itself. The majority of the refrigerant is conserved in the A/C system. If the high pressure relief valve vents refrigerant, it does not mean the valve is faulty.

The high pressure relief valve is factory-calibrated and cannot be adjusted or repaired, and must not be removed or otherwise disturbed. The valve is only serviced as a part of the A/C compressor.

DIAGNOSIS AND TESTING

COMPRESSOR-A/C

When investigating an A/C system related noise, you must first know the conditions under which the noise occurs. These conditions include: weather, vehicle speed, transmission in gear or neutral, engine speed, engine temperature, and any other special conditions. Noises that develop during A/C operation can often be misleading. For example: What sounds like a failed front engine bearing or connecting rod, may be caused by loose bolts, nuts, mounting brackets or a loose compressor clutch assembly.

Drive belts are speed sensitive. At different engine speeds and depending upon drive belt tension, drive belts can develop noises that are mistaken for an A/C compressor noise. Improper drive belt tension can cause a misleading noise when the compressor clutch is engaged, which may not occur when the compressor clutch is disengaged. Check the accessory drive belt condition and tension as described in Cooling before beginning this procedure.

1. Select a quiet area for testing. Duplicate the complaint conditions as much as possible. Turn the A/C compressor On and Off several times to clearly identify the compressor noise. Listen to the A/C compressor while the clutch is engaged and disengaged. Probe the A/C compressor with an engine stethoscope or a long screwdriver with the handle held to your ear to better localize the source of the noise.
2. Loosen all of the compressor mounting hardware and retighten. Check the compressor clutch retainer. Be certain that the clutch field coil is mounted securely to the A/C compressor, and that the clutch plate and pulley are properly aligned and have the correct air gap.
3. To duplicate high-ambient temperature conditions (high head pressure), restrict the air flow through the A/C condenser. Install a manifold gauge set or a scan tool to be certain that the discharge pressure does not exceed 2760 kPa (400 psi).
4. Check the refrigerant system plumbing for incorrect routing, rubbing or interference, which can cause unusual noises. Also check the refrigerant lines and hoses for kinks or sharp bends that will restrict refrigerant flow, which can cause noises. See **DESCRIPTION**.
5. If the noise is from opening and closing of the high pressure relief valve, recover, evacuate and recharge the refrigerant system. See **STANDARD PROCEDURE**.
6. If the high pressure relief valve still does not seat properly, replace the A/C compressor. See **REMOVAL**.

REMOVAL

2.8L ENGINE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The A/C compressor can be removed from the engine and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the A/C clutch or various engine components.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 128: Refrigerant Line System
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **STANDARD PROCEDURE**.
3. Remove the air cleaner housing. **REMOVAL**
4. Remove the air inlet tube from the throttle body and the charge air cooler.
5. Remove the battery. Refer to **REMOVAL** .
6. Remove the radiator fan and fan shroud. Refer to **REMOVAL** .
7. Remove the accessory drive belt. Refer to **REMOVAL** .
8. Remove the generator. Refer to **REMOVAL** .
9. On LHD models, remove the two nuts (2) that secure the A/C suction line (4) to the top of the engine.
10. Remove the nuts (5) that secures the A/C suction line and A/C discharge line (1) to the A/C compressor (3).
11. Disconnect the A/C suction and discharge lines from the A/C compressor and remove and discard the O-ring seals and gaskets.

Fig. 129: A/C Clutch Field Coil Connector, Bolts & A/C Compressor
Courtesy of CHRYSLER LLC

12. Disconnect the engine wire harness from the A/C clutch field coil connector (1).
13. Support the A/C compressor (3) and remove the three bolts (2) that secure the compressor to the engine.
14. Remove the A/C compressor from the engine compartment.
15. Install plugs in, or tape over the opened refrigerant line fittings and the compressor ports.

3.7L ENGINE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The A/C compressor can be removed from the engine and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the A/C clutch or various engine components.

Fig. 130: Removing/Installing Nuts That Secure A/C Suction Line And A/C Discharge Line To A/C Compressor

Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **STANDARD PROCEDURE**.
3. Remove the air cleaner housing (refer to **REMOVAL**).
4. Remove the accessory drive belt. Refer to **REMOVAL** .
5. Remove the nuts (2) that secure the A/C suction line (1) and A/C discharge line (3) to the A/C compressor (4).
6. Disconnect the A/C suction and discharge lines from the A/C compressor and remove and discard the O-ring seals and gaskets.

Fig. 131: A/C Compressor Components

Courtesy of CHRYSLER LLC

7. Disconnect the engine wire harness from the A/C clutch field coil connector (3).

8. Loosen the bolt (6) that secures the compressor bracket (8) to the engine front cover (7).
9. Remove the bolt (1) that secures the A/C compressor (2) to the intake manifold (9).
10. Remove the two bolts (4 and 5) that secure the A/C compressor to the front of the engine.
11. Remove the A/C compressor from the engine and install plugs in, or tape over the opened refrigerant line fittings and the compressor ports.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See WARNING and CAUTION. Failure to follow the warnings and cautions could result in possible serious or fatal injury.

81b94c68

Fig. 133: ENGINE MOUNT TO FRAME
 Courtesy of CHRYSLER LLC

8. Raise and support the vehicle.
9. Remove the nut (3) from the through bolt (1) on the right side engine mount (3).

CAUTION: Do not completely remove the right side motor mount through bolt when performing this procedure. The bolt supports the engine at the lower mount and removal of the bolt will allow the engine to sit further down in the frame, which may cause possible damage to the engine and various other components.

10. Support the engine with a suitable jack and partially remove the through bolt to allow the right side of the engine to be raised off of the motor mount.

8114d4s3

Fig. 134: Removing/Installing A/C Compressor

Courtesy of CHRYSLER LLC

11. Remove the jack stand and lower the vehicle.
12. Disconnect the engine wire harness from the A/C clutch field coil connector (1).

CAUTION: Use care when raising the engine when performing this procedure. Be sure to protect the bottom of the engine and various other components from damage.

13. Using a suitable floor jack and a block of wood under the oil pan to protect from damage, raise the right side of the engine to gain access to remove the stud (3) that secures the lower front of the A/C compressor (2) to the accessory drive belt bracket.
14. Remove the nut (4) and stud that secures the lower front of the A/C compressor to the accessory drive belt bracket.
15. Remove the bolt (7) that secures the rear of the A/C compressor to the engine.
16. Support the A/C compressor and remove the nut (6) and stud (5) that secures the upper front of the A/C compressor to the accessory drive belt bracket and remove the compressor.

INSTALLATION

2.8L ENGINE

CAUTION: If the A/C compressor is being replaced, be certain to adjust the refrigerant system oil level. See STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be removed from the new A/C compressor. See STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 135: A/C Clutch Field Coil Connector, Bolts & A/C Compressor
 Courtesy of CHRYSLER LLC

1. If the A/C compressor (3) is being replaced, the refrigerant oil in the old compressor must be first drained and measured. Then the oil in the new A/C compressor must be drained. Finally, the new compressor must be refilled with the same amount of new refrigerant oil that was drained out of the old compressor. See **STANDARD PROCEDURE**. When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Position the A/C compressor onto the engine.
3. Install the three bolts (2) that secure the A/C compressor to the engine. Tighten the bolts to 28 N.m (21 ft. lbs.).
4. Connect the engine wire harness to the A/C clutch field coil connector (1).

Fig. 136: Refrigerant Line System
 Courtesy of CHRYSLER LLC

5. Remove the tape or plugs from the opened refrigerant line fittings and the compressor ports.

6. Lubricate new O-ring seals with clean refrigerant oil and install them and new gaskets on the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
7. Connect the A/C suction line (4) and A/C discharge line (1) to the A/C compressor (3).
8. Install the nuts (5) that secure the A/C suction and discharge lines to the A/C compressor. Tighten the nuts to 12 N.m (105 in. lbs.).
9. On LHD models, install the two nuts (2) that secure the A/C suction line to the top of the engine. Tighten the nuts to 4.5 N.m (40 in. lbs.).
10. Install the generator. Refer to **INSTALLATION** .
11. Install the accessory drive belt. Refer to **INSTALLATION** .
12. Install the radiator fan and fan shroud. Refer to **INSTALLATION** .
13. Install the battery. Refer to **INSTALLATION** .
14. Install the air inlet tube to the throttle body and the charge air cooler. Tighten the clamps securely.
15. Install the air cleaner housing.
16. Reconnect the negative battery cable.
17. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
18. Charge the refrigerant system. See **STANDARD PROCEDURE**.

3.7L ENGINE

CAUTION: If the A/C compressor is being replaced, be certain to adjust the refrigerant system oil level. See **STANDARD PROCEDURE**. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be removed from the new A/C compressor. See **STANDARD PROCEDURE**.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 137: A/C Compressor Components
Courtesy of CHRYSLER LLC

1. If the A/C compressor (2) is being replaced, the refrigerant oil in the old compressor must be first drained and measured. Then the oil in the new A/C compressor must be drained. Finally, the new compressor must be refilled with the same amount of new refrigerant oil that was drained out of the old compressor. See **STANDARD PROCEDURE**. When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Position the A/C compressor to the intake manifold (9) and the engine front cover (7).
3. Install and hand tighten the three compressor retaining bolts (1, 4 and 5).
4. Tighten the bolts in the following sequence:
 - The rear bolt (1) to 55 N.m (41 ft. lbs.).
 - The front inboard bolt (5) to 40 N.m (30 ft. lbs.).
 - The front outboard bolt (4) to 55 N.m (41 ft. lbs.).
5. Tighten the bolt (6) that secures the compressor bracket (8) to the engine front cover to 40 N.m (30 ft. lbs.).
6. Connect the engine wire harness to the A/C clutch field coil connector (3).

Fig. 138: Removing/Installing Nuts That Secure A/C Suction Line And A/C Discharge Line To A/C Compressor

Courtesy of CHRYSLER LLC

7. Remove the tape or plugs from the opened refrigerant line fittings and the compressor ports.
8. Lubricate new O-ring seals with clean refrigerant oil and install them and new gaskets on the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
9. Connect the A/C suction line (1) and the A/C discharge line (3) to the A/C compressor (4).
10. Install the nuts (2) that secure the A/C suction and discharge lines to the A/C compressor. Tighten the nuts to 12 N.m (105 in. lbs.).
11. Install the accessory drive belt. Refer to **INSTALLATION** .
12. Install the air cleaner housing (refer to **INSTALLATION**).
13. Reconnect the negative battery cable.
14. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
15. Charge the refrigerant system. See **STANDARD PROCEDURE**.

4.0L ENGINE

CAUTION: If the A/C compressor is being replaced, be certain to adjust the refrigerant system oil level. See **STANDARD PROCEDURE**. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** chart to determine how much oil should be removed from the

new A/C compressor. See STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 139: Removing/Installing A/C Compressor
Courtesy of CHRYSLER LLC

1. If the A/C compressor (2) is being replaced, the refrigerant oil in the old compressor must be first drained and measured. Then the oil in the new A/C compressor must be drained. Finally, the new compressor must be refilled with the same amount of new refrigerant oil that was drained out of the old compressor. See STANDARD PROCEDURE. When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

CAUTION: Use care when raising the engine when performing this procedure. Be sure to protect the bottom of the engine and various other components from damage.

2. Using a suitable floor jack and a block of wood under the oil pan to protect from damage, raise the right side of the engine until the stud (3) that secures the lower front of the A/C compressor to the accessory drive belt bracket can be installed.
3. Install the stud that secures the lower front of the A/C compressor to the accessory drive belt bracket. Tighten the stud securely.
4. Install the stud (5) that secures the upper front of the compressor to the accessory drive belt bracket. Tighten the stud securely.
5. Loosely install the nuts (4 and 6) that secure the front of the A/C compressor to the accessory drive belt bracket.
6. Loosely install the bolt (7) that secures the rear of the A/C compressor to the engine.
7. Tighten each of the compressor fasteners to 28 N.m (21 ft. lbs.) using the following sequence:

- The upper nut at front of compressor.
 - The lower nut at front of compressor.
 - The bolt at the rear of compressor.
8. Lower the right side of the engine and remove the jack and wood block.
 9. Connect the engine wire harness to the A/C clutch field coil connector (1).
 10. Lower the engine and remove the floor jack.

81b84c/8

Fig. 140: ENGINE MOUNT TO FRAME
Courtesy of CHRYSLER LLC

11. Raise and support the vehicle.
12. Support the engine with a suitable jack and install the through bolt (1) and nut (3) to the right side engine mount (3). Tighten the nut to 101 N.m (75 ft. lbs.).

818d4c1

Fig. 141: A/C Discharge Line, Nuts, A/C Suction Line & A/C Compressor
Courtesy of CHRYSLER LLC

13. Remove the jack stand and lower the vehicle.
14. Remove the tape or plugs from the opened refrigerant line fittings and the compressor ports.
15. Lubricate new O-ring seals with clean refrigerant oil and install them and new gaskets on the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
16. Connect the A/C discharge line (1) and the A/C suction line (3) to the A/C compressor (4).
17. Install the nuts (2) that secure the A/C discharge and suction lines to the A/C compressor. Tighten the nuts to 12 N.m (105 in. lbs.).
18. Install the accessory drive belt. Refer to **INSTALLATION** .
19. Install the air cleaner housing (refer to **INSTALLATION**).
20. Reconnect the negative battery cable.
21. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
22. Charge the refrigerant system. See **STANDARD PROCEDURE**.

CONDENSER-A/C

DESCRIPTION

CONDENSER-A/C

Fig. 142: A/C Condenser Components
Courtesy of CHRYSLER LLC

The A/C condenser (1) is located in the front of the engine compartment behind the front fascia. The A/C condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the A/C compressor to give up its heat to the air passing over the condenser fins, which causes the refrigerant to cool and change to a liquid state.

The A/C condenser is equipped with mounting provisions (2) to attach it to the radiator and has tapping blocks (3) for the A/C discharge line and for the receiver/drier (5). A spring lock coupler is used on the condenser outlet tube (4) for the A/C liquid line connection. See **DESCRIPTION**.

On automatic transmission equipped vehicles, the A/C condenser is also equipped with an integral automatic transmission cooler (6).

OPERATION

CONDENSER-A/C

When air passes through the fins of the A/C condenser, the high-pressure refrigerant gas within the A/C condenser gives up its heat. The refrigerant then condenses as it leaves the A/C condenser and becomes a high-pressure liquid. The volume of air flowing over the condenser fins is critical to the proper cooling performance of the A/C system. Therefore, it is important that there are no objects placed in front of the radiator grille openings at the front of the vehicle or foreign material on the condenser fins that might obstruct proper air flow. Also, any factory-installed air seals or shrouds must be properly reinstalled following radiator or A/C condenser service.

NOTE: **Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.**

The A/C condenser has no serviceable parts. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever a refrigerant line is removed from the A/C condenser.

The A/C condenser cannot be repaired and must be replaced if leaking or damaged.

REMOVAL

CONDENSER-A/C

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

CAUTION: Before removing the A/C condenser, note the location of each of the radiator/condenser air seals. These air seals are used to direct air through the A/C condenser and radiator. The air seals must be reinstalled in their proper locations in order for the A/C and engine cooling systems to perform as designed.

NOTE: **LHD model shown in illustrations. RHD model similar.**

Fig. 143: A/C Liquid Line & Condenser Tube
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **STANDARD PROCEDURE**.
3. Remove the engine air cleaner housing (refer to **AIR INTAKE SYSTEM**).
4. Remove the secondary retaining clip and using the proper A/C line disconnect tool (Special Tool Kit 7193 or equivalent), disconnect the A/C liquid line (1) from the condenser tube (2). See **REMOVAL**.

Fig. 144: Radiator, Bolts, A/C Condenser, Nut & A/C Discharge Line
 Courtesy of CHRYSLER LLC

NOTE: Upper condenser retaining bracket and bolt shown in graphic. Lower retaining bracket and bolt similar.

5. Remove the grille. Refer to **REMOVAL** .
6. If equipped with an automatic transmission, disconnect the transmission cooler lines from the

transmission cooler portion of the A/C condenser. Refer to **REMOVAL** .

7. Position the right side condenser air seal out of the way to gain access to the discharge line fitting and the lower condenser retaining bolt.

NOTE: **Rotate and tilt the A/C discharge line as necessary to disconnect it from the A/C condenser.**

8. Remove the nut (4) that secures the A/C discharge line (5) to the A/C condenser (3) and disconnect the discharge line.
9. Remove the two bolts (2) that secure the A/C condenser to the right side of the radiator (1).
10. Carefully lift the A/C condenser straight up to disengage the condenser mounting brackets from the radiator and remove the condenser from the vehicle.
11. If required, remove the A/C receiver/drier from the A/C condenser. See **REMOVAL**.
12. Remove and discard the O-ring seals and gasket and install plugs in, or tape over the opened refrigerant line fittings and the condenser and receiver/drier ports.

INSTALLATION

CONDENSER-A/C

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See **STANDARD PROCEDURE**. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The radiator/condenser air seals must be reinstalled in their proper locations in order for the A/C and engine cooling systems to perform as designed.

NOTE: When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** chart to determine how much oil should be added to the refrigerant system. See **STANDARD PROCEDURE**.

NOTE: If only the A/C condenser is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 145: Radiator, Bolts, A/C Condenser, Nut & A/C Discharge Line
 Courtesy of CHRYSLER LLC

NOTE: Upper condenser retaining bracket and bolt shown in graphic. Lower retaining bracket and bolt similar.

1. Remove the tape or plugs from the opened refrigerant line fittings and the receiver/drier and condenser ports.
2. Lubricate new rubber O-ring seals with clean refrigerant oil and install them and a new gasket onto the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. If removed, install the A/C receiver/drier onto the A/C condenser (3). See **INSTALLATION**.
4. Position the A/C condenser into the engine compartment and install it onto the condenser mounting brackets.
5. Install the two bolts (2) that secure the A/C condenser to the right side of the radiator (1). Tighten the bolts to 5 N.m (44 in. lbs.).

NOTE: Rotate and tilt the A/C discharge line as necessary to connect it to the A/C condenser.

6. Connect the A/C discharge line (5) to the A/C condenser and install the retaining nut (4). Tighten the nut to 22.5 N.m (200 in. lbs.).
7. Reposition the right side condenser air seal.
8. If equipped with an automatic transmission, connect the transmission cooler lines to the transmission cooler portion of the A/C condenser. Refer to **INSTALLATION**.
9. Install the grille. Refer to **INSTALLATION**.

Fig. 146: A/C Liquid Line & Condenser Tube
Courtesy of CHRYSLER LLC

10. Connect the A/C liquid line (1) to the condenser tube (2) and install the secondary retaining clip. See **INSTALLATION**.
11. Install the engine air cleaner housing (refer to **AIR INTAKE SYSTEM**).
12. Reconnect the negative battery cable.
13. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
14. If the A/C condenser is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. See **STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
15. Charge the refrigerant system. See **STANDARD PROCEDURE**.

CORE-HEATER

DESCRIPTION

CORE-HEATER

618d324c

Fig. 147: Heater Core, Metal Retaining Clamps & Heater Core Tubes
Courtesy of CHRYSLER LLC

The heater core (1) is mounted into the HVAC air distribution housing, located behind the instrument panel. The heater core is a heat exchanger made of rows of tubes and fins. The heater core is secured to the air distribution housing by four plastic retaining tabs. The heater core tubes (3) are attached to the heater core by use of metal retaining clamps (2) and rubber O-ring seals.

The heater core tubes are not serviced separately from the heater core. The air distribution housing must be removed from the vehicle to service the heater core.

OPERATION

CORE-HEATER

Engine coolant is circulated through the heater hoses to the heater core at all times. As the coolant flows through the heater core, heat is removed from the engine and is transferred to the heater core tubes and fins. Air directed through the heater core picks up the heat from the heater core fins. The blend-air door allows control of the heater output air temperature by regulating the amount of air flowing through the heater core. The blower motor speed controls the volume of air flowing through the HVAC housing.

The heater core cannot be repaired and it must be replaced if inoperative, leaking or damaged.

REMOVAL

CORE-HEATER

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental

airbag deployment and possible personal injury or death.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See WARNING and CAUTION. Failure to follow the warnings and cautions could result in possible personal injury or death.

WARNING: The heater core tubes are not serviced separately from the heater core. The heater core tubes should not be repositioned, loosened or removed from the heater core. Failure to follow this warning could result in a coolant leak and possible personal injury or death.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 148: Air Distribution Housing Assembly
Courtesy of CHRYSLER LLC

1. Remove the HVAC housing assembly and place it on a workbench. See REMOVAL.
2. Remove the air distribution housing from the HVAC housing. See REMOVAL.
3. Remove the two screws (1) that secure the upper front passenger side floor duct (7) to the passenger side of the air distribution housing (8) and remove the duct.

NOTE: If the foam seal for the heater core tube flange is deformed or damaged, it must be replaced.

4. Carefully remove the foam seal (4) from the heater core tube flange (5). If the seal is deformed or damaged, it must be replaced.
5. Remove the screw (2) that secures the heater core tube flange to the air distribution housing.
6. Disengage the plastic retainer (5) from around the heater core tubes (6) and remove the flange.

618c6358

Fig. 149: Plastic Retaining Tabs, Heater Core & Air Distribution Housing
Courtesy of CHRYSLER LLC

NOTE: If the foam insulator around the heater core is deformed or damaged, the insulator must be replaced.

7. Disengage the four plastic retaining tabs (1) that secure the heater core (2) to the passenger side of the air distribution housing (3) and carefully remove the heater core from the housing.

INSTALLATION

CORE-HEATER

WARNING: The heater core tubes are not serviced separately from the heater core. The heater core tubes should not be repositioned, loosened or removed from the heater core. Failure to follow this warning could result in a coolant leak and possible personal injury or death.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 150: Plastic Retaining Tabs, Heater Core & Air Distribution Housing
 Courtesy of CHRYSLER LLC

NOTE: If the foam insulator around the heater core is deformed or damaged, the insulator must be replaced.

1. Carefully install the heater core (2) into the passenger side of the air distribution housing (3) and engage the four plastic retainer tabs (1) that secure the heater core to the housing. Make sure the retaining tabs are fully engaged.

Fig. 151: Air Distribution Housing Assembly
 Courtesy of CHRYSLER LLC

2. Position the heater core tube flange (4) over the heater core tubes (6) and onto the to the passenger side of the air distribution housing (8).
3. Engage the plastic retainer (5) around the heater core tubes. Make sure the retainer is fully engaged around the tubes.
4. Install the screw (2) that secure the heater core tube flange to the air distribution housing. Tighten the

screws to 1.2 N.m (10 in lbs.).

5. Install the upper front passenger side floor duct (7) onto the air distribution housing and install the two retaining screws (1). Tighten the screws to 1.2 N.m (10 in lbs.).

NOTE: If the foam seal for the heater core tube flange is deformed or damaged, it must be replaced.

6. Install the foam seal (3) onto the heater core tube flange.
7. Install the air distribution housing onto the HVAC housing. See INSTALLATION.

NOTE: If the heater core is being replaced, flush the cooling system. Refer to STANDARD PROCEDURE .

8. Install the HVAC housing assembly. See INSTALLATION.

CORE-VALVE-SERVICE PORT

DESCRIPTION

CORE-VALVE-SERVICE PORT

Fig. 152: Low-Side Service Port, A/C Suction Line, High-Side Service Port & A/C Liquid Line
Courtesy of CHRYSLER LLC

NOTE: 3.7L LHD model shown in illustration. 2.8L, 4.0L and RHD models similar.

Refrigerant system service ports are used to recover, recycle, evacuate, charge and test the A/C refrigerant system. Unique sizes are used on the two service ports for the R-134a refrigerant system to ensure the system is not accidentally contaminated with R-12 refrigerant or by service equipment used for R-12 refrigerant.

The low-side service port (1) is located on the A/C suction line (2) at either the rear of the engine compartment or near the A/C compressor, depending on engine and market. The high-side service port (3) is located on the

A/C liquid line (4) near the front of the engine compartment. Both the high-side and low-side A/C service port valve cores are serviceable.

NOTE: The protective cap aids in sealing the service port and helps to protect the refrigerant system from contamination. Remember to always reinstall the protective caps onto the service ports when refrigerant system service is complete.

Each of the service ports has a threaded plastic protective cap installed over it from the factory. The service port caps are serviceable items.

REMOVAL

CORE-VALVE-SERVICE PORT

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See WARNING and CAUTION. Failure to follow the warnings and cautions may result in serious or fatal injury.

8126e644

Fig. 153: Identifying A/C Service Port Components

Courtesy of CHRYSLER LLC

NOTE: Typical A/C service port shown in graphic.

1. Remove the protective cap (1) from the service port (2).
2. Recover the refrigerant from the refrigerant system. See **STANDARD PROCEDURE**.
3. Using a Schrader-type valve core tool, remove the valve core (3) from the service port.
4. Install a plug in, or tape over the opened service port(s).

INSTALLATION

CORE-VALVE-SERVICE PORT

Fig. 154: Identifying A/C Service Port Components
Courtesy of CHRYSLER LLC

NOTE: Typical A/C service port shown in graphic.

1. Lubricate the valve core (3) with clean refrigerant oil prior to installation. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Remove the tape or plug from the service port (2).

CAUTION: A valve core that is not fully seated in the A/C service port can result in damage to the valve during refrigerant system evacuation and charge. Such damage may result in a loss of system refrigerant while uncoupling the charge adapters.

3. Using a Schrader-type valve core tool, install and tighten the valve core into the service port(s).
4. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.

5. Charge the refrigerant system. See **STANDARD PROCEDURE**.

NOTE: The protective cap helps aid in service port sealing and helps protect the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.

6. Install the protective cap (1) onto the service port.

COUPLER-REFRIGERANT LINE

DESCRIPTION

COUPLER- REFRIGERANT LINE

Fig. 155: A/C Liquid Line, A/C Condenser Outlet Tube & Spring-Lock Type Refrigerant Line Coupler
Courtesy of CHRYSLER LLC

The A/C liquid line (1) is attached to the A/C condenser outlet tube (2) by use of a spring-lock type refrigerant line coupler (3). A secondary retaining clip is installed over the connected coupler for added protection.

The spring-lock refrigerant line coupler requires a special disconnect tool for disengaging the two coupler halves.

OPERATION

COUPLER- REFRIGERANT LINE

80a7e303

Fig. 156: Identifying Spring-Lock Type Refrigerant Line Coupler
 Courtesy of CHRYSLER LLC

The spring-lock type refrigerant line coupler is held together by a garter spring (6) inside a circular cage (7) on the male half of the fitting (1). When the two coupler halves are connected, the flared end of the female fitting (2) slips behind the garter spring inside the cage on the male fitting. The garter spring and cage prevent the flared end of the female fitting from pulling out of the cage. Some applications use a connection indicator ring (4) to help indicate when the two coupler halves are fully connected.

O-rings (8) are used to seal the coupler connections. These O-rings are compatible with R-134a refrigerant and must be replaced with O-rings made of the same material.

A secondary retaining clip (3) is installed over the connected coupler (5) for added protection.

REMOVAL

COUPLER- REFRIGERANT LINE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

J9324-5

Fig. 157: Disconnecting Spring-Lock Type Refrigerant Line Coupler
 Courtesy of CHRYSLER LLC

1. Recover the refrigerant from the refrigerant system. See **STANDARD PROCEDURE**.
2. Remove the secondary retaining clip from the spring-lock type refrigerant line coupler.
3. Fit the proper size A/C line disconnect tool (Special Tool Kit 7193 or equivalent) over the coupler cage (1).
4. Close the two halves of the A/C line disconnect tool around the coupler (2).

NOTE: The garter spring may not release if the A/C line disconnect tool is cocked while pushing it into the coupler cage opening.

5. Push the A/C line disconnect tool into the open side of the coupler cage to expand the garter spring (3). Once the garter spring is expanded, pull on the refrigerant line attached to the female half of the coupler until the flange on the female fitting is separated from the garter spring and cage on the male fitting.
6. Open and remove the A/C line disconnect tool from the refrigerant line coupler (4).

INSTALLATION

COUPLER- REFRIGERANT LINE

Fig. 158: Identifying Spring-Lock Type Refrigerant Line Coupler
 Courtesy of CHRYSLER LLC

1. Clean any dirt or foreign material from the spring-lock type refrigerant line coupler.
2. Check to make sure that the garter spring (6) is located within the cage (7) of the male half of the refrigerant line coupler (1), and that the garter spring is not damaged.
 - If the garter spring is missing, install a new spring by pushing it into the coupler cage opening.
 - If the garter spring is damaged, remove it from the coupler cage with a small hook (DO NOT use a screwdriver) and install a new garter spring.

CAUTION: Use only the specified O-rings as they are made of a special material for the R-134a system. The use of any other O-rings may allow the

connection to leak.

3. Install new O-rings (8) on the male half of the refrigerant line coupler.
4. Lubricate the O-rings, and the inside of the female half of the refrigerant line coupler (2) with clean R-134a refrigerant oil. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
5. Position the female half of the coupler over the male half of the coupler.
6. Push together firmly on the two halves of the refrigerant line coupler until the garter spring in the cage on the male half of the coupler snaps over the flanged end on the female half of the coupler.
7. Make sure that the refrigerant line coupler is fully engaged by firmly pulling the refrigerant lines away from each other on both sides of the coupler.
8. Install the secondary retaining clip (3) over connected coupler cage (5).
9. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
10. Charge the refrigerant system. See **STANDARD PROCEDURE**.

EVAPORATOR-A/C

DESCRIPTION

EVAPORATOR-A/C

818dac10

Fig. 159: A/C Evaporator Assembly
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

The A/C evaporator (1) and its insulator (2) for the heating-A/C system is located within the HVAC housing, behind the instrument panel. The A/C evaporator is positioned in the HVAC housing so that all air entering the housing must pass over the evaporator fins before it is distributed through the heater core and heating-A/C system ducts and outlets. However, air passing over the evaporator fins will only be conditioned when the A/C compressor is engaged and circulating refrigerant through the A/C evaporator.

The A/C evaporator tubes (3) are connected and sealed to the A/C expansion valve by use of rubber O-rings (4) and a tapping block (5).

The A/C evaporator can only be serviced by removing and disassembling the HVAC housing.

OPERATION

EVAPORATOR-A/C

Refrigerant enters the A/C evaporator from the A/C expansion valve as a low-temperature, low-pressure mixture of liquid and gas. As air flows over the fins of the A/C evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas when it leaves the A/C evaporator.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line or expansion valve is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C evaporator has no serviceable parts except for the O-ring seals. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever the A/C expansion valve is removed from the A/C evaporator.

The A/C evaporator cannot be repaired and must be replaced if leaking or damaged.

REMOVAL

EVAPORATOR-A/C

Fig. 160: A/C Evaporator, Foam Insulator, HVAC Housing, Rubber Seal & Tapping Block
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Remove the HVAC housing assembly and place it on a workbench. See **REMOVAL**.
2. Disassemble the HVAC housing. See **DISASSEMBLY**.

NOTE: If the foam insulator around the A/C evaporator is deformed or damaged, the insulator must be replaced.

3. Carefully lift the A/C evaporator (1) and the foam insulator (2) out of the lower half of the HVAC housing (3).

NOTE: If the rubber seal around the evaporator tubes and tapping block is deformed or damaged, the seal must be replaced.

4. If required, remove the rubber seal (4) from around the evaporator tubes and tapping block (5).

INSTALLATION

EVAPORATOR-A/C

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See **STANDARD PROCEDURE**. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** chart to determine how much oil should be added to the refrigerant system. See **STANDARD PROCEDURE**.

NOTE: If only the A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 161: A/C Evaporator, Foam Insulator, HVAC Housing, Rubber Seal & Tapping Block
 Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

NOTE: Make sure the rubber seal for the evaporator tubes and tapping block is properly positioned in the HVAC housing opening.

1. If removed, install the rubber seal (4) over the evaporator tubes and tapping block (5).

NOTE: Make sure that the foam insulator around the A/C evaporator is properly positioned within the HVAC housing.

2. Carefully install the A/C evaporator (1) and foam insulator (2) into the lower half of the HVAC housing (3).
3. Assemble the HVAC housing. See **ASSEMBLY**.
4. Install the HVAC housing assembly. See **INSTALLATION**.
5. If the A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. See **STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

LINE-A/C DISCHARGE

DESCRIPTION

LINE-A/C DISCHARGE

Fig. 162: A/C Discharge Line, Metal Gaskets & Rubber O-Ring Seals
Courtesy of CHRYSLER LLC

NOTE: 4.0L LHD model shown in illustration. Other models similar.

The A/C discharge line (1) is the refrigerant line that carries refrigerant from the A/C compressor to the A/C condenser.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C discharge line has no serviceable parts except for the metal gaskets (2) and rubber O-ring seals (3). The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever the A/C discharge line is removed and installed.

The A/C discharge line cannot be repaired and must be replaced if leaking or damaged.

REMOVAL

2.8L ENGINE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

CAUTION: Before removing the A/C discharge line, note the location of the right side condenser air seal. This air seal is to direct air through the A/C condenser and radiator. The air seals must be reinstalled in its proper location in order for the A/C and engine cooling systems to perform as designed.

NOTE: LHD model shown in illustrations. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **STANDARD PROCEDURE**.
3. Remove the air cleaner housing.
4. Remove the air inlet tube from the throttle body and position it out of the way.
5. Remove the battery for clearance. Refer to **REMOVAL** .
6. Remove the nut (5) that secures the A/C discharge line (1) to the A/C compressor (3).
7. Disconnect the A/C discharge line from the A/C compressor and remove and discard the O-ring seal and gasket.
8. Disengage the A/C discharge line from the plastic retaining clip located on the right side of the fan shroud.

Fig. 164: Removing/Installing Nut That Secures A/C Discharge Line To A/C Condenser
Courtesy of CHRYSLER LLC

9. Remove the grille. Refer to **REMOVAL** .
10. Position the right side condenser air seal out of the way to gain access to the discharge line fitting.
11. Remove the nut (3) that secures the A/C discharge line (1) to the A/C condenser (2).

NOTE: Rotate and tilt the A/C discharge line as necessary to disconnect it from the A/C condenser.

12. Disconnect the A/C discharge line from the condenser and remove and discard the O-ring seal and gasket.
13. Remove the A/C discharge line from the engine compartment and install plugs in, or tape over the opened discharge line fittings and the compressor and condenser ports.

3.7L ENGINE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

Fig. 165: Removing/Installing Nuts That Secure A/C Suction Line And A/C Discharge Line To A/C Compressor

7. Remove the nut (4) that secures the A/C discharge line (5) to the A/C condenser (3).
8. Remove the bolt (2) that secures the A/C condenser to the right side of the radiator (1).
9. For clearance, position the A/C condenser toward the left side of the vehicle and then disconnect the A/C

discharge line from the condenser.

10. Remove and discard the O-ring seal and gasket from the discharge line fitting.
11. Remove the A/C discharge line from the engine compartment and install plugs in, or tape over the opened discharge line fittings and the compressor and condenser ports.

INSTALLATION

2.8L ENGINE

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** chart to determine how much oil should be added to the refrigerant system. See STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 169: Removing/Installing Nut That Secures A/C Discharge Line To A/C Condenser
Courtesy of CHRYSLER LLC

1. Remove the tape or plugs from the opened discharge line fittings and compressor and condenser ports.
2. Lubricate new rubber O-ring seals with clean refrigerant oil and install them and new gaskets onto the discharge line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Rotate and tilt the A/C discharge line as necessary to connect it from the A/C condenser.

3. Position the A/C discharge line (1) into the engine compartment and connect it to the A/C condenser (2).
4. Install the nut (3) that secures the A/C discharge line to the A/C condenser. Tighten the nut to 22.5 N.m (200 in. lbs.).
5. Engage the A/C discharge line into the plastic retaining clip located on the right side of the fan shroud.
6. Install the grille. Refer to **INSTALLATION**.

LINE-A/C LIQUID

DESCRIPTION

LINE-A/C LIQUID

Fig. 175: A/C Liquid Line, High-Side Service Port, A/C Pressure Transducer & Condenser Outlet Tube Connection

Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

The A/C liquid line (1) is the refrigerant line that carries refrigerant from the A/C condenser to the A/C expansion valve. The A/C liquid line contains the high-side service port (2), a fitting for the A/C pressure transducer (3) and uses a spring lock coupler at the condenser outlet tube connection (4). On LHD models, the A/C liquid line is serviced only as an assembly. On RHD models, the A/C liquid line is serviced in two sections and uses a spring lock coupler to connect the two sections together.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C liquid line has no serviceable parts except for the rubber O-ring seals, high-side service port valve and its protective cap and the plastic retainer clips. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever the A/C liquid line is removed and installed.

The A/C liquid line cannot be repaired and must be replaced if leaking or damaged.

REMOVAL

LHD MODEL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

Fig. 176: Removing/Installing LHD Liquid Line
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **STANDARD PROCEDURE**.
3. Remove the air cleaner housing (refer to **REMOVAL**).
4. Disconnect the wire harness connector from the A/C pressure transducer (1) located on the A/C liquid line (5) near the A/C expansion valve (3) and if required, remove the A/C pressure transducer from the A/C liquid line. See **REMOVAL**.
5. Remove the nut (2) that secures the A/C suction line (1) and the A/C liquid line (4) to the A/C expansion valve (3) and disconnect the lines from the valve.
6. Separate the A/C liquid line from the A/C suction line and disengage the A/C liquid line from the two retaining clips (6) located on the right inner fender.

Fig. 177: A/C Liquid Line & Condenser Tube
Courtesy of CHRYSLER LLC

7. Remove the secondary retaining clip and using the proper A/C line disconnect tool (Special Tool Kit 7193 or equivalent), disconnect the A/C liquid line (1) from the condenser tube (2). See **REMOVAL**.
8. Remove the A/C liquid line from the engine compartment and remove and discard the O-ring seals and install plugs in, or tape over the opened refrigerant line fittings and the condenser and expansion valve ports.

RHD MODEL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

FRONT SECTION

Fig. 178: A/C Liquid Line & Condenser Tube

5. Disengage the front section of the A/C liquid line (4) from the two retaining clips (1) located on the right inner fender.
6. Remove the secondary retaining clip (2) and using the proper A/C line disconnect tool, disconnect the front section of the A/C liquid line from the rear section of the A/C liquid line (3). See **REMOVAL**.
7. Remove the front section of the A/C liquid line from the engine compartment and remove and discard the O-ring seals and install plugs in, or tape over the opened refrigerant line fittings and the condenser tube.

REAR SECTION

Fig. 180: Removing/Installing RHD Liquid Lines - Rear Section
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **STANDARD PROCEDURE**.
3. Remove the air cleaner housing (refer to **REMOVAL**).
4. Remove the two nuts that secure the engine coolant reservoir to the dash panel and position the reservoir out of the way.
5. Disconnect the wire harness connector from the A/C pressure transducer (6) located on the rear section of the A/C liquid line (8) near the A/C expansion valve (4) and if required, remove the A/C pressure transducer from the A/C liquid line. See **REMOVAL**.
6. Remove the nut (5) that secures the A/C suction line (7) and the rear section of the A/C liquid line to the A/C expansion valve and disconnect the lines from the valve.
7. Disengage the A/C liquid line from the retaining clips (3) located on the dash panel and the brake lines near the brake booster.
8. Separate the A/C liquid line from the A/C suction line and disengage the A/C liquid line from the two retaining clips (1) located on the right inner fender.
9. Remove the secondary retaining clip (2) and using the proper A/C line disconnect tool (Special Tool Kit 7193 or equivalent), disconnect the rear section of the A/C liquid line from the front section of the liquid line (9). See **REMOVAL**.
10. Remove the rear section of the A/C liquid line from out of the right side of the engine compartment and remove and discard the O-ring seals and install plugs in, or tape over the opened refrigerant line fittings and the expansion valve ports.

INSTALLATION

LHD MODELS

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See **STANDARD PROCEDURE**. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating

as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** chart to determine how much oil should be added to the refrigerant system. See **STANDARD PROCEDURE**.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 181: A/C Liquid Line & Condenser Tube

Courtesy of CHRYSLER LLC

5. Connect the front section of the A/C liquid line (4) to the rear section of the A/C liquid line (3) and install

the secondary retaining clip (2). See **INSTALLATION**.

6. Engage the A/C liquid line to the two retaining clips (1) located on the right inner fender.
7. Install the air cleaner housing (refer to **INSTALLATION**).
8. Reconnect the negative battery cable.
9. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
10. Charge the refrigerant system. See **STANDARD PROCEDURE**.

REAR SECTION

Fig. 185: Removing/Installing RHD Liquid Lines - Rear Section
Courtesy of CHRYSLER LLC

1. Remove the tape or plugs from the opened refrigerant line fittings and the expansion valve ports.
2. Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Position the rear section of the A/C liquid line (8) into the engine compartment from the right side of the vehicle. Be sure to route the liquid line behind the diesel engine fuel filter.
4. Connect the rear section of the A/C liquid line (8) to the A/C suction line (7).
5. Connect the A/C liquid and suction lines to the A/C expansion valve (4) and install the retaining nut (5). Tighten the nut to 23 N.m (17 ft. lbs.).
6. If removed, install the A/C pressure transducer (6) onto A/C liquid line and connect the wire harness connector to the transducer. See **INSTALLATION**.
7. Engage the A/C liquid line to the retaining clips (3) located on the dash panel and the brake lines near the brake booster.
8. Connect the front section of the A/C liquid line (9) to the rear section of the A/C liquid line and install the secondary retaining clip (2). See **INSTALLATION**.
9. Engage the A/C liquid line to the two retaining clips (1) located on the right inner fender.
10. Reposition the engine coolant reservoir to the dash panel and install the two retaining nuts. Tighten the nuts securely.

11. Install the air cleaner housing (refer to **INSTALLATION**).
12. Reconnect the negative battery cable.
13. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
14. Adjust the refrigerant oil level. See **STANDARD PROCEDURE**.
15. Charge the refrigerant system. See **STANDARD PROCEDURE**.

LINE-A/C SUCTION

DESCRIPTION

LINE-A/C SUCTION

Fig. 186: A/C Suction Line, Tapping Plate, Low-Side Service Port & Heat Shield
Courtesy of CHRYSLER LLC

NOTE: **4.0L engine shown in illustration. Other engines similar.**

The A/C suction line (1) is the refrigerant line that carries refrigerant from the A/C evaporator to the A/C compressor. The A/C suction line is secured to the A/C expansion valve by a tapping plate (2) and contains the low-side service port (3) and a heat shield (4), depending on engine application.

NOTE: **Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.**

The A/C suction line has no serviceable parts except for the rubber O-ring seals, metal gasket and the low-side service port valve and its protective cap. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gasket must be replaced whenever the A/C suction line is removed and installed.

The A/C suction line cannot be repaired and must be replaced if leaking or damaged.

REMOVAL

2.8L LHD ENGINE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See WARNING and CAUTION. Failure to follow the warnings and cautions could result in possible personal injury or death.

Fig. 187: Refrigerant Line System

Courtesy of CHRYSLER LLC

6. Remove the nut (2) that secures the A/C suction line (1) and the A/C liquid line (4) to the A/C expansion valve (3) and disconnect the lines from the valve.
7. Separate the A/C liquid line from the A/C suction line and remove the suction line from the engine compartment.
8. Install plugs in, or tape over the opened refrigerant line fittings and the compressor and expansion valve ports.

INSTALLATION

2.8L LHD ENGINE

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. See STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 195: A/C Suction Line, Nut, A/C Expansion Valve & A/C Liquid Line

OIL-A/C REFRIGERANT

DESCRIPTION

OIL-A/C REFRIGERANT

The refrigerant oil used in R-134a refrigerant systems is a synthetic-based, PolyAlkylene Glycol (PAG), wax-free lubricant. Mineral-based R-12 refrigerant oils are not compatible with PAG oils, and should never be introduced to an R-134a refrigerant system.

There are different PAG oils available, and each contains a different additive package. Use **only** refrigerant oil of the same type as recommended to service the refrigerant system (**always refer to the specification tag**

included with the replacement A/C compressor or the A/C Underhood Specification Label located in the engine compartment).

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. See STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level can prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

The A/C compressors used in this vehicle are designed to use VC-46 PAG refrigerant oil. Use only this type of refrigerant oil when servicing the A/C compressor.

OPERATION

OIL-A/C REFRIGERANT

After performing any refrigerant recovery or recycling operation, always replenish the refrigerant system with the same amount of the recommended refrigerant oil as was removed. Too little refrigerant oil can cause A/C compressor damage, and too much can reduce A/C system performance.

PAG refrigerant oil is more hygroscopic than mineral oil, and will absorb any moisture it comes into contact with, even moisture in the air. The PAG oil container should always be kept tightly capped until it is ready to be used. After use, recap the oil container immediately to prevent moisture contamination.

STANDARD PROCEDURE

REFRIGERANT OIL LEVEL

When an A/C system is assembled at the factory, all components except the A/C compressor are refrigerant oil free. After the refrigerant system has been charged and operated, the refrigerant oil in the A/C compressor is dispersed throughout the refrigerant system. The A/C accumulator, A/C evaporator, A/C condenser and the A/C compressor will each retain a significant amount of the needed refrigerant oil.

It is important to have the correct amount of refrigerant oil in the A/C system. This ensures proper lubrication of the A/C compressor. Too little oil will result in damage to the A/C compressor, while too much oil will reduce the cooling capacity of the A/C system and consequently result in higher discharge air temperatures.

CAUTION: The A/C compressors in this vehicle are designed to use VC-46 PAG refrigerant oil. Use only VC-46 PAG refrigerant oil or severe damage to the A/C system may occur. Always refer to the A/C Underhood Specification Label for correct oil designation. The oil container should be kept tightly capped until it is ready for use and then tightly capped after use to prevent contamination from dirt and moisture. Refrigerant oil will quickly absorb any moisture it comes in contact with, therefore, special effort must be used to keep all R-134a system components moisture-free. Moisture in the refrigerant oil is very difficult to remove and will cause a reliability problem with the A/C compressor.

NOTE: Most reclaim/recycling equipment will measure the lubricant being removed during recovery. This amount of lubricant should be added back into the system. Refer to the reclaim/recycling equipment manufacturers instructions.

It will not be necessary to check the oil level in the A/C compressor or to add oil, unless there has been an oil loss. An oil loss may occur due to component replacement, or a rupture or leak from a refrigerant line, connector fitting, component or component seal. If a leak occurs, add 30 milliliters (1 fluid ounce) of the recommended refrigerant oil to the refrigerant system after the repair has been made. Refrigerant oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

Refrigerant oil must be added when an A/C condenser, A/C evaporator or A/C receiver/drier is replaced. See the REFRIGERANT OIL CAPACITIES chart.

The refrigerant oil level in a new A/C compressor must first be adjusted prior to compressor installation. Refer to **COMPRESSOR OIL DRAIN PROCEDURE**.

REFRIGERANT OIL CAPACITIES

Component	ml	oz.
Total System Fill	150	5
A/C Condenser	30	1
A/C Evaporator	60	2
A/C Receiver/drier	30	1
A/C Compressor	Drain and measure the oil from the old compressor. Refer to <u>COMPRESSOR OIL DRAIN PROCEDURE</u> .	

COMPRESSOR OIL DRAIN PROCEDURE

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. Failure to properly drain and measure the refrigerant oil from the A/C compressor can prevent the A/C system from operating as designed and cause serious compressor damage.

The A/C compressor is filled with refrigerant oil from the factory. Use the following procedure to drain and measure refrigerant oil from the A/C compressor.

1. Drain all of the refrigerant oil from the old A/C compressor into a clean measured container.
2. Drain all of the refrigerant oil from the new A/C compressor into a clean measured container.
3. Refill the new A/C compressor with the same amount of refrigerant oil that was drained out of the old compressor. Use only clean refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Install the new A/C compressor onto the engine. See **INSTALLATION**.

RECEIVER/DRIER-A/C

DESCRIPTION

RECEIVER/DRIER-A/C

Fig. 203: A/C Receiver/Drier, Left Side A/C Condenser & Bolt
Courtesy of CHRYSLER LLC

The A/C receiver/drier (1) stores unnecessary refrigerant, filters the refrigerant, helps remove moisture from the refrigerant and retains any refrigerant vapor that may leave the A/C condenser (2) until it becomes a liquid. The A/C receiver/drier is installed on the high-side of the A/C system and is connected directly to the left end of the A/C condenser by a bolt (3). The A/C receiver/drier can be serviced separately from the A/C condenser.

OPERATION

RECEIVER/DRIER-A/C

The A/C receiver/drier performs a filtering action to prevent foreign material in the refrigerant from contaminating the A/C expansion valve. Refrigerant enters the A/C receiver/drier as a high-pressure, low temperature liquid. Desiccant inside the A/C receiver/drier absorbs any moisture which may have entered and become trapped within the refrigerant system. In addition, during periods of high demand operation of the A/C system, the A/C receiver/drier acts as a reservoir to store surplus refrigerant.

NOTE: **Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.**

The A/C receiver/drier has no serviceable parts except for the O-ring seals, gaskets and the high side service port valve and cap. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever the A/C receiver/drier is removed.

The A/C receiver/drier cannot be repaired and must be replaced if leaking or damaged, or if an internal failure of the A/C compressor has occurred.

REMOVAL

RECEIVER/DRIER-A/C

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See WARNING and CAUTION. Failure to follow the warnings and cautions could result in possible personal injury or death.

Fig. 204: A/C Receiver/Drier, Left Side A/C Condenser & Bolt
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with A/C condenser removed from vehicle for clarity.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See STANDARD PROCEDURE.
3. Remove the grille. Refer to REMOVAL.
4. Remove the air seal from the left side of the cooling module assembly.
5. Reach through the opening at the bottom of the front fascia and remove the bolt (3) that secures the A/C receiver/drier (1) to the left side A/C condenser (3).
6. Disconnect the A/C receiver/drier from the A/C condenser and remove and discard the O-ring seals.
7. Install plugs in, or tape over the opened receiver/drier fittings and the condenser ports.

INSTALLATION

RECEIVER/DRIER-A/C

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The receiver/drier must be replaced if an internal failure of the A/C

compressor has occurred. Failure to replace the receiver/drier can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** chart to determine how much oil should be added to the refrigerant system. See **STANDARD PROCEDURE**.

NOTE: If only the receiver/drier is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only the refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 205: A/C Receiver/Drier, Left Side A/C Condenser & Bolt
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with A/C condenser removed from vehicle for clarity.

1. Remove the tape or plugs from the receiver/drier fittings and the condenser ports.
2. Lubricate new O-ring seals with clean refrigerant oil and install them onto the receiver/drier fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Connect the A/C receiver/drier (1) to the left end of the A/C condenser (2).
4. Install the bolt (3) that secures the A/C receiver/drier to the A/C condenser. Tighten the bolt to 22 N.m (16 ft. lbs.).
5. Install the air seal onto the left side of the cooling module assembly.
6. Install the grille. Refer to **INSTALLATION**.
7. Reconnect the negative battery cable.

- 8. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
- 9. If the A/C receiver/drier is being replaced, add 30 milliliters (1.0 fluid ounce) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. See **STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
- 10. Charge the refrigerant system. See **STANDARD PROCEDURE**.

REFRIGERANT-A/C

DESCRIPTION

REFRIGERANT-A/C

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear, and colorless liquefied gas.

Even though R-134a does not contain chlorine, it must be reclaimed and recycled just like CFC-type refrigerants. This is because R-134a is a greenhouse gas and can contribute to global warming. See **STANDARD PROCEDURE**.

OPERATION

REFRIGERANT-A/C

R-134a refrigerant is not compatible with R-12 refrigerant in an A/C system. Even a small amount of R-12 refrigerant added to an R-134a refrigerant system will cause A/C compressor failure, refrigerant oil sludge or poor A/C system performance. In addition, the polyalkylene glycol (PAG) synthetic refrigerant oils used in an R-134a refrigerant system are not compatible with the mineral-based refrigerant oils used in an R-12 refrigerant system.

R-134a refrigerant system service ports, service tool couplers and refrigerant dispensing bottles have all been designed with unique fittings to ensure that an R-134a refrigerant system is not accidentally contaminated with the wrong refrigerant (R-12). There are also labels posted in the engine compartment of the vehicle and on the A/C compressor to identify that the A/C system is equipped with R-134a refrigerant.

STANDARD PROCEDURE

REFRIGERANT CHARGE LEVEL

All models	0.510 kg (1.12 lbs.)
------------	----------------------

VALVE-A/C EXPANSION

DESCRIPTION

VALVE-A/C EXPANSION

Fig. 206: A/C EXPANSION VALVE
Courtesy of CHRYSLER LLC

The A/C expansion valve controls the amount of refrigerant entering the A/C evaporator. The A/C expansion valve is of a thermostatic expansion valve (TXV) design and consists of an aluminum H-valve type body (1) with an inlet port (2), outlet port (3) and an integral thermal sensor (4).

The A/C expansion valve is located between the A/C refrigerant lines and the A/C evaporator in the engine compartment.

OPERATION

VALVE-A/C EXPANSION

The A/C expansion valve controls the high-pressure, low temperature liquid refrigerant from the A/C liquid line and converts it into a low-pressure, low-temperature mixture of liquid and gas before it enters the A/C evaporator. A mechanical sensor in the A/C expansion valve monitors the temperature and pressure of the refrigerant leaving the A/C evaporator through the A/C suction line, and adjusts the orifice size at the liquid line port to let the proper amount of refrigerant into the evaporator to meet the vehicle A/C cooling requirements. Controlling the refrigerant flow through the A/C evaporator ensures that none of the refrigerant leaving the A/C evaporator is still in a liquid state, which could damage the A/C compressor.

NOTE: **Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is disconnected from the expansion valve. Failure to replace the rubber O-ring seals could result in a refrigerant system leak.**

The A/C expansion valve is factory calibrated and cannot be adjusted or repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING

VALVE-A/C EXPANSION

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See WARNING and CAUTION. Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The A/C expansion valve should only be tested following testing of the A/C compressor.

NOTE: Liquid CO₂ is required to test the A/C expansion valve. This material is available from most welding supply facilities. Liquid CO₂ is also available from companies which service and sell fire extinguishers.

When testing the A/C expansion valve, the work area and the vehicle temperature must be 21° to 27° C (70° to 85° F). To test the expansion valve:

1. Connect a charging station or manifold gauge set to the refrigerant system service ports. Verify the refrigerant charge level.
2. Close all doors, windows and vents to the passenger compartment.
3. Set the A/C-heater controls so that the A/C compressor is operating, the temperature control is in the highest temperature position, the mode-air doors is directing air output to the floor and the blower motor operating is operating at the highest speed.
4. Start the engine and allow it to idle. After the engine has reached normal operating temperature, allow the passenger compartment to heat up. This will create the need for maximum refrigerant flow into the A/C evaporator.
5. If the refrigerant charge is sufficient, the discharge (high pressure) gauge should read 827 kPa to 1655 kPa (120 psi to 240 psi). The suction (low pressure) gauge should read 207 kPa to 345 kPa (30 psi to 50 psi). If OK, go to step 6. If not OK, replace the inoperative A/C expansion valve.

WARNING: Protect the skin and eyes from exposure to liquid CO₂ or personal injury can result.

6. If the suction (low pressure) gauge reads within the specified range, freeze the A/C expansion valve for 30 seconds using liquid CO₂ or another suitable super-cold material.**Do not spray R-134a or R-12 refrigerant on the A/C expansion valve for this test.** The suction (low pressure) gauge reading should drop by 69 kPa (10 psi). If OK, go to step 7. If not OK, replace the inoperative A/C expansion valve.
7. Allow the expansion valve control head to thaw. The suction (low pressure) gauge reading should stabilize at 207 kPa to 345 kPa (30 psi to 50 psi). If not OK, replace the inoperative A/C expansion valve.
8. When expansion valve testing is complete, test the overall A/C system performance. See DIAGNOSIS AND TESTING.

REMOVAL

VALVE-A/C EXPANSION

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See WARNING and CAUTION. Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 207: A/C Suction Line, Nut, A/C Expansion Valve & A/C Liquid Line
Courtesy of CHRYSLER LLC

1. Recover the refrigerant from the refrigerant system. See STANDARD PROCEDURE.
2. Disconnect and isolate the negative battery cable.
3. Remove the nut (2) that secures the A/C suction line (1) and the A/C liquid line (4) to the A/C expansion valve (3).
4. Disconnect the A/C suction and liquid lines from the A/C expansion valve, remove and discard the O-ring seals and position the refrigerant lines out of the way.

Fig. 208: Bolts, A/C Expansion Valve & Evaporator Tube Tapping Block
Courtesy of CHRYSLER LLC

5. Remove the two bolts (1) that secure the A/C expansion valve (2) to the evaporator tube tapping block (3).
6. Remove the A/C expansion valve from the evaporator tube tapping block and remove and discard the O-ring seals.
7. Install plugs in, or tape over the opened refrigerant line and evaporator tube fittings and all expansion valve ports.

INSTALLATION

VALVE-A/C EXPANSION

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 209: Bolts, A/C Expansion Valve & Evaporator Tube Tapping Block
Courtesy of CHRYSLER LLC

1. Remove the tape or plugs from the opened refrigerant line and evaporator tube fittings and all of the expansion valve ports.
2. Lubricate new O-ring seals with clean refrigerant oil and install them onto the refrigerant line and evaporator tube fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Install the A/C expansion valve (2) onto the evaporator tube tapping block (3).
4. Install the two bolts (1) that secure the A/C expansion valve to the evaporator tube tapping block. Tighten the bolts to 11 N.m (97 in. lbs.).

Fig. 210: A/C Suction Line, Nut, A/C Expansion Valve & A/C Liquid Line
Courtesy of CHRYSLER LLC

5. Connect the A/C suction line (1) and the A/C liquid line (4) to the A/C expansion valve (3).
6. Install the nut (2) that secures the A/C suction and liquid lines to the A/C expansion valve. Tighten the nut to 23 N.m (17 ft. lbs.).
7. Reconnect the negative battery cable.
8. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
9. Recharge the refrigerant system. See **STANDARD PROCEDURE**.

HEATER-CABIN

HEATER UNIT

DESCRIPTION

HEATER UNIT

816013f0

Fig. 211: PTC Heater Unit - Description

Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

An electric positive temperature coefficient (PTC) heater unit (1) is used on vehicles when equipped with the 2.8L diesel engine. The PTC heater unit aids in passenger compartment heating by compensating for the lower engine coolant temperatures produced by the diesel engine. The PTC heater unit is mounted in the HVAC air distribution housing, downstream of the heater core and is controlled by the diesel engine control module (ECM) and the totally integrated power module (TIPM) through two relays in diesel accessory fuse/relay block located below the left front fender.

The PTC heater consists of a molded plastic mounting plate (2) with an integral wire connector receptacle (3). Concealed behind the mounting plate are four heating elements with fins (4) that transfer the heat produced by the PTC heater to the conditioned air flowing within the air distribution housing. A positioning tab (5) is molded onto the end of the heater unit to help support the heater unit inside the air distribution housing. The

PTC heater unit is connected to the vehicle electrical system through the instrument panel wire harness.

The PTC heater unit is accessed for service from underneath the instrument panel.

OPERATION

HEATER UNIT

The positive temperature coefficient (PTC) heater unit dissipates 1 kW of electrical power through 4 heating bars. The totally integrated power module (TIPM) operates the two relays for the PTC heater unit. The PTC heater unit is split into two "banks". Each bank is driven separately based on alternator load. This allows for lower in-rush current and optimum battery charging. After a bank has been turned on, another bank can only be turned on 10 seconds after the previous. On average, the PTC banks are not switched more than 25 times for each vehicle start. Electrical power output is between 900-1050 W.

The control system for the PTC heater unit is diagnosed using a scan tool. Prior to replacing a PTC heater unit, check for any diagnostic trouble codes (DTCs) related to the ECM, TIPM and heating-A/C system (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

The PTC heater unit cannot be adjusted or repaired and, if faulty or damaged it must be replaced.

DIAGNOSIS AND TESTING

HEATER UNIT

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.

NOTE: For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

Prior to replacing the positive temperature coefficient (PTC) heater unit, check for any diagnostic trouble codes (DTCs) related to the engine control module (ECM), totally integrated power module (TIPM) and the heating-A/C system and repair as necessary (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the PTC heater unit. See **REMOVAL**.
3. Using an ohmmeter, check for continuity between all of the PTC heater unit terminals. In each case there

should be continuity. If OK, repair the wire harness circuits between the PTC heater unit and the TIPM. If NOT OK, replace the PTC heater unit.

REMOVAL

HEATER UNIT

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 212: HVAC Housing Assembly
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. If equipped, remove the silencer from below the driver side of the instrument panel. Refer to **REMOVAL** .
3. Disconnect the wire harness connector from the mode door actuator (2) and the blend door actuator (6) located on the driver side of the air distribution housing. See **REMOVAL**.
4. Carefully disengage the retaining tabs (3) that secure the mode door actuator and the blend door actuator to the actuator mounting bracket (5) and remove the actuators.
5. Remove the three screws (1) that secure the actuator mounting bracket to the air distribution housing and remove the bracket.
6. Remove the screw (8) that secures the driver side front floor duct (7) to the air distribution housing and remove the duct

Fig. 213: PTC Heater Connector
 Courtesy of CHRYSLER LLC

NOTE: PTC heater shown in illustration removed from distribution housing for clarity.

NOTE: To disconnect the wire harness connector from the PTC heater, disengage the connector lock while pulling the connector away from the heater unit.

7. Disengage the wire connector lock (2) that secures the wire harness connector (1) to the positive temperature coefficient (PTC) heater unit (3) and disconnect the connector from the heater.

Fig. 214: Removing/Installing Screws That Secure PTC Heater Unit To Air Distribution Housing
 Courtesy of CHRYSLER LLC

8. Remove the two screws (1) that secure the PTC heater unit (2) to the air distribution housing (3).
9. Carefully pull the PTC heater unit straight out of the air distribution housing.

INSTALLATION

HEATER UNIT

NOTE: LHD model shown in illustration. RHD model similar.

Fig. 215: Removing/Installing Screws That Secure PTC Heater Unit To Air Distribution Housing
Courtesy of CHRYSLER LLC

1. Carefully install the positive temperature coefficient (PTC) heater unit (2) into the driver side of the air distribution housing (3). Make sure to position the two locator tabs on the end of the heater unit into the molded locator indentations on the right side of the air distribution housing.
2. Install the two screws (1) that secure the PTC heater unit to the air distribution housing. Tighten the screws to 1.2 N.m (10 in. lbs.).

Fig. 216: PTC Heater Connector - Install
Courtesy of CHRYSLER LLC

NOTE: PTC heater shown in illustration removed from distribution housing for clarity.

3. Connect the wire harness connector (1) to the PTC heater unit (3) while pushing inward on the connector lock (2). Make sure the wire harness connector and lock are fully engaged.

Fig. 217: HVAC Housing Assembly
Courtesy of CHRYSLER LLC

4. Install the driver side front floor duct (7) onto the driver side of the air distribution housing (4) and install the retaining screw (8). Tighten the screw to 1.2 N.m (10 in lbs.).
5. Position the actuator mounting bracket (5) onto the air distribution housing and install the three retaining screws (1). Tighten the screws to 1.2 N.m (10 in lbs.).
6. Position the mode door actuator (2) and the blend door actuator (6) onto the actuator mounting bracket. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the door linkage.

NOTE: If the retaining tabs on the actuator mounting bracket become broken during service, the alignment pins on the bracket bosses can be removed and screws can be used to retain the actuator to the bracket. Once the alignment pins are removed, pre-made holes can be found the center of the bosses, exactly where the pins were. This assures correct actuator alignment to the bracket. Use care not to overtighten the screws and damage the bosses.

7. Engage the retaining tabs (3) that secure the mode and blend door actuators to the actuator mounting bracket. Make sure the retaining tabs are fully engaged.
8. Connect the wire harness connector to the mode and blend door actuators.
9. If equipped, install the silencer below the driver side of the instrument panel. Refer to **INSTALLATION**.
10. Reconnect the negative battery cable.

RELAY-HEATER UNIT

DESCRIPTION

RELAY-HEATER UNIT

Fig. 218: STANDARD ISO-TYPE RELAY

Courtesy of CHRYSLER LLC

Two relays (1) are used for the electric positive temperature coefficient (PTC) heater system when equipped with the 2.8L diesel engine. The relays are International Standards Organization (ISO)-type relays. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal functions and patterns (2). The PTC relays are electromechanical devices that switch fused battery current directly to the heating elements of the PTC heater unit. The PTC relays are energized by control circuits of the totally integrated power module (TIPM).

The two PTC relays are located in the diesel accessory fuse/relay block at the right front corner of the engine compartment.

OPERATION

RELAY-HEATER UNIT

The two ISO-standard relays (1) used for the electric positive temperature coefficient (PTC) heater system are electromechanical switches that use a low current ASD power input to control the high current fused battery power output to the PTC heater unit. On each relay, the movable, common feed relay contact is held against the fixed, normally closed relay contact by spring pressure. When the electromagnetic relay coil is energized, it draws the movable common feed relay contact away from the fixed, normally closed relay contact and, holds it against the fixed, normally open relay contact. This action allows high current to flow to one or more of the heating elements of the PTC heater.

When the relay coil is de-energized, spring pressure returns the movable relay contact back against the fixed, normally closed contact point. The resistor or diode is connected in parallel with the relay coil, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of

the relay coil collapses.

The terminals for the PTC relays are connected to the vehicle electrical system through receptacles in the diesel accessory fuse/relay block. The inputs and outputs of the PTC relays include:

Terminals (30) receive battery current through a fusible link at all times.

Terminals (85) are connected to a ground circuit.

Terminals (86) are connected to control circuits of the totally integrated power module (TIPM).

Terminals (87) provide fused battery current to the PTC heating elements through the PTC relays only when the PTC relay coil is energized.

Terminals (87A) are not connected to any circuit in this application, but provide battery current output only when the PTC relay coil is de-energized.

The two PTC relays cannot be repaired and, if faulty or damaged they must be replaced. Refer to the appropriate wiring information for diagnosis and testing of the ISO-standard relays and for complete TIPM and HVAC wiring diagrams.

REMOVAL

RELAY-HEATER UNIT

Fig. 219: Cover & Diesel Accessory Fuse/Relay Block
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Open the cover (1) of the diesel accessory fuse/relay block (2) located at the right front of the engine compartment.
3. Remove the positive temperature coefficient (PTC) relays as necessary from the fuse/relay block.

INSTALLATION

RELAY-HEATER UNIT

Fig. 220: Cover & Diesel Accessory Fuse/Relay Block
Courtesy of CHRYSLER LLC

1. Position the positive temperature coefficient (PTC) relays as necessary into the proper receptacle of the diesel accessory fuse/relay block (2) located at the right front of the engine compartment.
2. Align the PTC relay terminals with the terminal cavities in the fuse/relay block and push down firmly on each relay until the terminals are fully seated.
3. Close the cover (1) of the diesel accessory fuse/relay block.
4. Reconnect the negative battery cable.

2008 HVAC

Heating & Air Conditioning - Service Information - Liberty

DESCRIPTION

HEATER AND AIR CONDITIONER SYSTEM

A manual temperature control (MTC) single zone type heating-A/C system or an automatic temperature controlled (ATC) single zone type heating-A/C system is available on this model.

To maintain the performance level of the heating, ventilation and air conditioning (HVAC) system, the engine cooling system must be properly maintained. The use of a bug screen is not recommended. Any obstructions in front of the radiator or A/C condenser will reduce the performance of the A/C and engine cooling systems.

The engine cooling system includes the radiator, thermostat, radiator hoses and the engine coolant pump. Refer to **COOLING** article for more information before opening or attempting any service to the engine cooling system.

Fig. 1: HVAC Housing Assembly
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

All vehicles are equipped with a common heater, ventilation and air conditioning (HVAC) housing assembly (1). The heating-A/C system combines A/C, heating, and ventilating capabilities in a single HVAC housing assembly mounted within the passenger compartment behind the instrument panel. The HVAC housing assembly includes:

- Mode-air doors (2)
- A/C evaporator (3)
- Recirculation door actuator (4)

Air inlet housing (5)
Recirculation-air door (6)
Blower motor (7)
Blower motor resistor (8)
Heater core (9)
Air distribution housing (10)
Blend-air door (11)
Blend door actuator (12)
Floor distribution ducts (13)
Mode door actuator (14)

NOTE: An electric positive temperature coefficient (PTC) heater is used on vehicles when equipped with the 2.8L diesel engine. The PTC heater unit compensates for the lower engine coolant temperatures produced by the diesel engine. The PTC heater unit is mounted in the HVAC air distribution housing, downstream of the heater core. See DESCRIPTION.

Based upon the mode selected, conditioned air can exit the HVAC housing through one or a combination of the three main housing outlets: defrost, panel or floor. The defrost and panel outlets are located on the top of the housing and the floor outlets are located on each side of the housing. Once the conditioned air exits the HVAC housing, it is further directed through molded plastic ducts to the outlets within the vehicle interior. These outlets and their locations are as follows:

Defroster Outlet - Dual defroster outlets are located in the center of the instrument panel top cover, near the base of the windshield.

Side Window Demister Outlets - There are two side window demister outlets, one is located at each outboard end of the instrument panel and are integral to the instrument panel air outlets.

Panel Outlets - There are four panel outlets in the instrument panel, one located near each outboard end of the instrument panel facing the rear of the vehicle and two located near the top of the instrument panel center bezel.

Front Floor Outlets - There are two front floor outlets, one located above each side of the center of the floor panel near the dash panel.

Rear Floor Outlets - There are two rear floor outlets, one located on each side of the floor console near the rear of each front seat.

OPERATION

HEATER AND AIR CONDITIONER SYSTEM

Both the manual temperature control (MTC) and the automatic temperature controlled (ATC) heating-A/C systems are blend-air type systems. In a blend-air system, a blend-air door controls the amount of conditioned air that is allowed to flow through, or around the heater core. This design allows almost immediate control of output air temperature.

Fig. 2: Blend Air System Schematic
Courtesy of CHRYSLER LLC

NOTE: **Typical blend-air type HVAC system shown in graphic.**

The heating-A/C system pulls outside (ambient) air through the fresh air intake (4) located at the cowl panel at the base of the windshield and into the air inlet housing above the heating, ventilation and air conditioning (HVAC) housing and passes through the A/C evaporator (7). Air flow is then directed either through or around the heater core (2). This is done by adjusting the position of the blend-air door (3) with the temperature control located on the A/C-heater control in the instrument panel. Air flow is then directed out the floor outlet (8), instrument panel outlet (10) or the defroster outlet (1) in various combinations by adjusting the position of the mode-air doors (9 and 11) using the mode control located on the A/C-heater control. The temperature and mode control uses electrical actuators to operate the air doors.

The velocity of the air flow out of the outlets can be adjusted with the blower speed control located on the A/C-heater control.

The fresh air intake can be shut off by pressing the Recirculation button on the A/C-heater control. This will operate the electrically actuated recirculation-air door (5), which closes off the fresh air intake. With the fresh air intake closed, the conditioned air within the vehicle is pulled back into the HVAC housing through the recirculation air intake (6).

The A/C compressor can be engaged by pressing the A/C (snowflake) button on the A/C-heater control when the mode control is set in any floor to instrument panel position. The A/C compressor will automatically engage when the mode control is set in any Mix to Defrost position. This is done to help reduce fogging of the front windows by removing humidity from the conditioned air prior to it coming into contact with the windows.

The defroster outlet receives airflow from the HVAC housing through the molded plastic defroster duct. The airflow from the defroster outlet is directed by fixed vanes in the defroster outlet grille and cannot be adjusted.

The side window demister outlets receive airflow from the HVAC housing through the defroster duct and molded plastic demister ducts which are integral to the instrument panel. The airflow from the side window demister outlets is directed by fixed vanes in the demister outlet grilles and cannot be adjusted. The demisters

direct air from the HVAC housing through the outlets located on the top corners of the instrument panel. The demisters operate when the mode control is positioned in the floor-defrost and defrost-only settings. Some air may be noticeable from the demister outlets when the mode control is in the bi-level to floor positions.

The panel outlets receive airflow from the HVAC housing through the center panel duct and the two molded plastic panel ducts, which are integral to the instrument panel. The two end ducts direct airflow to the left and right instrument panel outlets, while the center panel duct directs airflow to the two center panel outlets. Each of these outlets can be individually adjusted to direct the flow of air.

The floor outlets receive airflow from the HVAC housing through the floor distribution ducts. The front floor outlets are integral to the molded plastic floor ducts, which are secured to the sides of the HVAC housing. The floor outlets cannot be adjusted.

NOTE: It is important to keep the air intake opening clear of debris. Leaf particles and other debris that is small enough to pass through the cowl opening screen can accumulate within the HVAC housing. The closed, warm, damp and dark environment created within the housing is ideal for the growth of certain molds, mildews and other fungi. Any accumulation of decaying plant matter provides an additional food source for fungal spores, which enter the housing with the fresh intake-air. Excess debris, as well as objectionable odors created by decaying plant matter and growing fungi can be discharged into the passenger compartment during heater-A/C operation if the air intake opening is not kept clear of debris.

This A/C system uses an A/C expansion valve to meter the flow of refrigerant to the A/C evaporator. The A/C evaporator cools and dehumidifies the incoming air prior to blending it with the heated air. To maintain minimum evaporator temperatures and prevent evaporator freezing, an evaporator temperature sensor is used. The sensor is located downstream of the evaporator and supplies an evaporator temperature signal to the A/C-heater control.

DIAGNOSIS AND TESTING

A/C PERFORMANCE

The A/C system is designed to provide the passenger compartment with low temperature and low humidity air. The A/C evaporator, located in the HVAC housing is cooled to temperatures near the freezing point. As warm damp air passes over the fins of the A/C evaporator, the air transfers its heat to the refrigerant in the evaporator coils and the moisture in the air condenses on the evaporator fins. During periods of high heat and humidity, an A/C system will be more effective in the Recirculation mode (max-A/C). With the system in the Recirculation mode, only air from the passenger compartment passes through the A/C evaporator. As the passenger compartment air dehumidifies, the A/C system performance levels rise.

Humidity has an important bearing on the temperature of the air delivered to the interior of the vehicle. It is important to understand the effect that humidity has on the performance of the A/C system. When humidity is high, the A/C evaporator has to perform a double duty. It must lower the air temperature, and it must lower the temperature of the moisture in the air that condenses on the evaporator fins. Condensing the moisture in the air transfers heat energy into the evaporator fins and coils. This reduces the amount of heat the A/C evaporator can

absorb from the air. High humidity greatly reduces the ability of the A/C evaporator to lower the temperature of the air.

However, evaporator capacity used to reduce the amount of moisture in the air is not wasted. Wringing some of the moisture out of the air entering the vehicle adds to the comfort of the passengers. Although, an owner may expect too much from their A/C system on humid days. A performance test is the best way to determine whether the system is performing up to design standards. This test also provides valuable clues as to the possible cause of trouble with the A/C system. The ambient air temperature in the location where the vehicle will be tested must be a minimum of 21° C (70° F) for this test.

A/C PERFORMANCE TEST

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible serious or fatal injury.

CAUTION: The use of an A/C recycling/charging station for purposes of determining the actual charge level of an A/C system is not recommend. Service recycling/charging stations do not reflect the correct amount of refrigerant charge in the A/C system after a single "reclaim" cycle. Tests have shown that it takes up to 3 or 4 "reclaim" cycles to remove all of the refrigerant charge. Use only the following procedure for determining the proper charge level.

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

1. Check for diagnostic trouble codes using a scan tool. If no DTCs are found in the powertrain control module (PCM) or engine control module (ECM), depending on engine application, go to step 2.
2. Connect a tachometer and a manifold gauge set or an A/C recycling/charging station.
3. Operate the heating-A/C system under the following conditions.
 - Engine at 1,000 rpm at operating temperature
 - Door or windows open
 - Transmission in Park or Neutral with parking brake set (depending on transmission application)
 - A/C-heater controls set to Recirculation mode (max-A/C), full cool, panel mode, high blower and with A/C compressor engaged. If the A/C compressor does not engage, see the A/C SYSTEM DIAGNOSIS chart.
4. Insert a thermometer in the driver side center panel air outlet and operate the vehicle a minimum of ten minutes to allow the thermometer temperature to stabilize.
5. With the A/C compressor clutch engaged, compare the air temperature at the center panel outlet and the A/C compressor discharge pressure (high side) to the A/C PERFORMANCE TEMPERATURE AND PRESSURE chart. The compressor clutch may cycle, depending upon the ambient temperature and humidity. If the clutch cycles, use the readings obtained before the clutch disengaged.

A/C PERFORMANCE TEMPERATURE AND PRESSURE

Ambient Air Temperature	21° C (70° F)	27° C (80° F)	32° C (90° F)	38° C (100° F)	43° C (110° F)
Air Temperature at Center Panel Outlet	7° C (45° F)	7° C (45° F)	13° C (55° F)	13° C (55° F)	18° C (64° F)
Compressor Inlet Pressure at Service Port (Low Side)	138 to 207 kPa (20 to 30 psi)	172 to 241 kPa (25 to 35 psi)	207 to 276 kPa (30 to 40 psi)	241 to 310 kPa (35 to 45 psi)	276 to 345 kPa (40 to 50 psi)
Condenser Outlet Pressure at Service Port (High Side)	1034 to 1724 kPa (150 to 250 psi)	1379 to 2068 kPa (200 to 300 psi)	1724 to 2413 kPa (250 to 350 psi)	1999 to 2689 kPa (290 to 390 psi)	2413 to 2965 kPa (350 to 430 psi)

6. If the air outlet temperature fails to meet the specifications in the A/C Performance Temperature and Pressure chart, or if the A/C compressor discharge pressure is high, refer to the A/C SYSTEM DIAGNOSIS chart.

A/C SYSTEM DIAGNOSIS

Condition	Possible Causes	Correction
Rapid A/C clutch cycling (ten or more cycles per minute).	1. Low refrigerant system charge.	1. See Refrigerant System Leaks in this service information. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system as required.
Equal pressures, but the A/C clutch does not engage.	1. No refrigerant in the refrigerant system.	1. See Refrigerant System Leaks in this service information. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system as required.
	2. Open fuse.	2. Check the fuses in the power distribution center and the junction block. Repair the shorted circuit or component and replace the fuses as required.
	3. Inoperative A/C clutch field coil.	3. See A/C Compressor Clutch in this service information. Test the A/C clutch field coil and replace as required.
	4. Inoperative A/C clutch relay.	4. See A/C Clutch Relay in this service information. Test the A/C clutch relay and relay circuits. Repair the circuits or replace the relay as required.
	5. Improperly installed or inoperative A/C pressure transducer.	5. See A/C Pressure Transducer in this service information. Test the A/C pressure transducer and tighten or replace as required.

-	6. Inoperative evaporator temperature sensor.	6. See Evaporator Temperature Sensor in this service information. Test the evaporator temperature sensor and replace as required.
-	7. Inoperative powertrain control module (PCM) or engine control module (ECM), depending on engine application.	7. Refer to the proper Diagnostic article for testing of the PCM or ECM. Test the PCM or ECM and replace as required.
Normal pressures, but A/C Performance Test air temperatures at center panel outlet are too high.	1. Excessive refrigerant oil in system.	1. See Refrigerant Oil Level in this service information. Recover the refrigerant from the refrigerant system and inspect the refrigerant oil content. Restore the refrigerant oil to the proper level as required.
-	2. Blend door actuator improperly installed or inoperative.	2. See Blend Door Actuator in this service information. Inspect the actuator for proper operation and replace as required.
-	3. Blend-air door inoperative or sealing improperly.	3. See HVAC Housing in this service information. Inspect the blend-air door for proper operation and sealing and correct as required.
The low side pressure is normal or slightly low, and the high side pressure is too low.	1. Low refrigerant system charge.	1. See Refrigerant System Leaks in this service information. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system as required.
-	2. Refrigerant flow through the A/C accumulator is restricted.	2. See A/C Accumulator in this service information. Replace the restricted accumulator as required.
-	3. Refrigerant flow through the A/C evaporator is restricted.	3. See A/C Evaporator in this service information. Replace the restricted A/C evaporator as required.
-	4. Inoperative A/C compressor.	4. See A/C Compressor in this service information. Replace the A/C compressor as required.
The low side pressure is normal or slightly high, and the high side pressure is too high.	1. A/C Condenser air flow restricted.	1. Check the A/C condenser for damaged fins, foreign objects obstructing air flow through the condenser fins, and missing or improperly installed air seals. Clean, repair, or replace components as required.
-	2. Inoperative radiator cooling fan.	2. Test the radiator cooling fan and replace as required.
-	3. Refrigerant system overcharged.	3. See Refrigerant System Charge Level in this service information. Recover the refrigerant from the refrigerant system. Charge the refrigerant system to the proper level as required.
-	4. Air in the refrigerant	4. See Refrigerant System Leaks in this

-	system.	service information. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system as required.
	5. Engine overheating.	5. Test the engine cooling system and repair, if required.
The low side pressure is too high, and the high side pressure is too low. - - -	1. Accessory drive belt slipping.	1. Inspect the accessory drive belt condition and tension. Replace the accessory drive belt and/or tensioner as required.
	2. Inoperative A/C expansion valve.	2. See A/C Expansion Valve in this service information. Test the expansion valve and replace as required.
	3. Inoperative A/C compressor.	3. See A/C Compressor in this service information. Replace the A/C compressor as required.
The low side pressure is too low, and the high side pressure is too high. - -	1. Restricted refrigerant flow through the refrigerant lines.	1. See Liquid Line, Suction Line and A/C Discharge Line in this service information. Inspect the refrigerant lines for kinks, tight bends or improper routing. Correct the routing or replace the refrigerant line as required.
	2. Restricted refrigerant flow through the A/C expansion valve.	2. See A/C Expansion Valve in this service information. Test the expansion valve and replace as required.
	3. Restricted refrigerant flow through the A/C condenser.	3. See A/C Condenser in this service information. Replace the restricted condenser as required.

HEATER PERFORMANCE

Before performing the following tests, refer to **COOLING** article for the procedures to check the engine coolant level and flow, engine coolant reserve/recovery system operation, accessory drive belt condition and tension, radiator air flow and the fan drive operation.

WARNING: Do not remove radiator cap when engine is hot, personal injury can result.

If vehicle has been run recently, wait 15 minutes before removing the radiator cap. Place a rag over the cap and turn it to the first safety stop. Allow pressure to escape through the overflow tube. When the system pressure stabilizes, remove the cap completely.

MAXIMUM HEATER OUTPUT

Engine coolant is delivered to the heater core through two heater hoses. With the engine idling at normal operating temperature, set the temperature control to the full hot position, the mode control to the floor position, and the blower motor control to the highest speed position. Using a test thermometer, check the temperature of the air being discharged at the front floor outlets. Compare the test thermometer reading to the HEATER TEMPERATURE REFERENCE chart.

HEATER TEMPERATURE REFERENCE

Ambient Air Temperature	16° C (60° F)	21° C (70° F)	26° C (80° F)	32° C (90° F)
Minimum Air Temperature at Floor Outlet	52° C (125° F)	56° C (133° F)	59° C (139° F)	62° C (144° F)

If the heater outlet air temperature is below the minimum specification, refer to **COOLING** article . Both of the heater hoses should be hot to the touch. The coolant return heater hose should be slightly cooler than the coolant supply heater hose. If the return hose is much cooler than the supply hose, locate and repair the engine coolant flow obstruction in the cooling system (refer to **COOLING** article for more information).

OBSTRUCTED COOLANT FLOW

Possible locations or causes of obstructed coolant flow are as follows:

- Inoperative water pump.
- Inoperative thermostat.
- Pinched or kinked heater hoses.
- Improper heater hose routing.
- Plugged heater hoses or supply and return ports at the cooling system connections.
- Plugged heater core.

If proper coolant flow through the cooling system is verified, and heater outlet air temperature is low, a mechanical problem may exist.

MECHANICAL PROBLEMS

Possible causes of insufficient heat due to mechanical problems are as follows:

- Obstructed cowl air intake.
- Obstructed heater system outlets.
- Inoperative engine thermostat.
- Inoperative blower motor system.
- Inoperative A/C-heater control.
- Inoperative blend door actuator.
- Inoperative, obstructed or improperly installed blend-air door.

TEMPERATURE CONTROL

If the heater outlet air temperature cannot be adjusted with the temperature control on the A/C-heater control, the following could require service:

- Inoperative A/C-heater control.
- Inoperative blend door actuator.

Inoperative, obstructed or improperly installed blend-air door.

Inoperative related wiring harness or connectors.

Improper engine coolant temperature.

SPECIFICATIONS

A/C SYSTEM

Item	Description	Notes
A/C Compressor	Zexel DKS-17DS (2.8L/4.0L engines)	VC-46 PAG oil
	Visteon HS-18 (3.7L engine)	VC-46 PAG oil
Freeze-up Control	Evaporator temperature sensor	Input to A/C-heater control. HVAC housing mounted.
Pressure Control	A/C pressure transducer	Input to PCM/ECM. A/C liquid line mounted. Cycles clutch off if refrigerant pressure falls below 206 kPa (30 psi) or rises above 2971 kPa (431 psi)
R-134a Refrigerant Charge Capacity	0.510 kg (1.12 lbs.)	Also see A/C Underhood Specification Label located in the engine compartment.
A/C Clutch Coil Draw	3.3 amps @ 12V $\pm$ 0.5V @ 25° C (77° F)	2.8L and 4.0L engines. A/C clutch field coil resistance when measured across coil lead connector is 4.02 ± 0.2 ohms @ 25° C (77° F).
	3.1 - 4 amps @ 12V $\pm$ 0.5V @ 21° C (70° F)	3.7L engine.
A/C Clutch Air Gap	0.30 - 0.60 mm (0.012 - 0.024 in.)	2.8L and 4.0L engines.
	0.35 - 0.65 mm (0.014 - 0.025 in.)	3.7L engine.

CONTROLS

ACTUATOR-BLEND DOOR

DESCRIPTION

ACTUATOR-BLEND DOOR

Fig. 10: Identifying Blend Door Actuator, Integral Wire Connector Receptacle, Integral Mounting Tabs & Output Shaft
Courtesy of CHRYSLER LLC

The heating-A/C system uses a reversible, 12-volt direct current (DC) servo motor which mechanically positions the blend-air door. The blend door actuator (1) is located on the driver side of the HVAC housing.

The blend door actuator is interchangeable with the actuators for the mode-air doors and the recirculation-air door. Each actuator is contained within a black molded plastic housing with an integral wire connector receptacle (2) and integral mounting tabs (3) that allow the actuator to be secured to the HVAC housing. The blend door actuator output shaft (4) is connected to the linkage that drives the blend-air door. The blend door actuator does not require mechanical indexing to the blend-air door, as it is electronically calibrated by the A/C-heater control.

OPERATION

ACTUATOR-BLEND DOOR

The blend door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the HVAC wire harness. The blend door actuator can move the blend-air door in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the blend-air door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the blend-air door moves in the opposite direction. When the A/C-heater control makes the voltage to both connections high or both connections low, the blend-air door stops and will not move.

The A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the blend door actuator and the blend-air door. The A/C-heater control learns the blend-air door stop positions during the actuator calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the blend door actuator circuits (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

The blend door actuator cannot be adjusted or repaired and must be replaced if found inoperative or damaged.

REMOVAL

ACTUATOR-BLEND DOOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

Fig. 11: Identifying Actuator Mounting Bracket, Blend Door Actuator, Wire Harness Connector, Air Distribution Housing & Screws
 Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. If equipped, remove the silencer from below the driver side of the instrument panel. Refer to **REMOVAL**.
3. Disconnect the wire harness connector (3) from the blend door actuator (2) located on the driver side of the air distribution housing (4).
4. Remove the two screws (5) that secure the blend door actuator to the actuator mounting bracket (1) and remove the actuator.

INSTALLATION

ACTUATOR-BLEND DOOR

Fig. 12: Identifying Actuator Mounting Bracket, Blend Door Actuator, Wire Harness Connector, Air Distribution Housing & Screws

Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Position the blend door actuator (4) to the actuator mounting bracket (1) located on the driver side of the air distribution housing (4). Make sure the actuator output shaft is properly aligned to the door linkage. If necessary, rotate the actuator slightly to align the splines on the output shaft with those in the door linkage.
2. Install the two screws (5) that secure the blend door actuator to the actuator mounting bracket. Tighten the screws to 1.2 N.m (10 in lbs.).
3. Connect the wire harness connector (3) to the blend door actuator.
4. If equipped, install the silencer below the driver side of the instrument panel. Refer to **INSTALLATION**.
5. Reconnect the negative battery cable.
6. Initiate the Actuator Calibration function using a scan tool. See **DIAGNOSIS AND TESTING**.

ACTUATOR-MODE DOOR

DESCRIPTION

ACTUATOR-MODE DOOR

Fig. 13: Identifying Blend Door Actuator, Integral Wire Connector Receptacle, Integral Mounting Tabs & Output Shaft

Courtesy of CHRYSLER LLC

The heating-A/C system uses a reversible, 12-volt direct current (DC) servo motor which mechanically positions the mode-air door. The mode door actuator (1) is located on the driver side of the HVAC housing.

The mode door actuator is interchangeable with the actuators for the blend-air door and the recirculation-air

door. Each actuator is contained within a black molded plastic housing with an integral wire connector receptacle (2) and integral mounting tabs (3) that allow the actuator to be secured to the HVAC housing. The mode door actuator output shaft (4) is connected to the linkage that drives the mode-air door. The mode door actuator does not require mechanical indexing to the mode-air doors, as it is electronically calibrated by the A/C-heater control.

OPERATION

ACTUATOR-MODE DOOR

The mode door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the HVAC wire harness. The mode door actuator can move the floor, defrost/demist and the panel-air doors in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the mode-air doors will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the mode-air doors moves in the opposite direction. When the A/C-heater control makes the voltage to both connections high or both connections low, the mode-air doors stop and will not move.

The A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the mode door actuator and the mode-air doors. The A/C-heater control learns the mode-air doors stop position during the actuator calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the mode door actuator circuits (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

The mode door actuator cannot be adjusted or repaired and must be replaced if found inoperative or damaged.

REMOVAL

ACTUATOR-MODE DOOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: LHD model shown in illustration. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. If equipped, remove the silencer from below the driver side of the instrument panel. Refer to **REMOVAL**.
3. Disconnect the wire harness connector (3) from the mode door actuator (2) located on the driver side of the air distribution housing (5).
4. Remove the two screws (1) that secure the mode door actuator to the actuator mounting bracket (4) and remove the actuator.

INSTALLATION

ACTUATOR-MODE DOOR

Fig. 15: Identifying Screws, Mode Door Actuator, Wire Harness Connector, Actuator Mounting Bracket & Air Distribution Housing

Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Position the mode door actuator (2) to the actuator mounting bracket (4) located on the driver side of the air distribution housing (5). Make sure the actuator output shaft is properly aligned to the door linkage. If necessary, rotate the actuator slightly to align the splines on the output shaft with those in the mode door linkage
2. Install the two screws (1) that secure the mode door actuator to the actuator mounting bracket. Tighten the screws to 1.2 N.m (10 in lbs.).
3. Connect the wire harness connector (3) to the mode door actuator.
4. If equipped, install the silencer below the driver side of the instrument panel. Refer to **INSTALLATION**.
5. Reconnect the negative battery cable.
6. Initiate the Actuator Calibration function using a scan tool. See **DIAGNOSIS AND TESTING**.

ACTUATOR-RECIRCULATION DOOR

DESCRIPTION

ACTUATOR-RECIRCULATION DOOR

Fig. 16: Identifying Blend Door Actuator, Integral Wire Connector Receptacle, Integral Mounting Tabs & Output Shaft

Courtesy of CHRYSLER LLC

The heating-A/C system uses a reversible, 12-volt direct current (DC) servo motor which mechanically positions the recirculation-air door. The recirculation door actuator (1) is located on the side of the HVAC air inlet housing.

The recirculation door actuator is interchangeable with the actuators for the blend-air door and the mode-air door. Each actuator is contained within a black molded plastic housing with an integral wire connector receptacle (2) and integral mounting tabs (3) that allow the actuator to be secured to the HVAC housing. The recirculation door actuator output shaft (4) is directly connected to the pivot shaft lever of the recirculation-air door. The recirculation door actuator does not require mechanical indexing to the recirculation-air door, as it is electronically calibrated by the A/C-heater control.

OPERATION

ACTUATOR-RECIRCULATION DOOR

The recirculation door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the HVAC wire harness. The recirculation door actuator can move the recirculation-air door in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the recirculation-air door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the recirculation-air door moves in the opposite direction. When the A/C-heater control makes the voltage to both connections high or both connections low, the recirculation-air door stops and will not move.

The A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the recirculation door actuator and the recirculation-air door. The A/C-heater control learns the recirculation-air door stop positions during the actuator calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the recirculation door actuator circuits (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

The recirculation door actuator cannot be adjusted or repaired and must be replaced if found inoperative or damaged.

REMOVAL

ACTUATOR-RECIRCULATION DOOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

Fig. 17: Recirculation Door Actuator, Screws & Air Inlet Housing
 Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. On LHD models, remove the glove box bin. Refer to **REMOVAL** .
3. On RHD models, remove the instrument panel. Refer to **REMOVAL** .
4. Remove the two screws (2) that secure the recirculation door actuator (1) to the air inlet housing (3).
5. Disconnect the wire harness connector from the recirculation door actuator and remove the actuator from the vehicle.

INSTALLATION

ACTUATOR-RECIRCULATION DOOR

Fig. 18: Recirculation Door Actuator, Screws & Air Inlet Housing
 Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Connect the wire harness connector to the recirculation door actuator (1).
2. Position the recirculation door actuator to the side of the air inlet housing (3). Make sure the actuator output shaft is properly aligned to the recirculation door pivot shaft. If necessary, rotate the actuator slightly to engage the splines on the output shaft with those in the pivot shaft.
3. Install the two screws (2) that secure the recirculation door actuator to the air inlet housing. Tighten the screws to 1.2 N.m (10 in lbs.).
4. On RHD models, install the instrument panel. Refer to **INSTALLATION** .
5. On LHD models, install the glove box bin. Refer to **INSTALLATION** .
6. Reconnect the negative battery cable.
7. Initiate the Actuator Calibration function using a scan tool. See **DIAGNOSIS AND TESTING**.

CLUTCH-A/C COMPRESSOR

DESCRIPTION

CLUTCH-A/C COMPRESSOR

Fig. 19: Bolt, Clutch Plate, Pulley Assembly, Stationary Electromagnetic Field Coil, Snap Ring & Shims
Courtesy of CHRYSLER LLC

The A/C system on models equipped with the 2.8L and 4.0L engine use a Zexel DKS-17DS A/C compressor. The clutch assembly for this A/C compressor consists of a stationary electromagnetic field coil (4), bearing and pulley assembly (3), shims (6), and a clutch plate (2) that is splined to the compressor shaft and secured by a bolt (1). These components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt.

The A/C clutch field coil is pressed onto the front of this A/C compressor and cannot be serviced separately from the compressor. The A/C clutch bearing and pulley assembly is retained to the front of the compressor by a snap ring (5) and can be serviced separately.

CLUTCH-A/C COMPRESSOR

Fig. 20: A/C Compressor Clutch Components
Courtesy of CHRYSLER LLC

The A/C system on models equipped with the 3.7L engine use the Visteon HS-18 A/C compressor. The clutch assembly for this A/C compressor consists of a stationary electromagnetic field coil (4), bearing and pulley assembly (3), shims (7), and a clutch plate (2) that is splined to the compressor shaft and secured by a bolt (1). These components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt.

The A/C clutch field coil is pressed onto the front of this A/C compressor and retained with a snap ring (6). The A/C clutch bearing and pulley assembly is also retained to the front of this compressor by a snap ring (5). Both the A/C clutch bearing and pulley assembly and the field coil can be serviced separately.

OPERATION

CLUTCH-A/C COMPRESSOR

The A/C compressor clutch components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt. When the electromagnetic A/C clutch field coil is energized, it magnetically draws the clutch plate into contact with the clutch pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub bearing, which is part of the pulley assembly.

A/C compressor clutch engagement is controlled by the powertrain control module (PCM) or the engine control module (ECM), depending on engine application. When the A/C-heater control is set to any A/C position, it sends a request signal on the CAN-B bus to the totally integrated power module (TIPM), which then transfers the request on the CAN-C Bus to the PCM/ECM, which determines if operating conditions are correct for A/C clutch engagement. When all operating conditions have been met, the PCM/ECM sends a signal on a dedicated hard-wired circuit back to the totally integrated power module (TIPM) to energize the internal A/C clutch high side driver. When energized, the A/C clutch high side driver provides battery current to the A/C clutch field coil.

The A/C clutch control system is diagnosed using a scan tool (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article or appropriate Engine ELECTRICAL DIAGNOSTICS article for more information).

The A/C compressor clutch components cannot be adjusted or repaired and must be replaced if found inoperative or damaged.

DIAGNOSIS AND TESTING

CLUTCH-A/C COMPRESSOR

The A/C compressor clutch coil electrical circuit is controlled by the powertrain control module (PCM) or the engine control module (ECM) (depending on engine application) through the totally integrated power module (TIPM). See **OPERATION**. Begin testing of a suspected compressor clutch coil problem by performing the preliminary checks.

PRELIMINARY CHECKS

1. Using a scan tool, check for diagnostic trouble codes (DTCs) in the A/C-heater control, TIPM and the PCM/ECM. If no DTCs are found, go to step 2. If any DTCs are found, repair as required.
2. If the A/C compressor clutch still will not engage, verify the refrigerant charge level. See **DIAGNOSIS AND TESTING**. If the refrigerant charge level is OK, go to step 3. If the refrigerant charge level is not OK, adjust the refrigerant charge as required.
3. If the A/C compressor clutch still will not engage, disconnect the wire harness connector from the A/C pressure transducer and check for battery current at the connector with the engine running and the A/C-heater control set to the A/C mode. If OK, go to **COIL CURRENT DRAW TEST**, and/or **COIL RESISTANCE TEST - 2.8L AND 4.0L ENGINES ONLY**.

COIL CURRENT DRAW TEST

1. Verify the battery state of charge. Refer to **DIAGNOSIS AND TESTING**.
2. Connect an ammeter (0 to 10 ampere scale selected) in series with the clutch field coil feed terminal.

- Connect a voltmeter (0 to 20 volt scale selected) to measure voltage across the battery and the clutch coil.
3. With the A/C-heater control in the A/C mode and the blower motor at low speed, start the engine and allow it to run at a normal idle speed.
 4. The A/C clutch should engage immediately, and the clutch field coil supply voltage should be within two volts of the battery voltage. If the field coil supply voltage is OK, go to step 5. If the field coil supply voltage is not within two volts of battery voltage, test the clutch field coil feed circuit for excessive voltage drop and repair as necessary.
 5. Refer to the following A/C CLUTCH FIELD COIL SPECIFICATIONS chart for the acceptable A/C clutch field coil current draw. If voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until voltage reads below 12.5 volts.
 - If the A/C clutch field coil current reading is zero, the coil is open and must be replaced.
 - If the A/C clutch field coil current reading is above specifications, the coil is shorted and must be replaced.

COIL RESISTANCE TEST - 2.8L AND 4.0L ENGINES ONLY

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the A/C clutch field coil connector.
3. Use an ohmmeter and measure the resistance of the clutch field coil at the field coil connector terminals.
4. Refer to the following A/C CLUTCH FIELD COIL SPECIFICATIONS chart for the acceptable A/C clutch coil resistance.
 - If the A/C clutch coil resistance reading is above specifications, the coil is shorted and must be replaced.
 - If the A/C clutch coil resistance reading is below specifications, the coil is open and must be replaced.

A/C CLUTCH FIELD COIL SPECIFICATIONS

A/C Compressor	Current Draw	Coil Resistance
Zexel DKS-17DS (2.8L/4.0L engines)	3.3 amps @ 12V ± 0.5V @ 25° C (77° F)	4.02 ± 0.2 ohms @ 25° C (77° F)
Visteon HS-18 (3.7L engine)	3.1 - 4 amps @ 12V ± 0.5V @ 21° C (70° F)	Not applicable

STANDARD PROCEDURE

CLUTCH-A/C COMPRESSOR

NOTE: The A/C clutch can be serviced in the vehicle. The refrigerant system can remain fully-charged during compressor clutch, pulley and bearing assembly, or coil replacement.

81229afa

Fig. 21: Identifying Compressor Shaft, Clutch Plate & Shim
Courtesy of CHRYSLER LLC

Examine the friction surfaces of the pulley and the clutch plate (2) for wear. The pulley and clutch plate should be replaced if there is excessive wear or scoring.

If the friction surfaces are oily, inspect the shaft and nose area of the A/C compressor (1) for refrigerant oil. If refrigerant oil is found, the compressor shaft seal is leaking and the A/C compressor must be replaced.

Check the pulley bearing for roughness or excessive leakage of grease. Replace the pulley and bearing assembly, if required.

CLUTCH-A/C COMPRESSOR

After a new A/C compressor clutch has been installed, cycle the compressor clutch approximately 20 times (5 seconds on, then 5 seconds off). During this procedure, set the A/C-heater controls to the A/C Recirculation Mode, the blower motor in the highest speed position, and the engine speed at 1500 to 2000 rpm. This procedure (burnishing) will seat the opposing friction surfaces and provide a higher compressor clutch torque capability.

REMOVAL

CLUTCH-A/C COMPRESSOR

NOTE: The compressor clutch assembly can be serviced with the refrigerant system fully-charged.

Fig. 22: Strap Wrench, Bolt, Clutch Plate, A/C Compressor & Clutch Field Coil Connector
Courtesy of CHRYSLER LLC

1. Disconnect and isolate negative battery cable.
2. Remove the accessory drive belt. Refer to **REMOVAL** .
3. Disconnect the engine wire harness from the clutch field coil connector (4).
4. Remove the bolts that secure the A/C compressor (4) to the mounting bracket. See **REMOVAL**.
5. Remove the A/C compressor from the mounting bracket and support the compressor while servicing the clutch.
6. Using a strap wrench (1), remove the bolt (2) that secures the clutch plate (3) to the compressor shaft.

NOTE: The clutch plate can be removed from the compressor shaft by hand or, if required, pressed off with an 8 x 1.25 mm bolt.

NOTE: Clutch plate shim(s) may remain inside the hub of the clutch plate. Be sure to remove all of the shims from inside the hub or from the end of the compressor shaft.

7. Remove the clutch plate and shim(s) from the A/C compressor. If required, install a 8 x 1.25 mm bolt into the center of the clutch plate and turn the bolt clockwise until the clutch plate is completely removed from the A/C compressor.

Fig. 23: Using Snap Ring Pliers To Remove/Install Snap Ring That Secures Pulley And Bearing Assembly To Front Of A/C Compressor

11. Using compressor field coil remover (Special Tool 9354 in Kit 9349) (1) and a two jaw puller (2), remove the clutch field coil (3) from the front of the A/C compressor (4).

CLUTCH-A/C COMPRESSOR

NOTE: The compressor clutch plate and pulley and bearing assembly and can be serviced with the refrigerant system fully-charged and with the A/C compressor installed on the engine.

NOTE: Typical A/C compressor and clutch assembly shown in illustrations.

Fig. 27: Locating A/C Compressor Shaft Bolt
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the coolant recovery container from the front of the engine compartment. Refer to **REMOVAL** .
3. Remove the radiator fan and shroud assembly. Refer to **REMOVAL** .
4. Remove the accessory drive belt. Refer to **REMOVAL** .
5. Disconnect the engine wire harness from the compressor clutch field coil connector (1) located on the top of the A/C compressor (5).
6. Remove the screw that secures the connector bracket (2) to the A/C compressor and position the bracket

and wire lead out of the way.

NOTE: A band-type oil filter wrench or a strap wrench may be used to hold the clutch plate from turning during compressor shaft bolt removal.

7. Hold the clutch plate (4) from turning and remove the compressor shaft bolt (3).

81229afa

Fig. 28: Identifying Compressor Shaft, Clutch Plate & Shim
Courtesy of CHRYSLER LLC

CAUTION: Do not pry between the clutch plate and the pulley and bearing assembly to remove the clutch plate from the compressor shaft as

this may damage the clutch plate.

NOTE: Use care not to lose any clutch shim(s) during removal of the clutch plate, as they may be reused during the clutch plate installation process.

8. Tap the clutch plate (2) lightly with a plastic mallet to release it from the splines on the compressor shaft (1) and remove the clutch plate and shim(s) (3).

Fig. 29: PULLEY AND SNAP RING
Courtesy of CHRYSLER LLC

NOTE: The pulley and bearing assembly can be removed from the compressor by hand or, if required, with a two jaw puller.

9. Using Snap Ring Pliers 9764 or equivalent (1), remove the snap ring (2) that secures the pulley and bearing assembly (3) to the front of the A/C compressor (4).
10. Remove the pulley and bearing assembly from the front of the A/C compressor. If required, install a two jaw puller and turn the puller center-bolt clockwise until the pulley and bearing assembly is completely removed.

INSTALLATION

CLUTCH-A/C COMPRESSOR

NOTE: Typical A/C compressor and clutch assembly shown in illustrations.

81229b4a

Fig. 30: Installing Pulley & Bearing Assembly
Courtesy of CHRYSLER LLC

CAUTION: Be certain to position the compressor clutch field coil wire lead so that it is not damaged during A/C compressor pulley and bearing installation.

CAUTION: When installing the pulley and bearing assembly, DO NOT mar the friction surfaces of the pulley or premature failure of the clutch will result.

1. Install the pulley and bearing assembly (1) onto the front of the A/C compressor. If necessary, tap the pulley gently with a block of wood (2) placed on the pulley friction surface.

61919000

Fig. 31: PULLEY AND SNAP RING
Courtesy of CHRYSLER LLC

CAUTION: The snap ring must be fully and properly seated in the groove or it will vibrate out, resulting in a clutch failure and severe damage to the A/C compressor.

NOTE: A new snap ring must be used to secure the pulley and bearing assembly to the A/C compressor. The bevel side of the snap ring must face outward.

2. Using Snap Ring Pliers 9764 or equivalent (1), install the snap ring (2) that secures the pulley and bearing assembly (3) to the front of the A/C compressor (4). Be certain that the snap ring is fully and properly seated in the groove.

81229afa

Fig. 32: Identifying Compressor Shaft, Clutch Plate & Shim
Courtesy of CHRYSLER LLC

3. If the original clutch plate (2) and pulley and bearing assembly are to be reused, reinstall the original shim (s) (3) onto the compressor shaft (1). If a new clutch plate and pulley and bearing assembly are being used, install a trial stack of shims 1.50 mm (0.059 in.) thick onto the compressor shaft.

Fig. 33: Locating A/C Compressor Shaft Bolt
Courtesy of CHRYSLER LLC

4. Install the clutch plate (4) onto the front of the A/C compressor (5).
5. Install the compressor shaft bolt (3). Tighten the bolt to 20 N.m (177 in. lbs.).

NOTE: The shims may compress after tightening the shaft bolt. Check the air gap in four or more places to verify the air gap is correct. Spin the pulley before performing a final check of the air gap.

NOTE: On models with the clutch plate recessed into the pulley, use a 90° wire gap gauge to measure the clutch air gap. On other models, use a blade type feeler gauge to measure the air gap.

6. With the clutch plate assembled tight against the shim(s), measure the air gap between the clutch plate and the pulley and bearing assembly. The air gap should be between 0.30 - 0.60 mm (0.012 - 0.024 in.). If the air gap is not between specifications, add or subtract shims as needed until the correct air gap is obtained.

CAUTION: Be certain that the compressor clutch field coil wire lead is routed so that it is not pinched between the A/C compressor and the field coil connector bracket.

7. Carefully route the compressor clutch field coil wire lead and install the connector bracket (2) and retaining screw onto the A/C compressor. Tighten the screw to 4.3 N.m (38 in. lbs.).
8. Connect the engine wire harness to the compressor clutch field coil connector (1).
9. Install the accessory drive belt. Refer to **INSTALLATION** .
10. Install the radiator and fan shroud assembly. Refer to **INSTALLATION** .
11. Install the coolant recovery container. Refer to **REMOVAL** .
12. Reconnect the negative battery cable.

CLUTCH-A/C COMPRESSOR

81716552

Fig. 34: Field Coil Installation - KJ Visteon Compressor
Courtesy of CHRYSLER LLC

1. Position the A/C clutch field coil (1) squarely onto the front of the A/C compressor (2).

CAUTION: Position the A/C clutch field coil so that the coil positioning tabs and the wire harness lead are oriented in the correct direction. Failure to correctly position the field coil on the A/C compressor will result in field coil damage.

2. Align the field coil positioning tabs to the recessed area at the front of the A/C compressor and install the clutch field coil onto the compressor using a two jaw puller (3), compressor field coil installer (Special Tool 9352 in Kit 9349) (4) and the compressor field coil installer spacer (Special Tool 9353 in Kit 9349) (5).

81715a56

Fig. 35: Locating Field Coil Wire Lead - KJ Visteon Compressor
Courtesy of CHRYSLER LLC

3. Position the clutch field coil wire lead and bracket (2) to the A/C compressor (3) and install the screw (1) that secures the bracket to the compressor. Tighten the screw to 4 N.m (35 in. lbs.).

81716551

Fig. 36: Installing Pulley & Bearing - KJ Visteon Compressor
Courtesy of CHRYSLER LLC

4. Align the pulley and bearing assembly (1) squarely onto the front of the A/C compressor (2).

NOTE: **A distinct change of sound during the clutch pulley tapping process indicates that the pulley and bearing assembly has bottomed out against the compressor housing.**

5. Using clutch pulley installer (Special Tool 9355 in Kit 9349) (3) and a hammer (4), install the pulley and bearing assembly onto the front of the A/C compressor. Tap the installer with a hammer until the pulley and bearing assembly has bottomed against the compressor housing.

Fig. 37: Using Snap Ring Pliers To Remove/Install Snap Ring That Secures Pulley And Bearing Assembly To Front Of A/C Compressor
Courtesy of CHRYSLER LLC

CAUTION: If the snap ring is not fully seated in the groove it will vibrate out, resulting in clutch failure and severe damage to the A/C compressor.

NOTE: Install the snap ring with the beveled side of the snap ring facing outward.

6. Using snap ring pliers (Special Tool 9764 or equivalent) (1), install the snap ring (2) that secures the pulley and bearing assembly (3) to the front of the A/C compressor (4). Make sure the snap ring is properly seated in the groove.

Fig. 38: Installing Clutch Bolt - KJ Visteon Compressor
Courtesy of CHRYSLER LLC

7. Verify that there is adequate clearance for the clutch field coil wire lead (1) between the housing of the A/C compressor (2) and the pulley and bearing assembly (3).

NOTE: When installing an original or a new clutch assembly, try the original shims first. When installing a clutch onto a compressor that previously did not have a clutch, use the 1.0, 0.50 and 0.13 millimeter (0.040, 0.020 and 0.005 inch) shims from the clutch hardware package which is provided with the new clutch.

8. Install the clutch shims onto the compressor shaft.
9. Using a strap wrench (4), install the bolt (5) that secures the clutch plate (6) to the A/C compressor. Hold the clutch plate stationary with the strap wrench and tighten the bolt to 15 N.m (133 in. lbs.).

8171654f

Fig. 39: Locating Clutch Air Gap - KJ Visteon Compressor
Courtesy of CHRYSLER LLC

10. Using 90° wire gauges (1), check the air gap between the clutch plate (2) and the pulley and bearing assembly (3). If the air gap is not between 0.35 to 0.65 millimeter (0.014 to 0.025 inch), add or subtract shims as required.
11. Position the A/C compressor onto the mounting bracket.
12. Install the bolts that secure the A/C compressor to the mounting bracket. See **INSTALLATION**.
13. Connect the engine wire harness to the compressor clutch field coil connector.
14. Install the accessory drive belt (Refer to **BELT-ACCESSORY DRIVE**).
15. Reconnect the negative battery cable.
16. Perform the Clutch Break-in Procedure. See **STANDARD PROCEDURE**.

CONTROL-A/C HEATER

DESCRIPTION

AUTOMATIC SINGLE ZONE

Fig. 40: A/C-Heater Control Assembly
Courtesy of CHRYSLER LLC

The A/C-heater control for the automatic temperature control (ATC) single zone system maintains the interior comfort level desired by the vehicle operator. This is accomplished by use of an infrared sensor located in the front overhead console that measures the surface temperature of the driver and front seat passengers. Based on the sensors input, the system automatically adjusts the air temperature, airflow volume, airflow distribution and amount of inside air recirculation to maintain occupant comfort, even under changing outside weather conditions. All controls are identified by ISO graphic symbols.

This ATC system offers several manual override features such as fan speed, airflow distribution and when the outside air contains smoke, odors, high humidity, or if rapid cooling is desired, the interior conditioned air can be recirculated within the vehicle.

The heating-A/C system uses electrically operated controls. These controls provide the vehicle operator with a number of setting options to help control the climate and comfort within the vehicle.

The A/C-heater control and integral computer (1) is located in the instrument panel and contains:

- a rotary control for manual and automatic blower motor speed selection and for turning the heating-A/C system on and off (2). This control also contains a push button function for recirculating the conditioned air. The control contains an indicator lamp that illuminates when the heating-A/C system is in recirculation mode.

- a rotary control for temperature control of the discharged air (3). This control also contains a push button function for manually turning the A/C system on and off. The control contains an indicator lamp that illuminates when the A/C system is in operation.

- a rotary control for manual and automatic mode control of the discharged air (4). This control also contains a push button function for turning the rear window defogger system on and off. The control contains an indicator lamp that illuminates when the rear window defogger system is in operation.

The A/C-heater control for the ATC heating and A/C system obtains vehicle speed, engine speed, engine coolant temperature, ambient temperature and refrigerant system head pressure data from the CAN-IHS bus and is diagnosed using a scan tool (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

Prior to replacing an A/C-heater control, check for any diagnostic trouble codes (DTCs) related to the heating-A/C system and run the Actuator Calibration function using a scan tool to verify that the concern is not a system issue. See **DIAGNOSIS AND TESTING**.

The A/C-heater control cannot be adjusted or repaired and must be replaced if inoperative or damaged.

CONTROL-A/C HEATER

81d5f14a

Fig. 41: AC Heater Control Components
Courtesy of CHRYSLER LLC

The A/C-heater control (1) for the manual temperature control (MTC) single zone heating-A/C system allows one temperature setting for the entire vehicle. All controls are identified by ISO graphic symbols.

The A/C-heater control and integral computer is located in the instrument panel and contains:

- a rotary control for fan speed selection and for turning the heating-A/C system on and off (2). This control also contains a push button function for recirculating the conditioned air. The control contains an indicator lamp that illuminates when the heating-A/C system is in recirculation mode.

- a rotary control for temperature control of the discharged air (3). This control also contains a push button function for turning the A/C system on and off. The control contains an indicator lamp that illuminates when the A/C system is in operation.

- a rotary control for mode control of the discharged air (4). This control also contains a push button function for turning the rear window defogger system on and off. The control contains an indicator lamp that illuminates when the rear window defogger system is in operation.

The A/C-heater control for this heating and A/C system is diagnosed using a scan tool (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

Prior to replacing an A/C-heater control, check for any diagnostic trouble codes (DTCs) related to the heating-A/C system and run the Actuator Calibration function using a scan tool to verify that the concern is not a system issue. See **DIAGNOSIS AND TESTING**.

The A/C-heater control cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

CONTROL-A/C HEATER

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

Fig. 42: A/C Heater Control - R and I
Courtesy of CHRYSLER LLC

NOTE: MTC A/C-heater control shown in illustration. ATC control similar.

1. Disconnect and isolate the negative battery cable.
2. Remove the center bezel from the instrument panel and place it on a workbench. Refer to **REMOVAL**.
3. Remove the four screws (1) that secure the A/C-heater control (2) to the instrument panel center bezel (3) and remove the control.

INSTALLATION

CONTROL-A/C HEATER

Fig. 43: A/C Heater Control - R and I
 Courtesy of CHRYSLER LLC

NOTE: MTC A/C-heater control shown in illustration. ATC control similar.

1. Install the A/C-heater control (2) onto the back of the instrument panel center bezel (3).
2. Install the four screws (1) that secure the A/C-heater control to the center bezel. Tighten the screws to 1.2 N.m (10 in. lbs.).
3. Position the center bezel to the instrument panel and connect the wire harness connectors to the back of the A/C-heater control.
4. Connect the wire harness connectors to the accessory switches and install the center bezel. Refer to **INSTALLATION** .
5. Reconnect the negative battery cable.

NOTE: The A/C-heater control will automatically perform the Actuator Calibration function when the ignition is initially turned on when installing a new control or when reinstalling the original control. However, the Actuator Calibration function must be manually initiated using a scan tool if the A/C-heater control has been previously installed in another vehicle (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

6. If required, initiate the Actuator Calibration function using a scan tool. See **DIAGNOSIS AND TESTING**.

MODULE-POWER-BLOWER MOTOR

DESCRIPTION

DESCRIPTION

81b872ad

Fig. 44: Power-Blower Motor Module
Courtesy of CHRYSLER LLC

A blower motor power module is used on this model when equipped with the automatic temperature control (ATC) heating-A/C system. Models equipped with the manual temperature control (MTC) heating-A/C system use a blower motor resistor, instead of the blower motor power module. See **DESCRIPTION**.

The blower motor power module is mounted to the rear of the HVAC housing, directly behind the glove box. The blower motor power module consists of a molded plastic mounting plate (1) with an integral connector receptacle (2). Concealed behind the mounting plate is the power module electronic circuitry and a finned aluminum heat sink (3). The blower motor power module is accessed for service from under the instrument panel.

The blower motor power module is accessed for service through the glove box opening.

OPERATION

MODULE-POWER-BLOWER MOTOR

The blower motor power module is connected to the vehicle electrical system through a dedicated lead and connector. A second lead and connector is connected to the blower motor. The blower motor power module allows the microprocessor-based automatic temperature control (ATC) A/C-heater control to calculate and provide infinitely variable blower motor speeds based upon either manual blower switch input or the ATC programming using a pulse width modulated (PWM) circuit strategy.

The PWM voltage is applied to a comparator circuit which compares the PWM signal voltage to the blower motor feedback voltage. The resulting output drives the power module circuitry, which provides a linear output voltage to change or maintain the desired blower speed.

The blower motor power module is diagnosed using a scan tool (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

The blower motor power module cannot be adjusted or repaired must be replaced if inoperative or damaged.

REMOVAL

MODULE-POWER-BLOWER MOTOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

WARNING: The heat sink for the blower motor power module may get very hot during normal operation. If the blower motor was turned on prior to servicing the blower motor power module, wait five minutes to allow the heat sink to cool before performing diagnosis or service. Failure to take this precaution can result in possible personal injury.

Fig. 45: HVAC Housing, Screws, Blower Motor Power Module & Wire Harness Connectors

NOTE: LHD model shown in illustration. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Lower the glove box door.
3. Disconnect the two wire harness connectors (4) from the blower motor power module (3).
4. Remove the two screws (2) that secure the blower motor power module to the HVAC housing (1) and remove the power module.

INSTALLATION

MODULE-POWER-BLOWER MOTOR

81b872a2

Fig. 46: HVAC Housing, Screws, Blower Motor Power Module & Wire Harness Connectors
 Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Position the blower motor power module (3) into the HVAC housing (1).
2. Install the two screws (2) that secure the blower motor power module to the HVAC housing. Tighten the screws to 1.2 N.m (10 in. lbs.).
3. Connect the wire harness connectors (4) to the blower motor power module.
4. Close the glove box door.
5. Reconnect the negative battery cable.

RESISTOR-BLOWER MOTOR

DESCRIPTION

RESISTOR-BLOWER MOTOR

81b84158

Fig. 47: Mounting Plate, Integral Wire Connector Receptacle & Metal Housing
Courtesy of CHRYSLER LLC

A blower motor resistor is used on vehicles equipped with the manual temperature control (MTC) heating-A/C system. Vehicles equipped with the automatic temperature control (ATC) heating-A/C system use a blower motor power module, instead of the blower motor resistor. See **DESCRIPTION**.

The blower motor resistor is mounted to the rear of the HVAC housing, directly behind the glove box. The blower motor resistor consists of a molded plastic mounting plate (1) with an integral wire connector receptacle (2). Concealed behind the mounting plate is the resistor circuit board located within a metal housing (3).

The blower motor resistor is accessed for service through the glove box opening.

OPERATION

RESISTOR-BLOWER MOTOR

The blower motor resistor is connected to the vehicle electrical system through a dedicated wire lead and connector of the HVAC wire harness. The blower motor resistor has multiple resistor circuits, each of which will reduce the current flow through the blower motor to change the blower motor speed.

The blower motor control in the MTC heating-A/C system directs the ground path for the blower motor through the correct resistor circuit to obtain the selected speed. With the blower motor control in the lowest speed position, the ground path for the blower motor is applied through all of the resistor circuits. Each higher speed selected with the blower motor control applies the blower motor ground path through fewer of the resistor circuits, increasing the blower motor speed. When the blower motor control is in the highest speed position, the blower motor resistor is bypassed and the blower motor receives a direct path to ground.

The blower motor resistor cannot be adjusted or repaired and it must be replaced if found inoperative or damaged.

DIAGNOSIS AND TESTING

RESISTOR-BLOWER MOTOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: For circuit descriptions and diagrams, refer to **SYSTEM WIRING DIAGRAMS** article and **WIRING DIAGRAM INFORMATION** article . The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location

views for the various wire harness connectors, splices and grounds.

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the blower motor resistor. See **REMOVAL**.
3. Using an ohmmeter, check for continuity between all of the blower motor resistor terminals. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor speed control and the blower motor resistor or blower motor as required. If not OK, replace the inoperative blower motor resistor.

REMOVAL

RESISTOR-BLOWER MOTOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

WARNING: The blower motor resistor may get very hot during normal operation. If the blower motor was turned on prior to servicing the blower motor resistor, wait five minutes to allow the blower motor resistors to cool before performing diagnosis or service. Failure to take this precaution can result in possible personal injury.

Fig. 48: Blower Motor Resistor, Wire Harness Connector, Screws & HVAC Housing
Courtesy of CHRYSLER LLC

NOTE: Typical resistor shown in illustration. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Lower the glove box door.
3. Disconnect the wire harness connector (2) from the blower motor resistor (1).
4. Remove the two screws (3) that secure the blower motor resistor to the HVAC housing (4) and remove the resistor.

INSTALLATION

RESISTOR-BLOWER MOTOR

Fig. 49: Blower Motor Resistor, Wire Harness Connector, Screws & HVAC Housing
Courtesy of CHRYSLER LLC

NOTE: Typical resistor shown in illustration. RHD model similar.

1. Position the blower motor resistor (1) into the HVAC housing (4).
2. Install the two screws (3) that secure the blower motor resistor to the HVAC housing. Tighten the screws to 1.2 N.m (10 in. lbs.).
3. Connect the wire harness connector (2) to the blower motor resistor.
4. Close the glove box door.
5. Reconnect the negative battery cable.

SENSOR-EVAPORATOR TEMPERATURE

DESCRIPTION

SENSOR-EVAPORATOR TEMPERATURE

812b0cc6

Fig. 50: Sensor-Evaporator Temperature
Courtesy of CHRYSLER LLC

NOTE: Typical evaporator temperature sensor shown in graphic.

The evaporator temperature sensor (1) measures the temperature of the conditioned air downstream of the A/C evaporator (2). The evaporator temperature sensor is an electrical thermistor within a molded plastic case that is inserted into rear the HVAC housing (3) near the coldest point of the A/C evaporator. Two terminals within the connector receptacle (4) connect the sensor to the vehicle electrical system through a wire lead and connector of the instrument panel wire harness.

The external location of the evaporator temperature sensor allows the sensor to be removed or installed without disturbing the refrigerant in the A/C system.

OPERATION

SENSOR-EVAPORATOR TEMPERATURE

The evaporator temperature sensor monitors the temperature of the conditioned air downstream of the A/C evaporator and supplies an input signal to the A/C-heater control. The A/C-heater control uses the evaporator temperature sensor input signal to optimize A/C system performance and to protect the A/C system from evaporator freezing. The evaporator temperature sensor will change its internal resistance in response to the temperatures it monitors and is connected to the A/C-heater control through sensor ground circuit and a 5-volt reference signal circuit. As the temperature of the A/C evaporator decreases, the internal resistance of the evaporator temperature sensor decreases.

The A/C-heater control uses the monitored voltage reading as an indication of evaporator temperature. The A/C-heater control is programmed to respond to this input by requesting the powertrain control module (PCM) or the engine control module (ECM) (depending on engine application) to cycle the A/C compressor clutch as necessary to optimize A/C system performance and to protect the A/C system from evaporator freezing.

The evaporator temperature sensor is diagnosed using a scan tool. See **DIAGNOSIS AND TESTING**.

The evaporator temperature sensor cannot be adjusted or repaired and must be replaced if found inoperative or damaged.

REMOVAL

SENSOR-EVAPORATOR TEMPERATURE

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: Illustration shown with instrument panel removed for clarity.

 Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Partially remove the instrument panel to gain access to the evaporator temperature sensor (1) located in the rear of the HVAC housing (2), near the bottom of the instrument panel on the passenger side. Refer to **REMOVAL** .
3. Disconnect the instrument panel wire harness connector from the evaporator temperature sensor and remove the sensor from the HVAC housing.

INSTALLATION

SENSOR-EVAPORATOR TEMPERATURE

NOTE: Illustration shown with instrument panel removed for clarity.

818d2672

Fig. 52: Removing/Installing Evaporator Temperature Sensor From Front Of HVAC Housing
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Install the evaporator temperature sensor (1) into rear of the HVAC housing (2) and connect the instrument panel wire harness connector.
2. Install the instrument panel. Refer to **INSTALLATION**.
3. Reconnect the negative battery cable.

SENSOR-INFRARED

DESCRIPTION

SENSOR-INFRARED

Fig. 53: Infrared Temperature Sensor, Integral Wire Connector Receptacle, Alignment Tabs & Clear Lens

Courtesy of CHRYSLER LLC

The infrared temperature sensor (1) consists of an infrared transducer concealed behind a clear lens (4) located in a molded plastic housing with an integral wire connector receptacle (2) and mounting and alignment tabs (3 and 5).

The infrared sensor is used only on models equipped with the automatic temperature control (ATC) heating-A/C system.

OPERATION

SENSOR-INFRARED

The infrared sensor detects thermal radiation emitted by the driver and front seat occupants and surroundings and converts its data into a linear pulse width modulated (PWM) output signal which is read by the automatic

temperature control (ATC) A/C-heater control. The ATC A/C-heater control uses the infrared sensor data as one of the inputs necessary to automatically control the interior cabin temperature level. By using thermal radiation (surface temperature) measurement, rather than an air temperature measurement, the ATC heating-A/C system is able to adjust itself to the comfort level as perceived by the front seat occupants. This allows the ATC system to compensate for other ambient conditions affecting comfort levels, such as solar heat gain or evaporative heat loss.

The ATC system logic responds to the infrared sensor message by calculating and adjusting the air flow temperature and air flow rate needed to properly obtain and maintain the selected comfort level temperature of the occupants. The A/C-heater control continually monitors the infrared sensor circuit, and will store diagnostic trouble codes (DTCs) for any problem it detects.

The infrared sensor is diagnosed using a scan tool (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

The infrared sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

SENSOR-INFRARED

NOTE: Take the proper precautions to protect the front face of the overhead console from cosmetic damage while performing this procedure.

Fig. 54: Overhead Console, Screw, Infrared Sensor & Tab
Courtesy of CHRYSLER LLC

NOTE: Typical overhead console shown in graphic.

1. Disconnect and isolate the negative battery cable.
2. Remove the overhead console (1) from the headliner and place it on a workbench.
3. Remove the screw (2) that secures the infrared sensor (3) to the back of the overhead console and remove

the sensor.

INSTALLATION

SENSOR-INFRARED

NOTE: Take the proper precautions to protect the front face of the overhead console from cosmetic damage while performing this procedure.

Fig. 55: Overhead Console, Screw, Infrared Sensor & Tab
Courtesy of CHRYSLER LLC

NOTE: Typical overhead console shown in graphic.

1. Position the infrared sensor (3) onto the back of the overhead console (1). Align the tab (4) on the sensor with the slot in the console.
2. Install the screw (2) that secures the infrared sensor(s) to the overhead console. Tighten the screw to 1.2 N.m (10 in. lbs).
3. Install the overhead console.
4. Reconnect the negative battery cable.

TRANSDUCER-A/C PRESSURE

DESCRIPTION

TRANSDUCER-A/C PRESSURE

81254c0f

Fig. 56: A/C Pressure Transducer
Courtesy of CHRYSLER LLC

The A/C pressure transducer (1) sends a signal to the powertrain control module (PCM) which controls both A/C compressor clutch engagement/disengagement and electric cooling fan operation. The A/C pressure transducer is mounted on a fitting located on the A/C liquid line near the dash panel. The PCM will disengage the A/C compressor clutch when high side pressure rises above 2971 kPa (431 psi) or fall below 206 kPa (30 psi).

The fitting for the A/C pressure transducer on the A/C liquid line is equipped with an O-ring seal and contains a Schrader-type valve to allow the transducer to be serviced without discharging the refrigerant system.

OPERATION

TRANSDUCER-A/C PRESSURE

The A/C pressure transducer monitors the pressures in the high side of the refrigerant system through its

connection to a fitting on the A/C liquid line. The A/C pressure transducer will change its internal resistance in response to the pressures it monitors. The powertrain control module (PCM) or the engine control module (ECM) (depending on engine application) provides a five volt reference signal and a sensor ground to the A/C pressure transducer, then monitors the output voltage of the A/C pressure transducer on a sensor return circuit to determine refrigerant pressure. The PCM/ECM is programmed to respond to the A/C pressure transducer and other sensor inputs by controlling the operation of the A/C compressor clutch and the radiator cooling fan to help optimize A/C system performance and to protect the system components from damage. The PCM/ECM will disengage the A/C compressor clutch when high side pressure rises above 2971 kPa (431 psi) or fall below 206 kPa (30 psi). The A/C pressure transducer input to the PCM/ECM also prevents the A/C compressor clutch from engaging when ambient temperatures are below about 10° C (50° F) due to the pressure/temperature relationship of the refrigerant.

A Schrader-type valve in the A/C discharge line fitting permits the A/C pressure transducer to be removed or installed without disturbing the refrigerant in the A/C system.

The A/C pressure transducer is diagnosed using a scan tool (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

The A/C pressure transducer cannot be adjusted or repaired and it must be replaced if found inoperative or damaged.

DIAGNOSIS AND TESTING

TRANSDUCER-A/C PRESSURE

The A/C pressure transducer is tested using a scan tool (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article or appropriate Engine ELECTRICAL DIAGNOSTICS article for more information). Before testing the A/C pressure transducer, be certain that the transducer wire harness connection is clean of corrosion and properly connected. For the A/C to operate, an A/C pressure transducer voltage reading between 0.451 and 4.519 volts is required. Voltages outside this range indicate a low or high refrigerant system pressure condition to the powertrain control module (PCM). The PCM is programmed to respond to a low or high refrigerant system pressure by suppressing operation of the A/C compressor. Refer to the A/C PRESSURE TRANSDUCER VOLTAGE chart for the possible conditions indicated by the transducer voltage reading.

A/C PRESSURE TRANSDUCER VOLTAGE

Voltage	Possible Indication
0.0	1. No sensor supply voltage from PCM.
-	2. Shorted sensor circuit.
-	3. Inoperative transducer.
0.150 TO 0.450	1. Ambient temperature below 10° C (50° F).
-	2. Low refrigerant system pressure.
0.451 TO 4.519	1. Normal refrigerant system pressure.
4.520 TO 4.850	1. High refrigerant system pressure.
5.0	1. Open sensor circuit.
-	2. Inoperative transducer.

REMOVAL

TRANSDUCER-A/C PRESSURE

NOTE: It is not necessary to discharge the refrigerant system to replace the A/C pressure transducer.

Fig. 57: Wire Harness Connector, A/C Pressure Transducer, A/C Liquid Line & Dash Panel
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector (1) from the A/C pressure transducer (2) located on the A/C liquid line (3) near the dash panel (4) in the engine compartment.
3. Remove the A/C pressure transducer from the A/C liquid line and remove and discard the O-ring seal.

INSTALLATION

TRANSDUCER-A/C PRESSURE

NOTE: Use only the specified O-ring as it is made of special material for R-134a. Use only refrigerant oil of the type required for the A/C compressor.

Fig. 58: Wire Harness Connector, A/C Pressure Transducer, A/C Liquid Line & Dash Panel
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it onto the A/C pressure transducer fitting.
2. Install the A/C pressure transducer (2) onto the A/C liquid line (3) near the dash panel (4). Hand-tightened the transducer securely.
3. Connect the wire harness connector (1) to the A/C pressure transducer.
4. Reconnect the negative battery cable.

DISTRIBUTION

DUCT-CENTER INSTRUMENT PANEL

REMOVAL

DUCT-CENTER INSTRUMENT PANEL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.

Fig. 59: Instrument Panel, Screws & Center Instrument Panel Duct

1. Disconnect and isolate the negative battery cable.
2. Remove the radio from the instrument panel. Refer to **REMOVAL** .
3. Reach through the opening in the instrument panel (2) and remove the three screws (3) that secure the center instrument panel duct (1) to the instrument panel.
4. Rotate the center instrument panel duct as necessary and remove the duct.

INSTALLATION

DUCT-CENTER INSTRUMENT PANEL

Fig. 60: Instrument Panel, Screws & Center Instrument Panel Duct
 Courtesy of CHRYSLER LLC

1. Rotate the center instrument panel duct as necessary to position the duct into the instrument panel.
2. Install the three screws (3) that secure the center instrument panel duct (1) to the instrument panel.

Tighten the screws to 1.2 N.m (10 in. lbs.).

3. Install the radio. Refer to **INSTALLATION** .
4. Reconnect the negative battery cable.

DUCT-DEFROSTER

REMOVAL

DUCT-DEFROSTER

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.

NOTE: Take the proper precautions to protect the front face of the instrument panel from cosmetic damage during this service procedure.

80cb43a1

Fig. 61: Defroster Duct

NOTE: Typical rear floor heat duct shown in graphic.

1. Position the rear floor heat duct (1) into the vehicle.

2. Connect the rear floor heat duct to the floor distribution duct (5) located in front of the gear shift lever assembly (4).
3. Install the push-pin retainer (2) that secures the rear floor heat duct to the floor console bracket (3).
4. Install the floor console. Refer to **INSTALLATION** .

FILTER-PARTICULATE AIR

DESCRIPTION

FILTER-PARTICULATE AIR

812d31e6

Fig. 71: Filter-Particulate Air Description
Courtesy of CHRYSLER LLC

Some models are equipped with a particulate air filter (1) that helps purify the outside air entering the HVAC

housing. The filter is mounted in the passenger compartment, behind the glove box bin.

The filter should be replaced at least once a year or every 24,000 km (15,000 miles) and checked if heating-A/C system performance seems lower than expected. The particulate air filter is labeled with an arrow (2) to indicate the direction of air flow through the filter.

REMOVAL

FILTER-PARTICULATE AIR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.

WARNING: Always make sure the A/C-heater system is turned off and that the ignition switch is in the OFF position prior to servicing the particulate air filter. Never place fingers or other objects into the filter opening of the HVAC housing. Failure to follow this warning may result in serious injury.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 72: Removing/Installing Particulate Filter Cover
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with instrument panel removed for clarity.

1. Remove the glove box bin. Refer to **REMOVAL** .
2. Disengage the two retaining tabs (1) that secure the particulate air filter cover (2) to the passenger side of

the HVAC housing (3) and remove the cover.

Fig. 73: Particulate Filter Removal S1
Courtesy of CHRYSLER LLC

3. Remove the particulate air filter (1) from the HVAC housing (2) by pulling the filter element straight out of the housing.

INSTALLATION

FILTER-PARTICULATE AIR

NOTE: The particulate air filter is labeled with an arrow to indicate air flow direction through the filter. Make sure to properly install the particulate air filter. Failure to properly install the filter will result in the need to replace the filter sooner than required by design.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 74: Particulate Filter Install S1
Courtesy of CHRYSLER LLC

1. Install the particulate air filter (1) into the filter opening in the HVAC housing (2). Insert the particulate air filter directly into the housing with the arrow on the filter pointing to the floor.

Fig. 75: Removing/Installing Particulate Filter Cover
Courtesy of CHRYSLER LLC

2. Position the particulate air filter cover (2) to the HVAC housing (3) and engage the two retaining tabs (1) that secure the cover to the housing. Make sure the retaining tabs are fully engaged.
3. Install the glove box bin. Refer to **INSTALLATION** .

HOUSING-HVAC

DESCRIPTION

HOUSING-HVAC

NOTE: LHD model shown in illustration. RHD model similar.

Fig. 76: Air Distribution Housing, HVAC Housing & Air Inlet Housing
Courtesy of CHRYSLER LLC

All models are equipped with a common HVAC housing assembly that combines A/C and heating capabilities into a single unit mounted within the passenger compartment. The HVAC housing assembly consists of three separate housings:

Air distribution housing - The air distribution housing (1) is mounted to the top of the HVAC housing (2) and contains the heater core, blend-air and mode-air doors and door linkage.

Air inlet housing - The air inlet housing (3) is mounted to the passenger side end of the HVAC housing. The air inlet housing contains the recirculation-air door and actuator.

HVAC housing - The HVAC housing is mounted to the dash panel behind the instrument panel and contains the A/C evaporator. The HVAC housing consists of a upper and a lower housing that are attached together and has mounting provisions for the air inlet housing, air distribution housing, blower motor and blower motor resistor.

The heating-A/C system is a blend-air type system. The blend-air door controls the amount of conditioned air that is allowed to flow through, or around, the heater core.

The A/C system is designed for the use of a non-CFC, R-134a refrigerant and uses an A/C evaporator to cool and dehumidify the incoming air prior to blending it with the heated air. A temperature control determines the discharge air temperature by operating the temperature control cable, which moves the blend-air door. This allows an almost immediate control of the output air temperature of the system. The mode door cable operates the mode-air doors which direct the flow of the conditioned air out the various air outlets, depending on the mode selected. The recirculation door actuator operates the recirculation-air door which closes off the fresh air intake and recirculates the air already inside the vehicle. The electric recirculation door actuator and the blower motor are connected to the vehicle electrical system by the instrument panel wire harness. The blower motor controls the velocity of air flowing through the HVAC housing assembly by spinning the blower wheel within the HVAC housing at the selected speed by use of the blower motor resistor, which is located in the dash panel in the engine compartment.

The air distribution housing must be removed from the HVAC housing and disassembled for service of the blend-air and mode-air doors. The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door. The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator.

REMOVAL

HOUSING-AIR DISTRIBUTION

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See WARNING and CAUTION. Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The air distribution housing must be removed from the HVAC housing and disassembled for service of the heater core and the blend-air and mode-air doors.

Fig. 77: Air Distribution Housing Remove/Install Components
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Remove the HVAC housing assembly and place it on a workbench. See REMOVAL.

2. Remove the screw (4) that secures the heater core tube flange (3) to the top of the HVAC housing (5).
3. Remove the three screws (6) and three metal clips (7) that secure the air distribution housing (8) to the top of the HVAC housing.
4. Disengage the plastic retaining tab (1) that secures the front driver side of the air distribution housing to the top of the HVAC housing.
5. Tip the rear of the air distribution housing slightly upward to disengage the two plastic retaining tabs (2) that secure the front of the distribution housing to the HVAC housing and remove the distribution housing.
6. If required, disassemble the air distribution housing. See **DISASSEMBLY**.

HOUSING-AIR INLET

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door on all models.

NOTE: On RHD models, the air inlet housing must be removed from HVAC housing for service of the recirculation door actuator.

Fig. 78: Screw, Plastic Retaining Tabs, Air Inlet Housing & HVAC Housing
Courtesy of CHRYSLER LLC

NOTE: Typical housing shown in illustration. RHD model similar.

1. Remove the HVAC housing assembly and place it on a workbench. See **REMOVAL**.
2. Remove the screw (1) that helps secure the rear of the air inlet housing (3) to the top of the HVAC housing (4).
3. Carefully pull the rear of the air inlet housing upward to release the inlet housing from the top of the HVAC housing and disengage the inlet housing from the two plastic retaining tabs (2) located at the front of the HVAC housing and remove the inlet housing.
4. If required, disassemble the air inlet housing. See **DISASSEMBLY**.

HOUSING-HVAC

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 79: Suction Line Assembly, Nuts, A/C Expansion Valve, Heater Hoses & Dash Panel
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **STANDARD PROCEDURE**.
3. Partially drain the engine cooling system.
4. Remove the nut (2) that secures the A/C liquid and suction line assembly (1) to the A/C expansion valve (3).
5. Disconnect the A/C liquid and suction line assembly from the A/C expansion valve and remove and discard the O-ring seals.
6. Install plugs in, or tape over the opened refrigerant line fittings and the expansion valve ports.
7. Disconnect the heater hoses (4) from the heater core tubes. Install plugs in, or tape over the opened heater core tubes to prevent coolant spillage during housing removal.
8. Remove the nut (6) that secures the HVAC housing assembly to the engine compartment side of the dash panel (5).

Fig. 80: Removing/Installing Nuts That Secure HVAC Housing Assembly To Passenger Side Of

Dash Panel

Courtesy of CHRYSLER LLC

9. Remove the instrument panel. Refer to **REMOVAL** .
10. Remove the rear floor duct. See **REMOVAL**.
11. Remove the two nuts (1) that secure the HVAC housing assembly (2) to the passenger side of the dash panel (3).

NOTE: Use care to ensure that the interior is covered in case of loss of residual fluids from the heater and evaporator cores.

12. Pull the HVAC housing assembly rearward and remove the housing from the passenger compartment.

SCREEN-AIR INLET

Fig. 81: Air Inlet Screen, Nuts, Cowl Panel & Retaining Studs
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Remove the cowl grille. Refer to **REMOVAL** .
2. Remove the two nuts (2) that secure the air inlet screen (1) to the cowl panel (3).
3. Slide the air inlet screen inward to disengage the screen from the two retaining studs (4) and pull the screen straight up to remove it from the cowl.

DISASSEMBLY

HOUSING-AIR DISTRIBUTION

WARNING: The heater core tubes are not serviced separately from the heater core.
The heater core tubes should not be repositioned, loosened or removed

from the heater core. Failure to follow this warning could result in a coolant leak and possible personal injury or death.

NOTE: The air distribution housing must be removed from the HVAC housing and disassembled for service of the heater core and the mode-air and blend-air doors.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 82: HVAC Housing Assembly
Courtesy of CHRYSLER LLC

1. Remove the HVAC housing assembly and place it on a workbench. See **REMOVAL**.
2. Remove the air distribution housing (4) from the HVAC housing. See **REMOVAL**.
3. Remove the screws (3) that secure the mode door actuator (2) and the blend door actuator (6) to the actuator mounting bracket (5) located on the driver side of the air distribution housing and remove the actuators.
4. Remove the three screws (1) that secure the actuator mounting bracket to the air distribution housing and remove the bracket.
5. Remove the two screws (8) that secure the driver side front floor duct (7) to the air distribution housing and remove the duct

Fig. 83: Removing/Installing Defrost Door Lever/Gear Assembly, Mode Door Cam, Panel Door Gear, Blend Door Gear, Blend Door Lever And Blend Door Cam From Driver Side Of Air Distribution Housing

Courtesy of CHRYSLER LLC

6. Remove the defrost door lever and gear assembly (1), mode door cam (2), panel door gear (3), blend door gear (4), blend door lever (6) and the blend door cam (5) from the driver side of the air distribution housing (7).
7. If equipped with the 2.8L diesel engine, remove the electric positive temperature coefficient (PTC) heater unit from the air distribution housing. See **REMOVAL**.

Fig. 84: Air Distribution Housing Assembly

Courtesy of CHRYSLER LLC

8. Remove the two screws (1) that secure the upper front passenger side floor duct (7) to the passenger side of the air distribution housing (8) and remove the duct.

NOTE: If the foam seal for the heater core tube flange is deformed or damaged, it

must be replaced.

9. Carefully remove the foam seal (3) from the heater core tube flange (4). If the seal is deformed or damaged, it must be replaced.
10. Remove the screw (2) that secures the heater core tube flange to the air distribution housing.
11. Disengage the plastic retainer (5) from around the heater core tubes (6) and remove the flange.

Fig. 85: Plastic Retaining Tabs, Heater Core & Air Distribution Housing
Courtesy of CHRYSLER LLC

NOTE: If the foam insulator around the heater core is deformed or damaged, the insulator must be replaced.

12. Disengage the four plastic retaining tabs (1) that secure the heater core (2) to the passenger side of the air distribution housing (3) and carefully remove the heater core from the housing.

Fig. 86: Foam Seal, Parting Line, Air Distribution Housing, Parting Line, Plastic Retaining Tabs &

Screw

Courtesy of CHRYSLER LLC

NOTE: If the seal on any air door is deformed or damaged, that air door must be replaced.

1. Install the floor-air door (1), blend-air door (2), panel-air door (3) and the defrost-air door (4) into the driver side of the air distribution housing (5) as required. Align the air door pivot shafts with the holes in the housing.

818c6355

Fig. 98: Air Deflector Vane Assembly & Air Distribution Housing
Courtesy of CHRYSLER LLC

2. Install the air deflector vane assembly (1) into the passenger side of the air distribution housing (2). Slide the vane assembly into the track in the housing and engage the two plastic retaining tabs. Make sure the retaining tabs are fully engaged.

818c6357

Fig. 99: Foam Seal, Parting Line, Air Distribution Housing, Parting Line, Plastic Retaining Tabs & Screw
Courtesy of CHRYSLER LLC

3. Align the air door pivot shafts with the holes in the passenger side of the air distribution housing (3) and carefully install passenger side of the air distribution housing (1) onto the driver side of the housing.
4. Engage the four plastic retaining tabs (4) that secure the two halves of the air distribution housing together. Make sure the retaining tabs are fully engaged.
5. Install the retaining screw (5) that secures the two halves of the air distribution housing together at the bottom of the housing, near the center. Tighten the screw to 1.2 N.m (10 in lbs.).

NOTE: If the foam seal on top of the air distribution housing is deformed or damaged, it must be replaced.

6. Inspect the foam seal (1), especially along the parting line (2) of the two halves of the air distribution housing. Replace the seal if it is deformed or damaged.

Fig. 100: Plastic Retaining Tabs, Heater Core & Air Distribution Housing
Courtesy of CHRYSLER LLC

NOTE: If the foam insulator around the heater core is deformed or damaged, the insulator must be replaced.

7. Carefully install the heater core (2) into the passenger side of the air distribution housing (3) and engage the four plastic retainer tabs (1) that secure the heater core to the housing. Make sure the retaining tabs are fully engaged.

Fig. 101: Air Distribution Housing Assembly
Courtesy of CHRYSLER LLC

8. Position the heater core tube flange (4) over the heater core tubes (6) and onto the to the passenger side of the air distribution housing (8).
9. Engage the plastic retainer (5) around the heater core tubes. Make sure the retainer is fully engaged.
10. Install the screw (2) that secures the heater core tube flange to the air distribution housing. Tighten the screw to 1.2 N.m (10 in lbs.).
11. Install the upper front passenger side floor duct (7) onto the air distribution housing and install the two retaining screws (1). Tighten the screws to 1.2 N.m (10 in lbs.).

NOTE: If the foam seal for the heater core tube flange is deformed or damaged, it must be replaced.

12. Install the foam seal (3) onto the heater core tube flange.

618c6353

Fig. 102: Removing/Installing Defrost Door Lever/Gear Assembly, Mode Door Cam, Panel Door Gear, Blend Door Gear, Blend Door Lever And Blend Door Cam From Driver Side Of Air Distribution Housing

Courtesy of CHRYSLER LLC

13. If equipped with the 2.8L diesel engine, install the electric positive temperature coefficient (PTC) heater unit. See **INSTALLATION**.
14. Install the blend door cam (5), blend door lever (6), blend door gear (4), panel door gear (3), mode door cam (2), and the defrost door lever and gear assembly (1) onto the driver side of the air distribution housing (7).

Fig. 103: HVAC Housing Assembly
Courtesy of CHRYSLER LLC

15. Install the driver side front floor duct (7) onto the driver side of the air distribution housing (4) and install the two retaining screws (8). Tighten the screws to 1.2 N.m (10 in lbs.).
16. Position the actuator mounting bracket (5) onto the air distribution housing and install the three retaining screws (1). Tighten the screws to 1.2 N.m (10 in lbs.).
17. Position the mode door actuator (2) and the blend door actuator (6) onto the actuator mounting bracket. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the door linkage.
18. Install the screws (3) that secure the mode and blend door actuators to the actuator mounting bracket. Tighten the screws to 1.2 N.m (10 in lbs.).
19. Install the air distribution housing onto the HVAC housing. See **INSTALLATION**.
20. Install the HVAC housing assembly. See **INSTALLATION**.

HOUSING-AIR INLET

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 104: Foam Seal, Parting Line, Recirculation-Air Door, Recirculation Door Actuator, Screws & Air Inlet Housing

Courtesy of CHRYSLER LLC

NOTE: If a rubber seal on the recirculation air-door is deformed or damaged, the air-door must be replaced.

1. Install the recirculation-air door (3) into the two halves of the air inlet housing (6 and 7). Align the air door pivot shaft with the holes in the housing halves.
2. Carefully install the two halves of the air inlet housing together and engage the three plastic retaining tabs. Make sure the retaining tabs are fully engaged.
3. Position the recirculation door actuator (4) to the air inlet housing. Make sure the actuator output shaft is properly aligned to the recirculation door pivot shaft. If necessary, rotate the actuator slightly to engage the splines on the output shaft with those in the pivot shaft.
4. Install the two screws (5) that secure the recirculation door actuator to the air inlet housing. Tighten the screws to 1.2 N.m (10 in lbs.).

NOTE: If the foam seal on top of the air inlet housing is deformed or damaged, it must be replaced.

5. Inspect the foam seal (1), especially along the parting line (2) of the two halves of the air inlet housing. Replace the seal if it is deformed or damaged.

818c1ee5

Fig. 105: Air Distribution Housing, HVAC Housing & Air Inlet Housing

6. Install the air inlet housing (3) onto the HVAC housing (2). See **INSTALLATION**.
7. Install the HVAC housing assembly. See **INSTALLATION**.

HOUSING-HVAC

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See **STANDARD PROCEDURE**. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** chart to determine how much oil should be added to the refrigerant system. See **STANDARD PROCEDURE**.

NOTE: If the A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 106: Air Deflector Vane, HVAC Housing & Foam Seal
 Courtesy of CHRYSLER LLC

1. If removed, install the foam seal (3) onto the condensate drain located at the bottom of the HVAC housing (2).
2. Install the air deflector vane (1) into the lower half of the HVAC housing. Make sure the retainers are fully engaged.

Fig. 107: A/C Evaporator, Foam Insulator, HVAC Housing, Rubber Seal & Tapping Block
 Courtesy of CHRYSLER LLC

NOTE: Make sure the rubber seal for the evaporator tubes and tapping block is properly positioned in the HVAC housing opening.

3. If removed, install the rubber seal (4) over the evaporator tubes and tapping block (5).

NOTE: Make sure that the foam insulator around the A/C evaporator is properly positioned within the HVAC housing.

- Carefully install the A/C evaporator (1) and foam insulator (2) into the lower half of the HVAC housing (3).

Fig. 108: Foam Seal, HVAC Housing, Screws, Plastic Retaining Tabs & Metal Clips
Courtesy of CHRYSLER LLC

- Install the two halves of the HVAC housing (2 and 6) together and engage the four plastic retaining tabs (4). Make sure the retaining tabs are fully engaged.

NOTE: Be sure to install the screws that secure the two halves of the HVAC housing together located at the bottom of the HVAC housing.

- Install the seven screws (5) and two metal clips (3) that secure the two halves of the HVAC housing together. Tighten the screws to 1.2 N.m (10 in lbs.). Make sure the metal clips are fully engaged to the housing halves.
- Install the foam seal (1) onto the front of the two HVAC housing halves.

Fig. 109: Removing/Installing Evaporator Temperature Sensor From Front Of HVAC Housing

Courtesy of CHRYSLER LLC

8. Install the evaporator temperature sensor (1) into the front of the HVAC housing (2). Make sure the sensor is fully engaged to the housing.

Fig. 110: Screws, HVAC Housing, Blower Motor & Blower Motor Resistor
Courtesy of CHRYSLER LLC

9. Position the blower motor (4) into the bottom of the HVAC housing (2) and install the three retaining screws (3). Tighten the screws to 1.2 N.m (10 in. lbs.).
10. Position the blower motor resistor (5) into the HVAC housing and install the two retaining screws (1). Tighten the screws to 1.2 N.m (10 in. lbs.).

Fig. 111: Air Distribution Housing, HVAC Housing & Air Inlet Housing
Courtesy of CHRYSLER LLC

11. Install the air inlet housing (3) onto the HVAC housing (2). See **INSTALLATION**.
12. Install the air distribution housing (1) onto the HVAC housing. See **INSTALLATION**.

13. Install the passenger side lower front floor duct. See **INSTALLATION**.

NOTE: **If the heater core is being replaced, flush the cooling system. Refer to STANDARD PROCEDURE .**

14. Install the HVAC housing assembly. See **INSTALLATION**.

15. If the A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. See **STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

INSTALLATION

HOUSING-AIR DISTRIBUTION

Fig. 112: Air Distribution Housing Remove/Install Components
Courtesy of CHRYSLER LLC

NOTE: **LHD model shown in illustration. RHD model similar.**

1. Position the air distribution housing (8) onto the top of the HVAC housing (5) and engage the two plastic retaining tabs (2) that secure the front of the distribution housing to the HVAC housing.
2. Engage the plastic retaining tab (1) that secures the front driver side of the air distribution housing to the HVAC housing. Make sure the passenger side floor ducts are properly connected to each other.
3. Install the three metal retaining clips (7) and three screws (6) that secure the air distribution housing to the HVAC housing. Tighten the screws to 1.2 N.m (10 in. lbs.).

NOTE: **If the foam seal for the heater core tube flange is deformed or damaged, it must be replaced.**

4. Install the screw (4) that secures the heater core tube flange (3) to the top of the HVAC housing. Tighten the screw to 1.2 N.m (10 in. lbs.).

NOTE: If the heater core is being replaced, flush the cooling system. Refer to **STANDARD PROCEDURE** .

5. Install the HVAC housing assembly. See **INSTALLATION**.

HOUSING-AIR INLET

Fig. 113: Screw, Plastic Retaining Tabs, Air Inlet Housing & HVAC Housing
Courtesy of CHRYSLER LLC

NOTE: Typical housing shown in illustration. RHD model similar.

1. Position the air inlet housing (3) to the top of the HVAC housing (4) and engage the front of the inlet housing to the two plastic retaining tabs (2) located on the top of the HVAC housing.
2. Firmly push down on the rear of the air inlet housing and engage the inlet housing to the HVAC housing. Make sure the two housings are fully engaged to each other.
3. Install the screw (1) that helps secure the rear of the air inlet housing to the HVAC housing. Tighten the screw to 1.2 N.m (10 in. lbs.).
4. Install the HVAC housing assembly. See **INSTALLATION**.

HOUSING-HVAC

NOTE: LHD model shown in illustrations. RHD model similar.

818d3ce3

Fig. 114: Removing/Installing Nuts That Secure HVAC Housing Assembly To Passenger Side Of Dash Panel

Courtesy of CHRYSLER LLC

1. Position the HVAC housing assembly (2) to the passenger side of the dash panel (3). Be certain that the housing is correctly located over the two dash panel mounting studs.
2. Install the two nuts (1) that secure the HVAC housing assembly to the dash panel. Tighten the nuts to 4.5 N.m (40 in. lbs.).
3. Install the rear floor duct. See **INSTALLATION**.
4. Install the instrument panel. Refer to **INSTALLATION**.

818c5aa1

Fig. 115: Suction Line Assembly, Nuts, A/C Expansion Valve, Heater Hoses & Dash Panel

Courtesy of CHRYSLER LLC

5. Install the nut (6) that secures the HVAC housing assembly to the engine compartment side of the dash panel (5). Tighten the nut to 4.5 N.m (40 in. lbs.).
6. Remove the previously installed plugs or caps and connect the heater hoses (4) to the heater core tubes.

7. Remove the tape or plugs from the refrigerant line fittings and the expansion valve ports.
8. Lubricate new rubber O-rings with clean refrigerant oil and install them onto the liquid and suction line fittings. Use only the specified O-ring seals as they are made of special materials compatible to the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
9. Connect the A/C liquid and suction line assembly (1) to the A/C expansion valve (3).
10. Install the nut (2) that secures the A/C liquid and suction line assembly to the A/C expansion valve. Tighten the nut to 23 N.m (17 ft. lbs.).
11. Reconnect the negative battery cable.
12. If the heater core is being replaced, flush the cooling system. Refer to **STANDARD PROCEDURE** .
13. Refill the engine cooling system. Refer to **STANDARD PROCEDURE** .
14. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
15. Charge the refrigerant system. See **STANDARD PROCEDURE**.
16. Initiate the Actuator Calibration function using a scan tool. See **DIAGNOSIS AND TESTING**.

SCREEN-AIR INLET

Fig. 116: Air Inlet Screen, Nuts, Cowl Panel & Retaining Studs
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Position the air inlet screen (1) into the cowl panel (3) and fully engage the screen onto the two retaining studs (4).
2. Install the air inlet screen onto the cowl panel and install the two retaining nuts (4). Tighten the nuts to 2.3 N.m (20 in. lbs.).
3. Install the cowl grille. Refer to **INSTALLATION** .

MOTOR-BLOWER

DESCRIPTION

MOTOR-BLOWER

Fig. 117: Identifying Blower Motor
Courtesy of CHRYSLER LLC

NOTE: Typical blower motor shown in graphic,

The blower motor (1) is a 12-volt, direct current (DC) motor mounted within a plastic housing with three integral mounting tabs (4), an integral wire harness connector (3) and a squirrel cage-type blower wheel (2) that is secured to the blower motor shaft. The blower motor wheel is positioned within the HVAC air inlet housing, which is mounted to the passenger side end of the HVAC housing.

The blower motor can be accessed for service from underneath the instrument panel.

OPERATION

MOTOR-BLOWER

The blower motor is used to control the velocity of air moving through the HVAC housing by spinning the blower wheel within the HVAC air inlet housing at the selected speed.

The blower motor will operate whenever the ignition switch is in the Run position and the blower motor control is in any position except Off. The blower motor receives battery current through the totally integrated power module (TIPM) whenever the ignition switch is in the Run position.

Blower motor speed is controlled by regulating the ground path through or around the blower motor resistor and through the blower motor control located within the A/C-heater control.

The blower motor can be accessed for service from underneath the instrument panel.

NOTE: The blower motor is supplied with a 12V feed from the TIPM, through the blower motor resistor, whenever the ignition switch is in the RUN position. Due to an open circuit condition within the blower motor control switch the TIPM is

UNABLE to detect an OPEN circuit for the blower motor.

The blower motor control system is diagnosed using a scan tool (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

The blower motor and blower motor wheel are factory balanced as an assembly and cannot be adjusted or repaired and must be replaced if found inoperative or damaged.

DIAGNOSIS AND TESTING

MOTOR-BLOWER

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: The blower motor is supplied with a 12V feed from the TIPM, through the blower motor resistor, whenever the ignition switch is in the RUN position. Due to an open circuit condition within the blower motor control switch the TIPM is **UNABLE to detect an OPEN circuit for the blower motor.**

To determine if an open condition exists within the blower motor circuit wiring, it is necessary to disconnect the negative battery cable and check for continuity within the blower motor circuits using an ohmmeter.

OPERATION

Possible causes of an inoperative blower motor include:

- Open fuse
- Inoperative blower motor resistor
- Inoperative blower motor switch
- Inoperative blower motor
- Inoperative blower motor circuit wiring or wire harness connectors

NOISE

To determine if the blower motor is the source of the noise, simply switch the blower motor from Off to On. To verify that the blower motor is the source of the noise, unplug the blower motor wire harness connector and operate the heater-A/C system. If the noise goes away, possible causes include:

- Foreign material on fresh air inlet screen
- Foreign material in blower wheel

Foreign material in HVAC housing
Improper blower motor mounting
Deformed or damaged blower wheel
Worn blower motor bearings or brushes

VIBRATION

Possible causes of a blower motor vibration include:

Improper blower motor mounting
Foreign material in blower wheel
Deformed or damaged blower wheel
Worn blower motor bearings

REMOVAL

MOTOR-BLOWER

NOTE: The blower motor is located on the bottom of the passenger side of the HVAC housing. The blower motor can be removed from the vehicle without having to remove the HVAC housing.

Fig. 118: HVAC Housing, Screws, Instrument Panel Wire Harness Connector & Blower Motor
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. If equipped, remove the silencer from below the passenger side of the instrument panel. Refer to **REMOVAL** .

3. From underneath the instrument panel, disconnect the instrument panel wire harness connector (3) from the blower motor (4).
4. Remove the three screws (2) that secure the blower motor to the bottom of the HVAC housing (1) and remove the blower motor.

INSTALLATION

MOTOR-BLOWER

Fig. 119: HVAC Housing, Screws, Instrument Panel Wire Harness Connector & Blower Motor
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Position the blower motor (4) into the bottom of the HVAC housing (1).
2. Install the three screws (2) that secure the blower motor to the HVAC housing. Tighten the screws to 1.2 N.m (10 in. lbs.).
3. Connect the instrument panel wire harness connector (3) to the blower motor.
4. If equipped, install the silencer below the passenger side of the instrument panel. Refer to **INSTALLATION**.
5. Reconnect the negative battery cable.

OUTLET-AIR

DESCRIPTION

OUTLET-AIR

81064e6c

Fig. 120: Instrument Panel Air Outlet Locations
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

There are two defroster air outlets (1) located on the top of the instrument panel (4). The airflow from the defroster outlets is directed by fixed vanes and cannot be adjusted. The defroster air outlets are serviced with the defroster grilles (2). Refer to **REMOVAL** .

There are two side window demister air outlets (3). One located at each end of the instrument panel near the A-pillars. The airflow from the side window demister air outlets is directed by fixed vanes and cannot be adjusted. The side window demister air outlets are integral to the left and right side instrument panel air outlets and cannot be serviced separately.

There are four instrument panel air outlets (5). One air outlet is located near each outboard end of the instrument panel facing the rear of the vehicle and the other two outlets are located near the top of the instrument panel center bezel. The driver side instrument panel air outlet is serviced with the instrument cluster bezel and the center air outlets are service with the center bezel (refer to **INSTRUMENT PANEL** for further information).

Each of the instrument panel air outlets contain an air outlet grille (6) that is used to direct or shut off the flow of the conditioned air leaving the instrument panel.

REMOVAL

OUTLET-AIR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible serious or fatal injury.

NOTE: The driver side instrument panel air outlet is serviced with the instrument cluster bezel and the center air outlets are service with the center bezel (refer to INSTRUMENT PANEL for further information).

Fig. 121: Passenger Side Air Outlet Grille
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the passenger side defroster grille. Refer to REMOVAL .
3. Remove the passenger side air bag. Refer to REMOVAL .
4. Remove the passenger side A-pillar trim molding. Refer to REMOVAL .
5. Remove the screw (1) that secures the top of the air outlet (2) to the instrument panel (4).
6. Using a trim stick C-4755 or equivalent (3), gently pry the lower portion of the air outlet rearward to disengage the two metal retaining clips from the instrument panel and remove the outlet.
7. If required, carefully disengage the plastic retaining tabs that secure the air outlet grille to the back of air outlet and remove the grille from the outlet.

INSTALLATION

OUTLET-AIR

NOTE: The driver side instrument panel air outlet is serviced with the instrument cluster bezel and the center air outlets are service with the center bezel (refer to INSTRUMENT PANEL for further information).

Fig. 122: Passenger Side Air Outlet Grille
Courtesy of CHRYSLER LLC

1. If removed, carefully install the air outlet grille onto the back of air outlet and engage the plastic retaining tabs that secure grille to the outlet. Make sure the retaining tabs are fully engaged.
2. Position the instrument panel air outlet to the instrument panel and engage the two metal retaining clips to the instrument panel. Make sure the retainers are fully engaged.
3. Install the screw (1) that secures the top of the air outlet (2) to the instrument panel (4). Tighten the screw to 1.2 N.m (10 in. lbs.).
4. Install the A-pillar trim molding. Refer to **INSTALLATION** .
5. Install the passenger side air bag. Refer to **INSTALLATION** .
6. Install the defroster grille. Refer to **INSTALLATION** .
7. Reconnect the negative battery cable.

PLUMBING

DESCRIPTION

REFRIGERANT LINES

The A/C refrigerant lines and hoses are used to carry the refrigerant between the various A/C system components. The refrigerant lines and hoses for the R-134a A/C system consist of a barrier-hose design with a nylon tube sandwiched between rubber layers. The nylon tube helps to contain the R-134a refrigerant, which has a small molecular structure. The ends of the refrigerant lines are made from lightweight aluminum with brazed fittings.

Any kinks or sharp bends in the refrigerant lines and hoses will reduce the capacity of the entire A/C system and can reduce the flow of refrigerant within the system.

OPERATION

REFRIGERANT LINES

High pressures are produced in a refrigerant system when the A/C compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

Depending on vehicle, model and market application, refrigerant lines are connected to each other or other A/C system components with block-type or quick-connect type fittings. To ensure the integrity of the refrigerant system, O-rings and/or gaskets may be used to seal the refrigerant system connections.

The refrigerant lines and hoses cannot be repaired and must be replaced if leaking or damaged.

WARNING

WARNING

WARNING: The A/C system contains refrigerant under high pressure. Repairs should only be performed by qualified service personnel. Serious or fatal injury may result from improper service procedures.

WARNING: Avoid breathing the refrigerant and refrigerant oil vapor or mist. Exposure may irritate the eyes, nose, and/or throat. Wear eye protection when servicing the A/C refrigerant system. Serious eye injury can result from direct contact with the refrigerant. If eye contact occurs, seek medical attention immediately.

WARNING: Do not expose the refrigerant to open flame. Poisonous gas is created when refrigerant is burned. An electronic leak detector is recommended. Serious or fatal injury may result from improper service procedures.

WARNING: If accidental A/C system discharge occurs, ventilate the work area before resuming service. Large amounts of refrigerant released in a closed work area will displace the oxygen and cause suffocation and serious or fatal injury.

WARNING: The evaporation rate of R-134a refrigerant at average temperature and altitude is extremely high. As a result, anything that comes in contact with the refrigerant will freeze. Always protect the skin or delicate objects from direct contact with the refrigerant.

WARNING: The R-134a service equipment or the vehicle refrigerant system should not be pressure tested or leak tested with compressed air. Some mixtures of air and R-134a have been shown to be combustible at elevated pressures. These mixtures are potentially dangerous, and may result in fire or explosion causing property damage and serious or fatal injury.

WARNING: The engine cooling system is designed to develop internal pressures up to 145 kilopascals (21 pounds per square inch). Do not remove or loosen the coolant pressure cap, cylinder block drain plugs, radiator drain, radiator hoses, heater hoses, or hose clamps while the engine cooling system is hot and under pressure. Allow the vehicle to cool for a minimum of 15 minutes before opening the cooling system for service. Failure to observe this warning can result in serious burns from the heated engine coolant.

CAUTION

CAUTION

CAUTION: Never add R-12 to a refrigerant system designed to use R-134a. Do not use R-12 equipment or parts on an R-134a A/C system. These refrigerants are not compatible and damage to the A/C system will result.

CAUTION: Never use R-12 refrigerant oil in an A/C system designed to use R-134a refrigerant oil. These refrigerant oils are not compatible and damage to the A/C system will result.

CAUTION: The use of A/C system sealers may result in damage to A/C refrigerant recovery/evacuation/recharging equipment and/or A/C system. Many federal, state/provincial and local regulations prohibit the recharge of A/C systems with known leaks. DaimlerChrysler recommends the detection of A/C system leaks through the use of approved leak detectors and fluorescent leak detection dyes. Vehicles found with A/C system sealers should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners voids the warranty for the A/C system.

CAUTION: Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: If equipped, do not remove the secondary retention clip from any spring-lock coupler connection while the refrigerant system is under pressure. Recover the refrigerant before removing the secondary retention clip. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: The internal parts of the A/C system will remain stable as long as moisture-free refrigerant and refrigerant oil is used. Abnormal amounts of dirt, moisture or air can upset the chemical stability. This may cause

operational troubles or even serious damage if present in more than very small quantities. Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system. Keep service tools and the work area clean. Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug. This will prevent contamination from entering the A/C system.

CAUTION: Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.

CAUTION: Do not overcharge the refrigerant system. Overcharging will cause excessive compressor head pressure and can cause compressor noise and A/C system failure.

DIAGNOSIS AND TESTING

REFRIGERANT SYSTEM LEAKS

WARNING: R-134a service equipment or vehicle A/C system should not be pressure tested or leak tested with compressed air. Mixture of air and R-134a can be combustible at elevated pressures. These mixtures are potentially dangerous and may result in fire or explosion causing property damage and possible serious or fatal injury.

Avoid breathing A/C refrigerant and lubricant vapor or mist. Exposure may irritate eyes, nose and throat. Use only approved service equipment meeting SAE requirements to discharge an R-134a system. If accidental system discharge occurs, ventilate work area before resuming service.

NOTE: If the A/C system refrigerant charge is empty or low, a leak in the A/C system is likely. Visually inspect all A/C lines, fittings and components for an oily residue. Oil residue can be an indicator of an A/C system leak location.

NOTE: The only way to correctly determine if the A/C system is fully charged with refrigerant to perform the A/C Performance Test. See **DIAGNOSIS AND TESTING**.

Connect a suitable manifold gauge set and determine if the static A/C system pressure is above or below 345 kPa (50 psi). See **STANDARD PROCEDURE**. If less than 345 kPa (50 psi), proceed to **SYSTEM EMPTY**. If greater than 345 kPa (50 psi), go to **SYSTEM LOW**.

SYSTEM EMPTY

1. Evacuate the refrigerant system to the lowest degree of vacuum possible (approximately -88 kPa (- 26 in. Hg) or greater vacuum). See **STANDARD PROCEDURE**. Determine if the system holds a vacuum for 15 minutes. If the refrigerant system will not maintain vacuum level, proceed to step 2. If vacuum is held, a leak is probably not present.
2. Prepare and dispense 0.284 kilograms (10 ounces) of R-134a refrigerant into the evacuated refrigerant system. See **STANDARD PROCEDURE**, and proceed to step 1 of the System Low procedure.

SYSTEM LOW

1. Position the vehicle in a wind-free work area. This will aid in detecting small leaks.
2. Operate the heating-A/C system with the engine at idle under the following conditions for at least 5 minutes.
 - Doors or windows open
 - Transmission in Park or Neutral with the parking brake set (depending on transmission application)
 - A/C compressor engaged with A/C-heater controls set to Recirculation mode (max-A/C), full cool, panel mode and high speed blower.

CAUTION: A leak detector only designed for R-12 refrigerant will not detect leaks in an R-134a refrigerant system.

3. Shut the vehicle Off and wait 2-7 minutes. Then use an electronic leak detector that is designed to detect R-134a refrigerant and search for leaks. Fittings, lines or components that appear to be oily usually indicate a refrigerant leak. To inspect the A/C evaporator for leaks, insert the leak detector probe into the passenger side floor duct. A dye for R-134a is available to aid in leak detection. Use only Chrysler approved refrigerant dye.

STANDARD PROCEDURE

REFRIGERANT SYSTEM CHARGE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See WARNING and CAUTION. Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The Underhood HVAC Specification Label contains the refrigerant fill specification of the vehicle being serviced.

After all refrigerant system leaks have been repaired and the refrigerant system has been evacuated, a refrigerant charge can be injected into the system. See **STANDARD PROCEDURE**.

An R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to charge the refrigerant system with R-134a refrigerant. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

CHARGING PROCEDURE

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you **MUST** replenish any oil lost during the recovery process. Refer the equipment manufacturer instructions for more information.

1. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
2. Connect an R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2210 to the refrigerant system.
3. Refer to **A/C SYSTEM** or the Underhood HVAC Specification Label for the proper amount of the refrigerant charge.
4. Measure the proper amount of refrigerant charge and heat it to 52° C (125° F) with the charging station. See the operating instructions supplied by the equipment manufacturer for proper use of this equipment.
5. Open both the suction and discharge valves, then open the charge valve to allow the heated refrigerant to flow into the system.
6. When the transfer of refrigerant has stopped, close both the suction and discharge valves.
7. If all of the refrigerant charge did not transfer from the dispensing device, open all of the windows in the vehicle and set the heating-A/C system controls so that the A/C compressor is engaged and the blower motor is operating at its lowest speed setting. Run the engine at a steady high idle (about 1400 rpm). If the A/C compressor does not engage, test the compressor clutch circuits and repair as required.

WARNING: Take care not to open the discharge (high pressure) valve at this time. Failure to follow this warning may result in serious or fatal injury.

8. Open the low-side valve to allow the remaining refrigerant to transfer to the refrigerant system.
9. Disconnect the charging station from the refrigerant system service ports.
10. Reinstall the caps onto the refrigerant system service ports.

REFRIGERANT SYSTEM EVACUATE

NOTE: Special effort must be used to prevent moisture from entering the A/C system oil. Moisture in the oil is very difficult to remove and will cause a reliability problem with the A/C compressor.

If an A/C compressor designed to use R-134a refrigerant is left open to the atmosphere for an extended period of time. It is recommended that the refrigerant oil be drained and replaced with new oil or a new A/C compressor be used. This will eliminate the possibility of contaminating the refrigerant system.

If the refrigerant system has been open to the atmosphere, it must be evacuated before the system can be filled. Moisture and air mixed with the refrigerant will raise the compressor head pressure above acceptable operating levels. This will reduce the performance of the A/C system and damage the A/C compressor. Moisture will boil at near room temperature when exposed to vacuum. To evacuate the refrigerant system:

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

1. Recover the refrigerant system. See STANDARD PROCEDURE.
2. Connect a suitable charging station, refrigerant recovery machine or a manifold gauge set with vacuum pump and refrigerant recovery equipment. See STANDARD PROCEDURE.
3. Open the suction and discharge valves and start the vacuum pump. The vacuum pump should run a minimum of 45 minutes prior to charge to eliminate all moisture in system. When the suction gauge reads to the lowest degree of vacuum possible (approximately -88 kPa (- 26 in. Hg) or greater) for 30 minutes, close all valves and turn off vacuum pump. If the system fails to reach specified vacuum, the refrigerant system likely has a leak that must be corrected. If the refrigerant system maintains specified vacuum for at least 30 minutes, start the vacuum pump, open the suction and discharge valves. Then allow the system to evacuate an additional 10 minutes.
4. Close all valves. Turn off and disconnect the vacuum pump.
5. Charge the refrigerant system. See STANDARD PROCEDURE.

REFRIGERANT SYSTEM RECOVERY

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See WARNING and CAUTION. Failure to follow the warnings and cautions may result in serious or fatal injury.

Fig. 123: Identifying R-134a Refrigerant Recovery/Recycling/Charging Station
 Courtesy of CHRYSLER LLC

An R-134a refrigerant recovery/recycling/charging station (1) that meets SAE standard J2210 must be used to recover the refrigerant from the R-134a refrigerant system. Refer to the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.

REFRIGERANT SYSTEM SERVICE EQUIPMENT

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

WARNING: Eye protection must be worn when servicing an air conditioning refrigerant system. Turn off (rotate clockwise) all valves on the equipment being used, before connecting to or disconnecting from the refrigerant system. Failure to observe these warnings may result in personal injury or death.

Fig. 124: Identifying R-134a Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER LLC

When servicing the A/C system, a R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2210 must be used (1). Contact an automotive service equipment supplier for refrigerant recovery/recycling/charging equipment. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

80add30c

Fig. 125: Manifold Gauge Set - Typical
 Courtesy of CHRYSLER LLC

A manifold gauge set (1) may be needed with some recovery/recycling/charging equipment. The manifold gauge set should have manual shut-off valves (2 and 6), or automatic back-flow valves located at the service port connector end of the manifold gauge set hoses (4 and 5). This will prevent refrigerant from being released into the atmosphere.

MANIFOLD GAUGE SET CONNECTIONS

CAUTION: Do not use an R-12 manifold gauge set on an R-134a system. The refrigerants are not compatible and system damage will result.

LOW PRESSURE GAUGE HOSE - The low pressure hose (Blue with Black stripe) attaches to the low-side service port. This port is located on the A/C suction line near the rear of the engine compartment.

HIGH PRESSURE GAUGE HOSE - The high pressure hose (Red with Black stripe) attaches to the high-side service port. This port is located on the A/C liquid line near the front of the engine compartment.

RECOVERY, RECYCLING, EVACUATION AND CHARGING HOSE - The center manifold hose (Yellow, or White, with Black stripe) is used to recover, evacuate, and charge the refrigerant system. When the low or high pressure valves on the manifold gauge set are opened, the refrigerant in the system will escape through this hose.

COMPRESSOR-A/C

DESCRIPTION

COMPRESSOR-A/C

812c0f81

Fig. 126: Denso 10S17 Compressor
Courtesy of CHRYSLER LLC

The A/C system on models equipped with the 3.7L engine use a Visteon HS-18 A/C compressor (1). This A/C compressor is a 10 cylinder reciprocating swash plate-type compressor that uses an electrically operated clutch to engage and disengage the A/C compressor from the engine accessory drive belt.

The HS-18 A/C compressor has a fixed displacement of 180 cubic centimeters (10.9 cubic inches) and has the suction and discharge ports (2) located on the compressor cylinder head (3) at the rear of the compressor and a label which identifies the use of R-134a refrigerant.

COMPRESSOR-A/C

Fig. 127: A/C Compressor Components
Courtesy of CHRYSLER LLC

The A/C system on models equipped with the 2.8L and 4.0L engine use a Zexel DKS-17DS A/C compressor (1). This A/C compressor is a ten cylinder, double-acting swash plate-type compressor that uses an electrically operated clutch (2) to engage and disengage the A/C compressor from the engine accessory drive belt.

The DKS-17DS A/C compressor has a fixed displacement of 175.5 cubic centimeters (10.7 cubic inches) and has the suction and discharge ports (6) located on the compressor cylinder block (3). This A/C compressor also has an integral high pressure relief valve (4) located on the cylinder head (5) and a label which identifies the use of R-134a refrigerant.

VALVE-HIGH PRESSURE RELIEF-A/C COMPRESSOR

A high pressure relief valve is located on the A/C compressor. This mechanical valve is designed to vent refrigerant from the A/C system to protect against damage to the A/C compressor and other A/C system components, caused by condenser air flow restriction or an overcharge of refrigerant.

OPERATION

COMPRESSOR-A/C

The A/C compressor is driven by the engine through an electric clutch, drive pulley and belt arrangement. The A/C compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the

refrigerant.

The A/C compressor draws in low-pressure refrigerant vapor from the A/C evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the A/C condenser through the compressor discharge port.

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. See STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level can prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

The A/C compressor cannot be repaired and must be replaced if inoperative or damaged. The compressor clutch, pulley and bearing assembly, and clutch field coil are available for service. If an internal failure of the A/C compressor has occurred, the A/C receiver/drier must also be replaced. See REMOVAL.

VALVE-HIGH PRESSURE RELIEF-A/C COMPRESSOR

The high pressure relief valve vents refrigerant from the A/C system when a discharge pressure of 3430 to 3930 kPa (497 to 570 psi) or above is reached. The high pressure relief valve closes with a minimum discharge pressure of 2990 kPa (4370 psi) is reached.

The high pressure relief valve vents only enough refrigerant to reduce the A/C system pressure, and then re-seats itself. The majority of the refrigerant is conserved in the A/C system. If the high pressure relief valve vents refrigerant, it does not mean the valve is faulty.

The high pressure relief valve is factory-calibrated and cannot be adjusted or repaired, and must not be removed or otherwise disturbed. The valve is only serviced as a part of the A/C compressor.

DIAGNOSIS AND TESTING

COMPRESSOR-A/C

When investigating an A/C system related noise, you must first know the conditions under which the noise occurs. These conditions include: weather, vehicle speed, transmission in gear or neutral, engine speed, engine temperature, and any other special conditions. Noises that develop during A/C operation can often be misleading. For example: What sounds like a failed front engine bearing or connecting rod, may be caused by loose bolts, nuts, mounting brackets or a loose compressor clutch assembly.

Drive belts are speed sensitive. At different engine speeds and depending upon drive belt tension, drive belts can develop noises that are mistaken for an A/C compressor noise. Improper drive belt tension can cause a misleading noise when the compressor clutch is engaged, which may not occur when the compressor clutch is disengaged. Check the accessory drive belt condition and tension as described in Cooling before beginning this procedure.

1. Select a quiet area for testing. Duplicate the complaint conditions as much as possible. Turn the A/C compressor On and Off several times to clearly identify the compressor noise. Listen to the A/C compressor while the clutch is engaged and disengaged. Probe the A/C compressor with an engine stethoscope or a long screwdriver with the handle held to your ear to better localize the source of the noise.
2. Loosen all of the compressor mounting hardware and retighten. Check the compressor clutch retainer. Be certain that the clutch field coil is mounted securely to the A/C compressor, and that the clutch plate and pulley are properly aligned and have the correct air gap.
3. To duplicate high-ambient temperature conditions (high head pressure), restrict the air flow through the A/C condenser. Install a manifold gauge set or a scan tool to be certain that the discharge pressure does not exceed 2760 kPa (400 psi).
4. Check the refrigerant system plumbing for incorrect routing, rubbing or interference, which can cause unusual noises. Also check the refrigerant lines and hoses for kinks or sharp bends that will restrict refrigerant flow, which can cause noises. See **DESCRIPTION**.
5. If the noise is from opening and closing of the high pressure relief valve, recover, evacuate and recharge the refrigerant system. See **STANDARD PROCEDURE**.
6. If the high pressure relief valve still does not seat properly, replace the A/C compressor. See **REMOVAL**.

REMOVAL

2.8L ENGINE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The A/C compressor can be removed from the engine and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the A/C clutch or various engine components.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 128: Refrigerant Line System
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **STANDARD PROCEDURE**.
3. Remove the air cleaner housing. **REMOVAL**
4. Remove the air inlet tube from the throttle body and the charge air cooler.
5. Remove the battery. Refer to **REMOVAL** .
6. Remove the radiator fan and fan shroud. Refer to **REMOVAL** .
7. Remove the accessory drive belt. Refer to **REMOVAL** .
8. Remove the generator. Refer to **REMOVAL** .
9. On LHD models, remove the two nuts (2) that secure the A/C suction line (4) to the top of the engine.
10. Remove the nuts (5) that secures the A/C suction line and A/C discharge line (1) to the A/C compressor (3).
11. Disconnect the A/C suction and discharge lines from the A/C compressor and remove and discard the O-ring seals and gaskets.

Fig. 129: A/C Clutch Field Coil Connector, Bolts & A/C Compressor
Courtesy of CHRYSLER LLC

12. Disconnect the engine wire harness from the A/C clutch field coil connector (1).
13. Support the A/C compressor (3) and remove the three bolts (2) that secure the compressor to the engine.
14. Remove the A/C compressor from the engine compartment.
15. Install plugs in, or tape over the opened refrigerant line fittings and the compressor ports.

3.7L ENGINE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The A/C compressor can be removed from the engine and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the A/C clutch or various engine components.

Fig. 130: Removing/Installing Nuts That Secure A/C Suction Line And A/C Discharge Line To A/C Compressor

Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **STANDARD PROCEDURE**.
3. Remove the air cleaner housing (refer to **REMOVAL**).
4. Remove the accessory drive belt. Refer to **REMOVAL** .
5. Remove the nuts (2) that secure the A/C suction line (1) and A/C discharge line (3) to the A/C compressor (4).
6. Disconnect the A/C suction and discharge lines from the A/C compressor and remove and discard the O-ring seals and gaskets.

Fig. 131: A/C Compressor Components

Courtesy of CHRYSLER LLC

7. Disconnect the engine wire harness from the A/C clutch field coil connector (3).

8. Loosen the bolt (6) that secures the compressor bracket (8) to the engine front cover (7).
9. Remove the bolt (1) that secures the A/C compressor (2) to the intake manifold (9).
10. Remove the two bolts (4 and 5) that secure the A/C compressor to the front of the engine.
11. Remove the A/C compressor from the engine and install plugs in, or tape over the opened refrigerant line fittings and the compressor ports.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See WARNING and CAUTION. Failure to follow the warnings and cautions could result in possible serious or fatal injury.

81b94c68

Fig. 133: ENGINE MOUNT TO FRAME
 Courtesy of CHRYSLER LLC

8. Raise and support the vehicle.
9. Remove the nut (3) from the through bolt (1) on the right side engine mount (3).

CAUTION: Do not completely remove the right side motor mount through bolt when performing this procedure. The bolt supports the engine at the lower mount and removal of the bolt will allow the engine to sit further down in the frame, which may cause possible damage to the engine and various other components.

10. Support the engine with a suitable jack and partially remove the through bolt to allow the right side of the engine to be raised off of the motor mount.

8114d4s3

Fig. 134: Removing/Installing A/C Compressor

Courtesy of CHRYSLER LLC

11. Remove the jack stand and lower the vehicle.
12. Disconnect the engine wire harness from the A/C clutch field coil connector (1).

CAUTION: Use care when raising the engine when performing this procedure. Be sure to protect the bottom of the engine and various other components from damage.

13. Using a suitable floor jack and a block of wood under the oil pan to protect from damage, raise the right side of the engine to gain access to remove the stud (3) that secures the lower front of the A/C compressor (2) to the accessory drive belt bracket.
14. Remove the nut (4) and stud that secures the lower front of the A/C compressor to the accessory drive belt bracket.
15. Remove the bolt (7) that secures the rear of the A/C compressor to the engine.
16. Support the A/C compressor and remove the nut (6) and stud (5) that secures the upper front of the A/C compressor to the accessory drive belt bracket and remove the compressor.

INSTALLATION

2.8L ENGINE

CAUTION: If the A/C compressor is being replaced, be certain to adjust the refrigerant system oil level. See STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be removed from the new A/C compressor. See STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 135: A/C Clutch Field Coil Connector, Bolts & A/C Compressor
 Courtesy of CHRYSLER LLC

1. If the A/C compressor (3) is being replaced, the refrigerant oil in the old compressor must be first drained and measured. Then the oil in the new A/C compressor must be drained. Finally, the new compressor must be refilled with the same amount of new refrigerant oil that was drained out of the old compressor. See **STANDARD PROCEDURE**. When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Position the A/C compressor onto the engine.
3. Install the three bolts (2) that secure the A/C compressor to the engine. Tighten the bolts to 28 N.m (21 ft. lbs.).
4. Connect the engine wire harness to the A/C clutch field coil connector (1).

Fig. 136: Refrigerant Line System
 Courtesy of CHRYSLER LLC

5. Remove the tape or plugs from the opened refrigerant line fittings and the compressor ports.

6. Lubricate new O-ring seals with clean refrigerant oil and install them and new gaskets on the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
7. Connect the A/C suction line (4) and A/C discharge line (1) to the A/C compressor (3).
8. Install the nuts (5) that secure the A/C suction and discharge lines to the A/C compressor. Tighten the nuts to 12 N.m (105 in. lbs.).
9. On LHD models, install the two nuts (2) that secure the A/C suction line to the top of the engine. Tighten the nuts to 4.5 N.m (40 in. lbs.).
10. Install the generator. Refer to **INSTALLATION** .
11. Install the accessory drive belt. Refer to **INSTALLATION** .
12. Install the radiator fan and fan shroud. Refer to **INSTALLATION** .
13. Install the battery. Refer to **INSTALLATION** .
14. Install the air inlet tube to the throttle body and the charge air cooler. Tighten the clamps securely.
15. Install the air cleaner housing.
16. Reconnect the negative battery cable.
17. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
18. Charge the refrigerant system. See **STANDARD PROCEDURE**.

3.7L ENGINE

CAUTION: If the A/C compressor is being replaced, be certain to adjust the refrigerant system oil level. See **STANDARD PROCEDURE**. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be removed from the new A/C compressor. See **STANDARD PROCEDURE**.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 137: A/C Compressor Components
Courtesy of CHRYSLER LLC

1. If the A/C compressor (2) is being replaced, the refrigerant oil in the old compressor must be first drained and measured. Then the oil in the new A/C compressor must be drained. Finally, the new compressor must be refilled with the same amount of new refrigerant oil that was drained out of the old compressor. See **STANDARD PROCEDURE**. When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Position the A/C compressor to the intake manifold (9) and the engine front cover (7).
3. Install and hand tighten the three compressor retaining bolts (1, 4 and 5).
4. Tighten the bolts in the following sequence:
 - The rear bolt (1) to 55 N.m (41 ft. lbs.).
 - The front inboard bolt (5) to 40 N.m (30 ft. lbs.).
 - The front outboard bolt (4) to 55 N.m (41 ft. lbs.).
5. Tighten the bolt (6) that secures the compressor bracket (8) to the engine front cover to 40 N.m (30 ft. lbs.).
6. Connect the engine wire harness to the A/C clutch field coil connector (3).

Fig. 138: Removing/Installing Nuts That Secure A/C Suction Line And A/C Discharge Line To A/C Compressor

Courtesy of CHRYSLER LLC

7. Remove the tape or plugs from the opened refrigerant line fittings and the compressor ports.
8. Lubricate new O-ring seals with clean refrigerant oil and install them and new gaskets on the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
9. Connect the A/C suction line (1) and the A/C discharge line (3) to the A/C compressor (4).
10. Install the nuts (2) that secure the A/C suction and discharge lines to the A/C compressor. Tighten the nuts to 12 N.m (105 in. lbs.).
11. Install the accessory drive belt. Refer to **INSTALLATION** .
12. Install the air cleaner housing (refer to **INSTALLATION**).
13. Reconnect the negative battery cable.
14. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
15. Charge the refrigerant system. See **STANDARD PROCEDURE**.

4.0L ENGINE

CAUTION: If the A/C compressor is being replaced, be certain to adjust the refrigerant system oil level. See **STANDARD PROCEDURE**. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** chart to determine how much oil should be removed from the

new A/C compressor. See STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 139: Removing/Installing A/C Compressor
Courtesy of CHRYSLER LLC

1. If the A/C compressor (2) is being replaced, the refrigerant oil in the old compressor must be first drained and measured. Then the oil in the new A/C compressor must be drained. Finally, the new compressor must be refilled with the same amount of new refrigerant oil that was drained out of the old compressor. See STANDARD PROCEDURE. When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

CAUTION: Use care when raising the engine when performing this procedure. Be sure to protect the bottom of the engine and various other components from damage.

2. Using a suitable floor jack and a block of wood under the oil pan to protect from damage, raise the right side of the engine until the stud (3) that secures the lower front of the A/C compressor to the accessory drive belt bracket can be installed.
3. Install the stud that secures the lower front of the A/C compressor to the accessory drive belt bracket. Tighten the stud securely.
4. Install the stud (5) that secures the upper front of the compressor to the accessory drive belt bracket. Tighten the stud securely.
5. Loosely install the nuts (4 and 6) that secure the front of the A/C compressor to the accessory drive belt bracket.
6. Loosely install the bolt (7) that secures the rear of the A/C compressor to the engine.
7. Tighten each of the compressor fasteners to 28 N.m (21 ft. lbs.) using the following sequence:

- The upper nut at front of compressor.
 - The lower nut at front of compressor.
 - The bolt at the rear of compressor.
8. Lower the right side of the engine and remove the jack and wood block.
 9. Connect the engine wire harness to the A/C clutch field coil connector (1).
 10. Lower the engine and remove the floor jack.

81b84c/8

Fig. 140: ENGINE MOUNT TO FRAME
Courtesy of CHRYSLER LLC

11. Raise and support the vehicle.
12. Support the engine with a suitable jack and install the through bolt (1) and nut (3) to the right side engine mount (3). Tighten the nut to 101 N.m (75 ft. lbs.).

818d4c1

Fig. 141: A/C Discharge Line, Nuts, A/C Suction Line & A/C Compressor
Courtesy of CHRYSLER LLC

13. Remove the jack stand and lower the vehicle.
14. Remove the tape or plugs from the opened refrigerant line fittings and the compressor ports.
15. Lubricate new O-ring seals with clean refrigerant oil and install them and new gaskets on the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
16. Connect the A/C discharge line (1) and the A/C suction line (3) to the A/C compressor (4).
17. Install the nuts (2) that secure the A/C discharge and suction lines to the A/C compressor. Tighten the nuts to 12 N.m (105 in. lbs.).
18. Install the accessory drive belt. Refer to **INSTALLATION** .
19. Install the air cleaner housing (refer to **INSTALLATION**).
20. Reconnect the negative battery cable.
21. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
22. Charge the refrigerant system. See **STANDARD PROCEDURE**.

CONDENSER-A/C

DESCRIPTION

CONDENSER-A/C

Fig. 142: A/C Condenser Components
Courtesy of CHRYSLER LLC

The A/C condenser (1) is located in the front of the engine compartment behind the front fascia. The A/C condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the A/C compressor to give up its heat to the air passing over the condenser fins, which causes the refrigerant to cool and change to a liquid state.

The A/C condenser is equipped with mounting provisions (2) to attach it to the radiator and has tapping blocks (3) for the A/C discharge line and for the receiver/drier (5). A spring lock coupler is used on the condenser outlet tube (4) for the A/C liquid line connection. See **DESCRIPTION**.

On automatic transmission equipped vehicles, the A/C condenser is also equipped with an integral automatic transmission cooler (6).

OPERATION

CONDENSER-A/C

When air passes through the fins of the A/C condenser, the high-pressure refrigerant gas within the A/C condenser gives up its heat. The refrigerant then condenses as it leaves the A/C condenser and becomes a high-pressure liquid. The volume of air flowing over the condenser fins is critical to the proper cooling performance of the A/C system. Therefore, it is important that there are no objects placed in front of the radiator grille openings at the front of the vehicle or foreign material on the condenser fins that might obstruct proper air flow. Also, any factory-installed air seals or shrouds must be properly reinstalled following radiator or A/C condenser service.

NOTE: **Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.**

The A/C condenser has no serviceable parts. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever a refrigerant line is removed from the A/C condenser.

The A/C condenser cannot be repaired and must be replaced if leaking or damaged.

REMOVAL

CONDENSER-A/C

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

CAUTION: Before removing the A/C condenser, note the location of each of the radiator/condenser air seals. These air seals are used to direct air through the A/C condenser and radiator. The air seals must be reinstalled in their proper locations in order for the A/C and engine cooling systems to perform as designed.

NOTE: **LHD model shown in illustrations. RHD model similar.**

Fig. 143: A/C Liquid Line & Condenser Tube
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **STANDARD PROCEDURE**.
3. Remove the engine air cleaner housing (refer to **AIR INTAKE SYSTEM**).
4. Remove the secondary retaining clip and using the proper A/C line disconnect tool (Special Tool Kit 7193 or equivalent), disconnect the A/C liquid line (1) from the condenser tube (2). See **REMOVAL**.

Fig. 144: Radiator, Bolts, A/C Condenser, Nut & A/C Discharge Line
 Courtesy of CHRYSLER LLC

NOTE: Upper condenser retaining bracket and bolt shown in graphic. Lower retaining bracket and bolt similar.

5. Remove the grille. Refer to **REMOVAL** .
6. If equipped with an automatic transmission, disconnect the transmission cooler lines from the

transmission cooler portion of the A/C condenser. Refer to **REMOVAL** .

7. Position the right side condenser air seal out of the way to gain access to the discharge line fitting and the lower condenser retaining bolt.

NOTE: **Rotate and tilt the A/C discharge line as necessary to disconnect it from the A/C condenser.**

8. Remove the nut (4) that secures the A/C discharge line (5) to the A/C condenser (3) and disconnect the discharge line.
9. Remove the two bolts (2) that secure the A/C condenser to the right side of the radiator (1).
10. Carefully lift the A/C condenser straight up to disengage the condenser mounting brackets from the radiator and remove the condenser from the vehicle.
11. If required, remove the A/C receiver/drier from the A/C condenser. See **REMOVAL**.
12. Remove and discard the O-ring seals and gasket and install plugs in, or tape over the opened refrigerant line fittings and the condenser and receiver/drier ports.

INSTALLATION

CONDENSER-A/C

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See **STANDARD PROCEDURE**. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The radiator/condenser air seals must be reinstalled in their proper locations in order for the A/C and engine cooling systems to perform as designed.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. See **STANDARD PROCEDURE**.

NOTE: If only the A/C condenser is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 145: Radiator, Bolts, A/C Condenser, Nut & A/C Discharge Line
 Courtesy of CHRYSLER LLC

NOTE: Upper condenser retaining bracket and bolt shown in graphic. Lower retaining bracket and bolt similar.

1. Remove the tape or plugs from the opened refrigerant line fittings and the receiver/drier and condenser ports.
2. Lubricate new rubber O-ring seals with clean refrigerant oil and install them and a new gasket onto the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. If removed, install the A/C receiver/drier onto the A/C condenser (3). See **INSTALLATION**.
4. Position the A/C condenser into the engine compartment and install it onto the condenser mounting brackets.
5. Install the two bolts (2) that secure the A/C condenser to the right side of the radiator (1). Tighten the bolts to 5 N.m (44 in. lbs.).

NOTE: Rotate and tilt the A/C discharge line as necessary to connect it to the A/C condenser.

6. Connect the A/C discharge line (5) to the A/C condenser and install the retaining nut (4). Tighten the nut to 22.5 N.m (200 in. lbs.).
7. Reposition the right side condenser air seal.
8. If equipped with an automatic transmission, connect the transmission cooler lines to the transmission cooler portion of the A/C condenser. Refer to **INSTALLATION**.
9. Install the grille. Refer to **INSTALLATION**.

Fig. 146: A/C Liquid Line & Condenser Tube
Courtesy of CHRYSLER LLC

10. Connect the A/C liquid line (1) to the condenser tube (2) and install the secondary retaining clip. See **INSTALLATION**.
11. Install the engine air cleaner housing (refer to **AIR INTAKE SYSTEM**).
12. Reconnect the negative battery cable.
13. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
14. If the A/C condenser is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. See **STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
15. Charge the refrigerant system. See **STANDARD PROCEDURE**.

CORE-HEATER

DESCRIPTION

CORE-HEATER

618d324c

Fig. 147: Heater Core, Metal Retaining Clamps & Heater Core Tubes
Courtesy of CHRYSLER LLC

The heater core (1) is mounted into the HVAC air distribution housing, located behind the instrument panel. The heater core is a heat exchanger made of rows of tubes and fins. The heater core is secured to the air distribution housing by four plastic retaining tabs. The heater core tubes (3) are attached to the heater core by use of metal retaining clamps (2) and rubber O-ring seals.

The heater core tubes are not serviced separately from the heater core. The air distribution housing must be removed from the vehicle to service the heater core.

OPERATION

CORE-HEATER

Engine coolant is circulated through the heater hoses to the heater core at all times. As the coolant flows through the heater core, heat is removed from the engine and is transferred to the heater core tubes and fins. Air directed through the heater core picks up the heat from the heater core fins. The blend-air door allows control of the heater output air temperature by regulating the amount of air flowing through the heater core. The blower motor speed controls the volume of air flowing through the HVAC housing.

The heater core cannot be repaired and it must be replaced if inoperative, leaking or damaged.

REMOVAL

CORE-HEATER

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental

airbag deployment and possible personal injury or death.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See WARNING and CAUTION. Failure to follow the warnings and cautions could result in possible personal injury or death.

WARNING: The heater core tubes are not serviced separately from the heater core. The heater core tubes should not be repositioned, loosened or removed from the heater core. Failure to follow this warning could result in a coolant leak and possible personal injury or death.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 148: Air Distribution Housing Assembly
Courtesy of CHRYSLER LLC

1. Remove the HVAC housing assembly and place it on a workbench. See REMOVAL.
2. Remove the air distribution housing from the HVAC housing. See REMOVAL.
3. Remove the two screws (1) that secure the upper front passenger side floor duct (7) to the passenger side of the air distribution housing (8) and remove the duct.

NOTE: If the foam seal for the heater core tube flange is deformed or damaged, it must be replaced.

4. Carefully remove the foam seal (4) from the heater core tube flange (5). If the seal is deformed or damaged, it must be replaced.
5. Remove the screw (2) that secures the heater core tube flange to the air distribution housing.
6. Disengage the plastic retainer (5) from around the heater core tubes (6) and remove the flange.

Fig. 149: Plastic Retaining Tabs, Heater Core & Air Distribution Housing
Courtesy of CHRYSLER LLC

NOTE: If the foam insulator around the heater core is deformed or damaged, the insulator must be replaced.

7. Disengage the four plastic retaining tabs (1) that secure the heater core (2) to the passenger side of the air distribution housing (3) and carefully remove the heater core from the housing.

INSTALLATION

CORE-HEATER

WARNING: The heater core tubes are not serviced separately from the heater core. The heater core tubes should not be repositioned, loosened or removed from the heater core. Failure to follow this warning could result in a coolant leak and possible personal injury or death.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 150: Plastic Retaining Tabs, Heater Core & Air Distribution Housing
 Courtesy of CHRYSLER LLC

NOTE: If the foam insulator around the heater core is deformed or damaged, the insulator must be replaced.

1. Carefully install the heater core (2) into the passenger side of the air distribution housing (3) and engage the four plastic retainer tabs (1) that secure the heater core to the housing. Make sure the retaining tabs are fully engaged.

Fig. 151: Air Distribution Housing Assembly
 Courtesy of CHRYSLER LLC

2. Position the heater core tube flange (4) over the heater core tubes (6) and onto the to the passenger side of the air distribution housing (8).
3. Engage the plastic retainer (5) around the heater core tubes. Make sure the retainer is fully engaged around the tubes.
4. Install the screw (2) that secure the heater core tube flange to the air distribution housing. Tighten the

screws to 1.2 N.m (10 in lbs.).

5. Install the upper front passenger side floor duct (7) onto the air distribution housing and install the two retaining screws (1). Tighten the screws to 1.2 N.m (10 in lbs.).

NOTE: If the foam seal for the heater core tube flange is deformed or damaged, it must be replaced.

6. Install the foam seal (3) onto the heater core tube flange.
7. Install the air distribution housing onto the HVAC housing. See INSTALLATION.

NOTE: If the heater core is being replaced, flush the cooling system. Refer to STANDARD PROCEDURE .

8. Install the HVAC housing assembly. See INSTALLATION.

CORE-VALVE-SERVICE PORT

DESCRIPTION

CORE-VALVE-SERVICE PORT

Fig. 152: Low-Side Service Port, A/C Suction Line, High-Side Service Port & A/C Liquid Line
Courtesy of CHRYSLER LLC

NOTE: 3.7L LHD model shown in illustration. 2.8L, 4.0L and RHD models similar.

Refrigerant system service ports are used to recover, recycle, evacuate, charge and test the A/C refrigerant system. Unique sizes are used on the two service ports for the R-134a refrigerant system to ensure the system is not accidentally contaminated with R-12 refrigerant or by service equipment used for R-12 refrigerant.

The low-side service port (1) is located on the A/C suction line (2) at either the rear of the engine compartment or near the A/C compressor, depending on engine and market. The high-side service port (3) is located on the

A/C liquid line (4) near the front of the engine compartment. Both the high-side and low-side A/C service port valve cores are serviceable.

NOTE: The protective cap aids in sealing the service port and helps to protect the refrigerant system from contamination. Remember to always reinstall the protective caps onto the service ports when refrigerant system service is complete.

Each of the service ports has a threaded plastic protective cap installed over it from the factory. The service port caps are serviceable items.

REMOVAL

CORE-VALVE-SERVICE PORT

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See WARNING and CAUTION. Failure to follow the warnings and cautions may result in serious or fatal injury.

Fig. 153: Identifying A/C Service Port Components
Courtesy of CHRYSLER LLC

NOTE: Typical A/C service port shown in graphic.

1. Remove the protective cap (1) from the service port (2).
2. Recover the refrigerant from the refrigerant system. See **STANDARD PROCEDURE**.
3. Using a Schrader-type valve core tool, remove the valve core (3) from the service port.
4. Install a plug in, or tape over the opened service port(s).

INSTALLATION

CORE-VALVE-SERVICE PORT

Fig. 154: Identifying A/C Service Port Components
Courtesy of CHRYSLER LLC

NOTE: Typical A/C service port shown in graphic.

1. Lubricate the valve core (3) with clean refrigerant oil prior to installation. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Remove the tape or plug from the service port (2).

CAUTION: A valve core that is not fully seated in the A/C service port can result in damage to the valve during refrigerant system evacuation and charge. Such damage may result in a loss of system refrigerant while uncoupling the charge adapters.

3. Using a Schrader-type valve core tool, install and tighten the valve core into the service port(s).
4. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.

5. Charge the refrigerant system. See **STANDARD PROCEDURE**.

NOTE: The protective cap helps aid in service port sealing and helps protect the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.

6. Install the protective cap (1) onto the service port.

COUPLER-REFRIGERANT LINE

DESCRIPTION

COUPLER- REFRIGERANT LINE

Fig. 155: A/C Liquid Line, A/C Condenser Outlet Tube & Spring-Lock Type Refrigerant Line Coupler
Courtesy of CHRYSLER LLC

The A/C liquid line (1) is attached to the A/C condenser outlet tube (2) by use of a spring-lock type refrigerant line coupler (3). A secondary retaining clip is installed over the connected coupler for added protection.

The spring-lock refrigerant line coupler requires a special disconnect tool for disengaging the two coupler halves.

OPERATION

COUPLER- REFRIGERANT LINE

Fig. 156: Identifying Spring-Lock Type Refrigerant Line Coupler
 Courtesy of CHRYSLER LLC

The spring-lock type refrigerant line coupler is held together by a garter spring (6) inside a circular cage (7) on the male half of the fitting (1). When the two coupler halves are connected, the flared end of the female fitting (2) slips behind the garter spring inside the cage on the male fitting. The garter spring and cage prevent the flared end of the female fitting from pulling out of the cage. Some applications use a connection indicator ring (4) to help indicate when the two coupler halves are fully connected.

O-rings (8) are used to seal the coupler connections. These O-rings are compatible with R-134a refrigerant and must be replaced with O-rings made of the same material.

A secondary retaining clip (3) is installed over the connected coupler (5) for added protection.

REMOVAL

COUPLER- REFRIGERANT LINE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

J9324-5

Fig. 157: Disconnecting Spring-Lock Type Refrigerant Line Coupler
 Courtesy of CHRYSLER LLC

1. Recover the refrigerant from the refrigerant system. See **STANDARD PROCEDURE**.
2. Remove the secondary retaining clip from the spring-lock type refrigerant line coupler.
3. Fit the proper size A/C line disconnect tool (Special Tool Kit 7193 or equivalent) over the coupler cage (1).
4. Close the two halves of the A/C line disconnect tool around the coupler (2).

NOTE: The garter spring may not release if the A/C line disconnect tool is cocked while pushing it into the coupler cage opening.

5. Push the A/C line disconnect tool into the open side of the coupler cage to expand the garter spring (3). Once the garter spring is expanded, pull on the refrigerant line attached to the female half of the coupler until the flange on the female fitting is separated from the garter spring and cage on the male fitting.
6. Open and remove the A/C line disconnect tool from the refrigerant line coupler (4).

INSTALLATION

COUPLER- REFRIGERANT LINE

Fig. 158: Identifying Spring-Lock Type Refrigerant Line Coupler
 Courtesy of CHRYSLER LLC

1. Clean any dirt or foreign material from the spring-lock type refrigerant line coupler.
2. Check to make sure that the garter spring (6) is located within the cage (7) of the male half of the refrigerant line coupler (1), and that the garter spring is not damaged.
 - If the garter spring is missing, install a new spring by pushing it into the coupler cage opening.
 - If the garter spring is damaged, remove it from the coupler cage with a small hook (DO NOT use a screwdriver) and install a new garter spring.

CAUTION: Use only the specified O-rings as they are made of a special material for the R-134a system. The use of any other O-rings may allow the

connection to leak.

3. Install new O-rings (8) on the male half of the refrigerant line coupler.
4. Lubricate the O-rings, and the inside of the female half of the refrigerant line coupler (2) with clean R-134a refrigerant oil. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
5. Position the female half of the coupler over the male half of the coupler.
6. Push together firmly on the two halves of the refrigerant line coupler until the garter spring in the cage on the male half of the coupler snaps over the flanged end on the female half of the coupler.
7. Make sure that the refrigerant line coupler is fully engaged by firmly pulling the refrigerant lines away from each other on both sides of the coupler.
8. Install the secondary retaining clip (3) over connected coupler cage (5).
9. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
10. Charge the refrigerant system. See **STANDARD PROCEDURE**.

EVAPORATOR-A/C

DESCRIPTION

EVAPORATOR-A/C

818dac10

Fig. 159: A/C Evaporator Assembly
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

The A/C evaporator (1) and its insulator (2) for the heating-A/C system is located within the HVAC housing, behind the instrument panel. The A/C evaporator is positioned in the HVAC housing so that all air entering the housing must pass over the evaporator fins before it is distributed through the heater core and heating-A/C system ducts and outlets. However, air passing over the evaporator fins will only be conditioned when the A/C compressor is engaged and circulating refrigerant through the A/C evaporator.

The A/C evaporator tubes (3) are connected and sealed to the A/C expansion valve by use of rubber O-rings (4) and a tapping block (5).

The A/C evaporator can only be serviced by removing and disassembling the HVAC housing.

OPERATION

EVAPORATOR-A/C

Refrigerant enters the A/C evaporator from the A/C expansion valve as a low-temperature, low-pressure mixture of liquid and gas. As air flows over the fins of the A/C evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas when it leaves the A/C evaporator.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line or expansion valve is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C evaporator has no serviceable parts except for the O-ring seals. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever the A/C expansion valve is removed from the A/C evaporator.

The A/C evaporator cannot be repaired and must be replaced if leaking or damaged.

REMOVAL

EVAPORATOR-A/C

Fig. 160: A/C Evaporator, Foam Insulator, HVAC Housing, Rubber Seal & Tapping Block
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Remove the HVAC housing assembly and place it on a workbench. See **REMOVAL**.
2. Disassemble the HVAC housing. See **DISASSEMBLY**.

NOTE: If the foam insulator around the A/C evaporator is deformed or damaged, the insulator must be replaced.

3. Carefully lift the A/C evaporator (1) and the foam insulator (2) out of the lower half of the HVAC housing (3).

NOTE: If the rubber seal around the evaporator tubes and tapping block is deformed or damaged, the seal must be replaced.

4. If required, remove the rubber seal (4) from around the evaporator tubes and tapping block (5).

INSTALLATION

EVAPORATOR-A/C

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See **STANDARD PROCEDURE**. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. See **STANDARD PROCEDURE**.

NOTE: If only the A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 161: A/C Evaporator, Foam Insulator, HVAC Housing, Rubber Seal & Tapping Block
 Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

NOTE: Make sure the rubber seal for the evaporator tubes and tapping block is properly positioned in the HVAC housing opening.

1. If removed, install the rubber seal (4) over the evaporator tubes and tapping block (5).

NOTE: Make sure that the foam insulator around the A/C evaporator is properly positioned within the HVAC housing.

2. Carefully install the A/C evaporator (1) and foam insulator (2) into the lower half of the HVAC housing (3).
3. Assemble the HVAC housing. See **ASSEMBLY**.
4. Install the HVAC housing assembly. See **INSTALLATION**.
5. If the A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. See **STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

LINE-A/C DISCHARGE

DESCRIPTION

LINE-A/C DISCHARGE

Fig. 162: A/C Discharge Line, Metal Gaskets & Rubber O-Ring Seals
Courtesy of CHRYSLER LLC

NOTE: 4.0L LHD model shown in illustration. Other models similar.

The A/C discharge line (1) is the refrigerant line that carries refrigerant from the A/C compressor to the A/C condenser.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C discharge line has no serviceable parts except for the metal gaskets (2) and rubber O-ring seals (3). The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever the A/C discharge line is removed and installed.

The A/C discharge line cannot be repaired and must be replaced if leaking or damaged.

REMOVAL

2.8L ENGINE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

CAUTION: Before removing the A/C discharge line, note the location of the right side condenser air seal. This air seal is to direct air through the A/C condenser and radiator. The air seals must be reinstalled in its proper location in order for the A/C and engine cooling systems to perform as designed.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 163: Refrigerant Line System
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **STANDARD PROCEDURE**.
3. Remove the air cleaner housing.
4. Remove the air inlet tube from the throttle body and position it out of the way.
5. Remove the battery for clearance. Refer to **REMOVAL** .
6. Remove the nut (5) that secures the A/C discharge line (1) to the A/C compressor (3).
7. Disconnect the A/C discharge line from the A/C compressor and remove and discard the O-ring seal and gasket.
8. Disengage the A/C discharge line from the plastic retaining clip located on the right side of the fan shroud.

Fig. 164: Removing/Installing Nut That Secures A/C Discharge Line To A/C Condenser
Courtesy of CHRYSLER LLC

9. Remove the grille. Refer to **REMOVAL** .
10. Position the right side condenser air seal out of the way to gain access to the discharge line fitting.
11. Remove the nut (3) that secures the A/C discharge line (1) to the A/C condenser (2).

NOTE: Rotate and tilt the A/C discharge line as necessary to disconnect it from the A/C condenser.

12. Disconnect the A/C discharge line from the condenser and remove and discard the O-ring seal and gasket.
13. Remove the A/C discharge line from the engine compartment and install plugs in, or tape over the opened discharge line fittings and the compressor and condenser ports.

3.7L ENGINE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

Fig. 165: Removing/Installing Nuts That Secure A/C Suction Line And A/C Discharge Line To A/C Compressor
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **STANDARD PROCEDURE**.
3. Remove the air cleaner housing (refer to **REMOVAL**).
4. Remove the nut (2) that secures the A/C discharge line (3) to the A/C compressor (4).
5. Disconnect the A/C discharge line from the A/C compressor and remove and discard the O-ring seal and gasket.

Fig. 166: Radiator, Bolts, A/C Condenser, Nut & A/C Discharge Line
 Courtesy of CHRYSLER LLC

6. Remove the grille. Refer to **REMOVAL** .
7. Remove the nut (4) that secures the A/C discharge line (5) to the A/C condenser (3).
8. Remove the bolt (2) that secures the A/C condenser to the right side of the radiator (1).
9. For clearance, position the A/C condenser toward the left side of the vehicle and then disconnect the A/C discharge line from the condenser.
10. Remove and discard the O-ring seal and gasket from the discharge line fitting.
11. Remove the A/C discharge line from the engine compartment and install plugs in, or tape over the opened discharge line fittings and the compressor and condenser ports.

4.0L ENGINE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

Fig. 167: A/C Discharge Line, Nuts, A/C Suction Line & A/C Compressor
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **STANDARD PROCEDURE**.
3. Remove the air cleaner housing (refer to **REMOVAL**).
4. Remove the nut (2) that secures the A/C discharge line (1) to the A/C compressor (4).
5. Disconnect the A/C discharge line from the A/C compressor and remove and discard the O-ring seal and gasket.

Fig. 168: Radiator, Bolts, A/C Condenser, Nut & A/C Discharge Line
 Courtesy of CHRYSLER LLC

6. Remove the grille. Refer to **REMOVAL** .
7. Remove the nut (4) that secures the A/C discharge line (5) to the A/C condenser (3).
8. Remove the bolt (2) that secures the A/C condenser to the right side of the radiator (1).
9. For clearance, position the A/C condenser toward the left side of the vehicle and then disconnect the A/C

discharge line from the condenser.

10. Remove and discard the O-ring seal and gasket from the discharge line fitting.
11. Remove the A/C discharge line from the engine compartment and install plugs in, or tape over the opened discharge line fittings and the compressor and condenser ports.

INSTALLATION

2.8L ENGINE

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** chart to determine how much oil should be added to the refrigerant system. See STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 169: Removing/Installing Nut That Secures A/C Discharge Line To A/C Condenser
Courtesy of CHRYSLER LLC

1. Remove the tape or plugs from the opened discharge line fittings and compressor and condenser ports.
2. Lubricate new rubber O-ring seals with clean refrigerant oil and install them and new gaskets onto the discharge line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Rotate and tilt the A/C discharge line as necessary to connect it from the A/C condenser.

3. Position the A/C discharge line (1) into the engine compartment and connect it to the A/C condenser (2).
4. Install the nut (3) that secures the A/C discharge line to the A/C condenser. Tighten the nut to 22.5 N.m (200 in. lbs.).
5. Engage the A/C discharge line into the plastic retaining clip located on the right side of the fan shroud.
6. Install the grille. Refer to **INSTALLATION**.

Fig. 170: Refrigerant Line System
Courtesy of CHRYSLER LLC

7. Connect the A/C discharge line (1) to the A/C compressor (4).
8. Install the nut (5) that secures the A/C discharge line to the A/C compressor. Tighten the nut to 12 N.m (105 in. lbs.).
9. Install the battery. Refer to **INSTALLATION**.
10. Install the air inlet tube to the throttle body. Tighten the clamp securely.
11. Install the air cleaner housing.
12. Reconnect the negative battery cable.
13. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
14. Adjust the refrigerant oil level. See **STANDARD PROCEDURE**.
15. Charge the refrigerant system. See **STANDARD PROCEDURE**.

3.7L ENGINE

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See **STANDARD PROCEDURE**. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** chart to determine how much oil should be added to the refrigerant system. See **STANDARD PROCEDURE**.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 171: Radiator, Bolts, A/C Condenser, Nut & A/C Discharge Line
Courtesy of CHRYSLER LLC

1. Remove the tape or plugs from the opened discharge line fittings and compressor and condenser ports.
2. Lubricate new rubber O-ring seals with clean refrigerant oil and install them and new gaskets onto the discharge line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. For clearance, position the A/C condenser (3) toward the left side of the vehicle.
4. Connect the A/C discharge line (5) to the A/C condenser and install the retaining nut (4) hand tight.
5. Reposition the A/C condenser and install the bolt (2) that secures the condenser to the right side of the radiator (1). Tighten the bolt to 5 N.m (44 in. lbs.).
6. Tighten the nut that secures the A/C discharge line to the A/C condenser to 22.5 N.m (200 in. lbs.).
7. Install the grille. Refer to **INSTALLATION**.

Fig. 172: Removing/Installing Nuts That Secure A/C Suction Line And A/C Discharge Line To A/C Compressor

Courtesy of CHRYSLER LLC

8. Connect the A/C discharge line (3) to the A/C compressor (4).
9. Install the nut (2) that secures the A/C discharge line to the A/C compressor. Tighten the nut to 12 N.m (105 in. lbs.).
10. Install the air cleaner housing (refer to **INSTALLATION**).
11. Reconnect the negative battery cable.
12. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
13. Adjust the refrigerant oil level. See **STANDARD PROCEDURE**.
14. Charge the refrigerant system. See **STANDARD PROCEDURE**.

4.0L ENGINE

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See **STANDARD PROCEDURE**. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. See **STANDARD PROCEDURE**.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 173: Radiator, Bolts, A/C Condenser, Nut & A/C Discharge Line

8. Connect the A/C discharge line (1) to the A/C compressor (4).
9. Install the nut (2) that secures the A/C discharge line to the A/C compressor. Tighten the nut to 12 N.m (105 in. lbs.).
10. Install the air cleaner housing (refer to **INSTALLATION**).
11. Reconnect the negative battery cable.
12. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
13. Adjust the refrigerant oil level. See **STANDARD PROCEDURE**.
14. Charge the refrigerant system. See **STANDARD PROCEDURE**.

LINE-A/C LIQUID

DESCRIPTION

LINE-A/C LIQUID

Fig. 175: A/C Liquid Line, High-Side Service Port, A/C Pressure Transducer & Condenser Outlet Tube Connection

Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

The A/C liquid line (1) is the refrigerant line that carries refrigerant from the A/C condenser to the A/C expansion valve. The A/C liquid line contains the high-side service port (2), a fitting for the A/C pressure transducer (3) and uses a spring lock coupler at the condenser outlet tube connection (4). On LHD models, the A/C liquid line is serviced only as an assembly. On RHD models, the A/C liquid line is serviced in two sections and uses a spring lock coupler to connect the two sections together.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C liquid line has no serviceable parts except for the rubber O-ring seals, high-side service port valve and its protective cap and the plastic retainer clips. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever the A/C liquid line is removed and installed.

The A/C liquid line cannot be repaired and must be replaced if leaking or damaged.

REMOVAL

LHD MODEL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

Fig. 176: Removing/Installing LHD Liquid Line
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **STANDARD PROCEDURE**.
3. Remove the air cleaner housing (refer to **REMOVAL**).
4. Disconnect the wire harness connector from the A/C pressure transducer (1) located on the A/C liquid line (5) near the A/C expansion valve (3) and if required, remove the A/C pressure transducer from the A/C liquid line. See **REMOVAL**.
5. Remove the nut (2) that secures the A/C suction line (1) and the A/C liquid line (4) to the A/C expansion valve (3) and disconnect the lines from the valve.
6. Separate the A/C liquid line from the A/C suction line and disengage the A/C liquid line from the two retaining clips (6) located on the right inner fender.

Fig. 177: A/C Liquid Line & Condenser Tube
Courtesy of CHRYSLER LLC

7. Remove the secondary retaining clip and using the proper A/C line disconnect tool (Special Tool Kit 7193 or equivalent), disconnect the A/C liquid line (1) from the condenser tube (2). See **REMOVAL**.
8. Remove the A/C liquid line from the engine compartment and remove and discard the O-ring seals and install plugs in, or tape over the opened refrigerant line fittings and the condenser and expansion valve ports.

RHD MODEL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

FRONT SECTION

Fig. 178: A/C Liquid Line & Condenser Tube
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **STANDARD PROCEDURE**.
3. Remove the air cleaner housing (refer to **REMOVAL**).
4. Remove the secondary retaining clip and using the proper A/C line disconnect tool, disconnect the A/C liquid line (1) from the condenser tube (2). See **REMOVAL**.

Fig. 179: Retaining Clips, Secondary Retaining Clip, A/C Liquid Line & A/C Liquid Line
Courtesy of CHRYSLER LLC

5. Disengage the front section of the A/C liquid line (4) from the two retaining clips (1) located on the right inner fender.
6. Remove the secondary retaining clip (2) and using the proper A/C line disconnect tool, disconnect the front section of the A/C liquid line from the rear section of the A/C liquid line (3). See **REMOVAL**.
7. Remove the front section of the A/C liquid line from the engine compartment and remove and discard the O-ring seals and install plugs in, or tape over the opened refrigerant line fittings and the condenser tube.

REAR SECTION

Fig. 180: Removing/Installing RHD Liquid Lines - Rear Section
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **STANDARD PROCEDURE**.
3. Remove the air cleaner housing (refer to **REMOVAL**).
4. Remove the two nuts that secure the engine coolant reservoir to the dash panel and position the reservoir out of the way.
5. Disconnect the wire harness connector from the A/C pressure transducer (6) located on the rear section of the A/C liquid line (8) near the A/C expansion valve (4) and if required, remove the A/C pressure transducer from the A/C liquid line. See **REMOVAL**.
6. Remove the nut (5) that secures the A/C suction line (7) and the rear section of the A/C liquid line to the A/C expansion valve and disconnect the lines from the valve.
7. Disengage the A/C liquid line from the retaining clips (3) located on the dash panel and the brake lines near the brake booster.
8. Separate the A/C liquid line from the A/C suction line and disengage the A/C liquid line from the two retaining clips (1) located on the right inner fender.
9. Remove the secondary retaining clip (2) and using the proper A/C line disconnect tool (Special Tool Kit 7193 or equivalent), disconnect the rear section of the A/C liquid line from the front section of the liquid line (9). See **REMOVAL**.
10. Remove the rear section of the A/C liquid line from out of the right side of the engine compartment and remove and discard the O-ring seals and install plugs in, or tape over the opened refrigerant line fittings and the expansion valve ports.

INSTALLATION

LHD MODELS

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See **STANDARD PROCEDURE**. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating

as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** chart to determine how much oil should be added to the refrigerant system. See **STANDARD PROCEDURE**.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 181: A/C Liquid Line & Condenser Tube
Courtesy of CHRYSLER LLC

1. Remove the tape or plugs from the opened refrigerant line fittings and the condenser and expansion valve ports.
2. Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Connect the A/C liquid line (1) to the condenser tube (2) and install the secondary retaining clip. See **INSTALLATION**.

Fig. 182: Removing/Installing LHD Liquid Line
Courtesy of CHRYSLER LLC

4. Install the A/C liquid line (5) into the two retaining clips (6) located on the right inner fender.
5. Connect the A/C liquid line to the A/C suction line (4).
6. Connect the A/C liquid and suction lines to the A/C expansion valve (3) and install the retaining nut (2). Tighten the nut to 23 N.m (17 ft. lbs.).
7. If removed, install the A/C pressure transducer (1) onto A/C liquid line and connect the wire harness connector to the transducer. See **INSTALLATION**.
8. Install the air cleaner housing (refer to **INSTALLATION**).
9. Reconnect the negative battery cable.
10. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
11. Adjust the refrigerant oil level. See **STANDARD PROCEDURE**.
12. Charge the refrigerant system. See **STANDARD PROCEDURE**.

RHD MODEL

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See **STANDARD PROCEDURE**. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** chart to determine how much oil should be added to the refrigerant system. See **STANDARD PROCEDURE**.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

FRONT SECTION

Fig. 183: A/C Liquid Line & Condenser Tube

1. Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See **STANDARD PROCEDURE**.
2. Remove the tape or plugs from the opened refrigerant line fittings and the condenser tube port.
3. Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the A/C liquid line (1) to the condenser tube (2) and install the secondary retaining clip. See **INSTALLATION**.

Fig. 184: Retaining Clips, Secondary Retaining Clip, A/C Liquid Line & A/C Liquid Line
Courtesy of CHRYSLER LLC

5. Connect the front section of the A/C liquid line (4) to the rear section of the A/C liquid line (3) and install

the secondary retaining clip (2). See **INSTALLATION**.

6. Engage the A/C liquid line to the two retaining clips (1) located on the right inner fender.
7. Install the air cleaner housing (refer to **INSTALLATION**).
8. Reconnect the negative battery cable.
9. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
10. Charge the refrigerant system. See **STANDARD PROCEDURE**.

REAR SECTION

Fig. 185: Removing/Installing RHD Liquid Lines - Rear Section
Courtesy of CHRYSLER LLC

1. Remove the tape or plugs from the opened refrigerant line fittings and the expansion valve ports.
2. Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Position the rear section of the A/C liquid line (8) into the engine compartment from the right side of the vehicle. Be sure to route the liquid line behind the diesel engine fuel filter.
4. Connect the rear section of the A/C liquid line (8) to the A/C suction line (7).
5. Connect the A/C liquid and suction lines to the A/C expansion valve (4) and install the retaining nut (5). Tighten the nut to 23 N.m (17 ft. lbs.).
6. If removed, install the A/C pressure transducer (6) onto A/C liquid line and connect the wire harness connector to the transducer. See **INSTALLATION**.
7. Engage the A/C liquid line to the retaining clips (3) located on the dash panel and the brake lines near the brake booster.
8. Connect the front section of the A/C liquid line (9) to the rear section of the A/C liquid line and install the secondary retaining clip (2). See **INSTALLATION**.
9. Engage the A/C liquid line to the two retaining clips (1) located on the right inner fender.
10. Reposition the engine coolant reservoir to the dash panel and install the two retaining nuts. Tighten the nuts securely.

11. Install the air cleaner housing (refer to INSTALLATION).
12. Reconnect the negative battery cable.
13. Evacuate the refrigerant system. See STANDARD PROCEDURE.
14. Adjust the refrigerant oil level. See STANDARD PROCEDURE.
15. Charge the refrigerant system. See STANDARD PROCEDURE.

LINE-A/C SUCTION

DESCRIPTION

LINE-A/C SUCTION

Fig. 186: A/C Suction Line, Tapping Plate, Low-Side Service Port & Heat Shield
Courtesy of CHRYSLER LLC

NOTE: 4.0L engine shown in illustration. Other engines similar.

The A/C suction line (1) is the refrigerant line that carries refrigerant from the A/C evaporator to the A/C compressor. The A/C suction line is secured to the A/C expansion valve by a tapping plate (2) and contains the low-side service port (3) and a heat shield (4), depending on engine application.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C suction line has no serviceable parts except for the rubber O-ring seals, metal gasket and the low-side service port valve and its protective cap. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gasket must be replaced whenever the A/C suction line is removed and installed.

The A/C suction line cannot be repaired and must be replaced if leaking or damaged.

REMOVAL

2.8L LHD ENGINE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

Fig. 187: Refrigerant Line System
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **STANDARD PROCEDURE**.
3. Remove the air cleaner housing.
4. Remove the air inlet tube from the throttle body and position it out of the way.
5. Remove the battery for clearance. Refer to **REMOVAL**.
6. Remove the nut (5) that secures the A/C suction line (4) to the A/C compressor (3).
7. Disconnect the A/C suction line from the A/C compressor and remove and discard the O-ring seal and gasket.
8. Remove the two nuts (2) that secure the A/C suction line to the top of the engine.

Fig. 188: A/C Suction Line, Nut, A/C Expansion Valve & A/C Liquid Line
 Courtesy of CHRYSLER LLC

9. Remove the nut (2) that secures the A/C suction line (1) and the A/C liquid line (4) to the A/C expansion valve (3) and disconnect the lines from the valve.
10. Separate the A/C liquid line from the A/C suction line and remove the suction line from the engine compartment.
11. Install plugs in, or tape over the opened refrigerant line fittings and the compressor and expansion valve ports.

2.8L RHD ENGINE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible personal injury or death.

OIL-A/C REFRIGERANT

DESCRIPTION

OIL-A/C REFRIGERANT

The refrigerant oil used in R-134a refrigerant systems is a synthetic-based, PolyAlkylene Glycol (PAG), wax-free lubricant. Mineral-based R-12 refrigerant oils are not compatible with PAG oils, and should never be introduced to an R-134a refrigerant system.

There are different PAG oils available, and each contains a different additive package. Use **only** refrigerant oil of the same type as recommended to service the refrigerant system (**always refer to the specification tag**

included with the replacement A/C compressor or the A/C Underhood Specification Label located in the engine compartment).

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. See STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level can prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

The A/C compressors used in this vehicle are designed to use VC-46 PAG refrigerant oil. Use only this type of refrigerant oil when servicing the A/C compressor.

OPERATION

OIL-A/C REFRIGERANT

After performing any refrigerant recovery or recycling operation, always replenish the refrigerant system with the same amount of the recommended refrigerant oil as was removed. Too little refrigerant oil can cause A/C compressor damage, and too much can reduce A/C system performance.

PAG refrigerant oil is more hygroscopic than mineral oil, and will absorb any moisture it comes into contact with, even moisture in the air. The PAG oil container should always be kept tightly capped until it is ready to be used. After use, recap the oil container immediately to prevent moisture contamination.

STANDARD PROCEDURE

REFRIGERANT OIL LEVEL

When an A/C system is assembled at the factory, all components except the A/C compressor are refrigerant oil free. After the refrigerant system has been charged and operated, the refrigerant oil in the A/C compressor is dispersed throughout the refrigerant system. The A/C accumulator, A/C evaporator, A/C condenser and the A/C compressor will each retain a significant amount of the needed refrigerant oil.

It is important to have the correct amount of refrigerant oil in the A/C system. This ensures proper lubrication of the A/C compressor. Too little oil will result in damage to the A/C compressor, while too much oil will reduce the cooling capacity of the A/C system and consequently result in higher discharge air temperatures.

CAUTION: The A/C compressors in this vehicle are designed to use VC-46 PAG refrigerant oil. Use only VC-46 PAG refrigerant oil or severe damage to the A/C system may occur. Always refer to the A/C Underhood Specification Label for correct oil designation. The oil container should be kept tightly capped until it is ready for use and then tightly capped after use to prevent contamination from dirt and moisture. Refrigerant oil will quickly absorb any moisture it comes in contact with, therefore, special effort must be used to keep all R-134a system components moisture-free. Moisture in the refrigerant oil is very difficult to remove and will cause a reliability problem with the A/C compressor.

NOTE: Most reclaim/recycling equipment will measure the lubricant being removed during recovery. This amount of lubricant should be added back into the system. Refer to the reclaim/recycling equipment manufacturers instructions.

It will not be necessary to check the oil level in the A/C compressor or to add oil, unless there has been an oil loss. An oil loss may occur due to component replacement, or a rupture or leak from a refrigerant line, connector fitting, component or component seal. If a leak occurs, add 30 milliliters (1 fluid ounce) of the recommended refrigerant oil to the refrigerant system after the repair has been made. Refrigerant oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

Refrigerant oil must be added when an A/C condenser, A/C evaporator or A/C receiver/drier is replaced. See the REFRIGERANT OIL CAPACITIES chart.

The refrigerant oil level in a new A/C compressor must first be adjusted prior to compressor installation. Refer to **COMPRESSOR OIL DRAIN PROCEDURE**.

REFRIGERANT OIL CAPACITIES

Component	ml	oz.
Total System Fill	150	5
A/C Condenser	30	1
A/C Evaporator	60	2
A/C Receiver/drier	30	1
A/C Compressor	Drain and measure the oil from the old compressor. Refer to <u>COMPRESSOR OIL DRAIN PROCEDURE</u> .	

COMPRESSOR OIL DRAIN PROCEDURE

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. Failure to properly drain and measure the refrigerant oil from the A/C compressor can prevent the A/C system from operating as designed and cause serious compressor damage.

The A/C compressor is filled with refrigerant oil from the factory. Use the following procedure to drain and measure refrigerant oil from the A/C compressor.

1. Drain all of the refrigerant oil from the old A/C compressor into a clean measured container.
2. Drain all of the refrigerant oil from the new A/C compressor into a clean measured container.
3. Refill the new A/C compressor with the same amount of refrigerant oil that was drained out of the old compressor. Use only clean refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Install the new A/C compressor onto the engine. See **INSTALLATION**.

RECEIVER/DRIER-A/C

DESCRIPTION

RECEIVER/DRIER-A/C

Fig. 203: A/C Receiver/Drier, Left Side A/C Condenser & Bolt
Courtesy of CHRYSLER LLC

The A/C receiver/drier (1) stores unnecessary refrigerant, filters the refrigerant, helps remove moisture from the refrigerant and retains any refrigerant vapor that may leave the A/C condenser (2) until it becomes a liquid. The A/C receiver/drier is installed on the high-side of the A/C system and is connected directly to the left end of the A/C condenser by a bolt (3). The A/C receiver/drier can be serviced separately from the A/C condenser.

OPERATION

RECEIVER/DRIER-A/C

The A/C receiver/drier performs a filtering action to prevent foreign material in the refrigerant from contaminating the A/C expansion valve. Refrigerant enters the A/C receiver/drier as a high-pressure, low temperature liquid. Desiccant inside the A/C receiver/drier absorbs any moisture which may have entered and become trapped within the refrigerant system. In addition, during periods of high demand operation of the A/C system, the A/C receiver/drier acts as a reservoir to store surplus refrigerant.

NOTE: **Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.**

The A/C receiver/drier has no serviceable parts except for the O-ring seals, gaskets and the high side service port valve and cap. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever the A/C receiver/drier is removed.

The A/C receiver/drier cannot be repaired and must be replaced if leaking or damaged, or if an internal failure of the A/C compressor has occurred.

REMOVAL

RECEIVER/DRIER-A/C

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See WARNING and CAUTION. Failure to follow the warnings and cautions could result in possible personal injury or death.

Fig. 204: A/C Receiver/Drier, Left Side A/C Condenser & Bolt
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with A/C condenser removed from vehicle for clarity.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See STANDARD PROCEDURE.
3. Remove the grille. Refer to REMOVAL.
4. Remove the air seal from the left side of the cooling module assembly.
5. Reach through the opening at the bottom of the front fascia and remove the bolt (3) that secures the A/C receiver/drier (1) to the left side A/C condenser (3).
6. Disconnect the A/C receiver/drier from the A/C condenser and remove and discard the O-ring seals.
7. Install plugs in, or tape over the opened receiver/drier fittings and the condenser ports.

INSTALLATION

RECEIVER/DRIER-A/C

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See STANDARD PROCEDURE. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The receiver/drier must be replaced if an internal failure of the A/C

compressor has occurred. Failure to replace the receiver/drier can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** chart to determine how much oil should be added to the refrigerant system. See **STANDARD PROCEDURE**.

NOTE: If only the receiver/drier is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only the refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 205: A/C Receiver/Drier, Left Side A/C Condenser & Bolt
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with A/C condenser removed from vehicle for clarity.

1. Remove the tape or plugs from the receiver/drier fittings and the condenser ports.
2. Lubricate new O-ring seals with clean refrigerant oil and install them onto the receiver/drier fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Connect the A/C receiver/drier (1) to the left end of the A/C condenser (2).
4. Install the bolt (3) that secures the A/C receiver/drier to the A/C condenser. Tighten the bolt to 22 N.m (16 ft. lbs.).
5. Install the air seal onto the left side of the cooling module assembly.
6. Install the grille. Refer to **INSTALLATION**.
7. Reconnect the negative battery cable.

- 8. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
- 9. If the A/C receiver/drier is being replaced, add 30 milliliters (1.0 fluid ounce) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. See **STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
- 10. Charge the refrigerant system. See **STANDARD PROCEDURE**.

REFRIGERANT-A/C

DESCRIPTION

REFRIGERANT-A/C

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear, and colorless liquefied gas.

Even though R-134a does not contain chlorine, it must be reclaimed and recycled just like CFC-type refrigerants. This is because R-134a is a greenhouse gas and can contribute to global warming. See **STANDARD PROCEDURE**.

OPERATION

REFRIGERANT-A/C

R-134a refrigerant is not compatible with R-12 refrigerant in an A/C system. Even a small amount of R-12 refrigerant added to an R-134a refrigerant system will cause A/C compressor failure, refrigerant oil sludge or poor A/C system performance. In addition, the polyalkylene glycol (PAG) synthetic refrigerant oils used in an R-134a refrigerant system are not compatible with the mineral-based refrigerant oils used in an R-12 refrigerant system.

R-134a refrigerant system service ports, service tool couplers and refrigerant dispensing bottles have all been designed with unique fittings to ensure that an R-134a refrigerant system is not accidentally contaminated with the wrong refrigerant (R-12). There are also labels posted in the engine compartment of the vehicle and on the A/C compressor to identify that the A/C system is equipped with R-134a refrigerant.

STANDARD PROCEDURE

REFRIGERANT CHARGE LEVEL

All models	0.510 kg (1.12 lbs.)

VALVE-A/C EXPANSION

DESCRIPTION

VALVE-A/C EXPANSION

Fig. 206: A/C EXPANSION VALVE
Courtesy of CHRYSLER LLC

The A/C expansion valve controls the amount of refrigerant entering the A/C evaporator. The A/C expansion valve is of a thermostatic expansion valve (TXV) design and consists of an aluminum H-valve type body (1) with an inlet port (2), outlet port (3) and an integral thermal sensor (4).

The A/C expansion valve is located between the A/C refrigerant lines and the A/C evaporator in the engine compartment.

OPERATION

VALVE-A/C EXPANSION

The A/C expansion valve controls the high-pressure, low temperature liquid refrigerant from the A/C liquid line and converts it into a low-pressure, low-temperature mixture of liquid and gas before it enters the A/C evaporator. A mechanical sensor in the A/C expansion valve monitors the temperature and pressure of the refrigerant leaving the A/C evaporator through the A/C suction line, and adjusts the orifice size at the liquid line port to let the proper amount of refrigerant into the evaporator to meet the vehicle A/C cooling requirements. Controlling the refrigerant flow through the A/C evaporator ensures that none of the refrigerant leaving the A/C evaporator is still in a liquid state, which could damage the A/C compressor.

NOTE: **Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is disconnected from the expansion valve. Failure to replace the rubber O-ring seals could result in a refrigerant system leak.**

The A/C expansion valve is factory calibrated and cannot be adjusted or repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING

VALVE-A/C EXPANSION

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See WARNING and CAUTION. Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The A/C expansion valve should only be tested following testing of the A/C compressor.

NOTE: Liquid CO2 is required to test the A/C expansion valve. This material is available from most welding supply facilities. Liquid CO2 is also available from companies which service and sell fire extinguishers.

When testing the A/C expansion valve, the work area and the vehicle temperature must be 21° to 27° C (70° to 85° F). To test the expansion valve:

1. Connect a charging station or manifold gauge set to the refrigerant system service ports. Verify the refrigerant charge level.
2. Close all doors, windows and vents to the passenger compartment.
3. Set the A/C-heater controls so that the A/C compressor is operating, the temperature control is in the highest temperature position, the mode-air doors is directing air output to the floor and the blower motor operating is operating at the highest speed.
4. Start the engine and allow it to idle. After the engine has reached normal operating temperature, allow the passenger compartment to heat up. This will create the need for maximum refrigerant flow into the A/C evaporator.
5. If the refrigerant charge is sufficient, the discharge (high pressure) gauge should read 827 kPa to 1655 kPa (120 psi to 240 psi). The suction (low pressure) gauge should read 207 kPa to 345 kPa (30 psi to 50 psi). If OK, go to step 6. If not OK, replace the inoperative A/C expansion valve.

WARNING: Protect the skin and eyes from exposure to liquid CO2 or personal injury can result.

6. If the suction (low pressure) gauge reads within the specified range, freeze the A/C expansion valve for 30 seconds using liquid CO2 or another suitable super-cold material.**Do not spray R-134a or R-12 refrigerant on the A/C expansion valve for this test.** The suction (low pressure) gauge reading should drop by 69 kPa (10 psi). If OK, go to step 7. If not OK, replace the inoperative A/C expansion valve.
7. Allow the expansion valve control head to thaw. The suction (low pressure) gauge reading should stabilize at 207 kPa to 345 kPa (30 psi to 50 psi). If not OK, replace the inoperative A/C expansion valve.
8. When expansion valve testing is complete, test the overall A/C system performance. See DIAGNOSIS AND TESTING.

REMOVAL

VALVE-A/C EXPANSION

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See WARNING and CAUTION. Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 207: A/C Suction Line, Nut, A/C Expansion Valve & A/C Liquid Line
Courtesy of CHRYSLER LLC

1. Recover the refrigerant from the refrigerant system. See STANDARD PROCEDURE.
2. Disconnect and isolate the negative battery cable.
3. Remove the nut (2) that secures the A/C suction line (1) and the A/C liquid line (4) to the A/C expansion valve (3).
4. Disconnect the A/C suction and liquid lines from the A/C expansion valve, remove and discard the O-ring seals and position the refrigerant lines out of the way.

Fig. 208: Bolts, A/C Expansion Valve & Evaporator Tube Tapping Block

5. Remove the two bolts (1) that secure the A/C expansion valve (2) to the evaporator tube tapping block (3).
6. Remove the A/C expansion valve from the evaporator tube tapping block and remove and discard the O-ring seals.
7. Install plugs in, or tape over the opened refrigerant line and evaporator tube fittings and all expansion valve ports.

INSTALLATION

VALVE-A/C EXPANSION

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 209: Bolts, A/C Expansion Valve & Evaporator Tube Tapping Block
Courtesy of CHRYSLER LLC

1. Remove the tape or plugs from the opened refrigerant line and evaporator tube fittings and all of the expansion valve ports.
2. Lubricate new O-ring seals with clean refrigerant oil and install them onto the refrigerant line and evaporator tube fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Install the A/C expansion valve (2) onto the evaporator tube tapping block (3).
4. Install the two bolts (1) that secure the A/C expansion valve to the evaporator tube tapping block. Tighten the bolts to 11 N.m (97 in. lbs.).

Fig. 210: A/C Suction Line, Nut, A/C Expansion Valve & A/C Liquid Line
Courtesy of CHRYSLER LLC

5. Connect the A/C suction line (1) and the A/C liquid line (4) to the A/C expansion valve (3).
6. Install the nut (2) that secures the A/C suction and liquid lines to the A/C expansion valve. Tighten the nut to 23 N.m (17 ft. lbs.).
7. Reconnect the negative battery cable.
8. Evacuate the refrigerant system. See **STANDARD PROCEDURE**.
9. Recharge the refrigerant system. See **STANDARD PROCEDURE**.

HEATER-CABIN

HEATER UNIT

DESCRIPTION

HEATER UNIT

816013f0

Fig. 211: PTC Heater Unit - Description
 Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

An electric positive temperature coefficient (PTC) heater unit (1) is used on vehicles when equipped with the 2.8L diesel engine. The PTC heater unit aids in passenger compartment heating by compensating for the lower engine coolant temperatures produced by the diesel engine. The PTC heater unit is mounted in the HVAC air distribution housing, downstream of the heater core and is controlled by the diesel engine control module (ECM) and the totally integrated power module (TIPM) through two relays in diesel accessory fuse/relay block located below the left front fender.

The PTC heater consists of a molded plastic mounting plate (2) with an integral wire connector receptacle (3). Concealed behind the mounting plate are four heating elements with fins (4) that transfer the heat produced by the PTC heater to the conditioned air flowing within the air distribution housing. A positioning tab (5) is molded onto the end of the heater unit to help support the heater unit inside the air distribution housing. The

PTC heater unit is connected to the vehicle electrical system through the instrument panel wire harness.

The PTC heater unit is accessed for service from underneath the instrument panel.

OPERATION

HEATER UNIT

The positive temperature coefficient (PTC) heater unit dissipates 1 kW of electrical power through 4 heating bars. The totally integrated power module (TIPM) operates the two relays for the PTC heater unit. The PTC heater unit is split into two "banks". Each bank is driven separately based on alternator load. This allows for lower in-rush current and optimum battery charging. After a bank has been turned on, another bank can only be turned on 10 seconds after the previous. On average, the PTC banks are not switched more than 25 times for each vehicle start. Electrical power output is between 900-1050 W.

The control system for the PTC heater unit is diagnosed using a scan tool. Prior to replacing a PTC heater unit, check for any diagnostic trouble codes (DTCs) related to the ECM, TIPM and heating-A/C system (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

The PTC heater unit cannot be adjusted or repaired and, if faulty or damaged it must be replaced.

DIAGNOSIS AND TESTING

HEATER UNIT

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.

NOTE: For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

Prior to replacing the positive temperature coefficient (PTC) heater unit, check for any diagnostic trouble codes (DTCs) related to the engine control module (ECM), totally integrated power module (TIPM) and the heating-A/C system and repair as necessary (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the PTC heater unit. See **REMOVAL**.
3. Using an ohmmeter, check for continuity between all of the PTC heater unit terminals. In each case there

should be continuity. If OK, repair the wire harness circuits between the PTC heater unit and the TIPM. If NOT OK, replace the PTC heater unit.

REMOVAL

HEATER UNIT

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: LHD model shown in illustrations. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. If equipped, remove the silencer from below the driver side of the instrument panel. Refer to **REMOVAL** .
3. Disconnect the wire harness connector from the mode door actuator (2) and the blend door actuator (6) located on the driver side of the air distribution housing. See **REMOVAL**.
4. Carefully disengage the retaining tabs (3) that secure the mode door actuator and the blend door actuator to the actuator mounting bracket (5) and remove the actuators.
5. Remove the three screws (1) that secure the actuator mounting bracket to the air distribution housing and remove the bracket.
6. Remove the screw (8) that secures the driver side front floor duct (7) to the air distribution housing and remove the duct

Fig. 213: PTC Heater Connector
 Courtesy of CHRYSLER LLC

NOTE: PTC heater shown in illustration removed from distribution housing for clarity.

NOTE: To disconnect the wire harness connector from the PTC heater, disengage the connector lock while pulling the connector away from the heater unit.

7. Disengage the wire connector lock (2) that secures the wire harness connector (1) to the positive temperature coefficient (PTC) heater unit (3) and disconnect the connector from the heater.

Fig. 214: Removing/Installing Screws That Secure PTC Heater Unit To Air Distribution Housing
 Courtesy of CHRYSLER LLC

8. Remove the two screws (1) that secure the PTC heater unit (2) to the air distribution housing (3).
9. Carefully pull the PTC heater unit straight out of the air distribution housing.

INSTALLATION

HEATER UNIT

NOTE: LHD model shown in illustration. RHD model similar.

Fig. 215: Removing/Installing Screws That Secure PTC Heater Unit To Air Distribution Housing
Courtesy of CHRYSLER LLC

1. Carefully install the positive temperature coefficient (PTC) heater unit (2) into the driver side of the air distribution housing (3). Make sure to position the two locator tabs on the end of the heater unit into the molded locator indentations on the right side of the air distribution housing.
2. Install the two screws (1) that secure the PTC heater unit to the air distribution housing. Tighten the screws to 1.2 N.m (10 in. lbs.).

Fig. 216: PTC Heater Connector - Install
Courtesy of CHRYSLER LLC

NOTE: PTC heater shown in illustration removed from distribution housing for clarity.

3. Connect the wire harness connector (1) to the PTC heater unit (3) while pushing inward on the connector lock (2). Make sure the wire harness connector and lock are fully engaged.

Fig. 217: HVAC Housing Assembly
Courtesy of CHRYSLER LLC

4. Install the driver side front floor duct (7) onto the driver side of the air distribution housing (4) and install the retaining screw (8). Tighten the screw to 1.2 N.m (10 in lbs.).
5. Position the actuator mounting bracket (5) onto the air distribution housing and install the three retaining screws (1). Tighten the screws to 1.2 N.m (10 in lbs.).
6. Position the mode door actuator (2) and the blend door actuator (6) onto the actuator mounting bracket. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the door linkage.

NOTE: If the retaining tabs on the actuator mounting bracket become broken during service, the alignment pins on the bracket bosses can be removed and screws can be used to retain the actuator to the bracket. Once the alignment pins are removed, pre-made holes can be found the center of the bosses, exactly where the pins were. This assures correct actuator alignment to the bracket. Use care not to overtighten the screws and damage the bosses.

7. Engage the retaining tabs (3) that secure the mode and blend door actuators to the actuator mounting bracket. Make sure the retaining tabs are fully engaged.
8. Connect the wire harness connector to the mode and blend door actuators.
9. If equipped, install the silencer below the driver side of the instrument panel. Refer to **INSTALLATION**.
10. Reconnect the negative battery cable.

RELAY-HEATER UNIT

DESCRIPTION

RELAY-HEATER UNIT

Fig. 218: STANDARD ISO-TYPE RELAY

Courtesy of CHRYSLER LLC

Two relays (1) are used for the electric positive temperature coefficient (PTC) heater system when equipped with the 2.8L diesel engine. The relays are International Standards Organization (ISO)-type relays. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal functions and patterns (2). The PTC relays are electromechanical devices that switch fused battery current directly to the heating elements of the PTC heater unit. The PTC relays are energized by control circuits of the totally integrated power module (TIPM).

The two PTC relays are located in the diesel accessory fuse/relay block at the right front corner of the engine compartment.

OPERATION

RELAY-HEATER UNIT

The two ISO-standard relays (1) used for the electric positive temperature coefficient (PTC) heater system are electromechanical switches that use a low current ASD power input to control the high current fused battery power output to the PTC heater unit. On each relay, the movable, common feed relay contact is held against the fixed, normally closed relay contact by spring pressure. When the electromagnetic relay coil is energized, it draws the movable common feed relay contact away from the fixed, normally closed relay contact and, holds it against the fixed, normally open relay contact. This action allows high current to flow to one or more of the heating elements of the PTC heater.

When the relay coil is de-energized, spring pressure returns the movable relay contact back against the fixed, normally closed contact point. The resistor or diode is connected in parallel with the relay coil, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of

the relay coil collapses.

The terminals for the PTC relays are connected to the vehicle electrical system through receptacles in the diesel accessory fuse/relay block. The inputs and outputs of the PTC relays include:

Terminals (30) receive battery current through a fusible link at all times.

Terminals (85) are connected to a ground circuit.

Terminals (86) are connected to control circuits of the totally integrated power module (TIPM).

Terminals (87) provide fused battery current to the PTC heating elements through the PTC relays only when the PTC relay coil is energized.

Terminals (87A) are not connected to any circuit in this application, but provide battery current output only when the PTC relay coil is de-energized.

The two PTC relays cannot be repaired and, if faulty or damaged they must be replaced. Refer to the appropriate wiring information for diagnosis and testing of the ISO-standard relays and for complete TIPM and HVAC wiring diagrams.

REMOVAL

RELAY-HEATER UNIT

Fig. 219: Cover & Diesel Accessory Fuse/Relay Block
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Open the cover (1) of the diesel accessory fuse/relay block (2) located at the right front of the engine compartment.
3. Remove the positive temperature coefficient (PTC) relays as necessary from the fuse/relay block.

INSTALLATION

RELAY-HEATER UNIT

Fig. 220: Cover & Diesel Accessory Fuse/Relay Block
Courtesy of CHRYSLER LLC

1. Position the positive temperature coefficient (PTC) relays as necessary into the proper receptacle of the diesel accessory fuse/relay block (2) located at the right front of the engine compartment.
2. Align the PTC relay terminals with the terminal cavities in the fuse/relay block and push down firmly on each relay until the terminals are fully seated.
3. Close the cover (1) of the diesel accessory fuse/relay block.
4. Reconnect the negative battery cable.

No

Replace the Horn Switch.

Perform **BODY VERIFICATION TEST - VER 1** .

3) STEERING WHEEL HARNESS SHORTED

819d5967

Fig. 3: Checking Steering Wheel Harness For Short
Courtesy of CHRYSLER LLC

Disconnect the Steering Control Module C5 connector.

With the scan tool, erase DTC's

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display HORN SWITCH STUCK?

Yes

Go To 4).

No

Repair/replace the shorted steering wheel harness.

Perform **BODY VERIFICATION TEST - VER 1**.

4) STEERING CONTROL MODULE SHORTED

81a3ef33

Fig. 4: Steering Control Module C2 Connector
Courtesy of CHRYSLER LLC

Disconnect the Steering Control Module C2 connector.

With the scan tool, erase DTC's

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display HORN SWITCH STUCK?

Yes

Go To 5).

No

Replace the Clockspring.

Perform **BODY VERIFICATION TEST - VER 1** .

5) (X3) HORN SWITCH SENSE SHORTED TO RETURN

Fig. 5: Measuring Resistance Between (X3) Horn Switch Sense And (X13) Signal Return Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Cluster C2 and C3 connector.

Measure the resistance between (X3) Horn Switch Sense and the (X13) Signal Return circuit.

Is the resistance below 1000.0 ohms?

Yes

Repair the (X3) Horn Switch Sense circuit for a short to (X13) Signal Return circuit.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 6).

6) (X3) HORN SWITCH SENSE SHORTED TO GROUND

Fig. 6: Measuring (X3) Horn Switch Sense Circuit To Ground
Courtesy of CHRYSLER LLC

Measure the (X3) Horn Switch Sense circuit to ground.

Is the resistance below 1000.0 ohms?

Yes

Repair the Horn Switch Sense circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Cluster.

Perform **BODY VERIFICATION TEST - VER 1** .

2008 ACCESSORIES AND EQUIPMENT

Horn System - Service Information - Liberty

HORN SYSTEM - SERVICE INFORMATION

DESCRIPTION

HORN SYSTEM

The dual-note horn system features dual electromagnetic horn units. The horn system includes the following major components:

- **Horn** - The two horns are located near the left side headlight.
- **Horn Fuse** - The horn fuse is located in the Totally Integrated Power Module (TIPM).
- **Horn Switch** - The horn switch is located under the driver airbag assembly.

OPERATION

HORN SYSTEM

The horn system operates on battery current received through fuse 41 and 42 in the Totally Integrated Power Module. The horn system circuit is designed so that the system will remain operational, regardless of the ignition switch position.

DIAGNOSIS AND TESTING

HORN SYSTEM

In most cases, any problem involving continually sounding horns can be quickly alleviated by removing the fuses from the Totally Integrated Power Module (TIPM).

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

HORN SYSTEM DIAGNOSIS TABLE

CONDITION	POSSIBLE CAUSES	CORRECTION
BOTH HORNS INOPERATIVE	1. Faulty fuse.	1. Check the fuses in the Totally Integrated Power Module (TIPM). Replace the fuse and repair the shorted circuit or component, if

-	2. Faulty horn switch.	required. 2. Refer to <u>SWITCH-HORN</u> for the proper diagnosis and testing procedure. Replace the horn switch or repair the open horn switch circuit, if required.
-	3. Faulty horns.	3. Refer to <u>HORN</u> for the proper diagnosis and testing procedure. Replace the horns or repair the open horn circuit, if required.
ONE HORN INOPERATIVE	1. Faulty horn.	1. Refer to <u>HORN</u> for the proper diagnosis and testing procedures. Replace the horn or repair the open horn circuit, if required.
HORN SOUNDS CONTINUOUSLY	1. Faulty horn switch.	1. Refer to <u>SWITCH-HORN</u> for the proper diagnosis and testing procedure. Replace the horn switch or repair the shorted horn switch circuit, if required.

HORN

REMOVAL

HORN

- 1. Disconnect and isolate the battery negative cable.
- 2. Disconnect the electrical harness connector from the horns.
- 3. Remove the mounting bolt.
- 4. Remove the horns.

INSTALLATION

HORN

- 1. Install the horns.
- 2. Install the mounting bolt. Tighten bolt to 25 N.m (19 ft. lbs.).
- 3. Connect the electrical harness connector to the horns
- 4. Connect the battery negative cable.

SWITCH-HORN

DESCRIPTION

HORN SWITCH

The horn switch is located in the center of the steering wheel under the flexible steering wheel pad for convenient operation.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

Fig. 1: Horn Switch
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the driver airbag. Refer to **REMOVAL** .
3. Disconnect the electrical connectors.
4. Remove horn switches.

INSTALLATION

INSTALLATION

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way

to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

81a0fa45

Fig. 2: Horn Switch
Courtesy of CHRYSLER LLC

1. Install the horn switches.
2. Connect the electrical connectors.
3. Install the driver airbag. Refer to **INSTALLATION**.
4. Connect the battery negative cable.

IGNITION CONTROL - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B2101-IGNITION RUN/START INPUT CIRCUIT LOW

Circuit Schematic

0130-1120

Fig. 1: Identifying Ignition Run/Start Input Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Monitor Conditions

When Monitored:

With the ignition switch on.

Set Conditions

- **Set Condition:**

The WCM/WIN (SKREEM) Module has detected the ignition switch input voltage below a calibrated value.

Possible Causes

Possible Causes
(F20) IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN (A106) FUSED B+ SHORTED TO GROUND IGNITION SWITCH TIPM

Diagnostic Test

1) CHECK FOR ACTIVE DTC

Turn the ignition on.

With a scan tool, read, record and erase TIPM DTCs.

Turn the ignition off for 30 seconds, then back on.

Using the scan tool, read TIPM DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2) (F20) IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN.

No

The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform **BODY VERIFICATION TEST - VER 1** .

2) (F20) IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN

Fig. 2: Checking Ignition Switch Output (Run-Start) Circuit For Open
 Courtesy of CHRYSLER LLC

NOTE: Check the related fuse (TIPM 46) to the (F20) Ignition Switch Output (Run-Start) circuit. If blown, use the wiring diagrams as a guide to make necessary repairs.

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, probe the (F20) Ignition Switch output (Run-Start) circuit in the TIPM C7 harness connector.

Does the test light illuminate brightly?

Yes

Replace the TIPM in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (F20) Ignition switch output circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

Circuit Schematic

Fig. 3: Identifying Ignition Run/Start Input Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to [SYSTEM WIRING DIAGRAMS](#) article.

Monitor Conditions

When Monitored:

With the ignition switch on.

Set Conditions

- **Set Condition:**

The WCM/WIN (SKREEM) Module has detected the ignition switch input voltage above a calibrated value.

Possible Causes

Possible Causes
(F20) IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SHORTED TO BATTERY VOLTAGE WCM/WIN (SKREEM) MODULE

Diagnostic Test

1) CHECK FOR ACTIVE DTC

NOTE: Check to make sure the battery and charging system are operating properly. Battery and charging system problems may cause these DTC's to set.

NOTE: Diagnose any related Powertrain DTC(s) before continuing.

Turn the ignition on.

With a scan tool, read, record and erase WCM/WIN (SKREEM) DTC(s).

Perform 5 ignition cycles, leaving the ignition switch on for a minimum of 90 seconds per cycle.

Using the scan tool, read WCM/WIN (SKREEM) DTC(s).

Does the scan tool display this DTC as active?

Yes

Go To 2).

No

The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform **BODY VERIFICATION TEST - VER 1** .

2) (F20) IGNITION SWITCH OUTPUT (RUN-START) SHORTED TO BATTERY VOLTAGE

Fig. 4: Checking Ignition Switch Output (Run-Start) For Short To Battery Voltage
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the WCM/WIN (SKREEM) harness connector.

Using a 12-volt test light connected to ground, probe the (F20) Ignition Switch Output (Run-Start) circuit in the WCM/WIN (SKREEM) harness connector.

Does the test light illuminate brightly?

Yes

Repair the (F20) Ignition Switch Output (Run-Start) circuit for a short to battery voltage.

Perform **SKREEM/SKIM VERIFICATION TEST** .

No

Replace and program the WCM/WIN (SKREEM) in accordance with the service information.

Perform **SKREEM/SKIM VERIFICATION TEST** .

B210D-BATTERY VOLTAGE LOW

Additional Wiring

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

Battery voltage less than 9 volts for approximately 5 to 6 seconds.

Possible Causes

Possible Causes
GENERATOR OPERATION PCM

Diagnostic Test

1) CHECK FOR ANY POWERTRAIN CONTROL MODULES DTCS

- NOTE:

Make sure the Battery is in good condition. Using the Midtronics Battery Tester, test the Battery before continuing.
- NOTE:

Inspect the vehicle for after market accessories that may exceed the Generator System output.
- NOTE:

Make sure the generator drive belt is in good operating condition.
- NOTE:

Inspect the fuses in the TIPM. If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.

Turn the ignition on.

With the scan tool, read active PCM DTC's.

Does the scan tool display any active PCM DTC's?

Yes

Refer to appropriate Engine ELECTRICAL DIAGNOSTICS article for the diagnostic test procedure.

No

Check the above conditions that can cause a low voltage condition. Repair as necessary.
Perform **BODY VERIFICATION TEST - VER 1** .

B210E-BATTERY VOLTAGE HIGH

Additional Wiring

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- Set Condition:**

Battery voltage greater than 16 volts for approximately 15 seconds.

Possible Causes

Possible Causes
GENERATOR PCM

Diagnostic Test

1) CHECK FOR ANY POWERTRAIN CONTROL MODULES DTCS

- NOTE:

Make sure the Battery is in good condition. Using the Midtronics Battery Tester, test the Battery before continuing.
- NOTE:

Inspect the vehicle for after market accessories that may exceed the Generator System output.
- NOTE:

Make sure the generator drive belt is in good operating condition.

NOTE: **Inspect the fuses in the TIPM. If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.**

Turn the ignition on.

With the scan tool, read active PCM DTC's.

Does the scan tool display any active PCM DTC's?

Yes

Refer to appropriate Engine ELECTRICAL DIAGNOSTICS article for the diagnostic test procedure.

No

Check the above conditions that can cause a high voltage condition. Repair as necessary.
Perform **BODY VERIFICATION TEST - VER 1** .

B2142-IGNITION OFF DRAW (IOD) FUSE NOT PRESENT

Additional Wiring

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Monitor Conditions

When Monitored:

With the Ignition on. This DTC will set only if vehicle has less that 50 miles on it. After 50 miles, DTC B219F will set.

Set Conditions

- Set Condition:**

IOD Fuse not installed in the TIPM.

Possible Causes

Possible Causes
IOD FUSE

Diagnostic Test

1) CHECK FOR ACTIVE DTC

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on, leaving the ignition off for a minimum of 30 seconds.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2).

No

If the DTC is stored, check for an intermittent condition. Using the wiring diagram/schematic as a guide, visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2) IOD FUSE INSTALLED

Verify IOD Fuse installed in TIPM

Is IOD Fuse present?

Yes

Go To 3).

No

Install the IOD Fuse.

Perform **BODY VERIFICATION TEST - VER 1** .

3) IOD FUSE BLOWN CHECK

Is IOD Fuse blown?

Yes

Replace the IOD Fuse.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test complete.

Circuit Schematic

0100-1101

Fig. 5: Fused Ignition Switch Output (Run-Start) Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams, refer to [SYSTEM WIRING DIAGRAMS](#) article.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

Over current condition detected on the (F1) Fused Ignition Switch Output (Run-Start) circuit.

Possible Causes

Possible Causes
TERMINAL DAMAGE OR CORROSION HIGH RESISTANCE ON THE (F1) IGNITION SWITCH OUTPUT (UNLOCK-RUN-START) CIRCUIT TIPM

Diagnostic Test

1) CHECK FOR ACTIVE DTC

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on, leaving the ignition off for a minimum of 30 seconds.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2).

No

If the DTC is stored, check for an intermittent condition. Using the wiring diagram/schematic as a guide, visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2) INSPECT THE TIPM, PCM, AND SHIFT LEVER ASSEMBLY (NAG1) TERMINALS & WIRE HARNESS FOR A CONDITION CAUSING HIGH CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Disconnect the PCM C1 harness connector.

Disconnect the Shift Lever Assembly (NAG1) harness connector

Inspect the connector terminals for signs of corrosion build up and damage.

Visually inspect the wiring harness for any chafed, pierced, pinched or partially broken wires hidden in the wire insulation.

Were any of the above conditions found?

Yes

Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the TIPM in accordance with the service information

Perform **BODY VERIFICATION TEST - VER 1** .

B219F-IGNITION OFF DRAW (IOD) FUSE BLOWN

Additional Wiring

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Monitor Conditions

When Monitored:

With the ignition on. This DTC will only set if vehicle has over 50 miles on it.

Set Conditions

- **Set Condition:**

IOD Fuse not installed or blown.

Possible Causes

Possible Causes
IOD FUSE NOT INSTALLED
IOD FUSE BLOWN

Diagnostic Test

1) CHECK FOR ACTIVE DTC

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on, leaving the ignition off for a minimum of 30 seconds.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2).

No

If the DTC is stored, check for an intermittent condition. Using the wiring diagram/schematic as a guide, visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2) IOD FUSE

Verify IOD Fuse installed in TIPM.

Is IOD Fuse present?

Yes

Go To 3).

No

Replace the IOD Fuse.

Perform **BODY VERIFICATION TEST - VER 1** .

3) IOD FUSE BLOWN

Verify IOD Fuse is blown.

Is IOD Fuse blown?

Yes

Using the wiring diagrams, diagnose for a short to ground condition.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test complete.

B2206-CURRENT VIN MISSING / MISMATCH

Additional Wiring

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

A PCM from another vehicle has been installed in the vehicle.

Possible Causes

Possible Causes
PCM FROM ANOTHER VEHICLE INSTALLED

Diagnostic Test

1) PCM FROM ANOTHER VEHICLE INSTALLED

NOTE: This DTC is set when a PCM from another vehicle is installed into the current vehicle.

Has another PCM been installed?

Yes

Replace the PCM in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 2).

2) OTHER CAN-C MODULES SET VIN MISMATCH

Is VIN Mismatch DTC set in other CAN-C modules?

Yes

Replace the PCM in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the TIPM in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

B222C-VEHICLE CONFIGURATION NOT PROGRAMMED

Additional Wiring

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Monitor Conditions

When Monitored:

Continuously

Set Conditions

- Set Condition:**

The TIPM is not configured for the vehicle.

Possible Causes

Possible Causes
TIPM

Diagnostic Test

1) CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2).

No

Test complete.

2) ACTIVE TIPM DTC

Cycle the ignition from off to run remaining in run.

With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 3).

No

Test complete.

3) VIN MISMATCH DTC PRESENT

Turn the ignition on.

With the scan tool, read DTCs.

Is DTC: B2206-CURRENT VIN MISSING / MISMATCH also active?

Yes

Refer to repair procedure for DTC **B2206-CURRENT VIN MISSING / MISMATCH.**

No

Replace the TIPM in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

U0100-LOST COMMUNICATION WITH ECM/PCM

Additional Wiring

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Diagnostic Test

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0101-LOST COMMUNICATION WITH TCM

Additional Wiring

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Diagnostic Test

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0114-LOST COMMUNICATION WITH FINAL DRIVE CONTROL MODULE

Additional Wiring

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Diagnostic Test

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE

Additional Wiring

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Diagnostic Test

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER

Additional Wiring

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Diagnostic Test

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0154-LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE

Additional Wiring

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Diagnostic Test

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0155-LOST COMMUNICATION WITH CLUSTER/CCN

Additional Wiring

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Diagnostic Test

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0164-LOST COMMUNICATION WITH HVAC CONTROL MODULE

Additional Wiring

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Diagnostic Test

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (SKREEM/WCM)

Additional Wiring

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Diagnostic Test

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0184-LOST COMMUNICATION WITH RADIO

Additional Wiring

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Diagnostic Test

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER

Additional Wiring

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Diagnostic Test

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

2008 ENGINE

Ignition Control - Service Information - Liberty

IGNITION CONTROL - SERVICE INFORMATION

DESCRIPTION

IGNITION SYSTEM-3.7L

The ignition system is controlled by the Powertrain Control Module (PCM) on all engines.

This engine uses a separate ignition coil for each cylinder. The one-piece coil bolts directly to the cylinder head. Rubber boots seal the secondary terminal ends of the coils to the top of all 6 spark plugs. A separate electrical connector is used for each coil.

Because of coil design, spark plug cables (secondary cables) are not used. A distributor is not used with the 3.7L engine.

Two knock sensors (one for each cylinder bank) are used to help control spark knock.

The Auto Shutdown (ASD) relay provides battery voltage to each ignition coil.

The ignition system consists of:

- 6 Spark Plugs
- 6 Separate Ignition Coils
- 2 Knock Sensors
- Powertrain Control Module (PCM)

Also to be considered part of the ignition system are certain inputs from the Crankshaft Position, Camshaft Position, 2 knock and MAP Sensors

SPECIFICATIONS

IGNITION COIL RESISTANCE - 3.7L V6

PRIMARY RESISTANCE 21-27°C (70-80°F)	SECONDARY RESISTANCE 21-27°C (70-80°F)
0.6 - 0.9 Ohms	6,000 - 9,000 Ohms

IGNITION TIMING

Ignition timing is not adjustable on any engine.

RELAY-AUTO SHUT DOWN**REMOVAL****AUTO SHUTDOWN RELAY**

Fig. 1: Identifying ASD, Totally Integrated Power Module (TIPM) & Left Inner Fender
Courtesy of CHRYSLER LLC

The ASD relay is located in the Totally Integrated Power Module (TIPM) (1). The TIPM is located in the engine compartment near the left inner fender (2). Refer to label on TIPM cover for relay location.

1. Remove TIPM cover.
2. Remove relay from TIPM.
3. Check condition of relay terminals and TIPM connector terminals for damage or corrosion. Repair if necessary before installing relay.
4. Check for pin height (pin height should be the same for all terminals within the TIPM connector). Repair if necessary before installing relay.

INSTALLATION

AUTO SHUTDOWN RELAY

Fig. 2: Identifying ASD, Totally Integrated Power Module (TIPM) & Left Inner Fender
Courtesy of CHRYSLER LLC

1. Refer to TIPM cover for ASD relay location.
2. Install relay to TIPM (1).
3. Install cover to TIPM.

SENSOR-CAMSHAFT POSITION

REMOVAL

CAMSHAFT POSITION SENSOR - 3.7L

Fig. 3: Camshaft Position Sensor
Courtesy of CHRYSLER LLC

The Camshaft Position Sensor (CMP) (3) is bolted to the front/top of the right cylinder head (1).

1. Raise and support vehicle.
2. Disconnect electrical connector at CMP sensor.
3. Remove sensor mounting bolt (2).
4. Carefully twist sensor from cylinder head.
5. Check condition of sensor o-ring.

INSTALLATION

CAMSHAFT POSITION SENSOR - 3.7L

Fig. 4: Camshaft Position Sensor
Courtesy of CHRYSLER LLC

1. Clean out machined hole in cylinder head.
2. Apply a small amount of engine oil to sensor o-ring.
3. Install sensor (3) into cylinder head with a slight rocking and twisting action.

CAUTION: Before tightening sensor mounting bolt (2), be sure sensor is completely flush to cylinder head. If sensor is not flush, damage to sensor mounting tang may result.

4. Install mounting bolt (2) and tighten to 12 N.m (106 in. lbs).
5. Connect electrical connector to sensor.

COIL-IGNITION

REMOVAL

COIL-IGNITION-3.7L

81607ec1

Fig. 5: Ignition Coil Seal Location
Courtesy of CHRYSLER LLC

An individual ignition coil (1) is used for each spark plug. The coil fits into machined holes in the cylinder head. A mounting stud/nut secures each coil to the top of the intake manifold. The bottom of the coil is equipped with a rubber boot to seal the spark plug to the coil. Inside each rubber boot is a spring. The spring is used for a mechanical contact between the coil and the top of the spark plug. These rubber boots and springs are a permanent part of the coil and are not serviced separately. An o-ring (2) is used to seal the coil at the opening

into the cylinder head.

1. Depending on which coil is being removed, the throttle body air intake tube or intake box may need to be removed to gain access to coil.
2. Disconnect electrical connector from coil by pushing downward on release lock on top of connector and pull connector from coil.
3. Clean area at base of coil with compressed air before removal.

8127179c

Fig. 6: Locating Ignition Coil - 3.7L
Courtesy of CHRYSLER LLC

4. Remove coil mounting nut (2) from mounting stud.
5. Carefully pull up coil from cylinder head opening with a slight twisting action.

6. Remove coil from vehicle.

INSTALLATION

COIL-IGNITION - 3.7L

81607ec1

Fig. 7: Ignition Coil Seal Location
Courtesy of CHRYSLER LLC

1. Using compressed air, blow out any dirt or contaminants from around top of spark plug.
2. Check condition of coil O-ring (2) and replace as necessary. To aid in coil installation, apply silicone to

coil o-ring (2).

8127179c

Fig. 8: Locating Ignition Coil - 3.7L
Courtesy of CHRYSLER LLC

3. Position ignition coil (1) into cylinder head opening and push onto spark plug. Do this while guiding coil base over mounting stud.
4. Install coil mounting stud nut (2).
5. Connect electrical connector to coil by snapping into position.
6. If necessary, install throttle body air tube.

SENSOR-KNOCK

OPERATION

OPERATION - 3.7L

Two knock sensors are used; one for each cylinder bank. When the knock sensor detects a knock in one of the cylinders on the corresponding bank, it sends an input signal to the Powertrain Control Module (PCM). In response, the PCM retards ignition timing for all cylinders by a scheduled amount.

Knock sensors contain a piezoelectric material which constantly vibrates and sends an input voltage (signal) to the PCM while the engine operates. As the intensity of the crystal's vibration increases, the knock sensor output voltage also increases.

The voltage signal produced by the knock sensor increases with the amplitude of vibration. The PCM receives the knock sensor voltage signal as an input. If the signal rises above a predetermined level, the PCM will store that value in memory and retard ignition timing to reduce engine knock. If the knock sensor voltage exceeds a preset value, the PCM retards ignition timing for all cylinders. It is not a selective cylinder retard.

The PCM ignores knock sensor input during engine idle conditions. Once the engine speed exceeds a specified value, knock retard is allowed.

Knock retard uses its own short term and long term memory program.

Long term memory stores previous detonation information in its battery-backed RAM. The maximum authority that long term memory has over timing retard can be calibrated.

Short term memory is allowed to retard timing up to a preset amount under all operating conditions (as long as RPM is above the minimum RPM) except at Wide Open Throttle (WOT). The PCM, using short term memory, can respond quickly to retard timing when engine knock is detected. Short term memory is lost any time the ignition key is turned off.

NOTE: Over or under tightening the sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensors.

REMOVAL

SENSOR-KNOCK-3.7L

Fig. 9: KNOCK SENSOR - 3.7L
Courtesy of CHRYSLER LLC

The two knock sensors (1) are bolted into the cylinder block under the intake manifold. The two sensors share a common wiring harness using one electrical connector (3). Because of this, they must be replaced as a pair.

NOTE: **The left sensor is identified by an identification tag (LEFT) (2). It is also identified by a larger bolt head. The Powertrain Control Module (PCM) must have and know the correct sensor left/right positions. Do not mix the sensor locations.**

1. Remove intake manifold. Refer to **INSTALLATION** .
2. Disconnect knock sensor dual pigtail harness from engine wiring harness. This connection is made near rear of engine.
3. Remove both sensor mounting bolts. Note foam strip on bolt threads. This foam is used only to retain the bolts to sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.
4. Remove sensors from engine.

INSTALLATION

INSTALLATION - 3.7L

Fig. 10: KNOCK SENSOR - 3.7L
 Courtesy of CHRYSLER LLC

NOTE: The left sensor is identified by an identification tag (LEFT) (2). It is also identified by a larger bolt head. The Powertrain Control Module (PCM) must have and know the correct sensor left/right positions. Do not mix the sensor locations.

1. Thoroughly clean knock sensor mounting holes.
2. Install sensors (1) into cylinder block.

NOTE: Over or under tightening the sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensors. The torque for the knock sensor bolt is relatively light for an 8 mm bolt.

NOTE: Note foam strip on bolt threads. This foam is used only to retain the bolts to sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

3. Install and tighten mounting bolts. Tighten to 15 +/- 2 ft. lbs. (20 N.m) (176 in. lbs).
4. Connect knock sensor wiring harness to engine harness at rear of intake manifold.
5. Install intake manifold. Refer to **INSTALLATION** .

SPARK PLUG

REMOVAL

SPARK PLUGS

Each individual spark plug is located under each ignition coil. Each individual ignition coil must be removed to gain access to each spark plug. See **REMOVAL**.

1. Remove necessary air filter tubing at throttle body.
2. Prior to removing ignition coil, spray compressed air around coil base at cylinder head.
3. Prior to removing spark plug, spray compressed air into cylinder head opening. This will help prevent foreign material from entering combustion chamber.
4. Remove spark plug from cylinder head using a quality socket with a rubber or foam insert. Also check condition of ignition coil O-ring and replace as necessary.
5. Inspect spark plug condition.

INSTALLATION

INSTALLATION

Special care should be taken when installing spark plugs into the cylinder head spark plug wells. Be sure the plugs do not drop into the plug wells as electrodes can be damaged.

Always tighten spark plugs to the specified torque. Over tightening can cause distortion resulting in a change in the spark plug gap or a cracked porcelain insulator.

1. Start the spark plug into the cylinder head by hand to avoid cross threading.
2. Tighten spark plugs. Refer to **INSTALLATION**.
3. Before installing ignition coil(s), check condition of coil O-ring and replace as necessary. To aid in coil installation, apply silicone to coil O-ring.
4. Install ignition coil(s). See **INSTALLATION**.

SPARK PLUG CABLE

DESCRIPTION

DESCRIPTION

Spark plugs cables are not used with either the 3.7L or 4.0L V6 engines.

SWITCH-IGNITION

DESCRIPTION

IGNITION SWITCH

80c9ad69

Fig. 11: Steering Column
Courtesy of CHRYSLER LLC

- | |
|--|
| <ul style="list-style-type: none">1 - KEY CYLINDER2 - GEAR SHIFT LEVER3 - MOUNTING HOLES4 - STEERING COLUMN5 - IGNITION SWITCH |
|--|

The ignition switch (5) is located on the steering column (4). It is used as the main on/off switching device for most electrical components. The mechanical key cylinder is used to engage/disengage the electrical ignition switch.

OPERATION

IGNITION SWITCH

Vehicles equipped with an automatic transmission and a steering column mounted shifter: an interlock device is located within the shift cable. This interlock device is used to lock the transmission shifter in the PARK position when the key cylinder is in any position and the brake pedal is not depressed.

DIAGNOSIS AND TESTING

IGNITION SWITCH

TEST AND REPAIR

If the key removal effort is excessive on a vehicle with an automatic transmission first adjust the shift linkage. Refer to **ADJUSTMENTS** .

If the ignition switch effort is excessive, remove the ignition key cylinder from the steering column. Check the turning effort of the key cylinder. If the ignition key cylinder effort is excessive, replace the key cylinder. Refer to **REMOVAL** .

REMOVAL

IGNITION SWITCH

SERVICE PRECAUTIONS

80c9ad69

Fig. 12: Steering Column
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - KEY CYLINDER
2 - GEAR SHIFT LEVER
3 - MOUNTING HOLES
4 - STEERING COLUMN
5 - IGNITION SWITCH |
|--|

NOTE: The steering column on vehicles equipped with an automatic transmission is not equipped with an internal locking shaft with the ignition cylinder. Alternative methods of locking the steering wheel for service will have to be used.

The tilt and standard column (4) have been designed to be serviced as an assembly; without wiring, switches, shrouds, steering wheel, etc. Most steering column components can be serviced without removing the steering column from the vehicle. See Fig. 12.

Safety goggles should be worn at all times when working on steering columns.

To service the steering wheel, switches or airbag, refer to RESTRAINTS - SERVICE INFORMATION article and follow all WARNINGS and CAUTIONS.

WARNING: The airbag system is a sensitive, complex electro-mechanical unit. Before attempting to diagnose, remove or install the airbag system components you must first disconnect and isolate the battery negative (ground) cable. Then wait two minutes for the system capacitor to discharge. Failure to do so could result in accidental deployment of the air bag and possible personal injury. The fasteners, screws and bolts, originally used for the airbag components, have special coatings and are specifically designed for the airbag system. They must never be replaced with any substitutes. Anytime a new fastener is needed, replace with the correct fasteners provided in the service package or fasteners listed in the parts books.

CAUTION: Do not hammer on steering column shaft. This may cause damage to the shaft or bearing.

CAUTION: Do not attempt to remove the pivot bolts to disassemble the tilting mechanism.

The ignition key must be in the key cylinder for cylinder removal. The key cylinder must be removed first before removing ignition switch.

1. Remove the negative (ground) cable from the battery.
2. Disable the airbag. Refer to REMOVAL .
3. Remove the lower and upper shrouds.
4. Remove key cylinder. Refer to REMOVAL .
5. Disconnect the lower clockspring connectors.

6. Remove the wire retainer from the tilt lever bracket.

80a7c390

Fig. 13: Ignition Switch With Tilt

- | |
|---|
| 1 - Ignition Switch Mounting Screws
2 - Non-Tilt Mounting Bracket Screws |
|---|

8. For columns without tilt remove the bracket (2) to gain access to the ignition switch mounting screws (1). See **Fig. 14**

80a7c21

Fig. 15: Ignition Switch
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - Ignition Switch
2 - Ignition Switch Mounting Screws |
|--|

9. Disconnect the electrical connector at rear of ignition switch (1). See **Fig. 15**.
10. Remove ignition switch mounting screws (2).
11. Using a small screwdriver, push on locking tab and remove switch from steering column.

INSTALLATION

IGNITION SWITCH

The ignition key must be in the key cylinder for cylinder removal. The key cylinder must be removed first before installing ignition switch.

1. Before installing ignition switch, rotate the slot in the switch to the ON position.

Fig. 16: Ignition Switch
Courtesy of CHRYSLER LLC

1 - Ignition Switch 2 - Ignition Switch Mounting Screws
--

2. Connect the electrical connector to rear of the ignition switch. Make sure that locking tabs are fully seated into wiring connector.
3. Position switch (1) to column and install the mounting screws (2). Tighten screw to 3 N.m (26 in. lbs.).

80a7c390

Fig. 17: Ignition Switch With Tilt
Courtesy of CHRYSLER LLC

1 - IGNITION SWITCH 2 - TILT LEVER MECHANISM

4. Install the tilt lever bracket (2) mounting screws. Tighten screws to 4.5 N.m (40 in. lbs.).

|--|
| 1 - KEY CYLINDER
2 - GEAR SHIFT LEVER
3 - MOUNTING HOLES
4 - STEERING COLUMN
5 - IGNITION SWITCH |
|--|

6. Position the wire retainer into the tilt lever bracket.
7. Reconnect the lower clockspring connectors.
8. Install the key cylinder (1)
9. Install steering column upper and lower shrouds.
10. Enable the airbag system. Refer to **INSTALLATION** .

SWITCH-KEY-IN IGNITION

DESCRIPTION

KEY-IN IGNITION SWITCH

The key-in ignition switch is integral to the ignition switch, which is mounted on the left side of the steering column. It closes a path to ground for the Central Timer Module (CTM) when the ignition key is inserted in the ignition key cylinder and the driver door ajar switch is closed (driver door is open). The key-in ignition switch opens the ground path when the key is removed from the ignition key cylinder. The ground path is also opened when the driver door ajar switch is open (driver door is closed).

The key-in ignition switch cannot be repaired and, if faulty or damaged, the entire ignition switch must be replaced. Refer to **REMOVAL** .

DIAGNOSIS AND TESTING

IGNITION SWITCH AND KEY LOCK CYLINDER

ELECTRICAL DIAGNOSIS

For ignition switch electrical schematics, refer to Ignition Switch in the **SYSTEM WIRING DIAGRAMS** article.

MECHANICAL DIAGNOSIS (KEY DIFFICULT TO ROTATE)

Refer to **DIAGNOSIS AND TESTING** .

CYLINDER-KEY/LOCK

REMOVAL

LOCK CYLINDER HOUSING

- | |
|---|
| 1 - KEY
2 - KEY CYLINDER
3 - RETAINING PIN HOLE |
|---|

The ignition key (1) must be in the key cylinder (2) for cylinder installation.

1. Install the key cylinder into the housing using care to align the end of the key cylinder (2) with the ignition switch.
2. Push the key cylinder (2) in until it clicks.
3. Replace the upper and lower shrouds.
4. Reconnect the battery.

PLUG-GLOW 2.8L DIESEL

DESCRIPTION

GLOW PLUG

8148308e

Fig. 23: View Of Glow Plug
Courtesy of CHRYSLER LLC

CAUTION: The glow plugs operate on a 4.4-volt system. The glow plugs **DO NOT** tolerate any over voltage. Full battery voltage will destroy the glow plug immediately. **DO NOT** test the glow plugs with a 12V source as damage will occur to the glow plug.

CAUTION:

- Never bend, bump or knock the fast metallic glow plugs.
- Fast metallic glow plugs must not be handled loose in a container. Store, handle, and transport them only in original boxes.
- If there is any doubt about the proper condition of a glow plug, do not reuse it.
- Do not clean the glow plugs with abrasive or aggressive media.
- Avoid dipping the glow plug into fluids.
- Read Diagnostic Trouble Codes (DTCs). If a glow plug problem is indicated, do not start the engine.

CAUTION: Disregarding these instructions may cause severe engine damage.

Glow plugs are used to help start a cold or cool engine. The glow plugs will heat up and glow to heat the combustion chamber of each cylinder. An individual glow plug is used for each cylinder.

OPERATION

GLOW PLUG

8148308e

Fig. 24: View Of Glow Plug
Courtesy of CHRYSLER LLC

CAUTION: The glow plugs operate on a 4.4-volt system. DO NOT test the glow plugs with a 12 V source as damage will occur to the glow plug(s).

The Engine Control Module (ECM) monitors various engine sensors. When the ignition key is turned to the ON position, the ECM sends a signal to the glow plug module (relay) to turn on, and cycle, the glow plugs for a pre-determined amount of time, plus illuminate the glow plug light in the instrument panel. Once activated, the element inside of the core of the glow plug begins to glow. Each glow plug draws approximately 8 amps, for a total system amperage of 32 amps at 22° C (72° F) ambient temperature. If there is a fault with the glow plug system, the ECM will store a fault code.

DIAGNOSIS AND TESTING

GLOW PLUG SYSTEM

CAUTION: DO NOT attempt to start the engine until the glow plug system tests correctly.

1. Measure the electrical resistance of each glow plug while it is still installed in the cylinder head. Resistance should be less than 0.8 ohm; between the electrical connector point on the glow plug and the cylinder head. The ground contact on the DVOM must be as close as possible to the point where the glow plug contacts the cylinder head to avoid erratic resistance measurements.
2. If the resistance is out of tolerance, remove the glow plug from the cylinder head and check the resistance again.
3. Use the actuator test function of the scan tool to test the glow plug module and glow plug lamp. The glow plug module's on-board diagnostic tests will automatically check the electrical condition of the entire glow plug system.
4. After the scan tool glow plug actuator test function is complete, if MIL is OFF and no glow plug DTCs are present, testing is complete and the engine can be started.

5. If MIL is still ON, check the harness connectors of glow plugs, repair any loose or damaged connections, and run the glow plug actuator test again.
6. If MIL is still ON and glow plug DTCs are present, refer to appropriate diagnostic information, and follow the diagnostic test(s) related to the active or stored DTCs.

REMOVAL

REMOVAL

81b16a21

Fig. 25: GLOW PLUG WIRING HARNESS
Courtesy of CHRYSLER LLC

The four glow plugs (1) are attached to cylinder head below fuel rail.

1. Disconnect negative battery cable.
2. Remove fuel rail and high-pressure fuel lines.
3. Disconnect glow plug wiring harness (2) at all four glow plugs (1).

Fig. 26: GLOW PLUGS - 2.8L DIESEL
Courtesy of CHRYSLER LLC

4. Use a socket to loosen glow plug(s) (1), (2), (3) or (4). After loosening, attach a flexible tool such as a rubber hose to remove glow plug from cylinder head.

CAUTION: After plug removal, do not bend, knock, or drop the glow plugs while handling (any mechanical impact may damage the glow plug).

INSTALLATION

INSTALLATION

Fig. 27: GLOW PLUGS - 2.8L DIESEL
 Courtesy of CHRYSLER LLC

1. Apply a small amount of clean diesel oil or motor oil to glow plug threads.
2. Attach a flexible tool such as a rubber hose to install glow plug into cylinder head. Tighten each plug to 14 N.m (10 ft. lbs.) (124 in. lbs.) torque.

Fig. 28: GLOW PLUG WIRING HARNESS
 Courtesy of CHRYSLER LLC

3. Connect glow plug wiring harness (2) to all four glow plugs (1).
4. Install fuel rail and high-pressure fuel lines.
5. Connect negative battery cable.

Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE (E12) PANEL LAMPS DRIVER CIRCUIT FOR AN OPEN

Fig. 7: Checking Panel Lamps Driver Circuit For Open
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Cluster C1 harness connector.

Inspect the connector and associated wiring for the Panel illumination circuit.

Using a fused jumper wire connected to 12 volts, probe cavity 2 of the Cluster C1 harness connector.

Did the components illuminate?

Yes

Replace the Instrument Cluster in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Using the wiring diagrams as a guide, locate and repair the (E12) Panel Lamps Driver circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

B210D-BATTERY VOLTAGE LOW

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

Battery voltage less than 9 volts for approximately 5 to 6 seconds.

Possible Causes

Possible Causes
GENERATOR OPERATION PCM

Diagnostic Test

1. **CHECK FOR ANY POWERTRAIN CONTROL MODULES DTCS**

- NOTE:

Make sure the Battery is in good condition. Using the Midtronics Battery Tester, test the Battery before continuing.
- NOTE:

Inspect the vehicle for after market accessories that may exceed the Generator System output.
- NOTE:

Make sure the generator drive belt is in good operating condition.
- NOTE:

Inspect the fuses in the TIPM. If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.

Turn the ignition on.

With the scan tool, read active PCM DTC's.

Does the scan tool display any active PCM DTC's?

Yes

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

No

Check the above conditions that can cause a low voltage condition. Repair as necessary.
Perform **BODY VERIFICATION TEST - VER 1** .

B210E-BATTERY VOLTAGE HIGH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

Battery voltage greater than 16 volts for approximately 15 seconds.

Possible Causes

Possible Causes
GENERATOR PCM

Diagnostic Test

1. CHECK FOR ANY POWERTRAIN CONTROL MODULES DTCS

- NOTE:

Make sure the Battery is in good condition. Using the Midtronics Battery Tester, test the Battery before continuing.
- NOTE:

Inspect the vehicle for after market accessories that may exceed the Generator System output.
- NOTE:

Make sure the generator drive belt is in good operating condition.
- NOTE:

Inspect the fuses in the TIPM. If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.

Turn the ignition on.

With the scan tool, read active PCM DTC's.

Does the scan tool display any active PCM DTC's?

Yes

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

No

Check the above conditions that can cause a high voltage condition. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0161-LOST COMMUNICATION WITH COMPASS MODULE

Circuit Schematic

00014810c

Fig. 8: Compass Module Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The Cluster does not receive information from the Compass Module.

Possible Causes

Possible Causes
(D506) LIN BUS CIRCUIT OPEN (F921) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN (Z916) GROUND CIRCUIT OPEN COMPASS MODULE INSTRUMENT CLUSTER

Diagnostic Test

1. **CHECK FOR AN ACTIVE DTC**

NOTE: Remove any electronic devices (laptop computers, cell phones) from the instrument panel.

NOTE: Before proceeding, check the compass variance and calibration in accordance with the service information.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform **BODY VERIFICATION TEST - VER 1** .

2. (D506) LIN BUS CIRCUIT

Fig. 9: Measuring Voltage Of (D506) LIN Bus Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Compass Module harness connector.

Turn the ignition on.

Measure the voltage of the (D506) LIN BUS circuit.

Is the voltage above 5 volts?

Yes

Go To 4.

No

Go To 3.

3. (D506) LIN BUS CIRCUIT OPEN

Fig. 10: Measuring Resistance Of (D506) LIN Bus Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Instrument Cluster C2 harness connector.

Measure the resistance of the (D506) LIN BUS circuit.

Is the resistance below 10K ohms?

Yes

Replace the Cluster in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (D506) LIN BUS circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. (F921) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN

Fig. 11: Measuring Voltage Of (F921) Fused Run Relay Output Circuit For An Ope
Courtesy of CHRYSLER LLC

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F921) Fused Ignition Switch Output (RUN) circuit at the Compass Module harness connector.

Does the test light illuminate brightly?

Yes

Go To 5.

No

Repair the (F921) Fused Ignition Switch Output (RUN) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

5. **(Z916) GROUND CIRCUIT OPEN**

Fig. 12: Measuring Resistance Of (Z916) Ground Circuit For An Open
Courtesy of CHRYSLER LLC

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (Z916) Ground circuit at the Compass Module harness connector.

Does the test light illuminate brightly?

Yes

Replace the Compass Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (Z916) ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

U0184-LOST COMMUNICATION WITH RADIO

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0208-LOST COMMUNICATION WITH HEATED SEAT CONTROL MODULE

Circuit Schematic

Fig. 13: Heated Seat Control Module Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The Instrument Cluster does not receive information from the Heated Seats Control Module.

Possible Causes

Possible Causes
(D506) LIN BUS CIRCUIT OPEN (P693) HEATED SEAT MODULE SUPPLY CIRCUIT OPEN (Z914A) GROUND CIRCUIT OPEN HEATED SEATS MODULE INSTRUMENT CLUSTER

Diagnostic Test

1. **CHECK FOR AN ACTIVE DTC**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

With the scan tool, read DTCs.

Does the scan tool display the DTC as active?

Yes

Go To 2.

No

The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **(D506) LIN BUS CIRCUIT OPEN**

Fig. 14: Measuring Voltage Of (D506) LIN BUS Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Heated Seats Module harness connector.

Turn the ignition on.

Measure the voltage of the (D506) LIN BUS circuit.

Is the voltage above 5 volts?

Yes

Go To 4.

No

Go To 3.

3. **(D506) LIN BUS CIRCUIT OPEN**

Fig. 15: Measuring Resistance Of (D506) LIN BUS Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Instrument Cluster C2 harness connector.

Turn the ignition on.

Measure the resistance of the (D506) LIN BUS circuit.

Is the resistance below 10K ohms?

Yes

Replace the Instrument Cluster in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (D506) LIN BUS circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. (P693) HEATED SEAT MODULE SUPPLY

Fig. 16: Using 12-Volt Test Light Connected To Ground To Check (P693) Heated Seat Module Supply Circuit
 Courtesy of CHRYSLER LLC

Using a 12-volt test light connected to ground, check the (P693) Heated Seat Module Supply circuit.

Does the test light illuminate brightly?

Yes

Go To 5.

No

Repair the (P693) Heated Seat Module Supply circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

5. (Z914A) GROUND CIRCUIT OPEN

Fig. 17: Using 12-Volt Test Light Connected To 12 Volts To Check (Z914A) Ground Circuit
 Courtesy of CHRYSLER LLC

Using a 12-volt test light connected to 12 volts, check the (Z914A) Ground circuit.

Does the test light illuminate brightly?

Yes

Replace the Heated Seats Module in accordance with the service information.
 Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (Z914A) ground circuit for an open.
 Perform **BODY VERIFICATION TEST - VER 1** .

U1008-LIN 1 BUS

Circuit Schematic

Fig. 18: LIN Bus Circuit Schematic

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

LIN 1 Bus Performance.

Possible Causes

Possible Causes
(D506) LIN BUS CIRCUIT OPEN
(D506) LIN BUS CIRCUIT SHORT TO GROUND
CLUSTER

Diagnostic Test

1. **CHECK FOR AN ACTIVE DTC**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

With the scan tool, read DTCs.

Does the scan tool display: U1008-LIN 1 BUS?

Yes

Go To 2.

No

The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **SHORTED COMPONENT**

NOTE: **After disconnecting each component, check DTCs with the scan tool.**

Turn the ignition on.

Disconnect the Compass Module harness connector.

Disconnect the Heated Seat Module harness connector.

Disconnect the Switch Bank harness connector.

Disconnect the Steering Control Module C1 and C2 harness connectors.

With each component disconnected, did the DTC U1008-LIN 1 BUS change from active to stored?

Yes

Replace the component that caused the DTC U1008-LIN 1 BUS to change from active to stored.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **(D506) LIN BUS CIRCUIT OPEN**

81d16649

Fig. 19: Measuring The Resistance Of The (D506) LIN Bus Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Cluster C2 harness connector.

Disconnect the Switch Bank harness connector.

Measure the resistance of the (D506) LIN Bus circuit.

Is the resistance above 10K ohms?

Yes

Repair the (D506) LIN Bus circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. (D506) LIN BUS CIRCUIT SHORT TO GROUND

818d2f47

Fig. 20: Measuring Resistance To Ground On (D506) LIN Bus Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance to ground on the (D506) LIN Bus circuit.

Is the resistance below 10K ohms?

Yes

Repair the (D506) LIN Bus circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Cluster in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

U1109-LOST COMMUNICATION WITH LIN STEERING WHEEL CONTROLS

Circuit Schematic

Diagnostic Test

1. **CHECK FOR AN ACTIVE DTC**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform **BODY VERIFICATION TEST - VER 1** .

2. (D506) LIN BUS CIRCUIT

Fig. 22: Measuring Voltage Of (D506) LIN Bus Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Steering Control Module C2 harness connector.

Turn the ignition on.

Measure the voltage of the (D506) LIN BUS circuit.

Is the voltage above 5 volts?

Yes

Go To 4.

No

Go To 3.

3. (D506) LIN BUS CIRCUIT OPEN

Fig. 23: Measuring Resistance Of (D506) LIN Bus Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Cluster C2 harness connector.

Measure the resistance of the (D506) LIN BUS circuit.

Is the resistance below 10K ohms?

Yes

Replace the Cluster in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (D506) LIN BUS circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. (F202) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN

Fig. 24: Using 12-Volt Test Light Connected To Ground To Check Fused RUN/START Relay Output Circuit At Steering Control Module Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition on.

Disconnect the Steering Control Module C1 harness connector.

Using a 12-volt test light connected to ground, check the (F202) Fused RUN/START Relay Output circuit at the Steering Control Module C1 harness connector.

Does the test light illuminate brightly?

Yes

Go To 5.

No

Repair the (F202) Fused RUN/START Relay Output circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

5. **(A412) FUSED B(+) (I.O.D.) CIRCUIT OPEN**

Fig. 25: Using 12-Volt Test Light Connected To Ground To Check (A412) Fused B+ (I.O.D.) Circuit At Steering Control Module Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (A412) Fused B+ (I.O.D.) circuit at the Steering Control Module C1 harness connector.

Does the test light illuminate brightly?

Yes

Go To 6.

No

Repair the (A412) Fused B+ (I.O.D.) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1**.

6. (Z910) GROUND CIRCUIT OPEN

Fig. 26: Using 12-Volt Test Light Connected To 12-Volts To Check (Z910) Ground Circuit At Steering Control Module Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (Z910) Ground circuit at the Steering Control Module C1 harness connector.

Does the test light illuminate brightly?

Yes

Replace the Steering Control Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (Z916) ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

U113B-LOST COMMUNICATION WITH SWITCH BANK MODULE

Circuit Schematic

01010000

Fig. 27: Switch Bank Module Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The Cluster does not receive information from the Switch Bank Module.

Possible Causes

Possible Causes
(D506) LIN BUS CIRCUIT OPEN (A108/A909) FUSED B+ CIRCUIT OPEN (Z911) GROUND CIRCUIT OPEN SWITCH BANK MODULE CLUSTER

Diagnostic Test

1. **CHECK FOR AN ACTIVE DTC**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **(D506) LIN BUS CIRCUIT**

Fig. 28: Switch Bank Module Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Switch Bank Module harness connector.

Turn the ignition on.

Measure the voltage of the (D506) LIN BUS circuit.

Is the voltage above 5 volts?

Yes

Go To 4.

No

Go To 3.

3. (D506) LIN BUS CIRCUIT OPEN

Turn the ignition off.

Disconnect the Cluster C2 harness connector.

Measure the resistance of the (D506) LIN BUS circuit.

Is the resistance below 10K ohms?

Yes

Replace the Cluster in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (D506) LIN BUS circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. (A909) FUSED B+ CIRCUIT OPEN

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (A909) Fused B+ circuit at the Switch Bank Module harness connector.

Does the test light illuminate brightly?

Yes

Go To 5.

No

Repair the (A909) Fused B+ circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

5. (Z910) GROUND CIRCUIT OPEN

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (Z910) Ground circuit at the Switch Bank Module harness connector.

Does the test light illuminate brightly?

Yes

Replace the Switch Bank Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (Z910) ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

U1149-LOST COMMUNICATION WITH MULTIFUNCTION SWITCH

Circuit Schematic

Fig. 29: Multifunction Switch Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The Cluster does not receive information from the Steering Control Module.

Possible Causes

Possible Causes
(D506) LIN BUS CIRCUIT OPEN (F943) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN (A412) FUSED B(+) (I.O.D.) CIRCUIT OPEN (Z910) GROUND CIRCUIT OPEN STEERING CONTROL MODULE CLUSTER

Diagnostic Test

1. **CHECK FOR AN ACTIVE DTC**

NOTE: Before proceeding with this diagnostic process, verify the proper connection of the SCM C1 harness connector. A loose connection at this connector will cause this DTC to set.

Turn the ignition off.

Gently pull the SCM C1 connector harness to verify the locking tab is fully engaged. If the connector locking tab is not fully engaged, push to seat the connector locking tab.

Turn the ignition on.

Wait 30 seconds.

With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform **BODY VERIFICATION TEST - VER 1** .

2. (D506) LIN BUS CIRCUIT

819fb971

Fig. 30: Steering Control Module Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Steering Control Module harness connector.

Turn the ignition on.

Measure the voltage of the (D506) LIN BUS circuit.

Is the voltage above 5 volts?

Yes

Go To 4.

No

Go To 3.

3. **(D506) LIN BUS CIRCUIT OPEN**

Fig. 31: Measuring Resistance Of (D506) LIN Bus Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Cluster C2 harness connector.

Measure the resistance of the (D506) LIN BUS circuit.

Is the resistance below 10K ohms?

Yes

Replace the Cluster in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Repair the (D506) LIN BUS circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1**.

4. **(F943) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN**

Fig. 32: Using 12-Volt Test Light Connected To Ground To Check Fused RUN/START Relay Output Circuit At Steering Control Module Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F943) Fused RUN/START Relay Output circuit at the Steering Control Module harness connector.

Does the test light illuminate brightly?

Yes

Go To 5.

No

Repair the (F943) Fused RUN/START Relay Output circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1**.

5. (A412) FUSED B+(+) (I.O.D.) CIRCUIT OPEN

Fig. 33: Using 12-Volt Test Light Connected To Ground To Check (A412) Fused B+ (I.O.D.) Circuit At Steering Control Module Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (A412) Fused B+ (I.O.D.) circuit at the Steering Control Module harness connector.

Does the test light illuminate brightly?

Yes

Go To 6.

No

Repair the (A412) Fused B+ (I.O.D.) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

6. (Z910) GROUND CIRCUIT OPEN

Fig. 34: Using 12-Volt Test Light Connected To 12-Volts To Check (Z910) Ground Circuit At Steering Control Module Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (Z910) Ground circuit at the Steering Control Module harness connector.

Does the test light illuminate brightly?

Yes

Replace the Steering Control Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (Z916) ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

2008 ACCESSORIES AND EQUIPMENT

Instrument Cluster - Service Information - Liberty

INSTRUMENT CLUSTER - SERVICE INFORMATION

DESCRIPTION

INSTRUMENT CLUSTER

Fig. 1: Instrument Cluster
Courtesy of CHRYSLER LLC

The instrument cluster (2) for this vehicle is an ElectroMechanical Instrument Cluster (EMIC) that is located in the instrument panel above the steering column opening, directly in front of the driver. The remainder of the EMIC, including the mounts and the electrical connections, are concealed within the instrument panel below the cluster bezel (1). The instrument cluster for this vehicle also includes the hardware and software necessary to serve as the electronic body control module and is sometimes referred to as the Cab Compartment Node or CCN.

Besides analog gauges and indicators, the EMIC module incorporates one standard blue-green digital Vacuum Fluorescent Display (VFD) unit. A second optional VFD unit is available in some vehicles. The standard VFD is a fixed segment unit for displaying odometer information, automatic transmission gear selector position (PRNDL), and several other indicators. The optional compass/temperature VFD unit is a large fixed segment display. The optional Electronic Vehicle Information Center (EVIC) VFD unit is a large reconfigurable display unit. These optional VFD units serve as the visual display for the compass, the outside temperature, the trip computer, the audio system settings as well as the user interface for the customer programmable features, numerous textual warning or reminder indicators and certain diagnostic information depending upon vehicle equipment.

Fig. 2: Cluster Hood And Mask Unit
Courtesy of CHRYSLER LLC

The EMIC gauges and indicators are visible through a dedicated opening in the cluster bezel and are protected by a clear plastic cluster lens (4). Nine integral latch formations on the lens secure it to the cluster hood and mask unit (3). Just behind the cluster lens is the cluster hood and integral mask, which is constructed of molded black plastic. The hood serves as a visor and shields the face of the cluster from ambient light and reflections to reduce glare, while the cluster mask serves to separate and define the individual gauges and trims the outside perimeter of the cluster overlay. The hood and mask unit has nine integral latch features that secure it to the outer perimeter of the cluster housing (2). The hood and mask unit also has four integral mounting tabs, one on each upper and lower corner that secure the EMIC to the molded plastic instrument panel cluster carrier with four screws.

The rear of the cluster housing and the EMIC electronic circuitry are protected by a molded black plastic rear cover (1), which is also secured to the cluster housing by two integral latch features and to the cluster hood and mask unit by eight latch features. The rear cover includes clearance holes for the four cluster connector receptacles. The connector receptacles on the back of the cluster electronic circuit board connect the EMIC to the vehicle electrical system through four take outs with connectors from the instrument panel wire harness.

Sandwiched between the rear cover and the hood and mask unit is the cluster housing. The molded white plastic cluster housing serves as the carrier for the cluster circuit board and circuitry, the cluster connector receptacles, the two major and two minor gauges, a Light Emitting Diode (LED) for each cluster indicator, the VFD display units, an audible tone transducer, several LED units for general cluster illumination, the cluster overlay, and the gauge pointers. The standard equipment molded black plastic odometer/trip odometer switch button extends from the face of the cluster housing through dedicated holes in the cluster mask and the cluster lens adjacent to the standard VFD unit.

The cluster overlay is a laminated plastic unit. The dark, visible, outer surface of the overlay is marked with all of the gauge dial faces and graduations, but this layer is also translucent. The darkness of this outer layer prevents the cluster from appearing cluttered or busy by concealing the cluster indicators that are not illuminated, while the translucence of this layer allows those indicators and icons that are illuminated to be readily visible. The underlying layer of the overlay is opaque and allows light from the LED for each of the various indicators and illumination lamps behind it to be visible through the outer layer of the overlay through

predetermined stencil-like cutouts. Openings in the overlay at the base of the tachometer and the speedometer dial faces have smoked clear lenses through which the illuminated VFD units can be viewed.

Several versions of the EMIC module are offered on this vehicle. These versions accommodate all of the variations of optional equipment and regulatory requirements for the various markets in which the vehicle is offered. The microprocessor-based EMIC utilizes integrated circuitry and information carried on the Controller Area Network (CAN) data bus and the Local Interface Network (LIN) data bus along with several hard wired analog and multiplexed inputs to monitor sensors and switches throughout the vehicle. In response to those inputs, the internal circuitry and programming of the EMIC allow it to control and integrate many electronic functions and features of the vehicle through both hard wired outputs and the transmission of electronic message outputs to other electronic modules in the vehicle over the CAN and LIN data busses. Refer to **DESCRIPTION** .

Besides typical instrument cluster gauge and indicator support, the electronic functions and features that the EMIC supports or controls include the following:

- **Audible Warnings** - The EMIC electronic circuit board is equipped with an audible tone transducer and programming that allows it to provide various audible alerts to the vehicle operator. These alerts include single chime tones and continuous slow or fast tones. An electromechanical relay is also soldered onto the circuit board to produce audible clicks that are used to emulate the sound of a conventional turn signal or hazard warning flasher.
- **Compass/Temperature Display Support** - The EMIC provides support for each of the functions and features of the compass/temperature display, as well as for the odometer push button switch, which also provides user inputs to control the compass/temperature display options.
- **Electronic Vehicle Information Center Display Support** - The EMIC provides support for each of the functions and features of the Electronic Vehicle Information Center (EVIC) display. This includes support for the compass, thermometer and audio system mode, customer programmable features, textual warnings, premium Tire Pressure Monitor (TPM), trip computer, U-Connect™ Hands-Free communication and the switch inputs from the two EVIC rocker switches located on the front surface of the steering wheel spokes that are used to control and configure many of the displays. This also includes display arbitrator programming, which controls the priorities, sequences, and transition of information that is displayed in the EVIC display, particularly when multiple display requests are received simultaneously.
- **Enhanced Accident Response Support** - The EMIC monitors inputs from the Occupant Restraint Controller (ORC) and the Powertrain Control Module (PCM) to automatically turn ON the interior lighting after an airbag deployment event, 10 seconds after the vehicle speed is zero. The interior lighting remains illuminated until the key is removed from the ignition switch lock cylinder, at which time the interior lighting returns to normal operation and control. These Enhanced Accident Response System (EARS) features are each dependent upon a functional vehicle electrical system following the vehicle impact event.
- **Exterior Lighting Switch Support** - The EMIC monitors electronic **exterior lighting switch** , and **turn signal switch status** messages from the Steering Control Module (SCM) on the steering column over the LIN data bus and transmits the appropriate electronic **exterior lighting** and **turn signal request** messages to the Totally Integrated Power Module (TIPM) over the CAN data bus to support the exterior lighting functions.
- **Horn Switch Support** - On vehicles without the optional EVIC, the EMIC receives a hard wired input from the horn switch on the steering wheel. On vehicles with the optional EVIC, the EMIC receives

electronic **horn switch status** messages from the Steering Wheel Switch Module (SWSM) over the LIN bus. In either case, the EMIC then provides electronic **horn request** messages over the CAN data bus to support the horn function.

- **Interior Lamp Load Shedding** - The EMIC provides a battery saver feature which will automatically turn OFF all interior lamps if they remain ON after a timed interval of about ten minutes.
- **Interior Lighting Control** - The EMIC monitors electronic messages and hard wired inputs from the reading lamp switches, the Sentry Key Remote Entry Module (SKREEM) (also known as the Wireless Control Module/WCM), the Steering Control Module (SCM) and the Totally Integrated Power Module (TIPM) to provide courtesy lamp control. This includes support for timed illuminated entry with theater-style fade-to-OFF and courtesy illumination DEFEAT features.
- **Local Interface Network Master Module** - The EMIC is the master module for the LIN data bus. In this role it gathers information from the compass sensor, the Heated Seat Module (HSM), the instrument panel switch pod, the Steering Wheel Switch Module (SWSM), the SCM and the remote compass module, then either acts on that information directly or places electronic messages on the CAN data bus for use by other modules
- **Panel Lamps Dimming Control** - The EMIC monitors electronic **dimming level** messages received from the panel lamps dimmer switch input to the SCM over the LIN data bus, then provides both a hard wired 12-volt Pulse-Width Modulated (PWM) output and electronic message outputs over the CAN data bus and the LIN data bus that synchronizes the dimming level of all panel lamps dimmer controlled lamps with that of the cluster general illumination lighting.
- **Wiper and Washer Switch Support** - The EMIC monitors electronic **wiper switch** and **washer switch status** messages from the SCM on the steering column over the LIN data bus and transmits the appropriate electronic **wiper** and **washer request** messages to the TIPM over the CAN data bus to support the wiper and washer system functions, including the headlamps-on with wipers programmable feature.

81d36a35

Fig. 3: Gauge Indicators
Courtesy of CHRYSLER LLC

The EMIC houses four analog gauges and has provisions for up to 30 indicators. Some of the EMIC indicators are automatically configured when the EMIC is connected to the vehicle electrical system for compatibility with

certain optional equipment or equipment required for regulatory purposes in certain markets. While each EMIC may have provisions for indicators to support every available option, the configurable indicators will not be functional in a vehicle that does not have the equipment that an indicator supports.

The EMIC includes the following analog gauges:

- **Engine Temperature Gauge (27)**
- **Fuel Gauge (1)**
- **Speedometer (11)**
- **Tachometer (19)**

The EMIC includes the following VFD display units:

- **Odometer Display (30)** - includes Cruise indicator, Gear Selector indicator and Four-Wheel Drive (4WD) indicator
- **Compass-Temperature or Electronic Vehicle Information Center Display (33)**

The EMIC includes provisions for the following indicators:

- **Airbag Indicator (14)**
- **Ajar Indicators (30 or 33)** - text in odometer display for doors, liftgate and liftgate glass in clusters without EVIC, or icons in the EVIC display of vehicles with that option
- **Antilock Brake System (ABS) Indicator (18)**
- **Brake Indicator (32)** - text only for U.S. market, icon only for markets outside U.S.
- **Change Oil Indicator** - textual message in odometer display (30) on all domestic market vehicles and only BUX market vehicles equipped with a 2.8L diesel engine and an optional diesel particulate filter
- **Charging Indicator (15)**
- **Cruise Indicator** - textual message in odometer display (30)
- **Electronic Stability Program (ESP)/Brake Assist System (BAS) Indicator (24)**
- **Electronic Throttle Control (ETC) Indicator (6)**
- **Engine Coolant Temperature Indicator (26)**
- **Four-Wheel Drive Full-Time (Green) Indicator** - textual message in odometer display (30) with optional four-wheel drive system only
- **Four-Wheel Drive Part-Time (Amber) Indicator (23)** - with optional four-wheel drive system only
- **Four-Wheel Drive Low Indicator (22)** - with optional four-wheel drive system only
- **Front Fog Lamp Indicator (34)** - with optional front fog lamps only
- **Gas Cap Indicator** - textual message in odometer display (30)
- **Gear Selector Indicator** - in odometer display (30) with automatic transmission only
- **High Beam Indicator (9)**
- **Hill Descent Indicator (20)** - with optional four-wheel drive system only
- **Low Fuel Indicator (3)**

- **Low Oil Pressure Indicator (17)**
- **Malfunction Indicator Lamp (MIL) (7)**
- **No Bus Indicator** - textual message in odometer display (30)
- **No Fuse Indicator** - textual message in odometer display (30)
- **Position Lamp Indicator (2)** - on vehicles manufactured for certain export markets
- **Rear Fog Lamp Indicator (5)** - in markets where rear fog lamps are available only
- **Seat Belt Indicator (16)**
- **Security Indicator (31)**
- **Service Four-Wheel Drive (4WD) Indicator (25)** - with optional four-wheel drive system only
- **Tire Pressure Monitor (TPM) Indicator (4)**
- **Tow/Haul Indicator (21)** - with automatic transmission only
- **Traction Control/Electronic Stability Program (ESP) Indicator (13)**
- **Transmission Temperature Indicator (29)** - with automatic transmission only
- **Turn Signal (Right and Left) Indicators (12)**
- **Wait-To-Start Indicator (10)** - with diesel engine only
- **Water-In-Fuel Indicator (8)** - with diesel engine only

Each indicator in the EMIC, except those located within a VFD unit, is illuminated by a dedicated LED that is soldered onto the EMIC electronic circuit board. Cluster illumination is accomplished by several dimmable LED units, which illuminate each of the gauge dial faces for visibility when the exterior lighting is turned ON. These LED units are not available for service replacement and, if damaged or ineffective, the entire EMIC must be replaced.

Hard wired circuitry connects the EMIC to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the EMIC through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The EMIC module for this vehicle is serviced only as a complete unit. The EMIC module cannot be adjusted or repaired. If a gauge, an LED unit, a VFD unit, the electronic circuit board, the circuit board hardware, the cluster overlay or the cluster housing are damaged or ineffective, the entire EMIC module must be replaced. The cluster lens and the cluster hood and mask unit are available for separate service replacement.

OPERATION

INSTRUMENT CLUSTER

The ElectroMechanical Instrument Cluster (EMIC) in this vehicle also includes the hardware and software necessary to serve as the electronic body control module and is sometimes referred to as the Cab Compartment Node or CCN. The following information deals primarily with the instrument cluster functions of this unit.

Additional details of the electronic body control functions of this unit may be found within the service information for the system or component that the EMIC controls. For example: Additional details of the audible warning functions of the EMIC are found within the Chime/Buzzer service information.

The EMIC is designed to allow the vehicle operator to monitor the conditions of many of the vehicle components and operating systems. The gauges and indicators in the EMIC provide valuable information about the various standard and optional powertrains, fuel and emissions systems, cooling systems, lighting systems, safety systems and many other convenience items. The EMIC is installed in the instrument panel so that all of these monitors can be easily viewed by the vehicle operator when driving, while still allowing relative ease of access for service.

The microprocessor-based EMIC hardware and software uses various inputs to control the gauges and indicators visible on the face of the cluster. Some of these inputs are hard wired, but most are in the form of electronic messages that are transmitted by other electronic modules over the Controller Area Network (CAN) data bus or the Local Interface Network (LIN) data bus. The EMIC is the master node for the LIN data bus. Refer to **OPERATION** .

The EMIC microprocessor smooths the input data using algorithms to provide gauge readings that are accurate, stable and responsive to operating conditions. These algorithms are designed to provide gauge readings during normal operation that are consistent with customer expectations. However, when abnormal conditions exist such as high coolant temperature, the algorithm can drive the gauge pointer to an extreme position and the microprocessor can sound a chime through the on-board audible tone transducer to provide distinct visual and audible indications of a problem to the vehicle operator. The EMIC may also produce audible warnings for other electronic modules in the vehicle based upon electronic **tone request** messages received over the CAN or LIN data bus. Each audible warning is intended to provide the vehicle operator with an audible alert to supplement a visual indication.

The EMIC circuitry operates on battery current received through a fused B(+) fuse on a non-switched fused B (+) circuit, and on battery current received through a fused ignition switch output (run-start) fuse on a fused ignition switch output (run-start) circuit. This arrangement allows the EMIC to provide some features regardless of the ignition switch position, while other features will operate only with the ignition switch in the ON or START positions. The EMIC circuitry is grounded through a ground circuit and take out of the instrument panel wire harness with an eyelet terminal connector that is secured by a ground screw to a ground location on the instrument panel structural support.

The EMIC also has a self-diagnostic actuator test capability, which will test each of the CAN or LIN bus message-controlled functions of the cluster by lighting the appropriate indicators, positioning the gauge needles at several predetermined calibration points across the gauge faces, and illuminating all segments of the Vacuum-Fluorescent Display (VFD) units. See **DIAGNOSIS AND TESTING**.

GAUGES

All gauges receive battery current through the EMIC circuitry only when the ignition switch is in the ON or START positions. With the ignition switch in the OFF position battery current is not supplied to any gauges, and the EMIC circuitry is programmed to move all of the gauge needles back to the low end of their respective scales. Therefore, the gauges do not accurately indicate any vehicle condition unless the ignition switch is in the ON or START positions.

Each of the EMIC gauges contains an electronically controlled stepper motor unit. The EMIC circuitry completely controls the activation and deactivation of these stepper motors to position each gauge needle in the appropriate position based upon cluster programming and electronic messages received over the CAN or LIN data bus.

The gauges are diagnosed using the self-diagnostic Cab Compartment Node (CCN) actuator test. Proper testing of the CAN or LIN data bus and the electronic data bus message inputs to the EMIC that control each gauge requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information. Specific operation details for each gauge may be found elsewhere in this service information.

VACUUM-FLUORESCENT DISPLAYS

The Vacuum-Fluorescent Display (VFD) units are soldered to the EMIC electronic circuit board. Both the standard odometer unit located below the tachometer and the optional compass/temperature unit located below the minor gauge set are fixed segment displays. The optional Electronic Vehicle Information Center (EVIC) VFD unit located below the minor gauge set is a reconfigurable segment display. With the ignition switch in the OFF or ACCESSORY positions, both VFD displays are activated and the total odometer information is displayed when the driver door is opened (Rental Car Mode) and are deactivated when the driver door is closed or after five minutes, whichever occurs first. Otherwise, both display units are active when the ignition switch is in the ON or START positions, and inactive when the ignition switch is in the OFF or ACCESSORY positions.

The illumination intensity of the VFD units is controlled by the EMIC circuitry based upon electronic **dimming level** messages received over the CAN data bus indicating the exterior lighting is turned ON and the dimming level selected using the panel dimmer function of the control sleeve on the control stalk of the left (lighting) multi-function switch. The illumination intensity of the EMIC VFD units is synchronized with that of other display units in the vehicle by sending the same electronic **dimming level** message inputs to all electronic modules in the vehicle over the CAN or LIN data bus. However, if the Malfunction Indicator Lamp (MIL) is active in domestic market vehicles, the odometer VFD will illuminate at full daytime brightness until the MIL is extinguished.

The odometer VFD unit has several display capabilities including odometer, trip odometer A and B, gear selector indication (PRNDL) for vehicles with an automatic transmission, several warning or reminder indications, and various diagnostic information when certain fault conditions exist. On vehicles not equipped with the optional compass/temperature display or EVIC, the odometer display toggles to an outside temperature display following Trip B. The compass/temperature VFD unit displays numerous warning or reminder textual messages, compass, temperature, the customer programmable features interface and various diagnostic information when certain fault conditions exist. An odometer/trip odometer switch on the EMIC circuit board is used to control many of the display modes of the VFD units. These switches are actuated manually by depressing the odometer/trip odometer push button that extends through the lower edge of the cluster lens, adjacent to the odometer VFD.

Actuating the odometer/trip odometer push button momentarily with the ignition switch in the ON position will toggle the odometer VFD between the odometer and trip odometer modes. Depressing the odometer/trip odometer push button for about two seconds while the VFD is in the trip odometer mode will reset the trip odometer value to zero. Holding the odometer/trip odometer push button depressed while turning the ignition switch from the OFF position to the ON position will initiate the CCN self-diagnostic actuator test. The EMIC microprocessor remembers which odometer display mode is active when the ignition switch is turned to the OFF position, and returns the display to that mode when the ignition switch is turned ON again.

Actuating the odometer/trip odometer push button momentarily with the ignition switch in the ON position will toggle the CMTC VFD between the various display functions and the various customer programmable feature selectors. The EMIC microprocessor remembers which display modes are active when the ignition switch is turned to the OFF position, and returns the display to that mode when the ignition switch is turned ON again.

Both VFD units are diagnosed using the self-diagnostic Cab Compartment Node (CCN) actuator test. See **DIAGNOSIS AND TESTING**. Proper testing of the CAN or LIN data bus message inputs to the EMIC that control some of the VFD functions requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information. Specific operation details for the odometer, the trip odometer, the gear selector indicator, the compass/temperature display, the EVIC and the various warning and reminder indicator functions of the VFD units may be found elsewhere in this service information.

INDICATORS

Indicators are located in various positions within the EMIC and are all connected to the EMIC electronic circuit board. Some indicators operate based upon hard wired inputs to the EMIC, but most are controlled by CAN or LIN data bus messages from other electronic modules in the vehicle. Some are controlled by a combination of hard wired inputs, electronic messaging and EMIC programming. If the EMIC loses CAN data bus communication, the EMIC circuitry will automatically turn ON the Malfunction Indicator Lamp (MIL) until CAN data bus communication is restored.

The various EMIC indicators are controlled by different strategies; some receive fused ignition switch output from the EMIC circuitry and have a switched ground, while others are grounded through the EMIC circuitry and have a switched battery feed. However, all indicators are completely controlled by the EMIC microprocessor based upon various hard wired and electronic message inputs. The cruise and 4WD indicators located within the odometer VFD unit are dimmable. All other indicators are illuminated at a fixed intensity, which is not affected by the selected illumination intensity of the EMIC general illumination LED units. The illumination intensity of the dimmable indicators is synchronized with that of the general illumination lighting.

In addition, certain indicators in this instrument cluster are automatically or self-configured. This feature allows the configurable indicators to be enabled by the EMIC circuitry for compatibility with certain optional equipment. These indicators are enabled or disabled by an electronic **configuration** message sent to the EMIC by the Totally Integrated Power Module (TIPM). The TIPM defaults for the ABS indicator and airbag indicator are enabled, and these configuration settings must be programmatically disabled in the TIPM using a diagnostic scan tool for vehicles that do not have this equipment. The automatically or self-configured indicators remain latent in each EMIC at all times and will be active only when the EMIC receives the appropriate CAN or LIN bus message inputs for that optional system or equipment.

The hard wired indicator inputs may be diagnosed using conventional diagnostic tools and procedures. However, the EMIC circuitry and electronic CAN or LIN data bus message controlled indicators are diagnosed using the self-diagnostic Cab Compartment Node (CCN) actuator test. See **DIAGNOSIS AND TESTING**. Proper testing of the CAN or LIN data bus and the electronic data bus message inputs to the EMIC that control each indicator requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information. Specific details of the operation for each indicator may be found elsewhere in this service information.

CLUSTER ILLUMINATION

The EMIC has several Light Emitting Diode (LED) units that provide cluster back lighting whenever the

ignition switch is in the ON or START positions or when the exterior lighting is turned ON. The illumination intensity of these LED units is adjusted when the panel lamps dimmer function of the control sleeve on the control stalk of the left (lighting) multi-function switch is rotated to one of six available minor detent positions. The EMIC monitors an electronic **dimming level** message input received over the LIN data bus from the Steering Control Module (SCM) to determine the selected lighting level. In response to that input, the EMIC electronic circuitry converts a fused 12-volt input it receives on a hard wired panel lamps dimmer switch signal circuit into a 12-volt Pulse Width Modulated (PWM) output.

The EMIC uses this PWM output to control the illumination intensity of the cluster general illumination lighting and the VFD units on the EMIC circuit board, then provides a synchronized PWM output on various hard wired fused panel lamps dimmer switch signal circuits to control and synchronize the illumination intensity of other incandescent illumination lamps in the vehicle. The EMIC also transmits electronic **dimming level** messages over the CAN and LIN data bus to other electronic modules in the vehicle to control and synchronize the illumination intensity of their display units to that of the EMIC displays.

The hard wired panel lamps dimmer outputs from the EMIC may be diagnosed using conventional diagnostic tools and procedures. However, proper testing of the PWM processing of the EMIC and the electronic **dimming level** messages received by the EMIC over the LIN data bus requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

INSTRUMENT CLUSTER

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

If all of the instrument cluster gauges and indicators are ineffective, be certain to check the instrument cluster fused B(+) fuse and the instrument cluster fused B(+) and ground circuits for shorts or opens. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

If an individual hard wired gauge or indicator is ineffective, refer to the diagnosis and testing service information for that specific gauge or indicator. If an individual Controller Area Network (CAN) or Local Interface Network (LIN) data bus message-controlled gauge or indicator is ineffective, perform the Actuator Test as follows:

CAUTION: Instrument clusters used in this vehicle automatically configure themselves for compatibility with the features and optional equipment in

the vehicle in which they are initially installed. The instrument cluster is programmed to do this by embedding the Vehicle Identification Number (VIN) and other information critical to proper cluster operation into electronic memory. This embedded information is learned through electronic messages received from other electronic modules in the vehicle over the Controller Area Network (CAN) data bus, and through certain hard wired inputs received when the cluster is connected to the vehicle electrically. Once configured, the instrument cluster memory may be irreparably damaged and certain irreversible configuration errors may occur if the cluster is connected electrically to another vehicle; or, if an electronic module from another vehicle is connected that provides data to the instrument cluster (including odometer values) that conflicts with that which was previously learned and stored. Therefore, the practice of exchanging (swapping) instrument clusters and other electronic modules in this vehicle with those removed from another vehicle must always be avoided. Failure to observe this caution may result in instrument cluster damage, which is not reimbursable under the terms of the product warranty. Service replacement instrument clusters are provided with the correct VIN, and the certified odometer and engine hours values embedded into cluster memory, but will otherwise be automatically configured for compatibility with the features and optional equipment in the vehicle in which they are initially installed.

NOTE: Certain indicators in this instrument cluster are automatically configured. This feature allows those indicators to be activated or deactivated for compatibility with certain optional equipment. If the problem being diagnosed involves improper illumination of the cruise indicator, the electronic throttle control indicator, the fog lamp indicator, any of the four-wheel drive indicators, the transmission overtemp indicator, the security indicator or the gear selector indicator, disconnect and isolate the battery negative cable. After about five minutes, reconnect the battery negative cable and turn the ignition switch to the ON position. The instrument cluster should automatically relearn the equipment in the vehicle and properly configure the configurable indicators accordingly.

ACTUATOR TEST

The instrument cluster actuator test will put the instrument cluster into its self-diagnostic mode. In this mode the instrument cluster can perform a self-diagnostic test that will confirm that the instrument cluster circuitry, the gauges and the indicators are capable of operating as designed. During the actuator test the instrument cluster circuitry will position each of the gauge needles at various calibration points, illuminate each of the segments in the Vacuum-Fluorescent Display (VFD) units, and turn all of the indicators ON and OFF again.

Successful completion of the actuator test will confirm that the instrument cluster is operational. However, there may still be a problem with the CAN or LIN data bus, the Powertrain Control Module (PCM), the Totally Integrated Power Module (TIPM), the Controller Antilock Brake (CAB), the Occupant Restraint Controller (ORC), the compass module, the Sentry Key Remote Entry Module (SKREEM) (also known as the Wireless Control Module/WCM), the Steering Wheel Switch Module (SWSM) or the inputs to one of these electronic

control modules. Use a diagnostic scan tool to diagnose these components. Refer to the appropriate diagnostic information.

1. Begin the test with the ignition switch in the OFF position.
2. Depress the odometer/trip odometer switch button.
3. While still holding the odometer/trip odometer switch button depressed, turn the ignition switch to the ON position, but do not start the engine.
4. Release the odometer/trip odometer switch button.
5. The instrument cluster will simultaneously begin to illuminate all of the operational segments in the VFD units, and perform a bulb check of each operational LED indicator. The VFD segments and LED indicators remain illuminated as each gauge needle is swept to several calibration points and back. If a VFD segment or an LED indicator fails to illuminate, or if a gauge needle fails to sweep through the calibration points and back during this test, the instrument cluster must be replaced.
6. The actuator test is now completed. The instrument cluster will automatically exit the self-diagnostic mode and return to normal operation at the completion of the test. The actuator test will be aborted if the ignition switch is turned to the OFF position, or if an electronic **vehicle speed** message indicating that the vehicle is moving is received over the CAN data bus during the test.
7. Go back to step 1 to repeat the test, if necessary.

REMOVAL

INSTRUMENT CLUSTER

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 4: Instrument Cluster
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the cluster bezel from the instrument panel. Refer to **REMOVAL** .
3. Remove the four screws (3) that secure the instrument cluster (1) to the instrument panel base trim (2).
4. Pull the top of the instrument cluster rearward far enough to access and disconnect the instrument panel wire harness connectors from the connector receptacles on the back of the cluster housing.
5. Remove the instrument cluster from the instrument panel.

DISASSEMBLY

INSTRUMENT CLUSTER

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Some of the components for the instrument cluster used in this vehicle are serviced individually. The serviced components include the cluster lens and the cluster hood and mask unit. Following are the procedures for disassembling these components from the instrument cluster.

CLUSTER LENS

81d363fb

Fig. 5: Instrument Cluster
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the instrument cluster from the instrument panel. See **REMOVAL**.
3. Working around the perimeter of the cluster, disengage each of the nine integral latch features that secure the cluster lens (4) to the cluster hood and mask unit (3).
4. Remove the lens from the face of the cluster hood and mask unit.

CLUSTER HOOD AND MASK

81d363fb

Fig. 6: Instrument Cluster
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the instrument cluster from the instrument panel. See **REMOVAL**.
3. Remove the cluster lens (4) from the face of the cluster hood and mask unit (3). Refer to **CLUSTER LENS**.

4. Working around the perimeter of the cluster, disengage each of the integral latch features that secure the cluster hood and mask unit to the cluster housing (2).
5. Remove the hood and mask unit from the face of the instrument cluster.

ASSEMBLY

INSTRUMENT CLUSTER

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Some of the components for the instrument cluster used in this vehicle are serviced individually. The serviced components include the cluster lens and the cluster hood and mask unit. Following are the procedures for assembling these components onto the instrument cluster.

CLUSTER LENS

Fig. 7: Instrument Cluster
Courtesy of CHRYSLER LLC

1. Position the cluster lens (4) over the face of the cluster hood and mask unit (3). Be certain that the odometer/trip odometer switch push button is installed through the clearance hole in the lens.
2. Working around the perimeter of the cluster, press the lens over the face of the hood and mask until each of the integral latch features is fully engaged in the receptacles of the hood and mask.

3. Reinstall the instrument cluster onto the instrument panel. See INSTALLATION.
4. Reconnect the battery negative cable.

CLUSTER HOOD AND MASK

Fig. 8: Instrument Cluster
Courtesy of CHRYSLER LLC

1. Position the cluster hood and mask unit (3) over the face of the cluster housing (2). Be certain that the odometer/trip odometer switch push button is inserted through the clearance hole in the mask.
2. Working around the perimeter of the cluster, press the hood and mask over the face of the cluster housing until each of the integral latch features is fully engaged with the housing.
3. Reinstall the cluster lens (4) onto the face of the cluster hood and mask unit. Refer to CLUSTER LENS.
4. Reinstall the instrument cluster onto the instrument panel. See INSTALLATION.
5. Reconnect the battery negative cable.

INSTALLATION

INSTRUMENT CLUSTER

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 9: Instrument Cluster
 Courtesy of CHRYSLER LLC

1. Position the instrument cluster (1) close enough to the instrument panel to reconnect the instrument panel wire harness connectors to the connector receptacles on the back of the cluster housing.
2. Position the instrument cluster mounting tabs to the mounting holes in the instrument panel base trim (2).
3. Install and tighten the four screws (3) that secure the mounting tabs of the instrument cluster. Tighten the screws to 2 N.m (17 in. lbs.).
4. Reinstall the cluster bezel onto the instrument panel. Refer to **INSTALLATION** .
5. Reconnect the battery negative cable.

NOTE: Certain indicators in this instrument cluster are automatically configured. This feature allows those indicators to be activated or deactivated for compatibility with certain optional equipment. If a problem is noted that involves improper illumination of an indicator, disconnect and isolate the battery negative cable. After about five minutes, reconnect the battery negative cable and turn the ignition switch to the ON position. The instrument cluster should automatically relearn the equipment in the vehicle and properly configure the configurable indicators accordingly.

ABS INDICATOR

DESCRIPTION

ABS INDICATOR

Fig. 10: ABS Indicator
Courtesy of CHRYSLER LLC

An Antilock Brake System (ABS) indicator is standard equipment on all instrument clusters. This indicator is located near the top of the overlay, between the speedometer and the tachometer. Illumination of this indicator may also be accompanied by the display of certain textual messages in the cluster odometer display.

The ABS indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Failure of Anti-lock Braking System** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The ABS indicator is serviced as a unit with the instrument cluster.

OPERATION

ABS INDICATOR

The ABS indicator gives an indication to the vehicle operator when the ABS system, or a circuit or component of the system is ineffective. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Controller Antilock Brake (CAB) over the Controller Area Network (CAN) data bus.

The ABS indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to

ground by the instrument cluster transistor. The instrument cluster will turn ON the ABS indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the ABS indicator is illuminated for about three seconds as a bulb test. The entire bulb test is a function of the CAB.
- **ABS Indicator Lamp-On Message** - Each time the cluster receives an electronic **ABS indicator lamp-ON** message from the CAB, the ABS indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the CAB, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Communication Error** - If the cluster receives no lamp-ON or lamp-OFF messages from the CAB for five consecutive message cycles, the ABS indicator is illuminated. The indicator remains illuminated until the cluster receives a valid message from the CAB, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Actuator Test** - Each time the instrument cluster is put through the actuator test and the Totally Integrated Power Module (TIPM) is configured for the ABS option, the ABS indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.
- **ABS Diagnostic Test** - The ABS indicator is blinked ON and OFF by lamp-ON and lamp-OFF messages from the CAB during the performance of the ABS diagnostic tests.

The CAB continually monitors the ABS circuits and sensors to decide whether the system is in good operating condition. The CAB then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). If the CAB sends a lamp-ON message after the bulb test, it indicates that the CAB has detected a system malfunction or that the ABS system has become ineffective. The CAB will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. Each time the ABS indicator fails to light due to an open or short in the cluster ABS indicator circuit, the cluster sends a message notifying the CAB of the condition, then the instrument cluster and the CAB will each store a DTC and the cluster will flash the brake indicator ON and OFF as a backup to notify the vehicle operator.

For proper diagnosis of the antilock brake system, the CAB, the EMIC, the CAN data bus or the electronic communication related to ABS indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

AIRBAG INDICATOR

DESCRIPTION

AIRBAG INDICATOR

Fig. 11: Identifying Airbag Indicator
Courtesy of CHRYSLER LLC

An airbag indicator is standard equipment on all instrument clusters. However, the instrument cluster can be programmed to disable this indicator on vehicles that are not equipped with the airbag system, which is not available in some markets. This indicator is located near the top of the cluster overlay, between the speedometer and the tachometer.

The airbag indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Airbag** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The airbag indicator is serviced as a unit with the instrument cluster.

OPERATION

AIRBAG INDICATOR

The airbag indicator gives an indication to the vehicle operator when the airbag system, or a circuit or component of the system is ineffective. The airbag indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Occupant Restraint Controller (ORC) over the Controller Area Network (CAN) data bus.

The airbag indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the airbag indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the airbag indicator is illuminated for about six to eight seconds. The entire bulb test is a function of the ORC.
- **Airbag Indicator Lamp-On Message** - Each time the cluster receives an electronic **airbag indicator lamp-ON** message from the ORC, the airbag indicator will be illuminated. The indicator remains illuminated for about 12 seconds or until the cluster receives a lamp-OFF message from the ORC, whichever is longer. This indicator will also be extinguished when the ignition switch is turned to the OFF position.
- **Communication Error** - If the cluster receives no lamp-ON or lamp-OFF messages from the ORC for 10 consecutive message cycles, the airbag indicator is illuminated. The indicator remains illuminated until the cluster receives a single lamp-OFF message from the ORC.
- **Actuator Test** - Each time the cluster is put through the actuator test, the airbag indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry. The actuator test illumination of the airbag indicator is a function of the instrument cluster.

The ORC continually monitors the airbag system circuits and sensors to decide whether the system is in good operating condition. The ORC then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). If the ORC sends a lamp-ON message after the bulb test, it indicates that the ORC has detected a system malfunction or that the airbags and seat belt tensioners may not deploy when required, or may deploy when not required. The ORC will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. Each time the airbag indicator fails to illuminate due to an open or short in the cluster airbag indicator circuit, the cluster sends a message notifying the ORC of the condition, then the instrument cluster and the ORC will each store a DTC.

For proper diagnosis of the airbag system, the ORC, the EMIC, the CAN data bus or the electronic communication related to airbag indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

AJAR INDICATORS

DESCRIPTION

AJAR INDICATORS

Door, liftgate and liftgate glass ajar indicators are standard equipment on all instrument clusters. The ajar indications appear within the fixed segment odometer Vacuum-Fluorescent Display (VFD) unit. However, on vehicles equipped with an optional Electronic Vehicle Information Center (EVIC), the ajar indications in the odometer VFD are electronically suppressed so as not to duplicate indications that are provided by the EVIC. The odometer VFD ajar indicators are textual messages that appear in place of the odometer/trip odometer information.

The odometer VFD unit is soldered onto the cluster electronic circuit board, and is visible through a window with a smoked clear lens located at the base of the cluster overlay tachometer dial face. The dark lens over the VFD prevents it from being clearly visible when it is not illuminated. The ajar indicator textual messages appear in the same blue-green color and at the same lighting level as the other information displayed in the odometer VFD when it is illuminated by the instrument cluster electronic circuit board.

The ajar indicators are serviced as a unit with the odometer VFD unit in the instrument cluster.

OPERATION

AJAR INDICATORS

The ajar indicators give an indication to the vehicle operator that one or more of the passenger compartment doors or the liftgate may be open or not completely latched. These indicators are controlled by the instrument cluster logic circuit based upon cluster programming and electronic **ajar switch status** messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The ajar indicator function of the odometer Vacuum-Fluorescent Display (VFD) unit is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the VFD ajar indications can occur regardless of the ignition switch position. The instrument cluster will turn ON the ajar indicator for the following reasons:

- **Ajar Switch Message Input** - Each time the cluster receives a door or liftgate ajar switch status message indicating that a door, the liftgate or any combination of these is open or not completely latched with the ignition switch in any position, the appropriate ajar textual message will be illuminated. If the cluster detects a vehicle speed input greater than zero (kilometers or miles-per-hour) while the ignition switch is in the ON or START positions, the ajar indication will be accompanied by a single chime tone. When the ignition switch is in any position except ON or START, any and all ajar indications will time out after about five minutes.

The TIPM continually monitors the door and liftgate ajar switches to determine the status of the doors and liftgate. The TIPM then sends the proper ajar switch status messages to the EMIC. The door and liftgate ajar switches and their circuits may be diagnosed using conventional diagnostic tools and methods. Refer to the appropriate wiring information.

BRAKE/PARK BRAKE INDICATOR

DESCRIPTION

BRAKE INDICATOR

Fig. 12: Identifying Brake/Park Brake Indicator
Courtesy of CHRYSLER LLC

A brake indicator is standard equipment on all instrument clusters. This indicator is located near the top of the cluster overlay, between the speedometer and the tachometer.

The brake indicator consists of a stencil-like cutout in the opaque layer of the instrument cluster overlay. The word **BRAKE** is cutout for vehicles manufactured for sale in the U.S. market, or the International Control and Display Symbol icon for **Brake Failure** is cutout for vehicles manufactured for all other markets. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The brake indicator is serviced as a unit with the instrument cluster.

OPERATION

BRAKE INDICATOR

The brake indicator gives an indication to the vehicle operator when the parking brake is applied, when there are certain brake hydraulic system malfunctions as indicated by a low brake hydraulic fluid level condition, or when the brake fluid level switch is disconnected. The brake indicator can also give an indication when certain faults are detected in the Antilock Brake System (ABS). This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming, electronic messages received by the cluster from the Controller Antilock Brake (CAB) over the Controller Area Network (CAN) data bus, and a hard wired input from the park brake switch.

The brake indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the brake indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the brake indicator is illuminated

by the instrument cluster for about three seconds as a bulb test.

- **Brake Indicator Lamp-On Message** - Each time the cluster receives an electronic **brake indicator lamp-ON** message from the CAB, the brake indicator will be illuminated. The CAB may also send lamp-ON messages as feedback during ABS diagnostic procedures. The indicator remains illuminated until the cluster receives a lamp-OFF message from the CAB, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Park Brake Switch Input** - Each time the cluster detects ground on the park brake switch sense circuit (park brake switch closed = park brake applied or not fully released) while the ignition switch is in the ON position, the brake indicator flashes ON and OFF. The indicator continues to flash until the park brake switch sense input to the cluster is an open circuit (park brake switch open = park brake fully released), or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Antilock Brake System (ABS) Indicator Backup** - If the instrument cluster detects a fault in the ABS indicator circuit it will send a message indicating the fault to the Controller Antilock Brake (CAB), then flash the brake indicator ON and OFF. The cluster will continue to flash the brake indicator until the ABS indicator circuit fault is resolved, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Actuator Test** - Each time the instrument cluster is put through the actuator test, the brake indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The park brake switch on the park brake lever mechanism provides a hard wired ground input to the instrument cluster circuitry through the park brake switch sense circuit whenever the park brake is applied or not fully released. The Totally Integrated Power Module (TIPM) monitors the brake fluid level switch on the brake master cylinder reservoir, then sends the appropriate electronic messages to the CAB. The CAB continually monitors the ABS system circuits and sensors to decide whether the system is in good operating condition. The CAB then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). If the CAB sends a lamp-ON message after the bulb test, it indicates that the CAB has detected a brake hydraulic system malfunction or that the ABS system has become ineffective. The CAB will store a Diagnostic Trouble Code (DTC) for any malfunction it detects.

The hard wired park brake switch input to the EMIC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. For proper diagnosis of the brake fluid level switch, the ABS, the CAB, the EMIC, the TIPM, the CAN data bus or the electronic communication related to brake indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

BRAKE INDICATOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in

accidental airbag deployment.

The hard wired park brake switch input to the ElectroMechanical Instrument Cluster (EMIC) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods may not prove conclusive in the diagnosis of the EMIC, the Controller Antilock Brake (CAB), the Totally Integrated Power Module (TIPM), the Controller Area Network (CAN) data bus, or the electronic message inputs also used by the EMIC to provide brake indicator operation. The most reliable, efficient, and accurate means to diagnose the EMIC, the CAB, the TIPM, the CAN data bus or the electronic communication related to brake indicator operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

CHANGE OIL INDICATOR

DESCRIPTION

CHANGE OIL INDICATOR

A change oil indicator is standard equipment on all instrument clusters. However, on vehicles manufactured for export markets except those equipped with a 2.8 liter diesel engine and an optional diesel particulate filter, this indicator is electronically disabled. This indicator is located within the odometer/trip odometer Vacuum Fluorescent Display (VFD) unit. The change oil indicator consists of cycling textual **CHANGE** and **OIL** messages which appear in place of the odometer/trip odometer information in the odometer VFD unit.

The odometer VFD is soldered onto the cluster electronic circuit board, and is visible through a window with a smoked clear lens located on the lower edge of the tachometer gauge dial face of the cluster overlay. The dark lens over the VFD prevents it from being clearly visible when it is not illuminated. The change oil textual messages appear in the same blue-green color and at the same lighting level as the odometer information when they are illuminated by the instrument cluster electronic circuit board.

The change oil indicator is serviced as a unit with the VFD in the instrument cluster.

OPERATION

CHANGE OIL INDICATOR

The change oil indicator gives an indication to the vehicle operator when a duty-cycle algorithm contained within the software of the Powertrain Control Module (PCM) determines that a recommended oil change interval has been attained. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and electronic messages received over the Controller Area Network (CAN) data bus from the PCM.

The change oil indicator function of the Vacuum Fluorescent Display (VFD) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the VFD

change oil indication will always be OFF when the ignition switch is in any position except ON or START. The instrument cluster will turn ON the change oil indicator for the following reasons:

- **Change Oil Indicator Lamp-On Message** - Each time the ignition switch is turned to the ON position and the cluster receives an electronic **change oil indicator lamp-ON** message from the PCM indicating that a duty-cycle based recommended oil change interval has been attained, the change oil indicator will be illuminated for about three seconds, until the trip odometer reset switch button is depressed, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Change Oil Indicator Reset Procedure** - Once an engine oil change has been completed, the PCM duty cycle counters can be reset using the following procedure. Turn the ignition switch to the ON position, but DO NOT start the engine. Slowly depress and release the accelerator pedal fully three times within ten seconds. Turn the ignition switch to the OFF position. If the change oil indicator illuminates the next time the engine is started, repeat this procedure.

The PCM continually monitors numerous sensor inputs to determine the duty-cycles to which the engine is being subjected. A pre-programmed algorithm within the PCM then determines when to send the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the change oil indicator, the PCM, the EMIC, the CAN data bus or the electronic communication related to change oil indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

CHARGING INDICATOR

DESCRIPTION

CHARGING INDICATOR

Fig. 13: Charging Indicator
Courtesy of CHRYSLER LLC

A charging indicator is standard equipment on all instrument clusters. This indicator is located near the top of the cluster overlay, between the speedometer and the tachometer.

The charging indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for

Battery Charging Condition in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The charging indicator is serviced as a unit with the instrument cluster.

OPERATION

CHARGING INDICATOR

The charging indicator gives an indication to the vehicle operator when the electrical system voltage is too low or too high. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The charging indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the charging indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the charging indicator is illuminated by the instrument cluster for about three seconds as a bulb test.
- **Voltage Low Message** - Each time the cluster receives an electronic **system voltage** message from the PCM indicating the voltage is low (less than about 11.5 volts is a charge fail condition), the charging indicator will be illuminated. The indicator remains illuminated until the cluster receives a message from the PCM indicating the voltage is normal (greater than about 12.0 volts, but less than 16.0 volts), or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Voltage High Message** - Each time the cluster receives an electronic **system voltage** message from the PCM indicating the voltage is high (greater than about 16.0 volts), the charging indicator will be illuminated. The indicator remains illuminated until the cluster receives a message from the PCM indicating the voltage is normal (less than about 15.5 volts, but greater than 11.5 volts), or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the charging indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the electrical system voltage to control the generator output. The PCM then sends the proper messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). If the instrument cluster turns ON the charging indicator due to a charge fail or voltage high condition, it may indicate that the charging system requires service.

For proper diagnosis of the charging system, the PCM, the EMIC, the CAN data bus or the electronic communication related to charging indicator operation a diagnostic scan tool is required. Refer to the

appropriate diagnostic information.

CRUISE INDICATOR

DESCRIPTION

CRUISE INDICATOR

Fig. 14: Cruise Indicator
Courtesy of CHRYSLER LLC

A cruise indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional speed control system, this indicator is electronically disabled. This indicator is located within the odometer Vacuum Fluorescent Display (VFD) unit.

The cruise indicator consists of the text **CRUISE** in the VFD display. The odometer VFD unit is soldered onto the instrument cluster electronic circuit board, and is visible through a window with a smoked clear lens located on the lower edge of the tachometer gauge dial face of the cluster overlay. The dark lens over the VFD prevents it from being clearly visible when it is not illuminated. The cruise indicator text appears in a blue-green color and at the same lighting level as the odometer information when it is illuminated by the instrument cluster electronic circuit board.

During daylight hours (exterior lamps are OFF) the odometer VFD unit is illuminated at full brightness for clear visibility. At night (exterior lamps are ON), the VFD lighting level is adjusted with the other cluster illumination lamps using the panel lamps dimmer function of the interior lighting control sleeve on the left multi-function switch control stalk. However, a PARADE mode position of the control sleeve allows the VFD unit to be illuminated at full brightness if the exterior lamps are turned ON during daylight hours.

The cruise indicator is serviced as a unit with the odometer VFD unit in the instrument cluster.

OPERATION

CRUISE INDICATOR

The cruise indicator gives an indication to the vehicle operator when the speed control system is ON, regardless of whether the speed control is engaged. This indicator is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The cruise indicator is completely controlled by the instrument cluster logic circuit, and that logic will only

allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the indicator will always be OFF when the ignition switch is in any position except ON or START. The indicator only illuminates when it is energized by the instrument cluster logic circuit. The instrument cluster will turn ON the cruise indicator for the following reasons:

- **Cruise Indicator Lamp-On Message** - Each time the cluster receives an electronic **cruise indicator lamp-ON** message from the PCM indicating the speed control system is ON, the cruise indicator is illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the PCM, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the cruise indicator will be turned ON, then OFF again during the Vacuum Fluorescent Display (VFD) portion of the test in order to confirm the functionality of the VFD and the cluster control circuitry.

The PCM continually monitors the speed control switches to determine the appropriate outputs to the speed control servo. The PCM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the speed control system, the PCM, the EMIC, the CAN data bus or the electronic communication related to cruise indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

ENGINE TEMPERATURE GAUGE

DESCRIPTION

ENGINE TEMPERATURE GAUGE

Fig. 15: Engine Temperature Gauge
Courtesy of CHRYSLER LLC

An engine coolant temperature gauge is standard equipment on all instrument clusters. This gauge is located on the right side of the instrument cluster, to the right of the tachometer. The gauge consists of a movable gauge

needle or pointer controlled by the instrument cluster circuitry and a fixed 120 degree gauge scale on the cluster overlay that reads left-to-right from **C** (or Cold) to **H** (or Hot). An International Control and Display Symbol icon for **Engine Coolant Temperature** is located on the cluster overlay, above the hub of the gauge needle.

The engine coolant temperature gauge graphics are white, gray and black against a black field except for a single red graduation at the high end of the gauge scale, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the ignition switch in the ON or START positions or with the exterior lamps turned ON, the graphics all retain their unilluminated colors and appearance. The orange gauge needle has internal optical illumination. Gauge illumination is provided by Light Emitting Diode (LED) units soldered onto the instrument cluster electronic circuit board.

The engine coolant temperature gauge is serviced as a unit with the instrument cluster.

OPERATION

ENGINE TEMPERATURE GAUGE

The engine coolant temperature gauge gives an indication to the vehicle operator of the engine coolant temperature. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The engine coolant temperature gauge is driven by an electronic stepper motor unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the ON or START positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the OFF position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Engine Temperature Message** - Each time the cluster receives an electronic **engine temperature** message from the PCM indicating the temperature is between the low end of normal [about 41 °C (105 °F) for gasoline engines, or about 28 °C (82 °F) for diesel engines] and the high end of normal [about 124 °C (255 °F) for gasoline engines, or about 115 °C (239 °F) for diesel engines], the gauge needle is moved to the actual relative temperature position on the gauge scale.
- **Engine Temperature Low Message** - Each time the cluster receives an electronic **engine temperature** message from the PCM indicating the temperature is low [at or below about 40 °C (104 °F) for gasoline engines, or about 27 °C (81 °F) for diesel engines], the gauge needle is held below the graduation on the far left end of the gauge scale. The gauge needle remains below the low end of the gauge scale until the cluster receives a message from the PCM indicating that the temperature is above the low end of normal, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Engine Temperature High or Critical Message** - Each time the cluster receives an electronic **engine temperature** message from the PCM indicating the temperature is high [at or above about 127 °C (261 °F) for gasoline engines, or about 118 °C (244 °F) for diesel engines], the gauge needle is moved to the red graduation at the high end of the gauge scale, the engine temperature indicator is illuminated and a single chime tone is sounded. The gauge needle remains at the red graduation and the engine temperature indicator remains illuminated until the cluster receives a message from the PCM indicating that the temperature is below about 124 °C (255 °F) for gasoline engines, or about 115 °C (239 °F) for diesel engines, or until the ignition switch is turned to the OFF position, whichever occurs first. The chime tone

feature will only repeat during the same ignition cycle if the engine temperature indicator is cycled OFF and then ON again by the appropriate messages from the PCM.

- **Communication Error** - If the cluster fails to receive an **engine temperature** message, it will hold the gauge needle at the last indication for about five seconds or until the ignition switch is turned to the OFF position, whichever occurs first. After five seconds, the cluster will move the gauge needle to the low end of the gauge scale.
- **Actuator Test** - Each time the cluster is put through the actuator test, the engine coolant temperature gauge needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the engine coolant temperature sensor to determine the engine operating temperature. The PCM then sends the proper messages to the ElectroMechanical Instrument Cluster (EMIC). If the instrument cluster turns ON the engine temperature indicator due to a high or critical engine coolant temperature gauge reading, it may indicate that the engine or the engine cooling system requires service.

For proper diagnosis of the engine coolant temperature sensor, the PCM, the EMIC, the CAN data bus or the electronic communication related to engine coolant temperature gauge operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

ENGINE TEMPERATURE INDICATOR

DESCRIPTION

ENGINE TEMPERATURE INDICATOR

Fig. 16: Identifying Engine Temperature Indicator
Courtesy of CHRYSLER LLC

An engine temperature indicator is standard equipment on all instrument clusters. The engine temperature indicator is located above the engine coolant temperature gauge on the cluster overlay, to the right of the tachometer.

The engine temperature indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Engine Coolant Temperature** in the opaque layer of the instrument cluster overlay. The dark

outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The engine temperature indicator is serviced as a unit with the instrument cluster.

OPERATION

ENGINE TEMPERATURE INDICATOR

The engine temperature indicator gives an indication to the vehicle operator when the engine temperature gauge reading reflects a condition requiring immediate attention. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The engine temperature indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the engine temperature indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the engine temperature indicator is illuminated for about two seconds as a bulb test. The entire bulb test is a function of the PCM.
- **Engine Temperature High or Critical Message** - Each time the cluster receives an electronic **engine temperature** message from the PCM indicating the temperature is high [at or above about 127 °C (261 °F) for gasoline engines, or about 118 °C (244 °F) for diesel engines], the engine temperature indicator will be illuminated and a single chime tone is sounded. The indicator remains illuminated until the cluster receives a message from the PCM indicating that the temperature is below about 124 °C (255 °F) for gasoline engines, or about 115 °C (239 °F) for diesel engines, or until the ignition switch is turned to the OFF position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the engine temperature indicator is cycled OFF, then ON again by the appropriate messages from the PCM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the engine temperature indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the engine coolant temperature sensor to determine the engine operating temperature. The PCM then sends the proper messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). For further diagnosis of the engine temperature indicator or the instrument cluster circuitry that controls the LED, see **DIAGNOSIS AND TESTING**. If the instrument cluster turns ON the engine temperature indicator due to a high engine temperature gauge reading, it may indicate that the engine or the engine cooling system requires service.

For proper diagnosis of the engine coolant temperature sensor, the PCM, the EMIC, the CAN data bus or the electronic communication related to engine temperature indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

ELECTRONIC STABILITY PROGRAM/BRAKE ASSIST SYSTEM INDICATOR

DESCRIPTION

ESP/BAS INDICATOR

Fig. 17: Electronic Stability Program/Brake Assist System Indicator
Courtesy of CHRYSLER LLC

An Electronic Stability Program (ESP)/Brake Assist System (BAS) indicator is standard equipment on all instrument clusters. This indicator is located above the engine coolant temperature gauge on the cluster overlay, to the right of the tachometer.

The ESP/BAS indicator consists of a stencil-like cutout of the text **ESP BAS** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The ESP/BAS indicator is serviced as a unit with the instrument cluster.

OPERATION

ESP/BAS INDICATOR

The ESP/BAS indicator gives an indication to the vehicle operator when the Electronic Stability Program (ESP)/Brake Assist System (BAS) has been activated. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Controller Antilock Brake (CAB) and the All-Wheel Drive Control Module (AWDCM) over the Controller Area Network (CAN) data bus.

The ESP/BAS indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the ESP/BAS indicator

for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the ESP/BAS indicator is illuminated for about four seconds as a bulb test.
- **ESP/BAS Indicator Lamp-On Message** - Each time the cluster receives an electronic **ESP/BAS indicator lamp-ON** message from the CAB indicating that the ESP/BAS system has been activated, the ESP/BAS indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the CAB, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **ESP Full Off Textual Message** - Each time the cluster receives an electronic **ESP Full OFF indicator lamp-ON** message from the CAB indicating that the ESP/BAS system has been manually disabled, an **ESP Full OFF** textual message will appear within the cluster odometer display. The **ESP Full OFF** textual message remains displayed until the cluster receives a lamp-OFF message from the CAB, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **ESP Permanent Disable Textual Message** - Each time the cluster receives an electronic **ESP Permanent Disable** message from the CAB indicating that the ESP/BAS system has been permanently disabled, an **ESP OFF** textual message will appear within the cluster odometer display for about 10 seconds each time the ignition switch is turned to the ON position.
- **Actuator Test** - Each time the cluster is put through the actuator test, the ESP/BAS indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The CAB continually monitors the ESP/BAS circuits and sensors to decide whether the system is in good operating condition and the proper outputs to the components of the system. The CAB then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the ESP/BAS system, the CAB, the AWDCM, the EMIC, the CAN data bus or the electronic communication related to the ESP/BAS indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

ETC INDICATOR

DESCRIPTION

ELECTRONIC THROTTLE CONTROL INDICATOR

Fig. 18: Electronic Throttle Control Indicator
Courtesy of CHRYSLER LLC

An Electronic Throttle Control (ETC) indicator is standard equipment on all instrument clusters. This indicator is located above the fuel gauge on the cluster overlay, to the left of the speedometer.

The ETC indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Electronic Throttle Control** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The ETC indicator is serviced as a unit with the instrument cluster.

OPERATION

ELECTRONIC THROTTLE CONTROL INDICATOR

The Electronic Throttle Control (ETC) indicator gives an indication to the vehicle operator when the ETC system, or a circuit or component of the system is ineffective. The ETC indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The ETC indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the ETC indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the ETC indicator is illuminated

for about three seconds. The entire bulb test is a function of the instrument cluster.

- **ETC Indicator Lamp-On Message** - Each time the cluster receives an electronic **ETC indicator lamp-ON** message from the PCM, the ETC indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the PCM message. The indicator remains illuminated solid or continues to flash for about 12 seconds or until the cluster receives a lamp-OFF message from the PCM, whichever is longer. If the indicator is illuminated solid with the engine running the vehicle will usually remain drivable. If the indicator is flashing with the engine running the vehicle may require towing. A flashing indicator means the ETC system requires immediate service. The indicator will be extinguished when the ignition switch is turned to the OFF position.
- **Actuator Test** - Each time the cluster is put through the actuator test, the ETC indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry. The actuator test illumination of the ETC indicator is a function of the PCM.

The PCM continually monitors the ETC system circuits and sensors to decide whether the system is in good operating condition. The PCM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). If the PCM sends a lamp-ON message after the bulb test, it indicates that the PCM has detected an ETC system malfunction or that the ETC system is ineffective. The PCM will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. Each time the ETC indicator fails to illuminate due to an open or short in the cluster ETC indicator circuit, the cluster sends a message notifying the PCM of the condition, then the EMIC and the PCM will each store a DTC.

For proper diagnosis of the ETC system, the PCM, the EMIC, the CAN data bus or the electronic communication related to ETC indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

FRONT FOG LAMP INDICATOR

DESCRIPTION

FRONT FOG LAMP INDICATOR

Fig. 19: Front Fog Lamp Indicator
Courtesy of CHRYSLER LLC

A front fog lamp indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional front fog lamps, this indicator is electronically disabled. This indicator is located above the fuel gauge on the cluster overlay, to the left of the speedometer.

The front fog lamp indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Front Fog Light** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A green Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in green through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The front fog lamp indicator is serviced as a unit with the instrument cluster.

OPERATION

FRONT FOG LAMP INDICATOR

The front fog lamp indicator gives an indication to the vehicle operator whenever the front fog lamps are illuminated. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The front fog lamp indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the front fog lamp indicator for the following reasons:

- **Front Fog Indicator Lamp-On Message** - Each time the cluster receives an electronic **front fog indicator lamp-ON** message from the TIPM indicating the front fog lamps are turned ON, the front fog lamp indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the TIPM, or until the exterior lamp load shedding (battery saver) timed interval expires, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the front fog lamp indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The TIPM continually monitors electronic **exterior lighting request** messages from the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) to determine the appropriate outputs to the front fog lamps. The TIPM activates or deactivates the front fog lamps then sends the proper lamp-ON or lamp-OFF message back to the EMIC.

For proper diagnosis of the front fog lamp system, the TIPM, the EMIC, the CAN data bus or the electronic communication related to front fog lamp indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

FUEL GAUGE

DESCRIPTION

FUEL GAUGE

Fig. 20: Fuel Gauge
Courtesy of CHRYSLER LLC

A fuel gauge is standard equipment on all instrument clusters. This gauge is located on the left side of the instrument cluster, to the left of the speedometer. The gauge consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 120 degree gauge scale on the cluster overlay that reads left-to-right from **E** (or Empty) to **F** (or Full). An International Control and Display Symbol icon for **Fuel** is located on the cluster overlay, above the hub of the gauge needle. An arrowhead pointed to the left side of the vehicle is imprinted on the cluster overlay next to the **Fuel** icon on the gauge to provide the driver with a reminder as to the location of the fuel filler access.

The fuel gauge graphics are white, gray and black against a black field except for a single red graduation at the low end of the gauge scale, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the ignition switch in the ON or START positions or with the exterior lamps turned ON, the graphics all retain their unilluminated colors and appearance. The orange gauge needle has internal optical illumination. Gauge illumination is provided by Light Emitting Diode (LED) units soldered onto the instrument cluster electronic circuit board.

The fuel gauge is serviced as a unit with the instrument cluster.

OPERATION

FUEL GAUGE

The fuel gauge gives an indication to the vehicle operator of the level of fuel in the fuel tank. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and electronic **fuel level**

messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The fuel gauge is driven by an electronic stepper motor unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the ON or START positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the OFF position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Fuel Level Message** - The TIPM provides a constant current source to the fuel level sending unit and monitors a return input on a fuel level sense circuit. The resistance through the fuel level sending unit increases as the fuel level rises and decreases as the fuel level falls causing changes in the fuel level sense input voltage. The TIPM then sends the appropriate electronic **fuel level** messages to the cluster. The cluster programming applies an algorithm to calculate the proper fuel gauge needle position based upon the fuel level message input, then moves the gauge needle to the proper relative position on the gauge scale. This algorithm is used to dampen gauge needle movement against the negative effect that fuel sloshing within the fuel tank can have on accurate inputs from the fuel tank sending unit to the TIPM.
- **Less Than 11 Percent Tank Full Message** - Each time the fuel level message to the cluster indicates the fuel tank is about 11 percent full or less for 10 consecutive seconds and the vehicle speed is zero, or for 60 consecutive seconds and the vehicle speed is greater than zero, the gauge needle is moved to about the one-sixteenth graduation on the gauge scale, the low fuel indicator is illuminated, and a single chime tone is sounded. The low fuel indicator remains illuminated until the fuel level message indicates that the fuel tank is greater than about 14 percent full for 10 consecutive seconds and the vehicle speed is zero, or for 60 consecutive seconds and the vehicle speed is greater than zero, or until the ignition switch is turned to the OFF position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the low fuel indicator is cycled OFF and then ON again by the appropriate messages from the TIPM.
- **Less Than Empty Stop Message** - Each time the cluster receives a fuel level message indicating the fuel level in the fuel tank is less than the **E** (or Empty) gauge needle stop position for five consecutive seconds, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the TIPM is a short circuit.
- **More Than Full Stop Message** - Each time the cluster receives a fuel level message indicating the fuel level in the fuel tank is more than the **F** (or Full) gauge needle stop position for five consecutive seconds, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the TIPM is an open circuit.
- **Actuator Test** - Each time the cluster is put through the actuator test, the fuel gauge needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The TIPM continually monitors the fuel tank sending unit to determine the level of fuel in the fuel tank. The TIPM then sends the proper electronic **fuel level** message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. The TIPM will store a Diagnostic Trouble Code (DTC) for any fault detected in the fuel level sense circuit.

For proper diagnosis of the fuel tank sending unit, the TIPM, the EMIC, the CAN data bus or the electronic

communication related to fuel gauge operation or fuel level data processing a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

GAS CAP INDICATOR

DESCRIPTION

GAS CAP INDICATOR

A gas cap indicator is standard equipment on all instrument clusters. However, on vehicles equipped with the optional diesel engine, as well as those manufactured for the Chinese market, this indicator is electronically disabled. The gas cap indication appears within the odometer Vacuum Fluorescent Display (VFD) unit. The gas cap indicator consists of a textual **gas cap** message which appears in place of the odometer information in the odometer display.

The odometer VFD is soldered onto the cluster electronic circuit board, and is visible through a window with a smoked clear lens located on the lower edge of the tachometer gauge dial face of the cluster overlay. The dark lens over the VFD prevents it from being clearly visible when it is not illuminated. The gas cap textual message appears in the same blue-green color and at the same lighting level as the odometer information when it is illuminated by the instrument cluster electronic circuit board.

The gas cap indicator is serviced as a unit with the VFD in the instrument cluster.

OPERATION

GAS CAP INDICATOR

The gas cap indicator gives an indication to the vehicle operator when there is a gross leak detected in the on-board fuel vapor recovery system. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and electronic messages received over the Controller Area Network (CAN) data bus from the Powertrain Control Module (PCM).

The gas cap indicator function of the odometer Vacuum Fluorescent Display (VFD) unit is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the odometer VFD gas cap indication will always be OFF when the ignition switch is in any position except ON or START. The instrument cluster will turn ON the gas cap indicator for the following reasons:

- **Gas Cap Indicator Lamp-On Message** - Each time the cluster receives an electronic **gas cap indicator lamp-ON** message from the PCM indicating there is a gross leak in the vapor recovery system, the gas cap indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the PCM, or until the ignition switch is turned to the OFF position, whichever occurs first.

The PCM continually monitors the on board vapor recovery system to determine whether there are air leaks in the system. The PCM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). If the EMIC turns ON the gas cap indicator due to a monitored gross leak in the vapor recovery system, it may indicate that the gas cap has been removed or is improperly installed.

For proper diagnosis of the on board vapor recovery system, the PCM, the EMIC, the CAN data bus or the electronic communication related to gas cap indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

GEAR SELECTOR INDICATOR

DESCRIPTION

GEAR SELECTOR INDICATOR

Fig. 21: Gear Selector Indicator
Courtesy of CHRYSLER LLC

An electronic automatic transmission gear selector indicator is standard factory-installed equipment on this vehicle. However, on vehicles not equipped with an optional automatic transmission, this indicator is electronically disabled. The gear selector indicator information is displayed in the upper portion of the odometer Vacuum Fluorescent Display (VFD) unit. This VFD unit is soldered onto the cluster electronic circuit board, and is visible through a window with a smoked clear lens located on the lower edge of the tachometer dial face of the cluster overlay. The dark lens over the VFD unit prevents the indicator from being clearly visible when it is not illuminated.

The gear selector indicator displays the following characters from left to right: **P** , **R** , **N** , **D** and a fifth, reconfigurable character. The reconfigurable character can be any number **1** through **6** . Each character appears in a blue-green color and at the same lighting level as the odometer information. Respectively, these characters represent the PARK, REVERSE, NEUTRAL, DRIVE and each of the forward drive gear positions of the transmission gear selector lever on the floor panel transmission tunnel. The indicator also illuminates a box around the character that represents the currently selected lever position.

During daylight hours (exterior lamps are OFF) the VFD unit is illuminated at full brightness for clear visibility. At night (exterior lamps are ON), the VFD unit lighting level is adjusted with the other cluster general illumination lamps using the panel lamps dimmer function of the interior lighting control sleeve on the left

multi-function switch control stalk. However, a PARADE mode position of the control sleeve allows the VFD unit to be illuminated at full brightness if the exterior lamps are turned ON during daylight hours.

The gear selector indicator is serviced as a unit with the VFD unit in the instrument cluster.

OPERATION

GEAR SELECTOR INDICATOR

The electronic gear selector indicator gives an indication to the vehicle operator of the transmission gear that has been selected with the automatic transmission gear selector lever. This indicator is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The gear selector indicator information is displayed by the odometer Vacuum Fluorescent Display (VFD) unit soldered onto the instrument cluster electronic circuit board, and the VFD will not display the gear selector indicator information after the ignition switch is turned to the OFF position. Each time the cluster is disconnected from battery current for more than about five minutes, it must configure itself for the automatic transmission type that is in the vehicle once it is reconnected to battery current. The instrument cluster circuitry operates the gear selector indicator to provide the following features:

- **Selected Gear Message** - Each time the cluster receives an electronic **selected gear** message from the PCM, a box will be illuminated around the appropriate character in the gear selector indicator. The box will remain illuminated until the cluster receives a different **selected gear** message, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Communication Error** - If the cluster fails to receive a **selected gear** message from the PCM within three seconds, the instrument cluster circuitry will display all gear selector positions boxed (selected) until a valid **selected gear** message is received or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the odometer VFD unit will display all of its characters at once to confirm the functionality of the VFD unit and the cluster control circuitry.

The PCM continually monitors a hard wired multiplex input from the Transmission Range Sensor (TRS), then sends the proper message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the TRS, the PCM, the EMIC, the CAN data bus or the electronic communication related to gear selector indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

HIGH BEAM INDICATOR

DESCRIPTION

HIGH BEAM INDICATOR

Fig. 22: High Beam Indicator
Courtesy of CHRYSLER LLC

A high beam indicator is standard equipment on all instrument clusters. This indicator is located above the fuel gauge on the cluster overlay, to the left of the speedometer.

The high beam indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **High Beam** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A blue Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in blue through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The high beam indicator is serviced as a unit with the instrument cluster.

OPERATION

HIGH BEAM INDICATOR

The high beam indicator gives an indication to the vehicle operator whenever the headlamp high beams are illuminated. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The high beam indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the high beam indicator for the following reasons:

- **High Beam Indicator Lamp-On Message** - Each time the cluster receives an electronic **high beam indicator lamp-ON** message from the TIPM indicating the high beam lamps are turned ON, the high beam indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the TIPM, or until the exterior lamp load shedding (battery saver) timed interval expires, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the high beam indicator will be

turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The TIPM continually monitors electronic **exterior lighting request** messages from the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) to determine the appropriate outputs to the headlamps. The TIPM activates or deactivates the headlamp high beams then sends the proper lamp-ON or lamp-OFF message back to the EMIC.

For proper diagnosis of the headlamp system, the TIPM, the EMIC, the CAN data bus or the electronic communication related to high beam indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

HILL DESCENT INDICATOR

DESCRIPTION

HILL DESCENT INDICATOR

Fig. 23: Hill Descent Indicator
Courtesy of CHRYSLER LLC

A hill descent indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with an optional four-wheel drive system, this indicator is electronically disabled. This indicator is located above the engine coolant temperature gauge on the cluster overlay, to the right of the tachometer.

The hill descent indicator consists of a stencil-like cutout of an icon depicting a vehicle descending a hill in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A green Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in green through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The hill descent indicator is serviced as a unit with the instrument cluster.

OPERATION

HILL DESCENT INDICATOR

The hill descent indicator gives an indication to the vehicle operator when the four-wheel drive transfer case gear selector is in the **4WD LOW** position and the hill descent control push button in the instrument panel switch pod has been depressed to turn the feature ON. This feature uses the grade sensing logic of the Controller Antilock Brake (CAB) to sense the vehicle is descending a hill and employs the brake system to automatically control the hill descent speed of the vehicle. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and electronic messages received over the Controller Area Network (CAN) data bus from the CAB.

The hill descent indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the hill descent indicator for the following reasons:

- **Hill Descent Indicator Lamp-On Message** - Each time the cluster receives an electronic **hill descent indicator lamp-ON** message from the CAB, the indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the CAB, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the hill descent indicator will be turned ON, then OFF again during the LED portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The CAB continually monitors electronic message inputs from the Totally Integrated Power Module (TIPM) and the ElectroMechanical Instrument Cluster (EMIC) to determine the status of the four-wheel drive system and the hill descent control switch, then monitors its own internal grade sensing logic to determine when the hill descent mode should be engaged. The CAB then sends the proper lamp-ON or lamp-OFF message to the EMIC.

For proper diagnosis of the hill descent control switch, the TIPM, the CAB, the EMIC, the CAN data bus or the electronic communication related to hill descent indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

INSTRUMENT PANEL SWITCH POD

DESCRIPTION

INSTRUMENT PANEL SWITCH POD

Fig. 24: Instrument Panel Switch Pod

Courtesy of CHRYSLER LLC

The instrument panel switch pod (1) is located just below the heater and air conditioner controls in the center stack area of the instrument panel. This switch is available in multiple configurations, which varies from two single push button switches to as many as five push button switches and an indicator lamp, depending upon the optional equipment in the vehicle. The pod may include the following switches or indicators:

- **Alternating Current (AC) Power Inverter Outlet Switch (4)**
- **Driver and Passenger Side Heated Seat Switches (2)**
- **Electronic Stability Program (ESP) Off Switch (7)**
- **Hazard Warning Switch (3)**
- **Headlamp Leveling Switch (Not Shown In Illustration)**
- **Hill Descent Control Switch (6)**
- **Park Assist Switch (Not Shown In Illustration)**
- **Passenger Airbag On/Off Indicator (5)**

The switch housing and the push buttons are constructed of molded plastic. Each push button has a smooth finish and is clearly identified with the appropriate text and International Control and Display Symbol icons. Several of the push buttons feature Light Emitting Diode (LED) units to give the vehicle operator an indication when the function of that switch is currently active. Only the hazard warning switch push button latches, while the remaining switches feature momentary operation.

Four screws secure the switch to the back of the instrument panel center bezel through integral mounting tabs that are molded into each corner of the switch housing. The back of the switch housing has an integral connector receptacle containing terminal pins that connect the switch to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

Panel lamps dimmer controlled illumination lamps integral to the circuit board within the switch provide back lighting for visibility at night, but these lamps are not serviceable. The individual switches in the instrument panel switch pod cannot be repaired and are not serviced separately. If any component within the switch pod is ineffective or damaged, the entire switch pod unit must be replaced.

OPERATION

INSTRUMENT PANEL SWITCH POD

For information covering details of operation for the individual switches or indicator contained within the instrument panel switch pod, refer to the specific service information covering the system to which that switch

or indicator belongs.

REMOVAL

INSTRUMENT PANEL SWITCH POD

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 25: Identifying Center Bezel, Instrument Panel Switch Pod & Screws
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the center bezel (1) from the instrument panel. Refer to **REMOVAL**.
3. Disconnect the wire harness connector from the back of the instrument panel switch pod (2).
4. Remove the four screws (3) that secure the switch pod to the back of the center bezel.
5. Remove the switch pod from the center bezel.

INSTALLATION

INSTRUMENT PANEL SWITCH POD

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS),

seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: There are several different instrument panel switch pods available, depending upon the optional equipment content of the vehicle. Be certain that a replacement switch pod matches the optional equipment of the vehicle into which it is being installed.

Fig. 26: Identifying Center Bezel, Instrument Panel Switch Pod & Screws
Courtesy of CHRYSLER LLC

1. Position the instrument panel switch pod (2) to the back of the center bezel (1).
2. Install and tighten the four screws (3) that secure the switch pod to the center bezel. Tighten the screws to 2 N.m (17 in. lbs.).
3. Reconnect the wire harness connector to the back of the switch pod.
4. Reinstall the center bezel onto the instrument panel. Refer to **INSTALLATION**.
5. Reconnect the battery negative cable.

LOW FUEL INDICATOR

DESCRIPTION

LOW FUEL INDICATOR

Fig. 27: Identifying Low Fuel Indicator
Courtesy of CHRYSLER LLC

A low fuel indicator is standard equipment on all instrument clusters. This indicator is located above the fuel gauge on the cluster overlay, to the left of the speedometer.

The low fuel indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Fuel** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The low fuel indicator is serviced as a unit with the instrument cluster.

OPERATION

LOW FUEL INDICATOR

The low fuel indicator gives an indication to the vehicle operator when the level of fuel in the fuel tank becomes low. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic **fuel level** messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The low fuel indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the low fuel indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the low fuel indicator is illuminated for about three seconds as a bulb test.
- **Less Than 11 Percent Tank Full Message** - The TIPM provides a constant current source to the fuel level sending unit and monitors a return input on a fuel level sense circuit. The resistance through the fuel

level sending unit increases as the fuel level rises and decreases as the fuel level falls causing changes in the fuel level sense input voltage. The TIPM then sends the appropriate electronic **fuel level** messages to the cluster. Each time the fuel level messages to the cluster indicate the fuel tank is about 11 percent full or less for 10 consecutive seconds and the vehicle speed is zero, or for 60 consecutive seconds and the vehicle speed is greater than zero, the gauge needle is moved to the appropriate position on the gauge scale, the low fuel indicator is illuminated, and a single chime tone is sounded. The low fuel indicator remains illuminated until the fuel level messages indicate that the fuel tank is greater than about 14 percent full for 10 consecutive seconds and the vehicle speed is zero, or for 60 consecutive seconds and the vehicle speed is greater than zero, or until the ignition switch is turned to the OFF position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the low fuel indicator is cycled OFF and then ON again by the appropriate messages from the TIPM.

- **Less Than Empty Stop Message** - Each time the cluster receives a fuel level message indicating the fuel level in the fuel tank is less than the **E** (or Empty) gauge needle stop position for five consecutive seconds, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the TIPM is a short circuit.
- **More Than Full Stop Message** - Each time the cluster receives a fuel level message indicating the fuel level in the fuel tank is more than the **F** (or Full) gauge needle stop position for five consecutive seconds, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the TIPM is an open circuit.

The TIPM continually monitors the fuel tank sending unit to determine the level of fuel in the fuel tank. The TIPM then sends the proper electronic **fuel level** message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. The TIPM will store a Diagnostic Trouble Code (DTC) for any fault detected in the fuel level sense circuit.

For proper diagnosis of the fuel tank sending unit, the TIPM, the EMIC, the CAN data bus or the electronic communication related to low fuel indicator operation or fuel level data processing a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

LOW OIL PRESSURE INDICATOR

DESCRIPTION

LOW OIL PRESSURE INDICATOR

Fig. 28: Low Oil Pressure Indicator
Courtesy of CHRYSLER LLC

A low oil pressure indicator is standard equipment on all instrument clusters. This indicator is located near the

top of the cluster overlay, between the speedometer and the tachometer.

The low oil pressure indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Engine Oil** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The low oil pressure indicator is serviced as a unit with the instrument cluster.

OPERATION

LOW OIL PRESSURE INDICATOR

The low oil pressure indicator gives an indication to the vehicle operator when the engine oil pressure reading reflects a condition requiring immediate attention. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The low oil pressure indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the low oil pressure indicator for the following reasons:

- **Engine Oil Pressure Low Message** - Each time the cluster receives an electronic **engine oil pressure** message from the PCM indicating the pressure is about 6.9 kPa (1 psi) or lower, the low oil pressure indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the PCM message. The indicator remains illuminated solid or flashing until the cluster receives a message from the PCM indicating that the pressure is above about 6.9 kPa (1 psi), or until the ignition switch is turned to the OFF position, whichever occurs first. The cluster will only turn the indicator ON in response to low engine oil pressure if the engine speed is greater than zero.
- **Actuator Test** - Each time the cluster is put through the actuator test, the low oil pressure indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the engine oil pressure sensor to determine the engine oil pressure. The PCM then sends the proper messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). If the EMIC turns ON the indicator after the bulb test, it may indicate that the engine or the engine oiling system requires service.

For proper diagnosis of the engine oil pressure sensor, the PCM, the EMIC, the CAN data bus or the electronic communication related to low oil pressure indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

MALFUNCTION INDICATOR LAMP (MIL)

DESCRIPTION

MALFUNCTION INDICATOR

Fig. 29: Malfunction Indicator Lamp
Courtesy of CHRYSLER LLC

A Malfunction Indicator Lamp (MIL) is standard equipment on all instrument clusters. This indicator is located above the fuel gauge on the cluster overlay, to the left of the speedometer.

The MIL consists of a stencil-like cutout of the International Control and Display Symbol icon for **Engine** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The MIL is serviced as a unit with the instrument cluster.

OPERATION

MALFUNCTION INDICATOR

The Malfunction Indicator Lamp (MIL) gives an indication to the vehicle operator when the Powertrain Control Module (PCM) has recorded a Diagnostic Trouble Code (DTC) for an On-Board Diagnostics II (OBDII) emissions-related circuit or component malfunction. The MIL is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the PCM over the Controller Area Network (CAN) data bus.

The MIL Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the

fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the MIL for the following reasons

- **Bulb Test** - Each time the ignition switch is turned to the ON position the indicator is illuminated for about 15 seconds as a bulb test. The entire bulb test is a function of the PCM.
- **MIL Lamp-On Message** - Each time the cluster receives an electronic **MIL lamp-ON** message from the PCM, the indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the PCM message. For some DTCs, if a problem does not recur, the PCM will send a lamp-OFF message automatically. Other DTCs may require that a fault be repaired and the PCM be reset before a lamp-OFF message will be sent. For more information on the PCM, and the DTC set and reset parameters, refer to **EMISSIONS CONTROL** article .
- **Communication Error** - If the cluster receives no lamp-ON or lamp-OFF messages from the PCM for 10 consecutive message cycles, the MIL is illuminated by the instrument cluster to indicate a loss of bus communication. The indicator remains controlled and illuminated by the cluster until a valid message is received from the PCM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the MIL indicator will be turned ON during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the fuel and emissions system circuits and sensors to decide whether the system is in good operating condition. The PCM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). If the EMIC turns ON the MIL after the bulb test, it may indicate that a malfunction has occurred and that the fuel and emissions systems require service.

For proper diagnosis of the fuel and emissions systems, the PCM, the EMIC, the CAN data bus or the electronic communication related to MIL operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

NO BUS INDICATOR

DESCRIPTION

NO BUS INDICATOR

A no bus indicator is standard equipment on all instrument clusters. The no bus indication appears within the fixed segment odometer Vacuum Fluorescent Display (VFD) unit. The odometer no bus indicator consists of a textual **noBUS** message that appears in place of the odometer/trip odometer information.

The odometer VFD is soldered onto the cluster electronic circuit board, and is visible through a window with a smoked clear lens located at the base of the cluster overlay right gauge dial face (Dodge) or the tachometer dial face (Chrysler). The dark lens over the VFD prevents it from being clearly visible when it is not illuminated. The no bus textual message appears in the same blue-green color and at the same lighting level as the other information displayed in the odometer VFD unit when it is illuminated by the instrument cluster electronic circuit board.

During daylight hours (exterior lamps are OFF) the odometer VFD unit is illuminated at full brightness for clear visibility. At night (exterior lamps are ON), the VFD lighting level is adjusted with the other cluster illumination lamps using the panel lamps dimmer thumbwheel of the headlamp switch on the instrument panel. However, a PARADE mode position of the thumbwheel allows the VFD unit to be illuminated at full brightness if the exterior lamps are turned ON during daylight hours.

The no bus indicator is serviced as a unit with the odometer VFD unit in the instrument cluster.

OPERATION

NO BUS INDICATOR

The no bus indicator gives an indication to the vehicle operator when the electronic communication data bus is ineffective. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and electronic messages not being received over the Controller Area Network (CAN) data bus from the Totally Integrated Power Module (TIPM).

The no bus indicator function of the odometer Vacuum Fluorescent Display (VFD) unit is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the odometer VFD no bus indication will always be OFF when the ignition switch is in any position except ON or START. The instrument cluster will turn ON the no bus indicator for the following reasons:

- **No Electronic Communication Messages** - Each time the ignition switch is turned to the ON position and the cluster does not receive electronic communication messages over the CAN data bus, the no bus indicator will be illuminated. The indicator remains illuminated, until CAN bus communication is restored or until the ignition switch is turned to the OFF position, whichever occurs first.

The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) continually monitors the CAN data bus to determine the status of many sensors and systems throughout the vehicle. If bus communication is interrupted, the EMIC cannot provide accurate displays and outputs.

For proper diagnosis of the no bus indicator, the EMIC, the CAN data bus or the electronic communication related to no bus indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

NO FUSE INDICATOR

DESCRIPTION

NO FUSE INDICATOR

A no fuse indicator is standard equipment on all instrument clusters. However, in vehicles built for the Chinese market this indicator is electronically disabled. The no fuse indication appears within the odometer/trip odometer Vacuum Fluorescent Display (VFD) unit. The no fuse indicator consists of a textual **noFUSE** message which appears in place of the odometer/trip odometer information in the odometer display.

The odometer VFD is soldered onto the cluster electronic circuit board, and is visible through a window with a

smoked clear lens located on the lower edge of the tachometer gauge dial face of the cluster overlay. The dark lens over the VFD prevents it from being clearly visible when it is not illuminated. The no fuse textual message appears in the same blue-green color and at the same lighting level as the odometer information when it is illuminated by the instrument cluster electronic circuit board.

The no fuse indicator is serviced as a unit with the odometer VFD in the instrument cluster.

OPERATION

NO FUSE INDICATOR

The no fuse indicator gives an indication to the vehicle operator when the Ignition Off Draw (IOD) fuse is ineffective or is not installed. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and electronic messages received over the Controller Area Network (CAN) data bus from the Totally Integrated Power Module (TIPM).

The no fuse indicator function of the odometer Vacuum Fluorescent Display (VFD) unit is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the odometer VFD no fuse indication will always be OFF when the ignition switch is in any position except ON or START. The instrument cluster will turn ON the no fuse indicator for the following reasons:

- **No Fuse Indicator Lamp-On Message** - Each time the ignition switch is turned to the ON position and the cluster receives an electronic **no fuse indicator lamp-ON** message from the TIPM indicating that the IOD fuse is missing or ineffective, the no fuse indicator will be illuminated. The indicator remains illuminated for about three seconds, until the IOD fuse is installed, until the trip odometer reset switch button is depressed or until the ignition switch is turned to the OFF position, whichever occurs first.

The TIPM continually monitors the IOD circuit to determine the status of the IOD fuse, then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over the CAN data bus.

For proper diagnosis of the no fuse indicator, the TIPM, the EMIC, the CAN data bus or the electronic communication related to no fuse indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

ODOMETER

DESCRIPTION

ODOMETER/TRIP ODOMETER

Fig. 30: Odometer/Trip Odometer
Courtesy of CHRYSLER LLC

An odometer and trip odometer are standard factory-installed equipment in all instrument clusters. The odometer and trip odometer are displayed in a common electronic, blue-green Vacuum-Fluorescent Display (VFD) unit. This VFD unit is soldered onto the cluster electronic circuit board, and is visible through a window with a smoked clear lens located on the lower edge of the tachometer in the lower right area of the cluster overlay. The dark lens over the VFD prevents the indicator from being clearly visible when it is not illuminated.

The odometer and trip odometer information are not displayed simultaneously. The trip odometer reset switch on the instrument cluster circuit board toggles the display between odometer and trip odometer modes by depressing the odometer/trip odometer switch button that extends through the lower edge of the cluster lens, just right of the tachometer. When the trip odometer information is displayed, the text **TRIP A** or **TRIP B** is also illuminated in the lower right corner of the odometer/trip odometer VFD in a blue-green color and at the same lighting level as the trip odometer information.

The odometer and trip odometer information are stored in the instrument cluster memory. This information can be increased when the proper inputs are provided to the instrument cluster, but the information cannot be decreased. The odometer can display values up to 999,999 kilometers (999,999 miles). The odometer latches at these values, and will not roll over to zero. The trip odometer can display values up to 999.9 kilometers (999.9 miles) before it rolls over to zero.

The odometer display does not show leading zeroes, does not have a decimal point and will not show values less than a full unit (kilometer or mile). The unit of measure (**km** or **miles**) for the odometer display is not shown in the VFD. The unit of measure for the instrument cluster odometer/trip odometer is selected at the time that it is manufactured, and cannot be changed. The odometer has a RENTAL CAR mode, which will illuminate the odometer information in the VFD whenever the driver side front door is opened with the ignition switch in the OFF or ACCESSORY positions.

During daylight hours (exterior lamps are OFF) the odometer VFD is illuminated at full brightness for clear visibility. At night (exterior lamps are ON), the VFD lighting level is adjusted with the other cluster general

illumination lamps using the panel lamps dimmer function of the interior lighting control sleeve on the left multi-function switch control stalk. However, a PARADE mode position of the control sleeve allows the VFD to be illuminated at full brightness if the exterior lamps are turned ON during daylight hours.

The odometer/trip odometer VFD, the trip odometer switch and the trip odometer push button are serviced as a unit with the instrument cluster.

OPERATION

ODOMETER/TRIP ODOMETER

The odometer and trip odometer give an indication to the vehicle operator of the distance the vehicle has traveled. This indicator is controlled by the instrument cluster circuitry based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The odometer and trip odometer information is displayed by the instrument cluster odometer/trip odometer Vacuum Fluorescent Display (VFD). The VFD will display the odometer information whenever the driver side front door is opened with the ignition switch in the OFF or ACCESSORY positions. The instrument cluster circuitry controls the VFD and provides the following features:

- **Odometer/Trip Odometer Display Toggling** - Actuating the trip odometer reset switch button momentarily with the VFD illuminated will toggle the display between the odometer and trip odometer A and B information. Each time the VFD is illuminated with the ignition switch in the ON or START positions, the display will automatically return to the last mode previously selected (odometer or trip odometer).
- **Trip Odometer Reset** - When the trip odometer reset switch button is pressed and held for longer than about two seconds with the ignition switch in the ON or START positions, the trip odometer will be reset to **0.0** kilometers (miles). The VFD must be displaying the trip odometer information in order for the trip odometer information to be reset.
- **Gas Cap Message Display** - On vehicles manufactured with a United States country code, each time the cluster receives an electronic message from the PCM indicating a monitored leak in the evaporative emissions system, the cluster replaces the displayed odometer/trip odometer value with the textual message, **gas cap** . This message serves as a reminder to the vehicle operator to check that the gas cap is properly installed and tightened, but could also indicate another source of air leakage in the on-board evaporative and vapor recovery emissions systems. Unless the leak is corrected, this message will latch and remain displayed during the current and each subsequent ignition cycle until the trip odometer reset button is pressed and released momentarily, which will revert the display to the odometer/trip odometer information that was last displayed for the remainder of that ignition cycle. Once the source of a leak has been corrected, either momentarily pressing the trip odometer reset button or cycling the ignition switch will unlatch the message and return the odometer/trip odometer to normal operation.
- **Communication Error** - If the cluster fails to receive an electronic **distance** message during normal operation, it will hold and display the last data received until the ignition switch is turned to the OFF position. If the cluster does not receive a **distance** message within one second after the ignition switch is turned to the ON position, it will display the last distance value stored in the cluster memory. If the cluster is unable to display odometer information due to an error internal to the cluster, the VFD will display **error** .

- **Actuator Test** - Each time the cluster is put through the actuator test, the odometer VFD will display all of its segments simultaneously during the VFD portion of the test to confirm the functionality of the VFD and the cluster control circuitry.

The PCM continually monitors the vehicle speed pulse information received from the wheel speed sensors, then sends the proper messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the wheel speed sensors, the PCM, the EMIC, the CAN data bus or the electronic communication related to odometer/trip odometer operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

POSITION LAMP INDICATOR

DESCRIPTION

POSITION LAMP INDICATOR

Fig. 31: Position Lamp Indicator
Courtesy of CHRYSLER LLC

A position lamp indicator is standard equipment only on instrument clusters for vehicles manufactured for sale in certain export markets. This indicator is located above the fuel gauge on the cluster overlay, to the left of the speedometer.

The position lamp indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Position Lights, Side Lights** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A green Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in green through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The position lamp indicator is serviced as a unit with the instrument cluster.

OPERATION

POSITION LAMP INDICATOR

The position lamp indicator gives an indication to the vehicle operator whenever the position lamps (exterior lighting) are illuminated. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The position lamp indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the position lamp indicator for the following reasons:

- **Position Lamp Indicator Lamp-On Message** - Each time the cluster receives an electronic **position lamp indicator lamp-ON** message from the TIPM indicating the position lamps are turned ON, the position lamp indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the TIPM, or until the exterior lamp load shedding (battery saver) timed interval expires, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the position lamp indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The TIPM continually monitors electronic **exterior lighting switch request** messages from the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) to determine the appropriate outputs to the park lamp relay. The TIPM activates or deactivates the park lamp relay then sends the proper lamp-ON or lamp-OFF message back to the EMIC.

For proper diagnosis of the position lamp system, the TIPM, the EMIC, the CAN data bus or the electronic communication related to position lamp indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

REAR FOG LAMP INDICATOR

DESCRIPTION

REAR FOG LAMP INDICATOR

Fig. 32: Rear Fog Lamp Indicator
Courtesy of CHRYSLER LLC

A rear fog lamp indicator is standard equipment on all instrument clusters for certain markets where rear fog lamps are available. However, on vehicles not equipped with the optional rear fog lamps, this indicator is electronically disabled. This indicator is located above the fuel gauge on the cluster overlay, to the left of the speedometer.

The rear fog lamp indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Rear Fog Light** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The rear fog lamp indicator is serviced as a unit with the instrument cluster.

OPERATION

REAR FOG LAMP INDICATOR

The rear fog lamp indicator gives an indication to the vehicle operator whenever the rear fog lamps are illuminated. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The rear fog lamp indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the rear fog lamp indicator for the following reasons:

- **Rear Fog Indicator Lamp-On Message** - Each time the cluster receives an electronic **rear fog indicator lamp-ON** message from the TIPM indicating the rear fog lamps are turned ON, the rear fog lamp indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the TIPM, or until the exterior lamp load shedding (battery saver) timed interval expires, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the rear fog lamp indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The TIPM continually monitors electronic **exterior lighting request** messages from the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) to determine the appropriate outputs to the rear fog lamps. The TIPM activates or deactivates the rear fog lamps then sends the proper lamp-ON or lamp-OFF message back to the EMIC.

For proper diagnosis of the rear fog lamp system, the TIPM, the EMIC, the CAN data bus or the electronic communication related to rear fog lamp indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

SEATBELT INDICATOR

DESCRIPTION

SEATBELT INDICATOR

Fig. 33: Seatbelt Indicator
Courtesy of CHRYSLER LLC

A seatbelt indicator is standard equipment on all instrument clusters. This indicator is located near the top of the cluster overlay, between the speedometer and the tachometer.

The seatbelt indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Seat Belt** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The seatbelt indicator is serviced as a unit with the instrument cluster.

OPERATION

SEATBELT INDICATOR

The seatbelt indicator gives an indication to the vehicle operator of the status of the front seat belts. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic **driver side** and **passenger side front seat belt switch status** messages received over the Controller Area Network (CAN) data bus.

The seatbelt indicator also includes a programmable enhanced seatbelt reminder or BELTMINDER feature that is enabled when the vehicle is shipped from the factory. This BELTMINDER feature can be disabled and enabled by the customer using a specific programming event sequence, or by the dealer using a diagnostic scan tool.

The seatbelt indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the seatbelt indicator for the following reasons:

- **Seatbelt Reminder Function** - Each time the cluster receives a battery current input on the fused ignition switch output (run-start) circuit, the indicator will be illuminated as a seatbelt reminder for about six seconds, or until the ignition switch is turned to the OFF position, whichever occurs first. This reminder function will occur regardless of the status of the seatbelt switch inputs to the cluster.
- **Front Seatbelt Not Buckled Message - Beltminder Active** - Following the seatbelt reminder function, each time the cluster receives an electronic **driver side** or **passenger side front seat belt unbuckled status** message with the ignition switch in the START or ON positions, the indicator will be illuminated. In addition, if a front seat belt remains unbuckled about 4 seconds after the conclusion of the seatbelt reminder function, the seatbelt indicator will begin to cycle between flashing ON and OFF for 3 seconds, then lighting solid for 2 seconds. The seatbelt indicator will continue to cycle between flashing and solid illumination for 13 complete cycles, until electronic **driver side** and **passenger side front seat belt buckled status** messages are received, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Front Seatbelt Not Buckled Message - Beltminder Inactive** - Following the seatbelt reminder function, each time the cluster receives an electronic **driver side** or **passenger side front seat belt unbuckled**

status message with the ignition switch in the START or ON positions, the indicator will be illuminated. The seatbelt indicator remains illuminated until electronic **driver side** and **passenger side front seat belt buckled status** messages are received, or until the ignition switch is turned to the OFF position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the seatbelt indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The driver side seat belt switch is connected in series between ground and the seat belt switch sense circuit input to the Totally Integrated Power Module (TIPM), while the passenger side seat belt switch is connected between an output and an input of the Occupant Restraint Controller (ORC). The ORC also monitors inputs from the Occupant Classification Module (OCM) to determine whether the passenger side front seat is occupied. The TIPM and the ORC continually monitor these inputs, then send the proper status messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over the CAN data bus.

For proper diagnosis of the seat belt switches, the TIPM, the OCM, the ORC, the EMIC, the CAN data bus or the electronic communication related to seat belt indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

STANDARD PROCEDURE

ENHANCED SEATBELT REMINDER PROGRAMMING

The seatbelt indicator also includes a programmable enhanced seatbelt reminder or BELTMINDER feature that is enabled when the vehicle is shipped from the factory. This BELTMINDER feature provides extended and modified visual seatbelt indicator and audible chime warning responses to an unbuckled driver side front seat belt or an occupied passenger side front seat with an unbuckled passenger side front seat belt. The BELTMINDER feature may be disabled or enabled by the customer using the programming sequence that follows, or by the dealer using a diagnostic scan tool.

CUSTOMER PROGRAMMING SEQUENCE

NOTE: **The following sequence of events must occur within 60 seconds of the ignition switch being placed in the ON position in order for the programming to be completed successfully.**

1. With all doors closed and the ignition switch in any position except ON or START, buckle the driver side front seat belt.
2. Turn the ignition switch to the ON position and wait for the seatbelt indicator reminder function to conclude (about six seconds).
3. Unbuckle and buckle the driver side front seat belt three or more times, ending with the belt buckled.
4. Turn the ignition switch to any position except ON or START to toggle the BELTMINDER feature from its current setting (from active to inactive, or from inactive to active). A single chime tone will provide an audible confirmation that the programming sequence has been successfully completed.

SECURITY INDICATOR

DESCRIPTION

SECURITY INDICATOR

Fig. 34: Security Indicator
Courtesy of CHRYSLER LLC

A security indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional Vehicle Theft Security System (VTSS), this indicator is electronically disabled. This indicator is located near the top of the cluster overlay, between the speedometer and the tachometer.

The security indicator consists of a small round cutout in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The security indicator is serviced as a unit with the instrument cluster.

OPERATION

SECURITY INDICATOR

The security indicator gives an indication to the vehicle operator when the Vehicle Theft Security System (VTSS) is arming or is armed. On vehicles equipped with the Sentry Key Immobilizer System (SKIS), the security indicator also gives an indication to the vehicle operator of the status of the SKIS. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming, and electronic **security indicator request** messages received by the cluster from the Totally Integrated Power Module (TIPM) or the Sentry Key Remote Entry Module (SKREEM) (also known as the Wireless Control Module/WCM) over the Controller Area Network (CAN) data bus.

The security indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. Depending upon the programmed condition, the indicator can be illuminated solid, flashed at a slow rate (0.5 Hertz, 12.5 percent duty cycle), or flashed at a fast rate (1 Hertz, 50 percent duty cycle). The instrument cluster will turn ON the security indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the security indicator illuminates for about two seconds as a bulb test. The entire bulb test is a function of the SKREEM.
- **Security Indicator Lamp-On Message** - During the 16 second VTSS arming function, the TIPM will request the cluster flash the security indicator ON and OFF repeatedly at a steady, fast rate to indicate that the VTSS is in the process of arming. Following successful VTSS arming, the TIPM will request the cluster flash the security indicator ON and OFF continuously at a slower rate to indicate that the VTSS is armed. The security indicator continues flashing at the slower rate until the VTSS is disarmed or triggered. If the VTSS has alarmed and rearmed, the TIPM will request the cluster flash the security indicator at a steady, slow rate for about 30 seconds after the VTSS is disarmed.
- **SKIS Indicator Lamp-On Message** - Each time the cluster receives an electronic **SKIS indicator lamp-ON** message from the SKREEM, the security indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the SKREEM message. The indicator remains illuminated solid or continues to flash until the cluster receives a lamp-OFF message from the SKREEM, or until the ignition switch is turned to the OFF position, whichever occurs first. For more information on the SKIS and the security indicator control parameters, refer to **OPERATION** .
- **Communication Error** - If the cluster receives no lamp-ON or lamp-OFF messages from the TIPM or the SKREEM for 10 consecutive message cycles, the security indicator is illuminated by the instrument cluster. The indicator remains controlled and illuminated by the cluster until a valid lamp-ON or lamp-OFF message is received from the SKREEM.
- **Actuator Test** - Each time the instrument cluster is put through the actuator test, the security indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The TIPM sends electronic **security indicator request** messages to control the security indicator whenever the ignition switch is in the OFF position and the VTSS is arming, armed, or alarming. Whenever the ignition switch is in the ON or START positions, the SKREEM performs a self-test to decide whether the SKIS is in good operating condition and whether a valid key is present in the ignition lock cylinder. The SKREEM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). If the cluster flashes the security indicator upon ignition ON, or turns ON the security indicator solid after the bulb test, it indicates that a SKIS malfunction has occurred or that the SKIS is ineffective.

For proper diagnosis of the VTSS, the SKIS, the SKREEM, the TIPM, the EMIC, the CAN data bus or the electronic communication related to security indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

SERVICE 4WD INDICATOR

DESCRIPTION

SERVICE 4WD INDICATOR

Fig. 35: Service 4WD Indicator
Courtesy of CHRYSLER LLC

A service 4WD indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional four-wheel drive system and electronically shifted transfer case, this indicator is electronically disabled. This indicator is located above the engine coolant temperature gauge on the cluster overlay, to the right of the tachometer.

The service 4WD indicator consists of a stencil-like cutout of the text **SERV 4WD** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The service 4WD indicator is serviced as a unit with the instrument cluster.

OPERATION

SERVICE 4WD INDICATOR

The service 4WD indicator gives an indication to the vehicle operator when the Totally Integrated Power Module (TIPM) has recorded a Diagnostic Trouble Code (DTC) for an electronic transfer case circuit or component malfunction. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster over the Controller Area Network (CAN) data bus.

The service 4WD indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF

when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the service 4WD indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the service 4WD indicator is illuminated for about two seconds as a bulb test.
- **Service 4WD Indicator Lamp-On Message** - Each time the cluster receives an electronic **service 4WD indicator lamp-ON** message from the TIPM, the service 4WD indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the TIPM, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Communication Error** - If the cluster receives no lamp-ON or lamp-OFF messages from the TIPM for 10 seconds, the service 4WD indicator is illuminated by the cluster to indicate a loss of TIPM communication. The indicator remains controlled and illuminated by the cluster until a valid message is received from the TIPM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the service 4WD indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The TIPM continually monitors the electronic transfer case control circuits and transfer case shift motor/mode sensor assembly to determine the condition of the system. The TIPM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC).

For proper diagnosis of the TIPM, the EMIC, the CAN data bus or the electronic communication related to service 4WD indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

SHIFT INDICATOR (TRANSFER CASE)

DESCRIPTION

4 LOW INDICATOR

Fig. 36: Identifying 4 Low Indicator
Courtesy of CHRYSLER LLC

A 4 low indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional four-wheel drive system, this indicator is electronically disabled. This indicator is located above the engine coolant temperature gauge on the cluster overlay, to the right of the tachometer.

The 4 low indicator consists of a stencil-like cutout of the text **4 LOW** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The 4 low indicator is serviced as a unit with the instrument cluster.

4WD INDICATOR - FULL-TIME

Fig. 37: Identifying 4WD Indicator
Courtesy of CHRYSLER LLC

A 4WD full-time indicator is standard equipment on all instrument clusters. However, on vehicles not equipped

with an optional four-wheel drive system, this indicator is electronically disabled. This indicator is located within the odometer Vacuum Fluorescent Display (VFD) unit.

The 4WD full-time indicator consists of the text **4WD** in the VFD display. The odometer VFD unit is soldered onto the instrument cluster electronic circuit board, and is visible through a window with a smoked clear lens located on the lower edge of the tachometer gauge dial face of the cluster overlay. The dark lens over the VFD prevents it from being clearly visible when it is not illuminated. The 4WD full-time indicator text appears in the same blue-green color and at the same lighting level as the odometer information when it is illuminated by the instrument cluster electronic circuit board.

During daylight hours (exterior lamps are OFF) the odometer VFD unit is illuminated at full brightness for clear visibility. At night (exterior lamps are ON), the VFD lighting level is adjusted with the other cluster illumination lamps using the panel lamps dimmer function of the interior lighting control sleeve on the left multi-function switch control stalk. However, a PARADE mode position of the control sleeve allows the VFD unit to be illuminated at full brightness if the exterior lamps are turned ON during daylight hours.

The 4WD full-time indicator is serviced as a unit with the odometer VFD unit in the instrument cluster.

4WD INDICATOR - PART-TIME

Fig. 38: Identifying 4WD Indicator
Courtesy of CHRYSLER LLC

A 4WD part-time indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with an optional four-wheel drive system, this indicator is electronically disabled. This indicator is located above the engine coolant temperature gauge on the cluster overlay, to the right of the tachometer.

The 4WD part-time indicator consists of a stencil-like cutout of the text **4WD** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The 4WD part-time indicator is serviced as a unit with the instrument cluster.

OPERATION

4 LOW INDICATOR

The 4 low indicator gives an indication to the vehicle operator when the electronic transfer case has been shifted into the **4WD LOW** mode. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The 4 low indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the 4 low indicator for the following reasons:

- **4 Low Indicator Lamp-On Message** - Each time the cluster receives an electronic **4 low indicator lamp-ON** message from the TIPM, the indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the TIPM, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the 4 low indicator will be turned ON, then OFF again during the LED portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The TIPM continually monitors the electronic transfer case through the transfer case shift motor/mode sensor assembly or the manual transfer case through the transfer case switch to determine when the **4WD LOW** mode is engaged. The TIPM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the transfer case shift motor/mode sensor, the transfer case switch, the TIPM, the EMIC, the CAN data bus or the electronic communication related to 4 low indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

4WD INDICATOR - FULL-TIME

The 4WD full-time indicator gives an indication to the vehicle operator when the transfer case has been shifted into a **4WD FULL-TIME** mode. This indicator is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The 4WD full-time indicator is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the indicator will always be OFF when the ignition switch is in any position except ON or START. The indicator only illuminates when it is energized by the instrument cluster logic circuit. The instrument cluster will turn ON the 4WD full-time indicator for the following reasons:

- **4WD Full-Time Indicator Lamp-On Message** - Each time the cluster receives an electronic **4WD full-time indicator lamp-ON** message from the TIPM, the indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the TIPM, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the 4WD full-time indicator will be

turned ON, then OFF again during the Vacuum Fluorescent Display (VFD) portion of the test in order to confirm the functionality of the VFD and the cluster control circuitry.

The TIPM continually monitors the electronic transfer case through the transfer case shift motor/mode sensor assembly or the manual transfer case through the transfer case switch to determine when the **4WD FULL-TIME** mode is engaged. The TIPM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the transfer case shift motor/mode sensor, the transfer case switch, the TIPM, the EMIC, the CAN data bus or the electronic communication related to 4WD full-time indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

4WD INDICATOR - PART-TIME

The 4WD part-time indicator gives an indication to the vehicle operator when the transfer case has been shifted into a **4WD PART-TIME** mode. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

The 4WD part-time indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the 4WD part-time indicator for the following reasons:

- **4WD Part-Time Indicator Lamp-On Message** - Each time the cluster receives an electronic **4WD part-time indicator lamp-ON** message from the TIPM, the indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the TIPM, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the 4WD part-time indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The TIPM continually monitors the electronic transfer case through the transfer case shift motor/mode sensor assembly or the manual transfer case through the transfer case switch to determine when the **4WD PART-TIME** mode is engaged. The TIPM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the transfer case shift motor/mode sensor, the transfer case switch, the TIPM, the EMIC, the CAN data bus or the electronic communication related to 4WD part-time indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

SPEEDOMETER

DESCRIPTION

SPEEDOMETER

MPH km/h

Fig. 39: Speedometer
Courtesy of CHRYSLER LLC

A speedometer is standard equipment on all instrument clusters. The speedometer is located to the left of center of the instrument cluster, between the tachometer and the fuel gauge. The speedometer consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 200 degree primary scale on the gauge dial face that reads left-to-right either from **0** to **120** or **140** mph, or from **0** to **240** km/h, depending upon the market for which the vehicle is manufactured.

Each version also has a secondary inner scale on the gauge dial face that provides the equivalent opposite units from the primary scale. Text appearing on the cluster overlay below the center of the primary scale or below the high end of the secondary scale abbreviates the unit of measure for that scale (either **MPH** or **km/h**).

The speedometer graphics are white, gray and black against a black field, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the ignition switch in the ON or START positions or with the exterior lamps turned ON, the graphics retain their unilluminated colors and appearance. The orange gauge needle has internal optical illumination. Gauge illumination is provided by Light Emitting Diode (LED) units soldered onto the instrument cluster electronic circuit board.

The speedometer is serviced as a unit with the instrument cluster.

OPERATION

SPEEDOMETER

The speedometer gives an indication to the vehicle operator of the vehicle road speed. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The speedometer is driven by an electronic stepper motor unit that receives battery current on the instrument

cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the ON or START positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the OFF position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Vehicle Speed Message** - Each time the cluster receives an electronic **vehicle speed** message from the PCM it will calculate the correct vehicle speed reading and position the gauge needle at that relative speed position on the gauge scale. The cluster will receive a new message and reposition the gauge pointer accordingly about every 88 milliseconds. The gauge needle will continually be positioned at the relative vehicle speed position on the gauge scale until the vehicle stops moving, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Communication Error** - If the cluster fails to receive a speed message, it will hold the gauge needle at the last indication for about three seconds, or until the ignition switch is turned to the OFF position, whichever occurs first. After three seconds, the gauge needle will return to the left end of the gauge scale.
- **Actuator Test** - Each time the cluster is put through the actuator test, the speedometer needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the Vehicle Speed Sensor (VSS) to determine the vehicle road speed. The PCM then sends the proper **vehicle speed** messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the VSS, the PCM, the EMIC, the CAN data bus or the electronic communication related to speedometer operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

TACHOMETER

DESCRIPTION

TACHOMETER

RPM X 1000

Fig. 40: Tachometer
Courtesy of CHRYSLER LLC

A tachometer is standard equipment on all instrument clusters. The tachometer is located to the right of center of the instrument cluster, between the speedometer and the engine coolant temperature gauge. The tachometer consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 200 degree scale on the gauge dial face that reads left-to-right either from **0** to **7** for vehicles with a gasoline engine, or from **0** to **6** for vehicles with a diesel engine. The text **RPM X 1000** imprinted on the cluster overlay directly below the center of the scale and above the hub of the tachometer needle identifies that each number on the tachometer scale is to be multiplied by 1000 RPM.

The tachometer graphics are white, gray and black against a black field except for several red graduations that designate the red line area at the high end of the gauge scale, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the ignition switch in the ON or START positions or with the exterior lamps turned ON, the graphics retain their unilluminated colors and appearance. The orange gauge needle has internal optical illumination. Gauge illumination is provided by Light Emitting Diode (LED) units soldered onto the instrument cluster electronic circuit board.

The tachometer is serviced as a unit with the instrument cluster.

OPERATION

TACHOMETER

The tachometer gives an indication to the vehicle operator of the engine speed. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The tachometer is driven by an electronic stepper motor unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition

switch is in the ON or START positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the OFF position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Engine Speed Message** - Each time the cluster receives an electronic **engine speed** message from the PCM it will calculate the correct engine speed reading and position the gauge needle at that relative speed position on the gauge scale. The cluster will receive a new message and reposition the gauge pointer accordingly about every 88 milliseconds. The gauge needle will continually be repositioned at the relative engine speed position on the gauge scale until the engine stops running, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Communication Error** - If the cluster fails to receive a speed message, it will hold the gauge needle at the last indication for about three seconds, or until the ignition switch is turned to the OFF position, whichever occurs first. After three seconds, the gauge needle will return to the left end of the gauge scale.
- **Actuator Test** - Each time the cluster is put through the actuator test, the tachometer needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the crankshaft position sensor to determine the engine speed. The PCM then sends the proper **engine speed** messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the crankshaft position sensor, the PCM, the EMIC, the CAN data bus or the electronic communication related to tachometer operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

TOW/HAUL INDICATOR

DESCRIPTION

TOW/HAUL INDICATOR

**TOW/
HAUL**

Fig. 41: Identifying Tow/Haul Indicator
Courtesy of CHRYSLER LLC

A tow/haul indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with an optional automatic transmission this indicator is electronically disabled. This indicator is located above the engine coolant temperature gauge on the cluster overlay, to the right of the tachometer.

The tow/haul indicator consists of a stencil-like cutout of the text **TOW/HAUL** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The tow/haul indicator is serviced as a unit with the instrument cluster.

OPERATION

TOW/HAUL INDICATOR

The tow/haul indicator gives an indication to the vehicle operator when the tow/haul function of the tow/haul switch has been selected, revising the shift schedule of the electronically controlled automatic transmission. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The tow/haul indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the tow/haul indicator for the following reasons:

- **Tow/Haul Indicator Lamp-On Message** - Each time the cluster receives an electronic **tow/haul indicator lamp-ON** message from the PCM indicating that the tow/haul shift schedule has been selected, the indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the PCM, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the tow/haul indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the tow/haul switch to determine the proper outputs to the automatic transmission. The PCM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). For further diagnosis of the tow/haul indicator or the instrument cluster circuitry that controls the LED, see **DIAGNOSIS AND TESTING**.

For proper diagnosis of the transmission control system, the PCM, the EMIC, the CAN data bus or the electronic communication related to tow/haul indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

TIRE PRESSURE MONITOR INDICATOR

DESCRIPTION

TIRE PRESSURE MONITOR INDICATOR

Fig. 42: Tire Pressure Monitor Indicator
Courtesy of CHRYSLER LLC

A Tire Pressure Monitor (TPM) indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the TPM system, this indicator is electronically disabled. This indicator is located above the fuel gauge on the cluster overlay, to the left of the speedometer.

The TPM indicator consists of a stencil-like cutout of an icon that represents a cross-section of a tire with a centered exclamation point in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The TPM indicator is serviced as a unit with the instrument cluster.

OPERATION

TIRE PRESSURE MONITOR INDICATOR

The Tire Pressure Monitor (TPM) indicator gives an indication to the vehicle operator of the status of the TPM system. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Sentry Key Remote Entry Module (SKREEM) (also known as the Sentry Key Immobilizer Module/SKIM or Wireless Control Module/WCM) over the Controller Area Network (CAN) data bus.

The TPM indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the TPM indicator for the

following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position, the SKREEM sends an electronic **TPM indicator lamp-ON** message to the cluster to illuminate the TPM indicator for about three seconds as a bulb test.
- **TPM Indicator Lamp-On Message** - Each time the cluster receives an electronic **TPM indicator lamp-ON** message from the SKREEM, the TPM indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the SKREEM message. The indicator remains illuminated until the cluster receives a lamp-OFF message from the SKREEM, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Communication Error** - If the cluster receives no TPM lamp-ON or lamp-OFF messages from the SKREEM for six consecutive seconds, the TPM indicator is illuminated by the instrument cluster. The indicator remains controlled and illuminated by the cluster until a valid lamp-ON or lamp-OFF message is received from the SKREEM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the TPM indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The SKREEM performs a self-test each time the ignition switch is turned to the ON position to decide whether the TPM system is in good operating condition and whether the tire inflation pressures are too high or too low. The SKREEM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). If the instrument cluster turns ON the TPM indicator after the bulb test, it indicates that the inflation pressure of a tire is too low or that a malfunction has occurred and the TPM system is ineffective.

For proper diagnosis of the TPM system, the SKREEM, the EMIC, the CAN data bus or the electronic communication related to TPM indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

TRACTION CONTROL INDICATOR

DESCRIPTION

TRACTION CONTROL INDICATOR

Fig. 43: Traction Control Indicator

Courtesy of CHRYSLER LLC

A traction control indicator is standard equipment on all instrument clusters. This indicator is located near the top of the cluster overlay, between the speedometer and the tachometer.

The traction control indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Stability - Anti-Spin** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The traction control indicator is serviced as a unit with the instrument cluster.

OPERATION

TRACTION CONTROL INDICATOR

The traction control indicator gives an indication to the vehicle operator when the Electronic Stability Program (ESP)/Brake Assist System (BAS)/Traction Control System (TCS) has been activated. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and electronic messages received by the cluster from the Controller Antilock Brake (CAB) over the Controller Area Network (CAN) data bus.

The traction control indicator is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the indicator will always be OFF when the ignition switch is in any position except ON or START. The indicator only illuminates when it is provided a path to ground by the instrument cluster circuitry. The instrument cluster will turn ON the traction control indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the traction control indicator is illuminated for about four seconds as a bulb test. The entire bulb test is a function of the CAB.
- **Traction Control Indicator Lamp-On Message** - Each time the cluster receives an electronic **traction control indicator lamp-ON** message from the CAB indicating that the ESP/BAS/TCS has been activated, the traction control indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the CAB message. The indicator remains illuminated solid or continues to flash until the cluster receives a lamp-OFF message from the CAB, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the traction control indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The CAB continually monitors the traction control switch to determine the proper outputs to the components of the Antilock Brake System (ABS). The CAB then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the traction control switch, the ESP/BAS/TCS, the CAB, the EMIC, the CAN data bus or the electronic communication related to traction control indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

TRANS TEMP INDICATOR

DESCRIPTION

TRANSMISSION OVERTEMP INDICATOR

Fig. 44: Identifying Transmission Over-Temperature
Courtesy of CHRYSLER LLC

A transmission over-temperature indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with an optional automatic transmission, this indicator is electronically disabled. This indicator is located above the engine coolant temperature gauge on the cluster overlay, to the right of the tachometer.

The transmission over-temperature indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Transmission Temperature** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The transmission over-temperature indicator is serviced as a unit with the instrument cluster.

OPERATION

TRANSMISSION OVERTEMP INDICATOR

The transmission over-temperature indicator gives an indication to the vehicle operator when the transmission fluid temperature is excessive, which may lead to accelerated transmission component wear or failure. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The transmission over-temperature indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the transmission over-temperature indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the transmission over-temperature indicator is illuminated for about two seconds as a bulb test.
- **Trans Over-Temp Indicator Lamp-On Message** - Each time the cluster receives an electronic **trans over-temp indicator lamp-ON** message from the PCM indicating that the transmission fluid temperature is 135 °C (275 °F) or higher, the indicator will be illuminated and a single chime tone is sounded. The indicator remains illuminated until the cluster receives a lamp-OFF message from the PCM, or until the ignition switch is turned to the OFF position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the indicator is cycled OFF and then ON again by the appropriate lamp-ON and lamp-OFF messages from the PCM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the transmission over-temperature indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the transmission temperature sensor to determine the transmission operating condition. The PCM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). If the instrument cluster illuminates the transmission over-temperature indicator due to a high transmission oil temperature condition, it may indicate that the transmission or the transmission cooling system are being overloaded, or that they require service. For further diagnosis of the transmission over-temperature indicator or the instrument cluster circuitry that controls the LED, see **DIAGNOSIS AND TESTING**.

For proper diagnosis of the transmission temperature sensor, the PCM, the EMIC, the CAN data bus or the electronic communication related to transmission over-temperature indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

TURN SIGNAL INDICATOR

DESCRIPTION

TURN SIGNAL INDICATOR

Fig. 45: Turn Signal Indicator
Courtesy of CHRYSLER LLC

Two turn signal indicators, one right and one left, are standard equipment on all instrument clusters. These indicators are located near the top of the cluster overlay, between the speedometer and the tachometer. Illumination of this indicator may also be accompanied by the display of a turn signal-on warning textual message in the cluster reconfigurable Vacuum Fluorescent Display (VFD) unit.

Each turn signal indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Turn Warning** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents these icons from being clearly visible when they are not illuminated. A green Light Emitting Diode (LED) behind each cutout in the opaque layer of the overlay causes the indicator to appear in green through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The turn signal indicators are serviced as a unit with the instrument cluster.

OPERATION

TURN SIGNAL INDICATOR

The turn signal indicators give an indication to the vehicle operator that the turn signal (left or right indicator flashing) or hazard warning (both left and right indicators flashing) have been selected and are operating. These indicators are controlled by transistors on the instrument cluster electronic circuit board based upon the cluster programming and electronic messages received from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus.

Each turn signal indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, each LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor.

The instrument cluster will turn ON the turn signal indicators for the following reasons:

- **Turn Signal Indicator Lamp-On Message** - Each time the cluster receives an electronic **right** or **left turn signal-ON** message from the TIPM over the CAN data bus, the appropriate turn signal indicator will be flashed ON and OFF. The TIPM also sends the appropriate electronic message to the cluster to control the flash rate of the turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the cluster electronic circuit board that emulates the sound emitted by a conventional turn signal flasher. The turn signal indicators continue to flash ON and OFF until the cluster receives a lamp-OFF message from the TIPM, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Hazard Warning Indicator Lamp-On Message** - Each time the cluster receives an electronic **hazard warning-ON** message from the TIPM over the CAN data bus, both turn signal indicators will be flashed ON and OFF. The TIPM also sends the appropriate electronic messages to the cluster to control the flash rate of the right and left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the cluster electronic circuit board that emulates the sound emitted by a conventional hazard warning flasher. The turn signal indicators continue to flash ON and OFF until the cluster receives a hazard warning-OFF message from the TIPM.
- **Turn Signal-On Textual Warning Message** - When the cluster detects that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle speed greater than 22 kilometers-per-hour (15 miles-per hour) a chime tone will be sounded and, if the vehicle is so equipped, a **TURN SIGNAL ON** textual message will appear within the instrument cluster reconfigurable Vacuum Fluorescent Display (VFD) unit.
- **Lamp Out Mode** - If the TIPM detects an ineffective turn signal lamp or circuit, it increases the flash rate for the remaining operative turn signals and sends an electronic message to the instrument cluster. To provide an indication of the problem to the vehicle operator the instrument cluster then increases the flash rate of the turn signal indicators, the click rate of the electromechanical relay and, if the vehicle is so equipped, displays a **TURN SIGNAL LAMP OUT** textual message in the reconfigurable VFD unit.
- **Actuator Test** - Each time the cluster is put through the actuator test, the turn signal indicators will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of each LED and the cluster control circuitry.

The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) continually monitors the electronic messages from the TIPM to determine the proper turn signal and hazard warning indicator operation.

For proper diagnosis of the turn signal and hazard warning system, the multi-function switch, the TIPM, the EMIC, the CAN data bus or the electronic communication related to turn signal indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

WAIT-TO-START INDICATOR

DESCRIPTION

WAIT-TO-START INDICATOR

Fig. 46: Wait-To-Start Indicator
Courtesy of CHRYSLER LLC

A wait-to-start indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with an optional diesel engine, this indicator is electronically disabled. This indicator is located above the fuel gauge on the cluster overlay, to the left of the speedometer.

The wait-to-start indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Diesel Preheat** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The wait-to-start indicator is serviced as a unit with the instrument cluster.

OPERATION

WAIT-TO-START INDICATOR

The wait-to-start indicator gives an indication to the vehicle operator when the diesel engine is too cool for efficient and reliable engine starting, and the engine glow plugs are energized in their pre-heat operating mode. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The wait-to-start indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the wait-to-start indicator for the following reasons:

- **Wait-To-Start Indicator Lamp-On Message** - Each time the cluster receives an electronic **wait-to-start indicator lamp-ON** message from the PCM indicating that the air temperature is too cool for efficient and reliable engine starting and the glow plugs are energized in their pre-heat mode, the wait-to-start indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF

message from the PCM, until the PCM detects that the engine is running, or until the ignition switch is turned to the OFF position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the wait-to-start indicator will be turned ON, then OFF again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the glow plug control circuits to determine when they are energized in their pre-heat operating mode. The PCM then sends the proper lamp-ON or lamp-OFF message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the glow plug control circuits, the PCM, the EMIC, the CAN data bus or the electronic communication related to wait-to-start indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

WATER-IN-FUEL INDICATOR

DESCRIPTION

WATER-IN-FUEL INDICATOR

Fig. 47: Identifying Water-In-Fuel Indicator
Courtesy of CHRYSLER LLC

A water-in-fuel indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with an optional diesel engine, this indicator is electronically disabled. This indicator is located above the fuel gauge on the cluster overlay, to the left of the speedometer.

The water-in-fuel indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for **Water In Fuel** in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The water-in-fuel indicator is serviced as a unit with the instrument cluster.

OPERATION

WATER-IN-FUEL INDICATOR

The water-in-fuel indicator gives an indication to the vehicle operator when there is excessive water detected in the diesel fuel. This indicator is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received over the Controller Area Network (CAN) data bus from the Powertrain Control Module (PCM).

The water-in-fuel indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON or START. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn ON the water-in-fuel indicator for the following reasons:

- **Water-In-Fuel Indicator Lamp-On Message** - Each time the cluster receives an electronic **water-in-fuel indicator lamp-ON** message from the PCM indicating there is excessive water in the diesel fuel system, the water-in-fuel indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-OFF message from the PCM, or until the ignition switch is turned to the OFF position, whichever occurs first.

The PCM continually monitors the water-in-fuel sensor to determine whether there is excessive water in the diesel fuel system. The PCM then sends the proper electronic **water-in-fuel** message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

For proper diagnosis of the water-in-fuel-sensor, the PCM, the EMIC, the CAN data bus or the electronic communication related to water-in-fuel indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

LAMPS/LIGHTING - EXTERIOR-ELECTRICAL/DIAGNOSTICS

DIAGNOSIS AND TESTING

B162B-LEFT LOW BEAM CONTROL CIRCUIT LOW

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the Headlamps activated.

Set Conditions

- Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a LOW condition.

Possible Causes

Possible Causes
(L43) LEFT LOW BEAM CONTROL CIRCUIT SHORT TO GROUND
LEFT LOW BEAM BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. **INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Headlamps on.

With the scan tool, read DTC's.

Does the scan tool display active: B162B-LEFT LOW BEAM CONTROL CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **LEFT LOW BEAM BULB**

Turn the ignition off.

Disconnect the Left Low Beam Bulb.

Turn the ignition on.

With the scan tool, read DTC's.

Does the DTC reset?

Yes

Go To 3.

No

Replace the Left Low Beam Bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. **(L43) LEFT LOW BEAM CONTROL CIRCUIT SHORT TO GROUND**

MODULE-
TOTALLY
INTEGRATED
POWER C1

Fig. 1: Measuring Resistance Between Ground And (L43) Left Low Beam Control Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Disconnect the Left Headlamp harness connector.

Measure the resistance between ground and the (L43) Left Low Beam Control circuit.

Is the resistance above 10k ohms?

Yes

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (L43) Left Low Beam Control circuit for a short to ground.
Perform **BODY VERIFICATION TEST - VER 1** .

B162C-LT LOW BEAM CONTROL CKT HI

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

• **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects an OPEN condition when the low beam is on.

Possible Causes

Possible Causes
CHECK (L911) LEFT HEADLAMP RETURN SIGNAL (L911) LEFT HEADLAMP RETURN SIGNAL CHECK (L43) LEFT LOW BEAM CONTROL CIRCUIT

(L43) LEFT LOW BEAM CONTROL CIRCUIT OPEN
LEFT LOW BEAM BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Headlamps on.

With the scan tool, read DTC's.

Does the scan tool display active: B162C-LEFT LOW BEAM CONTROL CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK (L911) LEFT HEADLAMP RETURN SIGNAL

Turn the ignition off.

Disconnect the Left Low Beam Lamp harness connector.

With a 12-volt test light connected to 12-volts, probe the (L911) left headlamp return signal circuit.

Does the test light illuminate brightly?

Yes

Go To 4.

No

Go To 3.

3. (L911) LEFT HEADLAMP RETURN SIGNAL

Measure the resistance of the (L911) left headlamp return signal circuit at the Left Low Beam harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Inoperative bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (L911) left headlamp return signal circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. CHECK (L43) LEFT LOW BEAM CONTROL CIRCUIT

Fig. 2: Checking Left Low Beam Control Circuit
Courtesy of CHRYSLER LLC

Turn the ignition on.

With a 12-volt test light connected to ground, check the (L43) Left Low Beam Control circuit.

Does the test light illuminate brightly with the headlamps switch turned on, and shut off with the headlamps turned off?

Yes

Replace the Inoperative bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 5.

5. (L43) LEFT LOW BEAM CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Measure the resistance of the (L43) Left Low Beam Control circuit between the Left Low Beam harness connector and the TIPM C3 harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (L43) Left Low Beam Control circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

B162F-RIGHT LOW BEAM CONTROL CIRCUIT LOW

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the Headlamps activated.

Set Conditions

• **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a SHORT condition when the right low beam is on.

Possible Causes

Possible Causes
(L44) RIGHT LOW BEAM CONTROL CIRCUIT SHORT TO GROUND

Is the resistance below 10.0 ohms?

Yes

Go To 6.

No

Repair the (L33) Left High Beam Control circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

6. (L33) LEFT HIGH BEAM CONTROL CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (L33) Left High Beam Control circuit.

Is there any voltage present?

Yes

Repair the (L33) Left High Beam Control circuit for a short to voltage.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

B1637-RIGHT HI BEAM CONTROL CIRCUIT LOW

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the High Beam Headlamps activated.

Set Conditions

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a LOW condition.

Possible Causes

Possible Causes
(L34) RIGHT HIGH BEAM CONTROL CIRCUIT SHORT TO GROUND
RIGHT HIGH BEAM BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the High Beam Lamps on.

With the scan tool, read DTC's.

Does the scan tool display active: B1637-RIGHT HIGH BEAM CONTROL CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. RIGHT HIGH BEAM BULB

Turn the ignition off.

Disconnect the Right High Beam Bulb.

Turn the ignition on.

With the scan tool, read DTC's.

Does the DTC reset?

Yes

Go To 3.

No

Replace the Right High Beam Bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. (L34) RIGHT HIGH BEAM CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Disconnect the Right Headlamp harness connector.

Measure the resistance between ground and the Right High Beam Control circuit.

Is the resistance above 10k ohms?

Yes

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (L34) Right High Beam Control circuit for a short to ground.
Perform **BODY VERIFICATION TEST - VER 1** .

B1638-RIGHT HI BEAM CONTROL CIRCUIT HIGH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a HIGH condition.

Possible Causes

Possible Causes
CHECK (L910) RIGHT HEADLAMP RETURN SIGNAL CIRCUIT (L910) RIGHT HEADLAMP RETURN SIGNAL CIRCUIT OPEN CHECK (L34) RIGHT HIGH BEAM CONTROL CIRCUIT (L34) RIGHT HIGH BEAM CONTROL CIRCUIT OPEN (L34) RIGHT HIGH BEAM CONTROL CIRCUIT SHORT TO VOLTAGE RIGHT HIGH BEAM BULB TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Headlamps on.

With the scan tool, read DTC's.

Does the scan tool display active: B1638-RIGHT HIGH BEAM CONTROL CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK (L910) RIGHT HEADLAMP RETURN SIGNAL CIRCUIT

Turn the ignition off.

Disconnect the Right High Beam Lamp harness connector.

With a 12-volt test light connected to 12-volts, probe the (L910) right headlamp return signal circuit.

Does the test light illuminate brightly on each ground circuit?

Yes

Go To 4.

No

Go To 3.

3. (L910) RIGHT HEADLAMP RETURN SIGNAL CIRCUIT OPEN

Measure the resistance of the (L910) right headlamp return signal circuit at the Right High Beam harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Inoperative bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (L910) right headlamp return signal circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. CHECK (L34) RIGHT HIGH BEAM CONTROL CIRCUIT

Turn the ignition on.

With a 12-volt test light connected to ground, check the (L34) Right High Beam Control circuit.

Does the test light illuminate brightly with the headlamps switch turned on, and shut off with the headlamps turned off?

Yes

Replace the Inoperative bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 5.

5. (L34) RIGHT HIGH BEAM CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Measure the resistance of the (L34) Right High Beam Control circuit between the Right Headlamp harness connector and the TIPM C3 harness connector.

Is the resistance below 10.0 ohms?

Yes

Go To 6.

No

Repair the (L34) Right High Beam Control circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

6. (L34) HIGH BEAM CONTROL CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (L34) High Beam Control circuit.

Is there any voltage present?

Yes

Repair the (L34) High Beam Control circuit for a short to voltage.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

B163B-FRONT LEFT TURN CONTROL CIRCUIT LOW

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the Turn Signal activated.

Set Conditions

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a LOW condition.

Possible Causes

Possible Causes
(L61) FRONT LEFT TURN SIGNAL CONTROL CIRCUIT SHORT TO GROUND FRONT LEFT TURN SIGNAL BULB TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Left Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool display active: B163B-FRONT LEFT TURN LAMP CONTROL CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **FRONT LEFT TURN SIGNAL BULB**

Turn the ignition off.

Disconnect the Front Left Turn Signal Bulb.

Turn the ignition on.

With the scan tool, read DTC's.

Does the DTC reset?

Yes

Go To 3.

No

Replace the Front Left Turn Signal Bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. **(L61) FRONT LEFT TURN SIGNAL CONTROL CIRCUIT SHORT TO GROUND**

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Disconnect the Front Left Turn Signal Lamp harness connector.

Measure the resistance between ground and the (L61) Front Left Turn Signal Control circuit.

Is the resistance above 10k ohms?

Yes

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (L61) Front Left Turn Signal Control circuit for a short to ground.
Perform **BODY VERIFICATION TEST - VER 1** .

B163C-FRONT LEFT TURN CONTROL CIRCUIT HIGH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

• **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a HIGH condition.

Possible Causes

Possible Causes
CHECK (Z904) GROUND CIRCUIT (Z904) GROUND CIRCUIT OPEN CHECK (L61) FRONT LEFT TURN SIGNAL CONTROL CIRCUIT (L61) FRONT LEFT TURN SIGNAL CONTROL CIRCUIT OPEN (L61) FRONT LEFT TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE FRONT LEFT TURN LAMP BULB TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Left Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool display active: B163C-FRONT LEFT TURN LAMP CONTROL CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK (Z904) GROUND CIRCUITS

Turn the ignition off.

Disconnect the Front Left Turn Signal Lamp assembly harness connector.

With a 12-volt test light connected to 12-volts, probe each (Z904) Ground circuit.

Does the test light illuminate brightly on each ground circuit?

Yes

Go To 4.

No

Go To 3.

3. (Z904) GROUND CIRCUIT OPEN

Measure the resistance of the appropriate (Z904) Ground circuit(s) at the Front Left Turn Signal Lamp assembly harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Inoperative bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the appropriate (Z904) Ground circuit(s) for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. CHECK (L61) FRONT LEFT TURN SIGNAL CONTROL CIRCUIT

Turn the ignition on.

With the Left Turn Signal still on and a 12-volt test light connected to ground, check the (L61) Front Left Turn Signal Control circuit.

Does the test light blink brightly from on to off with the turn signal indicator?

Yes

Replace the Inoperative bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 5.

5. (L61) FRONT LEFT TURN SIGNAL CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Measure the resistance of the (L61) Front Left Turn Signal Control circuit between the Front Left Turn Signal Lamp assembly harness connector and the TIPM C3 harness connector.

Is the resistance below 10.0 ohms?

Yes

Go To 6.

No

Repair the (L61) Front Left Turn Lamp Control circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

6. (L61) FRONT LEFT TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (L61) Front Left Turn Signal Control circuit.

Is there any voltage present?

No

Repair the (L61) Front Left Turn Signal Control circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

B163F-FRONT RIGHT TURN CONTROL CIRCUIT LOW

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the Turn Signal activated.

Set Conditions

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a LOW condition.

Possible Causes

Possible Causes
(L60) FRONT RIGHT TURN SIGNAL CONTROL CIRCUIT SHORT TO GROUND FRONT RIGHT TURN SIGNAL BULB TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Right Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool display active: B163F-FRONT RIGHT TURN LAMP CONTROL CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. FRONT RIGHT TURN SIGNAL BULB

Turn the ignition off.

Disconnect the Front Right Turn Signal Bulb.

Turn the ignition on.

With the scan tool, read DTC's.

Does the DTC reset?

Yes

Go To 3.

No

Replace the Front Right Turn Signal Bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. (L60) FRONT RIGHT TURN SIGNAL CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Disconnect the Right Front Turn Signal Lamp harness connector.

Measure the resistance between ground and the (L60) Right Front Turn Signal Control circuit.

Is the resistance above 10k ohms?

Yes

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (L60) Right Front Turn Signal Control circuit for a short to ground.
Perform **BODY VERIFICATION TEST - VER 1** .

B1640-FRONT RIGHT TURN CONTROL CIRCUIT HIGH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Right Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool display active: B1640-FRONT RIGHT TURN LAMP CONTROL CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1**.

2. CHECK (Z904) GROUND CIRCUITS

Turn the ignition off.

Disconnect the Front Right Turn Signal Lamp assembly harness connector.

With a 12-volt test light connected to 12-volts, probe each (Z904) Ground circuit.

Does the test light illuminate brightly on each ground circuit?

Yes

Go To 4.

No

Go To 3.

3. (Z904) GROUND CIRCUIT OPEN

Measure the resistance of the appropriate (Z904) Ground circuit(s) at the Front Right Turn Signal Lamp assembly harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Inoperative bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the appropriate (Z904) Ground circuit(s) for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. CHECK (L60) FRONT RIGHT TURN SIGNAL CONTROL CIRCUIT

Turn the ignition on.

With the Right Turn Signal still on and a 12-volt test light connected to ground, check the (L60) Front Right Turn Signal Control circuit.

Does the test light blink brightly from on to off with the turn signal indicator?

Yes

Replace the Inoperative bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 5.

5. (L60) FRONT RIGHT TURN SIGNAL CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Measure the resistance of the (L60) Front Right Turn Signal Control circuit between the Front Right Turn Signal Lamp assembly harness connector and the TIPM C3 harness connector.

Is the resistance below 10.0 ohms?

Yes

Go To 6.

No

Repair the (L60) Front Right Turn Signal Control circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

6. **(L60) RIGHT TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE**

Turn the ignition on.

Measure for voltage on the (L60) Front Right Turn Signal Control circuit.

Is there any voltage present?

No

Repair the (L60) Front Right Turn Signal Control circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1643-REAR LEFT TURN CONTROL CIRCUIT LOW

When the Totally Integrated Power Module (TIPM) detects a LOW condition.

Possible Causes

Possible Causes
(L63) REAR LEFT TURN SIGNAL CONTROL CIRCUIT SHORT TO GROUND
REAR LEFT TURN SIGNAL BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Left Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool display active: B1643-REAR LEFT TURN LAMP CONTROL CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. REAR LEFT TURN SIGNAL BULB

Turn the ignition off.

Disconnect the Rear Left Turn Signal Bulb.

Turn the ignition on.

With the scan tool, read DTC's.

Does the DTC reset?

Yes

Go To 3.

No

Replace the Rear Left Turn Signal Bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. (L63) LEFT TURN SIGNAL CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Disconnect the Left Rear Tail Lamp harness connector.

Measure the resistance between ground and the (L63) Rear Left Turn Signal Control circuit.

Is the resistance above 10k ohms?

Yes

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (L63) Rear Left Turn Signal Control circuit for a short to ground.
Perform **BODY VERIFICATION TEST - VER 1** .

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Left Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool display active: B1644-REAR LEFT TURN LAMP CONTROL CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1**.

2. CHECK (Z910) GROUND CIRCUITS

Turn the ignition off.

Disconnect the Left Rear Turn Signal Lamp assembly harness connector.

With a 12-volt test light connected to 12-volts, probe each (Z910) Ground circuit.

Does the test light illuminate brightly on each ground circuit?

Yes

Go To 4.

No

Go To 3.

3. (Z910) GROUND CIRCUIT OPEN

Measure the resistance of the appropriate (Z910) Ground circuit(s) at the Left Rear Turn Signal Lamp assembly harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Inoperative bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the appropriate (Z910) Ground circuit(s) for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. CHECK (L63) LEFT REAR TURN SIGNAL CONTROL CIRCUIT

Turn the ignition on.

With the Left Turn Signal still on and a 12-volt test light connected to ground, check the (L63) Left Rear Turn Signal Control circuit.

Does the test light blink brightly from on to off with the turn signal indicator?

Yes

Replace the Inoperative bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 5.

5. (L63) LEFT TURN SIGNAL CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Measure the resistance of the (L63) Left Rear Turn Signal Control circuit between the Left Rear Tail Lamp assembly harness connector and the TIPM C7 harness connector.

Is the resistance below 10.0 ohms?

Yes

Go To 6.

No

Repair the (L63) Left Rear Turn Signal Control circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

6. **(L63) LEFT REAR TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE**

Turn the ignition on.

Measure for voltage on the (L63) Left Rear Turn Signal Control circuit.

Is there any voltage present?

Yes

Repair short to voltage on the (L63) Left Rear Turn Signal Control circuit.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's

Turn the Stop Lamps on.

With the scan tool, read DTC's.

Does the scan tool display active: B16B5-RIGHT STOP LAMP CONTROL CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK (Z920) GROUND CIRCUITS

Disconnect the Right Rear Tail Lamp harness connector.

With a 12-volt test light connected to 12-volts, probe each (Z920) Ground circuit.

Does the test light illuminate brightly on each ground circuit?

Yes

Go To 4.

No

Go To 3.

3. (Z920) GROUND CIRCUIT OPEN

Measure the resistance of the appropriate (Z920) Ground circuit(s) at the Right Rear Tail Lamp assembly harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Inoperative bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the appropriate (Z920) Ground circuit(s) for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. CHECK (L54) RIGHT STOP LAMP CONTROL CIRCUIT

Turn the ignition on.

With the Stop Lamps still on and a 12-volt test light connected to ground, check the (L54) Right Stop Lamp Control circuit.

Does the test light illuminate brightly?

Yes

Replace the Inoperative bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 5.

5. (L54) RIGHT STOP LAMP CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C7 connector.

Measure the resistance of the (L54) Right Stop Lamp Control circuit between the Right Rear Tail Lamp harness connector and the TIPM C7 harness connector.

Is the resistance below 10.0 ohms?

No

Go To 6.

Yes

Repair the (L54) Right Stop Lamp Control circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

6. **(L54) RIGHT STOP LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE**

Turn the ignition on.

Measure the voltage between (L54) Right Stop Lamp Control circuit and ground.

Is there any voltage present?

Yes

Repair the (L54) Right Stop Lamp Control circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

Possible Causes

Possible Causes
(L62) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT SHORT TO GROUND
RIGHT REAR TURN SIGNAL BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Right Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool display active: B1647-REAR RIGHT TURN LAMP CONTROL CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. REAR RIGHT TURN SIGNAL BULB

Turn the ignition off.

Disconnect the Right Rear Turn Signal Bulb.

Turn the ignition on.

With the scan tool, read DTC's.

Does the DTC reset?

Yes

Go To 3.

No

Replace the Right Rear Turn Signal Bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. (L62) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Disconnect the Right Rear Tail Lamp harness connector.

Measure the resistance between ground and the (L62) Right Rear Turn Signal Control circuit.

Is the resistance above 10k ohms?

Yes

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (L62) Right Rear Turn Signal Control circuit for a short to ground.
Perform **BODY VERIFICATION TEST - VER 1** .

CHECK (Z910) GROUND CIRCUIT (Z910) GROUND CIRCUIT OPEN CHECK (L62) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT (L62) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT OPEN (L62) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Right Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool display active: B1648-REAR RIGHT TURN LAMP CONTROL CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK (Z910) GROUND CIRCUITS

Turn the ignition off.

Disconnect the Right Rear Turn Signal Lamp assembly harness connector.

With a 12-volt test light connected to 12-volts, probe each (Z910) Ground circuit.

Does the test light illuminate brightly on each ground circuit?

Yes

Go To 4.

No

Go To 3.

3. (Z910) GROUND CIRCUIT OPEN

Measure the resistance of the appropriate (Z910) Ground circuit(s) at the Right Rear Turn Signal Lamp assembly harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Inoperative bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the appropriate (Z910) Ground circuit(s) for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. CHECK (L62) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT

Turn the ignition on.

With the Right Turn Signal still on and a 12-volt test light connected to ground, check the (L62) Right Rear Turn Signal Control circuit.

Does the test light blink brightly from on to off with the turn signal indicator?

Yes

Replace the Inoperative bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 5.

5. (L62) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Measure the resistance of the (L62) Right Rear Turn Signal Control circuit between the Right Rear Tail Lamp assembly harness connector and the TIPM C7 harness connector.

Is the resistance below 10.0 ohms?

Yes

Go To 6.

No

Repair the (L62) Right Rear Turn Lamp Control circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

6. **(L62) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE**

Turn the ignition on.

Measure for voltage on the (L62) Right Rear Turn Signal Control circuit.

Is there any voltage present?

Yes

Repair the (L62) Right Rear Turn Signal Control circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

B165C-PARK LAMP CONTROL CIRCUIT LOW

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the Park Lamps activated.

Set Conditions

• **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a LOW condition.

Possible Causes

Possible Causes
(L17)(L217) FUSED PARK LAMP CONTROL CIRCUIT SHORT TO GROUND TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Park Lamps on.

With the scan tool, read DTC's.

Does the scan tool display active: B165C-PARK LAMP CONTROL CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1**.

2. (L17)(L217) FUSED PARK LAMP CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C5 harness connector.

Disconnect the Park Lamp harness connectors.

Measure the resistance between ground and the (L17) (L217) Fused Park Lamp Control circuits.

Is the resistance above 10k ohms?

Yes

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Repair the (L17)(L217) Fused Park Lamp Control circuits for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1**.

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a HIGH condition.

Possible Causes

Possible Causes
(L17)(L217) FUSED PARK LAMP CONTROL CIRCUITS OPEN TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, clear all DTC's

Turn the Park Lamps on.

With the scan tool, read DTC's.

Does the scan tool display active: B165D-PARK LAMP CONTROL CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **(L17)(L217) FUSED PARK LAMP CONTROL CIRCUITS OPEN**

Turn the ignition off.

Disconnect the TIPM C5 harness connector.

Disconnect the Park Lamp harness connector.

Measure the resistance of the (L17)(L217) Fused Park Lamp Control circuits between the Park Lamp Harness Connectors and the TIPM C5 harness connector.

Does the ohm meter read open circuit?

Yes

Repair the (L17)(L217) Fused Park Lamp Control circuits for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

B166C-LEFT TRAILER TOW LAMP CONTROL CIRCUIT HIGH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

• **Set Condition:**

The Totally Integrated Power Module (TIPM) detects an HIGH condition.

Possible Causes

Possible Causes
(L673) LEFT TRAILER TOW LAMP CONTROL CIRCUIT OPEN
(L673) LEFT TRAILER TOW LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's

Turn on the Left Turn Signal.

With the scan tool, read DTC's.

Does the scan tool display active: B166C-LEFT TRAILER TOW LAMP CONTROL CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. (L673) LEFT TRAILER TOW LAMP CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C6 harness connector.

Disconnect the Left Trailer Tow Lamp harness connectors.

Measure the resistance of the (L673) Left Trailer Tow Lamp Control circuit between the Left Trailer Tow Lamp harness connectors and the TIPM C6 harness connector.

Does the ohm meter read open circuit?

Yes

Repair the (L673) Left Trailer Tow Lamp Control circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. (L673) LEFT TRAILER TOW LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure the voltage on the (L673) Left Trailer Tow Lamp Control circuit.

Is there any voltage present?

Yes

Repair the (L673) Left Trailer Tow Lamp Control circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

B166F-RIGHT TRAILER TOW LAMP CONTROL CIRCUIT LOW

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

• **Set Condition:**

The Totally Integrated Power Module (TIPM) Detects a LOW condition.

Possible Causes

Possible Causes
(L674) RIGHT TRAILER TOW LAMP CONTROL CIRCUIT SHORT TO GROUND TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn on the Right Turn Signal.

With the scan tool, read DTC's.

Does the scan tool display active: B166F-RIGHT TRAILER TOW LAMP CONTROL CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1**.

2. (L674) RIGHT TRAILER TOW LAMP CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C6 harness connector.

Measure the resistance between ground and the (L674) Right Trailer Tow Lamp Control circuit.

Is the resistance above 10k ohms?

Yes

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1**.

No

Repair the (L674) Right Trailer Tow Lamp Control circuit for a short to ground.
Perform **BODY VERIFICATION TEST - VER 1**.

B1670-RIGHT TRAILER TOW LAMP CONTROL CIRCUIT HIGH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously

Set Conditions

- **Set Condition:**

The Totally Integrated Power Module (TIPM) Detects a HIGH condition.

Possible Causes

Possible Causes
(L674) RIGHT TRAILER TOW LAMP CONTROL CIRCUIT OPEN
(L674) RIGHT TRAILER TOW LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's

Turn on the Right Turn Signal.

With the scan tool, read DTC's.

Does the scan tool display active: B1670-RIGHT TRAILER TOW LAMP CONTROL CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or

contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. (L674) RIGHT TRAILER TOW LAMP CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C6 harness connector.

Disconnect the Right Trailer Tow Lamp harness connectors.

Measure the resistance of the (L674) Right Trailer Tow Lamp Control circuit between the Right Trailer Tow Lamp harness connectors and the TIPM C6 harness connector.

Does the ohm meter read open circuit?

Yes

Repair the (L674) Right Trailer Tow Lamp Control circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. (L674) RIGHT TRAILER TOW LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure the voltage on the (L674) Right Trailer Tow Lamp Control circuit.

Is there any voltage present?

Yes

Repair the (L674) Right Trailer Tow Lamp Control circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

B16B1-LEFT STOP LAMP CONTROL CIRCUIT HIGH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

- Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a HIGH condition.

Possible Causes

Possible Causes
CHECK (Z919) GROUND CIRCUIT (Z919) GROUND CIRCUIT OPEN CHECK (L53) LEFT STOP LAMP CONTROL CIRCUIT (L53) LEFT STOP LAMP CONTROL CIRCUIT OPEN (L53) LEFT STOP LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE LEFT STOP LAMP BULB TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's

Turn the Stop Lamps on.

With the scan tool, read DTC's.

Does the scan tool display active: B16B1-LEFT STOP LAMP CONTROL CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK (Z919) GROUND CIRCUITS**

Turn the ignition off.

Disconnect the Left Rear Tail Lamp harness connector.

With a 12-volt test light connected to 12-volts, probe each (Z919) Ground circuit.

Does the test light illuminate brightly on each ground circuit?

Yes

Go To 4.

No

Go To 3.

3. **(Z919) GROUND CIRCUIT OPEN**

Measure the resistance of the appropriate (Z919) Ground circuit(s) at the Left Rear Tail Lamp assembly harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Inoperative bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the appropriate (Z919) Ground circuit(s) for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. **CHECK (L53) LEFT STOP LAMP CONTROL CIRCUIT**

Turn the ignition on.

With the Stop Lamps still on and a 12-volt test light connected to ground, check the (L53) Left Stop Lamp Control circuit.

Does the test light illuminate brightly?

Yes

Replace the Inoperative bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 5.

5. (L53) LEFT STOP LAMP CONTROL CIRCUIT OPEN

Disconnect the TIPM C7 harness connector.

Measure the resistance of the (L53) Left Rear Turn Signal Control circuit between the Left Rear Tail Lamp harness connector and the TIPM C7 harness connector.

Is the resistance below 10.0 ohms?

Yes

Go To 6.

No

Repair the (L53) Turn Signal Control circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

6. (L53) LEFT STOP LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (L53) Left Stop Lamp Control circuit.

Is there any voltage present?

Yes

Repair the (L53) Left Stop Lamp Control circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

B16F8-FRONT LEFT FOG LAMP CONTROL CIRCUIT LOW

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

Diagnostic Test

1. **INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Front Fog Lamps on.

With the scan tool, read DTC's.

Does the scan tool display active: B16F8-FRONT LEFT FOG LAMP CONTROL CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **FRONT LEFT FOG LAMP BULB**

Turn the ignition off.

Disconnect the Front Left Fog Lamp Bulb.

Turn the ignition on.

With the scan tool, read DTC's.

Does the DTC reset?

Yes

Go To 3.

No

Replace the Front Left Fog Lamp Bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. **(L89) FRONT LEFT FOG LAMP CONTROL CIRCUIT SHORT TO GROUND**

Turn the ignition off.

Disconnect the TIPM C4 harness connector.

Measure the resistance between ground and the (L89) Front Left Fog Lamp Control circuit.

Is the resistance above 10k ohms?

Yes

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

No

Repair the (L89) Front Left Fog Lamp Control circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK (Z904) GROUND CIRCUITS**

Disconnect the Front Left Fog Lamp harness connector.

With a 12-volt test light connected to 12-volts, probe each (Z904) Ground circuit.

Does the test light illuminate brightly on each ground circuit?

Yes

Go To 4.

No

Go To 3.

3. (Z904) GROUND CIRCUIT OPEN

Measure the resistance of the appropriate (Z904) Ground circuit(s) at the Front Left Fog Lamp harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Inoperative bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the appropriate (Z904) Ground circuit(s) for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. CHECK (L89) FRONT LEFT FOG LAMP CONTROL CIRCUIT

Turn the ignition on.

With a 12-volt test light connected to ground, check the (L89) Front Left Fog Lamp Control circuit.

Does the test light illuminate brightly with the fog lamp switch turned on, and shut off with the fog lamps turned off?

Yes

Replace the Inoperative bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 5.

5. (L89) FRONT LEFT FOG LAMP CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C4 harness connector.

Measure the resistance between the (L89) Front Left Fog Lamp Control circuit and the Front Left Fog Lamp harness connector to the TIPM C4 connector.

Is the resistance below 10.0 ohms?

Yes

Go To 6.

No

Repair the (L89) Front Left Fog Lamp Control circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

6. (L89) FRONT LEFT FOG LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (L89) Front Left Fog Lamp Control circuit.

Is there any voltage present?

Yes

Repair the (L89) Front Left Fog Lamp Control circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Left Turn Signals on.

With the scan tool, read DTC's.

Does the scan tool read active: B17B8-LEFT STOP LAMP CONTROL CIRCUIT OVERCURRENT?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. LEFT STOP LAMP BULB

Turn the ignition off.

Remove Left Stop Lamp Bulb.

Inspect the Left Stop Lamp Bulb.

Is the inoperative bulb OK?

Yes

Go To 3.

No

Replace the Inoperative bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. (L53) LEFT STOP LAMP CONTROL CIRCUIT SHORT TO GROUND

Disconnect the TIPM C7 harness connector.

Disconnect the Left Stop Lamp harness connector.

Measure the resistance between ground and the (L53) Left Stop Lamp Control circuit.

Is the resistance above 10k ohms?

Yes

Go To 4.

No

Repair the (L53) Left Stop Lamp Control circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

4. (L53) LEFT STOP LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (L53) Left Stop Lamp Control circuit.

Is there any voltage present?

Yes

Repair the (L53) Left Stop Lamp Control circuit short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

B17BA-HEADLAMP LEVELING MOTOR CONTROL CIRCUIT OVERCURRENT

TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, clear all DTC's

Turn the Headlamps on.

With the scan tool, read DTC's.

Does the scan tool display active: B17BA-HEADLAMP LEVELING MOTOR CONTROL CIRCUIT OVERCURRENT?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. (L133) HEADLAMP LEVELING MOTOR CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Disconnect the Headlamp harness connector.

Measure the resistance between ground and the (L133) Headlamp Leveling Motor Control circuit.

Is the resistance above 10k ohms?

Yes

Go To 3.

No

Repair the (L133) Headlamp Leveling Motor Control circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

3. (L133) HEADLAMP LEVELING MOTOR CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (L133) Headlamp Leveling Motor Control circuit.

Is there any voltage present?

Yes

Repair the (L133) Headlamp Leveling Motor Control circuit short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

B17BD-LEFT SIDEMARKER LAMP CONTROL CIRCUIT HIGH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's

Turn the Left Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool display active: B17BD-LEFT SIDEMARKER LAMP CONTROL CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. LEFT REAR TURN SIGNAL BULB

Turn the ignition off.

Remove Left Rear Turn Signal Bulb.

Inspect the Left Rear Turn Signal Bulb.

Is the inoperative bulb OK?

Yes

Go To 3.

No

Replace the Inoperative bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. (L163) LEFT SIDEMARKER LAMP CONTROL CIRCUIT OPEN

Disconnect the TIPM C4 harness connector.

Disconnect the Left Sidemarker Lamp assembly harness connector.

Measure the resistance of the (L163) Left Sidemarker Lamp Control circuit between the Left Sidemarker Lamp assembly harness connector and the TIPM C4 harness connector.

Does the ohm meter read open circuit?

Yes

Repair the (L163) Left Sidemarker Lamp Control circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. (L163) LEFT SIDEMARKER LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (L163) Left Sidemarker Lamp Control circuit.

Is there any voltage present?

Yes

Repair the (L163) Left Sidemarker Lamp Control circuit short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

B17BF-LEFT SIDEMARKER LAMP CONTROL CIRCUIT OVERCURRENT

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a OVERCURRENT condition.

Possible Causes

Possible Causes
(L163) LEFT SIDEMARKER LAMP CONTROL CIRCUIT SHORT TO GROUND (L163) LEFT SIDEMARKER LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's

Turn the Left Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool display active: B17BF-LEFT SIDEMARKER LAMP CONTROL CIRCUIT OVERCURRENT?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **LEFT REAR TURN SIGNAL BULB**

Turn the ignition off.

Remove Left Rear Turn Signal Bulb.

Inspect the Left Rear Turn Signal Bulb.

Is the inoperative bulb OK?

Yes

Go To 3.

No

Replace the Inoperative bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. **(L163) LEFT SIDEMARKER LAMP CONTROL CIRCUIT SHORT TO GROUND**

Disconnect the TIPM C4 harness connector.

Disconnect the Left Sidemarkers Lamp harness connector.

Measure the resistance between ground and the (L163) Left Sidemarkers Lamp Control circuit.

Is the resistance above 10k ohms?

Yes

Go To 4.

No

Repair the (L163) Left Sidemarkers Lamp Control circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

4. (L163) LEFT SIDEMARKER LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (L163) Left Sidemarker Lamp Control circuit.

Is there any voltage present?

Yes

Repair the (L163) Left Sidemarker Lamp Control circuit short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

B17C2-RIGHT SIDEMARKER LAMP CONTROL CIRCUIT HIGH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

- Set Condition:

When the Totally Integrated Power Module (TIPM) detects a HIGH condition.

Possible Causes

Possible Causes
(L162) RIGHT SIDEMARKER LAMP CONTROL CIRCUIT OPEN
(L162) RIGHT SIDEMARKER LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's

Turn the Right Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool display active: B17C2-RIGHT SIDEMARKER LAMP CONTROL CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. RIGHT REAR TURN SIGNAL BULB

Turn the ignition off.

Remove Right Rear Turn Signal Bulb.

Inspect the Right Rear Turn Signal Bulb.

Is the inoperative bulb OK?

Yes

Go To 3.

No

Replace the Inoperative bulb in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. (L162) RIGHT SIDEMARKER LAMP CONTROL CIRCUIT OPEN

Disconnect the TIPM C4 harness connector.

Disconnect the Right Sidemarker Lamp assembly harness connector.

Measure the resistance of the (L162) Right Sidemarkers Lamp Control circuit between the Right Sidemarkers Lamp assembly harness connector and the TIPM C4 harness connector.

Does the ohm meter read open circuit?

Yes

Repair the (L162) Right Sidemarkers Lamp Control circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. (L162) RIGHT SIDEMARKER LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (L162) Right Sidemarkers Lamp Control circuit.

Is there any voltage present?

Yes

Repair the (L162) Right Sidemarkers Lamp Control circuit short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

B17C4-RIGHT SIDEMARKER LAMP CONTROL CIRCUIT OVERCURRENT

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

- **Set Condition:**

When the Totally Integrated Power Module (TIPM) detects a OVERCURRENT condition.

Possible Causes

Lamps/lighting - Exterior - Service Information - Liberty

LAMPS/LIGHTING - EXTERIOR - SERVICE INFORMATION

DESCRIPTION

LAMPS/LIGHTING - EXTERIOR

Fig. 1: Exterior Lighting System
Courtesy of CHRYSLER LLC

The exterior lighting system for this vehicle includes the following exterior lamp units:

- **Center High Mounted Stop Lamp (2)** - A standard equipment Center High Mounted Stop Lamp (CHMSL) is centered on the upper liftgate header above the liftgate glass opening at the rear of the vehicle.
- **Front Lamp Units (1)** - A standard equipment front lamp unit is located at each outboard end of the grille assembly in the front end module.
- **Front Park/Turn Signal Lamps (7)** - Standard equipment front park/turn signal lamp units are mounted to each forward-facing end of the front fascia, adjacent to the front lamp units.
- **Front Side Marker Lamps (6)** - Standard equipment front side marker lamp units are mounted to each outboard-facing end of the front fascia on domestic market vehicles. On export market vehicles these lamps are replaced by a non-illuminated white reflector.
- **License Plate Lamps (3)** - Two standard equipment rear license plate lamp units are integral to the light bar assembly, just above the license plate tub formation in the outer liftgate panel.
- **Rear Lamp Units (4)** - A standard equipment rear lamp unit is mounted to the rear of each quarter panel on either side of the liftgate opening.
- **Repeater Lamps (5)** - A repeater lamp is mounted to each front fender just behind the front wheel opening on vehicles manufactured for export market vehicles where they are required.

These exterior lighting lamp units and their controls are combined to provide the following exterior lighting

features:

- **Backup Lamps** - The backup (or reverse) lamps include a clear bulb, reflector and clear lens that are integral to each rear lamp unit.
- **Brake Lamps** - The brake (or stop) lamps include a clear bulb, reflector and red lens that are integral to each rear lamp unit, and the red lens and multiple Light-Emitting Diode (LED) units of the CHMSL.
- **Daytime Running Lamps** - Vehicles manufactured for sale in Canada illuminate the high beam headlamp bulb in each front lamp unit at a reduced intensity to serve as the Daytime Running Lamps (DRL). United States fleet vehicles illuminate the low beam headlamp bulb in each front lamp unit to serve as DRL.
- **Exterior Lamp Fail-Safe Operation** - The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and the Totally Integrated Power Module (TIPM) provide a fail-safe feature which will automatically turn ON the low beam headlamps and all park lamps when the ignition switch is in the ON position and there is no detected input from the Steering Control Module (SCM), or when there is no communication over the Local Interface Network (LIN) or Controller Area Network (CAN) data buses.
- **Exterior Lamp Load Shedding** - The TIPM provides a battery saver feature which will automatically turn OFF all exterior lamps (except park lamps in certain markets) that remain ON with the ignition switch in the LOCK position after a timed interval of about eight minutes.
- **Front Fog Lamps** - The standard equipment front fog lamps include the clear bulb, adjustable reflector and clear lens integral to each front lamp unit.
- **Hazard Warning Lamps** - The hazard warning lamps include the bulbs, reflectors and lenses of each lamp in the right and left, front and rear turn signal circuits.
- **Headlamp Delay** - The standard equipment low or high beam headlamps remain illuminated for a customer-programmable delay period of 0 (disabled), 30, 60 or 90 seconds when the headlamps are turned OFF after the ignition switch has been turned to the OFF position.
- **Headlamps** - The headlamps include a single, dual filament halogen bulb, an adjustable reflector and a clear lens integral to each front lamp unit.
- **Headlamp Leveling** - Headlamp leveling is available only in certain markets where it is required equipment. A headlamp leveling actuator motor on each headlamp unit and a headlamp leveling switch integral to the switch pod in the instrument panel allow the headlamp beam pattern to be adjusted by the vehicle operator from the interior of the vehicle to compensate for passenger or cargo loads.
- **Optical Horn** - Also known as flash-to-pass, the beam selection function of the left (lighting) multi-function switch control stalk has a momentary intermediate position that allows the headlamp high beams to be flashed momentarily, without changing the headlamp beam selection.
- **Park Lamps** - The front park lamps include the amber bulbs, the reflectors and the clear lenses of the front park/turn signal lamp units as well as the clear bulbs and the amber lenses of the front side marker lamps or the clear position lamp bulb integral to each front lamp unit. The rear park lamps include a clear bulb, a reflector and a red lens integral to each rear lamp unit as well as the clear bulb and lens of the license plate lamp units.
- **Rear Fog Lamps** - Rear fog lamps are available only in certain markets where they are required equipment. The rear fog lamps include a clear bulb, a reflector and a red lens that are integral to each rear lamp unit.
- **Turn Signal Lamps** - The front turn signal lamps include an amber bulb, a reflector, and a clear lens that are integral to each front park/turn signal lamp unit and the front side marker lamps. In certain markets

where required, the repeater lamps on each front fender replace the front side marker lamps in the front turn signal circuits. The rear turn signal lamps include a clear bulb, a reflector and a red lens integral to each rear lamp unit for domestic market vehicles, or an amber bulb and a clear lens for export market vehicles.

Other components of the exterior lighting system for this vehicle include:

- **Backup Lamp Switch** - A plunger-type backup lamp switch is installed through the transmission housing of vehicles equipped with a manual transmission and is actuated by the shifter mechanism within the transmission when REVERSE gear is selected. On vehicles with an optional automatic transmission a stand-alone Transmission Range Sensor (TRS) performs the backup lamp switch function.
- **Brake Lamp Switch** - A plunger-type brake lamp switch is located on the brake pedal support bracket under the instrument panel and is actuated by the brake pedal arm when the brake pedal is depressed.
- **Clockspring** - The clockspring includes an integral turn signal cancel cam, which provides automatic turn signal cancellation as the steering wheel is rotated back to its centered position following a vehicle turning maneuver. The clockspring is located near the top of the steering column, directly beneath the steering wheel. Refer to **DESCRIPTION** .
- **Hazard Switch** - A latching push button-actuated hazard switch is integral to the switch pod located just below the heater and air conditioner controls in the center stack area of the instrument panel.
- **Headlamp Leveling Switch** - A four mode push button-actuated headlamp leveling switch is integral to the switch pod located just below the heater and air conditioner controls in the center stack area of the instrument panel of vehicles manufactured for certain markets where the headlamp leveling feature is required.
- **Instrument Cluster** - The ElectroMechanical Instrument Cluster (EMIC) is also known as the Cab Compartment Node (CCN) in this vehicle. The EMIC/CCN is located in the instrument panel above the steering column opening, directly in front of the driver. Refer to **DESCRIPTION** .
- **Instrument Panel Switch Pod** - The instrument panel switch pod contains the hazard switch and, on vehicles so equipped, the headlamp leveling switch. The switch pod is located just below the heater and air conditioner controls in the center stack area of the instrument panel. Refer to **DESCRIPTION** .
- **Left Multi-Function Switch** - The left (lighting) multi-function switch is located on the steering column, just below the steering wheel. A control stalk that extends from the left side of the switch is used to select the turn signal lamps (right or left) and to select the headlamp beam (low, high or optical horn). A control knob on the control stalk is used to select the park lamps, headlamps or fog lamps.
- **Park Brake Switch** - A park brake switch is located on the park brake lever mechanism on the floor panel transmission tunnel between the two front seats.
- **Steering Control Module** - The Steering Control Module (SCM) is located within the left multi-function switch housing on the top of the steering column, just below the steering wheel. Refer to **DESCRIPTION** .
- **Totally Integrated Power Module** - The Totally Integrated Power Module (TIPM) is located in the engine compartment, near the battery. Refer to **DESCRIPTION** .
- **Trailer Tow Wiring Adapter** - Vehicles equipped with a factory-installed trailer towing package have a wiring adapter provided that adapts the factory-installed heavy duty 7-way trailer tow connector to a conventional 4-way light duty connector.
- **Trailer Tow Connector** - Vehicles equipped with a factory-installed trailer towing package have a heavy duty 7-way trailer tow connector installed in a bracket on the trailer hitch receiver.

Hard wired circuitry connects the exterior lighting system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the exterior lighting components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

LAMPS/LIGHTING - EXTERIOR

Following are paragraphs that briefly describe the operation of each of the major exterior lighting systems. The lamps and the hard wired circuits between components related to the exterior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the exterior lighting system or the electronic controls or communication between modules and other devices that provide some features of the exterior lighting system. The most reliable, efficient, and accurate means to diagnose the exterior lighting system or the electronic controls and communication related to exterior lighting system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

BACKUP LAMPS

The backup (or reverse) lamps have a path to ground at all times through a takeout and eyelet terminal of the unibody wire harness that is secured by a nut to a ground stud on the body sheet metal within the passenger compartment. On vehicles with a manual transmission, the backup lamp switch provides a hard wired input to the Totally Integrated Power Module (TIPM) through a reverse switch signal circuit and the TIPM provides battery voltage to the backup lamps on the backup lamp feed circuit whenever the ignition switch is not in the LOCK position and the REVERSE position is selected with the transmission shift linkage.

On vehicles with an automatic transmission the Powertrain Control Module (PCM) or the Transmission Control Module (TCM) monitors a multiplex input from the Transmission Range Sensor (TRS), then sends the proper electronic **transmission gear selector status** messages to the TIPM over the Controller Area Network (CAN) data bus. Whenever the ignition switch is not in the LOCK position and the TIPM receives an electronic message indicating the status of the transmission gear selector is REVERSE, it provides a battery voltage output through a high side driver to the backup lamps on the backup lamp feed circuit.

BRAKE LAMPS

The brake (or stop) lamps and the Center High Mounted Stop Lamp (CHMSL) each have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is secured by a nut to a ground stud on the body sheet metal within the passenger compartment. The CHMSL receives battery voltage directly on the brake lamp switch output circuit when the brake lamp switch is closed by the brake pedal arm. The TIPM also

receives battery voltage on the brake lamp switch output circuit, which it uses as a logic input to energize the brake lamps. The TIPM provides battery voltage to the brake lamps through two high side drivers on the tail/stop lamp rear feed circuit when it receives the proper input from the closed brake lamp switch.

DAYTIME RUNNING LAMPS

Vehicles manufactured for sale in Canada illuminate the high beam filament of both headlamp bulbs at a reduced intensity when the engine is running, the parking brake is released, the headlamps are turned OFF, and the optional automatic transmission gear selector lever is in any position except PARK. The park lamps may be ON or OFF for DRL to operate. For vehicles with a manual transmission, the Daytime Running Lamps (DRL) will operate in any transmission gear selector lever position. In fleet vehicles manufactured for the U. S. and Mexican markets, DRL operates in the same manner, but the low beam filament of both headlamp bulbs is used rather than the high beam filament. The TIPM must be programmed appropriately for this feature to be enabled.

Once enabled, anytime the TIPM receives electronic messages over the CAN data bus from the Powertrain Control Module (PCM) indicating the engine is running, from the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) indicating the status of the left (lighting) multi-function switch is in any position except headlamps ON and the parking brake lever is released, and from the Powertrain Control Module (PCM) or the Transmission Control Module (TCM) indicating the automatic transmission gear selector lever is in any position except PARK, the TIPM provides a pulse width modulated voltage output to the headlamp high beam bulb filaments through high side drivers on the right and left high or low beam feed circuits to produce illumination at a reduced intensity.

FRONT FOG LAMPS

The front fog lamps have a path to ground at all times through their connection to the engine compartment wire harness. The engine compartment wire harness has takeouts with eyelet terminals that are secured by nuts to ground studs on the front end sheet metal within the engine compartment. The Steering Control Module (SCM) monitors a hard wired multiplex input from the left multi-function switch to determine whether the fog lamps are selected, then sends an electronic **front fog lamp switch status** message to the EMIC over the Local Interface Network (LIN) data bus and the EMIC relays an electronic **front fog lamp request** message to the TIPM over the CAN data bus.

When the TIPM receives a **front fog lamp request** message it then controls front fog lamp operation by controlling a battery voltage output through high side drivers on right and left fog lamp feed circuits. The TIPM also sends the appropriate electronic message back to the EMIC to illuminate or extinguish the front fog lamp indicator. In certain markets where required, the TIPM will automatically de-energize the front fog lamps any time the headlamp high beams are selected.

The TIPM also provides a battery saver (load shedding) feature for the front fog lamps, which will turn these lamps OFF if they are left ON for more than about eight minutes with the ignition switch in the LOCK position or if there is a charging system failure.

Each front fog lamp shares a reflector with the headlamp and is adjusted in concert with the headlamp for the same side of the vehicle.

HAZARD WARNING LAMPS

The hazard warning system includes the EMIC, the TIPM and the hazard switch in the switch pod located in the center stack area of the instrument panel, below the air conditioner and heater controls. The hazard switch provides a hard wired input to the TIPM. When the TIPM receives an input from the hazard switch it controls hazard warning system operation and flash rate by controlling battery voltage outputs through high side drivers on the right and left turn signal feed circuits.

The TIPM also sends the appropriate electronic messages back to the EMIC over the CAN data bus to control the illumination and flash rate of the right and left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the EMIC electronic circuit board that emulates the sound emitted by a conventional hazard warning flasher.

HEADLAMPS

The headlamp system includes the SCM, the EMIC, the TIPM, and the left (lighting) multi-function switch on the steering column. The headlamp bulbs have a path to ground at all times through their connection to the engine compartment wire harness. The engine compartment harness has takeouts with eyelet terminals that are secured by nuts to ground studs on the front end sheet metal within the engine compartment. The TIPM will store a Diagnostic Trouble Code (DTC) for any shorts or opens in the headlamp circuits.

The SCM monitors a hard wired multiplex input to determine the status of the left multi-function switch and whether the headlamp high or low beams are selected. The SCM then sends the appropriate electronic **headlamp switch** and **headlamp beam select switch status** messages to the EMIC over the LIN data bus. The EMIC then sends the appropriate electronic **headlamp request** and **headlamp beam request** messages to the TIPM over the CAN data bus. The TIPM responds to these messages by providing a pulse width modulated voltage output to the headlamps through high side drivers on the right and left low and high beam feed circuits to illuminate the selected headlamp filaments. The TIPM also sends the appropriate electronic messages to the EMIC to control the illumination of the high beam indicator. When the optical horn feature is selected, the low beams will shut OFF about 200 milliseconds after the high beams are activated.

The TIPM also remembers which beams (LOW or HIGH) were selected when the headlamps were last turned OFF, and energizes those beams again the next time the headlamps are turned ON. The TIPM provides a battery saver (load shedding) feature for the headlamps, which will turn these lamps OFF if they are left ON for more than about eight minutes with the ignition switch in the LOCK position. The SCM and the EMIC each provide a fail-safe feature for the headlamps, which will cause the TIPM to turn the low beam headlamps ON automatically if there is no input available from the left multi-function switch. The TIPM also provides a fail-safe feature for the headlamps that will turn the headlamps ON automatically whenever a loss of CAN bus communication is detected with the ignition switch in the ON position.

Each headlamp includes an integral reflector adjustment screw (domestic markets) or screws (export markets) to be used for static aiming of the headlamps and front fog lamps.

HEADLAMP DELAY

The headlamp delay feature includes the left (lighting) multi-function switch, the SCM, the EMIC and the TIPM. This feature has customer programmable delay intervals of 0 seconds (disabled), 30 seconds, 60 seconds and 90 seconds. If the left multi-function switch remains in the headlamp ON position until after the ignition switch is turned to the OFF position, then the headlamps will remain illuminated until after the selected delay interval has elapsed. The park lamps will not stay ON during the headlamp delay interval. The default delay

interval is zero seconds (disabled), but can be reprogrammed by the customer using the customer programmable features function of the EMIC.

HEADLAMP LEVELING

In certain markets where required, a headlamp leveling system is provided on the vehicle. The headlamp leveling system includes unique front headlamp units each connected to a headlamp leveling actuator motor, and a rocker-actuated headlamp leveling switch integral to the switch pod in the instrument panel center stack. The headlamp leveling system allows the headlamp beams to be adjusted to one of four vertical positions to compensate for changes in inclination caused by the loading of the vehicle suspension. The leveling motors are mechanically connected through an integral pushrod to the adjustable headlamp mounting collar.

Each time the headlamp leveling switch is depressed the circuitry of the switch pod provides an electronic **select status up** or **select status down** message input to the EMIC over the LIN data bus. The EMIC then sends the appropriate electronic **select request up** or **select request down** messages to the TIPM over the CAN data bus. The TIPM responds to these messages by providing a voltage output to the headlamp leveling motors through high side drivers on the headlamp leveling motor right and left signal circuits to move the headlamp reflectors to the selected position based upon the voltage input received from the TIPM. The TIPM also sends the appropriate electronic messages back to the EMIC and the EMIC relays the message back to the switch to control the illumination of the **1**, **2**, or **3** Light Emitting Diode (LED) selected position indicator in the leveling switch button. The EMIC and TIPM logic will only allow the headlamp leveling system to operate while the ignition switch is in the ON position and the exterior lighting is turned ON.

PARK LAMPS

The park lamps system includes the left (lighting) multi-function switch, the SCM, the EMIC and the TIPM. The front park/turn lamp and the position lamp bulbs each have a path to ground at all times through their connection to the engine compartment wire harness. The engine compartment wire harness has takeouts with eyelet terminals that are secured by nuts to ground studs on the front end sheet metal within the engine compartment. The rear lamp units and license plate lamp bulbs have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is secured by a nut to a ground stud on the body sheet metal within the passenger compartment.

The SCM monitors a hard wired multiplex input from the left multi-function switch, then sends the appropriate electronic **headlamp switch status** messages to the EMIC over the LIN data bus. Then the EMIC relays the appropriate electronic message to the TIPM over the CAN data bus. The TIPM responds to these messages by providing a battery voltage output to the appropriate lamp bulbs through high side drivers on the proper park/tail/license/running lamp right and left circuits. The TIPM and the SCM also send the appropriate electronic messages to the EMIC to control the illumination and lighting level of the panel lamps.

The TIPM provides a battery saver (load shedding) feature for the park lamps, which will turn these lamps OFF if they are left ON for more than about eight minutes with the ignition switch in the LOCK position. The SCM and the EMIC each provide a fail-safe feature for the park lamps, which will send an electronic message to the TIPM to turn these lamps ON automatically if there is no input available from the left multi-function switch. The TIPM also provides a fail-safe feature for the park lamps that will turn these lamps ON automatically whenever a loss of CAN bus communication is detected with the ignition switch in the ON position.

REAR FOG LAMPS

Rear fog lamps are installed on vehicles manufactured for all export markets. The rear fog lamp system includes the left (lighting) multi-function switch, the SCM, the EMIC and the TIPM. The rear fog lamp bulbs have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is secured by a nut to a ground stud on the body sheet metal within the passenger compartment.

The SCM monitors a hard wired multiplex input from the left multi-function switch to determine whether the rear fog lamps are selected, then sends electronic **rear fog lamp switch status** messages to the EMIC over the LIN data bus. Then the EMIC relays an electronic **rear fog lamp request** message to the TIPM over the CAN data bus. The TIPM responds to this message by providing a battery voltage output to the rear fog lamp bulbs through high side drivers on the fog lamp relay control rear circuit. The TIPM also sends the appropriate electronic message back to the EMIC to control the rear fog lamp indicator.

The TIPM will automatically energize and de-energize the front fog lamps in concert with the rear fog lamps. The TIPM also provides a battery saver (load shedding) feature for the rear fog lamps, which will turn these lamps OFF if they are left ON for more than about eight minutes with the ignition switch in the LOCK position.

TRAILER TOW WIRING

Domestic market vehicles equipped with an optional trailer tow package include a trailer tow take out of the body wire harness connected to a molded, seven-way trailer tow connector and an integral cover that are snapped into a bracket on the trailer hitch receiver platform.

TURN SIGNAL LAMPS

The turn signal lamps system includes the left (lighting) multi-function switch, the SCM, the EMIC and the TIPM. The front turn signal lamp bulbs each have a path to ground at all times through their connection to the engine compartment wire harness. The engine compartment wire harness has a takeout with an eyelet terminal that is secured by a nut to a ground stud on the body sheet metal within the engine compartment. The rear turn signal lamp bulbs have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is secured by a nut to a ground stud on the body sheet metal within the passenger compartment.

The SCM monitors a hard wired multiplex input from the left multi-function switch to determine the status of the turn signal switch, then sends the appropriate electronic **turn signal switch status** messages to the EMIC over the LIN data bus. Then the EMIC relays an electronic **turn signal request** message to the TIPM over the CAN data bus. The TIPM responds to these messages by controlling a battery voltage output and the flash rate for either the right or left turn signal lamps through high side drivers on the appropriate right or left turn signal feed circuits. The TIPM also sends the appropriate electronic messages back to the EMIC to control the illumination and flash rate of the right or left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the EMIC electronic circuit board that emulates the sound emitted by a conventional turn signal flasher.

The EMIC also provides a **turn signal ON warning** that will generate repetitive chimes to indicate that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle speed greater than 22 kilometers-per-hour (15 miles-per hour). Vehicles built for markets other than the United States and Canada have a revised distance threshold of 4 kilometers (2.49 miles) for this feature. The chime will continue until the turn signal input becomes inactive or until the vehicle speed message indicates that the speed is less than 22 kilometers-per-hour (15 miles-per-hour), whichever occurs first.

WARNING

LAMPS/LIGHTING - EXTERIOR

WARNING: To avoid serious or fatal injury eye protection should be used when servicing any glass components.

CAUTION: Do not contaminate the glass of halogen bulbs with fingerprints or allow contact with other possibly oily surfaces. Reduced bulb life will result.

CAUTION: Do not use bulbs with higher candle power than indicated in the **BULB APPLICATION TABLE**. See **SPECIFICATIONS**. In addition, do not use fuses, circuit breakers or relays having greater amperage value than indicated on the fuse panel or in the Owner's Manual. Damage to lamps, lenses, wiring and other related electrical components can result.

DIAGNOSIS AND TESTING

LAMPS/LIGHTING - EXTERIOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: When diagnosing the exterior lighting circuits, remember that high generator output can burn out bulbs rapidly and repeatedly; and, that dim or flickering bulbs can be caused by low generator output or poor battery condition. If one of these symptoms is a problem on the vehicle, be certain to diagnose the battery and charging system, then repair as necessary.

NOTE: A good ground is necessary for proper lighting operation. If a lighting problem is being diagnosed that involves multiple symptoms, systems, or components, the problem can often be traced to a loose, corroded, or open ground.

The lamps and the hard wired circuits between components related to the exterior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the exterior lighting system or the electronic controls or communication between modules and other devices that provide some features of the exterior lighting system. The most reliable, efficient, and accurate means to diagnose the exterior lighting system or the electronic controls and communication related to exterior lighting system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

BACKUP LAMPS

CONDITION	POSSIBLE CAUSES	CORRECTION
BACKUP LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb. 2. Ineffective ground circuit. 3. Ineffective feed circuit. 4. Ineffective switch. 5. Ineffective TIPM inputs or outputs.	1. Test and replace backup lamp bulb if required. 2. Test and repair open backup lamp ground circuit if required. 3. Test and repair open backup lamp feed circuit if required. 4. Test and replace backup lamp switch (manual transmission) or transmission range sensor (automatic transmission) if required. 5. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
BACKUP LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit. 2. Ineffective switch. 3. Ineffective TIPM inputs or outputs.	1. Test and repair shorted backup lamp feed circuit if required. 2. Test and replace backup lamp switch (manual transmission) or transmission range sensor (automatic transmission) if required. 3. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

BRAKE LAMPS

NOTE: The Center High Mounted Stop Lamp (CHMSL) is illuminated by several Light-Emitting Diode (LED) units that are soldered to the electronic circuit board within the lamp housing. The CHMSL is hard wired to the output of the brake lamp switch, while the brake lamps are powered by high side drivers within the TIPM based upon an input from the brake lamp switch. If the brake lamps and all of the LED units within the CHMSL fail to operate, diagnose and repair the brake lamps before attempting to repair the CHMSL. If the brake lamps operate but none of the CHMSL LED units illuminate, test and repair the CHMSL ground or feed circuit if required. If some of the CHMSL LED units operate and others do not, the CHMSL assembly must be replaced with a new unit.

CONDITION	POSSIBLE CAUSES	CORRECTION

BRAKE LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb. 2. Ineffective ground circuit. 3. Ineffective fuse. 4. Ineffective feed circuit. 5. Ineffective switch. 6. Ineffective TIPM inputs or outputs.	1. Test and replace brake lamp bulb if required. 2. Test and repair open brake lamp ground circuit if required. 3. Test and replace the fuse in the TIPM if required. 4. Test and repair open brake lamp switch output circuit or stop lamp output circuit if required. 5. Test and replace brake lamp switch if required. 6. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
BRAKE LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit. 2. Improperly adjusted switch. 3. Ineffective switch. 4. Ineffective TIPM inputs or outputs.	1. Test and repair shorted brake lamp switch output circuit or stop lamp output circuit if required. 2. Adjust the brake lamp switch if required. 3. Test and replace brake lamp switch if required. 4. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

DAYTIME RUNNING LAMPS

NOTE: Before performing the following tests, determine whether the headlamp low and high beams operate. If the headlamp low and high beams are also ineffective, diagnose and repair that problem before attempting to repair the Daytime Running Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
DAYTIME RUNNING LAMPS WILL NOT ILLUMINATE	1. Incorrect TIPM programming. 2. Automatic transmission in PARK position. 3. Parking brake applied. 4. Engine not running. 5. Ineffective TIPM inputs or outputs.	1. Use a diagnostic scan tool to check and configure TIPM if required. 2. Place the transmission gear selector lever in any position except PARK. 3. Release the parking brake. 4. Start the engine. 5. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

FRONT FOG LAMPS

NOTE: The front fog lamp switch is integral to the left multi-function switch/Steering Control Module (SCM), which communicates with the ElectroMechanical Instrument Cluster (EMIC)/Cab Compartment Node (CCN) over the Local Interface Network (LIN) data bus. Before performing any of the following tests, determine whether the other functions of the left multi-function switch/SCM are operational. If the other left multi-function switch/SCM functions are ineffective, diagnose and repair that problem before attempting to repair the Front Fog Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
FRONT FOG LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb. 2. Ineffective ground circuit. 3. Ineffective feed circuit. 4. Ineffective EMIC (CCN) inputs or outputs. 5. Ineffective TIPM inputs or outputs.	1. Test and replace front fog lamp bulb if required. 2. Test and repair open front fog lamp ground circuit if required. 3. Test and repair open front fog lamp feed circuit if required. 4. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information. 5. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
FRONT FOG LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit. 2. Ineffective EMIC (CCN) inputs or outputs. 3. Ineffective TIPM inputs or outputs.	1. Test and repair shorted front fog lamp feed circuit if required. 2. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information. 3. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

HAZARD WARNING LAMPS

NOTE: The hazard switch is integral to the instrument panel switch bank, which communicates with the EMIC/CCN over the LIN data bus. Before performing any of the following tests, confirm whether the left and right turn signals operate satisfactorily. Then determine whether the other functions of the instrument panel switch bank are operational. If the turn signals are ineffective or operate improperly, or if the other instrument panel switch bank functions are ineffective, diagnose and repair those problems before attempting to repair the Hazard Warning Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
HAZARD WARNING LAMPS DO NOT FLASH	1. Ineffective EMIC (CCN) inputs or outputs.	1. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information.

	2. Ineffective TIPM inputs or outputs.	2. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
HAZARD WARNING LAMPS DO NOT STOP FLASHING	1. Ineffective EMIC (CCN) inputs or outputs. 2. Ineffective TIPM inputs or outputs.	1. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information. 2. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

HEADLAMPS

NOTE: As part of the exterior lighting failsafe feature, upon ignition ON, all exterior park lamps and the headlamp low beams will illuminate regardless of the left multi-function switch control knob position if the SCM cannot detect an input from the left multi-function switch, or if there is a loss of communication between the left multi-function switch/SCM and the EMIC or between the EMIC and the TIPM. Diagnose and repair those problems before attempting to repair the Headlamps. In addition, the TIPM will store a Diagnostic Trouble Code (DTC) for an open or shorted headlamp circuit.

CONDITION	POSSIBLE CAUSES	CORRECTION
HEADLAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb. 2. Ineffective ground circuit. 3. Ineffective feed circuit. 4. Ineffective EMIC (CCN) inputs or outputs. 5. Ineffective TIPM inputs or outputs.	1. Test and replace headlamp bulb if required. 2. Test and repair open headlamp ground circuit if required. 3. Test and repair open headlamp low beam or high beam feed circuit if required. 4. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information. 5. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
HEADLAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit. 2. Ineffective EMIC (CCN) inputs or outputs. 3. Ineffective TIPM inputs or outputs.	1. Test and repair shorted headlamp low beam or high beam feed circuit if required. 2. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information. 3. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
HEADLAMPS ILLUMINATE WITH IGNITION ON AND	1. Loss of LIN or CAN data bus communication.	1. Test and repair the LIN or CAN data bus if required. Refer to the appropriate

HEADLAMP SWITCH OFF (FAIL-SAFE OPERATION)		diagnostic information.
HEADLAMPS WILL NOT SWITCH FROM HIGH TO LOW BEAMS, OR FROM LOW TO HIGH BEAMS	1. Ineffective EMIC (CCN) inputs or outputs. 2. Ineffective TIPM inputs or outputs.	1. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information. 2. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

HEADLAMP LEVELING

NOTE: **The headlamp leveling switch is integral to the instrument panel switch bank, which communicates with the EMIC/CCN over the LIN data bus. Before performing any of the following tests, confirm whether the park lamps operate satisfactorily. Then determine whether the other functions of the instrument panel switch bank are operational. If the park lamps are ineffective or operate improperly, or if the other instrument panel switch bank functions are ineffective, diagnose and repair those problems before attempting to repair the Headlamp Leveling function.**

CONDITION	POSSIBLE CAUSES	CORRECTION
ONE LEVELING MOTOR IS INEFFECTIVE	1. Ineffective ground circuit. 2. Ineffective feed circuit. 3. Ineffective signal circuit. 4. Ineffective motor.	1. Test and repair open leveling motor ground circuit if required. 2. Test and repair open leveling motor feed circuit if required. 3. Test and repair open headlamp leveling motor signal circuit if required. 4. Test and replace headlamp leveling motor if required.
BOTH LEVELING MOTORS ARE INEFFECTIVE	1. Ineffective EMIC (CCN) inputs or outputs. 2. Ineffective motor ground circuit. 3. Ineffective motor feed circuit. 4. Ineffective signal circuit. 5. Ineffective TIPM inputs or outputs. 6. Ineffective motors.	1. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information. 2. Test and repair open leveling motor ground circuit if required. 3. Test and repair open leveling motor feed circuit if required. 4. Test and repair open or shorted headlamp leveling motor signal circuit if required. 5. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information. 6. Test and replace leveling motors if required.

PARK LAMPS

NOTE: As part of the exterior lighting failsafe feature, upon ignition ON, all exterior park lamps and the headlamp low beams will illuminate regardless of the left multi-function switch control knob position if the SCM cannot detect an input from the left multi-function switch, or if there is a loss of communication between the left multi-function switch/SCM and the EMIC or between the EMIC and the TIPM. Diagnose and repair those problems before attempting to repair the Park Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
PARK LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb. 2. Ineffective ground circuit. 3. Ineffective feed circuit. 4. Ineffective EMIC (CCN) inputs or outputs. 5. Ineffective TIPM inputs or outputs.	1. Test and replace park lamp bulb if required. 2. Test and repair open park lamp ground circuit if required. 3. Test and repair open park lamp feed circuit if required. 4. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information. 5. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
PARK LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit. 2. Ineffective EMIC (CCN) inputs or outputs. 3. Ineffective TIPM inputs or outputs.	1. Test and repair shorted park lamp feed circuit if required. 2. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information. 3. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

REAR FOG LAMPS

NOTE: The rear fog lamp switch is integral to the left multi-function switch/SCM, which communicates with the EMIC/CCN over the LIN data bus. Before performing any of the following tests, determine whether the other functions of the left multi-function switch/SCM are operational. If the other left multi-function switch/SCM functions are ineffective, diagnose and repair that problem before attempting to repair the Rear Fog Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
REAR FOG LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb. 2. Ineffective ground circuit. 3. Ineffective feed circuit.	1. Test and replace rear fog lamp bulb if required. 2. Test and repair open rear fog lamp ground circuit if required. 3. Test and repair open fog lamp relay

	4. Ineffective EMIC (CCN) inputs or outputs. 5. Incorrect TIPM configuration. 6. Ineffective TIPM inputs or outputs.	control rear circuit if required. 4. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information. 5. Use a diagnostic scan tool to check and correct the TIPM configuration settings if required. Refer to the appropriate diagnostic information. 6. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
REAR FOG LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit. 2. Ineffective EMIC (CCN) inputs or outputs. 3. Ineffective TIPM inputs or outputs.	1. Test and repair shorted fog lamp relay control rear circuit if required. 2. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information. 3. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

TURN SIGNAL LAMPS

NOTE: The turn signal switch is integral to the left multi-function switch/SCM, which communicates with the EMIC/CCN over the LIN data bus. Before performing any of the following tests, determine whether the other functions of the left multi-function switch/SCM are operational. If the other left multi-function switch/SCM functions are ineffective, diagnose and repair that problem before attempting to repair the Turn Signal Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
ONE TURN SIGNAL LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb. 2. Ineffective ground circuit. 3. Ineffective feed circuit. 4. Ineffective TIPM inputs or outputs.	1. Test and replace turn signal bulb if required. 2. Test and repair open ground circuit if required. 3. Test and repair open right or left turn signal feed circuit if required. 4. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.
ALL RIGHT SIDE OR ALL LEFT SIDE TURN SIGNAL LAMPS (OR BOTH SIDES) DO NOT FLASH	1. Ineffective feed circuit. 2. Ineffective EMIC (CCN) inputs or outputs. 3. Ineffective TIPM inputs or outputs.	1. Test and repair open right or left turn signal feed circuit if required. 2. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information. 3. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the

		appropriate diagnostic information.
ALL RIGHT SIDE OR ALL LEFT SIDE TURN SIGNALS FLASH TOO RAPIDLY (MORE THAN 100 FLASHES PER MINUTE)	1. Ineffective or missing bulb. 2. Ineffective ground circuit. 3. Ineffective feed circuit.	1. Test and replace turn signal bulb if required. 2. Test and repair open bulb ground circuit if required. 3. Test and repair open right or left turn signal feed circuit if required.
TURN SIGNALS DO NOT AUTOMATICALLY CANCEL -	1. Ineffective cancel cam. 2. Ineffective cancel actuator.	1. Inspect and replace the turn signal cancel cam (clockspring) if required. 2. Inspect and replace the turn signal cancel actuator (left multi-function switch) if required.

STANDARD PROCEDURE

FRONT LAMP AIMING

VEHICLE PREPARATION FOR LAMP ALIGNMENT

1. Check for and correct any burnt out bulbs.
2. If the vehicle is equipped with headlamp leveling, be certain that the headlamp leveling switch is in the **0** position.
3. Repair or replace any ineffective, worn or damaged body or suspension components that could hinder proper lamp alignment.
4. Verify proper tire inflation pressures.
5. Remove any accumulations of mud, snow or ice from the vehicle underbody and clean the front lamp lenses.
6. Verify that there is no load in the vehicle (cargo or passengers), except for the driver.
7. The fuel tank should be FULL. Add 2.94 kilograms (6.5 pounds) of weight over the fuel tank for each estimated gallon of missing fuel.
8. Verify correct vehicle suspension height.

LAMP ALIGNMENT SCREEN PREPARATION

81a55e35

Fig. 2: Lamp Alignment Screen Preparation
Courtesy of CHRYSLER LLC

The procedure that follows will prepare a suitable front lamp alignment screen.

1. Tape a line on a level floor 7.62 meters (25 feet) away from and parallel to the flat wall that will be used as the lamp alignment screen. The level floor will be used as the horizontal zero reference.
2. An adjacent wall or floor member that is perpendicular to the alignment screen can be used as the vertical zero reference. If there is no adjacent wall or floor member that is perpendicular to the screen, tape a second line on the floor perpendicular to both the alignment screen and the first line, and outboard of either side of where the vehicle will be positioned. This will be used as the vertical zero reference.
3. Position the vehicle so that the side of the vehicle is parallel to the vertical zero reference, and so that the front of the lamp lenses are in the vertical plane of the parallel line taped on the floor 7.62 meters (25 feet) away from the screen.
4. Rock the vehicle side-to-side three times to allow the suspension to stabilize.
5. Jounce the front suspension three times by pushing downward on the front bumper and releasing.
6. Measure the distance between the optical center of one of the lamps being aimed (head or fog) and the floor (horizontal zero reference). Transfer this measurement to the alignment screen with a piece of tape placed horizontally to the floor. This line will be used as the lamp horizontal reference.
7. Measure the distance between the vertical zero reference and the optical center of the nearest lamp being

aimed (head or fog). Transfer this measurement to the alignment screen with a piece of tape placed vertically across the appropriate (head or fog) lamp horizontal reference. This is the centerline reference for the first lamp.

8. Measure the distance on center between the first and the second lamp being aimed. Transfer this measurement to the alignment screen with a second piece of tape placed vertically across the appropriate (head or fog) lamp horizontal reference. This is the centerline reference for the second lamp.

HEADLAMP ALIGNMENT

NOTE: Due to the linear nature of the headlamp cutoff, a properly aimed low beam headlamp will project the top edge of the high intensity pattern on the alignment screen from the horizontal line to 50 millimeters (2 inches) below the horizontal line for domestic market vehicles, or to 125 millimeters (5 inches) below the horizontal line for export market vehicles. No horizontal (right/left) adjustment is required for this headlamp beam pattern in domestic market vehicles. Export market vehicles have a second horizontal (right/left) adjustment screw provided. The high beam pattern will be correct when the low beams are properly aimed.

Fig. 3: Headlamp Vertical Adjustment Screw
Courtesy of CHRYSLER LLC

1. Turn the headlamps ON and select the LOW beams for vehicles in all markets.
2. On all vehicles except those with headlamp leveling, use a screwdriver to rotate the headlamp vertical adjustment screw (2) on the back of the front lamp unit just inboard of the fender and forward of the upper radiator crossmember (1) to adjust the beam height as required.
3. For export markets only, use a screwdriver to rotate the headlamp horizontal adjustment screw on each headlamp to adjust the beam right or left as required.

FOG LAMP ALIGNMENT

NOTE: Each front fog lamp shares a common reflector with the headlamp for that side

of the vehicle and is automatically adjusted correctly when the headlamp is properly adjusted.

SWITCH-BACKUP LAMP

DESCRIPTION

BACKUP LAMP SWITCH

80c936e1

Fig. 4: Identifying Backup Lamp Switch
Courtesy of CHRYSLER LLC

Vehicles equipped with a manual transmission (1) have a normally open, spring-loaded plunger type backup lamp switch (2). Vehicles with an optional electronic automatic transmission have a Transmission Range Sensor (TRS) that is used to perform several functions, including that of the backup lamp switch. The TRS is described in further detail elsewhere in this service information. Refer to the service and diagnostic information for the automatic transmission type installed in the vehicle.

The backup lamp switch is located in a threaded hole on the side of the manual transmission housing. The switch has a threaded body and a hex formation near the plunger end of the switch. An integral connector receptacle at the end of the switch opposite the plunger connects the switch to the vehicle electrical system through a take out and connector of the engine wire harness. When installed, only the switch connector and the

hex formation are visible on the outside of the transmission housing.

The backup lamp switch cannot be adjusted or repaired and, if ineffective or damaged, the entire switch unit must be replaced.

OPERATION

BACKUP LAMP SWITCH

The backup lamp switch controls a path to ground for the Totally Integrated Power Module (TIPM) on the reverse switch signal circuit. The TIPM reads this input through an internal pull-up, then controls an output through a high side driver that regulates the flow of battery voltage to the backup lamp bulbs as appropriate on the backup lamp feed circuit. The switch plunger is mechanically actuated by the gearshift mechanism within the transmission, which will depress the switch plunger and close the switch contacts whenever the REVERSE gear has been selected. The switch receives ground at all times through a take out and eyelet terminal of the engine wire harness that is secured by a nut to a ground stud on the body sheet metal within the engine compartment of the vehicle.

The backup lamp switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

BACKUP LAMP SWITCH

1. Disconnect and isolate the battery negative cable.
2. Raise and support the vehicle.
3. Locate and disconnect the engine wire harness connector from the backup lamp switch connector receptacle.
4. Check for continuity between the two terminal pins in the backup lamp switch connector receptacle.
 - With the gear selector lever in the REVERSE position, there should be continuity.
 - With the gear selector lever in any position other than REVERSE, there should be no continuity.
5. If the switch fails either of these two continuity tests, replace the ineffective backup lamp switch.

BRAKE LAMP SWITCH

DESCRIPTION

BRAKE LAMP SWITCH

80c92641

Fig. 5: Brake Lamp Switch
Courtesy of CHRYSLER LLC

The brake lamp switch (2) is a three circuit, spring-loaded plunger actuated switch that is secured to the steering column support bracket under the instrument panel on the driver side of the vehicle. The molded plastic switch housing has an integral connector receptacle (1) containing six terminal pins and featuring a Connector Position Assurance (CPA) lock. The switch is connected to the vehicle electrical system through a dedicated take out of the instrument panel wire harness.

The switch plunger (3) extends through a mounting collar (4) on one end of the switch housing. The plunger has a one time telescoping self-adjustment feature that is activated after the switch is installed by moving an adjustment release lever (5) on the opposite end of the switch housing clockwise, until it locks into a position that is parallel to the connector receptacle.

An installed brake lamp switch cannot be readjusted or repaired. If the switch is damaged, ineffective, or removed from its mounting position for any reason, it must be replaced with a new unit.

OPERATION

BRAKE LAMP SWITCH

The brake lamp switch controls three independent circuits. These circuits are described as follows:

- **Brake Lamp Switch Circuit** - A normally open brake lamp switch circuit receives a battery voltage input, and supplies this battery voltage to the brake lamps and the Controller Antilock Brake (CAB) on a brake lamp switch output circuit only when the brake pedal is depressed (brake lamp switch plunger released).
- **Brake Lamp Switch Signal Circuit** - A normally closed brake lamp switch signal circuit receives a direct path to ground, and supplies this ground input to the Powertrain Control Module (PCM) on a brake lamp switch sense circuit only when the brake pedal is released (brake lamp switch plunger is depressed).
- **Speed Control Circuit** - A normally closed speed control circuit receives a battery voltage input from the PCM on a speed control supply circuit, and supplies this battery voltage to the speed control servo solenoids (dump, vacuum, and vent) on a speed control brake switch output circuit only when the speed control system is turned ON and the brake pedal is released (brake lamp switch plunger is depressed).

The components of the self-adjusting brake switch plunger consist of a two-piece telescoping plunger, a split plunger locking collar, and a release wedge. The release lever has a shaft with a wedge that spreads the plunger locking collar to an open or released position. After the switch is installed and the brake pedal is released, the plunger telescopes to the correct adjustment position. When the release lever is moved to the release position, the wedge is disengaged from the locking collar causing the collar to apply a clamping pressure to the two plunger halves, fixing the plunger length.

The brake lamp switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

BRAKE LAMP SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

CAUTION: Do not remove the brake lamp switch from the mounting bracket. The self-adjusting switch plunger is a one time only feature. If the switch is removed from the mounting bracket, it **MUST** be replaced with a new switch.

80bce8e6

Fig. 6: Brake Lamp Switch Terminal Identification

Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Disconnect the wire harness connector from the brake lamp switch.
3. Using an ohmmeter, perform the continuity tests at the terminal pins (1) in the brake lamp switch connector receptacle as shown in the BRAKE LAMP SWITCH TESTS table.

BRAKE LAMP SWITCH TESTS	
PLUNGER POSITION (2)	CONTINUITY BETWEEN (1)
Released (Extended)	Pins 1 and 2
Compressed (Depressed)	Pins 3 and 4, 5 and 6

4. If the switch fails any of the continuity tests, replace the ineffective brake lamp switch as required.

REMOVAL

BRAKE LAMP SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable

the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

CAUTION: The brake lamp switch self-adjusting switch plunger is a one time only feature. If the switch is removed from the mounting bracket, it **MUST** be replaced with a new switch.

80c922a2

Fig. 7: Removing/Installing Brake Lamp Switch
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the steering column opening cover from the instrument panel. Refer to **REMOVAL**.
3. Locate the brake lamp switch (4) near the support bracket (1) on the lower steering column.
4. Disconnect the wire harness connector (2) from the brake lamp switch.
5. Rotate the brake lamp switch housing counterclockwise about 30 degrees to align the tabs on the switch

locking collar with the keyed mounting hole in the switch mounting bracket.

6. Pull the switch straight back from the keyed hole to remove it from the bracket.
7. Discard the removed brake lamp switch.

INSTALLATION

BRAKE LAMP SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

CAUTION: The brake lamp switch self-adjusting switch plunger is a one time only feature. If the switch is removed from the mounting bracket, it **MUST** be replaced with a new switch.

Fig. 8: Removing/Installing Brake Lamp Switch
Courtesy of CHRYSLER LLC

1. Depress and hold the brake pedal (5) in the depressed position.
2. Align the tabs on the brake lamp switch (4) locking collar with the keyed hole in the switch mounting bracket.
3. Insert the tabs on the brake lamp switch locking collar through the keyed hole in the switch mounting bracket until the switch housing is firmly seated against the bracket.
4. Rotate the switch clockwise about 30 degrees to engage the tabs on the locking collar with the switch mounting bracket.
5. Release the brake pedal.

CAUTION: Do not release or pull up on the brake pedal before the switch plunger adjustment has been completed.

6. Release the brake pedal, but do not pull it upward.
7. Rotate the plunger adjustment release lever (3) clockwise until it locks into place. The lever should be parallel to the brake lamp switch connector receptacle. This action will set the switch plunger length to a final adjustment position and cannot be undone. If not performed properly the first time, a new brake lamp switch **must** be installed.
8. Reconnect the wire harness connector (2) to the brake lamp switch.
9. Reinstall the steering column opening cover onto the instrument panel. Refer to **INSTALLATION**.
10. Reconnect the battery negative cable.

LAMP-HIGH MOUNTED STOP

Fig. 9: Identifying Liftgate Outer Panel, Screws, Washer Supply Hose, Plastic Nuts, Liftgate Wire

Harness Connector & Center High Mounted Stop Lamp (CHMSL)

Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the two screws (2) that secure the Center High Mounted Stop Lamp (CHMSL) (6) to the upper header of the liftgate outer panel (1).
3. Pull the CHMSL down and away from the liftgate far enough to access and disconnect the washer supply hose (3) from the barbed nipple of the rear washer nozzle at the back of the lamp housing.
4. Disconnect the liftgate wire harness connector (5) from the back of the lamp housing.
5. Remove the CHMSL from the liftgate.

INSTALLATION

CENTER HIGH MOUNTED STOP LAMP

Fig. 10: Identifying Liftgate Outer Panel, Screws, Washer Supply Hose, Plastic Nuts, Liftgate Wire Harness Connector & Center High Mounted Stop Lamp (CHMSL)

Courtesy of CHRYSLER LLC

1. Check to be certain that the two plastic nuts (4) are properly installed and in good condition on each side of the Center High Mounted Stop Lamp (CHMSL) (6) opening in the upper header of the liftgate outer panel (1).
2. Position the CHMSL near the liftgate opening.
3. Reconnect the liftgate wire harness connector (5) to the back of the lamp housing.
4. Reconnect the washer supply hose (3) to the barbed nipple of the rear washer nozzle at the back of the lamp housing.
5. Position the CHMSL into the liftgate opening with the lower edge slightly away from the liftgate.
6. Move the CHMSL left-to-right to align the temporary locator on the back of the CHMSL with the locator notch in the liftgate opening.
7. Slide the CHMSL slightly upward then rock the lower edge into the opening so that the retention feature holds the CHMSL to the liftgate without fasteners.

8. Install and tighten the right side screw (2) that secures the CHMSL to the liftgate, followed by the left side screw. Tighten the screws to 2.5 N.m (20 in. lbs.).
9. Reconnect the battery negative cable.

FRONT LAMP UNIT

STANDARD PROCEDURE

FRONT LAMP MOISTURE CLEARING

Some occasional moisture accumulation inside a vented front lamp unit is normal and appears as a fogging on the inside of the lamp lens, similar to the fog that sometimes appears on the inside of a windshield. This condition is caused by rapidly changing temperature and humidity levels between the air internal and external to the lamp, and will usually dissipate once the temperature and humidity conditions have been allowed to stabilize. Accelerated removal of such moisture may be accomplished by activating the headlamps on HIGH beam for about 15 minutes.

However, water droplets larger than 1 millimeter (0.039 inch) in size accumulated on the inside of the lamp lens, water droplets visible on most internal lamp surfaces or large quantities of water within the lamp indicates a problem with the lamp sealing that has allowed excessive amounts of water to enter the lamp. Once such excessive moisture has entered the lamp, it will always be present and will never disappear. A lamp with permanent internal moisture should be replaced.

REMOVAL

FRONT FOG LAMP BULB

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

Fig. 11: Front Lamp Unit Housing
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Disconnect the wire harness connector from the connector receptacle integral to the front fog lamp bulb (3) on the back of the front lamp unit housing (1) located on the back of the front end module carrier.
3. Firmly grasp the bulb base and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the bulb and base straight out from the keyed opening in the housing.

FRONT LAMP UNIT

Fig. 12: Front Lamp Unit
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the grille from the front of the vehicle. Refer to **REMOVAL** .
3. Remove the four screws (2) that secure the front lamp unit (1) to the front end module carrier.
4. Pull the front lamp unit away from the front end module far enough to access and disconnect the wire harness connections on the back of the lamp housing.
5. Remove the front lamp unit from the vehicle.

HEADLAMP BULB - DOMESTIC

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

Fig. 13: Front Lamp Unit Housing
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Disconnect the wire harness connector from the connector receptacle integral to the headlamp bulb (2) on the back of the front lamp unit housing (1) located on the back of the front end module carrier.
3. Firmly grasp the bulb base and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the bulb and base straight out from the keyed opening in the reflector.

HEADLAMP BULB - EXPORT

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

Fig. 14: Front Lamp Unit Housing
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Disconnect the wire harness connector from the headlamp bulb base (3) on the back of the front lamp unit housing (1) located on the back of the front end module carrier.
3. Remove the rubber boot seal (5) from the back of the front lamp unit housing and the headlamp bulb base.
4. Pinch the two ends of the wire bulb retainer together and disengage them from the hooks that secure them to the bulb flange on the reflector.
5. Pivot the wire retainer up off of the flange of the headlamp bulb base and out of the way.
6. Pull the bulb straight out of the keyed opening in the headlamp reflector.

POSITION LAMP BULB

NOTE: The following procedure applies only to vehicles manufactured for export markets. Vehicles manufactured for domestic markets do not have a position lamp bulb, socket or wiring provided in the front lamp unit.

Fig. 15: Front Lamp Unit Housing
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Disconnect the wire harness connector from the connector receptacle integral to the position lamp bulb socket (2) on the back of the front lamp unit housing (1) located on the back of the front end module carrier.
3. Firmly grasp the position lamp bulb socket on the back of the housing and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the socket and bulb straight out from the keyed opening in the housing.
5. Pull the base of the bulb straight out of the socket.

INSTALLATION

FRONT FOG LAMP BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

Fig. 16: Front Lamp Unit Housing
Courtesy of CHRYSLER LLC

1. Align the front fog lamp bulb and base (2) with the keyed opening on the back of the front lamp unit housing (1) located on the back of the front end module carrier.
2. Insert the bulb into the housing until the base is firmly seated.
3. Rotate the bulb base clockwise about 30 degrees to lock it into place. The bulb connector receptacle should be pointed straight downward.
4. Reconnect the wire harness connector to the connector receptacle integral to the front fog lamp bulb base.
5. Reconnect the battery negative cable.

FRONT LAMP UNIT

Fig. 17: Front Lamp Unit
Courtesy of CHRYSLER LLC

1. Position the front lamp unit (1) close enough to the front of the vehicle to reconnect the wire harness connections to the back of the lamp.
2. Position the lamp to the front end module carrier.
3. Install and tighten the four screws (2) that secure the front lamp unit to the front end module carrier. Tighten the screws securely.
4. Reinstall the grille onto the front of the vehicle. Refer to **INSTALLATION** .
5. Reconnect the battery negative cable.
6. Confirm proper headlamp alignment. See **STANDARD PROCEDURE**.

HEADLAMP BULB - DOMESTIC

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

Fig. 18: Front Lamp Unit Housing
Courtesy of CHRYSLER LLC

1. Align the headlamp bulb and base (2) with the keyed opening on the back of the front lamp unit (1) reflector located on the back of the front end module carrier.
2. Insert the bulb into the reflector until the base is firmly seated.
3. Rotate the bulb base clockwise about 30 degrees to lock it into place.
4. Reconnect the wire harness connector to the connector receptacle integral to the headlamp bulb base.
5. Reconnect the battery negative cable.

HEADLAMP BULB - EXPORT

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

Fig. 19: Front Lamp Unit Housing
Courtesy of CHRYSLER LLC

1. Align the headlamp bulb and base (3) with the keyed opening in the reflector on the back of the front lamp unit housing (1) located on the back of the front end module carrier.
2. Insert the bulb into the reflector until the base is fully seated, then pivot the wire bulb retainer back over the bulb flange.
3. Pinch the two ends of the wire bulb retainer together and engage them under the hooks to secure them to the bulb flange of the reflector.
4. Position the center opening of the rubber boot seal (5) over the base of the headlamp bulb and push it fully over the bulb base.
5. Position the outer circumference of the boot seal over the flange on the back of the front lamp unit housing and pull it over the housing flange until the seal is fully engaged.
6. Reconnect the wire harness connector to the headlamp bulb base on the back of the front lamp unit housing.
7. Reconnect the battery negative cable.

POSITION LAMP BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

NOTE: The following procedure applies only to vehicles manufactured for export markets. Vehicles manufactured for domestic markets do not have a position lamp bulb, socket or wiring provided in the front lamp unit.

Fig. 20: Front Lamp Unit Housing
Courtesy of CHRYSLER LLC

1. Align the base of the bulb with the position lamp bulb socket (2).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening on the back of the front lamp unit housing (1) located on the back of the front end module carrier.
4. Insert the socket and bulb straight into the housing until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place.
6. Reconnect the wire harness connector to the connector receptacle integral to the position lamp bulb socket.
7. Reconnect the battery negative cable.

FRONT SIDE MARKER LAMP

REMOVAL

FRONT SIDE MARKER BULB

NOTE: The following procedure applies only to vehicles manufactured for domestic markets. Vehicles manufactured for export markets do not have a bulb, socket or wiring provided to illuminate the front side marker compartment of the front lamp unit. The front side marker for export vehicles is replaced by a white reflector.

Fig. 21: Front Side Marker Lamp Housing
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Partially remove the liner from the front of the front fender wheel house. Refer to **REMOVAL** .
3. Disconnect the wire harness connector (3) from the connector receptacle integral to the bulb socket (2) on the back of the front side marker lamp housing (1) located on the inside of the outboard-facing end of the front fascia (4).
4. Firmly grasp the bulb socket on the back of the lamp housing and rotate it counterclockwise about 30 degrees to unlock it.
5. Pull the socket and bulb straight out from the keyed opening in the lamp housing.
6. Pull the base of the bulb straight out of the socket.

FRONT SIDE MARKER LAMP

NOTE: **The following procedure applies only to vehicles manufactured for domestic markets. Vehicles manufactured for export markets do not have a bulb, socket or wiring provided to illuminate the front side marker compartment of the front lamp unit. The front side marker for export vehicles is replaced by a white reflector.**

Fig. 22: Lamp Housing
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Partially remove the liner from the front of the front fender wheel house. Refer to **REMOVAL** .
3. Disconnect the wire harness connector from the connector receptacle integral to the bulb socket on the back of the front side marker lamp housing (1) located on the inside of the outboard-facing end of the front fascia (2).
4. Remove the nut (3) that secures the stud near the bottom of the lamp housing to the inside surface of the front fascia.
5. Disengage the lower edge of the lamp from the outer surface of the front fascia, then pull it slightly downward to disengage the tab at the top of the housing from the notch in the fascia.

INSTALLATION

FRONT SIDE MARKER BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

NOTE: The following procedure applies only to vehicles manufactured for domestic markets. Vehicles manufactured for export markets do not have a bulb, socket or wiring provided to illuminate the front side marker compartment of the front lamp unit. The front side marker for export vehicles is replaced by a white reflector.

Fig. 23: Front Side Marker Lamp Housing
 Courtesy of CHRYSLER LLC

1. Align the base of the bulb with the front side marker bulb socket (2).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening on the back of the front side marker lamp housing (1) located on the inside of the outboard-facing end of the front fascia (4).
4. Insert the socket and bulb into the housing until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place. The connector receptacle integral to the bulb socket should be pointed downward.
6. Reconnect the wire harness connector (3) to the connector receptacle integral to the bulb socket.
7. Reinstall the liner to the front of the front fender wheel house. Refer to **INSTALLATION** .
8. Reconnect the battery negative cable.

FRONT SIDE MARKER LAMP

NOTE: The following procedure applies only to vehicles manufactured for domestic markets. Vehicles manufactured for export markets do not have a bulb, socket or wiring provided to illuminate the front side marker compartment of the front lamp unit. The front side marker for export vehicles is replaced by a white reflector.

Fig. 24: Lamp Housing
Courtesy of CHRYSLER LLC

1. From the outer surface of the front fascia engage the tab at the top of the front side marker lamp housing into the notch of the outboard-facing end of the fascia, then insert the stud on the bottom of the housing into the mounting hole.
2. Install and tighten the nut (3) that secures the stud near the bottom of the lamp housing (1) to the inside surface of the front fascia (2). Tighten the nut securely.
3. Reconnect the wire harness connector (3) to the connector receptacle integral to the bulb socket.
4. Reinstall the liner to the front of the front fender wheel house. Refer to **INSTALLATION** .
5. Reconnect the battery negative cable.

HAZARD SWITCH

DESCRIPTION

HAZARD SWITCH

Fig. 25: Identifying Occupant Classification System Switches & Indicators
Courtesy of CHRYSLER LLC

The hazard switch (3) is integral to the instrument panel switch pod (1), which is secured to the instrument panel center bezel just below the heater and air conditioner controls. A red, stencil-like International Control and Display Symbol icon for **Hazard Warning** identifies the hazard switch button. The remainder of the hazard switch circuitry is concealed within the instrument panel switch pod.

The hazard switch button has panel lamps dimmer controlled illumination for night visibility. The switch button latches to a slightly lowered position when the hazard warning system is activated and the icon on the switch button will illuminate at an increased intensity while the turn signals and turn signal indicators are flashing. The switch button unlatches to a position flush with the other push buttons in the switch pod when the hazard warning is deactivated.

All of the circuitry and components of the hazard switch are contained within a molded black plastic instrument panel switch pod housing. A single connector receptacle is integral to the back of the switch pod housing. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The hazard switch cannot be adjusted or repaired and, if ineffective or damaged, the entire instrument panel switch pod unit must be replaced. Refer to **REMOVAL** .

OPERATION

HAZARD SWITCH

The status of the hazard switch is continually monitored by the circuitry within the instrument panel switch pod. The switch pod receives battery voltage at all times on a fused battery feed circuit, and a path to ground at all times through the instrument panel wire harness. The only other inputs to the switch pod consists of electronic communication with the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over the single wire Local Interface Network (LIN) data bus.

Whenever the hazard switch is in its unlatched and raised position, the hazard warning system is selected and the switch pod circuitry sends a hard wired output to the Totally Integrated Power Module (TIPM) over the CAN data bus. When the TIPM receives a hazard switch input it then controls hazard warning system operation and flash rate by controlling battery voltage outputs through high side drivers on the right and left turn signal feed circuits. The TIPM also sends the appropriate electronic messages back to the EMIC to control the illumination and flash rate of the right and left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the EMIC electronic circuit board that emulates the sound emitted by a conventional hazard warning flasher. The EMIC then sends messages back to the switch pod to control the illumination of the hazard switch push button.

The hard wired circuits for the instrument panel switch pod may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the hazard warning switch or the electronic controls and communication between other modules and devices that provide some features of the hazard warning system. The most reliable, efficient, and accurate means to diagnose the hazard switch or the electronic controls and communication related to hazard warning system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

HEADLAMP LEVELING MOTOR

DESCRIPTION

HEADLAMP LEVELING MOTOR

Fig. 26: Headlamp Components
Courtesy of CHRYSLER LLC

The headlamp leveling motor (6) is located on the rear outboard side of each front lamp unit housing (1) on vehicles equipped with the headlamp leveling system, which is available only in certain markets where it is required equipment. The motor is encased within a molded plastic housing and is secured by an integral wedge-type mounting boss to a keyed flange on the back of the front lamp unit housing. A rubber seal around the circumference of the mounting boss seals the motor to the lamp housing.

The outside of the motor housing features an integral molded connector on its rearward surface and a plastic pushrod with a ball formation on its free end extends from the motor mounting boss. Within the motor housing is a 12-volt Direct Current (DC) servo motor, an electronic controller board that includes the motor logic circuits, and an integral screw-drive transmission. The headlamp leveling motor is connected to the vehicle electrical system through a dedicated take out and connector of the front end module wire harness.

The headlamp leveling motor is serviced as a unit with the front lamp unit. The motor cannot be repaired and, if ineffective or damaged, the entire front lamp unit must be replaced.

OPERATION

HEADLAMP LEVELING MOTOR

The controller board and logic circuitry of the headlamp leveling motor controls motor operation based upon a voltage signal input received from the Totally Integrated Power Module (TIPM). The TIPM uses electronic messages received over the Controller Area Network (CAN) data bus from the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) to determine the correct voltage signal to provide the leveling motor, while the EMIC uses electronic messages received over the Local Interface Network (LIN) data bus from the instrument panel switch pod to monitor the headlamp leveling switch selection.

The headlamp leveling motors have a path to ground at all times. The motors operate on battery voltage received through the headlamp low beam feed circuits so that the system will only operate when the headlamp low beams are turned ON. When the motor is energized it will extend or retract the motor pushrod through an integral screw-drive transmission. The ball on the end of the pushrod is snapped into a socket on the back of the reflector within the front lamp unit housing, which will cause the reflector to move as the pushrod is extended

or retracted, changing the angle at which the light is projected from the headlamp low beam bulb filaments.

The hard wired circuits for the headlamp leveling motors may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the active electronic elements within the headlamp leveling motors or the electronic controls and communication between other modules and devices that provide some features of the headlamp leveling system. The most reliable, efficient, and accurate means to diagnose the headlamp leveling motor or the electronic controls and communication related to headlamp leveling system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

SWITCH-HEADLAMP LEVELING

DESCRIPTION

HEADLAMP LEVELING SWITCH

Fig. 27: Identifying Headlamp Leveling Switch
Courtesy of CHRYSLER LLC

The headlamp leveling switch (3) is used only on vehicles manufactured for certain markets where the headlamp leveling system is required. The headlamp leveling switch is integral to the switch pod (1) on the instrument panel. A stencil-like International Control and Display Symbol icon for **Headlamp Levelling Control** identifies the headlamp leveling switch button. The switch push button is also marked with the numbers **0** , **1** , **2** , and **3** , which indicates each of the four headlamp leveling positions. Each higher number represents a lower aiming position of the headlamp beam relative to the road surface.

The headlamp leveling switch button has panel lamps dimmer controlled illumination for night visibility. The switch button also features a jewel like Light Emitting Diode (LED) indicator adjacent to the numbers **1** , **2** , and **3** . The appropriate LED is illuminated when that headlamp position is currently selected. The momentary switch push button is operated by depressing, then releasing the top or bottom of the button in a rocker manner to enable the selection of a sequentially higher or lower position with each button press.

All of the circuitry and components of the headlamp leveling switch are contained within a molded black plastic instrument panel switch pod housing. A single connector receptacle is integral to the back of the switch pod housing. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The headlamp leveling switch cannot be adjusted or repaired and, if ineffective or damaged, the entire instrument panel switch pod unit must be replaced. Refer to **REMOVAL** .

OPERATION

HEADLAMP LEVELING SWITCH

The status of the headlamp leveling switch is continually monitored by the circuitry within the instrument panel switch pod. The switch pod receives battery voltage at all times on a fused battery feed circuit, and a path to ground at all times through the instrument panel wire harness. The only other inputs to and outputs from the switch pod consist of electronic communication with the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over the single wire Local Interface Network (LIN) data bus.

Whenever the headlamp leveling switch push button is depressed the switch pod circuitry sends an electronic **select status up** or **select status down** message input to the EMIC over the LIN data bus. The EMIC then sends the appropriate electronic **select request up** or **select request down** message to the TIPM over the CAN data bus.

The TIPM responds to these messages by providing a voltage output to the headlamp leveling motors through high side drivers on the headlamp leveling motor right and left signal circuits to move the headlamp reflectors to the selected position based upon the voltage input received from the TIPM. The TIPM also sends the appropriate electronic messages back to the EMIC and the EMIC relays the messages back to the switch pod to control the illumination of the **1** , **2** , or **3** Light Emitting Diode (LED) selected position indicator in the leveling switch button. The EMIC and TIPM logic will only allow the headlamp leveling system to operate while the ignition switch is in the ON position and the exterior lighting is turned ON.

The hard wired circuits for the instrument panel switch pod may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the headlamp leveling switch or the electronic controls and communication between other modules and devices that provide some features of the headlamp leveling system. The most reliable, efficient, and accurate means to diagnose the headlamp leveling switch or the electronic controls and communication related to headlamp leveling system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

LEFT MULTI-FUNCTION SWITCH

DESCRIPTION

LEFT MULTI- FUNCTION SWITCH

Fig. 28: Left Multi-Function Switch
 Courtesy of CHRYSLER LLC

The left (lighting) multi-function switch is located on the left side of the steering column, just below the steering wheel. This switch is the primary control for the interior and exterior lighting systems. The only visible components of the switch are the control stalk (2), control knob (1) and control sleeve (3) that extend through the steering column shrouds on the left side of the column. The remainder of the switch including its mounting provisions, its electrical connection, and the turn signal cancel actuator are concealed beneath the shrouds.

Fig. 29: Steering Control Module
 Courtesy of CHRYSLER LLC

The switch housing (2) and controls (1) are constructed of molded black plastic. Each of the switch controls has white International Control and Display Symbol graphics applied to it, which clearly identify its many functions. A single screw (7) through a mounting tab integral to the back of the switch housing, and a slide tab integral to the bottom of the switch housing secure the switch to the mounting bracket integral to the

clockspring (3).

The Steering Control Module (SCM) is internal to the switch housing. The switch outputs are internally connected directly to the SCM. A single connector receptacle containing seven terminal pins is integral to the inboard end of the switch housing and connects the right multi-function switch (6) through a jumper wire harness (5) directly to the SCM. An integral connector receptacle on the back of the switch housing connects the SCM to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The left multi-function switch provides the vehicle operator with a control interface for the following exterior lighting system functions:

- **Front Fog Lamps** - For vehicles so equipped, the left multi-function switch control knob provides detent switching for the optional front fog lamps.
- **Headlamps** - The left multi-function switch control knob provides detent switching for the headlamps.
- **Headlamp Beam Selection** - The left multi-function switch control stalk provides detent switching for selection of the headlamp high or low beams.
- **Headlamp Optical Horn** - The left multi-function switch control stalk includes momentary switching of the headlamp high beam circuits to provide an optical horn feature (sometimes referred to as flash-to-pass), which allows the vehicle operator to momentarily flash the headlamp high beams as an optical signalling device.
- **Park Lamps** - The left multi-function switch control knob provides detent switching for the park lamps.
- **Rear Fog Lamps** - For vehicles so equipped, the left multi-function switch control knob provides detent switching for the optional rear fog lamps. Rear fog lamps are optional only for vehicles manufactured for certain markets, where they are required.
- **Turn Signal Control** - The left multi-function switch control stalk provides both momentary non-detent switching and detent switching with automatic cancellation for both the left and right turn signal lamps.

The left multi-function switch also provides the vehicle operator with a control interface for the following interior lighting functions:

- **Interior Lamps Defeat** - The left multi-function switch control ring provides detent switching to DEFEAT the illumination of all interior courtesy lamps when a door, the rear flip-up glass, or the liftgate are opened.
- **Interior Lamps On** - The left multi-function switch control ring provides detent switching to simultaneously illuminate all interior courtesy lamps.
- **Panel Lamps Dimming** - The left multi-function switch control ring provides simultaneous adjustable control of the illumination intensity of all instrument panel lighting at one of five available illumination intensity levels.
- **Parade Mode** - The left multi-function switch control ring provides detent switching for a PARADE mode that maximizes the illumination intensity of all instrument panel lighting for visibility when driving in daylight with the exterior lamps turned ON.

The left multi-function switch cannot be adjusted or repaired. If any function of the switch is ineffective, or if the switch is damaged, the entire switch unit must be replaced. The clockspring (with the multi-function switch

mounting bracket), the left multi-function switch (with the SCM), the right multi-function switch and the jumper wire harness are each available for separate service replacement.

OPERATION

LEFT MULTI- FUNCTION SWITCH

The left (lighting) multi-function switch uses resistor multiplexing to control the many functions and features it provides using a minimal number of hard wired circuits. The switch receives clean grounds from the Steering Control Module (SCM), then provides resistor multiplexed return outputs to the SCM to indicate the selected switch positions. The SCM then sends electronic **switch status** messages over a Local Interface Network (LIN) data bus to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN), and the EMIC relays electronic **switch request** messages over the Controller Area Network (CAN) data bus to other electronic modules in the vehicle.

If the SCM detects no inputs from the left multi-function switch, it transmits an electronic **Signal Not Available (SNA)** status message over the LIN data bus. The SNA status signals the EMIC to request other electronic modules to implement a failsafe mode of operation for the exterior lighting systems. The failsafe mode automatically turns the exterior lighting ON when the ignition switch is in the ON position, and OFF when the ignition switch is in the OFF position.

The hard wired inputs and outputs of the left multi-function switch and SCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the most reliable, efficient and accurate means to diagnose this component requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

EXTERIOR LIGHTING

Following are descriptions of how the left multi-function switch is operated to control the many exterior lighting functions and features it provides:

- **Front Fog Lamps** - The optional front fog lamps are requested when the left multi-function switch control knob is pulled outward to the front fog lamps detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **exterior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **exterior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle. The switch control knob incorporates an internal cam mechanism that will only allow the front fog lamps to be selected while the headlamp ON position is also selected, and will automatically move the control knob to the front fog lamps OFF position when the control knob is rotated to deselect the headlamps.
- **Headlamps** - The headlamps are requested when the left multi-function switch control knob is rotated to the headlamps ON detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **exterior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **exterior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Headlamp Beam Selection** - The headlamp high beams are selected when the left multi-function switch control stalk is pushed forward to the high beam selection detent position. The low beams are selected when the control stalk is pulled rearward to the low beam selection detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **beam select switch**

status message over the LIN data bus to the EMIC, which relays an electronic **beam select switch request** message over the CAN data bus to other electronic modules in the vehicle.

- **Headlamp Optical Horn** - The headlamp optical horn is selected each time the left multi-function switch control stalk is pulled fully rearward to a momentary position. The headlamp high beams will remain illuminated for as long as the control stalk is held in this momentary position and the low beams will be restored when the control stalk is released. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **beam select switch status** message over the LIN data bus to the EMIC, which relays an electronic **beam select switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Park Lamps** - The headlamps are requested when the left multi-function switch control knob is rotated to the park lamps ON detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **exterior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **exterior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Rear Fog Lamps** - The optional rear fog lamps are requested when the left multi-function switch control knob is pulled outward to the front fog lamps detent position and then rotated to the rear fog lamps detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **exterior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **exterior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle. The switch control knob incorporates an internal cam mechanism that will only allow the rear fog lamps to be selected while the front fog lamps ON position is also selected, and will automatically move the control knob to the rear fog lamp OFF position when the control knob is pushed in to deselect the front fog lamps.
- **Turn Signal Control** - The turn signals are requested when the left multi-function switch control stalk is moved downward (left signal) or upward (right signal). The control stalk has a detent position in each direction that provides turn signals with automatic cancellation, and an intermediate, momentary position in each direction that automatically provides three turn signal blinks as a LANE CHANGE feature when the control stalk is tapped or will energize the turn signals for as long as the control stalk is held in the momentary position. When the control stalk is moved to a detent turn signal switch position, a cancel actuator extends through an opening in the side of the clockspring case toward the center of the steering column. A turn signal cancel cam that is integral to the clockspring rotor rotates with the steering wheel and the cam lobes contact the cancel actuator when it is extended from the left multi-function switch. When the steering wheel is rotated during a turning maneuver, one of the turn signal cancel cam lobes will contact the turn signal cancel actuator. The cancel actuator latches against the cancel cam rotation in the direction opposite that which is signaled. If the left turn signal detent is selected, the lobes of the cancel cam will ratchet past the cancel actuator when the steering wheel is rotated to the left, but will unlatch the cancel actuator as the steering wheel rotates to the right and returns to center, which will cancel the turn signal event and release the control stalk from the detent so it returns to the neutral OFF position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **exterior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **exterior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle.

INTERIOR LIGHTING

Following are descriptions of the how the left multi-function switch is operated to control the many interior lighting functions and features it provides:

- **Interior Lamps Defeat** - The interior lamps defeat feature is requested when the left multi-function switch control sleeve is rotated to the interior lamps DEFEAT detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **interior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **interior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Interior Lamps On** - The interior lamps ON feature is requested when the left multi-function switch control sleeve is rotated to the interior lamps ON detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **interior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **interior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Panel Lamps Dimming** - The panel lamps dimming function is active only when the left multi-function switch control knob is in any exterior lighting ON position. With the exterior lighting ON, the panel lamps dimming level is requested when the left multi-function switch control sleeve is rotated to any one of five minor detent positions. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **interior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **interior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Parade Mode** - The PARADE (or funeral) mode is active only when the left multi-function switch control knob is in any exterior lighting ON position. With the exterior lighting ON, the PARADE mode is requested when the left multi-function switch control sleeve is rotated to the PARADE mode detent position. The SCM reads the resistor multiplexed input from the left multi-function switch and sends an electronic **interior lighting switch status** message over the LIN data bus to the EMIC, which relays an electronic **interior lighting switch request** message over the CAN data bus to other electronic modules in the vehicle.

REMOVAL

LEFT MULTI-FUNCTION SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 30: Left Multi-Function Switch Replacement
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove both the upper and lower shrouds from the steering column. Refer to **REMOVAL** .
3. Disconnect the instrument panel wire harness connector from the connector receptacle on the back of the left multi-function switch.
4. Remove the screw (2) that secures the left multi-function switch (1) to the mounting bracket integral to the left side of the clockspring (3) on the steering column.
5. Slide the switch away from the clockspring far enough to disengage the slide tabs on the switch housing from the channel formations in the mounting bracket.
6. Disconnect the jumper wire harness connector from the connector receptacle on the inboard end of the left multi-function switch.
7. Remove the switch from the clockspring.

INSTALLATION

LEFT MULTI-FUNCTION SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 31: Left Multi-Function Switch Replacement
Courtesy of CHRYSLER LLC

1. Position the left multi-function switch (1) close enough to the mounting bracket (3) integral to the left side of the clockspring to reconnect the jumper wire harness connector to the connector receptacle on the inboard side of the switch housing.
2. Align the slide tabs on the switch housing with the channel formations integral to the clockspring mounting bracket, then slide the switch into the bracket until it is firmly seated.
3. Install and tighten the screw (2) that secures the mounting tab on the front of the left multi-function switch to the mounting bracket on the clockspring. Tighten the screw to 1 N.m (10 in. lbs.).
4. Reconnect the instrument panel wire harness connector to the connector receptacle on the back of the switch housing.
5. Reinstall the upper and lower shrouds onto the steering column. Refer to **INSTALLATION** .
6. Reconnect the battery negative cable.

LICENSE PLATE LAMP

REMOVAL

LICENSE PLATE LAMP BULB

NOTE: The following procedure is for replacement of a license plate lamp bulb. The license plate lamps are integral to the liftgate handle and light bar unit. If any part of this unit is ineffective or damaged, the entire handle and light bar unit must be replaced.

815be3cf

Fig. 32: Locating License Plate Lamp
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Reach under the liftgate handle and light bar unit (2) to access and depress the latch tab (1) on the outboard side of the license plate lamp lens toward the lens (3).
3. Pull the outboard side of the lens downward far enough to disengage the two tabs on the inboard side of the lens from the lamp housing.
4. Remove the lens from under the handle and light bar.

Fig. 33: Removing/Installing Bulb
Courtesy of CHRYSLER LLC

5. Firmly grasp and pull the bulb (2) straight out of the socket (1) in the outboard side of the lamp housing.

INSTALLATION

LICENSE PLATE LAMP BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

NOTE: The following procedure is for replacement of a license plate lamp bulb. The license plate lamps are integral to the liftgate handle and light bar unit. If any part of this unit is ineffective or damaged, the entire handle and light bar unit

must be replaced.

815be3d3

Fig. 34: Removing/Installing Bulb
Courtesy of CHRYSLER LLC

1. Align the base of the bulb (2) with the socket (1) in the outboard side of the license plate lamp housing.
2. Push the bulb straight into the socket until the base is firmly seated.

815be3cf

Fig. 35: Locating License Plate Lamp
Courtesy of CHRYSLER LLC

3. Position the lens (3) over the lamp housing under the handle and light bar unit (2).
4. Engage the two tabs on the inboard side of the lens into the slots on the inboard side of the lamp housing.
5. Push the outboard side of the lens upward until the lens latch tab (1) is fully engaged in the lamp housing.
6. Reconnect the battery negative cable.

PARK BRAKE SWITCH

DESCRIPTION

PARK BRAKE SWITCH

81460874

Fig. 36: Park Brake Switch
Courtesy of CHRYSLER LLC

The park brake switch (1) is located on the park brake lever mechanism on the floor panel transmission tunnel below the center floor console. This switch includes a spade-type output terminal (2) that connects the switch to the vehicle electrical system through a dedicated take out and connector of the body wire harness. The output terminal is integral to the stationary contact within a molded plastic insulator. A locating tab (4) on the insulator engages a slot in the park brake lever mechanism for positive switch location. External to the insulator is a movable leaf contact (3) with an integral grounding lug on one end and an integral actuating lever and follower on the opposite end. The switch is secured to and grounded by a single screw to the park brake lever mechanism.

The park brake switch cannot be adjusted or repaired and, if ineffective or damaged, it must be replaced.

OPERATION

PARK BRAKE SWITCH

The park brake switch is a normally closed, mechanically actuated leaf contact switch that is operated by the park brake lever mechanism. The switch is grounded through its mounting to the park brake lever mechanism.

and provides a ground input to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) on a park brake switch sense circuit whenever the park brake is applied, and opens this circuit whenever the park brake is released. The park brake switch sense input to the EMIC is used for control of the brake indicator and may also be used as a logic input for other electronic features in the vehicle.

The park brake switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

PARK BRAKE SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: If the brake indicator stays ON with the ignition switch in the ON position and the park brake released, or comes ON while driving, the brake system must be diagnosed and repaired prior to performing the following tests. Refer to DIAGNOSIS AND TESTING . If no brake system problem is found, the following procedures will help to locate a shorted or open park brake switch sense circuit, or an ineffective park brake switch.

INDICATOR ILLUMINATES DURING BULB TEST, BUT DOES NOT WHEN PARK BRAKE APPLIED

1. Disconnect and isolate the battery negative cable. Disconnect the wire harness connector for the park brake switch from the switch terminal. Apply the parking brake. Check for continuity between the park brake switch terminal and a good ground. There should be continuity. If OK, go to step 2. If not OK, replace the ineffective park brake switch.
2. Disconnect the instrument panel wire harness connector from the cluster connector receptacle. Check for continuity between the park brake switch sense circuit cavities of the wire harness connector for the park brake switch and the wire harness connector for the instrument cluster. There should be continuity. If not OK, repair the open park brake switch sense circuit between the park brake switch and the instrument cluster as required.

INDICATOR REMAINS ILLUMINATED - BRAKE SYSTEM CHECKS OK

1. Disconnect and isolate the battery negative cable. Disconnect the wire harness connector for the park brake switch from the switch terminal. Check for continuity between the terminal of the park brake switch and a good ground. There should be no continuity with the park brake released, and continuity with the park brake applied. If OK, go to step 2. If not OK, replace the ineffective park brake switch.

2. Disconnect the instrument panel wire harness connector from the cluster connector receptacle. Check for continuity between the park brake switch sense circuit cavity of the wire harness connector for the park brake switch and a good ground. There should be no continuity. If not OK, repair the shorted park brake switch sense circuit between the park brake switch and the instrument cluster as required.

REMOVAL

PARK BRAKE SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 37: Identifying Park Brake Switch, Wire Harness Connector, Parking Brake Lever Mechanism & Screw

Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the console from the floor panel transmission tunnel. Refer to **REMOVAL** .
3. Apply the parking brake lever mechanism (3).
4. Disconnect the wire harness connector (2) from the terminal of the park brake switch (1) located on the left side of the park brake lever mechanism.
5. Remove the screw (4) that secures the park brake switch to the park brake lever mechanism.
6. Remove the switch from the park brake lever mechanism.

INSTALLATION

PARK BRAKE SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 38: Identifying Park Brake Switch, Wire Harness Connector, Parking Brake Lever Mechanism & Screw

Courtesy of CHRYSLER LLC

1. Position park brake switch (1) onto the left side of the park brake lever mechanism (3). Be certain to engage the locating pin on the back of the switch insulator into the locating slot in the lever mechanism bracket.
2. Install and tighten the screw (4) that secures the park brake switch to the park brake lever mechanism. Tighten the screw to 2.5 N.m (24 in. lbs.).
3. Reconnect the wire harness connector (2) to the terminal of the park brake switch.
4. Reinstall the console onto the floor panel transmission tunnel. Refer to **INSTALLATION** .
5. Reconnect the battery negative cable.
6. Turn the ignition switch to the On position and check for proper brake indicator operation with the parking brake applied, then release the parking brake and check that the brake indicator extinguishes.

PARK/TURN SIGNAL LAMP

REMOVAL

FRONT PARK/TURN SIGNAL LAMP

Fig. 39: Wire Harness Connector
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Partially remove the liner from the front of the front fender wheel house. Refer to **REMOVAL** .
3. Disconnect the wire harness connector (2) from the connector receptacle integral to the bulb socket on the back of the front park/turn signal lamp housing located on the inside of the forward-facing end of the front fascia (1).
4. Remove the two nuts (3) that secure the studs of the lamp housing to the inside surface of the front fascia.
5. Remove the lamp from the outer surface of the front fascia.

FRONT PARK/TURN SIGNAL LAMP BULB

Fig. 40: Wire Harness Connector
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Partially remove the liner from the front of the front fender wheel house. Refer to **REMOVAL** .

3. Disconnect the wire harness connector (2) from the connector receptacle integral to the park/turn signal bulb socket (3) on the back of the park/turn signal lamp housing located on the back of the inside of the forward facing end of the front fascia (1).
4. Firmly grasp the socket and rotate it counterclockwise about 30 degrees to unlock it.
5. Pull the socket and bulb straight out from the keyed opening in the lamp housing.
6. Pull the base of the bulb straight out of the socket.

INSTALLATION

FRONT PARK/TURN SIGNAL LAMP

Fig. 41: Wire Harness Connector
 Courtesy of CHRYSLER LLC

1. Position the front park/turn signal lamp to the outer surface of the front fascia by inserting the studs on the back of the lamp housing into the mounting holes of the fascia.
2. Install and tighten the two nuts (3) that secure the studs of the lamp housing to the inside surface of the front fascia (1). Tighten the nuts securely.
3. Reconnect the wire harness connector (2) to the connector receptacle integral to the bulb socket.
4. Reinstall the liner to the front of the front fender wheel house. Refer to **INSTALLATION** .
5. Reconnect the battery negative cable.

FRONT PARK/TURN SIGNAL LAMP BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

Fig. 42: Wire Harness Connector
Courtesy of CHRYSLER LLC

1. Align the base of the bulb with the park/turn signal bulb socket (3).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening in the back of the front park/turn signal lamp housing located on the back of the inside of the forward facing end of the front fascia (1).
4. Insert the socket and bulb into the housing until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place.
6. Reconnect the wire harness connector (2) to the connector receptacle integral to the park/turn signal bulb socket on the back of the lamp housing.
7. Reinstall the liner to the front of the front fender wheel house. Refer to **INSTALLATION** .
8. Reconnect the battery negative cable.

REAR LAMP UNIT

REMOVAL

REAR LAMP UNIT

Fig. 43: Rear Lamp Unit
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Open the liftgate to access and remove the two screws (2) that secure the rear lamp unit (3) to the side jamb of the liftgate opening.
3. Pull the outboard side of the rear lamp unit rearward far enough to unsnap the two ball studs on the outboard side of the lamp housing from the two plastic grommets (1) in the rear body sheet metal.
4. Disconnect the wire harness connector (4) from the connector receptacle on the socket plate on the back of the lamp housing.
5. Remove the lamp from the vehicle.
6. Remove the two plastic grommets from the rear body sheet metal and discard.

REAR LAMP UNIT BULB

Fig. 44: Rear Lamp Unit
Courtesy of CHRYSLER LLC

NOTE: The rear lamp unit may contain up to four bulbs, depending upon the market for which the vehicle was manufactured. The service procedures for each bulb are the same, only the bulb sizes and types may differ.

1. Disconnect and isolate the battery negative cable.
2. Remove the rear lamp unit (1) from the rear body sheet metal. See **REMOVAL**.
3. Remove the two screws (2) that secure the socket plate (3) to the back of the rear lamp unit housing.
4. Remove the socket plate from the rear lamp.
5. Pull the base of the bulb straight out of the socket plate.

INSTALLATION

REAR LAMP UNIT

Fig. 45: Rear Lamp Unit
Courtesy of CHRYSLER LLC

1. Install two new plastic grommets (1) into the rear body sheet metal.
2. Position the rear lamp unit (3) to the lamp opening in the rear body sheet metal.
3. Reconnect the wire harness connector (4) to the connector receptacle on the socket plate on the back of the lamp housing.
4. Align the two ball studs on the outboard side of the rear lamp housing with the two plastic grommets in the rear body sheet metal.
5. Using hand pressure, push firmly and evenly on the outboard side of the lamp until the two ball studs snap into the plastic grommets.
6. Install and tighten the two screws (2) that secure the inboard side of the lamp housing to the side jamb of the liftgate opening. Tighten the screws to 5.5 N.m (50 in. lbs.).
7. Reconnect the battery negative cable.

REAR LAMP UNIT BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

Fig. 46: Rear Lamp Unit
Courtesy of CHRYSLER LLC

NOTE: The rear lamp unit may contain up to four bulbs, depending upon the market for which the vehicle was manufactured. The service procedures for each bulb are the same, only the bulb sizes and types may differ.

1. Align the base of the bulb with the socket in the rear lamp unit socket plate (3).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Be certain that a rubber sealing washer is properly installed and in good condition around the base of each bulb on the socket plate.
4. Align the bulbs in the socket plate with the openings on the back of the rear lamp unit housing (1).
5. Insert the bulbs straight into the housing until the socket plate is firmly seated against the housing.
6. Install and tighten the two screws (2) that secure the socket plate to the housing. Tighten the screws to 1 N.m (12 in. lbs.).
7. Reinstall the rear lamp unit onto the end of the rear body sheet metal. See **INSTALLATION**.
8. Reconnect the battery negative cable.

REPEATER LAMP

REMOVAL

REPEATER LAMP

NOTE: Repeater lamps are used only on vehicles manufactured for certain markets where these lamps are required.

Fig. 47: Identifying Fender, Wire Harness Connector & Lamp Lens/Housing
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.

NOTE: The same repeater lamp is used on both sides of the vehicle. Regardless of which side of the vehicle the lamp is on, when properly oriented the fixed hook tab integral to the back of the lamp housing is on the right-hand side of the lamp and the latch feature is on the left-hand side.

2. Using hand pressure, press the right edge of the repeater lamp lens/housing (3) toward the left against the spring pressure of the latch feature, then pull the right edge of the lamp outward far enough to disengage the hook tab from the right side of the mounting hole in the fender (1).
3. Pull the lamp out from the fender far enough to access and disconnect the wire harness connector (2) from the bulb socket on the back of the lamp lens/housing.
4. Remove the repeater lamp from the fender.

REPEATER LAMP BULB

NOTE: Repeater lamps are used only on vehicles manufactured for certain markets where these lamps are required.

815bb10d

Fig. 48: Remove/Install Repeater Lamp Bulb

Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the repeater lamp from the fender mounting hole, but do not disconnect the wire harness connector. See **REMOVAL**.
3. Firmly grasp the bulb socket (1) on the back of the lamp lens/housing (4) and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the socket and bulb straight out from the keyed opening in the housing.
5. Pull the base of the bulb (3) straight out of the socket.

INSTALLATION

REPEATER LAMP

NOTE: Repeater lamps are used only on vehicles manufactured for certain markets where these lamps are required.

Fig. 49: Identifying Fender, Wire Harness Connector & Lamp Lens/Housing
Courtesy of CHRYSLER LLC

1. Position the repeater lamp lens/housing (3) close enough to the mounting hole in the fender (1) to access and reconnect the wire harness connector (2) to the bulb socket on the back of the lamp lens/housing.

NOTE: The same repeater lamp is used on both sides of the vehicle. Regardless of which side of the vehicle the lamp is on, when properly oriented the fixed hook tab integral to the back of the lamp housing is on the right-hand side of the lamp and the latch feature is on the left-hand side.

2. With the lamp lens/housing properly oriented, engage the hook tab on the back of the right side of the lamp with the right edge of the fender mounting hole.
3. Using hand pressure, press the left side of the lamp lens/housing into the mounting hole against the spring pressure of the latch feature until the latch snaps into place.
4. Reconnect the battery negative cable.

REPEATER LAMP BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

NOTE: Repeater lamps are used only on vehicles manufactured for certain markets where these lamps are required.

Fig. 50: Remove/Install Repeater Lamp Bulb
Courtesy of CHRYSLER LLC

1. Align the base of the bulb (3) with the socket (1).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Be certain that a rubber O-ring seal (2) is properly installed and in good condition around the base of the bulb socket.
4. Align the socket and bulb with the keyed opening on the back of the repeater lamp lens/housing (4).
5. Insert the socket and bulb into the housing until the socket is firmly seated.
6. Rotate the socket clockwise about 30 degrees to lock it into place.
7. Reinstall the repeater lamp into the fender mounting hole. See **INSTALLATION**.
8. Reconnect the battery negative cable.

REMOVAL

TRAILER TOW CONNECTOR

Fig. 51: Identifying Body Wire Harness Connector, Bracket & Trailer Tow Connector
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Reach underneath and behind the bracket (2) for the trailer tow connector (3) to access and disconnect the body wire harness connector (1).

Fig. 52: Identifying Trailer Tow Connector & Bracket
Courtesy of CHRYSLER LLC

3. Grasp the trailer tow connector (1) firmly from the face of the bracket (2) and rotate it 90 degrees counterclockwise to unlock it.
4. Pull the trailer tow connector straight rearward to remove it from the hitch receiver bracket.

INSTALLATION

TRAILER TOW CONNECTOR

Fig. 53: Identifying Trailer Tow Connector & Bracket
Courtesy of CHRYSLER LLC

1. Align the trailer tow connector (1) to the keyed mounting hole in the bracket (2) of the trailer hitch receiver.
2. Insert the connector into the bracket until it is firmly seated.
3. Rotate the connector clockwise 90 degrees to lock it into place.

Fig. 54: Identifying Body Wire Harness Connector, Bracket & Trailer Tow Connector
Courtesy of CHRYSLER LLC

4. Reach underneath and behind the bracket (2) for the trailer tow connector (3) to access and reconnect the body wire harness connector (1).
5. Reconnect the battery negative cable.

TRAILER TOW WIRING

DESCRIPTION

TRAILER TOW WIRING

Fig. 55: Trailer Tow Wiring
Courtesy of CHRYSLER LLC

Vehicles equipped with an optional factory-installed trailer towing package have a rear body wire harness that includes a trailer tow wiring take out (2) secured beneath the rear underbody with retainer clips (1 and 3). A molded connector (4) at the end of the take out is connected to a heavy duty, sealed, 7-pin trailer tow connector located on a bracket on the trailer hitch receiver. The rear body harness includes a second take out with a trailer tow relay connector bank and the four trailer tow relays that isolate the right turn signal, left turn signal, and brake lamp circuits of the vehicle from the electrical system of the trailer. The fourth relay in the connector bank provides a fused ignition switch output (run) source of battery voltage to the trailer tow connector through a trailer tow relay output circuit.

The package also includes an adapter harness (stored beneath the left rear seat cushion of the vehicle when it is shipped from the factory) that adapts the 7-pin trailer tow connector to a standard, light-duty, 4-pin trailer tow connector. Refer to the appropriate wiring information.

TURN SIGNAL CANCEL CAM

DESCRIPTION

TURN SIGNAL CANCEL CAM

The turn signal cancel cam is concealed within the clockspring case on the steering column. The turn signal cancel cam consists of integral eccentrics on the outer circumference of the molded plastic clockspring rotor. The clockspring mechanism provides turn signal cancellation as well as a constant electrical connection between the horn switch, driver airbag, speed control switches, Electronic Vehicle Information Center (EVIC) switches and remote radio switches on the steering wheel and the instrument panel wire harness on the steering column. The housing of the clockspring is secured to the steering column and remains stationary. The rotor of the clockspring, including the turn signal cancel cam lobes rotate with the steering wheel.

The turn signal cancel cam is serviced as a unit with the clockspring and cannot be repaired. If ineffective or damaged, the entire clockspring unit must be replaced. Refer to **REMOVAL** .

OPERATION

TURN SIGNAL CANCEL CAM

When the left multi-function switch control stalk is moved to a latched turn signal ON position, a turn signal cancel actuator is extended from the inside surface of the switch housing through a small rectangular opening on the left side of the clockspring case toward the turn signal cancel cam. As the steering wheel is rotated to complete the turn, one of the cam eccentrics will contact the actuator, automatically cancelling the turn signal event and releasing the latched left multi-function switch control stalk to the neutral or OFF position.

Additional Wiring

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Monitor Conditions

When Monitored:

Continuously

Set Conditions

- **Set Condition:**
- When the Instrument Cluster detects a short to battery on the Control circuit.

Possible Causes

Possible Causes
(M24) COURTESY LAMPS DRIVER CIRCUIT SHORT TO GROUND
(M24) COURTESY LAMPS DRIVER CIRCUIT OPEN
INSTRUMENT CLUSTER

Diagnostic Test

1) TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

Clear all Instrument Cluster DTC's

Turn the Courtesy Lamps on.

With the scan tool, read DTC's.

Does the scan tool read: B161A-COURTESY/DOME LAMP CONTROL CIRCUIT?

Yes

Go To 2).

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2) CHECK THE (M24) COURTESY LAMPS DRIVER CIRCUIT FOR A SHORT TO GROUND

Fig. 2: Checking Courtesy Lamps Driver Circuit For Short To Ground
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Instrument Cluster C2 harness connector.

Measure the resistance between the (M24) Courtesy Lamp Driver circuit and ground.

Is the resistance below 5.0 ohms?

Yes

Repair the (M24) Courtesy Lamp Driver circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 3).

3) CHECK THE (M24) COURTESY LAMPS DRIVER CIRCUIT FOR AN OPEN

Fig. 3: Checking Courtesy Lamps Driver Circuit For Open
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Instrument Cluster C2 harness connector.

Turn the ignition on.

Measure the voltage of the (M24) Courtesy Lamp Driver circuit.

Is the voltage below 10.0 volts?

Yes

Repair the (M24) Courtesy Lamp Driver circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Instrument Cluster in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B161E-READING LAMP CONTROL CIRCUIT

Circuit Schematic

Additional Wiring

For complete wiring diagrams, refer to [SYSTEM WIRING DIAGRAMS](#) article.

Monitor Conditions

When Monitored:

Continuously

Set Conditions

- **Set Condition:**
- When the Instrument Cluster detects a short to battery on the Control circuit.

Possible Causes

Possible Causes
(M24) COURTESY LAMP DRIVER CIRCUIT SHORT TO GROUND
(M24) COURTESY LAMP DRIVER CIRCUIT OPEN
INSTRUMENT CLUSTER

Diagnostic Test

1) TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

Clear all Instrument Cluster DTC's

Turn the Courtesy Lamps on.

With the scan tool, read DTC's.

Does the scan tool read: B161E-READING LAMP CONTROL CIRCUIT?

Yes

Go To 2).

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2) CHECK THE (M24) COURTESY LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND

8172a930

Fig. 5: Checking Courtesy Lamp Driver Circuit For Short To Ground
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Instrument Cluster C2 harness connector.

Measure the resistance between the (M24) Courtesy Lamp Driver circuit and ground.

Is the resistance below 5.0 ohms?

Yes

Repair the (M24) Courtesy Lamp Driver circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3).

3) CHECK THE (M24) COURTESY LAMP DRIVER CIRCUIT FOR AN OPEN

CLUSTER C2

8172a93a

Fig. 6: Checking Courtesy Lamp Driver Circuit For An Open
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Instrument Cluster C2 harness connector.

Activate the left and right vanity lamps (if equipped), the glove box lamp, and the left and right door handle lamps.

Turn the ignition on.

Measure the voltage of the (M24) Glove Box Lamp Driver circuit.

Is the voltage below 10.0 volts?

Yes

Repair the (M24) Courtesy Lamp Driver circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Instrument Cluster in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

LAMPS/LIGHTING - INTERIOR - SERVICE INFORMATION

DESCRIPTION

LAMPS/LIGHTING - INTERIOR

81d5f1a8

Fig. 1: Interior Lamps
Courtesy of CHRYSLER LLC

The interior lighting system for this vehicle includes incandescent lighting on two separate circuits: the dome/courtesy lamp circuit and the panel lamps dimmer circuit. The lamps on the dome/courtesy circuit include:

- **Cargo Lamp (5)** - A cargo lamp is located in the headliner near the rear roof header and is controlled by both the courtesy lamp circuit and an independent lens-actuated switch to illuminate the rear cargo area of the vehicle.
- **Courtesy Lamps (1)** - Available courtesy lamps are located below both the right and left side of the instrument panel, and are controlled by the courtesy lamp circuit.
- **Front Dome Lamp (2)** - A standard front dome lamp including two bulbs is located in the headliner

between the sun visors near the windshield header. These lamps are controlled by both the courtesy lamp circuit and independent push button switches on the lamp housing adjacent to each bulb.

- **Reading Lamps (2)** - Available front seat driver side and passenger side reading lamps located in the optional mini overhead console in the headliner between the sun visors near the windshield header are controlled by both the courtesy lamp circuit and independent lens-actuated switches.
- **Second Row Dome/Reading Lamps (4)** - The second row seat dome/reading lamps are controlled by both the courtesy lamp circuit and independent lens-actuated switches. These lamps are integral to the grab handles located on the headliner above each rear door opening adjacent to each outboard second row seating position.
- **Vanity Lamps (3)** - An optional single-intensity vanity lamp is located above a covered mirror on both the right and left sun visors. These lamps are controlled by an integral vanity mirror cover-actuated switch on the courtesy lamp circuit.

Most controls on the instrument panel and elsewhere on the interior of the vehicle are illuminated by the panel lamps dimmer circuit for night visibility. All except the automatic transmission gear selector bezel lamp have miniature incandescent bulbs, Light-Emitting Diode (LED) units or a combination of the two lighting types that are soldered to internal circuit boards and are not serviceable.

The optional automatic transmission gear selector bezel lamp is located on the left side of the gear selector lever mechanism just beneath the bezel on the floor panel transmission tunnel. This lamp has a replaceable incandescent bulb.

Other components of the interior lighting system for this vehicle include:

- **Door Ajar Switches** - A door ajar switch is integral to the door latch mechanism of each front and rear door.
- **Instrument Cluster** - The ElectroMechanical Instrument Cluster (EMIC) is also known as the Cab Compartment Node (CCN) in this vehicle. The EMIC/CCN is located in the instrument panel above the steering column opening, directly in front of the driver. Refer to **DESCRIPTION** .
- **Left Multi-Function Switch** - The left (lighting) multi-function switch is located on the steering column, just below the steering wheel. A control sleeve on the control stalk that extends from the left side of the switch is used to select the panel lamps dimmer lighting level or the courtesy lamp circuit operating mode. Refer to **DESCRIPTION** .
- **Liftgate Ajar Switch** - A liftgate ajar switch is integral to the latch mechanism of the liftgate.
- **Liftgate Flip-Up Glass Ajar Switch** - A liftgate flip-up glass ajar switch is integral to the latch mechanism of the liftgate flip-up glass.
- **Steering Control Module** - The Steering Control Module (SCM) is located within the left multi-function switch housing on the top of the steering column, just below the steering wheel. Refer to **DESCRIPTION** .
- **Totally Integrated Power Module** - The Totally Integrated Power Module (TIPM) is located in the engine compartment near the battery. Refer to **DESCRIPTION** .

Hard wired circuitry connects the interior lighting system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical

system and to the interior lighting components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

LAMPS/LIGHTING - INTERIOR

The lamps of the interior lighting system can be divided into two general classifications based upon the circuit that controls their operation: The courtesy lamp circuit (which includes the courtesy lamp load shed circuits for each lamp as well as the convenience circuits for those lamps with independent switching), or the panel lamps dimmer circuit. Following are paragraphs that briefly describe the operation of each of these interior lighting circuits.

The lamps and the hard wired circuits between components related to the interior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the interior lighting system or the electronic controls or communication between modules and other devices that provide some features of the interior lighting system. The most reliable, efficient, and accurate means to diagnose the interior lighting system or the electronic controls and communication related to interior lighting system operation requires the use of a diagnostic scan tool.

COURTESY LAMP CIRCUIT

The courtesy lamp circuit includes the courtesy lamps located under each outboard end of the instrument panel and, depending upon the selected vehicle options may include either the front dome lamp located on the headliner between the sun visors near the windshield header or the map/reading lamps located in the mini overhead console near the windshield header, the second row dome/reading lamps located in the headliner near the roof rail above each rear door opening, the cargo lamp located in the headliner near the center of the rear header above the cargo area, and the vanity lamps located in the sun visors. The lamps in the courtesy lamp circuit are provided with battery voltage and ground by the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) using internal drivers through a courtesy lamp driver circuit and two ground circuits based upon electronic **ajar switch status** message inputs received from the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus. The EMIC also uses electronic **left multi-function switch** and **ignition switch status** message inputs received from the Steering Control Module (SCM) over the Local Interface Network (LIN) data bus to control these outputs.

After all of the ajar switch inputs to the TIPM transition to open, the EMIC will keep the courtesy lamps illuminated for about 30 seconds, then fade the lamps to OFF (theater dimming) over about 3 seconds. The EMIC also provides courtesy lamp operation based upon the electronic **left multi-function switch status** messages received from the SCM, and provides an illuminated entry feature in response to certain electronic message inputs received from the Sentry Key Remote Entry Module (SKREEM) (also known as the Sentry Key

Immobilizer Module/SKIM or the Wireless Control Module/WCM) and the Occupant Restraint Controller (ORC) over the CAN data bus. A courtesy lamp DEFEAT mode based upon an electronic **left multi-function switch status** message received from the SCM will cause the EMIC to override normal courtesy lamp operation based upon any ajar switch inputs to the TIPM.

For those lamps on the courtesy lamp circuit with independent switching such as the front dome lamp, the optional reading lamps, the second row dome/reading lamps, the cargo lamp and the vanity lamps, the EMIC provides a second battery feed to the switches using another internal driver through a separate courtesy lamp load shed circuit (also known as the convenience circuit). The EMIC provides a battery saver (load shedding) feature for all courtesy lamps, which will automatically turn these lamps OFF if they are left ON for more than about eight minutes with the ignition switch in the OFF position.

PANEL LAMPS DIMMER CIRCUIT

The panel lamps dimmer circuit actually includes several circuits. These circuits control the illumination and dimming level of the heater-air conditioner controls and the automatic transmission gear selector bezel lamp. All lamps in the panel lamps dimmer circuits are provided a path to ground at all times through a hard wired ground circuit. These lamps are illuminated by a 12-volt Pulse Width Modulated (PWM) output of the EMIC through the panel lamps dimmer circuit.

This shared PWM output synchronizes the selected illumination intensity level of all of the lamps in the panel lamps dimmer circuits. The EMIC uses electronic **left multi-function switch status** and **dimming level** message inputs received from the SCM over the LIN data bus. The SCM sends the proper **left multi-function switch status** and **dimming level** messages based upon the exterior lighting selection of the control knob and the dimming level selection of the control sleeve on the left multi-function switch control stalk.

The EMIC, the instrument panel switch pod and the radio use the **dimming level** messages from the SCM to control the illumination intensity of their own back lighting and controls. In addition, when the control sleeve of the left multi-function switch is moved to the PARADE (or funeral) mode detent position, all of the Vacuum Fluorescent Display (VFD) units in the vehicle are illuminated at their full intensity levels for increased visibility when the vehicle is driven during daylight hours with the exterior lights turned ON. The PARADE mode has no effect on the illumination intensity of incandescent panel lamps.

WARNING

LAMPS/LIGHTING - INTERIOR

WARNING: To avoid serious or fatal injury eye protection should be used when servicing any glass components.

CAUTION: Do not use bulbs with higher candle power than indicated in the Bulb Application table. See **SPECIFICATIONS**. In addition, do not use fuses, circuit breakers or relays having a greater amperage value than indicated on the fuse panel or in the Owner's Manual. Damage to lamps, lenses, wiring and other related electrical components can result.

DIAGNOSIS AND TESTING

LAMPS/LIGHTING - INTERIOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: When diagnosing the interior lighting circuits, remember that high generator output can burn out bulbs rapidly and repeatedly; and, that dim or flickering bulbs can be caused by low generator output or poor battery condition. If one of these symptoms is a problem on the vehicle, be certain to diagnose the battery and charging system, then repair as necessary.

NOTE: A good ground is necessary for proper lighting operation. If a lighting problem is being diagnosed that involves multiple symptoms, systems, or components, the problem can often be traced to a loose, corroded, or open ground.

The lamps and the hard wired circuits between components related to the interior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the interior lighting system or the electronic controls or communication between modules and other devices that provide some features of the interior lighting system. The most reliable, efficient, and accurate means to diagnose the interior lighting system or the electronic controls and communication related to interior lighting system operation requires the use of a diagnostic scan tool.

COURTESY LAMP CIRCUIT

CONDITION	POSSIBLE CAUSES	CORRECTION
A SINGLE LAMP IN THE COURTESY LAMP CIRCUIT DOES NOT ILLUMINATE	1. Ineffective or missing bulb. 2. Ineffective lamp switch. 3. Ineffective ground circuit. 4. Ineffective feed circuit.	1. Test and replace the courtesy lamp bulb if required. 2. Test and replace a map/reading lamp switch if required. 3. Test and repair the open ground circuit if required. 4. Test and repair the open feed circuit if required.

AJAR SWITCH

DESCRIPTION

DOOR AJAR SWITCH

This vehicle has one door ajar switch for each door. Each switch is concealed within and integral to its respective door latch unit. The switches are momentary leaf contact-type units that are actuated by the mechanisms internal to the door latch. A short pigtail wire and connector on each door latch connects the door ajar switch to the vehicle electrical system through its respective door wire harness.

The door ajar switches cannot be adjusted or repaired and, if ineffective or damaged, the door latch unit must be replaced. Refer to **REMOVAL** for front latch, or **REMOVAL** for rear latch.

FLIP-UP GLASS AJAR SWITCH

A liftgate flip-up glass ajar switch is standard equipment on this vehicle. The switch is concealed within and integral to the liftgate flip-up glass latch unit. The switch is a momentary leaf contact-type unit that is actuated by the flip-up glass latch mechanism. An integral connector receptacle on the flip-up glass latch connects the ajar switch to the vehicle electrical system through the liftgate wire harness.

The flip-up glass ajar switch cannot be adjusted or repaired and, if ineffective or damaged, the flip-up glass latch unit must be replaced. Refer to **REMOVAL** .

LIFTGATE AJAR SWITCH

A liftgate ajar switch is standard equipment on this vehicle. The switch is concealed within and integral to the liftgate latch unit. The switch is a momentary leaf contact-type unit that is actuated by the liftgate latch mechanism. An integral connector receptacle on the liftgate latch connects the liftgate ajar switch to the vehicle electrical system through the liftgate wire harness.

The liftgate ajar switch cannot be adjusted or repaired and, if ineffective or damaged, the liftgate latch unit must be replaced. Refer to **REMOVAL** .

OPERATION

DOOR AJAR SWITCH

The door ajar switches are actuated by the mechanisms internal to the door latch. When a door is closed and properly latched, its door ajar switch is an open circuit. When a door is open or only partially latched, the door ajar switch is a closed circuit. The door ajar switches are hard wired in series between a body ground and the Totally Integrated Power Module (TIPM). The TIPM reads the hard wired door ajar switch inputs through internal pull-ups, then uses these inputs to control many electronic functions and features of the vehicle. The TIPM also sends electronic **door ajar switch status** messages over the Controller Area Network (CAN) data bus.

The door ajar switches as well as the hard wired inputs and outputs of the switches may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

FLIP-UP GLASS AJAR SWITCH

The liftgate flip-up glass ajar switch is actuated by the flip-up glass latch mechanism. When the flip-up glass is closed and properly latched, its ajar switch is an open circuit. When the glass is open or only partially latched, the ajar switch is a closed circuit. The flip-up glass ajar switch is hard wired in series between a body ground and the Totally Integrated Power Module (TIPM). The TIPM reads the hard wired flip-up glass ajar switch input through an internal pull-up, then uses this input to control many electronic functions and features of the vehicle. The TIPM also sends electronic **flip-up glass ajar switch status** messages over the Controller Area Network (CAN) data bus.

The flip-up glass ajar switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

LIFTGATE AJAR SWITCH

The liftgate ajar switch is actuated by the liftgate latch mechanism. When the liftgate is closed and properly latched, its liftgate ajar switch is an open circuit. When the liftgate is open or only partially latched, the liftgate ajar switch is a closed circuit. The liftgate ajar switch is hard wired in series between a body ground and the Totally Integrated Power Module (TIPM). The TIPM reads the hard wired liftgate ajar switch input through an internal pull-up, then uses this input to control many electronic functions and features of the vehicle. The TIPM also sends electronic **liftgate ajar switch status** messages over the Controller Area Network (CAN) data bus.

The liftgate ajar switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

CARGO LAMP

REMOVAL

CARGO LAMP

812165d8

Fig. 2: Removing/Installing Cargo Lamp Unit
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Insert the tip of a small flat bladed screwdriver into the notch (5) between the lens (2) and the housing (1) on one side of the cargo lamp unit.
3. Gently pry the end of the lens outward until it unsnaps from the housing.
4. Swing the lens outward until it is perpendicular to the housing.
5. Pull the lens hinge/retainer (3) end of the housing outward slightly from the headliner, then slide the exposed end of the housing away from the mounting hole far enough to disengage the fixed retainer (4) on the notched end from the headliner.
6. Pull the lamp away from the headliner mounting hole far enough to access and disconnect the wire harness connector from the back of the lamp.
7. Remove the lamp from the vehicle.

CARGO LAMP BULB

81216a1d

Fig. 3: Removing/Installing Cargo Lamp Bulb
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Insert the tip of a small flat-bladed screwdriver into the notch on one side of the cargo lamp between the lens (4) and the lamp housing (1).
3. Gently pry the notched edge of the lens downward until it unsnaps from the housing.
4. Swing the notched end of the lens downward far enough to access the bulb (3).
5. Carefully unsnap the bulb from the two bulb holders within the cargo lamp housing.

INSTALLATION

CARGO LAMP

812165d8

Fig. 4: Removing/Installing Cargo Lamp Unit
Courtesy of CHRYSLER LLC

1. Position the dome lamp unit (1) to the mounting hole in the headliner.
2. Reconnect the wire harness connector to the connector on the back of the lamp.
3. Insert the fixed retainer (4) on the notched end of the lamp housing up into one side of the mounting hole in the headliner.
4. Slide the notched end of the housing into the mounting hole far enough to engage the lens hinge/retainer (3) into the opposite side of the hole in the headliner.
5. Gently and evenly press the lens hinge/retainer end of the lamp into the mounting hole until the bezel of the lamp housing is flush with the headliner.
6. Swing the notched end of the lamp lens (2) into position against the lamp housing, then press on the lens firmly and evenly until it snaps into the housing.
7. Reconnect the battery negative cable.

CARGO LAMP BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

81216a1d

Fig. 5: Removing/Installing Cargo Lamp Bulb
Courtesy of CHRYSLER LLC

1. Align the ends of the bulb (3) with the two bulb holders within the cargo lamp housing (1).
2. Carefully press the bulb firmly and evenly into the bulb holders until it snaps into place.
3. Swing the notched end of the lens (4) up into position against the housing, then press upward on the lens firmly and evenly until it snaps into the housing.
4. Reconnect the battery negative cable.

COURTESY LAMP

REMOVAL

COURTESY LAMP

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or

service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 6: Courtesy Lamp
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the screw (2) that secures the integral mounting tab of the courtesy lamp unit (1) to the lower instrument panel (3).
3. Pull the courtesy lamp down from the lower instrument panel far enough to access and disconnect the instrument panel wire harness connector from the back of the courtesy lamp.
4. Remove the courtesy lamp from under the instrument panel.

COURTESY LAMP BULB

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or

service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 7: Courtesy Lamp Lens
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Support the courtesy lamp unit housing (1) with one hand while firmly grasping the flange on the outer circumference of the lens (4) with the other hand, then pull the lens straight down to unsnap it from the housing.
3. Pull the bulb (3) straight out of the courtesy lamp socket.

INSTALLATION

COURTESY LAMP

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or

2. Carefully press the bulb firmly and evenly into the bulb holders until it snaps into place.
3. Reinstall the lamp into the headliner. See **INSTALLATION**.
4. Reconnect the battery negative cable.

SECOND ROW DOME/READING LAMP BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

NOTE: The second row reading lamps are integral to the grab handle in the headliner on the inner roof side rail over each outboard rear seating position. Refer to INTERIOR for the handle service procedure.

814a8d26

Fig. 16: Removing/Installing Second Row Reading Lamp Bulb
Courtesy of CHRYSLER LLC

1. Align the base of the bulb (1) with the bulb holder within the reading lamp housing.
2. Push the bulb into the holder until the base is fully seated.

814a8d06

Fig. 17: Removing/Installing Second Row Reading Lamp Lens
Courtesy of CHRYSLER LLC

3. Insert the large tab on the rear end of the lamp lens (1) into the rear of the lamp housing.
4. Using hand pressure, push the small tab at the upper front corner of the lens (2) rearward and inward towards the lamp housing until it snaps into place.
5. Reconnect the battery negative cable.

GEAR SELECTOR LAMP

REMOVAL

GEAR SELECTOR LAMP BULB

NOTE: This procedure applies only to vehicles equipped with an optional automatic

transmission.

Fig. 18: Identifying Bulb Socket & Gear Selector Bezel
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the center floor console from over the gear selector lever and bezel (2).
3. Firmly grasp the bulb socket (1) on the left lower edge of the bezel housing and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the socket and bulb straight out from the keyed opening in the housing.
5. Pull the base of the bulb straight out of the socket.

INSTALLATION

GEAR SELECTOR LAMP BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

NOTE: This procedure applies only to vehicles equipped with an optional automatic transmission.

Fig. 19: Identifying Bulb Socket & Gear Selector Bezel
Courtesy of CHRYSLER LLC

1. Align the base of the bulb with the gear selector bulb socket (1).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening on the left lower edge of the gear selector bezel (2) housing.
4. Insert the socket and bulb into the housing until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place.
6. Reinstall the center floor console over the gear selector lever and bezel.
7. Reconnect the battery negative cable.

READING LAMP

REMOVAL

READING LAMP BULB

NOTE: The reading lamps are integral to the mini overhead console in the headliner near the windshield.

Fig. 20: Identifying Switch Tab, Lens & Pivot Pins
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Using a small thin-bladed screwdriver, gently pry the notched (forward) end (2) of the reading lamp lens away from the mini overhead console far enough to unsnap the lens from the two pivot pins (3) in the lamp housing.
3. Pull the notched end of the lens downward and slide it forward far enough to disengage the switch tab (1) on the rearward edge of the lens from between the mini overhead console and the switch plunger.
4. Remove the lens from the housing.

Fig. 21: Identifying Overhead Reading Lamp Shield, Reflector & Bulb
Courtesy of CHRYSLER LLC

5. Using a small thin-bladed screwdriver, gently pry either side of the shield (1) inward from the lamp housing toward the reflector (2) and bulb (3) far enough to remove the shield from the housing.

Fig. 22: View Of Reading Lamp Bulb & Holder
Courtesy of CHRYSLER LLC

6. Carefully unsnap the bulb (2) from the two bulb holders (1) within the lamp housing.
7. Remove the bulb from the lamp.

INSTALLATION

READING LAMP BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

NOTE: The reading lamps are integral to the mini overhead console in the headliner

near the windshield.

Fig. 23: View Of Reading Lamp Bulb & Holder
Courtesy of CHRYSLER LLC

1. Align the ends of the bulb (2) with the two bulb holders (1) within the mini overhead console lamp housing.
2. Carefully press the bulb firmly and evenly into the bulb holders until it snaps into place.

Fig. 24: Identifying Overhead Reading Lamp Shield, Reflector & Bulb
Courtesy of CHRYSLER LLC

3. Position the shield (1) over the lamp reflector (2) and bulb (3) within the lamp housing.
4. Using hand pressure, push both sides of the shield up into the housing to secure it into place.

Fig. 25: Identifying Switch Tab, Lens & Pivot Pins
 Courtesy of CHRYSLER LLC

5. Engage the switch tab (1) on the rearward edge of the lens (2) between the mini overhead console and the switch plunger.
6. Position the pivots on both forward sides of the lens over the pivot pins (3) in the lamp housing.
7. Using hand pressure over both lens pivots, press upward firmly and evenly until both pivots snap into place.
8. Reconnect the battery negative cable.

VANITY LAMP

REMOVAL

VANITY LAMP BULB

NOTE: Vehicles equipped with optional vanity lamps have a single lamp above a covered mirror that is integral to each sun visor. Each lamp is independently controlled by an integral switch that is automatically actuated by the mirror cover. The bulb types and service procedures are identical for both of these lamps.

815070ce

Fig. 26: Identifying Vanity Lamp Lens
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Using a small flat-bladed screwdriver, gently pry the upper edge of the lens (3) away from the vanity lamp housing far enough to disengage the two snap features (1).
3. Pull the upper edge of the lens away from the visor far enough to disengage the two tabs (2) at the bottom of the lens from the lamp housing.

81507134

Fig. 27: Removing/Installing Vanity Lamp Bulb
Courtesy of CHRYSLER LLC

4. Carefully unsnap the bulb (2) from the two bulb holders (1) within the lamp housing.
5. Remove the bulb from the lamp.

INSTALLATION

VANITY LAMP BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

NOTE: Vehicles equipped with optional vanity lamps have a single lamp above a covered mirror that is integral to each sun visor. Each lamp is independently

controlled by an integral switch that is automatically actuated by the mirror cover. The bulb types and service procedures are identical for both of these lamps.

81507134

Fig. 28: Removing/Installing Vanity Lamp Bulb
Courtesy of CHRYSLER LLC

1. Align the ends of the bulb (2) with the two bulb holders (1) within the vanity lamp housing.
2. Carefully press the bulb firmly and evenly into the bulb holders until it snaps into place.

815070ce

Fig. 29: Identifying Vanity Lamp Lens
Courtesy of CHRYSLER LLC

3. Engage the two tabs (2) on the lower edge of the lens (3) within the bottom of the lamp housing.
4. Using hand pressure, press the upper edge of the lens over the top of the lamp housing until the two tabs (1) at the top of the lens snap into place.
5. Reconnect the battery negative cable.

2008 MAINTENANCE

Lubrication & Maintenance - Liberty

INTERNATIONAL SYMBOLS

DESCRIPTION

INTERNATIONAL SYMBOLS

	ENGINE OIL		BRAKE FLUID
	AUTOMATIC TRANSMISSION FLUID		POWER STEERING FLUID
	ENGINE COOLANT		WINDSHIELD WASHER FLUID

DaimlerChrysler Corporation uses international symbols to identify engine compartment lubricant and fluid inspection and fill locations. See **Fig. 1**.

PARTS & LUBRICANT RECOMMENDATION

DESCRIPTION

FLUID TYPES

When service is required, Chrysler recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing Chrysler vehicles.

Only lubricants bearing designations defined by the following organization should be used to service a Chrysler

vehicle:

Society of Automotive Engineers (SAE)

American Petroleum Institute (API). See **Fig. 2**.

National Lubricating Grease Institute (NLGI)

European Automobile Manufacturers Association (ACEA)

API QUALITY CLASSIFICATION

9400-9

Fig. 2: API Symbol

Courtesy of CHRYSLER LLC

This symbol on the front of an oil container means that the oil has been certified by the American Petroleum Institute (API) to meet all the lubrication requirements specified by Chrysler.

GEAR LUBRICANTS

SAE ratings also apply to multigrade gear lubricants. In addition, API classification defines the lubricant's usage, such as API GL-5 and SAE 75W-90.

PARTS & LUBRICATION RECOMMENDATIONS

CHASSIS

Component	Fluid, Lubricant, or Genuine Part
Steering Gear & Linkage, Ball Joints, Prop Shafts & Yokes, Wheel Bearings	Mopar® Multi-Purpose Lubricant NLGI Grade 2 EP, GC-LB

BODY

Component	Fluid, Lubricant, and Genuine Part
Hinges:	
Door & Hood	Mopar® Engine Oil
Swing Gate	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Latches: Door, Hood/Safety Catch, Swing Gate	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Seat Regulator & Track	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Lock Cylinders	Mopar® Lock Cylinder Lube

FLUID TYPES

DESCRIPTION

A/C REFRIGERANT

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear and colorless liquefied gas.

CAUTION: R-134a refrigerant is not compatible with R-12 refrigerant in an A/C system. Even a small amount of R-12 refrigerant added to an R-134a refrigerant system will cause A/C compressor failure.

The A/C refrigerant system is filled-for-life at the factory and requires no regular maintenance. Although not required at specific intervals, the charge level should be checked if system performance deteriorates or if a noise or leak is suspected. Refer to **DIAGNOSIS AND TESTING** .

ATF+4 POWER STEERING FLUID

Mopar® ATF +4, Automatic Transmission Fluid is required in the power steering system. Substitute fluids can induce power steering system failure.

Mopar® ATF +4, Automatic Transmission Fluid when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

AUTOMATIC TRANSMISSION FLUID

NOTE: Refer to Service Procedures in this service information for fluid level checking procedures.

Mopar® ATF +4, Automatic Transmission Fluid is the recommended fluid for DaimlerChrysler automatic transmissions.

Dexron II fluid IS NOT recommended. Clutch chatter can result from the use of improper fluid.

Mopar® ATF +4, Automatic Transmission Fluid when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

FLUID ADDITIVES

DaimlerChrysler strongly recommends against the addition of any fluids to the transmission, other than those automatic transmission fluids listed above. Exceptions to this policy are the use of special dyes to aid in detecting fluid leaks.

Various "special" additives and supplements exist that claim to improve shift feel and/or quality. These additives and others also claim to improve converter clutch operation and inhibit overheating, oxidation, varnish, and sludge. These claims have not been supported to the satisfaction of DaimlerChrysler and these additives **must not be used.** The use of transmission "sealers" should also be avoided, since they may adversely affect the integrity of transmission seals.

BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar brake fluid or an equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from a container which has been left open. An open container of brake fluid will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

COOLANT

WARNING: Antifreeze is an ethylene glycol based coolant and is harmful if swallowed or inhaled. If swallowed, drink two glasses of water and induce vomiting. If inhaled, move to fresh air area. Seek medical attention immediately. Do

not store in open or unmarked containers. Wash skin and clothing thoroughly after coming in contact with ethylene glycol. Keep out of reach of children. Dispose of glycol based coolant properly, contact your dealer or government agency for location of collection center in your area. Do not open a cooling system when the engine is at operating temperature or hot under pressure, personal injury can result. Avoid radiator cooling fan when engine compartment related service is performed, personal injury can result.

CAUTION: Use of Propylene Glycol based coolants is not recommended, as they provide less freeze protection and less corrosion protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769), or the equivalent ethylene glycol based coolant with organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% Ethylene Glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

CAUTION: Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769) may not be mixed with any other type of antifreeze. Mixing of coolants other than specified (non-HOAT or other HOAT), may result in engine damage that may not be covered under the new vehicle warranty, and decreased corrosion protection.

COOLANT PERFORMANCE

The required ethylene-glycol (antifreeze) and water mixture depends upon climate and vehicle operating conditions. The coolant performance of various mixtures follows:

Pure Water- Water can absorb more heat than a mixture of water and ethylene-glycol. This is for purpose of heat transfer only. Water also freezes at a higher temperature and allows corrosion.

100 percent Ethylene-Glycol- The corrosion inhibiting additives in ethylene-glycol need the presence of water to dissolve. Without water, additives form deposits in system. These act as insulation causing temperature to rise to as high as 149°C (300°F). This temperature is hot enough to melt plastic and soften solder. The increased temperature can result in engine detonation. In addition, 100 percent ethylene-glycol freezes at -22°C (-8°F).

50/50 Ethylene-Glycol and Water -Is the recommended mixture, it provides protection against freezing to -37°C (-34°F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. If percentage is lower, engine parts may be eroded by cavitation. Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7°C (-90°F). A higher

percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because specific heat of antifreeze is lower than that of water.

CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.

CAUTION: Do not use coolant additives that are claimed to improve engine cooling.

ENGINE OIL

WARNING: New or used engine oil can be irritating to the skin. Avoid prolonged or repeated skin contact with engine oil. Contaminants in used engine oil, caused by internal combustion, can be hazardous to your health. Thoroughly wash exposed skin with soap and water. Do not wash skin with gasoline, diesel fuel, thinner, or solvents, health problems can result. Do not pollute, dispose of used engine oil properly. Contact your dealer or government agency for location of collection center in your area.

Only lubricants bearing designations defined by the following organization should be used.

Society of Automotive Engineers (SAE)

American Petroleum Institute (API)

National Lubricating Grease Institute (NLGI)

Association des Constructeurs Europeens d' Automobiles (European Automobile Manufacturers Association) (ACEA)

API SERVICE GRADE CERTIFIED

Use an engine oil that is API Certified. MOPAR® provides engine oils, that meet or exceed this requirement.

SAE VISCOSITY

81364ec7

Fig. 3: Oil Filler Cap
Courtesy of CHRYSLER LLC

An SAE viscosity grade is used to specify the viscosity of engine oil. Use only engine oils with multiple viscosities. These are specified with a dual SAE viscosity grade which indicates the cold-to-hot temperature viscosity range. Select an engine oil that is best suited to your particular temperature range. **Refer to your engine oil filler cap for the recommended engine oil viscosity for your vehicle.**

Engine Oil Viscosity (2.8L Diesel Engines)

For vehicles equipped with a Diesel Particulate Filter (DPF), use ESP fully synthetic, low ash oil that meets DaimlerChrysler Material Standard MS-11106 must be used.

For vehicles not equipped with a DPF, use ESP fully synthetic oil that meets DaimlerChrysler Material Standard MS-10725 may be used.

ACEA Categories

For countries that use the ACEA European Oil Categories for Service Fill Oils, use engine oils that meet the requirements of ACEA A1/B1, A2/B2, or A3/B3.

ENERGY CONSERVING OIL

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

CONTAINER IDENTIFICATION

9400-9

Fig. 4: API Certification Mark
Courtesy of CHRYSLER LLC

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the front label of engine oil plastic bottles and the top of engine oil cans.

This symbol means that the oil has been certified by the American Petroleum Institute (API). DaimlerChrysler only recommends API Certified engine oils. Use Mopar® engine oil or equivalent.

SYNTHETIC ENGINE OILS

There are a number of engine oils being promoted as either synthetic or semi-synthetic. If you chose to use such a product, use **only** those oils that meet the American Petroleum Institute (API) and SAE viscosity standard. Follow the service schedule that describes your driving type.

ENGINE OIL ADDITIVES/SUPPLEMENTS

The manufacturer **does not recommend** the addition of any engine oil additives/supplements to the specified engine oil. Engine oil additives/supplements should not be used to enhance engine oil performance. Engine oil additives/supplements should not be used to extend engine oil change intervals. No additive is known to be safe for engine durability and can degrade emission components. Additives can contain undesirable materials that harm the long term durability of engines by:

Doubling the level of phosphorus in the engine oil. The ILSAC (International Lubricant Standard

Approval Committee) GF-2 and GF-3 standards require that engine oil contain no more than 0.10% phosphorus to protect the vehicles emissions performance. Addition of engine oil additives/supplements can poison, from the added sulfur and phosphorus, catalysts and hinder efforts to guarantee emissions performance to 80,000 miles.

Altering the viscosity characteristics of the engine oil so that it no longer meets the requirements of the specified viscosity grade.

Creating potential for an undesirable additive compatibility interaction in the engine crankcase. Generally it is not desirable to mix additive packages from different suppliers in the crankcase; there have been reports of low temperature engine failures caused by additive package incompatibility with such mixtures.

MANUAL TRANSMISSION

NOTE: DaimlerChrysler recommends using Mopar® lubricants or lubricants of equal quality.

NSG370 - Mopar® Manual Transmission Lubricant MS-9224

TRANSFER CASE - MP1522

The MP1522 transfer case uses MOPAR® ATF + 4 automatic transmission fluid.

TRANSFER CASE - MP3022

The MP3022 transfer case uses MOPAR® ATF + 4 automatic transmission fluid.

OPERATION

AUTOMATIC TRANSMISSION FLUID

The automatic transmission fluid is selected based upon several qualities. The fluid must provide a high level of protection for the internal components by providing a lubricating film between adjacent metal components. The fluid must also be thermally stable so that it can maintain a consistent viscosity through a large temperature range. If the viscosity stays constant through the temperature range of operation, transmission operation and shift feel will remain consistent. Transmission fluid must also be a good conductor of heat. The fluid must absorb heat from the internal transmission components and transfer that heat to the transmission case.

FLUID - CAPACITIES & RECOMMENDED

SPECIFICATIONS

SPECIFICATIONS

ENGINE - EXCEPT EXPORT

Component	Fluids, Lubricants and Genuine Parts
Engine Coolant	Mopar® Antifreeze/Coolant 5 Year/100,000 Mile Formula HOAT (Hybrid Organic Additive Technology) or equivalent.

Engine Oil	Use API Certified SAE 5W-20 Engine Oil meeting the requirements of DaimlerChrysler Material Standard MS-6395. Refer to the engine oil fill cap for correct SAE grade.
Engine Oil Filter	Mopar ® Engine Oil Filter, P/N 5281090 or equivalent.
Spark Plugs	ZFR6F-11 (Gap .043 in [1.1 mm])
Fuel Selection	87 Octane, (R+M)/2 Method

ENGINE - EXPORT

Component	Fluids, Lubricants, and Genuine Parts
Engine Coolant	Mopar ® Antifreeze/Coolant 5 Year/100,000 Mile Formula HOAT (Hybrid Organic Additive Technology)
Engine Oil (Gasoline Engines) - Non ACEA Categories	Use API Certified SAE 5W-20 engine oil, meeting the requirements of DaimlerChrysler Material Standard MS-6395. Refer to your engine oil filler cap for correct SAE grade. SAE 5W-30 engine oil approved to MB 229.31 or MB 229.51 may be used when SAE 5W-20 engine oil is not available.
Engine Oil (Gasoline Engines) - ACEA Categories	For countries that use the ACEA European Oil Categories for Service Fill Oils, use engine oils meeting the requirements of ACEA C3, and approved to MB 229.31 or MB 229.51. SAE 5W-30 engine oil approved to MB 229.31 or MB 229.51 may be used when SAE 5W-20 engine oil is not available.
Engine Oil - Diesel (without Particulate Filter)	Use SAE 0W-40 diesel engine oils confirming to API Quality CI-4 or CJ-4. For countries that use the ACEA European Oil Categories for Service Fill Oils, use engine oils meeting the requirements of ACEA C3 and approved to MB 229.31 or MB 229.51.
Engine Oil - Diesel (with Particulate Filter)	Use SAE 5W-30 diesel engine oils conforming to API Quality CI-4 or CJ-4. For countries that use the ACEA European Oil Categories for Service Fill Oils, use engine oils meeting the requirements of ACEA C3 (LOW ASH) and approved to MB 229.31 or MB 229.51.
Spark Plugs (3.7 Liter Engine)	ZFR6F-11 (Gap .043 in [1.1 mm])
Engine Oil Filter (3.7 Liter Engine)	Mopar ® 5281090 or equivalent.
Engine Oil Filter (2.8 Liter Diesel Engine)	Mopar ® Oil Filter (P/N 5003558AA)
Fuel Selection (3.7 Liter Engine)	91 Octane
Fuel Selection (Diesel Engine)	50 Cetane or higher (Less than 15 ppm Sulfur).

CHASSIS

Component	Fluids, Lubricants and Genuine Parts.
Automatic Transmission	Mopar ® ATF+4, Automatic Transmission Fluid.
Manual Transmission	Mopar ® Manual Transmission Lubricant or equivalent (meeting the requirements of DaimlerChrysler Material Standard MS-9224)
Transfer Case	Mopar ® ATF+4, Automatic Transmission Fluid.

Brake Master Cylinder/Manual Transmission Clutch System	Mopar ® DOT 3 Brake Fluid, SAE J1703 should be used. If DOT 3, SAE J1703 brake fluid is not available, then DOT 4 is acceptable. Use only recommended brake fluids.
Power Steering Reservoir	Mopar ® ATF+4, Automatic Transmission Fluid.

AXLES

-	-	U.S.	Metric

*Nominal refill capacities are shown. A variation may be observed from vehicle to vehicle due to manufacturing tolerance and refill procedure.		

MAINTENANCE SCHEDULES

DESCRIPTION

MAINTENANCE SCHEDULES - GAS

The oil change indicator system will remind you that it is time to take your vehicle in for scheduled maintenance.

On Electronic Vehicle Information Center (EVIC) equipped vehicles, "Oil Change Required" will be displayed in the EVIC and a single chime will sound, indicating that an oil change is necessary.

On Non-EVIC equipped vehicles, "Change Oil" will flash in the instrument cluster odometer and a single chime will sound, indicating that an oil change is necessary.

Based on engine operation conditions the oil change indicator message will illuminate, this means that service is required for your vehicle. Have your vehicle serviced as soon as possible, within the next 500 mi (805 km).

NOTE: **The oil change indicator message will not monitor the time since the last oil change. Change your vehicles oil if it has been six months since your last oil change even if the oil change indicator message is NOT illuminated.**

Change your engine oil more often if you drive your vehicle off-road for an extended period of time.

Under no circumstances should oil change intervals exceed 6,000 mi (10 000 km) or 6 months, whichever comes first.

Your authorized dealer will reset the oil change indicator message after completing the scheduled oil change. If a scheduled oil change is performed by someone other than your authorized dealer, the message can be reset by referring to **CHANGE OIL INDICATOR** .

At Each Stop for Fuel

- Check the engine oil level about five minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of coolant reservoir, brake master cylinder, and power steering, and add as needed.
- Check all lights and other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the brake hoses and lines.
- Check the manual transmission fluid level.
- Check the coolant level, hoses, and clamps.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

REQUIRED MAINTENANCE INTERVALS

Maintenance Items	Perform Maintenance Every		
	(Where time and mileage are listed, follow the interval that occurs first.)		
	Miles	Kilometers	or Months
Change the engine oil and engine oil filter.	6,000	10 000	6
Rotate the tires.	6,000	10 000	6
If using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary.	12,000	20 000	12

Inspect the brake linings, and replace if necessary.	12,000	20 000	12
Replace the air conditioning air filter (if equipped).	12,000	20 000	12
Inspect the front and rear axle lubricant. Change the lubricant if using your vehicle for police, taxi, fleet, off-road, or frequent trailer towing.	18,000	30 000	18
Inspect the CV Joints. Perform the first inspection at 12,000 mi (20 000 km) or 12 months.	24,000	40 000	24
Inspect the exhaust system. Perform the first inspection at 12,000 mi (20 000 km) or 12 months.	24,000	40 000	24
Inspect the front suspension, tie rod ends and boot seals, and replace if necessary.	24,000	40 000	24
Replace the engine air cleaner filter.	30,000	50 000	30
Change the manual transmission fluid if using your vehicle for any of the following: trailer towing, snow plowing, heavy loading, taxi, police, delivery service (commercial service), off-road, desert operation, or more than 50% of your driving is at sustained high speeds during hot weather, above 90°F (32°C).	30,000	50 000	30
Inspect the transfer case fluid.	30,000	50 000	30
Replace the spark plugs.	30,000	50 000	30
Change the automatic transmission fluid and filter if using your vehicle for police, taxi, fleet, off-road, or frequent trailer towing.	60,000	100 000	60
Change the transfer case fluid if using your vehicle for any of the following: police, taxi, fleet, off-road, or frequent trailer towing.	60,000	100 000	60
Inspect and replace the PCV valve if necessary.	90,000	150 000	90
Flush and replace the engine coolant.	102,000	170 000	60
Change the automatic transmission fluid and filter.	120,000	200 000	120
Replace the accessory drive belt(s).	120,000	200 000	120

WARNING: You can be badly injured working on or around a motor vehicle. Do only that service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.

There are two maintenance schedules that show the **required** service for your vehicle.

First is Schedule "**A**". It is for vehicles that are not operated under any of the conditions listed under Schedule "B."

Second is Schedule "**B**". It is for vehicles that are operated under the conditions that are listed below and at the beginning of the schedule.

- Day or night temperatures are below 0°C (32°F).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 16.2 km (10 miles).
- More than 50% of your driving is at sustained high speeds during hot weather, above 32°C (90°F).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.

NOTE: **Most vehicles are operated under the conditions listed for Schedule "B."**

Use the schedule that best describes your driving conditions. Where time and mileage are listed, follow the interval that occurs first.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent, add as required.

Once a Month

- Check the tire pressure and look for unusual wear or damage.
- Inspect the battery, and clean and tighten the terminals as required.
- Check the fluid levels of the coolant reservoir, brake master cylinder, and transmission, and add as needed.
- Check all lights and all other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the exhaust system.
- Inspect brake hoses.
- Inspect the CV joints (If equipped) and front suspension components.
- Check the coolant level, hoses, and clamps.
- After completion of off-road operation, the underside of the vehicle should be thoroughly inspected. Examine threaded fasteners for looseness.

Schedule "A"

Kilometers (Miles) [Months]	12 000 (7,500) [6]	24 000 (15,000) [12]	36 000 (22,500) [18]	48 000 (30,000) [24]
Change the engine oil and engine oil filter.	X	X	X	X
Rotate the tires.	X	X	X	X
Inspect the engine air filter element, and replace if necessary.	-	-	-	X
Replace the spark plugs (3.7L Only).	-	-	-	X
Inspect the brake linings.	-	-	X	-
Inspect the manual transmission fluid, add as necessary (3.7L Only).	X	X	X	X
Inspect the transfer case fluid, add as necessary.	-	-	-	X

Kilometers (Miles) [Months]	60 000 (37,500) [30]	72 000 (45,000) [36]	84 000 (52,500) [42]	96 000 (60,000) [48]
Change the engine oil and engine oil filter.	X	X	X	X
Rotate the tires.	X	X	X	X
Inspect the engine air filter element, and replace if necessary.	-	-	-	X
Inspect the PCV Valve, and replace if necessary.<--	-	-	-	X
Replace the spark plugs (3.7L Only).	-	-	-	X
Inspect the brake linings.	-	X	-	-
Inspect the drive belt, and replace as needed.	-	-	-	X
Flush and replace the engine coolant/anti-freeze. Where both time and mileage are indicated, follow the interval which occurs first.	-	-	-	X
Inspect the manual transmission fluid, add as necessary (3.7L Only).	X	X	X	X
Inspect transfer case fluid, add as necessary.	-	-	-	X

--	--	--	--	--

Kilometers (Miles) [Months]	108 000 (67,500) [54]	120 000 (75,000) [60]	132 000 (82,500) [66]	144 000 (90,000) [72]
Change the engine oil and engine oil filter.	X	X	X	X
Rotate the tires.	X	X	X	X
Inspect the engine air filter element, and replace if necessary.	-	-	-	X
Inspect the PCV Valve, and replace if necessary.<--	-	-	-	X
Replace the spark plugs (3.7L Only).	-	-	-	X
Inspect the brake linings.	X	-	-	X
Inspect the drive belt, and replace as needed. Not required if previously replaced (3.7L Only).	X	-	X	-
Inspect the drive belt, and replace as needed. Not required if previously replaced (4.0L Only).	-	X	-	X
Inspect the manual transmission fluid, add as necessary (3.7L Only).	X	X	X	X
Inspect transfer case fluid, add as necessary.	-	-	-	X
Flush and replace the engine coolant/anti-freeze. Where both time and mileage are indicated, follow the interval which occurs first.	-	X	-	-

Kilometers (Miles) [Months]	156 000 (97,500) [78]	168 000 (105,000) [84]	180 000 (112,500) [90]	192 000 (120,000) [96]
Change the engine oil and engine oil filter.	X	X	X	X
Rotate the tires.	X	X	X	X
Inspect the engine air filter element, and replace if necessary.	-	-	-	X
Inspect the PCV Valve, and replace if necessary.<--	-	-	-	X
Replace the spark plugs (3.7L Only).	-	-	-	X
Replace the spark plugs (4.0L Only).	X	-	-	-
Inspect the timing belt, replace if necessary (4.0L Only).	-	X	-	-
Inspect the brake linings.	-	-	X	-
Inspect the drive belt, and replace as needed. Not required if previously replaced (3.7L Only).	X	-	-	X
Inspect the drive belt, and replace as needed. Not required if previously replaced (4.0L Only).	-	X	-	X
Flush and replace the engine coolant/anti-freeze	X	-	-	-

if not done at 60 months.				
Inspect the manual transmission fluid, add as necessary (3.7L Only).	X	X	X	X
Drain and refill the transfer case fluid.	-	-	-	X

Inspection and service should be performed anytime a malfunction is observed or suspected. Retain all receipts.

<-- This maintenance is recommended by the manufacturer to the owner, but it is not required to maintain emissions warranty.

Schedule "B"

Follow schedule "B" if you usually operate your vehicle under one or more of the following conditions.

- Day or night temperatures are below 0°C (32°F).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 16.2 km (10 miles).
- More than 50% of your driving is at sustained high speeds during hot weather, above 32°C (90°F).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.

Kilometers (Miles)	5 000 (3,000)	10 000 (6,000)	14 000 (9,000)	19 000 (12,000)	24 000 (15,000)
Change the engine oil and engine oil filter, if not replaced at 3 months.	X	X	X	X	X
Rotate the tires.	-	X	-	X	-
Inspect the engine air filter element, replace if necessary.	-	-	-	-	X
Inspect the brake linings.	-	-	-	X	-
Inspect the manual transmission fluid, add as necessary (3.7L Only).	X	X	X	X	X
Drain and refill the front and rear axle fluid.	-	-	-	-	X
Inspect the transfer case fluid, add if necessary.	-	-	-	-	X

Kilometers (Miles)	29 000 (18,000)	34 000 (21,000)	38 000 (24,000)	43 000 (27,000)	48 000 (30,000)
Change the engine oil and engine oil filter, if not replaced at 3 months.	X	X	X	X	X
Rotate the tires.	X	-	X	-	X

Inspect the engine air filter element, replace if necessary.	-	-	-	-	X
Inspect the PCV Valve, and replace if necessary.<--	-	-	-	-	X
Replace the spark plugs (3.7L Only).	-	-	-	-	X
Inspect the brake linings.	-	-	X	-	-
Inspect the manual transmission fluid, add as necessary (3.7L Only).	X	X	X	X	X
Drain and refill the front and rear axle fluid.	-	-	-	-	X
Inspect the transfer case fluid, add if necessary.	-	-	-	-	X

Kilometers (Miles)	53 000 (33,000)	58 000 (36,000)	62 000 (39,000)	67 000 (42,000)	72 000 (45,000)
Change the engine oil and engine oil filter, if not replaced at 3 months.	X	X	X	X	X
Rotate the tires.	-	X	-	X	-
Inspect the engine air filter element, replace if necessary.	-	-	-	-	X
Inspect the drive belt, and replace as needed.	-	-	-	-	X
Inspect the brake linings.	-	X	-	-	-
Inspect the manual transmission fluid, add as necessary (3.7L Only).	X	X	X	X	X
Drain and refill the front and rear axle fluid.	-	-	-	-	X
Inspect the transfer case fluid, add if necessary.	-	-	-	-	X

Kilometers (Miles)	77 000 (48,000)	82 000 (51,000)	86 000 (54,000)	91 000 (57,000)	96 000 (60,000)
Change the engine oil and engine oil filter, if not replaced at 3 months.	X	X	X	X	X
Rotate the tires.	X	-	X	-	X
Inspect the engine air filter element, replace if necessary.	-	-	-	-	X
Inspect the PCV Valve, and replace if necessary.<--	-	-	-	-	X
Replace the spark plugs (3.7L Only).	-	-	-	-	X
Inspect the drive belt, and replace as needed. Not required if belt was previously.	-	-	-	-	X

Inspect the brake linings.	X	-	-	-	X
Inspect manual transmission fluid, add as necessary (3.7L Only).	X	X	X	X	X
Drain and refill the automatic transmission fluid. Replace main sump filter and spin-on cooler return filter (if equipped).!	-	-	-	-	X
Drain and refill the front and rear axle fluid.	-	-	-	-	X
Drain and refill the transfer case fluid.	-	-	-	-	X
Flush and replace the engine coolant/anti-freeze.	-	-	-	-	X

Kilometers (Miles)	101 000 (63,000)	106 000 (66,000)	110 000 (69,000)	115 000 (72,000)	120 000 (75,000)
Change the engine oil and engine oil filter, if not replaced at 3 months.	X	X	X	X	X
Rotate the tires.	-	X	-	X	-
Inspect the engine air filter element, replace if necessary.	-	-	-	-	X
Inspect the drive belt, and replace as needed. Not required if belt was previously replaced.	-	-	-	-	X
Inspect the brake linings.	-	-	-	X	-
Inspect manual transmission fluid, add as necessary (3.7L Only).	X	X	X	X	X
Inspect the transfer case fluid, add if necessary.	-	-	-	-	X
Drain and refill the front and rear axle fluid.	-	-	-	-	X

Kilometers (Miles)	125 000 (78,000)	130 000 (81,000)	134 000 (84,000)	139 000 (87,000)	144 000 (90,000)
Change the engine oil and engine oil filter, if not replaced at 3 months.	X	X	X	X	X
Rotate the tires.	X	-	X	-	X
Inspect the engine air filter element, replace if necessary.	-	-	-	-	X
Inspect the PCV Valve, and replace if necessary.<--	-	-	-	-	X
Replace the spark plugs (3.7L Only).	-	-	-	-	X
Inspect the drive belt, and replace as needed. Not required if belt was previously replaced.	-	-	-	-	X

Inspect the brake linings.	-	-	X	-	-
Drain and refill the front and rear axle fluid.	-	-	-	-	X
Inspect the manual transmission fluid, add as necessary (3.7L Only).	X	X	X	X	X
Inspect the transfer case fluid, add if necessary.	-	-	-	-	X

Kilometers (Miles)	149 000 (93,000)	154 000 (96,000)	158 000 (99,000)	163 000 (102,000)	168 000 (105,000)
Change the engine oil and engine oil filter, if not replaced at 3 months.	X	X	X	X	X
Rotate the tires.	-	X	-	X	-
Inspect the engine air filter element, replace if necessary.	-	-	-	-	X
Replace the spark plugs (4.0L Only).	-	-	X	-	-
Inspect the timing belt, replace if necessary (4.0L Only).	-	-	-	X	-
Inspect the drive belt, and replace as needed. Not required if belt was previously replaced.	-	-	-	-	X
Inspect the brake linings.	-	X	-	-	-
Inspect the manual transmission fluid, add as necessary (3.7L Only).	X	X	X	X	X
Drain and refill the front and rear axle fluid.	-	-	-	-	X
Inspect the transfer case fluid, add if necessary.	-	-	-	-	X
Flush and replace the engine coolant/anti-freeze, if not done at 60,000 miles (96 000 km).	-	-	-	X	-

Kilometers (Miles)	173 000 (108,000)	178 000 (111,000)	182 000 (114,000)	187 000 (117,000)	192 000 (120,000)
Change the engine oil and engine oil filter, if not replaced at 3 months.	X	X	X	X	X
Rotate the tires.	X	-	X	-	X
Inspect the engine air filter element, replace if necessary.	-	-	-	-	X
Inspect the PCV Valve, and replace if necessary.<--	-	-	-	-	X
Replace the spark plugs (3.7L Only).	-	-	-	-	X
Inspect the drive belt, and replace as					

needed. Not required if belt was previously replaced.	-	-	-	-	X
Inspect the brake linings.	X	-	-	-	X
Drain and refill the front and rear axle fluid.	-	-	-	-	X
Inspect the manual transmission fluid, add as necessary (3.7L Only).	X	X	X	X	X
Drain and refill the automatic transmission fluid. Replace main sump filter and spin-on cooler return filter (if equipped).!	-	-	-	-	X
Drain and refill the transfer case fluid.	-	-	-	-	X
Flush and replace the engine coolant/anti-freeze, if not replaced at 102,000 miles (163 000 km).	-	-	-	-	X

Inspection and service should also be performed anytime a malfunction is observed or suspected. Retain all receipts.

! Applies only if vehicle is used for frequent trailer towing or fleet/commercial service.

<-- This maintenance is recommended by the manufacturer to the owner, but is not required to maintain emissions warranty.

MAINTENANCE SCHEDULES - EXPORT DIESEL

There are two maintenance schedules that show the **required** service for your vehicle.

First is Schedule "**A**". It is for vehicles that are not operated under any of the conditions listed under Schedule "B".

Second is Schedule "**B**". It is for vehicles that are operated under the conditions that are listed below and at the beginning of the schedule.

- Day or night temperatures are below 0°C (32°F).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 16.2 km (10 miles).
- More than 50% of your driving is at sustained high speeds during hot weather, above 32°C (90°F).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.

NOTE: Most vehicles are operated under the conditions listed for Schedule "B".

Use the schedule that best describes your driving conditions. Where time and mileage are listed, follow the interval that occurs first.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

At Each Stop for Fuel

Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.

Check the windshield washer solvent and add if required.

Once a Month

Check the tire pressure and look for unusual wear or damage.

Inspect the battery and clean and tighten the terminals as required.

Check the fluid levels of coolant reservoir, brake master cylinder, power steering and transmission and add as needed.

Check all lights and all other electrical items for correct operation.

At Each Oil Change

Change the engine oil filter.

Inspect the exhaust system.

Inspect brake hoses.

Check the engine coolant/anti-freeze level, hoses, and clamps.

Inspect engine accessory drive belts. Replace as necessary.

Inspect for the presence of water in the fuel filter/water separator unit.

Schedule "A"

Kilometers (Miles)	20 000 (12,500)	40 000 (25,000)	60 000 (37,500)	80 000 (50,000)	100 000 (62,500)
Change the engine oil and engine oil filter.	X	X	X	X	X
Inspect the engine air filter element. Replace as necessary.	X	-	X	-	X
Replace the engine air filter element.	-	X	-	X	-
Replace the fuel filter/water separator unit.	-	X	-	X	-
Replace the engine accessory drive belt.	-	-	-	-	X
Inspect the brake linings.	-	X	-	X	-

Inspect the manual transmission fluid, add if necessary.	-	X	-	X	-
Inspect the transfer case fluid, add if necessary.	-	-	-	X	-

Kilometers (Miles)	120 000 (75,000)	140 000 (87,500)	160 000 (100,000)	180 000 (112,500)	200 000 (125,000)
Change the engine oil and engine oil filter.	X	X	X	X	X
Inspect the engine air filter element. Replace as necessary.	-	X	-	X	X
Replace the engine air filter element.	X	-	X	-	X
Replace the fuel filter/water separator unit.	X	-	X	-	X
Flush and replace the engine coolant.	-	-	X	-	X
Replace the engine accessory drive belt.	-	-	-	-	X
Replace the engine timing belt, and timing belt tensioner.	-	-	-	-	X
Inspect the brake linings.	X	-	X	-	X
Inspect the manual transmission fluid, add if necessary.	X	-	X	-	X
Inspect the transfer case fluid, add if necessary.	-	-	X	-	-

Inspection and service should be performed anytime a malfunction is observed or suspected. Retain all receipts.

Schedule "B"

Follow schedule "B" if you usually operate your vehicle under one or more of the following conditions.

- Day or night temperatures are below 0°C (32°F).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 16.2 km (10 miles).
- More than 50% of your driving is at sustained high speeds during hot weather, above 32°C (90°F).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.

Kilometers (Miles)	10 000 (6,250)	20 000 (12,500)	30 000 (18,750)	40 000 (25,000)	50 000 (31,250)
Change the engine oil and engine oil filter.	X	X	X	X	X
Inspect the engine air filter element.	X	X	X	X	X

Replace as necessary.					
Replace the engine air filter element.	-	X	-	X	-
Replace the fuel filter/water separator unit.	-	-	-	X	-
Inspect the brake linings.	-	X	-	X	-
Drain and refill the front and rear axle fluid.	-	X	-	X	-

Kilometers (Miles)	60 000 (37,500)	70 000 (43,750)	80 000 (50,000)	90 000 (56,250)	100 000 (62,500)
Change the engine oil and engine oil filter.	X	X	X	X	X
Inspect the engine air filter element. Replace as necessary.	X	X	X	X	X
Replace the engine air filter element.	X	-	X	-	X
Replace the fuel filter/water separator unit.	-	-	X	-	-
Replace the engine accessory drive belt.	X	-	-	-	-
Inspect the brake linings.	X	-	X	-	X
Drain and refill the front and rear axle fluid.	X	-	X	-	X
Drain and refill the transfer case fluid.	-	-	-	-	X
Drain and refill the automatic transmission fluid, and replace sump filter.<--	-	-	-	-	X

Kilometers (Miles)	10 000 (6,250)	20 000 (12,500)	30 000 (18,750)	40 000 (25,000)	50 000 (31,250)
Change the engine oil and engine oil filter.	X	X	X	X	X
Inspect the engine air filter element. Replace as necessary.	X	-	X	-	X
Replace the engine air filter element.	-	X	-	X	-
Replace the fuel filter/water separator unit.	-	-	-	X	-
Drain and refill the front and rear axle fluid.	-	X	-	X	-
Inspect the brake linings.	-	X	-	X	-
Inspect the manual transmission fluid, add if necessary.	-	-	-	-	X
Inspect the transfer case fluid, add if necessary.	-	X	-	X	-
Drain and refill the front and rear axle fluid.	-	X	-	X	-

Kilometers	60 000	70 000	80 000	90 000	100 000

Flush and replace the engine coolant/anti-freeze.	X	-	-	-	-
Inspect the brake linings.	X	-	X	-	X
Inspect the manual transmission fluid, add if necessary.	-	-	-	-	X
Drain and refill the automatic transmission fluid. Replace main sump filter and spin-on cooler return filter (if equipped).	-	-	-	-	X
Inspect the transfer case fluid, add if necessary.	X	-	X	-	X
Drain and refill the front and rear axle fluid.	X	-	X	-	X

<-- Applies only if vehicle is used for frequent trailer towing, or fleet/commercial service.

Inspection and service should be performed anytime a malfunction is observed or suspected. Retain all receipts.

FLUID FILL/CHECK LOCATIONS

DESCRIPTION

FLUID FILL/CHECK LOCATIONS

The fluid check/fill point locations are located in each applicable service information.

HOISTING

STANDARD PROCEDURE

HOISTING RECOMMENDATIONS

Refer to the Owner's Manual for emergency vehicle lifting procedures.

When properly positioned, a floor jack can be used to lift the vehicle. Support the vehicle in the raised position

with jack stands at the front and rear ends of the frame rails.

Fig. 5: Lift Contact Points
Courtesy of CHRYSLER LLC

1 -	Frame Contact Lift (Single Post) Chassis Lift (Non-Axle Dual Post)
-	Outboard Lift (Dual Post) Floor Jack
2 -	Floor Jack

CAUTION: Do not attempt to lift the vehicle with a floor jack positioned under:

- A body side sill.
- A steering linkage component.
- A drive shaft.
- The engine or transmission oil pan.
- The fuel tank.
- A front suspension arm.
- Transfer case.

NOTE: Use the correct sub-frame rail or frame rail lifting locations only.

HOIST

Refer to the Owner's Manual for emergency vehicle lifting procedures.

A vehicle can be lifted with:

A single-post, frame-contact hoist.

A twin-post, chassis hoist.

A ramp-type, drive-on hoist.

NOTE: When a frame-contact type hoist is used, verify that the lifting pads are positioned properly.

WARNING: The hoisting and jack lifting points provided are for a complete vehicle. When a chassis or drivetrain component is removed from a vehicle, the center of gravity is altered making some hoisting conditions unstable. Properly support or secure vehicle to hoisting device when these conditions exist.

JUMP STARTING

STANDARD PROCEDURE

JUMP STARTING PROCEDURE

WARNING: Review all safety precautions and warnings in the battery system service information. Refer to STANDARD PROCEDURE .

Do not jump start a frozen battery, personal injury can result.

If equipped, do not jump start when maintenance free battery indicator dot is yellow or bright color.

Do not jump start a vehicle when the battery fluid is below the top of lead plates.

Do not allow jumper cable clamps to touch each other when connected to a booster source.

Do not use open flame near battery.

Remove metallic jewelry worn on hands or wrists to avoid injury by accidental arcing of battery current.

When using a high output boosting device, do not allow battery voltage to exceed 15 volts. Refer to instructions provided with device being used.

Failure to follow these instructions may result in personal injury.

CAUTION: When using another vehicle as a booster, do not allow vehicles to touch. Electrical systems can be damaged on either vehicle.

TO JUMP START A DISABLED VEHICLE:

1. Raise hood on disabled vehicle and visually inspect engine compartment for:
 - Generator drive belt condition and tension.
 - Fuel fumes or leakage, correct if necessary.
 - Frozen battery.
 - Yellow or bright color test indicator, if equipped.
 - Low battery fluid level.

CAUTION: If the cause of starting problem on disabled vehicle is severe, damage to booster vehicle charging system can result.

2. When using another vehicle as a booster source, turn off all accessories, place gear selector in park or neutral, set park brake or equivalent and operate engine at 1200 RPM.
3. On disabled vehicle, place gear selector in park or neutral and set park brake or equivalent. Turn OFF all accessories.
4. Connect jumper cables to booster battery. RED clamp to positive terminal (+). BLACK clamp to negative terminal (-). DO NOT allow clamps at opposite end of cables to touch, electrical arc will result. See **Fig. 6**. Review all warnings in this procedure.
5. On disabled vehicle, connect RED jumper cable clamp to battery positive (+) terminal. Connect BLACK jumper cable clamp to the engine as close to the ground cable connection as possible. See **Fig. 6**.

CAUTION: Do not crank starter motor on disabled vehicle for more than 15 seconds, starter will overheat and could fail.

6. Allow battery in disabled vehicle to charge to at least 12.4 volts (75% charge) before attempting to start engine. If engine does not start within 15 seconds, stop cranking engine and allow starter to cool (15 min.), before cranking again.

Fig. 6: Connecting Jumper Cables To Battery
Courtesy of CHRYSLER LLC

- 1 - ENGINE GROUND
- 2 - NEGATIVE JUMPER CABLE
- 3 - BATTERY NEGATIVE CABLE
- 4 - POSITIVE JUMPER CABLE
- 5 - BATTERY POSITIVE CABLE
- 6 - BATTERY
- 7 - TEST INDICATOR (IF EQUIPPED)

DISCONNECT CABLE CLAMPS AS FOLLOWS:

Disconnect BLACK cable clamp from engine ground on disabled vehicle.

When using a booster vehicle, disconnect BLACK cable clamp from battery negative terminal.

Disconnect RED cable clamp from battery positive terminal.

Disconnect RED cable clamp from battery positive terminal on disabled vehicle.

TOWING

STANDARD PROCEDURE

TOWING

WHEEL LIFT

FLAT BED

80a7aebb

Fig. 7: Tow Vehicles With Approved Equipment
Courtesy of CHRYSLER LLC

A vehicle equipped with SAE approved wheel lift-type towing equipment can be used to tow Jeep vehicles. When towing a 4WD vehicle using a wheel-lift towing device, use tow dollies under the opposite end of the vehicle. A vehicle with flatbed device can also be used to transport a disabled vehicle.

SAFETY PRECAUTIONS

CAUTION: The following safety precautions must be observed when towing a vehicle:

Secure loose and protruding parts.

Always use a safety chain system that is independent of the lifting and towing equipment.

Do not allow towing equipment to contact the disabled vehicle's fuel tank.

Do not allow anyone under the disabled vehicle while it is lifted by the towing device.

Do not allow passengers to ride in a vehicle being towed.

Always observe state and local laws regarding towing regulations.

Do not tow a vehicle in a manner that could jeopardize the safety of the operator, pedestrians or other motorists.

Do not attach tow chains, T-hooks, or J-hooks to a bumper, steering linkage, drive shafts or a non-reinforced frame hole.

Do not tow a heavily loaded vehicle. Use a flatbed device to transport a loaded vehicle.

TWO-WHEEL - DRIVE VEHICLE TOWING

DaimlerChrysler Corporation recommends that a vehicle be towed with the rear end lifted, whenever possible.

WARNING: When towing a disabled vehicle and the drive wheels are secured in a wheel lift or tow dollies, ensure the transmission is in the park position (automatic transmission) or a forward drive gear (manual transmission).

WARNING: Ensure vehicle is on a level surface or the wheels are blocked to prevent vehicle from rolling.

TWO WHEEL DRIVE TOWING - REAR END LIFTED

CAUTION: Do not use steering column lock to secure steering wheel during towing operation.

Provided that the transmission is operable, tow with the transmission in N (Neutral) and the ignition key in the OFF position along with the front wheels raised and the rear wheels on the ground. The speed must not exceed 30 mph (50 km/h) and the distance must not exceed 15 miles (25 km).

If the vehicle is to be towed more than 15 miles (25 km) or faster than 30 mph, it must be towed on a flatbed, or with the rear wheels raised and the front wheels on the ground, or with the front end raised and the rear wheels

on a towing dolly.

1. Attach wheel lift device to rear wheels.
2. Place the transmission in neutral.
3. Raise vehicle to towing position.
4. Attach safety chains. Route chains so not to interfere with tail pipe when vehicle is lifted.

CAUTION: Do not use steering column lock to secure steering wheel during towing operation.

5. Secure steering wheel in straight ahead position with a clamp device designed for towing.
6. Place transmission in park.

CAUTION: Towing the vehicle, with the rear wheels on the ground, at more than 30 mph (50 km/h) or for more than 15 miles (25 km) can cause severe transmission damage.

TWO WHEEL DRIVE TOWING - FRONT END LIFTED

CAUTION: Many vehicles are equipped with air dams, spoilers, and/or ground effect panels. To avoid component damage, a wheel-lift towing vehicle or a flat-bed hauling vehicle is recommended.

1. Attach wheel lift device to rear wheels.
2. Place the transmission in neutral.
3. Raise the rear of the vehicle off the ground and install tow dollies under rear wheels.
4. Attach wheel lift device to front wheels and raise vehicle to towing position.
5. Attach the safety chains.

CAUTION: Do not use steering column lock to secure steering wheel during towing operation.

6. Turn the ignition switch to the OFF position to unlock the steering wheel.
7. Secure steering wheel in straight ahead position with a clamp device designed for towing.
8. Place transmission in park.

FOUR-WHEEL - DRIVE VEHICLE TOWING

DaimlerChrysler Corporation recommends that a 4WD vehicle be transported on a flat-bed device. A Wheel-lift device can be used provided **the trailing wheels are off the ground and positioned in tow dollies.**

WARNING: When towing a disabled vehicle and the drive wheels are secured in a wheel lift or tow dollies, ensure the transmission is in the park position.

CAUTION: Many vehicles are equipped with air dams, spoilers, and/or ground effect panels. To avoid component damage, a wheel-lift towing vehicle or a flat-bed hauling vehicle is recommended.

FOUR WHEEL DRIVE TOWING - REAR END LIFTED

WARNING: Ensure vehicle is on a level surface or the wheels are blocked to prevent vehicle from rolling.

1. Attach wheel lift device to front wheels.
2. Place the transmission in neutral.
3. Raise the front of the vehicle off the ground and install tow dollies under front wheels.
4. Attach wheel lift device to rear wheels and raise vehicle to towing position.
5. Attach safety chains. Route chains so not to interfere with tail pipe when vehicle is lifted.
6. Turn the ignition switch to the OFF position to unlock the steering wheel.

CAUTION: Do not use steering column lock to secure steering wheel during towing operation.

7. Secure steering wheel in straight ahead position with a clamp device designed for towing.
8. Place transmission in park.

FOUR WHEEL DRIVE TOWING - FRONT END LIFTED

WARNING: Ensure vehicle is on a level surface or the wheels are blocked to prevent vehicle from rolling.

1. Attach wheel lift device to rear wheels.
2. Place the transmission in neutral.
3. Raise the rear of the vehicle off the ground and install tow dollies under rear wheels.
4. Attach wheel lift device to front wheels and raise vehicle to towing position.
5. Attach the safety chains.

CAUTION: Do not use steering column lock to secure steering wheel during towing operation.

6. Secure steering wheel in straight ahead position with a clamp device designed for towing.
7. Place transmission in park.

2008 MANUAL TRANSMISSION

NSG370 - Service Information - Liberty

MANUAL TRANSMISSION - NSG370

DIAGNOSIS AND TESTING

MANUAL TRANSMISSION - NSG370

LOW LUBRICANT LEVEL

A low transmission lubricant level is generally the result of a leak, inadequate lubricant fill or incorrect lubricant level check.

Rear transmission leaks will be from the oil seals or component mating surfaces.

Front transmission leaks will be from the front input shaft retainer seal. Lubricant may drip from the clutch housing after extended operation. If leak is severe, it may contaminate the clutch disc.

Lubricant level check can only be made when the vehicle is level and allowing the lubricant to settle for a minute before checking. This will ensure an accurate check and avoid an under filled or over filled condition.

HARD SHIFTING

Hard shifting is usually caused by low lubricant level, improper or contaminated lubricants. This will cause noise, excessive wear, internal bind, and hard shifting. Substantial lubricant leaks can result in gear, shift rail, synchro, and bearing damage. The first indications of component damage is usually hard shifting and noise.

Shift component damage, clutch adjustment, worn pressure plate or disc are also causes of increased shift effort. If clutch problem is advanced, gear clash during shifts can result. Worn or damaged synchronizer rings can cause gear clash when shifting into any forward gear. In some new or rebuilt transmissions, new synchro rings may tend to stick slightly causing hard or noisy shifts. In most cases, this condition will decline as the rings wear-in.

TRANSMISSION NOISE

Most manual transmissions make some noise during normal operation. Rotating gears generate a mild whine that is audible, but generally only at extreme speeds.

Severe, highly audible transmission noise is generally the initial indicator of a lubricant problem. Insufficient, improper or contaminated lubricant will promote rapid wear of gears, synchronizers, shift rails, forks and bearings. The overheating caused by a lubricant problem, can also lead to gear and bearing damage.

STANDARD PROCEDURE

STANDARD PROCEDURE-DRAIN & FILL

8137542a

Fig. 1: Drain Plug
Courtesy of CHRYSLER LLC

1. With vehicle in neutral, position vehicle on hoist.
2. Remove drain plug (1) and drain fluid.

8137542e

Fig. 2: Fill Plug

Courtesy of CHRYSLER LLC

3. Install drain plug and remove fill plug (1).
4. Fill transmission with 1.5 L (3.17 pts.) of Mopar® Manual Transmission Lubricant MS-9224 or to the bottom of the fill plug (1) hole.

REMOVAL

MANUAL TRANSMISSION - NSG370

Fig. 3: Identifying Shift Knob & Boot

8. Remove mainshaft bearing (1) retainer bolts and remove retainers (2).
9. Remove bearing from housing with a hammer and driver.

CLEANING

MANUAL TRANSMISSION - NSG370

Clean gears, shafts, shift components and transmission housings with a standard parts cleaning solvent. Do not use acid or corrosive base solvents. Dry all parts except bearings with compressed air.

Clean shaft bearings with a mild solvent such as Mopar™ degreasing solvent or similar solvents. Do not dry the bearings with compressed air. Allow the bearings to either air dry or wipe them dry with clean shop towels.

INSPECTION

813cb160

Fig. 59: Mainshaft
Courtesy of CHRYSLER LLC

NOTE: Minor corrosion, nicks, or pitting can be smoothed with 400 grit emery and polished out with crocus cloth.

Bearings: Inspect for worn, cracked, flat-spotted or brinnelled.

Gears: Inspect for worn, chipped or cracked teeth. Inspect bearing surfaces for ware or flat-spotted.

Mainshaft: Inspect for worn splines, snap ring grooves and threads. Inspect bearing surfaces for ware or flat-spotted. **Third gear (1) and fourth gear (2) are serviced with mainshaft only.**

813c9828

Fig. 60: Identifying Bearing Surfaces & 3-4 Synchronizer Assembly
Courtesy of CHRYSLER LLC

Countershaft: Inspect for worn, chipped or cracked teeth. Inspect bearing surfaces (1) for wear or flat-spots. Inspect 3-4 synchronizer assembly (2). Inspect oil slinger for cracks. **The countershaft is serviced as an assembly.**

Oil Slinger: Inspect first/reverse oil slinger for cracks.

814170a3

Fig. 61: Input Shaft
Courtesy of CHRYSLER LLC

Input Shaft: Inspect for worn, chipped or cracked teeth (1). Inspect bearing surface (2) for wear or flat-spots. Inspect for worn splines (3).

8141712e

Fig. 62: Synchronizer Rings
Courtesy of CHRYSLER LLC

Synchronizer components: Inspect for worn, chipped or cracked teeth (1) and burned friction surface (2) or flaking off friction material (3). **Synchronizers are serviced as an assembly. 3-4 synchronizer assembly is serviced with countershaft.**

Fig. 63: Shift Forks
Courtesy of CHRYSLER LLC

Shift forks: Inspect shift forks and shoes (1) for wear and distortion. Check fit of fork shoes in synchronizer sleeve to ensure parts fit and work smoothly, replace if necessary. If shift fork pads (2) are worn, the shift fork must be replaced.

Housing/Tail housing: Inspect sealing and mating surfaces are free of burrs and nicks. Inspect alignment dowels are tight and in good condition.

81416ff3

Fig. 64: Identifying Retainer Input Shaft
Courtesy of CHRYSLER LLC

Input Shaft Retainer: Inspect retainer (1) release bearing slide surface (2).

ASSEMBLY

MANUAL TRANSMISSION - NSG370

MAINSHAFT

813c9c6e

Fig. 65: Second Gear Bearing
Courtesy of CHRYSLER LLC

1. Place mainshaft in Fixture 9648 mounted in a vise.
2. Install second gear bearing (1) on mainshaft (2).

813c9caa

Fig. 66: Second Gear

14. Install first gear (1) and bearing (2). Then center 1-2 synchronizer sleeve on synchronizer hub.

813eed6a

Fig. 78: Washer & Race
Courtesy of CHRYSLER LLC

WARNING: Use welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.

CAUTION: A bearing heater is used to assemble first gear thrust washer (1) and reverse gear bearing race (2). Use only a bearing heater/hot plate and follow manufacture's instructions. Heat components to 100 - 177 Celsius (212° Min. - 350° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to

following these instructions will result in component damage.

15. Heat first gear thrust washer (1) and reverse gear bearing race (2) with bearing heater to maximum of 177 Celsius (350° Fahrenheit).

Fig. 79: Thrust Washer & Race
Courtesy of CHRYSLER LLC

16. Using welding gloves or tongs, install first gear thrust washer (1) then reverse gear bearing race (2).

Fig. 80: Identifying Reverse Gear & Bearing
Courtesy of CHRYSLER LLC

17. Install reverse gear (1) and bearing (2).

Fig. 81: Identifying Reverse Gear & Synchronizer Ring
Courtesy of CHRYSLER LLC

18. Install reverse gear (1) synchronizer friction ring (2).

COMPASS TEMPERATURE FUNCTION

DESCRIPTION

ELECTRONIC VEHICLE INFORMATION CENTER

Instrument Cluster With Compass And Temperature Display

Fig. 3: Instrument Cluster With Electronic Vehicle Information Center (EVIC)
 Courtesy of CHRYSLER LLC

NOTE: Instrument cluster with Electronic Vehicle Information Center (EVIC) shown in illustration. Instrument cluster with Temperature Display and instrument cluster with Compass Temperature Display similar.

The Compass Temperature Display functions are available on the mid level instrument cluster. The compass and temperature readout is displayed in the lower left part of the instrument cluster (30) below the fuel (1) and engine coolant temperature (3) gauges. The display shows the current ambient temperature and one of eight compass readings identifying which direction the vehicle is facing. Pressing and holding the instrument cluster push-button (29) allows setting of the variance zone and manual calibration of the compass.

The display in the lower right part of the instrument cluster (26) below the tachometer (23) shows the vehicle odometer related functions. These functions include Trip Odometer (ODO), Trip A and Trip B readouts. The instrument cluster push-button (29) can be used to scroll through the different odometer functions. Refer to **DESCRIPTION** for additional information on the instrument cluster and related functions.

The Compass Temperature Display system is comprised of several different components. Those components are:

- Instrument Cluster (sometimes referred to as Cab Compartment Node)
- Ambient Temperature Sensor
- Remote Compass Module (RCM)
- Controller Area Network (CAN) Data Bus
- Local Interface Network (LIN) Data Bus
- Totally Integrated Power Module

The compass temperature display and the instrument cluster button are part of the Instrument Cluster assembly and cannot be serviced as separate components. If the display or button are inoperative the complete Instrument

Cluster assembly must be replaced. Refer to **REMOVAL** .

Instrument Cluster With Temperature Display

Fig. 4: Instrument Cluster With Electronic Vehicle Information Center (EVIC)
Courtesy of CHRYSLER LLC

NOTE: Instrument cluster with Electronic Vehicle Information Center (EVIC) shown in illustration. Instrument cluster with Temperature Display and instrument cluster with Compass Temperature Display similar.

The Temperature Display function is available on the base level instrument cluster. The temperature readout for the base level cluster is displayed in the lower right part of the instrument cluster (26) below the tachometer (23). The display shows the current ambient temperature. The display also shows the vehicle odometer related functions. These functions include Trip Odometer (ODO), Trip A and Trip B readouts. The instrument cluster push-button (29) can be used to scroll through the different odometer functions. Refer to **DESCRIPTION** for additional information on the instrument cluster and related functions.

OPERATION

ELECTRONIC VEHICLE INFORMATION CENTER

The Compass Temperature Display system uses both non-switched and ignition switched sources of battery current so that some of its features remain operational at any time, while others may only operate with the ignition switch in the ON position. When the ignition switch is turned to the ON position, the display will return to the last function being displayed before the ignition was turned to the OFF position. Pressing and holding the instrument cluster push-button allows setting variance zones and manual calibration of the compass.

The Compass Temperature Display system is comprised of several different components that communicate over the Controller Area Network (CAN) and Local Interface Network (LIN) Data Bus circuits. If the system is inoperative a scan tool and the appropriate diagnostic information must be used to diagnose the system and related data buses.

DIAGNOSIS AND TESTING

COMPASS TEMPERATURE FUNCTION

CAUTION: Do not place any external magnets, such as magnetic roof mount antennas, in the vicinity of the Remote Compass Module (RCM) located above the headliner in the rear of the vehicle. Do not place any electronic devices (cell phones, laptop computers, PDAs, portable DVD players, etc), on or near the rear of the roof as the RCM performance may be effected. Do not use magnetic tools when servicing the RCM.

The Compass and Temperature data is obtained from several components on the Controller Area Network (CAN) and Local Interface Network (LIN) Data Bus circuits. The Compass Temperature Display will not function properly if the bus messages from any of these components is not received. If no Compass Temperature Display data is present or the display is inaccurate, check the CAN and LIN Data Bus circuit communications, the Instrument Cluster functions, the Remote Compass Module (RCM) and the Totally Integrated Power Module (TIPM). Should the RCM become disconnected or the signal from the RCM is lost, the instrument cluster will display dashes "- -".

The use of a scan tool and the proper diagnostic procedures information are recommended for further testing of the Instrument Cluster, the RCM, the CAN Data Bus and the LIN Data Bus circuits. Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

STANDARD PROCEDURE

COMPASS DEMAGNETIZING

Fig. 5: DEGAUSSING TOOL #6029
Courtesy of CHRYSLER LLC

A degaussing tool (Special Tool 6029) is used to demagnetize, or degauss, the overhead console forward mounting screw and the roof panel above the overhead console. Equivalent units must be rated as continuous duty for 110/115 volts and 60 Hz. They must also have a field strength of over 350 gauss at 7 millimeters (0.25 inch) beyond the tip of the probe.

To demagnetize the roof panel proceed as follows:

1. Be certain that the ignition switch is in the Off position, before you begin the demagnetizing procedure.

J908E-27

Fig. 6: Demagnetizing Roof Panel Procedure
Courtesy of CHRYSLER LLC

2. Place a piece of paper approximately 22 by 28 centimeters (8.5 by 11 inches), oriented on the vehicle lengthwise from rear to front, on the center line of the roof at the rear liftgate. The purpose of the paper is to protect the roof panel from scratches, and to define the area to be demagnetized.
3. Connect the degaussing tool to an electrical outlet, while keeping the tool at least 61 centimeters (2 feet) away from the vehicle.
4. Slowly approach the center line of the roof panel at the rear liftgate, with the degaussing tool connected.
5. Contact the roof panel with the plastic coated tip of the degaussing tool. Be sure that the template is in place to avoid scratching the roof panel. Using a slow, back-and-forth sweeping motion, and allowing 13 millimeters (0.50 inch) between passes, move the tool at least 11 centimeters (4 inches) to each side of the roof center line, and 28 centimeters (11 inches) forward of the rear liftgate.
6. With the degaussing tool still energized, slowly back it away from the roof panel. When the tip of the tool is at least 61 centimeters (2 feet) from the roof panel, disconnect the tool.
7. Calibrate the compass and adjust the compass variance. See **STANDARD PROCEDURE**.

MANUAL COMPASS CALIBRATION

CAUTION: Do not place any external magnets, such as magnetic roof mount antennas, in the vicinity of the Remote Compass Module (RCM) located above the headliner in the rear of the vehicle. Do not place any electronic devices (cell phones, laptop computers, PDAs, portable DVD players, etc), on or near the rear of the roof as the RCM performance may be effected.

Do not use magnetic tools when servicing the RCM.

NOTE: Manual calibration is required anytime a new RCM is installed. The RCM can be calibrated by performing the following procedure.

The electronic compass unit features a continuous self-calibrating feature. This feature automatically updates the compass calibration as the vehicle is driven. This allows the compass unit to compensate for small changes in the residual magnetism that the vehicle may acquire during normal use. If the compass readings appear to be erratic or the Compass Temperature Displays "CAL", perform the following calibration procedure. Also, any time a new RCM is installed, it must be manually calibrated using this procedure.

Manually calibrate the compass as follows:

NOTE: Do not attempt to calibrate the compass near large metal objects such as other vehicles, large buildings, or bridges; or, near overhead or underground power lines.

1. Start the engine but leave the vehicle in "PARK".
2. Depress the instrument cluster button for approximately 10 seconds until the current variance zone is displayed.
3. Once in the current variance zone is displayed depress the instrument cluster button for approximately 10 seconds until the "CAL" message is displayed solidly not blinking.
4. To complete the compass calibration, drive the vehicle in one or more complete 360 degree circles under 8 km/h (5 mph) in an area free of large metal objects such as other vehicles, large buildings, or bridges; or, near overhead or underground power lines, until the "CAL" indicator turns off. The compass will now function normally.

NOTE: If the compass display indicates an inaccurate compass heading or the display is locked up, the RCM may be inoperative or the vehicle may need to be demagnetized. Perform the Compass Demagnetizing Procedure prior to performing any system diagnosis. See STANDARD PROCEDURE.

NOTE: If the "CAL" message remains in the display or if the compass heading is inaccurate following the calibration procedure and there are no internal compass faults, either there is excessive magnetism near the compass, or the unit is inoperative. Repeat the calibration procedure at least one more time prior to performing any system diagnosis.

NOTE: If the wrong direction is still indicated in the compass display, the area selected for calibration may be too close to a strong magnetic field. Repeat the calibration procedure in another location.

80a13863

Fig. 7: Variance Settings
Courtesy of CHRYSLER LLC

NOTE: If the vehicle is taken on long trips into a new variance zone the compass function may be effected. Compass variance will need to be updated to the new zone number to function properly.

Compass variance, also known as magnetic declination, is the difference in angle between magnetic north and geographic north. In some geographic locations, the difference between magnetic and geographic north is great enough to cause the compass to give inaccurate readings. To optimize compass accuracy, the compass variance should be properly set according to the compass variance map zone for the region that the vehicle is in.

To set the compass variance:

1. Using the Variance Settings map, find your geographic location and note the zone number.
2. Turn the ignition switch to the ON position.
3. Depress the instrument cluster button for approximately 10 seconds until the current variance zone is displayed.

NOTE: The default for the compass variance from the factory is 8. During programming, the Zone value will wrap around from Zone 15 to Zone 1.

4. To change the zone, press and hold (longer than two seconds) the instrument cluster button to increment the variance one step. Repeat as necessary, with individual long (longer than two seconds) instrument cluster button presses for each increment, until the desired variance is achieved. When the correct zone is displayed, wait approximately 15 seconds. The instrument cluster will store the new variance value in memory and the compass will resume normal operation.
5. Confirm that the correct directions are now indicated by the compass.

ELECTRONIC VEHICLE INFORMATION CENTER

DESCRIPTION

ELECTRONIC VEHICLE INFORMATION CENTER

Fig. 8: Instrument Cluster With Electronic Vehicle Information Center (EVIC)
Courtesy of CHRYSLER LLC

The Electronic Vehicle Information Center (EVIC) features a driver-interactive display (30). The display is located in the lower left part of the instrument cluster below the fuel (1) and engine temperature (3) gauges.

The display in the lower right part of the instrument cluster (26) below the tachometer (23) shows the vehicle odometer related functions. These functions include Trip Odometer (ODO), Trip A and Trip B readouts. The instrument cluster push-button (29) can be used to scroll through the different odometer functions. Refer to **DESCRIPTION** for additional information on the instrument cluster and related functions.

Fig. 9: EVIC Function Buttons
Courtesy of CHRYSLER LLC

The EVIC system conveniently allows the driver to navigate through and select a variety of useful information by pressing the EVIC function buttons located on the steering wheel. The EVIC displays information related to the following:

- System Status
- Vehicle information warning message displays
- Tire Pressure Monitor System (TPM) - If Equipped
- Personal Settings (customer programmable features)
- Compass display
- Outside temperature display
- Trip computer functions
- UConnect™ hands-free communication system displays - If Equipped
- Navigation system screens - If Equipped
- Audio mode display

The EVIC system is comprised of several different components. Those components are:

- Instrument Cluster (sometimes referred to as Cab Compartment Node [CCN])
- Steering Wheel Function Buttons
- Ambient Temperature Sensor
- Remote Compass Module (RCM)
- Controller Area Network (CAN) Data Bus
- Local Interface Network (LIN) Data Bus

The EVIC display is part of the Instrument Cluster assembly and is not serviced as a separate component. If the display is inoperative the complete Instrument Cluster assembly must be replaced. Refer to **REMOVAL** .

OPERATION

ELECTRONIC VEHICLE INFORMATION CENTER

The Electronic Vehicle Information Center (EVIC) uses both non-switched and ignition switched sources of battery current so that some of its features remain operational at any time, while others may only operate with the ignition switch in the "ON" position. When the ignition switch is turned to the "ON" position, the EVIC display will return to the last function being displayed before the ignition was turned to the "OFF" position.

The EVIC system is comprised of several different components that communicate over the Controller Area Network (CAN) and Local Interface Network (LIN) Data Buses. **If the system is inoperative a scan tool and the appropriate diagnostic information must be used to diagnose the system.**

Fig. 10: EVIC Function Buttons
Courtesy of CHRYSLER LLC

The EVIC function buttons are used to operate the different functions of the EVIC system. Pressing and releasing the **MENU** button (1) allows the driver to select the Compass/Temperature, Trip Computer, Personal Settings or System Status functions. The **STEP** button (4) is used to toggle through options or features of the Trip Computer, Personal Settings or System Status functions. Pressing and releasing the **RESET** button (3) allows the selection of setting or resetting of the function currently displayed at that time. Pressing and releasing the **C/T** (compass/temperature) button (2) will cause the EVIC to return to the compass/temperature display mode from any other mode.

EVIC DISPLAY MODES

SYSTEM STATUS MODE

System display mode displays warnings and user interaction messages on the EVIC display. The driver can scroll to view multiple messages by using the **STEP** button. System warnings will always over ride the current display as they become active.

When the appropriate conditions exist, the EVIC displays the following messages:

- Turn Signal On (with a continuous warning chime)
- Left Front Turn Signal Lamp Out (with a single chime)
- Left Rear Turn Signal Lamp Out (with a single chime)
- Right Front Turn Signal Lamp Out (with a single chime)
- Right Rear Turn Signal Lamp Out (with a single chime)
- RKE Battery Low (with a single chime)
- Personal Settings Not Available - Vehicle Not in Park (automatic transmissions) or vehicle in motion (manual transmissions)
- Left/Right Front Door Ajar (one or more, with a single chime if speed is above 1 mph)
- Left/Right Rear Door Ajar (one or more, with a single chime if speed is above 1 mph)
- Door (S) Ajar (with a single chime if vehicle is in motion)
- Liftgate Ajar (with a single chime)
- Left Front Low Pressure (with a single chime)
- Left Rear Low Pressure (with a single chime)
- Right Front Low Pressure (with a single chime)
- Right Rear Low Pressure (with a single chime)
- Check TPM System (with a single chime)
- Check Gascap

PERSONAL SETTINGS MODE (CUSTOMER PROGRAMMABLE FEATURES)

Allows the driver to set and recall features when the transmission is in Park by pressing and releasing the **MENU** button until Personal Settings is displayed in the EVIC. Pressing and releasing the **STEP** button will scroll through the following personal settings choices:

Language When in this display you may select one of five languages for all display nomenclature, including the trip functions and the navigation system (if equipped). Press the **RESET** button while in this display to select English, Espanol, or Francais. Then, as you continue, the information will display in the selected language.

NOTE: **The EVIC will not change the UConnect™ language selection.**

Lock Doors Automatically at 15 mph (24 km/h) When ON is selected, all doors will lock automatically when the vehicle reaches a speed of 15 mph (24 km/h). To make your selection, press and release the **RESET** button until "ON" or "OFF" appears.

Unlock Doors Automatically on Exit When ON is selected, all doors will unlock when the vehicle is stopped and the transmission is in the P (Park) or N (Neutral) position and the driver's door is opened. To

make your selection, press and release the **RESET** button until "ON" or "OFF" appears.

Remote Key Unlock When DRIVER DOOR 1ST PRESS is selected, only the driver's door will unlock on the first press of the remote keyless entry unlock button. When Driver Door 1st Press is selected, you must press the remote keyless entry unlock button twice to unlock the passenger's doors. When ALL DOORS 1ST PRESS is selected, all of the doors will unlock on the first press of the remote keyless entry unlock button. To make your selection, press and release the **RESET** button until "Driver Door 1st Press" or "All Doors 1st Press" appears.

Sound Horn with Remote Key Lock When ON is selected, a short horn sound will occur when the remote keyless entry "Lock" button is pressed. This feature may be selected with or without the flash lights on lock/unlock feature. To make your selection, press and release the **RESET** button until "ON" or "OFF" appears.

Flash Lights with Remote Key Lock When ON is selected, the front and rear turn signals will flash when the doors are locked or unlocked with the remote keyless entry transmitter. This feature may be selected with or without the sound horn on lock feature selected. To make your selection, press and release the **RESET** button until "ON" or "OFF" appears.

Delay Turning Headlights Off When this feature is selected, the driver can choose to have the headlights remain on for 0, 30, 60, or 90 seconds when exiting the vehicle. To make your selection, press and release the **RESET** button until "0," "30," "60," or "90" appears.

Turn Headlights On with Remote Key Unlock When this feature is selected, the headlights will activate and remain on for up to 90 seconds when the doors are unlocked with the remote keyless entry transmitter. To make your selection, press and release the **RESET** button until "OFF," "30 sec," "60 sec," or "90 sec." appears.

Delay Power Off to Accessories Until Exit When this feature is selected, the power window switches, radio, hands-free system (if equipped), DVD video system (if equipped), power sunroof (if equipped), and power outlets will remain active for up to 60 minutes after the ignition switch is turned off. Opening a vehicle door will cancel this feature. To make your selection, press and release the **RESET** button until "Off," "45 sec," "5 min," or "10 min." appears.

Confirmation of Voice Commands - If Equipped When ON is selected, all voice commands from the UConnect™ system are confirmed. To make your selection, press and release the **RESET** button until "ON" or "OFF" appears.

Display Units of Measure in The EVIC, odometer, and navigation system (if equipped) can be changed between English and Metric units of measure. To make your selection, press and release the **RESET** button until "US" or "METRIC" appears.

COMPASS/TEMPERATURE

Compass heading and outside temperature are displayed on the EVIC display screen. One of eight compass headings to indicate the direction the vehicle is facing (N, S, E, W, NE, NW, SE, SW) and one of 15 compass variance settings can be programmed. Outside temperature is displayed in °C (degrees Celsius) or °F (degrees Fahrenheit). The audio mode is always present when the compass/temperature function is displayed.

TRIP COMPUTER

Press and release the **MENU** button until one of the following Trip Functions displays in the EVIC:

Average Fuel Economy

Distance To Empty
Elapsed Time
Display Units of Measure in

Press the **STEP** button to cycle through all the Trip Computer functions.

The Trip Functions mode displays the following information:

Average Fuel Economy Shows the average fuel economy since the last reset. When the fuel economy is reset, the display will read "RESET" or show dashes for two seconds. Then, the history information will be erased, and the averaging will continue from the last fuel average reading before the reset.

Distance To Empty (DTE) Shows the estimated distance that can be traveled with the fuel remaining in the tank. This estimated distance is determined by a weighted average of the instantaneous and average fuel economy, according to the current fuel tank level. DTE cannot be reset through the **RESET** button. When the DTE value is less than 30 miles (48 km) estimated driving distance, the DTE display will change to a text display of "LOW FUEL." This display will continue until the vehicle runs out of fuel. Adding a significant amount of fuel to the vehicle will turn off the "LOW FUEL" text and a new DTE value will display.

Elapsed Time Shows the total elapsed time of travel since the last reset when the ignition switch is in the ACC position. Elapsed time will increment when the ignition switch is in the ON or START position.

Display Units of Measure in: To make your selection, press and release the **RESET** button until "US" or "METRIC" appears.

To Reset The Display Reset will only occur while a resettable function is being displayed. Press and release the **RESET** button once to clear the resettable function being displayed. To reset all resettable functions, press and release the **RESET** button a second time within 3 seconds of resetting the currently displayed function (>Reset ALL will display during this 3 second window).

HANDS FREE TELEPHONE MODE - IF EQUIPPED

Provides the following information and features for the optional hands-free communications system:

Phone status: idle, voice mail, roaming, battery strength and signal strength in increments of 20 percent
Call status: Incoming call, connecting, connected, air time in minutes and seconds, call ended, busy, call failed, roaming and no phone connection
UConnect Active
Caller ID phone number display

DIAGNOSIS AND TESTING

ELECTRONIC VEHICLE INFORMATION CENTER

CAUTION: Do not place any external magnets, such as magnetic roof mount antennas, in the vicinity of the Remote Compass Module (RCM) located above the headliner in the rear of the vehicle. Do not place any electronic

devices (cell phones, laptop computers, PDAs, portable DVD players, etc), on or near the rear of the roof as the RCM performance may be effected. Do not use magnetic tools when servicing the RCM.

The Electronic Vehicle Information Center (EVIC) data is obtained from several components on the Controller Area Network (CAN) and Local Interface Network (LIN) Data Bus circuits. The EVIC will not function properly if the bus messages from any of these components is not receive. If no EVIC data is displayed or the display indicates dashes "- -", check the CAN and LIN Data Bus circuit communications, the Instrument Cluster functions, the Remote Compass Module (RCM) and the Totally Integrated Power Module (TIPM). Should the RCM become disconnected, the instrument cluster display will go blank.

The use of a scan tool and the proper diagnostic procedures information are recommended for further testing of the Instrument Cluster, the RCM, the CAN Data Bus and the LIN Data Bus circuits. Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

STANDARD PROCEDURE

COMPASS DEMAGNETIZING

Fig. 11: DEGAUSSING TOOL #6029
Courtesy of CHRYSLER LLC

A degaussing tool (Special Tool 6029) is used to demagnetize, or degauss, the overhead console forward mounting screw and the roof panel above the overhead console. Equivalent units must be rated as continuous duty for 110/115 volts and 60 Hz. They must also have a field strength of over 350 gauss at 7 millimeters (0.25 inch) beyond the tip of the probe.

To demagnetize the roof panel proceed as follows:

1. Be certain that the ignition switch is in the Off position, before you begin the demagnetizing procedure.

J908E-27

Fig. 12: Compass Demagnetizing
Courtesy of CHRYSLER LLC

2. Place a piece of paper approximately 22 by 28 centimeters (8.5 by 11 inches), oriented on the vehicle lengthwise from rear to front, on the center line of the roof at the rear liftgate. The purpose of the paper is to protect the roof panel from scratches, and to define the area to be demagnetized.
3. Connect the degaussing tool to an electrical outlet, while keeping the tool at least 61 centimeters (2 feet) away from the vehicle.
4. Slowly approach the center line of the roof panel at the rear liftgate, with the degaussing tool connected.
5. Contact the roof panel with the plastic coated tip of the degaussing tool. Be sure that the template is in place to avoid scratching the roof panel. Using a slow, back-and-forth sweeping motion, and allowing 13 millimeters (0.50 inch) between passes, move the tool at least 11 centimeters (4 inches) to each side of the roof center line, and 28 centimeters (11 inches) forward of the rear liftgate.
6. With the degaussing tool still energized, slowly back it away from the roof panel. When the tip of the tool is at least 61 centimeters (2 feet) from the roof panel, disconnect the tool.
7. Calibrate the compass and adjust the compass variance. See **STANDARD PROCEDURE**.

COMPASS VARIANCE ADJUSTMENT

80a13863

Fig. 13: Variance Settings
Courtesy of CHRYSLER LLC

Compass variance, also known as magnetic declination, is the difference in angle between magnetic north and true geographic north. In some geographic locations, the difference between magnetic and geographic north is great enough to cause the compass to give false readings. If this problem occurs, the compass variance must be set.

NOTE: If the vehicle is taken on long trips into a new variance zone the compass function may be effected. Compass variance will need to be updated to the new zone number to function properly.

NOTE: The default for the compass variance from the factory is 8.

To set the compass variance:

1. Using the Variance Settings Map, find your geographic location and note the zone number.

Fig. 14: EVIC Function Buttons
Courtesy of CHRYSLER LLC

2. Turn the ignition switch to the ON/RUN position. Press and release the **MENU** push button (1) until "Personal Settings" is displayed.
3. Press the **STEP** push button (4) until "Compass Variance" is displayed.
4. Momentarily depress and release the **RESET** push button (3) to toggle through the zone numbers (1-15), until the zone number for your geographic location appears in the display.

NOTE: **The default for the compass variance from the factory is 8. During programming, the Zone value will wrap around from Zone 15 to Zone 1.**

5. Momentarily depress and release the **C/T** push button (2) to enter the displayed zone number into the compass unit memory.
6. Confirm that the correct directions are now indicated by the compass.

MANUAL COMPASS CALIBRATION

CAUTION: Do not place any external magnets, such as magnetic roof mount antennas, in the vicinity of the Remote Compass Module (RCM) located above the headliner in the rear of the vehicle. Do not place any electronic devices (cell phones, laptop computers, PDAs, portable DVD players, etc), on or near the rear of the roof as the RCM performance may be effected. Do not use magnetic tools when servicing the RCM.

NOTE: **Confirmation that the proper variance zone is programmed, is recommended whenever manual compass calibration is performed. See STANDARD PROCEDURE for the appropriate procedure.**

Fig. 15: EVIC Function Buttons
Courtesy of CHRYSLER LLC

The electronic compass unit features a self-calibrating design, which simplifies the calibration procedure. This feature automatically updates the compass calibration while the vehicle is being driven. This allows the compass unit to compensate for small changes in the residual magnetism that the vehicle may acquire during normal use. If the compass readings appear to be erratic or the Electronic Vehicle Information Center (EVIC) displays "CAL", perform the following manual calibration procedure. Also, any time EVIC service replacement components are installed, they must be calibrated using this procedure. Do not attempt to calibrate the compass near large metal objects such as other vehicles, large buildings, or bridges; or, near overhead or underground power lines.

Calibrate the compass manually as follows:

1. Turn the ignition switch to the ON/RUN position. Press and release the **MENU** push button (1) until "Personal Settings" is displayed.
2. Press the **STEP** push button (4) until "Calibrate Compass" is displayed.
3. Momentarily depress and release the **RESET** push button (3) to initiate the calibration procedure. The "CAL" symbol will come on solid in the EVIC display.
4. Slowly drive the vehicle on a level surface, away from large metal objects and power lines, through one or two **complete** circles not exceeding 8 km/h (5 mph). The "CAL" message will disappear from the display to indicate successful compass calibration.

NOTE: A blank compass display indicates that vehicle degaussing (demagnetizing) may be necessary.

NOTE: If the "CAL" message remains in the display, either there is excessive magnetism near the compass, or the EVIC is inoperative. Attempt the calibration procedure at least one more time before performing EVIC diagnosis.

NOTE: If the wrong direction is still indicated in the compass display, the area selected for calibration may be too close to a strong magnetic field. Repeat the manual calibration procedure in another location.

HOMELINK TRANSCEIVER

DESCRIPTION

UNIVERSAL TRANSMITTER

Fig. 16: Homelink(R) Transceiver & Drivers Side Sun Visor Assembly
Courtesy of CHRYSLER LLC

Some vehicles are equipped with the HomeLink® transceiver (1). The transceiver is located in the drivers side sun visor assembly (2). The only visible component of the HomeLink® transceiver are the three push buttons. The buttons are marked with one, two or three dots, respectively, for identification of each channel.

Each of the three HomeLink® transceiver push buttons controls an independent radio transmitter channel. Each of these three channels can be trained to transmit a different radio frequency signal for the remote operation of garage door openers, motorized gate openers, home or office lighting, security systems or just about any other device that can be equipped with a radio receiver in the 280 to 435 MegaHertz (MHz) frequency range for remote operation. The transceiver is capable of operating systems using either rolling code or non-rolling code technology. The system will not transmit operating signals if the Vehicle Theft Security System is armed.

The HomeLink® transceiver cannot be repaired, and is available for service only with the visor assembly. If any part of the component is inoperative or damaged, the complete visor assembly must be replaced. Refer to **REMOVAL** .

OPERATION

UNIVERSAL TRANSMITTER

The HomeLink® transceiver operates on a non-switched source of battery current so the unit will remain functional, regardless of the ignition switch position. For more information on the features, programming

procedures and operation of the HomeLink® transceiver, see the owner's manual.

DIAGNOSIS AND TESTING

UNIVERSAL TRANSMITTER

80f230cb

Fig. 17: Radio Frequency Detector
Courtesy of CHRYSLER LLC

If the HomeLink® transceiver is inoperative, retrain the transceiver with a known good transmitter, insuring the transmitter battery is OK. See **STANDARD PROCEDURE** for the proper procedure. Test the universal transmitter operation again. If the unit is still inoperative, test the universal transmitter with Radio Frequency Detector special tool as described below:

1. Turn the Radio Frequency (RF) Detector ON (3). A "chirp" will sound and the green power Light

- Emitting Diode (LED) will light (2). If the green LED does not light, replace the battery (4).
2. Hold the RF detector within one inch of the TRAINED universal transmitter and press any of the transmitters buttons.
 3. The red signal detection LEDs (1) will light and the tool will beep if a radio signal is detected. Repeat this test for all three transmitter buttons. If the tool does not detect a radio signal for any of the three buttons, replace the inoperative HomeLink® transceiver assembly. Refer to **REMOVAL** .

STANDARD PROCEDURE

ERASING TRANSMITTER CODES

NOTE: Individual channels cannot be erased. Erasing the HomeLink® transceiver codes will erase ALL programmed codes.

To erase programming from all three buttons (individual buttons cannot be erased but can be "reprogrammed"), follow the step noted:

Press and hold the two outer HomeLink® transceiver buttons until the indicator light begins to flash-after 20 seconds. Release both buttons. Do not hold for longer than 30 seconds. HomeLink® is now in the train (or learning) mode and can be programmed at any time beginning with "Programming". See **STANDARD PROCEDURE**.

PROGRAMMING TRANSMITTER CODES

WARNING: Vehicle exhaust contains carbon monoxide, a dangerous gas. Do not run the vehicle's exhaust while training the transceiver. Exhaust gas can cause serious injury or death.

WARNING: Your motorized door or gate may open and close while you are training the HomeLink® transceiver if the vehicle is in range of the motorized device. Do not train the HomeLink® transceiver if people or pets are in the path of the door or gate. A moving door or gate can cause serious injury or death to people and pets or damage to objects.

NOTE: When programming a garage door opener, it is advised to park outside the garage. It is also recommended that a new battery be placed in the hand-held transmitter of the device being programmed to the HomeLink® transceiver for quicker training and accurate transmission of the radio-frequency signal.

NOTE: If programing the HomeLink® transceiver is unsuccessful using the following procedure, refer to the Owner's Manual for the current customer assistance phone number.

1. Press and hold the two outer HomeLink® transceiver buttons, and release only when the indicator light begins to flash (after 20 seconds). **Do not** hold the buttons for longer than 30 seconds and **do not** repeat step one to program a second and/or third hand-held transmitter to the remaining two HomeLink®

transceiver buttons.

2. Position the end of your hand-held transmitter 3-8 cm (1-3 inches) away from the HomeLink® transceiver buttons while keeping the indicator light in view.
3. Simultaneously press and hold both the HomeLink® transceiver button that you want to train and the hand-held transmitter button. **Do not release the buttons until step 4 has been completed.**
4. The HomeLink® transceiver indicator light will flash slowly and then rapidly after HomeLink® successfully receives the frequency signal from the hand-held transmitter. Release both buttons after the indicator light changes from the slow to rapid flash.
5. Press and hold the just trained HomeLink® transceiver button and observe the indicator light. If the indicator light **stays on constantly, programming is complete** and your device should activate when the button is pressed and released.

NOTE: To program the remaining two buttons, begin with "Programming" step 2. Do not repeat step 1.

If the indicator light blinks rapidly for two seconds and then turns to a constant light, continue with "Programming" steps 6-8 to complete the programming of a rolling code equipped device (most commonly a garage door opener).

6. At the garage door opener receiver (motor-head unit) in the garage, locate the "learn" or "smart" button. This can usually be found where the hanging antenna wire is attached to the motor-head unit.
7. Firmly press and release the "learn" or "smart" button. (The name and color of the button may vary by manufacturer.)

NOTE: There are 30 seconds in which to initiate step 8.

8. Return to the vehicle and firmly **press, hold for two seconds and release** the programmed HomeLink® transceiver button. Repeat the "**press/hold/release**" sequence a second time, and, depending on the brand of the garage door opener (or other rolling code equipped device), repeat this sequence a third time to complete the programming.

The HomeLink® transceiver should now activate your rolling code equipped device.

NOTE: To program the remaining two HomeLink® transceiver buttons, begin with "Programming" step 2. Do not repeat step 1.

Canadian Programming/Gate Programming

Canadian radio-frequency laws require transmitter signals to "time-out" (or quit) after several seconds of transmission which may not be long enough for the HomeLink® transceiver to pick up the signal during programming. Similar to this Canadian law, some U.S. gate operators are designed to "time-out" in the same manner.

If you live in Canada or you are having difficulties programming a gate operator by using the "Programming"

procedures (regardless of where you live), **replace "Programming HomeLink® Transceiver Codes" step 3** with the following:

NOTE: When programming a garage door opener or gate operator, it is advised to **unplug the device or move the vehicle out of range during the "cycling" process to prevent possible overheating.**

3. Continue to press and hold the HomeLink® transceiver button while you **press and release every two seconds** ("cycle") your hand-held transmitter until the frequency signal has successfully been accepted. The indicator light will flash slowly and then rapidly. Proceed with "Programming" step 4 to complete.

REPROGRAMMING TRANSMITTER CODES

WARNING: Vehicle exhaust contains carbon monoxide, a dangerous gas. Do not run the vehicle's exhaust while training the HomeLink® transceiver. Exhaust gas can cause serious injury or death.

WARNING: Your motorized door or gate may open and close while you are training the HomeLink® transceiver if the vehicle is in range of the motorized device. Do not train the HomeLink® transceiver if people or pets are in the path of the door or gate. A moving door or gate can cause serious injury or death to people and pets or damage to objects.

NOTE: If programing the HomeLink® transceiver is unsuccessful using the following procedure, refer to the Owner's Manual for the current customer assistance phone number.

To program a device to the HomeLink® transceiver using a button previously trained, follow these steps:

1. Press and hold the desired HomeLink® transceiver button. **DO NOT** release the button. The indicator light will begin to flash after 20 seconds. Without releasing the HomeLink® transceiver button, proceed to step 2.
2. Position the end of your hand-held transmitter 3-8 cm (1-3 inches) away from the HomeLink® transceiver button while keeping the indicator light in view.
3. Simultaneously press and hold both the HomeLink® transceiver button that you want to train and the hand-held transmitter buttons. **Do not release the buttons until step 4 has been completed.**
4. The HomeLink® transceiver indicator light will flash slowly and then rapidly after it successfully receives the frequency signal from the hand-held transmitter. Release both buttons after the indicator light changes from the slow to the rapid flash.
5. Press and hold the just trained HomeLink® transceiver button and observe the indicator light. If the indicator light **stays on constantly, reprogramming is complete** and your device should activate when the button is pressed and released.

NOTE: If the indicator light blinks rapidly for two seconds and then turns to a constant light, continue with "Reprogramming" steps 6-8 to complete the

programming of a rolling code equipped device (most commonly a garage door opener).

6. At the garage door opener receiver (motor-head unit) in the garage, locate the "learn" or "smart" button. This can usually be found where the hanging antenna wire is attached to the motor-head unit.
7. Firmly press and release the "learn" or "smart" button. (The name and color of the button may vary by manufacturer.)

NOTE: There are 30 seconds in which to initiate step 8.

8. Return to the vehicle and firmly **press, hold for two seconds and release** the reprogrammed HomeLink® transceiver button. Repeat the "**press/hold/release**" sequence a second time, and, depending on the brand of the garage door opener (or other rolling code equipped device), repeat this sequence a third time to complete the reprogramming.

The HomeLink® transceiver should now activate your rolling code equipped device.

Canadian radio-frequency laws require transmitter signals to "time-out" (or quit) after several seconds of transmission which may not be long enough for the HomeLink® transceiver to pick up the signal during programming. Similar to this Canadian law, some U.S. gate operators are designed to "time-out" in the same manner.

If you live in Canada or you are having difficulties programming a gate operator by using the "Programming" procedures (regardless of where you live), **replace "Reprogramming HomeLink® Transceiver Codes" step 3** with the following:

NOTE: When programming a garage door opener or gate operator, it is advised to unplug the device or move the vehicle out of range during the "cycling" process to prevent possible overheating.

3. Continue to press and hold the HomeLink® transceiver button while you **press and release every two seconds** ("cycle") your hand-held transmitter until the frequency signal has successfully been accepted. The indicator light will flash slowly and then rapidly. Proceed with "Programming" step 4 to complete.

SENSOR-AMBIENT TEMPERATURE

DESCRIPTION

AMBIENT TEMP SENSOR

Fig. 18: Ambient Temperature Sensor Location
 Courtesy of CHRYSLER LLC

The ambient temperature sensor (2) is a variable resistor mounted to a bracket that is secured to the left side of the radiator support, behind the grille (1) and in front of the engine compartment.

938C-10

Fig. 19: Identifying Ambient Air Temperature Sensor
 Courtesy of CHRYSLER LLC

The ambient temperature sensor cannot be adjusted or repaired and, if inoperative or damaged, it must be replaced.

OPERATION

AMBIENT TEMPERATURE SENSOR

The ambient temperature sensor is a variable resistor that operates on a five-volt reference signal. The resistance in the sensor changes as temperature changes, changing the temperature sensor signal circuit voltage to the Totally Integrated Power Module (TIPM). Based upon the resistance in the sensor, the instrument cluster, sometimes referred to as the Cab Compartment Node (CCN), display senses a specific voltage on the Controller Area Network (CAN) data bus circuit, which corresponds to a specific temperature. The applicable instrument cluster display then displays the proper ambient temperature.

DIAGNOSIS AND TESTING

AMBIENT TEMP SENSOR

The temperature function is supported by the ambient temperature sensor, a wiring circuit, the Controller Area Network (CAN) data bus, the Local Area Network (LIN) data bus and the Totally Integrated Power Module (TIPM). When the sensor is exposed to temperatures above 60° C (130° F), or if the sensor circuit is shorted, 60° C (130° F) will appear in the display in place of the temperature. When the sensor is exposed to temperatures below - 40° C (- 40° F) or if the sensor circuit is open, - 40° C (- 40° F) will appear in the display.

The ambient temperature sensor circuit can be diagnosed using the following Temperature System Test, and Sensor Test. If the temperature sensor and circuit are confirmed to be OK, but the temperature display is inoperative or incorrect, further testing of the instrument cluster may be necessary. Refer to **DIAGNOSIS AND TESTING** for the appropriate procedure.

TEMPERATURE SYSTEM TEST

For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** article . The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

NOTE: **Temperature readings do not update immediately. Allow up to 60 seconds after the ignition switch is turned to the "ON" position for readings to meet test specifications.**

1. Turn the ignition switch to the "OFF" position. Disconnect the wire harness connector from the ambient temperature sensor.
2. Turn the ignition switch to the "ON" position. The display should now read - 40° C (- 40° F). If OK, go to step 3. If not OK, repair the shorted sensor return circuit or ambient temperature sensor signal circuit to the ambient temperature sensor as required.
3. Turn the ignition switch to the "OFF" position. Taking care not to damage the wire terminals, connect a jumper wire between the two terminals in the body half of the ambient temperature sensor harness connector.
4. Turn the ignition switch to the "ON" position. The display should now read 60° C (130° F). If OK, go to step 5. If not OK, repair the open sensor return circuit or ambient temperature sensor signal circuit to the ambient temperature sensor as required.

NOTE: If the EVIC display does not show the ambient temperature in step 4, the vehicle may need to be driven several miles at a speed greater than 32 km/h (20 mph) for the temperature to update.

5. Turn the ignition switch to the "OFF" position. Remove the jumper wire. Turn the ignition switch to the "ON" position and wait until the display again reads - 40° C (- 40° F). Turn the ignition switch to the "OFF" position. Reconnect the ambient temperature sensor. Turn the ignition switch to the "ON" position. The display should now read the ambient temperature. If OK, the problem is intermittent. Perform further diagnosis while manipulating the related wire harnesses and components. If not OK, go to step 6.
6. Clear any Diagnostic Trouble Codes that may have been set while performing the test. Perform further diagnosis of the CAN data bus circuit, the LIN data bus circuit, the TIPM and the ambient temperature sensor (refer to **SENSOR TEST**).

SENSOR TEST

1. Turn the ignition switch to the Off position. Disconnect the ambient temperature sensor harness connector.
2. Measure the resistance of the ambient temperature sensor. At - 40° C (- 40° F), the sensor resistance is 336 kilohms. At 55° C (130° F), the sensor resistance is 2.488 kilohms. The sensor resistance should read between these two values. If OK, further testing of the instrument cluster may be necessary. Refer to **DIAGNOSIS AND TESTING** for the appropriate procedure. If not OK, replace the inoperative ambient temperature sensor.

REMOVAL

AMBIENT TEMP SENSOR

Fig. 20: Ambient Temperature Sensor Wire Harness Connector
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the grille. Refer to **REMOVAL** .
3. Disconnect the wire harness connector (1) from the ambient temperature sensor (2).

Fig. 21: Ambient Temperature Sensor Bracket
Courtesy of CHRYSLER LLC

4. Remove the fastener that secures the ambient temperature sensor to the radiator support.
5. Remove the ambient temperature sensor from the vehicle.

INSTALLATION

AMBIENT TEMP SENSOR

Fig. 22: Ambient Temperature Sensor Bracket
Courtesy of CHRYSLER LLC

1. Position the ambient temperature sensor in the vehicle.
2. Install the fastener that secures the ambient temperature sensor to the radiator support.

Fig. 23: Ambient Temperature Sensor Wire Harness Connector
Courtesy of CHRYSLER LLC

3. Connect the wire harness connector (1) to the ambient temperature sensor (2).
4. Install the grille. Refer to **INSTALLATION** .
5. Connect the battery negative cable.

MODULE

DESCRIPTION

DESCRIPTION

Fig. 24: Remote Compass Module (RCM)
Courtesy of CHRYSLER LLC

The Remote Compass Module (RCM) (2) is a separate stand alone module mounted to the top side of the headliner (1). The module is located at the rear left of the vehicle. The RCM can be accessed by removing both quarter trim panels and the headliner molding, then carefully lowering the rear of the headliner at the D-pillar area.

If the compass position sensor (Remote Compass Module) is inoperative and requires replacement. See **REMOVAL** for the appropriate procedure.

DIAGNOSIS AND TESTING

DIAGNOSIS & TESTING

The Remote Compass Module (RCM) data is transferred on the Controller Area Network (CAN) Data Bus circuit. The RCM and Electronic Vehicle Information Center (EVIC)/Compass Temperature Display will not function properly if the bus messages are not properly received. If no EVIC/Compass Temperature Display data is displayed, check the CAN Data Bus circuit communications, the RCM, the Instrument Cluster functions and the Totally Integrated Power Module (TIPM). **Any diagnosis of the RCM and EVIC/Compass Temperature Display system should begin with the use of a scan tool and the appropriate diagnostic service information.**

For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** article . The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

REMOVAL

REMOVAL

Fig. 25: Headliner, RCM, RCM Electrical Connector & RCM Retaining Screws
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Partially remove the headliner (1) to gain access to the Remote Compass Module (RCM) (2). Refer to **REMOVAL** for the appropriate procedure.
3. Disconnect the RCM electrical connector (3).
4. Remove the RCM retaining screws (4).
5. Remove the RCM (2) from the vehicle.

INSTALLATION

INSTALLATION

Fig. 26: Headliner, Remote Compass Module (RCM), Electrical Connector & RCM Retaining Screws
Courtesy of CHRYSLER LLC

1. Position the Remote Compass Module (RCM) (2) into the bracket on the upper side of the headliner (1).
2. Install the RCM retaining screws (4).
3. Connect the electrical connector (3).
4. Install the headliner assembly. Refer to **INSTALLATION**.
5. Connect the battery negative cable.
6. Perform the Compass Variance Adjustment. See **STANDARD PROCEDURE**.
7. Perform the Manual Compass Calibration. See **STANDARD PROCEDURE**.
8. Verify proper compass operation.

NAVIGATION/TELECOMMUNICATION - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B143B-MICROPHONE 1 CIRCUIT LOW

Circuit Schematic

Fig. 1: Microphone Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The Hands Free Module detects a fault in any of the microphone circuits.

Possible Causes

Possible Causes
(X712) MICROPHONE 1 IN (+) CIRCUIT SHORTED TO GROUND INSIDE REARVIEW MIRROR HANDS FREE MODULE

Diagnostic Test

1. **CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

Attempt to make a phone call with the system.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. **INSIDE REARVIEW MIRROR**

Fig. 2: Inside Rearview Mirror C2 Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Inside Rearview Mirror C2 harness connector.

Turn the ignition on.

With the scan tool, read the DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 3.

No

Replace the Inside Rearview Mirror in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. (X712) MICROPHONE 1 IN (+) CIRCUIT SHORTED TO GROUND

Fig. 3: Measuring Resistance Between Ground And (X712) Microphone 1 Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

Measure the resistance between ground and the (X712) Microphone 1 circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X712) Microphone 1 circuit for short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Hands Free Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B143B-MICROPHONE 1 CIRCUIT LOW (RADIO)

Circuit Schematic

81667926

Fig. 4: Radio Microphone Control Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The Hands Free Module detects a fault in any of the microphone circuits.

Possible Causes

Possible Causes
(X712) MICROPHONE 1 IN (+) CIRCUIT SHORTED TO GROUND INSIDE REARVIEW MIRROR HANDS FREE MODULE

Diagnostic Test

1. **CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

Attempt to make a phone call with the system.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. **INSIDE REARVIEW MIRROR**

Turn the ignition off.

Disconnect the Inside Rearview Mirror C2 harness connector.

Turn the ignition on.

With the scan tool, read the DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 3.

No

Replace the Inside Rearview Mirror in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. (X712) MICROPHONE 1 IN (+) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

Measure the resistance between ground and the (X712) Microphone 1 circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X712) Microphone 1 circuit for short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Hands Free Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B143C-MICROPHONE 1 CIRCUIT HIGH

Circuit Schematic

Fig. 5: Microphone Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The Hands Free Module detects a fault in any of the microphone circuits.

Possible Causes

Possible Causes
(X712) MICROPHONE 1 IN (+) CIRCUIT OPEN
(X712) MICROPHONE 1 IN (+) CIRCUITS SHORTED TO VOLTAGE
INSIDE REARVIEW MIRROR
HANDS FREE MODULE

Diagnostic Test

1. **CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

Attempt to make a phone call with the system.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. **INSIDE REARVIEW MIRROR**

Fig. 6: Inside Rearview Mirror C2 Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Rearview Mirror harness connector.

Turn the ignition on.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 3.

No

Replace the Rearview Mirror in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. (X712) MICROPHONE CIRCUITS SHORTED TO VOLTAGE

Fig. 7: Measuring Voltage Of (X712) Microphone Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

Turn the ignition on.

Measure the voltage of the (X712) Microphone circuit.

Is the voltage above 1.0 volt?

Yes

Repair the (X712) Microphone circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. (X712) MICROPHONE 1 IN (+) CIRCUIT OPEN

Fig. 8: Measuring Resistance Of (X712) Microphone 1 IN (+) Circuit Between HFM Connector And Inside Rearview Mirror Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance of the (X712) Microphone 1 IN (+) circuit between the HFM connector and the inside rearview mirror connector.

Is the resistance below 5.0 ohms?

Yes

Replace the Hands Free Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (X712) Microphone 1 IN (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

B143C-MICROPHONE 1 CIRCUIT HIGH (RADIO)

Circuit Schematic

81667926

Fig. 9: Radio Microphone Control Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The Hands Free Module detects a fault in any of the microphone circuits.

Possible Causes

Possible Causes
(X712) MICROPHONE 1 IN (+) CIRCUIT OPEN
(X712) MICROPHONE 1 IN (+) CIRCUITS SHORTED TO VOLTAGE
INSIDE REARVIEW MIRROR
HANDS FREE MODULE

Diagnostic Test

1. **CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

Attempt to make a phone call with the system.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. **INSIDE REARVIEW MIRROR**

Turn the ignition off.

Disconnect the Rearview Mirror harness connector.

Turn the ignition on.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 3.

No

Replace the Rearview Mirror in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. (X712) MICROPHONE CIRCUITS SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

Turn the ignition on.

Measure the voltage of the (X712) Microphone circuit.

Is the voltage above 1.0 volt?

Yes

Repair the (X712) Microphone circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. (X712) MICROPHONE 1 IN (+) CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (X712) Microphone 1 IN (+) circuit between the HFM connector and the inside rearview mirror connector.

Is the resistance below 5.0 ohms?

Yes

Replace the Hands Free Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (X712) Microphone 1 IN (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

B143E-MICROPHONE 2 CIRCUIT LOW

Circuit Schematic

Fig. 10: Microphone Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The Hands Free Module detects a fault in any of the microphone circuits.

Possible Causes

Possible Causes
(X722) MICROPHONE 2 IN (+) CIRCUIT SHORTED TO GROUND INSIDE REARVIEW MIRROR HANDS FREE MODULE

Diagnostic Test

1. **CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

Attempt to make a phone call with the system.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. **INSIDE REARVIEW MIRROR**

Fig. 11: Inside Rearview Mirror C2 Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Inside Rearview Mirror harness connector.

Turn the ignition on.

With the scan tool, read the DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 3.

No

Replace the Inside Rearview Mirror in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

3. (X722) MICROPHONE 2 IN (+) CIRCUIT SHORTED TO GROUND

Fig. 12: Measuring Resistance Between Ground And (X722) Microphone 2 Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

Measure the resistance between ground and the (X722) Microphone 2 circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X722) Microphone 2 circuit for short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Hands Free Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B143E-MICROPHONE 2 CIRCUIT LOW (RADIO)

Circuit Schematic

81667926

Fig. 13: Radio Microphone Control Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The Hands Free Module detects a fault in any of the microphone circuits.

Possible Causes

Possible Causes
(X722) MICROPHONE 2 IN (+) CIRCUIT SHORTED TO GROUND INSIDE REARVIEW MIRROR HANDS FREE MODULE

Diagnostic Test

1. **CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

Attempt to make a phone call with the system.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. **INSIDE REARVIEW MIRROR**

Turn the ignition off.

Disconnect the Inside Rearview Mirror harness connector.

Turn the ignition on.

With the scan tool, read the DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 3.

No

Replace the Inside Rearview Mirror in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. (X722) MICROPHONE 2 IN (+) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

Measure the resistance between ground and the (X722) Microphone 2 circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X722) Microphone 2 circuit for short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Hands Free Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B143F-MICROPHONE 2 CIRCUIT HIGH

Circuit Schematic

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The Hands Free Module detects a fault in any of the microphone circuits.

Possible Causes

Possible Causes
(X722) MICROPHONE 2 IN (+) CIRCUIT OPEN
(X722) MICROPHONE 2 IN (+) CIRCUITS SHORTED TO VOLTAGE
INSIDE REARVIEW MIRROR
HANDS FREE MODULE

Diagnostic Test

1. **CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

Attempt to make a phone call with the system.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. **INSIDE REARVIEW MIRROR**

Fig. 15: Inside Rearview Mirror C2 Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Rearview Mirror harness connector.

Turn the ignition on.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 3.

No

Replace the Rearview Mirror in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. (X722) MICROPHONE CIRCUITS SHORTED TO VOLTAGE

Fig. 16: Measuring Voltage Of (X722) Microphone Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

Turn the ignition on.

Measure the voltage of the (X722) Microphone circuit.

Is the voltage above 1.0 volt?

Yes

Repair the (X722) Microphone circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. (X722) MICROPHONE 2 IN (+) CIRCUIT OPEN

Fig. 17: Measuring Resistance Of (X722) Microphone 2 IN (+) Circuit Between HFM Connector And Inside Rearview Mirror Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance of the (X722) Microphone 2 IN (+) circuit between the HFM connector and the inside rearview mirror connector.

Is the resistance below 5.0 ohms?

Yes

Replace the Hands Free Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (X722) Microphone 2 IN (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

B143F-MICROPHONE 2 CIRCUIT HIGH (RADIO)

- **Set Condition:**

The Hands Free Module detects a fault in any of the microphone circuits.

Possible Causes

Possible Causes
(X722) MICROPHONE 2 IN (+) CIRCUIT OPEN
(X722) MICROPHONE 2 IN (+) CIRCUITS SHORTED TO VOLTAGE
INSIDE REARVIEW MIRROR
HANDS FREE MODULE

Diagnostic Test

1. **CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

Attempt to make a phone call with the system.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. **INSIDE REARVIEW MIRROR**

Turn the ignition off.

Disconnect the Rearview Mirror harness connector.

Turn the ignition on.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 3.

No

Replace the Rearview Mirror in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. (X722) MICROPHONE CIRCUITS SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

Turn the ignition on.

Measure the voltage of the (X722) Microphone circuit.

Is the voltage above 1.0 volt?

Yes

Repair the (X722) Microphone circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. (X722) MICROPHONE 2 IN (+) CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (X722) Microphone 2 IN (+) circuit between the HFM connector and the inside rearview mirror connector.

Is the resistance below 5.0 ohms?

Yes

Replace the Hands Free Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (X722) Microphone 2 IN (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

B1459-TELEMATICS MIRROR CONTROL CIRCUIT LOW

Circuit Schematic

01A01775

Fig. 19: Microphone Feed Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The Hands Free Module detects low voltage on the (X793) Microphone Feed circuit.

Possible Causes

Possible Causes
(X793) MICROPHONE FEED CIRCUIT SHORT TO GROUND INSIDE REARVIEW MIRROR HANDS FREE MODULE

Diagnostic Test

1. **CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

Attempt to make a phone call with the system.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. **(X793) MICROPHONE FEED CIRCUIT SHORT TO GROUND**

Fig. 20: Measuring Resistance Between Ground And (X793) Microphone Feed Circuit
 Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (X793) Microphone Feed circuit

Is the resistance below 100.0 ohms?

Yes

Repair the (X793) Microphone Feed circuit for short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. INSIDE REARVIEW MIRROR

Replace the Inside Rearview Mirror in accordance with the service information.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

Attempt to make a phone call with the system.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair is complete.

Perform **BODY VERIFICATION TEST - VER 1** .

B145A-TELEMATICS MIRROR CONTROL CIRCUIT HIGH

Circuit Schematic

01A01770

Fig. 21: Microphone Feed Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The Hands Free Module detects high voltage on the (X793) Microphone Feed circuit.

Possible Causes

Possible Causes
(X793) MICROPHONE FEED CIRCUIT SHORT TO VOLTAGE INSIDE REARVIEW MIRROR HANDS FREE MODULE

Diagnostic Test

1. **CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

Attempt to make a phone call with the system.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. **(X793) MICROPHONE FEED CIRCUIT SHORT TO VOLTAGE**

Fig. 22: Measuring Voltage Of (X793) Microphone Feed Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition on.

Measure the voltage of the (X793) Microphone Feed circuit.

Is the voltage above 1.0 volt?

Yes

Repair the (X793) Microphone Feed circuit for short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. INSIDE REARVIEW MIRROR

Replace the Inside Rearview Mirror in accordance with the service information.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

Attempt to make a phone call with the system.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair is complete.

Perform **BODY VERIFICATION TEST - VER 1** .

B145B-TELEMATICS MIRROR CONTROL CIRCUIT OPEN

Circuit Schematic

01A01776

Fig. 23: Microphone Feed Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The Hands Free Module detects an open on the (X793) Microphone Feed circuit.

Possible Causes

Possible Causes
(X793) MICROPHONE FEED CIRCUIT OPEN INSIDE REARVIEW MIRROR HANDS FREE MODULE

Diagnostic Test

1. **CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

Attempt to make a phone call with the system.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. **(X793) MICROPHONE FEED CIRCUIT OPEN**

Fig. 24: Measuring Resistance Of (X793) Microphone Feed Circuit Between HFM Connector And Inside Rearview Mirror Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

Disconnect the Inside Rearview Mirror harness connector.

Measure the resistance of the (X793) Microphone Feed circuit between the HFM connector and the inside rearview mirror connector.

Is the resistance below 5.0 ohms?

Yes

Go To 3.

No

Repair the (X793) Microphone Feed circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

3. **INSIDE REARVIEW MIRROR**

Replace the Inside Rearview Mirror in accordance with the service information.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

Attempt to make a phone call with the system.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair is complete.

Perform **BODY VERIFICATION TEST - VER 1** .

B2205-ORIGINAL VIN MISSING/MISMATCH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

• **Set Condition:**

The Hands Free Module will receive and monitor the VIN message from the PCM and record the VIN if different from the last VIN.

Possible Causes

Possible Causes
INCORRECT VIN PROGRAMMED IN PCM

Diagnostic Test

1. CHECK FOR ACTIVE DTC

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. CHECK VIN IN PCM

With the scan tool compare the VIN that is programmed into the PCM to the VIN on the vehicle.

Does the VIN programmed into the PCM match the vehicles VIN?

Yes

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Program the correct VIN in the PCM and retest the HFM system.

B2223-(HFM) HANDS FREE PHONE INTERNAL

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The Hands Free Module detects a fault during an internal diagnostic check.

Possible Causes

Possible Causes
HANDS FREE MODULE

Diagnostic Test

1. **REPLACE THE HANDS FREE MODULE IF DTC IS ACTIVE**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Replace and program the Hands Free Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

B222A-VEHICLE LINE MISMATCH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The Hands Free Module will receive and monitor the vehicle line message from the PCM and record the vehicle line if different from the last vehicle line.

Possible Causes

Possible Causes
INCORRECT PCM HANDS FREE MODULE

Diagnostic Test

1. **CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. **CHECK VEHICLE LINE IN PCM**

With the scan tool compare the vehicle line that is programmed into the PCM to the vehicle line of the vehicle.

Does the vehicle line programmed into the PCM match the vehicle?

Yes

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace and program the Powertrain Control Module in accordance with the service information.
Ensure the PCM is replaced with the correct vehicle line PCM.
Perform **BODY VERIFICATION TEST - VER 1** .

B222E-FLASH CHECKSUM PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The Hands Free Module detects a fault during an internal diagnostic check.

Possible Causes

Possible Causes
HANDS FREE MODULE

Diagnostic Test

1. **REPLACE THE HANDS FREE MODULE IF DTC IS ACTIVE**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Replace and program the Hands Free Module in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness

connectors. Look for broken, bent, pushed out, or corroded terminals.

B2230-RAM WRITE PERFORMANCE

Monitor Conditions

When Monitored:

Continuously

Set Conditions

- Set Condition:**

Whenever the CAN Interior Bus (+) or (-) circuits are open, shorted to voltage, or shorted to ground.

Possible Causes

Possible Causes
CAN INTERIOR BUS DTC's IN TIPM (D265) CAN INTERIOR BUS (+) CIRCUIT OPEN (D264) CAN INTERIOR BUS (-) CIRCUIT OPEN HANDS FREE MODULE

Diagnostic Test

1. **CHECK FOR ACTIVE DTCS**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. **CHECK TIPM DTC's**

With the scan tool, read TIPM active DTC's

Does the scan tool display any CAN Interior Bus DTCs - ACTIVE?

Yes

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. (D265) CAN INTERIOR BUS (+) CIRCUIT OPEN

Fig. 26: Measuring Resistance Of (D265) CAN Interior BUS (+) Circuit Between TIPM C7 Connector And Hands Free Module Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Hands Free Module connector.

Disconnect the TIPM C7 harness connector.

Measure the resistance of the (D265) CAN Interior Bus (+) circuit between the TIPM C7 connector and

the Hands Free Module connector.

Is the resistance below 2.0 ohms?

Yes

Go To 4.

No

Repair the (D265) CAN Interior Bus (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. (D264) CAN INTERIOR BUS (-) CIRCUIT OPEN

Fig. 27: Measuring Resistance Of (D264) CAN Interior BUS (-) Circuit Between TIPM C7 Harness Connector And Hands Free Module Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (D264) CAN Interior Bus (-) circuit between the TIPM C7 harness connector and the Hands Free Module connector.

Is the resistance below 2.0 ohms?

Yes

Replace the Hands Free Module in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (D264) CAN Interior Bus (-) circuit for an open.
Perform **BODY VERIFICATION TEST - VER 1** .

2008 ACCESSORIES AND EQUIPMENT

Navigation/Telecommunication - Service Information - Liberty

NAVIGATION/TELECOMMUNICATION - SERVICE INFORMATION

DESCRIPTION

NAVIGATION/TELECOMMUNICATION

TELECOMMUNICATIONS

The hands-free cellular system on this vehicle uses Bluetooth™ technology to provide wireless communication between the operator's compatible cellular telephone and the vehicle's on-board receiver.

The system uses voice recognition technology to control operation. The incoming voice is broadcast through the vehicle's radio speakers, automatically overriding any other audio signals on the front speakers when the hands-free system is in use. A microphone in the rearview mirror picks up vehicle occupant's voices. If a call is in progress when the ignition is switched off, the call will be transferred to the hand-held telephone.

The system will communicate with a telephone that is anywhere within the vehicle. However, covering the hand held phone or the hands-free phone module with a metal object may block the signal. The system will recognize up to seven telephones, each of which is given a spoken identification by the user during the setup process. The system includes Spanish and French voice recognition in addition to English.

The hands free module is contained within the radio for premium systems. The hands free module is located in the right rear of the vehicle behind the rear quarter panel.

NAVIGATION

The navigation system offers several new customer features for expanded usability and convenience with hands-free voice-activated operation in addition to the touch screen buttons. The navigation system uses the Bluetooth™ microphone in the rear view mirror. Navigation routes can be based on a variety of formats including some of the following:

- Destination entry by street intersection, city, zip code, street name, street address and number, state/province/country and phone number

- Stop/change route

- Save current position

- Personal menu, including Guide Me Home (Go Home), Trip Itinerary, List of Saved Locations, Favorite Points of Interest (from a data base), Manage Personal User and Choose User

- Personal Interests including recent routes, address book, Where Am I Now, Emergency (police stations, Dodge dealerships, fire stations, hospitals and emergency care centers), Trail and geo- coordinates

- Route options include shortest, quickest, maximize freeways, minimize freeways, avoid toll roads and avoid ferries

- Navigation can be put into DEMO mode to enhance trip planning

This navigation system will support Traffic Messaging. Traffic Messaging displays voice and pop up warning messages for medium and high priority situations on the route such as road closures due to accidents/hazardous situations and it can even generate a traffic detour for a traffic event located on the route.

OPERATION

NAVIGATION/TELECOMMUNICATION

TELECOMMUNICATION

Two buttons on the rearview mirror, identified with ISO icons, control the system: A "phone" button turns the system on and off; a "voice recognition" (or voice command) button prompts the hands-free system to listen for a voice command. The system includes the following features:

- Phone book - Stores telephone numbers for later recall by name or other verbal identification, called a voice tag, and memory location.
- Four memory locations - Home, Work, Mobile, and Pager. A maximum of 32 unique names or voice tags may be stored at the same time, with a different number in each of the four memory locations.
- Voice tag dialing - Dials the number associated with a voice tag and memory location.
- Digit dialing - Dials the telephone number by recognizing the names of the digits as they are spoken.
- Receiving calls - A voice prompt notifies the user of an incoming call. Pressing the UConnect button accepts or rejects the call.
- Privacy Mode - Switches the call to the handheld telephone and the hands-free system and back again using the "voice recognition" (or "voice command") button and a voice command, if desired.

NAVIGATION

The navigation system collects data from GPS satellites in orbit around the Earth. This information is sent to the radio to be processed and provides the user with present location and is used to provide the route planning and guidance as the vehicle is driven.

HANDS FREE MODULE

REMOVAL

HANDS FREE MODULE

Fig. 1: Removing Hands Free Module
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the right quarter trim panel. Refer to **REMOVAL** .
3. Remove mounting fasteners.
4. Disconnect electrical harness connector.

INSTALLATION

HANDS FREE MODULE

Fig. 2: Installing Hands Free Module
Courtesy of CHRYSLER LLC

1. Connect electrical harness connector.
2. Position module, and install mounting fasteners.
3. Install quarter trim panel. Refer to **INSTALLATION** .

4. Connect battery negative cable.

2008 ACCESSORIES AND EQUIPMENT

Overhead Console - Service Information - Liberty

OVERHEAD CONSOLE - SERVICE INFORMATION

DESCRIPTION

OVERHEAD CONSOLE

81a28142

Fig. 1: Identifying Overhead Console, Sunroof Switch, Courtesy Lamps & Infrared Temperature Sensor
Courtesy of CHRYSLER LLC

An overhead console (1) is standard factory-installed equipment on this model. All overhead consoles are equipped with two reading and courtesy lamps (3). On vehicles equipped with a power sunroof, the sunroof switch (2) is located between the two reading and courtesy lamps. On vehicles equipped with automatic climate control an infrared temperature sensor (4) is located on the front edge of the overhead console. The overhead console is mounted with three snap clips into a molded plastic retainer bracket located above the headliner to provide secure overhead console attachment.

REMOVAL

OVERHEAD CONSOLE

81a28142

Fig. 2: Identifying Overhead Console, Sunroof Switch, Courtesy Lamps & Infrared Temperature Sensor
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Using your fingertips, grasp the sides of the overhead console (1) and pull straight down evenly to disengage the three snap clips from the mounting bracket.

81a281a6

Fig. 3: Identifying Overhead Console & Wire Harness Connector
 Courtesy of CHRYSLER LLC

3. Lower the overhead console (1) far enough to access the wire harness connector (2).
4. If equipped, disconnect the courtesy lamps, infrared temperature sensor and power sunroof switch electrical connectors.
5. Remove the overhead console (1) assembly from the vehicle.

INSTALLATION

OVERHEAD CONSOLE

Fig. 4: Identifying Overhead Console & Wire Harness Connector
 Courtesy of CHRYSLER LLC

1. Position the overhead console (1) in the vehicle near the headliner assembly.
2. If equipped, connect the courtesy lamps, infrared temperature sensor and power sunroof switch electrical connectors (2).

Fig. 5: Identifying Snap Clips & Overhead Console
 Courtesy of CHRYSLER LLC

3. Grasp the sides of the overhead console (2) and push straight up evenly to engage the three snap clips (1) into the mounting bracket.
4. Connect the battery negative cable.

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
P129C	INVERTER CONTROL CIRCUIT HIGH (TIPM)
P129E	INVERTER CONTROL CIRCUIT OVERCURRENT (TIPM)

POWER DISTRIBUTION - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

P129C-INVERTER CONTROL CIRCUIT HIGH (TIPM)

Additional Wiring

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Monitor Conditions

When Monitored:

With the ignition on. Battery voltage greater than 10 volts. Once the inverter switch has been turned on, the CCN sends a request to the TIPM to turn on the Inverter.

Set Conditions

- **Set Condition:**

An open or shorted high condition has been detected in the Inverter Control output circuit by the TIPM. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes

Possible Causes
(P805) INVERTER CONTROL OUTPUT CIRCUIT OPEN
(P805) INVERTER CONTROL OUTPUT CIRCUIT SHORTED TO VOLTAGE
INVERTER MODULE
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1) ACTIVE DTC

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

Go To 2) (P805) INVERTER CONTROL OUTPUT CIRCUIT SHORTED TO VOLTAGE.

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2) (P805) INVERTER CONTROL OUTPUT CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Inverter Module harness connector.

Disconnect the TIPM C7 harness connector.

Turn the ignition on.

Measure the voltage of the (P805) Inverter Control Output circuit at the Inverter Module harness connector.

Is voltage present?

Yes

Repair the short to voltage in the (P805) Inverter Control Output circuit.

No

Go To 3).

3) INVERTER MODULE

Turn the ignition off.

Reconnect the TIPM harness connector.

Using a test light connected to ground, probe the Inverter Enable Switch Signal circuit at the Inverter Module harness connector.

Using the scan tool, actuate the Inverter Enable control.

NOTE: **The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly?

Yes

Replace the Inverter Module per Service Information.
Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 4).

4) (P805) INVERTER CONTROL OUTPUT CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM harness connector.

Disconnect the Inverter Module harness connector.

Measure the resistance of the (P805) Inverter Control Output circuit between the TIPM and Inverter Module harness connector.

Is the resistance below 5.0 ohms?

Yes

Replace the Totally Integrated Power Module per Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the open in the (P805) Inverter Control Output circuit.

P129E-INVERTER CONTROL CIRCUIT OVERCURRENT (TIPM)

Additional Wiring

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Monitor Conditions

When Monitored:

With the ignition on. Battery voltage greater than 10.4 volts.

Set Conditions

- **Set Condition:**

An overcurrent condition is detected in the Inverter Control Output circuit. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes

Possible Causes
TERMINAL DAMAGE OR CORROSION (P805) INVERTER CONTROL OUTPUT CIRCUIT SHORTED TO GROUND INVERTER MODULE TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1) ACTIVE DTC

Ignition on, engine not running.

NOTE: Low battery voltage can also cause excessive current draw, in very hot and very cold ambient temperatures. Make sure the battery can pass a load test before continuing.

With a scan tool, select View DTCs.

Look closely at the temperatures at which this DTC set.

Is the DTC Active at this time?

Yes

Go To 2).

No

Refer to the **INTERMITTENT CONDITION** Diagnostic Procedure.

2) (P805) INVERTER CONTROL OUTPUT CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the TIPM harness connector.

Disconnect the Inverter Module harness connector.

Inspect the wiring connections for corrosion and repair as necessary.

Measure the resistance between ground and the (P805) Inverter Control Output circuit at the Inverter Module harness connector.

Is the resistance below 5.0 ohms?

Yes

Go To 3).

No

Repair the short to ground in the (P805) Inverter Control Output circuit.

3) INVERTER MODULE

Turn the ignition off.

Reconnect the TIPM harness connector.

Using a test light connected to ground, probe the Inverter Enable Switch Signal circuit at the Inverter Module harness connector.

Using the scan tool, actuate the Inverter Enable control.

NOTE: **The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly?

Yes

Replace the Inverter Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace the Totally Integrated Power Module per Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

2008 ACCESSORIES AND EQUIPMENT

Power Distribution - Service Information - Liberty

POWER DISTRIBUTION

DESCRIPTION

POWER DISTRIBUTION

The power distribution system for this vehicle consists of the Totally Integrated Power Module (TIPM) and related fuses, relays and wiring connectors.

OPERATION

POWER DISTRIBUTION

The power distribution system for this vehicle is designed to provide safe, reliable, centralized, and convenient to access, distribution of the electrical current required to operate all of the many standard and optional factory-installed electrical and electronic powertrain, chassis, safety, comfort and convenience systems. At the same time, these systems were designed to provide centralized locations for conducting diagnosis of faulty circuits, and for sourcing the additional current requirements of many aftermarket vehicle accessory and convenience items.

These power distribution systems also incorporate various types of circuit control and protection features, including fuses and relays.

CIGAR LIGHTER/POWER OUTLET

DESCRIPTION

CIGAR LIGHTER/POWER OUTLET

INSTRUMENT PANEL MOUNTED

81a28090

Fig. 1: Heated Seat System Components
Courtesy of CHRYSLER LLC

An instrument panel mounted cigar lighter/power outlet receptacle (6) is available on this model. On models equipped with the optional Smoker's Package, the cigar lighter knob and heating element are included. On models without the Smoker's Package, the cigar lighter receptacle is equipped with a snap fit plastic cap and is treated as an auxiliary power outlet. The cigar lighter receptacle is installed in the instrument panel accessory switch bezel (1), which is located near the bottom of the instrument panel center stack area, below the radio. The cigar lighter base is secured by a snap fit within the left lower bezel. This power outlet has a constant 12 volt battery feed.

REAR CARGO MOUNTED

8195a23d

Fig. 2: Quarter Trim Panel Electrical Connector
Courtesy of CHRYSLER LLC

A rear cargo area power outlet (1) is standard equipment on this vehicle. The rear power outlet is installed in the left rear quarter trim panel, near the spare tire jack. The power outlet base and mount are secured by a snap fit within the quarter trim panel. A plastic protective cap snaps into the power outlet base when the power outlet is

not being used, and hangs from the power outlet base mount by an integral bail strap while the power outlet is in use. While the power outlet is very similar to a cigar lighter base unit, it does not include the two small spring-clip retainers inside the bottom of the receptacle shell that are used to secure the cigar lighter heating element to the insulated contact. It has 12 volt battery voltage when the ignition is in the ON or ACC positions.

OPERATION

CIGAR LIGHTER/POWER OUTLET

CIGAR LIGHTER/POWER OUTLET

The cigar lighter consists of two major components: a knob and heating element unit, and the cigar lighter base or receptacle shell. The receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current.

The cigar lighter knob and heating element are encased within a spring-loaded housing, which also features a sliding protective heat shield. When the knob and heating element are inserted in the receptacle shell, the heating element resistor coil is grounded through its housing to the receptacle shell. If the cigar lighter knob is pushed inward, the heat shield slides up toward the knob exposing the heating element, and the heating element extends from the housing toward the insulated contact in the bottom of the receptacle shell.

Two small spring-clip retainers are located on either side of the insulated contact inside the bottom of the receptacle shell. These clips engage and hold the heating element against the insulated contact long enough for the resistor coil to heat up. When the heating element is engaged with the contact, battery current can flow through the resistor coil to ground, causing the resistor coil to heat.

When the resistor coil becomes sufficiently heated, excess heat radiates from the heating element causing the spring-clips to expand. Once the spring-clips expand far enough to release the heating element, the spring-loaded housing forces the knob and heating element to pop back outward to their relaxed position. When the cigar lighter knob and element are pulled out of the receptacle shell, the protective heat shield slides downward on the housing so that the heating element is recessed and shielded around its circumference for safety.

POWER OUTLET

The power outlet base or receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current. The power outlet receives battery voltage from a fuse in the Totally Integrated Power Module (TIPM) when the ignition is in the ON or ACC positions.

REMOVAL

CIGAR LIGHTER/POWER OUTLET

Fig. 3: Removing Cigar Lighter/Power Outlet
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Look inside and note position of the retaining bosses (1).
3. Using special tool 9857 Power Outlet Remover. Insert the tool forcing the bosses out of base.
4. Pull out the base through mounting ring by gently rocking the tool (3).
5. Disconnect the base wires.
6. Set base aside and remove base mount ring.

INSTALLATION

CIGAR LIGHTER/POWER OUTLET

1. Position mount ring to the instrument panel and feed the wires through ring. Index the cap and the mount ring with the index tab at 9 o'clock to the key in the instrument panel. Install the ring.
2. Connect wires to base. Orient base alignment rib at 11 o'clock to mate the groove in mount ring at the same location.
3. Push base into the bezel till it locks.
4. Install cigar lighter cap.
5. Connect the battery negative cable.

IOD FUSE

DESCRIPTION

IOD FUSE

All vehicles are equipped with an Ignition-Off Draw (IOD) fuse that is disconnected within the Totally Integrated Power Module (TIPM) when the vehicle is shipped from the factory. Dealer personnel are to push the IOD fuse down until fully seated in the TIPM as part of the preparation procedures performed just prior to new

vehicle delivery.

OPERATION

IOD FUSE

The term ignition-off draw identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. The IOD fuse feeds the memory and sleep mode functions for some of the electronic modules in the vehicle as well as various other accessories that require battery current when the ignition switch is in the Off position, including the clock. The only reason the IOD fuse is pulled out is to reduce the normal IOD of the vehicle electrical system during new vehicle transportation and pre-delivery storage to reduce battery depletion, while still allowing vehicle operation so that the vehicle can be loaded, unloaded and moved as needed by both vehicle transportation company and dealer personnel.

The IOD fuse is pulled out from the Totally Integrated Power Module (TIPM) fuse cavity J13 when the vehicle is shipped from the assembly plant. Dealer personnel must push the IOD fuse down until fully seated in the TIPM when the vehicle is being prepared for delivery in order to restore full electrical system operation. Once the vehicle is prepared for delivery, the IOD function of this fuse becomes transparent and the fuse that has been assigned the IOD designation becomes only another Fused B(+) circuit fuse. The IOD fuse serves no useful purpose to the dealer technician in the service or diagnosis of any vehicle system or condition, other than the same purpose as that of any other standard circuit protection device.

The IOD fuse can be used by the vehicle owner as a convenient means of reducing battery depletion when a vehicle is to be stored for periods not to exceed about thirty days. However, it must be remembered that pulling out the IOD fuse will not eliminate IOD, but only reduce this normal condition. If a vehicle will be stored for more than about thirty days, the battery negative cable should be disconnected to eliminate normal IOD; and, the battery should be tested and recharged at regular intervals during the vehicle storage period to prevent the battery from becoming discharged or damaged.

REMOVAL

IOD FUSE

NOTE: When removing or installing the IOD fuse, it is important that the ignition switch be in the Off position. Failure to place the ignition switch in the Off position can cause the radio display to become scrambled when the IOD fuse is installed. Removing and installing the IOD fuse again with the ignition switch in the Off position will usually correct the scrambled radio display condition.

1. Turn the ignition switch to the Off position.
2. Open the cover of the Totally Integrated Power Module (TIPM).
3. Pull up fuse J13 until it is in the pre-stage position from the TIPM.

INSTALLATION

IOD FUSE

CAUTION: It is extremely important that the Ignition Off Draw (IOD) fuse is fully seated into the Totally Integrated Power Module (TIPM) fuse cavity. Failure to install the fuse correctly could result in erratic electrical systems behavior.

1. Open the TIPM cover.
2. Insert fuse J13 into the TIPM. Push fuse down until it is fully seated in the TIPM cavity.
3. Close the TIPM cover.

MODULE-INVERTER

DESCRIPTION

DESCRIPTION

Fig. 4: Heated Seat System Components
Courtesy of CHRYSLER LLC

The inverter module is located under the right rear seat cushion. The A/C outlet is mounted in the rear of the center floor console. The inverter module provides A/C power for user accessories when the 115 Volt AC outlet switch (4) in the instrument panel center stack (1) is in the "ON" position. The inverter converts the 12 Volt DC from the vehicle battery system to a 115 Volt AC output. The outlet switch is part of the accessory switch bank assembly and is not available for service as an individual part. If the switch is damaged or inoperative the complete accessory switch bank assembly must be replaced. Refer to **REMOVAL** for the appropriate procedure.

OPERATION

OPERATION

The 115 volt AC power outlet switch receives 12 volts from the Totally Integrated Power Module (TIPM) and passes it as an enable signal to the inverter module. The inverter module also receives 12 volts via the TIPM and inverts this to a 115 volt AC output. The enable signal received from the power outlet switch enables the

inverter to convert the received voltage and pass it to the power outlet to power external devices.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING

For complete circuit diagrams, refer to the **SYSTEM WIRING DIAGRAMS** article.

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

115 VOLT POWER OUTLET DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
NO POWER AT THE 115 VOLT POWER OUTLET	1. Fuse inoperative.	1. Check Totally Integrated Power Module (TIPM) fuse number 37. Replace fuse, if required.
	2. Power outlet connector damaged.	2. Check for loose or corroded power outlet connector. Repair, if required.
	3. Inverter module connector damaged.	3. Check for loose or corroded inverter module connector. Repair, if required.
	4. Wiring damaged.	4. Check for shorted or open wires. Repair wiring, if required.
	5. Inverter module ground damaged.	5. Check for continuity between the inverter module and a known good ground. There should be continuity. Repair ground, if required.
	6. Power outlet inoperative.	6. Replace the power outlet.
	7. Inverter module inoperative.	7. Replace the inverter module.
	8. Power outlet switch inoperative.	6. Replace the accessory switch bank.

REMOVAL

REMOVAL

Fig. 5: Identifying Fasteners & Inverter Module
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the rear seat assembly. Refer to **REMOVAL** .
3. Remove the fasteners (1) from the mounting brackets of the inverter module (2).
4. Remove the inverter module.

INSTALLATION

INSTALLATION

Fig. 6: Identifying Fasteners & Inverter Module
 Courtesy of CHRYSLER LLC

1. Position the inverter module (2) on the mounting bracket assembly.
2. Install the fasteners (1).

3. Install the rear seat assembly. Refer to **INSTALLATION** .
4. Connect the battery negative cable.

MODULE-TOTALLY INTEGRATED POWER

DESCRIPTION

POWER DISTRIBUTION CENTER

Fig. 7: Identifying Integrated Power Module (TIPM), TIPM Mounting Bracket & Mounting Tabs
Courtesy of CHRYSLER LLC

All of the electrical current distributed throughout this vehicle is directed through the standard equipment Totally Integrated Power Module (TIPM) (1). The molded plastic TIPM housing is located in the left front corner of the engine compartment, just behind the battery. The TIPM housing has a molded plastic cover. The TIPM cover is easily opened for service access and has a convenient fuse layout label affixed to the inside surface of the cover to ensure proper component identification.

The TIPM housing is secured to the TIPM mounting bracket (2) by four mounting tabs (3) and four clips integral to the TIPM housing. The TIPM mounting bracket is secured to the battery tray with three screws and two mounting tabs integral to the battery tray.

OPERATION

POWER DISTRIBUTION CENTER

All of the current to the Totally Integrated Power Module (TIPM) comes directly from the positive battery cable to a stud located on the top of the TIPM. The cable is secured to the TIPM stud with a nut. Internal connection of all the TIPM circuits is accomplished by an intricate network of hard wiring and bus bars. Refer to **SYSTEM WIRING DIAGRAMS** for complete circuit diagrams.

The fuses, relays and TIPM housing assembly are available for service replacement.

REMOVAL

POWER DISTRIBUTION CENTER

1. Open hood.
2. Disconnect and isolate the battery negative cable.
3. Open the Totally Integrated Power Module (TIPM) cover (4).
4. Remove the TIPM positive cable retaining nut (1) and remove the cable (2) from the mounting stud (3).

Fig. 9: Identifying Integrated Power Module (TIPM), TIPM Mounting Bracket & Mounting Tabs

Courtesy of CHRYSLER LLC

5. Using an appropriate flat bladed tool, depress the four mounting clips to disengage and remove the TIPM housing (1) from the TIPM bracket mounting tabs (3).

Fig. 10: Disconnecting/Connecting TIPM Wire Harness Connectors
Courtesy of CHRYSLER LLC

6. Disconnect each of the seven TIPM wire harness connectors from the TIPM housing (2).
7. Remove the TIPM from the vehicle.

INSTALLATION

POWER DISTRIBUTION CENTER

Fig. 11: Identifying TIPM Wire Harness Connectors
Courtesy of CHRYSLER LLC

CAUTION: The original Cab Compartment Node (CCN) and Powertrain Control Module (PCM) must be installed and functioning properly prior to powering up the new Totally Integrated Power Module (TIPM). The TIPM receives vehicle configuration data from the CCN and Vehicle Identification Number information from the PCM. If configuration information becomes lost or corrupted, the data can be obtained from DealerCONNECT

1. Position the TIPM into the engine compartment.
2. Connect each of the seven TIPM wire harness connectors in the order shown in illustration.

Fig. 12: Identifying Integrated Power Module (TIPM), TIPM Mounting Bracket & Mounting Tabs
Courtesy of CHRYSLER LLC

3. Position the TIPM (1) onto the mounting bracket (2) and push down until the four mounting clips are fully seated onto the mounting tabs (3).

Fig. 13: TIPM Positive Cable Retaining Nut, Cable, Mounting Stud & Totally Integrated Power Module (TIPM) Cover

Courtesy of CHRYSLER LLC

4. Open the TIPM cover (4) and position the TIPM positive cable (2) onto the mounting stud (3) and install the retaining nut (1). Tighten the nut to 20 - 28 N.m (180 - 250 in. lbs.).
5. Fully seat the Airbag fuse holder (two fuses in one yellow carrier) and the Ignition Off Draw (IOD) fuse.
6. Close the TIPM cover (4).
7. Connect the battery negative cable.
8. Close the hood.
9. Insert the ignition key and turn it to the "RUN" position and wait twelve seconds. The TIPM will collect the necessary vehicle configuration and VIN data from the CCN and PCM at this time. After twelve seconds turn the ignition key to the "OFF" position and then back to the "ON" position and verify proper vehicle systems operation.

POWER OUTLET-AC

REMOVAL

REMOVAL

Fig. 14: Identifying Console Lid, Screws, Panel & Electrical Connectors
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Open the console lid (1) and remove the two screws (2).
3. Using a trim stick C-4755 or equivalent, release the fasteners at all of the locations around the floor console trim panel (3).
4. Lift up and rearward to release the panel (3) from the floor console.
5. Disconnect the electrical connectors (4) from the panel (3).
6. Remove AC power outlet from the trim panel.

INSTALLATION

INSTALLATION

Fig. 15: Identifying Console Lid, Screws, Panel & Electrical Connectors
Courtesy of CHRYSLER LLC

1. Install the AC power outlet into the floor console trim panel (3).
2. Connect the electrical connectors (4) to the panel (3).
3. Align the trim panel (3) to the console, use hand pressure to seat the clips.
4. Install the two screws (2) to the trim panel (3).
5. Connect the battery negative cable.

2008 ACCESSORIES AND EQUIPMENT

Power Locks - Service Information - Liberty

POWER LOCKS - SERVICE INFORMATION

DESCRIPTION

POWER LOCKS

POWER LOCKS

The power lock system allows all of the doors and the tailgate to be locked or unlocked electrically by operating a switch on either front door trim panel. The power lock system receives non-switched battery current through a fuse in the Totally Integrated Power Module (TIPM), so that the power locks remain operational, regardless of the ignition switch position.

The TIPM locks the doors and tailgate automatically when the vehicle is driven beyond the speed of 25.7 Km/h (15 mph), all doors are closed and the accelerator pedal is depressed. The rolling door lock feature can be disabled if desired.

This vehicle also offers several customer programmable features, which allows the selection of several optional electronic features to suit individual preferences.

The power lock system for this vehicle can also be operated remotely using the available Remote Keyless Entry (RKE) system radio frequency transmitters, if equipped.

Certain functions and features of the power lock system rely upon resources shared with other electronic modules in the vehicle over the Controlled Area Network (CAN). For proper diagnosis of these electronic modules or of the CAN, the use of a scan tool and the appropriate diagnostic information are required.

REMOTE KEYLESS ENTRY

The RKE system allows the use of a remote battery-powered radio transmitter to signal the TIPM to actuate the power lock system. The RKE receiver operates on non-switched battery current through a fuse in the TIPM, so that the system remains operational, regardless of the ignition switch position.

Certain RKE transmitters are also equipped with a Panic button. If the Panic button on the RKE transmitter is depressed, the horn will sound and the exterior lights will flash on the vehicle for about three minutes, or until the Panic button is depressed a second time. A vehicle speed of about 25.7 Km/h (15 mph) will also cancel the panic event.

The RKE system can also perform other functions on this vehicle. If the vehicle is equipped with the optional Vehicle Theft Security System (VTSS), the RKE transmitter will arm the VTSS when the Lock button is depressed, and disarm the VTSS when the Unlock button is depressed.

The RKE system includes two transmitters when the vehicle is shipped from the factory, but the system can retain the vehicle access codes of up to four transmitters. The transmitter codes are retained in the RKE receiver

memory, even if the battery is disconnected. If an RKE transmitter is faulty or lost, new transmitter vehicle access codes can be programmed into the system using a scan tool.

This vehicle also offers several customer programmable features, which allows the selection of several optional electronic features to suit individual preferences. Customer programmable feature options affecting the RKE system include:

- **Remote Unlock Sequence** - Allows the option of having only the driver side front door unlock when the RKE transmitter Unlock button is depressed the first time. The remaining doors and the tailgate unlock when the button is depressed a second time within 5 seconds of the first unlock press. Another option is having all doors and the tailgate unlock upon the first depression of the RKE transmitter Unlock button.
- **Sound Horn on Lock** - Allows the option of having the horn sound a short chirp as an audible verification that the RKE system received a valid Lock request from the RKE transmitter, or having no audible verification. This feature is not available on export vehicles.
- **Flash Lights with Lock and Unlock** - Allows the option of having the lights flash as an optical verification that the RKE system received a valid Lock request or Unlock request from the RKE transmitter, or having no optical verification.
- **Programming Additional Transmitters** - Allows up to four transmitter vehicle access codes to be stored in the receiver memory. This feature is not available on export vehicles.

Certain functions and features of the RKE system rely upon resources shared with other electronic modules in the vehicle over the Controlled Area Network (CAN). For diagnosis of these electronic modules or of the CAN, the use of a scan tool and the appropriate diagnostic information are required.

COMBINATION FLASHER

This flasher can be energized by the TIPM to flash all of the park/turn signal lamps as an optical alert for the RKE panic function and if the Flash Lights with Lock/Unlock programmable feature is enabled, as an optical verification for the RKE lock/unlock event.

LOW BEAM HEADLAMP RELAY

This relay can be energized by the TIPM to flash the headlamp low beams as an optical alert for the RKE panic function.

OPERATION

POWER LOCKS

POWER LOCKS

The Totally Integrated Power Module (TIPM) locks or unlocks the doors when an actuation input signal from a door lock switch or Remote Keyless Entry Module (RKE) is received. The TIPM turns on the output drivers and provides a voltage level to the door lock motor for a specified time. All passenger doors can be locked or unlocked using a mechanical button mounted on the door trim panel. The front passenger doors and tailgate can be locked or unlocked by using the key cylinder (tailgate cylinder does not lock/unlock vehicle. It only unlocks the tailgate). The tailgate will lock and can not be unlocked if the rear wiper switch is activated (this prevents the wiper from operating when the tailgate is ajar). The tailgate will also lock if battery power is lost and then

restored.

AUTOMATIC DOOR LOCKS

When the automatic door locks are ENABLED the door locks will lock when the vehicle is moving at about 25.7 Km/h (15 mph), all doors are closed and the accelerator pedal is depressed. This feature can be switched ON or OFF as desired. When the system is DISABLED the door locks will operate normally, but will not lock automatically when the vehicle is rolling. Once the automatic door locks have been actuated, they will not try to lock the doors again until a door is opened.

DOOR LOCK INHIBIT

If the key is in the ignition, in any position, and either front door is ajar, the doors can not be locked, but the unlock function still operates. Pressing the RKE lock/unlock button under these conditions will result in a normal lock/unlock activation.

After the key is removed from the Ignition Switch, or the doors are closed, the power door locks will operate normally.

DOOR LOCK CIRCUIT PROTECTION

The TIPM controls the door lock relays. If the door lock switch is actuated continuously for more than five seconds the TIPM will turn the output driver OFF (the TIPM would consider the switch stuck). Each lock motor is protected with a Positive Temperature Coefficient device that prevents motor burn out.

REMOTE KEYLESS ENTRY

LOCK : Pressing the LOCK button locks all doors, sounds horn (chirp) if enabled, and arms the Vehicle Theft Security System, if enabled. The chirp verifies that the RKE receiver has sent a message to the TIPM for door lock operation. If a door has not been closed before pressing the LOCK button, the vehicle may not be secured and the VTSS (if equipped) will not arm until the door is closed.

UNLOCK : Pressing the UNLOCK button once will unlock the driver's door and activate the illuminated entry system and disarm Vehicle Theft Security System, if equipped. Pressing the UNLOCK button twice within five seconds will unlock all doors.

PANIC : If equipped, pressing the PANIC button sounds the horns at half second intervals, flashes the exterior lamps, and turns ON the interior lamps. The panic alarm will remain on for three minutes, or until the PANIC button is actuated again or the ignition switch is turned to the RUN position.

The Remote Keyless Entry Module is capable of retaining the transmitter Vehicle Access Code(s) in its memory even after vehicle power has been interrupted.

DIAGNOSIS AND TESTING

POWER LOCKS

The Totally Integrated Power Module (TIPM) enters a reduced power mode after the key is turned OFF. All diagnosis and testing of the power lock system must be done with the key in the ON position unless otherwise stated.

The most reliable, efficient, and accurate means to diagnose the power lock system requires the use of a scan tool and the proper Electrical Diagnostics article. The scan tool can provide confirmation that the CAN data bus is functional, that all of the electronic modules are sending and receiving the proper messages on the CAN data bus, and that the power lock motors are being sent the proper hard wired outputs by the relays for them to perform their power lock system functions.

Following are tests that will help to diagnose the hard wired components and circuits of the power lock system. However, these tests may not prove conclusive in the diagnosis of this system. In order to obtain conclusive testing of the power lock system, the Controlled Area Network (CAN) and all of the electronic modules that provide inputs to, or receive outputs from the power lock system components must be checked.

The TIPM will set Diagnostic Trouble Codes (DTC) for the power lock system.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

PRELIMINARY DIAGNOSIS

As a preliminary diagnosis for the power lock system, note the system operation while you actuate both the Lock and Unlock functions with the power lock switches and with the Remote Keyless Entry (RKE) transmitter. Then, proceed as follows:

If the entire power lock system fails to function with either the power lock switches or the RKE transmitter, check the fused B(+) fuse in the Junction Block (JB).

If the power lock system functions with both power lock switches, but not with the RKE transmitter, proceed to diagnosis of the Remote Keyless Entry (RKE) system. See **DIAGNOSIS AND TESTING**.

If the driver side power lock switch operates only the driver side front door power lock motor, but all other power lock motors operate with the passenger side power lock switch or the RKE transmitter, use a scan tool and the appropriate diagnostic information to diagnose the Controlled Area Network (CAN).

If only one power lock motor fails to operate with both power lock switches and the RKE transmitter, proceed to diagnosis of the power lock motor. See **DIAGNOSIS AND TESTING**.

1. Disconnect and isolate the battery negative cable.
2. Gently pry the switch from the door trim panel.
3. Disconnect electrical harness connector from switch.

INSTALLATION

DOOR LOCK / UNLOCK SWITCH

81a0tc54

Fig. 3: Door Lock/Unlock Switch
Courtesy of CHRYSLER LLC

1. Connect the electrical harness connector to the switch.
2. Press the switch into place.
3. Connect the battery negative cable.

DOOR LOCK MOTOR

DESCRIPTION

DOOR LOCK MOTOR

The lock mechanisms are actuated by a reversible electric motor mounted within each door and tailgate. The power lock motors are integral to the door latch units.

The power lock motors cannot be adjusted or repaired and, if faulty or damaged, the door latch unit must be replaced.

OPERATION

DOOR LOCK MOTOR

The door lock motors are controlled by relays. A positive and negative battery connection to the two motor terminals will cause the motor to move in one direction. Reversing the current will cause the motor to move in the opposite direction.

DIAGNOSIS AND TESTING

DOOR LOCK MOTOR

The most reliable, efficient, and accurate means to diagnose the power lock system requires the use of a scan tool and the proper Electrical Diagnostics article. Refer to the appropriate wiring information.

REMOTE KEYLESS ENTRY MODULE

REMOVAL

REMOTE KEYLESS ENTRY MODULE

INSTALLATION

REMOTE KEYLESS ENTRY MODULE

. Refer to **INSTALLATION** .

REMOTE KEYLESS ENTRY TRANSMITTER

DIAGNOSIS AND TESTING

REMOTE KEYLESS ENTRY TRANSMITTER

8141c5d3

Fig. 4: View Of Remote Keyless Entry Transmitter
 Courtesy of CHRYSLER LLC

Using special tool 9001, first test to ensure that the transmitter is functioning. Typical testing distance is 2.5 centimeters (1 inch) for Asian transmitters and 30.5 centimeters (12 inches) for all others. To test, position the transmitter as shown. Press any transmitter button, then test each button individually. The tool will beep if a radio signal strength that lights five or more LED's is detected. Repeat this test three times. If transmitter fails any of the test refer to the Diagnostic article.

STANDARD PROCEDURE

RKE TRANSMITTER BATTERIES

The Remote Keyless Entry (RKE) transmitter case snaps open and shut for battery access. To replace the RKE transmitter batteries:

1. Using a thin coin, gently pry at the notch in the center seam of the RKE transmitter case halves near the

key ring until the two halves unsnap.

2. Lift the back half of the transmitter case off of the RKE transmitter.
3. Remove the two batteries from the RKE transmitter.
4. Replace the two batteries with new Panasonic 2016 (if equipped with one battery, use 2032), or equivalent. Be certain that the batteries are installed with their polarity correctly oriented.
5. Align the two RKE transmitter case halves with each other, and squeeze them firmly and evenly together until they snap back into place.

RKE TRANSMITTER CUSTOMER PREFERENCES

AUTOMATIC (ROLLING) LOCKS

The rolling locks feature can be toggled ON/OFF by using the scan tool only.

HORN CHIRP DISABLING / ENABLING

The horn chirp can be toggled using the scan tool or by using the Remote Keyless Entry (RKE) transmitter.

To DISABLE (cancel) the horn chirp feature, press and hold the transmitter LOCK button for four to ten seconds. While pressing the LOCK button in, press the UNLOCK button. Release both buttons.

To ENABLE the horn chirp feature, repeat the above procedure.

OPTICAL CHIRP (FLASH) DISABLING / ENABLING

The optical chirp can be toggled using the scan tool or by using the Remote Keyless Entry (RKE) transmitter.

To DISABLE (cancel) the optical chirp feature, press and hold the transmitter LOCK button for four to ten seconds. While pressing the LOCK button in, press the TAILGATE RELEASE button. Release both buttons.

To ENABLE the optical chirp feature, repeat the above procedure.

TAIL GATE RELEASE DELAY

Press the UNLOCK button for four to ten seconds. While pressing the UNLOCK button, press the TAIL GATE RELEASE button. Release both buttons.

This will toggle between PRESS AND HOLD and PRESS (no delay).

UNLOCK SEQUENCE

The unlock sequence can be toggled using the scan tool or by using the Remote Keyless Entry (RKE) transmitter.

Press and hold the transmitter UNLOCK button for four to ten seconds. While pressing the UNLOCK button in, press the LOCK button. Release both buttons.

This will toggle between Driver door first and Unlock all doors function.

RKE TRANSMITTER PROGRAMING

New Remote Keyless Entry (RKE) transmitters can be programed using the scan tool and the proper Diagnostic article, if no functioning transmitter is available. The scan tool can provide confirmation that the Controlled Area Network (CAN) is functional, and that all of the electronic modules are sending and receiving the proper messages on the CAN data bus.

The following procedure can be used as long as one functioning transmitter is available:

1. Turn ignition to the RUN position (allow ignition chimes to stop).
2. Using any original (working) transmitter, press the UNLOCK button for 4 to 10 seconds.
3. Within the specified 4 to 10 seconds, continue pressing the UNLOCK button and press the PANIC button for 1 second, and release both buttons (a chime will sound to indicate that the transmitter programming mode has been entered - allow 3 seconds for chime to sound).
4. Press LOCK and UNLOCK buttons simultaneously for 1 second and release.
5. Press and release any button on the same transmitter and a chime will sound after successfully programming the transmitter.
6. Repeat steps 4 to 6 to program additional transmitters.
7. Turn ignition to the OFF position. Transmitter programming mode will discontinue after 60 seconds. All transmitter programming must be completed within time specified.

SPECIFICATIONS

REMOTE KEYLESS ENTRY TRANSMITTER

RANGE

Normal operation range is up to a distance of 3 to 7 meters (10 to 23 ft.) of the vehicle. Range may be better or worse depending on the environment around the vehicle.

TAILGATE CYLINDER LOCK SWITCH

DESCRIPTION

TAILGATE CYLINDER LOCK SWITCH

The tailgate cylinder lock switch is integral to the key lock cylinder inside the tailgate. The tailgate cylinder lock switch is a normally-open momentary switch that is hard wired directly to the Totally Integrated Power Module (TIPM), and closes a path to ground through an internal resistor when the lock cylinder is rotated to the unlock or lock position.

The tailgate cylinder lock switch cannot be adjusted or repaired.

OPERATION

TAILGATE CYLINDER LOCK SWITCH

The tailgate cylinder lock switch is actuated when the key is inserted in the lock cylinder and turned to the unlock or lock position. The tailgate cylinder lock switch closes a path to ground through an internal resistor for the Totally Integrated Power Module (TIPM) when the tailgate key lock cylinder is in the lock or unlock position, and opens the ground path when the lock cylinder is in the neutral position. The TIPM reads the switch status, then sends the proper switch status messages to other electronic modules over the Controlled Area Network (CAN). The tailgate cylinder lock switch unlock status message is used by the TIPM as an input for Vehicle Theft Security System (VTSS) operation and to tell the TIPM to lock or unlock the tailgate. There is no mechanical linkage between the tailgate key cylinder and the latches.

DIAGNOSIS AND TESTING

TAILGATE CYLINDER LOCK SWITCH

- 1. Disconnect and isolate the battery negative cable.
- 2. Remove tailgate trim panel. Refer to **REMOVAL** .
- 3. Disconnect tailgate cylinder lock switch harness connector.
- 4. Using a ohmmeter, test for resistances as shown in the TAILGATE CYLINDER LOCK SWITCH TABLE.

TAILGATE CYLINDER LOCK SWITCH TABLE

SWITCH POSITION	RESISTANCE
NEUTRAL	0 OHMS
LOCK (CLOCKWISE)	2 K OHMS ± 10 %
UNLOCK (COUNTERCLOCKWISE)	470 OHMS ± 10 %

- 5. If switch resistance is not correct, replace switch.

REMOVAL

TAILGATE CYLINDER LOCK SWITCH

Fig. 5: Removing/Installing Lock Cylinder Switch - Typical
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the tailgate trim panel. Refer to **REMOVAL** .
3. Remove the retainer clip from the pin on the back of the door lock cylinder (3).
4. Remove the washer from the pin on the back of the door lock cylinder.
5. Remove the door cylinder lock switch (4) from the back of the lock cylinder.

INSTALLATION

TAILGATE CYLINDER LOCK SWITCH

Fig. 6: Removing/Installing Lock Cylinder Switch - Typical
Courtesy of CHRYSLER LLC

1. Position the tailgate cylinder lock switch (4) onto the back of the lock cylinder (3) with the wire harness oriented toward the bottom.
2. Position the washer over the switch.
3. Install the retainer (2) clip onto the pin on the back of the tailgate lock cylinder. Be certain that the center tab of the retainer is engaged in the retention hole on the lock lever.
4. Install the trim panel. Refer to **INSTALLATION** .
5. Connect the battery negative cable.

DIAGNOSIS AND TESTING

B1D62-POWER SEAT SWITCH STUCK

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

- **Set Condition:**

When the Memory Seat Module detects the Driver Seat Switch engaged in an active position for over 50 seconds, this code will set.

Possible Causes

Possible Causes
DRIVER SEAT SWITCH

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, erase all DTC's.

Press the Driver Seat Switch in all directions several times.

Wait one minute.

With the scan tool, read DTC's.

Does the scan tool display active: B1D62-POWER SEAT SWITCH STUCK?

Yes

Replace the Driver Seat Switch in accordance with the Service Information.
Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

Measure the resistance of the (P28) Driver Seat Switch MUX Return between the Driver Seat Switch harness connector and the Memory Seat Module C3 harness connector.

Is the resistance below 3.0 ohms?

Yes

Go To 5.

No

Repair the (P28) Driver Seat Switch MUX Return circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

5. **(P29) DRIVER SEAT SWITCH MUX SUPPLY CIRCUIT OPEN**

81d6a533

Fig. 5: Measuring The Resistance Of The (P29) Driver Seat Switch Mux Supply Between The Driver Seat Switch Harness Connector And The Memory Seat Module C3 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (P29) Driver Seat Switch MUX Supply between the Driver Seat Switch harness connector and the Memory Seat Module C3 harness connector.

Is the resistance below 3.0 ohms?

Yes

Go To 6.

No

Repair the (P29) Driver Seat Switch MUX Supply for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

6. CHECK THE DRIVER SEAT SWITCH CIRCUIT RESISTANCES TO GROUND

81d6ae2b

Fig. 6: Measuring The Resistance Between Ground And Each Of The Driver Seat Switch Circuits At The Driver Seat Switch Harness Connector
 Courtesy of CHRYSLER LLC

Measure the resistance between ground and each of the Driver Seat Switch circuits at the Driver Seat Switch harness connector.

Is the resistance above 10k ohms for each circuit?

Yes

Go To 7.

No

Repair the circuit(s) that measured below 10k ohms for a short to ground.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

7. CHECK THE MSM SENSOR SUPPLY AND SENSOR RETURN

81d6ae3c

Fig. 7: Measuring The Voltage Between The (P29) Driver Seat Switch Mux Supply Circuit And The (P28) Driver Seat Switch Mux Return Circuit At The Driver Seat Switch Harness Connector
 Courtesy of CHRYSLER LLC

Reconnect the Memory Seat Module C3 harness connector.

Turn the ignition on.

Measure the voltage between the (P29) Driver Seat Switch MUX Supply circuit and the (P28) Driver Seat Switch MUX Return circuit at the Driver Seat Switch harness connector.

Is the voltage above 11.0 volts?

Yes

Go To. 8.

No

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

8. DRIVER SEAT HORIZONTAL SWITCH

81d6ae64

Fig. 8: Checking Driver Seat Horizontal Switch
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Reconnect the Driver Seat Switch harness connector.

Turn the ignition on.

Backprobe and measure the voltage of the (P309) Driver Seat Horizontal Rear Riser Switch MUX circuit while moving the Driver Seat Switch horizontally and the rear riser up, down.

NOTE: The Voltage readings for all positions should be between 1.0 volt and 5.0 volts.

Is the voltage between 1.0 and 5.0 volts when the Driver Seat Switch is moved to each position?

Yes

Go To 9.

No

Replace the Driver Seat Switch.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

9. DRIVER SEAT FRONT RISER SWITCH

Fig. 9: Checking Driver Seat Front Riser Switch
 Courtesy of CHRYSLER LLC

Backprobe and measure the voltage of the (P311) Driver Seat Front Riser MUX circuit while moving the Driver Seat Front Riser Switch forward and rearward.

NOTE: The Voltage readings for all positions should be between 1.0 volt and 5.0 volts.

Is the voltage between 1.0 and 5.0 volts when the Driver Seat Switch is moved to each position?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Replace the Driver Seat Switch.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the Driver Seat Switch in the Horizontal position three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

2. **CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT VOLTAGE**

81d6e55b

Fig. 11: Measuring The Voltage Of The (G401) Driver Seat Horizontal Position Sense Circuit At The Driver Horizontal Seat Adjuster Motor Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Driver Horizontal Seat Adjuster Motor harness connector.

Actuate the seat switch in the affected position for the next step.

Measure the voltage of the (G401) Driver Seat Horizontal Position Sense circuit at the Driver Horizontal Seat Adjuster Motor harness connector.

Is the voltage above 10.0 volts?

Yes

Replace the Seat Track Horizontal Motor assembly in accordance with the Service Information.
 Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Go To 3.

3. **CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT FOR A SHORT TO GROUND**

81d6e593

Fig. 12: Measuring The Resistance Between Ground And The (G401) Driver Seat Horizontal Position Sense Circuit At The Driver Horizontal Seat Adjuster Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Memory Seat Module C2 harness connector.

Measure the resistance between ground and the (G401) Driver Seat Horizontal Position Sense circuit at the Driver Horizontal Seat Adjuster Motor harness connector.

Is the resistance above 10k ohms?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (G401) Driver Seat Horizontal Position Sense circuit for a short to ground.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

B1D6E-SEAT HORIZONTAL POSITION SENSOR CIRCUIT HIGH

Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

When the Seat Motor is activated.

Set Conditions

- **Set Condition:**

If during motor operation the sensor voltage is not within a specified range this code will set.

Possible Causes

Possible Causes
(G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT SHORTED TO VOLTAGE
(G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT SHORTED TO ANOTHER CIRCUIT
(G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT OPEN
DRIVER HORIZONTAL SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the Driver Seat Switch in the horizontal position three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

2. **DRIVER HORIZONTAL SEAT ADJUSTER MOTOR**

Turn the ignition off.

Disconnect the Driver Horizontal Seat Adjuster Motor harness connector.

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the seat switch in the horizontal positions three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go to 3.

No

Replace the Driver Horizontal Seat Adjuster Motor assembly in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

3. **(G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 14: Measuring The Voltage Of The (G401) Driver Seat Horizontal Position Sense Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Memory Seat Module C2 harness connector.

Turn the ignition on.

Measure the voltage of the (G401) Driver Seat Horizontal Position Sense circuit.

Is there any voltage present?

Yes

Repair the (G401) Driver Seat Horizontal Position Sense circuit for a short to voltage.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Go to 4.

4. **(G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 15: Measuring The (G401) Driver Seat Horizontal Position Sense Circuit To Other Circuits In The Memory Seat Module C2 Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the (G401) Driver Seat Horizontal Position Sense circuit to other circuits in the Memory Seat Module C2 connector.

Is there any continuity present?

Yes

Repair the (G401) Driver Seat Horizontal Position Sense circuit for a short to another circuit.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Go to 5.

5. (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT OPEN

Fig. 16: Measuring The Resistance Of The (G401) Driver Seat Horizontal Position Sense Circuit Between The Memory Seat Module C2 Harness Connector And The Driver Horizontal Seat Adjuster Motor Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance of the (G401) Driver Seat Horizontal Position Sense circuit between the Memory Seat Module C2 harness connector and the Driver Horizontal Seat Adjuster Motor harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (G401) Driver Seat Horizontal Position Sense circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

If sensor voltage is not within a specified range this DTC will set.

Possible Causes

Possible Causes
(G404) DRIVER SEAT VERTICAL POSITION SENSE CIRCUIT SHORTED TO GROUND FRONT DRIVER VERTICAL SEAT ADJUSTER MOTOR MEMORY SEAT MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the Driver Seat Switch in the Vertical position three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent

condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

2. CHECK THE (G404) DRIVER SEAT VERTICAL POSITION SENSE CIRCUIT VOLTAGE

Fig. 18: Measuring The Voltage Of The (G404) Driver Seat Vertical Position Sense Circuit At The Driver Vertical Seat Adjuster Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Driver Vertical Seat Adjuster Motor harness connector.

Measure the voltage of the (G404) Driver Seat Vertical Position Sense circuit at the Driver Vertical Seat Adjuster Motor harness connector.

Is the voltage above 10.0 volts?

Yes

Replace the Seat Track Vertical Motor assembly in accordance with the Service Information.
Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Go To 3.

3. CHECK THE (G404) DRIVER SEAT VERTICAL POSITION SENSE CIRCUIT FOR A SHORT TO GROUND

81d7430f

Fig. 19: Measuring The Resistance Between Ground And The (G404) Driver Seat Vertical Position Sense Circuit At The Driver Vertical Seat Adjuster Motor Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Memory Seat Module C2 harness connector.

Measure the resistance between ground and the (G404) Driver Seat Vertical Position Sense circuit at the Driver Vertical Seat Adjuster Motor harness connector.

Is the resistance above 10k ohms?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (G404) Driver Seat Vertical Position Sense circuit for a short to ground.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

MEMORY SEAT MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the Driver Seat Switch in the Vertical position three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

2. DRIVER VERTICAL SEAT ADJUSTER MOTOR

Turn the ignition off.

Disconnect the Front Driver Vertical Seat Adjuster Motor harness connector.

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the seat switch in the Front Vertical positions three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go to 3.

No

Replace the Driver Front Vertical Seat Adjuster Motor assembly in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

3. (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT FOR A SHORT TO VOLTAGE

81d74fdd

Fig. 21: Measuring The Voltage Of The (G404) Driver Seat Front Vertical Position Sense Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Memory Seat Module C2 harness connector.

Turn the ignition on.

Measure the voltage of the (G404) Driver Seat Front Vertical Position Sense circuit.

Is there any voltage present?

Yes

Repair the (G404) Driver Seat Front Vertical Position Sense circuit for a short to voltage.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Go to 4.

4. (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

MEMORY SEAT MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the Driver Seat Switch in the Vertical position three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

2. REAR DRIVER VERTICAL SEAT ADJUSTER MOTOR

Turn the ignition off.

Disconnect the Rear Driver Vertical Seat Adjuster Motor harness connector.

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the seat switch in the Vertical positions three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go to 3.

No

Replace the Rear Driver Vertical Seat Adjuster Motor assembly in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

3. (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT FOR A SHORT TO VOLTAGE

81d773f4

Fig. 28: Measuring The Voltage Of The (G402) Driver Seat Rear Vertical Position Sense Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Memory Seat Module C2 harness connector.

Turn the ignition on.

Measure the voltage of the (G402) Driver Seat Rear Vertical Position Sense circuit.

Is there any voltage present?

Yes

Repair the (G402) Driver Seat Rear Vertical Position Sense circuit for a short to voltage.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Go to 4.

4. (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Possible Causes
SEAT POSITION SENSOR CIRCUIT DIAGNOSTIC TROUBLE CODES (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT OPEN (G491) DRIVER SEAT HORIZONTAL SENSOR GROUND CIRCUIT OPEN (P115) DRIVER SEAT HORIZONTAL FORWARD DRIVER (P117) DRIVER SEAT HORIZONTAL REARWARD DRIVER DRIVER HORIZONTAL SEAT ADJUSTER MOTOR MEMORY SEAT MODULE

Diagnostic Test

1. **CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES**

Turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display any seat position sensor DTC's?

Yes

Diagnose and repair the other DTC(s) first. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 2.

2. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the Driver Seat Switch in the horizontal forward and rearward position three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go To 3.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

3. CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT VOLTAGE

81d7efe3

Fig. 32: Measuring The Voltage Between The (G401) Driver Seat Horizontal Position Sense Circuit And The (G491) Driver Seat Horizontal Sensor Ground Circuit At The Driver Horizontal Seat Adjuster Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Driver Horizontal Seat Adjuster Motor harness connector.

Turn the ignition on.

Measure the voltage between the (G401) Driver Seat Horizontal Position Sense circuit and the (G491) Driver Seat Horizontal Sensor Ground circuit at the Driver Horizontal Seat Adjuster Motor harness connector.

Is the voltage above 10.0 volts?

Yes

Go To 4.

No

Go To 5.

4. CHECK THE DRIVER SEAT HORIZONTAL FORWARD/REARWARD DRIVER CIRCUIT VOLTAGE

Fig. 33: Checking The Driver Seat Horizontal Forward/Rearward Driver Circuit Voltage
Courtesy of CHRYSLER LLC

Using a 12-volt test light connect one lead to the (P115) Driver Seat Horizontal Forward Driver circuit and the other lead to (P117) Driver Seat Horizontal Rearward Driver circuit at the Driver Horizontal Seat Adjuster Motor harness connector.

Move the Driver Seat Switch in the Horizontal forward and rearward position.

Does the test light illuminate with the seat switch engaged in both positions?

Yes

Replace the track/horizontal motor assembly in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Go To 7.

5. **CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT FOR AN OPEN**

Fig. 34: Measuring The Resistance Of The (G401) Driver Seat Horizontal Position Sense Circuit Between The Memory Seat Module C2 Harness Connector And The Driver Horizontal Seat Adjuster Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Memory Seat Module C2 harness connector.

Measure the resistance of the (G401) Driver Seat Horizontal Position Sense circuit between the Driver Horizontal Seat Adjuster Motor harness connector and the Memory Seat Module C2 harness connector.

Is the resistance below 10.0 ohms?

Yes

Go To 6.

No

Repair the (G401) Driver Seat Horizontal Position Sense circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

6. **CHECK THE (G491) DRIVER SEAT HORIZONTAL SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 35: Measuring The Resistance Of The (G491) Driver Seat Horizontal Sensor Ground Circuit Between The Driver Horizontal Seat Adjuster Motor Harness Connector And The Memory Seat Module C2 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (G491) Driver Seat Horizontal Sensor Ground circuit between the Driver Horizontal Seat Adjuster Motor harness connector and the Memory Seat Module C2 harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (G491) Driver Seat Horizontal Sensor Ground circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

7. **CHECK THE (P115) DRIVER SEAT HORIZONTAL FORWARD DRIVER CIRCUIT FOR AN OPEN**

Fig. 36: Measuring The Resistance Of The (P115) Driver Seat Horizontal Forward Driver Circuit Between The Driver Horizontal Seat Adjuster Motor Harness Connector To The Memory Seat Module C2 Harness Connector
Courtesy of CHRYSLER LLC

Disconnect the Memory Seat Module C2 harness connector.

Measure the resistance of the (P115) Driver Seat Horizontal Forward Driver circuit between the Driver Horizontal Seat Adjuster Motor harness connector to the Memory Seat Module C2 harness connector.

Is the resistance below 10.0 ohms?

Yes

Go To 8.

No

Repair the (P115) Driver Seat Horizontal Forward Driver circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

8. CHECK THE (P117) DRIVER SEAT HORIZONTAL REARWARD DRIVER CIRCUIT FOR AN OPEN

Fig. 37: Measuring The Resistance Of The (P117) Driver Seat Horizontal Rearward Driver Circuit Between The Driver Horizontal Seat Adjuster Motor Harness Connector And The Memory Seat Module C2 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (P117) Driver Seat Horizontal Rearward Driver circuit between the Driver Horizontal Seat Adjuster Motor harness connector and the Memory Seat Module C2 harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (P117) Driver Seat Horizontal Rearward Driver circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

B1D7F-SEAT FRONT VERTICAL MOTOR CONTROL CIRCUIT PERFORMANCE

Circuit Schematic

Monitor Conditions

When Monitored:

Whenever the Seat Motor is activated.

Set Conditions

- **Set Condition:**

If the Memory Seat Module does not detect the rotation of the Seat Motor this DTC will set.

Possible Causes

Possible Causes
SEAT POSITION SENSOR CIRCUIT DIAGNOSTIC TROUBLE CODES (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT OPEN (G494) DRIVER SEAT FRONT VERTICAL SENSOR GROUND CIRCUIT OPEN (P119) DRIVER SEAT FRONT VERTICAL UP DRIVER (P121) DRIVER SEAT FRONT VERTICAL DOWN DRIVER FRONT DRIVER VERTICAL SEAT ADJUSTER MOTOR MEMORY SEAT MODULE

Diagnostic Test

1. **CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES**

Turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display any seat position sensor DTC's?

Yes

Diagnose and repair the other DTC(s) first. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 2.

2. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the Driver Seat Switch in the Front Vertical up and down position three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go To 3.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

3. **CHECK THE (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT VOLTAGE**

Fig. 39: Measuring The Voltage Between The (G404) Driver Seat Front Vertical Position Sense Circuit And The (G494) Driver Seat Front Vertical Sensor Ground Circuit At The Driver Front Vertical Seat Adjuster Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Driver Front Vertical Seat Adjuster Motor harness connector.

Turn the ignition on.

Measure the voltage between the (G404) Driver Seat Front Vertical Position Sense circuit and the (G494) Driver Seat Front Vertical Sensor Ground circuit at the Driver Front Vertical Seat Adjuster Motor harness connector.

Is the voltage above 10.0 volts?

Yes

Go To 4.

No

Go To 5.

4. CHECK THE DRIVER SEAT FRONT VERTICAL UP/DOWN DRIVER CIRCUIT VOLTAGE

Fig. 40: Checking The Driver Seat Front Vertical Up/Down Driver Circuit Voltage
Courtesy of CHRYSLER LLC

Using a 12-volt test light connect one lead to the (P119) Driver Seat Front Vertical Up Driver circuit and the other lead to (P121) Driver Seat Front Vertical Down Driver circuit at the Driver Front Vertical Seat Adjuster Motor harness connector.

Move the Driver Seat Switch in the Front Vertical up and down position.

Does the test light illuminate with the seat switch engaged in both positions?

Yes

Replace the track/Front Vertical motor assembly in accordance with the Service Information.
Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Go To 7.

5. **CHECK THE (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT FOR AN OPEN**

Fig. 41: Measuring The Resistance Of The (G404) Driver Seat Front Vertical Position Sense Circuit Between The Memory Seat Module C2 Harness Connector And The Driver Vertical Seat Adjuster Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Memory Seat Module C2 harness connector.

Measure the resistance of the (G404) Driver Seat Front Vertical Position Sense circuit between the Driver Front Vertical Seat Adjuster Motor harness connector and the Memory Seat Module C2 harness connector.

Is the resistance below 10.0 ohms?

Yes

Go To 6.

No

Repair the (G404) Driver Seat Front Vertical Position Sense circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

6. **CHECK THE (G494) DRIVER SEAT FRONT VERTICAL SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 42: Measuring The Resistance Of The (G494) Driver Seat Front Vertical Sensor Ground Circuit Between The Driver Front Vertical Seat Adjuster Motor Connector And The Memory Seat Module C2 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (G494) Driver Seat Front Vertical Sensor Ground circuit between the Driver Front Vertical Seat Adjuster Motor connector and the Memory Seat Module C2 harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (G494) Driver Seat Front Vertical Sensor Ground circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

7. **CHECK THE (P119) DRIVER SEAT FRONT VERTICAL UP DRIVER CIRCUIT FOR AN OPEN**

Fig. 43: Measuring The Resistance Of The (P119) Driver Seat Front Vertical Up Driver Circuit Between The Driver Front Vertical Seat Adjuster Motor Harness Connector To The Memory Seat Module C2 Harness Connector

Courtesy of CHRYSLER LLC

Disconnect the Memory Seat Module C2 harness connector.

Measure the resistance of the (P119) Driver Seat Front Vertical Up Driver circuit between the Driver

Front Vertical Seat Adjuster Motor harness connector to the Memory Seat Module C2 harness connector.

Is the resistance below 10.0 ohms?

Yes

Go To 8.

No

Repair the (P119) Driver Seat Front Vertical Up Driver circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

8. CHECK THE (P121) DRIVER SEAT FRONT VERTICAL DOWN DRIVER CIRCUIT FOR AN OPEN

Fig. 44: Measuring The Resistance Of The (P121) Driver Seat Front Vertical Down Driver Circuit Between The Driver Front Vertical Seat Adjuster Motor Harness Connector And The Memory Seat Module C2 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (P121) Driver Seat Front Vertical Down Driver circuit between the Driver Front Vertical Seat Adjuster Motor harness connector and the Memory Seat Module C2 harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (P121) Driver Seat Front Vertical Down Driver circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

B1D83-SEAT REAR VERTICAL MOTOR CONTROL CIRCUIT PERFORMANCE

Circuit Schematic

01421000

Fig. 45: Seat Rear Vertical Position Sensor Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the Seat Motor is activated.

Set Conditions

- **Set Condition:**

If the Memory Seat Module does not detect the rotation of the Seat Motor this DTC will set.

Possible Causes

Possible Causes
SEAT POSITION SENSOR CIRCUIT DIAGNOSTIC TROUBLE CODES (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT OPEN (G492) DRIVER SEAT REAR VERTICAL SENSOR GROUND CIRCUIT OPEN (P111) DRIVER SEAT REAR VERTICAL UP DRIVER (P113) DRIVER SEAT REAR VERTICAL DOWN DRIVER REAR DRIVER VERTICAL SEAT ADJUSTER MOTOR MEMORY SEAT MODULE

Diagnostic Test

1. **CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES**

Turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display any seat position sensor DTC's?

Yes

Diagnose and repair the other DTC(s) first. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 2.

2. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the Driver Seat Switch in the Rear Vertical up and down position three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go To 3.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

3. **CHECK THE (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT VOLTAGE**

Fig. 46: Measuring The Voltage Between The (G402) Driver Seat Rear Vertical Position Sense Circuit And The (G492) Driver Seat Rear Vertical Sensor Ground Circuit At The Driver Rear Vertical Seat Adjuster Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Driver Rear Vertical Seat Adjuster Motor harness connector.

Turn the ignition on.

Measure the voltage between the (G402) Driver Seat Rear Vertical Position Sense circuit and the (G492) Driver Seat Rear Vertical Sensor Ground circuit at the Driver Rear Vertical Seat Adjuster Motor harness connector.

Is the voltage above 10.0 volts?

Yes

Go To 4.

No

Go To 5.

4. CHECK THE DRIVER SEAT REAR VERTICAL UP/DOWN DRIVER CIRCUIT VOLTAGE

Fig. 47: Checking The Driver Seat Rear Vertical Up/Down Driver Circuit Voltage
Courtesy of CHRYSLER LLC

Using a 12-volt test light connect one lead to the (P111) Driver Seat Rear Vertical Up Driver circuit and the other lead to (P113) Driver Seat Rear Vertical Down Driver circuit at the Driver Rear Vertical Seat Adjuster Motor harness connector.

Move the Driver Seat Switch in the Rear Vertical up and down position.

Does the test light illuminate with the seat switch engaged in both positions?

Yes

Replace the track/Rear Vertical motor assembly in accordance with the Service Information.
Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Go To 7.

5. **CHECK THE (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT FOR AN OPEN**

Fig. 48: Measuring The Resistance Of The (G402) Driver Seat Rear Vertical Position Sense Circuit Between The Memory Seat Module C2 Harness Connector And The Rear Driver Vertical Seat Adjuster Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Memory Seat Module C2 harness connector.

Measure the resistance of the (G402) Driver Seat Rear Vertical Position Sense circuit between the Driver Rear Vertical Seat Adjuster Motor harness connector and the Memory Seat Module C2 harness connector.

Is the resistance below 10.0 ohms?

Yes

Go To 6.

No

Repair the (G402) Driver Seat Rear Vertical Position Sense circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

6. **CHECK THE (G492) DRIVER SEAT REAR VERTICAL SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 49: Measuring The Resistance Of The (G492) Driver Seat Rear Vertical Sensor Ground Circuit Between The Driver Rear Vertical Seat Adjuster Motor Connector And The Memory Seat Module C2 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (G492) Driver Seat Rear Vertical Sensor Ground circuit between the Driver Rear Vertical Seat Adjuster Motor connector and the Memory Seat Module C2 harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (G492) Driver Seat Rear Vertical Sensor Ground circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

7. **CHECK THE (P111) DRIVER SEAT REAR VERTICAL UP DRIVER CIRCUIT FOR AN OPEN**

Fig. 50: Measuring The Resistance Of The (P111) Driver Seat Rear Vertical Up Driver Circuit Between The Driver Rear Vertical Seat Adjuster Motor Harness Connector To The Memory Seat Module C2 Harness Connector
Courtesy of CHRYSLER LLC

Disconnect the Memory Seat Module C2 harness connector.

Measure the resistance of the (P111) Driver Seat Rear Vertical Up Driver circuit between the Driver Rear Vertical Seat Adjuster Motor harness connector to the Memory Seat Module C2 harness connector.

Is the resistance below 10.0 ohms?

Yes

Go To 8.

No

Repair the (P111) Driver Seat Rear Vertical Up Driver circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

8. **CHECK THE (P113) DRIVER SEAT REAR VERTICAL DOWN DRIVER CIRCUIT FOR AN OPEN**

Fig. 51: Measuring The Resistance Of The (P113) Driver Seat Rear Vertical Down Driver Circuit Between The Driver Rear Vertical Seat Adjuster Motor Harness Connector And The Memory Seat Module C2 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (P113) Driver Seat Rear Vertical Down Driver circuit between the Driver Rear Vertical Seat Adjuster Motor harness connector and the Memory Seat Module C2 harness

connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Memory Seat Module in accordance with the Service Information.
Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (P113) Driver Seat Rear Vertical Down Driver circuit for an open.
Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

B1D9B-SEAT HORIZONTAL FRONT STOP NOT LEARNED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the Seat Motor is activated.

Set Conditions

- Set Condition:**

Seat becomes de-standardized. If the seat is not standardized, an Easy Exit/Entry function can not be performed. If seat is standardized (learn seat cushion horizontal front hardstop) and then becomes de-standardized (conditions are: seat cushion motor is 5% past the expected hard stop position or seat cushion hall sensor failure is occurred), a DTC is logged.

Possible Causes

Possible Causes
OTHER DIAGNOSTIC TROUBLE CODES SET IN THE MEMORY SEAT MODULE
SEAT STANDARDIZATION ROUTINE NOT PERFORMED

Diagnostic Test

1. CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES

Turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display any seat position sensor or circuit performance DTC's?

Yes

Diagnose and repair the other DTC(s) first. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 2.

2. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the seat in the full forward horizontal position.

With the scan tool, read DTC's.

Does the scan tool display active: B1D9B-SEAT HORIZONTAL FRONT STOP NOT LEARNED?

Yes

With the scan tool, perform the Memory Seat Module (MSM) Standard Routine.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

B210D-BATTERY VOLTAGE LOW - MSM

Circuit Schematic

Fig. 52: Battery Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

Engine running, during seat motor operation.

Set Conditions

- **Set Condition:**

This code is set immediately after the Memory Seat Module (MSM) receives a low charging system voltage message over the CAN Interior Bus or detects voltage under 9.5 volts on the (A210) Fused B(+) circuit.

Possible Causes

Possible Causes
CHARGING SYSTEM VOLTAGE LOW (A210) FUSED B(+) CIRCUIT OPEN (Z913) GROUND CIRCUIT OPEN MEMORY SEAT MODULE

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **CHECK PCM FOR CHARGING SYSTEM DTC**

With the scan tool, read Powertrain Control Module DTC's.

Are there any Charging System DTC's set in the Powertrain/Engine Control Module?

Yes

(Refer to **DIAGNOSIS AND TESTING**) for Charging System diagnostic procedures.

No

Go To 2.

2. **TEST FOR INTERMITTENT CONDITION**

With the scan tool, erase all DTC's.

Turn the ignition switch to the OFF position then start the engine and operate the driver power seat.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go To 3.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

3. (A210) FUSED B(+) CIRCUIT OPEN

Fig. 53: Measuring The Voltage On The (A210) Fused B(+) Circuit At The Memory Seat Module Harness Connector And Compare To Voltage At The Vehicles Battery
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Memory Seat Module C1 harness connector.

Start the engine and let idle.

Measure the voltage on the (A210) Fused B(+) circuit at the Memory Seat Module C1 harness connector and compare to voltage at the vehicle battery.

Is the voltage at the Memory Seat Module connector the same as measured at the battery?

Yes

Go To 4.

No

Repair the (A210) Fused B(+) circuit as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

4. (Z913) GROUND CIRCUIT OPEN

Fig. 54: Checking The (Z913) Ground Circuit At The Memory Seat Module C1 Harness Connector Using A 12-Volt Test Light Connected To 12-Volts
Courtesy of CHRYSLER LLC

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (Z913) Ground circuit at the Memory Seat Module C1 harness connector.

Does the test light illuminate brightly?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (Z913) Ground circuit as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

B210E-BATTERY VOLTAGE HIGH - MSM

Circuit Schematic

Fig. 55: Battery Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Engine running, during seat operation.

Set Conditions

- **Set Condition:**

This code is set immediately after the Memory Seat Module (MSM) receives a high charging system voltage message over the CAN Interior Bus or detects voltage over 16.5 volts on the (A210) Fused B(+) circuit.

Possible Causes

Possible Causes
CHARGING SYSTEM VOLTAGE HIGH (A210) FUSED B(+) CIRCUIT OPEN MEMORY SEAT MODULE

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **CHECK PCM/ECM FOR CHARGING SYSTEM DTC**

With the scan tool, read Powertrain Control Module DTC's.

Are there any Charging System DTC's set in the Powertrain Control Module?

Yes

(Refer to **DIAGNOSIS AND TESTING**) for Charging System diagnostic procedures.

No

Go To 2.

2. **TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase DTC's

Turn the ignition switch to the OFF position then start the engine and let run for one minute.

Attempt to operate the Driver Power Seat.

With the scan tool, read DTC's.

Does the scan tool display active this DTC?

Yes

Go To 3.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

3. CHECK THE VOLTAGE ON THE (A210) FUSED B(+) CIRCUIT

Fig. 56: Measuring The Voltage On The (A210) Fused B(+) Circuit At The Memory Seat Module Harness Connector And Compare To Voltage At The Vehicles Battery
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Memory Seat Module harness connector.

Start the engine and let idle.

Measure the voltage on the (A210) Fused B(+) circuit at the Memory Seat Module harness connector and compare to voltage at the vehicles battery.

Is the voltage at the Memory Seat Module connector the same as measured at the battery?

Yes

Replace the Memory Seat Module in accordance with the Service Information.
Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (A210) Fused B(+) circuit as necessary.
Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

B221C-MEMORY SEAT MODULE INTERNAL

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Ignition on.

Set Conditions

• **Set Condition:**

This code is set immediately if the Memory Seat Module (MSM) internal self test fails.

Possible Causes

Possible Causes
MEMORY SEAT MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

With the scan tool, erase all DTC's.

Cycle the ignition switch off then back on.

With the scan tool, read DTC's.

Does the scan tool display active: B221C-MEMORY SEAT MODULE INTERNAL?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

U0011-CAN INTERIOR BUS OFF PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Perform U0010-CAN INTERIOR BUS diagnostic procedure.

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0155-LOST COMMUNICATION WITH CLUSTER/CCN

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0203-LOST COMMUNICATION WITH DOOR MODULE LEFT FRONT

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0204-LOST COMMUNICATION WITH DOOR MODULE FRONT RIGHT

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

POWER SEAT SYSTEM VERIFICATION TEST - VER 1

Diagnostic Test

1. Perform Power Seat System Verification Test

Disconnect all jumper wires and reconnect all previously disconnected components and connectors.

Ensure that all accessories are turned off.

Ensure that the battery is fully charged.

Turn the ignition on.

If either the Memory Seat Module or the Driver Horizontal Seat Adjuster Motor/Seat Track was replaced, the MSM Standard Routine must be performed using the scan tool.

With the scan tool, record and erase DTCs from all modules.

Operate the driver seat in all positions.

With the Memory Switch on the Driver's Door, program the Driver's Seat No. 1 Button to a desired position and Driver No. 2 Button to a different position.

Verify that both Memory positions can be recalled from the RKE transmitter and the Memory Switch on the Driver's Door.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select ECU View.

Check for DTCs in the modules.

Are DTCs present in any of the modules or is the original condition still present?

Yes

The repair is not complete. Refer to the related article for the DTC or symptom that is still present.

No

The repair is complete.

2008 ACCESSORIES AND EQUIPMENT

Power Seats - Service Information - Liberty

POWER SEATS - SERVICE INFORMATION

DESCRIPTION

POWER SEAT SYSTEM

POWER SEAT SYSTEM

81a82c25

Fig. 1: Identifying Power Seat Switch, Seat Cushion & Seat Cushion Side Shield

Courtesy of CHRYSLER LLC

NOTE: Driver seat shown in illustration, passenger seat similar.

The power seat system allows the driver and front seat passenger to electrically adjust the seating position using the power seat switch assembly (2) located on the outboard seat cushion side shield (3).

81a71095

Fig. 2: Identifying Upper Power Seat Adjuster & Lower Power Seat Adjuster
 Courtesy of CHRYSLER LLC

A driver side six-way power seat is available on this vehicle. The power seat includes a six-way adjustable seat cushion track. The six-way power seat can be adjusted back up, back down, front up, front down, forward and rearward. A two-way front passenger seat is also available as an option. The front passenger seat can be adjusted forward and rearward only. The power seat system is also available with the heated seat option. Refer to **DESCRIPTION** for additional information on the heated seats.

The power seat adjuster can be made up of the upper and lower power seat adjuster assemblies. The upper power seat adjuster (1) is used for the driver power seat only. It contains two reversible motors that are connected to worm-drive gearboxes that move the seat adjusters through screw-type drive units. These motors control the front seat tilt, rear seat tilt and when activated together the height of the driver seat. The lower power seat adjuster (2) is used on both the driver and front passenger power seats. It contains one reversible motor that is connected to a worm-drive gearbox that moves the seat adjuster through a screw-type drive unit. This motor is responsible for the fore and aft movement of the driver seat. Each motor contains a self-resetting circuit breaker to protect it from overload. Consecutive or frequent resetting of the circuit breakers may damaged the motors.

81a710a1

Fig. 3: Front/Rear Tilt Motor, Reversible Motor & Power Seat Track Unit
Courtesy of CHRYSLER LLC

The power seat system for this vehicle includes the following major components:

The **Front Tilt Motor (2)** is located on the upper power seat adjuster assembly and controls the up and down movement of the seat front only. The front tilt motor is part of the power seat track unit (1) and must be replaced as an assembly. See **REMOVAL**.

The **Rear Tilt Motor (3)** is located on the upper power seat adjuster assembly and controls the up and down movement of the seat rear only. The front tilt motor is part of the power seat track unit (1) and must be replaced as an assembly. See **REMOVAL**.

The **Lower Power Seat Adjuster** contains one reversible motor (4) that is connected to a worm-drive gearbox that moves the seat adjuster through a screw-type drive unit. This motor is responsible for the fore and aft movement of the driver seat. The motor is part of the power seat track unit (1) and must be replaced as an assembly. See **REMOVAL**.

81aB2c41

Fig. 4: Power Seat Switch
Courtesy of CHRYSLER LLC

Power Seat Switch - Vehicles may be equipped with a driver side six-way power seat switch. The power seat switch has a paddle-type lever mounted on the outboard seat side shield. Movement of the seat cushion mimics the action of the switch paddle.

MEMORY SEAT SYSTEM

An electronic memory seat system is available on certain models. The memory system is able to store and recall all driver side power seat positions and driver outside mirror position. The system can be set for two different drivers. On vehicles with a factory installed radio connected to the Controller Area Network (CAN) data bus network, the memory system is also able to store and recall up to twelve radio station presets (six AM and six FM), for two drivers. The memory system will also store and recall the last station listened to for each driver, even if it is not one of the twelve preset stations.

The memory system will automatically recall all of these settings when a button of the memory switch is depressed, or when the doors are unlocked using the Remote Keyless Entry (RKE) transmitter (if enabled). If the vehicle has more than two drivers the RKE transmitter recall of memory features can be disabled. This is a customer programmable feature of the Electronic Vehicle Information Center (EVIC) set through the use of the appropriate steering wheel switches. Refer to **OPERATION** for additional information on the customer programmable features.

The memory system also has an "Easy Entry and /Exit" feature that provides the driver with more room to enter or exit the vehicle. When the seat is in a memorized position, it will move rearward 60 millimeters or to the end of its travel, whichever occurs first, when the key is removed from the ignition switch lock cylinder. This is also a customer programmable feature of the Electronic Vehicle Information Center (EVIC) set through the use of the appropriate steering wheel switches.

The memory system includes the following components:

Memory Selector Switch - located in the driver door trim panel.

Driver Door Module (DDM) - located in the driver door, behind the trim panel.

Hall Effect Sensors - Outside Mirror - The hall effect sensor is permanently installed on the outside mirror motor. This hall effect sensor is used to provide a reference signal to the memory seat module, letting the module know the exact position of the mirror.

Sentry Key Remote Entry Module (SKREEM) - located at ignition key cylinder.

Remote Keyless Entry (RKE) Transmitter - located with ignition key.

Memory Seat Module (MSM) - located underneath the driver seat and also controls the Adjustable Pedals.

Hall Effect Sensors - Seat Track - These hall effect sensors are permanently installed in each of the power seat track motors. They are used to provide a reference signal to the memory heated seat mirror module, letting the module know the exact position of the seat cushion and recliner.

Radio - located in the instrument panel center stack.

Certain functions and features of the memory system rely upon resources shared with other electronic modules in the vehicle over the Controller Area Network (CAN) bus. The CAN bus allows the sharing of sensor information. This helps to reduce wire harness complexity, internal controller hardware, and component sensor current loads. At the same time, this system provides increased reliability, enhanced diagnostics, and allows the addition of many new feature capabilities. For diagnosis of these electronic modules or of the CAN bus, the use of a scan tool and the proper diagnostic procedures information are needed.

OPERATION

POWER SEAT SYSTEM

The power seat system receives battery current through a fuse in the Totally Integrated Power Module (TIPM) so that the power seats remain operational, regardless of the ignition switch position.

When a power seat switch is actuated, a battery feed and a ground path are applied through the power seat switch contacts to the appropriate motor or motors. The motor and drive unit operate to move the seat in the selected direction until the switch is released, or until the travel limit of the power seat track is reached. When

the switch is moved in the opposite direction, the battery feed and ground path to the motor is reversed through the switch contacts. This causes the motor to run in the opposite direction.

DIAGNOSIS AND TESTING

MEMORY SEAT SYSTEM

In order to obtain conclusive testing of the power seats with and without the memory system option, the Controller Area Network (CAN) bus, and all of the electronic modules that provide inputs to, or receive outputs from the memory system components must be checked. Use a scan tool and the proper diagnostic information to accurately diagnose the power seat/memory seat systems.

If the driver power seat exhibits an interrupted or jerky motion, ensure the wire harness is connected correctly. To verify the concern, obtain a scan tool and energize each axis one at a time. If any axis stops in approximately 2 seconds (without hitting the end of travel), the feedback for that axis may have an open, short or be incorrectly connected. Check the wiring to that axis (module to motor). Repair any wiring problems and retry that axis. Refer to appropriate wiring information for complete circuit schematic or connector pin-out information.

NOTE: Vehicles equipped with the memory/heated seat option utilize a low voltage cut-off feature. This feature turns off the 12V power to the power seat system anytime vehicle voltage is below 11.0V. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the power seat system is attempted, the battery should be fully-charged.

POWER SEAT ADJUSTER

Operate the power seat switch and move the seat in all directions. The seat should move in each of the selected directions.

If the power seat adjuster fails to operate in more than one direction, proceed as follows:

1. Inspect the power seat adjuster motors to ensure the electrical connectors are fully seated to the motors. If OK, go to step 2. If not OK, connect the electrical connector to the fully seated position.
2. Check the power seat fuse in the Totally Integrated Power Module (TIPM). If OK, go to step 3. If not OK, replace the inoperative fuse.
3. Remove the power seat switch from the seat cushion side panel. Check for battery voltage at the fused B (+) circuit cavity of the power seat switch wire harness connector. If OK, go to step 4. If not OK, repair the open circuit to the TIPM as required.
4. Check for continuity between the ground circuit cavity of the power seat switch wire harness connector and a good ground. There should be continuity. If OK, go to step 5. If not OK, repair the open circuit to ground as required.
5. See **DIAGNOSIS AND TESTING**. If the switch tests OK, check the wire harness between the power seat switch and the motor. If the circuits check OK, replace the faulty power seat motor, track or seat back frame assembly. If the circuits are not OK, repair the wire harness as required.

POWER SEAT DIAGNOSIS CHART

SYMPTOM	POSSIBLE CAUSE	CORRECTION
Power seat inoperative in all directions	Blown Fuse or inoperative circuit breaker	Check for damaged wiring and possible circuit short, Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information. Repair as necessary
	Power seat switch	Perform appropriate power seat switch test. See DIAGNOSIS AND TESTING . Replace switch as necessary.
	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring, Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information. Repair as necessary
Fore/aft seat movement completely inoperative	Power seat switch	Perform appropriate power seat switch test. See DIAGNOSIS AND TESTING . Replace switch as necessary
	Fore aft motor or flex drive cable.	Replace the power seat track assembly.
	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring, Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information. Repair as necessary
Up/down seat movement completely inoperative	Power seat switch	Perform appropriate power seat switch test. See DIAGNOSIS AND TESTING . Replace switch as necessary
	Height adjust motor or drive assembly	Replace the power seat track assembly.
	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring, Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information. Repair as necessary
Seat tilt movement completely inoperative	Power seat switch	Perform appropriate power seat switch test. See DIAGNOSIS AND TESTING . Replace switch as necessary
	Front tilt motor or drive assembly	Replace the power seat track assembly.
	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring, Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information. Repair as necessary
		Perform appropriate power seat switch

Seat power recline movement completely inoperative	Power seat switch	test. See DIAGNOSIS AND TESTING . Replace switch as necessary
	Recline motor or drive assembly	Replace the power seat back frame assembly.
	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring. Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information. Repair as necessary
Seat motion chattering or vibrating during fore/aft movement	Foreign material under seat or in seat track	Remove foreign material. Clean and lubricate seat tracks as necessary
	Poor seat track lubrication	Lubricate the lower portion of the effected seat tracks
	Loose components	Check and tighten loose components as necessary
	Binding or sticking of components	Loosen seat track to vehicle mounting bolts. Using the power seat switch, move the effected seat reward to the track stops. Tighten track bolts to proper torque and recheck seat operation. If seat motion is still abnormal, replace the power seat track assembly.
	Fore aft motor or flex drive cable.	Replace the power seat track assembly.
	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring. Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information. Repair as necessary
Seat motion chattering or vibrating during up/down movement	Foreign material under seat or in upper seat track pivots	Remove foreign material. Clean and lubricate upper seat track pivots as necessary
	Poor upper seat track pivot lubrication	Lubricate the effected upper seat track pivots
	Poor height adjust motor drive assembly lubrication	Lubricate the height adjust motor drive assembly
	Loose components	Check and tighten loose components as necessary
	Binding or sticking of components	Inspect and lubricate the effected upper seat track pivots. Recheck seat operation. If seat motion is still abnormal, replace the power seat track assembly.
	height adjust motor or drive assembly	Replace the power seat track assembly.

	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring, Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information. Repair as necessary
Seat motion chattering or vibrating during seat tilt movement	Foreign material under seat or in upper seat track pivots	Remove foreign material. Clean and lubricate upper seat track pivots as necessary
	Poor upper seat track pivot lubrication	Lubricate the effected upper seat track pivots
	Poor front tilt motor drive assembly lubrication	Lubricate the front tilt motor drive assembly
	Loose components	Check and tighten loose components as necessary
	Binding or sticking of components	Inspect and lubricate the effected upper seat track pivots. Recheck seat operation. If seat motion is still abnormal, replace the power seat track assembly.
	Front tilt motor or drive assembly	Replace the power seat track assembly.
	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring, Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information. Repair as necessary
Seat motion chattering or vibrating during power recline movement	Foreign material in seat back frame pivots or drive shaft	Remove foreign material. Clean and lubricate seat back frame pivots and drive shaft as necessary
	Poor seat back frame pivot or drive shaft lubrication	Lubricate the seat back frame pivots and drive shaft
	Loose components	Check and tighten loose components as necessary
	Binding or sticking of components	Inspect and lubricate the effected seat back frame pivots and drive shaft. Recheck seat operation. If seat motion is still abnormal, replace the seat back frame assembly.
	Recline motor or drive assembly	Replace the seat back frame assembly.
	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring, Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information. Repair as necessary
Slow seat motion during	Battery voltage low	Check vehicle charging system operation. Repair charging system and charge

fore/aft movement		battery as necessary
	Poor power seat system ground	Check for loose ground connections or damaged wiring. Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information. Repair as necessary
	Foreign material under seat or in seat track	Remove foreign material. Clean and lubricate seat tracks as necessary
	Poor seat track lubrication	Lubricate the lower portion of the effected seat tracks
	Loose components	Check and tighten loose components as necessary
	Binding or sticking of components	Loosen seat track to vehicle mounting bolts. Using the power seat switch, move the effected seat reward to the track stops. Tighten track bolts to proper torque and recheck seat operation. If seat motion is still abnormal, replace the power seat track assembly.
	Fore aft motor or flex drive cable.	Replace the power seat track assembly.
Slow seat motion during up/down movement	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring. Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information. Repair as necessary
	Battery voltage low	Check vehicle charging system operation. Repair charging system and charge battery as necessary
	Poor power seat system ground	Check for loose ground connections or damaged wiring. Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information. Repair as necessary
	Foreign material under seat or in upper seat track pivots	Remove foreign material. Clean and lubricate upper seat track pivots as necessary
	Poor upper seat track pivot lubrication	Lubricate the effected upper seat track pivots
	Poor height adjust motor drive assembly lubrication	Lubricate the height adjust motor drive assembly
	Loose components	Check and tighten loose components as necessary
	Binding or sticking of components	Inspect and lubricate the effected upper seat track pivots. Recheck seat operation. If seat motion is still abnormal, replace

		the power seat track assembly.
	Height adjust motor or drive assembly	Replace the power seat track assembly.
	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring, Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information. Repair as necessary
Slow seat motion during seat tilt movement	Battery voltage low	Check vehicle charging system operation. Repair charging system and charge battery as necessary
	Poor power seat system ground	Check for loose ground connections or damaged wiring, Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information. Repair as necessary
	Foreign material under seat or in upper seat track pivots	Remove foreign material. Clean and lubricate upper seat track pivots as necessary
	Poor upper seat track pivot lubrication	Lubricate the effected upper seat track pivots
	Poor front tilt motor drive assembly lubrication	Lubricate the front tilt motor drive assembly
	Loose components	Check and tighten loose components as necessary
	Binding or sticking of components	Inspect and lubricate the effected upper seat track pivots. Recheck seat operation. If seat motion is still abnormal, replace the power seat track assembly.
	Front tilt motor or drive assembly	Replace the power seat track assembly.
	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring, Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information. Repair as necessary
Slow seat motion during power recline movement	Battery voltage low	Check vehicle charging system operation. Repair charging system and charge battery as necessary
	Poor power seat system ground	Check for loose ground connections or damaged wiring, Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information. Repair as necessary
	Foreign material in seat back	Remove foreign material. Clean and lubricate seat back frame pivots and drive

	frame pivots or drive shaft	shaft as necessary
	Poor seat back frame pivot or drive shaft lubrication	Lubricate the seat back frame pivots and drive shaft
	Loose components	Check and tighten loose components as necessary
	Binding or sticking of components	Inspect and lubricate the effected seat back frame pivots and drive shaft. Recheck seat operation. If seat motion is still abnormal, replace the seat back frame assembly.
	Recline motor or drive assembly	Replace the seat back frame assembly.
	Wiring problems (system or vehicle)	Check for loose wire connections or damaged wiring. Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information. Repair as necessary
Squeaks, noises and rattles during fore/aft movement	Foreign material under seat or in seat track	Remove foreign material. Clean and lubricate seat tracks as necessary
	Poor seat track lubrication	Lubricate the lower portion of the effected seat tracks
	Loose components	Check and tighten loose components as necessary
	Binding or sticking of components	Loosen seat track to vehicle mounting bolts. Using the power seat switch, move the effected seat reward to the track stops. Tighten track bolts to proper torque and recheck seat operation. If seat motion is still abnormal, replace the power seat track assembly.
	Fore aft motor or flex drive cable.	Replace the power seat track assembly.
Squeaks, noises and rattles during up/down movement	Foreign material under seat or in upper seat track pivots	Remove foreign material. Clean and lubricate upper seat track pivots as necessary
	Poor upper seat track pivot lubrication	Lubricate the effected upper seat track pivots
	Poor height adjust motor drive assembly lubrication	Lubricate the height adjust motor drive assembly
	Loose components	Check and tighten loose components as necessary
	Binding or sticking of components	Inspect and lubricate the effected upper seat track pivots. Recheck seat operation. If seat motion is still abnormal, replace the power seat track assembly.

-	height adjust motor or drive assembly	Replace the power seat track assembly.
Squeaks, noises and rattles during seat tilt movement	Foreign material under seat or in upper seat track pivots	Remove foreign material. Clean and lubricate upper seat track pivots as necessary
	Poor upper seat track pivot lubrication	Lubricate the effected upper seat track pivots
	Poor front tilt motor drive assembly lubrication	Lubricate the front tilt motor drive assembly
	Loose components	Check and tighten loose components as necessary
	Binding or sticking of components	Inspect and lubricate the effected upper seat track pivots. Recheck seat operation. If seat motion is still abnormal, replace the power seat track assembly.
	Front tilt motor or drive assembly	Replace the power seat track assembly.
Squeaks, noises and rattles during power recline movement	Foreign material in seat back frame pivots or drive shaft	Remove foreign material. Clean and lubricate seat back frame pivots and drive shaft as necessary
	Poor seat back frame pivot or drive shaft lubrication	Lubricate the seat back frame pivots and drive shaft
	Loose components	Check and tighten loose components as necessary
	Binding or sticking of components	Inspect and lubricate the effected seat back frame pivots and drive shaft. Recheck seat operation. If seat motion is still abnormal, replace the seat back frame assembly.
	Recline motor or drive assembly	Replace the seat back frame assembly.

STANDARD PROCEDURE

MEMORY SYSTEM PROGRAMMING

The Memory Seat Module (MSM) interfaces with the Remote Keyless Entry (RKE) system via the Controller Area Network (CAN) bus. The proper procedure of setting and recalling a memory position using the RKE is as follows:

1. Press and release memory switch 1 or 2 to recall memory position 1 or 2.
2. Adjust the seat, recliner, adjustable pedal position, set radio station presets, and the side view mirrors to the desired position.
3. Press momentarily and release memory switch S.
4. Within five seconds, press momentarily and release memory switch 1.

5. To link the RKE transmitter: within ten seconds, press and release the "LOCK" button on one of the RKE transmitters

To program the second driver's position, repeat the above procedure using memory switch 2. The second RKE transmitter can be programmed in the same fashion as indicated in step 5.

NOTE: The module will abort a recall if the transmission is moved out of park or if any seat movement is activated whether manually or by memory recall. The module will also abort a recall if any movement of the adjustable pedals is detected.

To recall either of the programmed positions momentarily press and release either memory selector switch 1 or 2. If using RKE, just press and release the "UNLOCK" button on the proper transmitter for either position 1 or 2.

A recall is possible any time the vehicle transmission is in PARK and the seatbelt is unbuckled. This condition is monitored by the MSM.

SWITCH-MEMORY

DESCRIPTION

MEMORY SWITCH

Vehicles equipped with the memory system have a memory switch mounted to the driver side front door trim panel. This switch is used to set and recall all of the memory system settings for up to two drivers. The memory switch is a resistor multiplexed unit that is hard wired to the left Front Door Module (FDM). The left FDM in turn sends out the memory system set and recall requests to the other electronic modules over the Controller Area Network (CAN) data bus.

The memory switch cannot be adjusted or repaired and, if inoperative or damaged, it must be replaced.

OPERATION

MEMORY SWITCH

The memory switch has three momentary switch buttons labeled Set, 1 and 2. When the memory set switch is depressed, a resistance value is sent to the left Front Door Module (FDM) via hard wired connections. When the memory system is in "set" mode a chime will be generated and a message will appear in the electronic vehicle information center display (if equipped).

REMOVAL

MEMORY SWITCH

Fig. 5: Identifying Screws
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the driver front door trim panel. Refer to **REMOVAL** .
3. Remove the two screws (1) that secure the memory switch (3) to the back of the driver front door trim panel (2).
4. Remove the memory switch.

INSTALLATION

MEMORY SWITCH

Fig. 6: Identifying Screws
Courtesy of CHRYSLER LLC

1. Position the memory switch (3) and install and tighten the two screws (1) that secure it to the back of the driver front door trim panel (2).

2. Install the driver front door trim panel. Refer to **INSTALLATION** .
3. Reconnect the battery negative cable.

SWITCH - POWER SEAT

DESCRIPTION

SEAT SWITCH

Fig. 7: Driver Seat Switch
Courtesy of CHRYSLER LLC

NOTE: Driver seat switch shown in illustration, passenger seat switch similar.

The driver power seat can be adjusted in six different ways and the passenger power seat can be adjusted fore and aft using the power seat switch. The power seat switch (2) is located on the lower outboard side of the seat cushion (1) on the seat cushion side shield (3). The power seat system incorporates a seat switch with a seat cushion control paddle.

The individual components in the power seat switch assembly cannot be repaired. If the switch is damaged or inoperative, the entire power seat switch must be replaced.

OPERATION

SEAT SWITCH

When a power seat switch is actuated, a battery feed and a ground path are applied through the switch contacts to the power seat track adjuster motor. The selected adjuster motor operates to move the seat through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the adjuster motor to run in the opposite direction.

No power seat switch should be held applied in any direction after the adjuster has reached its travel limit. The

power seat adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker may result in motor damage.

DIAGNOSIS AND TESTING

POWER SEAT SWITCH

DRIVER WITHOUT MEMORY SEAT SYSTEM

8132c253

Fig. 8: Power Seat Switch Terminals
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the power seat switch from the power seat. See **REMOVAL**.
3. Use an ohmmeter to test the continuity of the power seat switch. Refer to **DRIVER POWER SEAT SWITCH WITHOUT MEMORY SEAT SYSTEM CONTINUITY** table. If not OK, replace the faulty power seat switch. If switch tests OK, see **DIAGNOSIS AND TESTING**.

DRIVER POWER SEAT SWITCH WITHOUT MEMORY SEAT SYSTEM CONTINUITY

SWITCH POSITION	CONTINUITY BETWEEN
OFF	7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
HORIZONTAL FORWARD	6-8, 7-1, 7-3, 7-4, 7-5, 7-9, 7-10, 7-11
HORIZONTAL REARWARD	6-4, 7-1, 7-3, 7-5, 7-8, 7-9, 7-10, 7-11
FRONT TILT DOWN	6-5, 7-1, 7-3, 7-4, 7-8, 7-9, 7-10, 7-11
FRONT TILT UP	6-9, 7-1, 7-3, 7-4, 7-5, 7-8, 7-10, 7-11
REAR TILT DOWN	6-10, 7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-11
REAR TILT UP	6-11, 7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10

8132c253

Fig. 9: Power Seat Switch Terminals
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the power seat switch from the power seat. See **REMOVAL**.
3. Use an ohmmeter to test the continuity of the power seat switch. Refer to **PASSENGER POWER SEAT SWITCH CONTINUITY** table. If not OK, replace the faulty power seat switch. If switch tests OK, see **DIAGNOSIS AND TESTING**.

PASSENGER POWER SEAT SWITCH CONTINUITY

SWITCH POSITION	CONTINUITY BETWEEN
OFF	7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
HORIZONTAL FORWARD	6-8, 7-1, 7-3, 7-4, 7-5, 7-9, 7-10, 7-11
HORIZONTAL REARWARD	6-4, 7-1, 7-3, 7-5, 7-8, 7-9, 7-10, 7-11

DRIVER WITH MEMORY SEAT SYSTEM

8132c26a

Fig. 10: Power Seat Switch Terminals
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the power seat switch from the power seat. See **REMOVAL**.
3. Use an ohmmeter to test the resistance of the power seat switch. Refer to **DRIVER POWER SEAT SWITCH WITH MEMORY SEAT SYSTEM CONTINUITY** table. If not OK, replace the faulty power seat switch. If switch tests OK, see **DIAGNOSIS AND TESTING**.

DRIVER POWER SEAT SWITCH WITH MEMORY SEAT SYSTEM CONTINUITY

SWITCH POSITION	CONTINUITY BETWEEN	RESISTANCE VALUE
OFF	10-4	OPEN
OFF	10-11	OPEN
OFF	1-4	47 OHMS
OFF	1-11	47 OHMS
REAR TILT UP	10-11	169 OHMS
REAR TILT DOWN	10-11	76 OHMS
HORIZONTAL FORWARD	10-11	43 OHMS
HORIZONTAL REARWARD	10-11	10 OHMS
FRONT TILT UP	10-4	169 OHMS
FRONT TILT DOWN	10-4	76 OHMS
ALL RESISTANCE VALUES ARE $\pm$ FIVE PERCENT		

REMOVAL

SEAT SWITCH

Fig. 11: Identifying Mounting Tabs, Power Seat Switch, Seat Cushion Side Shield & Power Seat Switch Electrical Harness Connector
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the outboard seat cushion side shield (3).
3. Disconnect the power seat switch electrical harness connector (4).
4. Using a small flat bladed tool, gently release the four mounting tabs (1) that secure the power seat switch (2) and separate switch from side shield (3).

INSTALLATION

SEAT SWITCH

Fig. 12: Identifying Mounting Tabs, Power Seat Switch, Seat Cushion Side Shield & Power Seat Switch Electrical Connector
 Courtesy of CHRYSLER LLC

1. Position the power seat switch (2) onto the seat cushion side shield (3). Gently apply pressure to the switch until the four mounting tabs (1) are fully seated into place.
2. Connect the power seat switch electrical connector (4).
3. Install the seat cushion outboard side shield.
4. Connect the battery negative cable.
5. Verify normal operation of the power seat assembly.

TRACK - POWER SEAT

REMOVAL

POWER SEAT TRACK

Fig. 13: Side Shield, Seat Belt Bolts, Seat Belts, Front Bolts, Electrical Connectors
 Courtesy of CHRYSLER LLC

WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. Refer to WARNING .

1. Disconnect and isolate the battery negative cable.
2. Remove the head rests to ease with seat removal.
3. Remove the side shield (4) to expose the seat belt bolts.
4. Position the recliner lever up and remove the seat belt bolts (2) and seat belts (3). Refer to REMOVAL .
5. Slide the seats back and remove the front bolts (1).
6. Disconnect the electrical connectors (5).

81971b50

Fig. 14: Rear Nuts and Bolts
Courtesy of CHRYSLER LLC

7. Slide the seats to forward position and remove the rear nuts (1) and bolts (2).
8. Remove the seats from the vehicle.
9. Remove bolts attaching seat frame to cushion pan.
10. Disconnect wire harness fasteners from cushion pan.
11. Remove seat back.
12. Remove seat cushion tension springs.
13. Remove power seat track nuts.
14. Remove power seat track from riser.
15. Remove any parts that need to be transferred to the new seat track assembly.

INSTALLATION

POWER SEAT TRACK

81971b50

Fig. 15: Rear Nuts and Bolts
Courtesy of CHRYSLER LLC

WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. Refer to WARNING .

NOTE: Start all seat fasteners first before tightening to specifications.

1. Install the seats to the vehicle.
2. Install any parts that need to be transferred from the old seat track assembly.
3. Place power seat track in position on the seat frame ensuring motor is installed correctly into seat risers.
4. Install power seat track to seat riser nuts.
5. Install seat springs.
6. Connect wire harness fasteners to the cushion pan.
7. Install bolts attaching power seat track to cushion pan.
8. Install seat back. Tighten recliner bolts to 12 N.m (9 ft. lbs.) torque. Tighten pivot bolts to 40 N.m (30 ft. lbs.) torque.
9. Slide the seats to the rearward position, connect the electrical connectors (5) and install the bolts (1).
10. Tighten the inboard bolts first then tighten the outboard bolts (1) to 62 N.m (46 ft. lbs.).
11. Install the seat belts (3) and bolts (2). Refer to INSTALLATION .

Fig. 16: Side Shield, Seat Belt Bolts, Seat Belts, Front Bolts, Electrical Connectors
Courtesy of CHRYSLER LLC

12. Tighten the rear nuts (1) to 62 N.m (46 ft. lbs.).
13. Tighten the rear bolts (2) to 62 N.m (46 ft. lbs.).
14. Install the side shield (4) to the seats.
15. Install the head rest to the seats.

16. Do not reconnect the battery negative cable at this time. The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component. Refer to **STANDARD PROCEDURE** .
17. Following successful completion of the supplemental restraint system verification test procedure, perform the Occupant Classification System Verification Test using a scan tool.
18. Verify normal operation of the power seat assembly.

POWER TOP-FULL OPEN RETRACTABLE DIAGNOSTICS

DIAGNOSIS AND TESTING

B210A-SYSTEM VOLTAGE LOW

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

At all times.

Set Conditions

- **Set Condition:**

When the Sunroof Module detects input voltage below 10.0 volts for over 15 seconds, this code will set.

Possible Causes

Possible Causes
LOW BATTERY VOLTAGE (A959) FUSED B+ CIRCUIT HIGH RESISTANCE SUNROOF MODULE

Diagnostic Test

1. **CHECK ENGINE DTC's**

NOTE: **Ensure the battery is fully charged and serviceable before proceeding.**

With the scan tool, read ENGINE DTC's

Are there any ENGINE DTC's present?

No

Go To 2.

Yes

Refer to symptom list for problems related to ENGINE.

2. **TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase DTC's

Start the engine and run for two minutes.

With the scan tool, read DTC's.

Does the scan tool display B210A-SYSTEM VOLTAGE LOW?

Yes

Go To 3.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

3. **CHECK THE (A906) FUSED B+ CIRCUIT FOR HIGH RESISTANCE**

Using the scan tool, read the Battery Voltage of the Sunroof Module.

Using the scan tool, read the Battery Voltage of the TIPM (Central Gateway).

Is the voltage within 0.2 volt of each module?

Yes

Replace the Sunroof Module in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (A906) Fused B+ circuit for high resistance.

Perform **BODY VERIFICATION TEST - VER 1** .

B210B-SYSTEM VOLTAGE HIGH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

At all times.

Set Conditions

- Set Condition:**

When the Sunroof Module detects input voltage above 16 volts for over 15 seconds, this code will set.

Possible Causes

Possible Causes
HIGH BATTERY VOLTAGE SUNROOF MODULE

Diagnostic Test

1. CHECK ENGINE DTC's

NOTE: Ensure the battery is fully charged and serviceable before proceeding.

With the scan tool, read ENGINE DTC's

Are there any ENGINE DTC's present?

No

Go To 2.

Yes

Refer to symptom list for problems related to ENGINE.

2. TEST FOR INTERMITTENT CONDITION

With the scan tool, record and erase DTC's

Start the engine and run for two minutes.

With the scan tool, read DTC's.

Does the scan tool display B210B-SYSTEM VOLTAGE HIGH?

Yes

Replace the Power Sunroof Module in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

B210D-BATTERY VOLTAGE LOW - MEMORY MIRROR MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

At all times.

Set Conditions

- **Set Condition:**

Anytime the module senses voltage input below 9.0 volts (motor operating or not). After this code is set, it becomes stored when the voltage exceeds 9.1 volts.

Possible Causes

Possible Causes
LOW VOLTAGE ENGINE DTC (A906) FUSED B(+) CIRCUIT RESISTANCE SUNROOF MOTOR/MODULE

Diagnostic Test

1. **CHECK ENGINE DTC's**

NOTE: **Ensure the battery is fully charged before proceeding.**

With the scan tool, read ENGINE DTC's

Are there any ENGINE BATTERY OR CHARGING SYSTEM DTC's present?

No

Go to 2.

Yes

Refer to symptom list for problems related to ENGINE.

2. **TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase DTC's

Start the engine and run for 2 minutes.

Turn the ignition off.

Turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display BATTERY VOLTAGE LOW in the Sunroof module only?

Yes

Go To 4.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

3. CHECK THE SUNROOF MOTOR/MODULE

NOTE: To further diagnose the sunroof, it is necessary to lower or remove the headliner.

Turn the ignition off.

Disconnect the Sunroof Motor/Module harness connector.

NOTE: Ensure the A-Pillar connector is connected before proceeding.

Test for an open or high resistance on the (A906) Fused B(+) circuit by connecting a 12-volt test light between the (A932) Fused B(+) circuit and the (Z919) Ground circuit in the Sunroof Motor/Module harness connector. The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

Replace the Sunroof Motor/Module in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. CHECK (A906) FUSED B(+) AND (Z919) GROUND CIRCUITS FOR AN OPEN

NOTE: Ensure the A-Pillar connector is connected before proceeding.

Using a 12-volt test light connected to 12 volts, probe the (Z919) Ground circuit in the Sunroof Motor/Module harness connector. The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

Repair the (A906) Fused B(+) circuit for an open or high resistance.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (Z919) Ground circuit for an open or high resistance.
Perform **BODY VERIFICATION TEST - VER 1** .

B210E-BATTERY VOLTAGE HIGH - MEMORY MIRROR MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

At all times.

Set Conditions

- **Set Condition:**

Anytime the module senses voltage input above 16 volts. This code will become stored when the voltage drops below 15.9 volts.

Possible Causes

Possible Causes
HIGH VOLTAGE ENGINE DTC SUNROOF MOTOR/ MODULE

Diagnostic Test

1. CHECK ENGINE DTC's

With the scan tool, read ENGINE DTC's

Are there any ENGINE DTC's present?

No

Go to 2.

Yes

Refer to symptom list for problems related to ENGINE.

2. TEST FOR INTERMITTENT CONDITION

With the scan tool, record and erase DTC's

Start the engine and run for two minutes.

Cycle the ignition from on to off three times.

Turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display BATTERY VOLTAGE HIGH in this module only?

Yes

Replace the Sunroof Motor/Module in accordance with service information. Refer to **REMOVAL** .
Refer to **REMOVAL** .

Perform **BODY VERIFICATION TEST - VER 1** .

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

B2125-SENSOR SUPPLY VOLTAGE PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the Sunroof module is awake.

Set Conditions

- **Set Condition:**

Whenever the module has determined that there is a motor or electronic malfunction, this code will set.

Possible Causes

Possible Causes
SUNROOF MOTOR/MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Sunroof Switch in all positions several times.

Wait 30 seconds.

With the scan tool, read DTC's.

Does the scan tool display this DTC as active?

Yes

Replace the Sunroof Motor/Module.

Perform the Sunroof Position Calibration, refer to **STANDARD PROCEDURE** . Perform the Excessive Force Limitation Calibration, , refer to **STANDARD PROCEDURE** .

Perform **BODY VERIFICATION TEST - VER 1** .

No

The conditions that caused this code to set are not present at this time. Operate the Sunroof several times and recheck for DTC's. If the code reappears now or later, replace the Sunroof Motor/Module.

B2206-CURRENT VIN MISSING/MISMATCH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The module will receive and monitor the VIN message from the PCM and record the VIN if different from the last VIN.

Possible Causes

Possible Causes
INCORRECT VIN PROGRAMMED IN PCM
SUNROOF MOTOR/MODULE

Diagnostic Test

1. **CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. **CHECK VIN IN PCM**

With the scan tool compare the VIN that is programmed into the PCM to the VIN on the vehicle.

Does the VIN programmed into the PCM match the vehicles VIN?

Yes

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Sunroof Motor/Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Program the correct VIN in the PCM and retest.
Perform **BODY VERIFICATION TEST - VER 1** .

B2227-SUNROOF ECU INTERNAL

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the Sunroof module is awake.

Set Conditions

- **Set Condition:**

Whenever the module has determined that there is a motor or electronic malfunction, this code will set.

Possible Causes

Possible Causes
SUNROOF MOTOR/MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Sunroof Switch in all positions several times.

Wait 30 seconds.

With the scan tool, read DTC's.

Does the scan tool display this DTC as active?

Yes

Replace the Sunroof Motor/Module.

Perform the Sunroof Position Calibration, refer to **STANDARD PROCEDURE** . Perform the Excessive Force Limitation Calibration, , refer to **STANDARD PROCEDURE** .

Perform **BODY VERIFICATION TEST - VER 1** .

No

The conditions that caused this code to set are not present at this time. Operate the Sunroof several times and recheck for DTC's. If the code reappears now or later, replace the Sunroof Motor/Module.

B2582-FULL OPEN ROOF REARWARD OPEN SWITCH CIRCUIT PERFORMANCE

Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

Anytime the Sunroof is being operated.

Set Conditions

- **Set Condition:**

This code will set when the Sunroof/Motor Module does not receive the Sunroof Switch signal.

Possible Causes

Possible Causes
SUNROOF SWITCH
SUNROOF/MOTOR MODULE

Diagnostic Test

1. **CHECK FOR DTCS**

With the scan tool, record DTC's.

Erase the DTCs.

Turn the ignition off, wait 10 seconds, then turn the ignition on.

Attempt to operate the Power Sunroof.

With the scan tool, read DTCs.

Does the scan tool display this DTC?

Yes

Go To 2.

No

Using the wiring diagrams as a guide, inspect the wiring and connectors for an intermittent condition.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK THE POWER SUNROOF SWITCH**

Using the scan tool monitor the Sunroof Switch inputs.

Does the Sunroof Switch change state?

No

Replace the Sunroof Switch in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Replace the Sunroof/Motor Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B2585-FULL OPEN ROOF FORWARD OPEN SWITCH CIRCUIT PERFORMANCE

Circuit Schematic

014000a7

Fig. 2: Full Open Roof Module Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

At all times.

Set Conditions

- **Set Condition:**

This code will set when the Full Open Roof Control Module does not receive the switch input within 500 msec after power up.

Possible Causes

Possible Causes
SUNROOF SWITCH SUNROOF MOTOR/MODULE

Diagnostic Test

1. **CHECK FOR DTCS**

With the scan tool, record DTC's and any DTC's.

Erase the DTCs.

Turn the ignition off, wait 10 seconds, then turn the ignition on.

Attempt to operate the Power Sliding Roof.

With the scan tool, read DTCs.

Does the scan tool display this DTC?

Yes

Go To 2.

No

Using the wiring diagrams as a guide, inspect the wiring and connectors for an intermittent condition.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK THE POWER ROOF FOR MECHANICAL PROBLEMS**

Examine the Full Power Roof for proper alignment, worn or binding rollers and cables, loose/damaged

weatherstrip, and track assembly for wear or anything that would cause an obstruction to proper operation.

Were there any mechanical problems found?

Yes

Refer to appropriate Service information article for the related symptom(s).

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK THE FULL POWER ROOF SWITCH

Turn the ignition off.

Turn the ignition on.

With the scan tool, monitor the Full Power Roof Switch state.

Does the state of the Full Power Roof Switch change when the switch is operated?

No

Replace the Full Power Roof Switch in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Replace the Full Power Roof Motor/Module in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B2588-FULL OPEN ROOF CLOSE SWITCH CIRCUIT PERFORMANCE

Circuit Schematic

014000a7

Fig. 3: Full Open Roof Module Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

Anytime the Full Power Top Switch is in operation.

Set Conditions

- **Set Condition:**

This code will set when the Power Top Module does not see any top movement 500 msec after switch activation.

Possible Causes

Possible Causes
POWER SUNROOF HARNESS SUNROOF SWITCH POWER SUNROOF MODULE

Diagnostic Test

1. **CHECK FOR DTCS**

With the scan tool, record DTC's and any Power Top DTC's.

Erase the DTCs.

Turn the ignition off, wait 10 seconds, then turn the ignition on.

Attempt to operate the Power Top

With the scan tool, read DTCs.

Does the scan tool display this DTC?

Yes

Go To 2.

No

Using the wiring diagrams as a guide, inspect the wiring and connectors for an intermittent condition.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK THE POWER SUNROOF SWITCH**

Using the scan tool check for proper sunroof switch operation.

Does the scan tool show the switch change state when operated?

Yes

Replace the Full Power Top Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **POWER SUNROOF MODULE**

Turn the ignition off.

Check the Full Power Top jumper harness for possible damage.

Is there any present damage to the harness?

No

Replace the Full Power Top Module in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Replace the Full Power Top jumper harness in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B258B-FULL OPEN ROOF FRONT MOTOR CONTROL PERFORMANCE

Circuit Schematic

Monitor Conditions

When Monitored:

At all times.

Set Conditions

- **Set Condition:**

When the Power Top Module receives an input from the Power Top Switch and the Front Power Top Motor does not operate.

Possible Causes

Possible Causes
FRONT POWER TOP MOTOR POWER TOP CONTROL MODULE

Diagnostic Test

1. **CHECK FOR DTCS**

With the scan tool, record DTC's.

Erase the DTCs.

Turn the ignition off, wait 10 seconds, then turn the ignition on.

Attempt to operate the Power Top

With the scan tool, read DTCs.

Does the scan tool display this DTC?

Yes

Go To 2.

No

Using the wiring diagrams as a guide, inspect the wiring and connectors for an intermittent condition.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **FRONT POWER TOP CONTROL MOTOR**

Disconnect the Front Power Top Control Motor harness connector.

Using a volt meter measure the voltage at the Power Top Control Motor.

Does the volt meter display above 10.0 volts?

Yes

Replace the Front Power Top Control Motor in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Power Top Control Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

U0010-CAN INTERIOR BUS

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously

Set Conditions

• **Set Condition:**

Whenever the CAN C Interior Bus (125K) (+) or CAN C Interior Bus (125K) (-) circuit is open, shorted to voltage or shorted to ground.

Possible Causes

Possible Causes
CAN C INTERIOR BUS (125K) DTCs IN THE TOTALLY INTEGRATED POWER MODULE (TIPM) (D265) CAN C INTERIOR BUS (125K) (+) CIRCUIT OPEN (D264) CAN C INTERIOR BUS (125K) (-) CIRCUIT OPEN SUNROOF MOTOR/MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTCS

Turn the ignition on.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK TIPM DTCS

With the scan tool, read TIPM active DTC's

Does the scan tool display any active CAN C INTERIOR BUS DTCS?

Yes

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

No

Go To 3.

3. CHECK THE (D265) CAN C INTERIOR BUS (125K) (+) CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the negative battery cable.

Disconnect the Sunroof Motor/Module harness connector.

Disconnect the TIPM C7 harness connector.

Turn the ignition on.

Measure the voltage of the (D265) CAN Interior Bus (125K) (+) circuit in the TIPM C7 harness connector.

Is the voltage below 0.2 volts?

Yes

Go To 4.

No

Repair the (D265) CAN C Interior Bus (125K) (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

4. **CHECK THE (D264) CAN C INTERIOR BUS (125K) (-) CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition on.

Measure the voltage of the (D264) CAN Interior Bus (125K) (-) circuit in the TIPM C7 harness connector.

Is the voltage below 0.2 volts?

Yes

Go To 5.

No

Repair the (D264) CAN C Interior Bus (125K) (-) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

5. **CHECK THE (D265) CAN C INTERIOR BUS (125K) (+) CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Measure the resistance between ground and the (D265) CAN Interior Bus (125K) (+) circuit in the TIPM C7 harness connector.

Is the resistance above 10,000 ohms?

Yes

Go To 6.

No

Repair the (D265) CAN C Interior Bus (125K) (+) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

6. **CHECK THE (D264) CAN C INTERIOR BUS (125K) (-) CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Measure the resistance between ground and the (D264) CAN Interior Bus (125K) (-) circuit in the TIPM C7 harness connector.

Is the resistance above 10,000 ohms?

Yes

Go To 7.

No

Repair the (D264) CAN C Interior Bus (125K) (-) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

7. CHECK THE (D265) CAN C INTERIOR BUS (125K) (+) CIRCUIT FOR AN OPEN

Measure the resistance of the (D265) CAN Interior Bus (125K) (+) circuit between the TIPM C7 harness connector and the Sunroof Motor/Module harness connector.

Is the resistance below 2.0 ohms?

Yes

Go To 8.

No

Repair the (D265) CAN C Interior Bus (125K) (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

8. CHECK THE (D264) CAN C INTERIOR BUS (125K) (-) CIRCUIT FOR AN OPEN

Measure the resistance of the (D264) CAN C Interior Bus (125K) (-) circuit between the TIPM C7 harness connector and the Sunroof Motor/Module harness connector.

Is the resistance below 5.0 ohms?

Yes

Replace the Sunroof Motor/Module in accordance with the service information.

Perform the Sunroof Position Calibration, refer to **STANDARD PROCEDURE** . Perform the Excessive Force Limitation Calibration, refer to **STANDARD PROCEDURE** .

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (D264) CAN C Interior Bus (125K) (-) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0155-LOST COMMUNICATION WITH CLUSTER/CCN

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

- 8 - FRAME ASSEMBLY
- 9 - BRACKETS
- 10 - END CAPS

WARNING: Keep fingers and other body parts out of sunroof opening at all times.

The sunroof features a power sliding glass panel and a sunshade which can be manually positioned anywhere along its travel, rearward of glass panel front edge.

The sunroof is electrically operated from two switches located in the overhead console. To operate the sunroof the ignition switch must be in either the Accessory or On/Run position. One switch (vent) is a push button type and opens the sunroof to the vent position only. The other switch (open/close) is a rocker type for opening and closing the sunroof. Pressing and releasing the open button once the sunroof will express open and the wind deflector will raise. If the button is pressed a second time the sunroof will stop in that position. Pressing and holding the close button will close the sunroof. If the close button is released the sunroof will stop in that position. Also, by pressing the close button the sunroof will close automatically.

SUNROOF OPERATION INSTRUCTIONS

SWITCH INPUTS			
-	OPEN	CLOSE	VENT
FULL VENT	1. Push and hold switch until glass stops in flush closed position glass will then express open 2. Press switch for less than 0.65 seconds for express to full open.	1. Push and hold switch until glass stops in flush closed position. 2. Press switch for less than 0.65 seconds for express to flush closed.	No action -
VENT RANGE	1. Push and hold switch until glass passes through flush closed position. Glass will then open 2. Press switch for less than 0.65 seconds for express to full open.	1. Push and hold switch until glass stops in flush closed position. 2. Press switch for less than 0.65 seconds for express to flush closed.	1. Push and hold switch until glass stops in full vent position. 2. Press switch for less than 0.65 seconds for express to full vent.
	1. Press switch for less than 0.65 seconds for express to full open.	No action	1. Press and hold switch. Glass will travel through flush closed to full vent. Glass will stop when

FLUSH	2. Press switch for more than 0.65 seconds and glass will stop when switch is released	-	switch is released or when fully vented. 2. Press switch for less than 0.65 seconds for express to full vent.
FULL OPEN	No action -	1. Press and hold switch until glass stops in flush closed position or anywhere in between. 2. Press switch for less than 0.65 seconds for express to flush closed.	1. Press and hold switch. Glass will travel through flush closed to full vent. Glass will stop when switch is released. 2. Press switch for less than 0.65 seconds for express to full vent.

OPERATION

POWER SUNROOF

This vehicle has a vent, tilt and slide power sunroof system with express (one-touch) open/close feature. The sunroof system receives battery feed through the "sunroof" relay and a 25 amp mini fuse located in the Totally Integrated Power Module (TIPM). The sunroof system power is supplied when the ignition switch is in the RUN and ACCESSORY positions. The sunroof will operate normally with the key in any position while the Accessory Delay system is active.

The sunroof is electrically operated from two switches located in the overhead console in between the two reading lamps. The "VENT" switch is a push button type switch and opens the sunroof to the vent position only. The other switch "OPEN/CLOSED" is a rocker type switch for opening and closing the sunroof. Pressing and releasing the open button once, the sunroof will express open and the wind deflector will raise. If the button is pressed a second time the sunroof will stop in that position. Pressing and releasing the close button once will express close the sunroof. If the close button is pressed a second time during the express close operation the sunroof will stop in that position.

DIAGNOSIS AND TESTING

DIAGNOSTIC PROCEDURES

Before beginning sunroof diagnostics verify that all other power accessories are in proper operating condition. Refer to **SUNROOF DIAGNOSIS CHART** for possible causes. If not, a common electrical problem may exist. Refer to **SYSTEM WIRING DIAGRAMS** article for circuit, splice and component descriptions. Check the condition of the circuit protection (20 amp circuit breaker in the Totally Integrated Power Module (TIPM)). Inspect all wiring connector pins for proper engagement and continuity. Check for battery voltage at the power sunroof drive motor. Refer to **SYSTEM WIRING DIAGRAMS** article for circuit information. If battery voltage of more than 9 volts is detected at the drive motor, proceed with the following tests (the drive motor will not operate at less than 9 volts).

Before beginning diagnosis for wind noise or water leaks, verify that the problem was not caused by releasing

the control switch before the sunroof was fully closed. The sunroof module has a water-management system. If however, the sunroof glass is in a partial closed position, high pressure water may be forced beyond the water management system boundaries and onto the headlining.

SUNROOF DIAGNOSIS CHART

SYMPTOM	POSSIBLE CAUSE
Sunroof motor inoperative.	Faulty control switch. Faulty circuit ground between sunroof drive motor, control switch, and body harness. Faulty power circuit between sunroof drive motor, control switch, and body harness. Faulty drive motor. Faulty drive motor electrical connector.
Audible whine when switch is depressed, sunroof does not operate.	Faulty drive motor. Binding cable.
Audible clicking or ratcheting when switch is pressed, sunroof does not operate.	Broken or worn drive cable. Worn drive motor gear. Mechanisms not synchronized.
Sunroof vents and opens, but does not close.	Binding cable. Faulty circuit. Faulty control switch. Faulty drive motor. Broken trough guide
Sunroof vents, but does not open.	Binding cable or mechanism. Faulty circuit. Faulty switch. Faulty drive motor.
Sunroof does not vent.	Binding cable or mechanism. Faulty circuit. Faulty control switch. Faulty drive motor.
Sunroof water leak.	Drain tubes clogged or kinked or disconnected from the sunroof. Glass panel improperly adjusted. Faulty glass panel seal.
Gurgling sound from sunroof.	Low spot in drain hose routing, allowing water to stand.
Wind noise from sunroof.	Front of glass panel too high or rear too low. Wind deflector not deploying. Glass not centered in opening. Faulty glass panel seal.
Rattles from open sunroof while driving.	Loose or broken attaching hardware. Worn or broken mechanism.
Sunroof does not stop in the fully closed	Drive motor has lost position of glass, teach procedure

position.

required to reprogram drive motor. Refer to **DRIVE MOTOR TEACH PROCEDURE**.

MOTOR/MODULE - SUNROOF

STANDARD PROCEDURE

DRIVE MOTOR TEACH PROCEDURE

REPLACEMENT DRIVE MOTOR

1. Press and hold the sunroof switch open until the sunroof glass fully opens, automatically reverses direction, and stops at a position just forward of the full open position.
2. Release sunroof switch.
3. Within five seconds of releasing sunroof switch, press and hold the sunroof switch open again until the sunroof glass closes, goes into vent position, and then finally stops in the closed position.
4. Release sunroof switch. Sunroof will now operate normally.

ORIGINAL DRIVE MOTOR

1. Press and hold sunroof switch open until the sunroof glass opens and stops.
2. Release sunroof switch.
3. Press and hold sunroof switch open once again for at least 10 seconds. After 10 seconds of pressing the switch open, the sunroof glass will automatically move and stop at a new location.
4. Release sunroof switch.
5. Within five seconds of releasing the sunroof switch, press and hold the switch open again until the sunroof glass closes, goes into vent position, and then finally stops in the closed position.
6. Release sunroof switch. The sunroof will now operate normally.

REMOVAL

MOTOR-SUNROOF - W/CONTROL UNIT

Fig. 2: Sunroof Motor Components (W/Control Unit)

Courtesy of CHRYSLER LLC

- 1 - ELECTRICAL CONNECTOR
- 2 - MODULE ASSEMBLY
- 3 - DRIVE MOTOR
- 4 - MOUNTING SCREWS

1. Remove headliner. Refer to **REMOVAL** .
2. Disconnect the electrical connector (1).
3. Remove three motor assembly attaching screws (4) from bottom side of motor assembly (3) and remove motor assembly from the motor bracket.

INSTALLATION

MOTOR-SUNROOF - W/CONTROL UNIT

Fig. 3: Lift Arm Positioning

- 1 - LIFTER ARM
- 2 - TROLLEY
- 3 - ALIGNMENT PIN

1. If sunroof was open when drive motor was removed, carefully move glass panel into closed position and remove glass panel. Refer to **REMOVAL** .
2. Set lifter arm timing by manually sliding the mechanisms (1) in the track until timing holes in the trollies are aligned with the timing holes in the lifter arm cams (2) and insert pins (3) into the mechanisms to hold mechanisms in closed position.

Fig. 4: Sunroof Motor Components (W/Control Unit)
Courtesy of CHRYSLER LLC

- 1 - ELECTRICAL CONNECTOR
- 2 - MODULE ASSEMBLY
- 3 - DRIVE MOTOR
- 4 - MOUNTING SCREWS

3. Place motor (3) into position and install screws (4) attaching motor to bracket (2).
4. Tighten the screws (4) to 3 N.m (26 in. lbs.).
5. If sunroof glass panel was removed previously, remove the timing pins and install the sunroof glass panel. Refer to **INSTALLATION** .
6. Partially install the headliner and connect the sunroof wiring electrical connectors. Refer to **INSTALLATION** .
7. Temporarily install sunroof switch and perform the sunroof motor teach procedure. See **STANDARD PROCEDURE**.
8. Test sunroof operation, adjust glass as necessary. Refer to **ADJUSTMENTS** .
9. Complete the headliner installation. Refer to **INSTALLATION** .

SWITCH-SUNROOF

DESCRIPTION

SUNROOF SWITCH

81a28142

Fig. 5: Identifying Overhead Console, Sunroof Switch, Courtesy Lamps & Infrared Temperature Sensor
 Courtesy of CHRYSLER LLC

The power sunroof switch (2) is a combination push-button and rocker switch module mounted in the overhead console assembly (1). The sunroof switch is a direct contact unit that is directly wired to the sunroof motor/module assembly. The sunroof switch performs the following functions:

- Power sunroof open (back of switch pushed)
- Power sunroof express open (back of switch pushed and released)
- Power sunroof closed (front of switch pushed)
- Power sunroof express closed (front of switch pushed and released)
- Power sunroof vent (switch center button pushed)

The power sunroof switch is part of the overhead console assembly and cannot be serviced separately. If the switch is damaged or inoperative the overhead console assembly must be replaced. Refer to **REMOVAL** .

OPERATION

SUNROOF SWITCH

The sunroof is electrically operated from two switches located in the headliner on the courtesy/reading lamp assembly. The power sunroof switch is hard wired to the sunroof motor/module assembly. The "VENT" switch is a push button type switch and opens the sunroof to the vent position only. The other switch "OPEN/CLOSED" is a rocker type switch for opening and closing the sunroof. Pressing and releasing the open button once, the sunroof will express open and the wind deflector will raise. If the button is pressed a second time the sunroof will stop in that position. Pressing and releasing the close button once will express close the sunroof. If the close button is pressed a second time during the express close operation the sunroof will stop in that position.

The switch is grounded at one terminal and receives a 5 volt signal from the sunroof motor/module on the remaining three terminals. The switch pulls down the 5 volt reference voltage from the module signaling it to perform the desired function.

For complete circuit diagrams, refer to the **SYSTEM WIRING DIAGRAMS** article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

DIAGNOSIS AND TESTING

SUNROOF SWITCH

For complete circuit diagrams, refer to the **SYSTEM WIRING DIAGRAMS** article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

1. Remove the overhead console, refer to **REMOVAL** .
2. Disconnect the power sunroof switch wire harness connector.
3. With the ignition key in the "RUN" position check for 5 volts on the "OPEN", "CLOSE" and "VENT" circuits of the sunroof switch harness connector. If OK, go to step 4. If not OK, inspect the wiring harness and connectors between the motor/module and switch for damage and repair as necessary.
4. With the ignition key in the "OFF" position check for continuity between the ground circuit of the sunroof switch harness connector and a known good ground. Continuity should be present. If OK, go to step 5. If not OK, inspect the wiring harness and connector and repair the ground circuit as necessary.

813794bc

Fig. 6: Identifying Power Sunroof Switch Terminal Connectors

Courtesy of CHRYSLER LLC

5. Using an ohmmeter, test the continuity of the power sunroof switch in each switch position. Refer to **POWER SUNROOF SWITCH CONTINUITY TABLE**. If OK, inspect the wiring harness and connectors for damage and repair as necessary. If not OK, replace the overhead console assembly, refer to **REMOVAL** .

POWER SUNROOF SWITCH CONTINUITY TABLE

SWITCH POSITION	CONTINUITY BETWEEN PINS
OFF	NO CONTINUITY
SUNROOF OPEN	B & D
SUNROOF CLOSED	B & C
SUNROOF VENT	B & A

DIAGNOSIS AND TESTING

B16A4-PASSENGER WINDOW SWITCH BACKLIGHTING CIRCUIT LOW - PDM

Circuit Schematic

019975a7

Fig. 1: Passenger Window Switch Backlighting Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the module is awake, the park lamps are on and the window lock out switch is on.

Set Conditions

- **Set Condition:**

When the Passenger Window Express Switch Illumination Driver circuit falls below 3.0 volts for over 25 ms. and the above conditions are met, this code will set.

Possible Causes

Possible Causes
(E34) PASSENGER WINDOW EXPRESS SWITCH ILLUMINATION DRIVER CIRCUIT SHORT TO GROUND
(E34) PASSENGER WINDOW EXPRESS SWITCH ILLUMINATION DRIVER CIRCUIT SHORT TO (Q936) PASSENGER WINDOW EXPRESS SWITCH RETURN
WINDOW/DOOR LOCK SWITCH SHORTED
PASSENGER DOOR MODULE (PDM)

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Ensure the passenger window lock out switch is on.

Turn the park lights on.

Wait 30 seconds.

With the scan tool, read DTC's.

Does the scan tool display B16A4-PASSENGER WINDOW SWITCH BACKLIGHTING CIRCUIT LOW?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. WINDOW/DOOR LOCK SWITCH SHORTED

Fig. 2: Passenger Window/Door Lock Switch Connector
Courtesy of CHRYSLER LLC

With the scan tool, erase DTC's.

Turn the ignition off.

Disconnect the Passenger Window/Door Lock Switch connector.

Ensure the passenger window lock out switch is on and the park lamps are still on.

Turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display B16A4-PASSENGER WINDOW SWITCH BACKLIGHTING CIRCUIT LOW?

No

Replace the Window/Door Lock Switch.

Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Go To 3.

3. **(E34) PASSENGER WINDOW EXPRESS SWITCH ILLUMINATION DRIVER CIRCUIT SHORT TO GROUND**

Fig. 3: Measuring Resistance Between Ground And (E34) Passenger Window Express Switch Illumination Driver Circuit

Courtesy of CHRYSLER LLC

Turn the ignition off.

Turn the park lamps off.

Disconnect the Passenger Door Module C5 connector.

Measure the resistance between Ground and the (E34) Passenger Window Express Switch Illumination Driver circuit.

Is the resistance below 10000.0 ohms?

Yes

Repair the (E34) Passenger Window Express Switch Illumination Driver circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. **(E34) PASSENGER WINDOW EXPRESS SWITCH ILLUMINATION DRIVER CIRCUIT**

SHORT TO (Q936) PASSENGER WINDOW EXPRESS SWITCH RETURN

Fig. 4: Measuring Resistance Between (E34) Passenger Window Express Switch Illumination Driver Circuit And (Q936) Passenger Window Express Switch Return Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between the (E34) Passenger Window Express Switch Illumination Driver circuit and the (Q936) Passenger Window Express Switch Return circuit.

Is the resistance below 10000.0 ohms?

Yes

Repair the (E34) Passenger Window Express Switch Illumination Driver circuit for a short to the (Q936) Passenger Window Express Switch Return circuit.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Passenger Door Module.

Perform **BODY VERIFICATION TEST - VER 1** .

B16A5-PASSENGER WINDOW SWITCH BACKLIGHTING CIRCUIT HIGH - PDM

Circuit Schematic

019975a7

Fig. 5: Passenger Window Switch Backlighting Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the power is turned off to the module and it goes from awake to sleep mode.

Set Conditions

- **Set Condition:**

When the Passenger Window Express Switch Illumination Driver circuit is above 2.5 volts for over 15 ms. and the switch illumination output is turned off.

Possible Causes

Possible Causes
(E34) PASSENGER WINDOW EXPRESS SWITCH ILLUMINATION DRIVER CIRCUIT SHORT TO VOLTAGE WINDOW/DOOR LOCK SWITCH SHORTED PASSENGER DOOR MODULE (PDM)

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Ensure the passenger window lock out switch is off.

Wait 30 seconds.

With the scan tool, read DTC's.

Does the scan tool display B16A5-PASSENGER WINDOW SWITCH BACKLIGHTING CIRCUIT HIGH?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. WINDOW/DOOR LOCK SWITCH SHORTED

Fig. 6: Passenger Window/Door Lock Switch Connector
Courtesy of CHRYSLER LLC

With the scan tool, erase DTC's.

Turn the ignition off.

Disconnect the Passenger Window/Door Lock Switch connector.

Turn the ignition on.

Operate the passenger window lock out switch several times.

With the scan tool, read DTC's.

Does the scan tool display B16A5-PASSENGER WINDOW SWITCH BACKLIGHTING CIRCUIT HIGH?

No

Replace the Window/Door Lock Switch.

Perform **BODY VERIFICATION TEST - VER 1**.

Yes

Go To 3.

3. (E34) PASSENGER WINDOW EXPRESS SWITCH ILLUMINATION DRIVER CIRCUIT SHORT TO VOLTAGE

Fig. 7: Measuring Voltage Between (E34) Passenger Window Express Switch Illumination Driver Circuit And Ground
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Passenger Door Module C5 connector.

Turn the ignition on.

Measure the voltage between the (E34) Passenger Window Express Switch Illumination Driver circuit and Ground.

Is there any voltage present?

Yes

Repair the (E34) Passenger Window Express Switch Illumination Driver circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Passenger Door Module.

Perform **BODY VERIFICATION TEST - VER 1** .

B1854-DRIVER WINDOW MOTOR CONTROL CIRCUIT LOW - DDM

Circuit Schematic

MODULE-DOOR-DRIVER C4

MOTOR-WINDOW-DRIVER EXPRESS (EXCEPT BASE)

01990ccc

Fig. 8: Driver Window Motor Control Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

Whenever the module is awake.

Set Conditions

- **Set Condition:**

When both Driver Window Driver circuits (Up and Down) are grounded during a window movement command, this code will set.

Possible Causes

Possible Causes
(Q321) (LHD) LEFT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO GROUND
(Q322) (RHD) RIGHT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO GROUND
(Q311) (LHD) LEFT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT SHORT TO GROUND
(Q312) (RHD) RIGHT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT SHORT TO GROUND
(Q321) (LHD) LEFT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORTED TO THE
(Q311) (LHD) LEFT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT
(Q322) (RHD) RIGHT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORTED TO THE
(Q312) (RHD) RIGHT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT
WINDOW MOTOR SHORTED
DRIVER DOOR MODULE (DDM)

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: This test shows text for a Left Hand Drive (LHD) vehicle. Right Hand Drive (RHD) vehicles use the same cavities. Refer to the schematic for different names and circuit numbers.

Turn the ignition on.

With the scan tool, record and erase DTC's

Try to operate the Driver Window up and down several times.

Wait 30 seconds.

With the scan tool, read DTC's.

Does the scan tool display B1854-DRIVER WINDOW MOTOR CONTROL CIRCUIT LOW?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. WINDOW MOTOR SHORTED

Fig. 9: Identifying Driver Window Motor Connector
Courtesy of CHRYSLER LLC

With the scan tool, erase DTC's.

Turn the ignition off.

Disconnect the Driver Window Motor connector.

Turn the ignition on.

Operate the driver window switch up and down several times.

With the scan tool, read DTC's.

Does the scan tool display B1854-DRIVER WINDOW MOTOR CONTROL CIRCUIT LOW?

No

Replace the Driver Window Motor in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1**.

Yes

Go To 3.

3. (Q321) LEFT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO GROUND

Fig. 10: Measuring Resistance Between Ground And (Q321) Left Front Window Express Down Driver Circuit

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Driver Door Module C4 connector.

Measure the resistance between Ground and the (Q321) Left Front Window Express Down Driver circuit.

Is the resistance below 1000.0 ohms?

Yes

Repair the (Q321) Left Front Window Express Down Driver circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 4.

4. (Q311) LEFT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT SHORT TO GROUND

Fig. 11: Measuring Resistance Between Ground And (Q311) Left Front Window Express Up Driver Circuit

Courtesy of CHRYSLER LLC

Measure the resistance between Ground and the (Q311) Left Front Window Express Up Driver circuit.

Is the resistance below 1000.0 ohms?

Yes

Repair the (Q311) Left Front Window Express Up Driver circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 5.

5. (Q321) LEFT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO (Q311) LEFT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT

MODULE-
DOOR-
DRIVER C4

819b9d25

Fig. 12: Measuring Resistance Between (Q321) Left Front Window Express Down Driver Circuit And (Q311) Driver Window Express Up Driver Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between the (Q321) Left Front Window Express Down Driver circuit and the (Q311) Driver Window Express Up Driver circuit.

Is the resistance below 1000.0 ohms?

Yes

Repair the (Q321) Left Front Window Express Down Driver circuit for a short to the (Q311) Left Front Window Express Up Driver circuit.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Driver Door Module in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1855-DRIVER WINDOW MOTOR CONTROL CIRCUIT HIGH - DDM

Circuit Schematic

01990ccc

Fig. 13: Driver Window Motor Control Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the module is awake.

Set Conditions

- **Set Condition:**

When both Driver Window Driver circuits (Up and Down) are supplied with voltage during a window movement command for more than five ms, this code will set.

Possible Causes

Possible Causes
(Q321) (LHD) LEFT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO VOLTAGE
(Q322) (RHD) RIGHT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO VOLTAGE
(Q311) (LHD) LEFT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT SHORT TO VOLTAGE
(Q312) (RHD) RIGHT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT SHORT TO VOLTAGE
WINDOW MOTOR (REGULATOR)
DRIVER DOOR MODULE (DDM)

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: This test shows text for a Left Hand Drive (LHD) vehicle. Right Hand Drive (RHD) vehicles use the same cavities. Refer to the schematic for difference names and circuit numbers.

Turn the ignition on.

With the scan tool, record and erase DTC's

Try to operate the Driver Window up and down several times.

Wait 30 seconds.

With the scan tool, read DTC's.

Does the scan tool display B1855-DRIVER WINDOW MOTOR CONTROL CIRCUIT HIGH?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. WINDOW MOTOR SHORTED

Fig. 14: Identifying Driver Window Motor Connector
Courtesy of CHRYSLER LLC

With the scan tool, erase DTC's.

Turn the ignition off.

Disconnect the Driver Window Motor connector.

Turn the ignition on.

Operate the driver window switch up and down several times.

With the scan tool, read DTC's.

Does the scan tool display B1855-DRIVER WINDOW MOTOR CONTROL CIRCUIT HIGH?

No

Replace the Driver Window Motor (regulator) in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1**.

Yes

Go To 3.

3. (Q321) LEFT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO VOLTAGE

Fig. 15: Measuring Voltage Between (Q321) Left Front Window Express Down Driver Circuit And Ground

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Driver Door Module C4 connector.

Turn the ignition on.

Measure the voltage between the (Q321) Left Front Window Express Down Driver circuit and Ground.

Is there any voltage present?

Yes

Repair the (Q321) Left Front Window Express Down Driver circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 4.

4. (Q311) LEFT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT SHORT TO VOLTAGE

Fig. 16: Measuring Voltage Between (Q311) Left Front Window Express Up Driver Circuit And Ground

Courtesy of CHRYSLER LLC

Measure the voltage between the (Q311) Left Front Window Express Up Driver circuit and Ground.

Is there any voltage present?

Yes

Repair the (Q311) Left Front Window Express Up Driver circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Driver Door Module.

Perform **BODY VERIFICATION TEST - VER 1** .

B1856-DRIVER WINDOW MOTOR CONTROL CIRCUIT OPEN - DDM

Circuit Schematic

01990ccc

Fig. 17: Driver Window Motor Control Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the module is awake.

Set Conditions

- **Set Condition:**

When one or both Driver Window Driver circuits (Up and Down) are not supplied with voltage, when they should be, during a window movement command for more than five ms, this code will set.

Possible Causes

Possible Causes
(Q321) (LHD) LEFT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT OPEN (Q322) (RHD) RIGHT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT OPEN (Q311) (LHD) LEFT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT OPEN (Q312) (RHD) RIGHT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT OPEN WINDOW MOTOR (REGULATOR) DRIVER DOOR MODULE (DDM)

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: This test shows text for a Left Hand Drive (LHD) vehicle. Right Hand Drive (RHD) vehicles use the same cavities. Refer to the schematic for difference names and circuit numbers.

Turn the ignition on.

With the scan tool, record and erase DTC's

Try to operate the Driver Window up and down several times.

Wait 30 seconds.

With the scan tool, read DTC's.

Does the scan tool display B1856-DRIVER WINDOW MOTOR CONTROL CIRCUIT OPEN?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. WINDOW MOTOR OR CIRCUIT OPEN

Fig. 18: Connecting Test Light Between (Q311) Left Front Window Express Up Driver Circuit And (Q321) Left Front Window Express Down Driver Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Driver Express Window Motor connector.

Connect a test light between the (Q311) Left Front Window Express Up Driver circuit and the (Q321) Left Front Window Express Down Driver circuit

Turn the ignition on.

Trip the driver door latch to the closed position.

Operate the driver window switch up and down several times while observing the test light.

Does the test light illuminate brightly when the switch is pressed in both directions? With the express up window, the test light may only flash momentarily.

Yes

Replace the Driver Window Motor (regulator) in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **(Q321) LEFT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT OPEN**

Fig. 19: Measuring Resistance Of (Q321) Left Front Window Express Down Driver Circuit Between C4 Module Connector And Motor Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Driver Door Module C4 connector.

Measure the resistance of the (Q321) Left Front Window Express Down Driver circuit between the C4 module connector and the motor connector.

Is the resistance below 2.0 ohms?

No

Repair the (Q321) Left Front Window Express Down Driver circuit for an open.
Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Go To 4.

4. (Q311) LEFT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT OPEN

Fig. 20: Measuring Resistance Of (Q311) Left Front Window Express Up Driver Circuit Between C4 Module Connector And Motor Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (Q311) Left Front Window Express Up Driver circuit between the C4 module connector and the motor connector.

Is the resistance below 2.0 ohms?

No

Repair the (Q311) Left Front Window Express Up Driver circuit for an open.
Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Replace the Driver Door Module.
Perform **BODY VERIFICATION TEST - VER 1** .

B1858-DRIVER WINDOW POSITION SENSOR POWER SUPPLY LOW - DDM

Circuit Schematic

Fig. 21: Driver Window Hall Sensor Supply Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the module is awake.

Set Conditions

- **Set Condition:**

When the Driver Window Hall Sensor Supply circuit falls below 0.8 volts for over 480 ms, this code will set.

Possible Causes

Possible Causes
(Q305) DRIVER WINDOW HALL SENSOR SUPPLY CIRCUIT SHORT TO GROUND WINDOW MOTOR SHORTED DRIVER DOOR MODULE (DDM)

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Driver Window up and down several times.

Wait 30 seconds.

With the scan tool, read DTC's.

Does the scan tool display B1858-DRIVER WINDOW POSITION SENSOR POWER SUPPLY LOW?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. WINDOW MOTOR SHORTED

Fig. 22: Identifying Driver Window Motor Connector
 Courtesy of CHRYSLER LLC

With the scan tool, erase DTC's.

Turn the ignition off.

Disconnect the Driver Window Motor connector.

Turn the ignition on.

Operate the driver window switch up and down several times.

With the scan tool, read DTC's.

Does the scan tool display B1858-DRIVER WINDOW POSITION SENSOR POWER SUPPLY LOW?

No

Replace the Window Motor (regulator).

Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Go To 3.

3. (Q305) DRIVER WINDOW HALL SENSOR SUPPLY CIRCUIT SHORT TO GROUND

819c100d

Fig. 23: Measuring Resistance Between Ground And (Q305) Driver Window Hall Sensor Supply Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Driver Door Module C4 connector.

Measure the resistance between Ground and the (Q305) Driver Window Hall Sensor Supply circuit.

Is the resistance below 1000.0 ohms?

Yes

Repair the (Q305) Driver Window Hall Sensor Supply circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Driver Door Module in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1859-DRIVER WINDOW POSITION SENSOR POWER SUPPLY HIGH - DDM

Circuit Schematic

Fig. 24: Driver Window Hall Sensor Supply Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the power is turned off to the module and it goes from being awake to sleep mode.

Set Conditions

- **Set Condition:**

When the Driver Window Hall Sensor Supply circuit is above 1.5 volts for over 15 ms. and the power to the module has been turned off, this code will set.

Possible Causes

Possible Causes
(Q305) DRIVER WINDOW HALL SENSOR SUPPLY CIRCUIT SHORT TO VOLTAGE DRIVER DOOR MODULE (DDM)

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Wait 30 seconds.

With the scan tool, read the active DTC's.

Does the scan tool display B1859-DRIVER WINDOW POSITION SENSOR POWER SUPPLY HIGH?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. (Q305) DRIVER WINDOW HALL SENSOR SUPPLY CIRCUIT SHORT TO VOLTAGE

Fig. 25: Measuring Voltage Between (Q305) Driver Window Hall Sensor Supply Circuit And Ground
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Driver Door Module C4 connector.

Turn the ignition on.

Measure the voltage between the (Q305) Driver Window Hall Sensor Supply circuit and Ground.

Is the voltage above 1.5 volts?

Yes

Repair the (Q305) Driver Window Hall Sensor Supply circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Driver Door Module in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

DOOR-
PASSENGER C5**

**SWITCH-
WINDOW/DOOR
LOCK-
PASSENGER
(EXPRESS UP)**

019c23aa

Fig. 26: Passenger Window Express Switch Mux Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the module is awake.

Set Conditions

- **Set Condition:**

When the Passenger Window Express Switch Mux circuit is resisted for over 30 seconds.

Possible Causes

Possible Causes
(Q336) PASSENGER WINDOW EXPRESS SWITCH MUX CIRCUIT PARTIAL SHORT TO GROUND
(Q336) PASSENGER WINDOW EXPRESS SWITCH MUX CIRCUIT SHORT TO THE (Q936) PASSENGER WINDOW EXPRESS SWITCH RETURN CIRCUIT
WINDOW/DOOR LOCK SWITCH SHORT TO GROUND
PASSENGER DOOR MODULE (PDM)

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Passenger Window Switch in all positions several times.

Wait 30 seconds.

With the scan tool, read DTC's.

Does the scan tool display B185D-PASSENGER WINDOW SWITCH CIRCUIT STUCK?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Check for a sticking switch and using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform **BODY VERIFICATION TEST - VER 1** .

2. PASSENGER WINDOW SWITCH SHORTED

Fig. 27: Passenger Window/Door Lock Switch Connector
Courtesy of CHRYSLER LLC

With the scan tool, erase DTC's.

Disconnect the Passenger Window/Door Lock Switch connector.

With the scan tool, read DTC's.

Does the scan tool display B185D-PASSENGER WINDOW SWITCH CIRCUIT STUCK?

No

Replace the Passenger Express Window/Door Lock Switch.

Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Go To 3.

3. (Q336) PASSENGER WINDOW EXPRESS SWITCH MUX CIRCUIT SHORT TO GROUND

MODULE-
DOOR-
PASSENGER C5

819c2849

Fig. 28: Measuring Resistance Between Ground And (Q336) Passenger Window Express Switch Mux Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Passenger Door Module C5 connector.

Measure the resistance between ground and the (Q336) Passenger Window Express Switch Mux circuit.

Is the resistance below 10000.0 ohms?

Yes

Repair the (Q336) Passenger Window Express Switch Mux circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. **(Q336) PASSENGER WINDOW EXPRESS SWITCH MUX CIRCUIT SHORT TO (Q936) PASSENGER EXPRESS SWITCH RETURN CIRCUIT**

Fig. 29: Measuring Resistance Between (Q336) Passenger Window Express Switch Mux Circuit And (Q936) Passenger Express Switch Return Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between the (Q336) Passenger Window Express Switch Mux circuit and the (Q936) Passenger Express Switch Return circuit.

Is the resistance below 10000.0 ohms?

Yes

Repair the (Q336) Passenger Express Switch Mux circuit for a short to the (Q936) Passenger Window Express Switch Return circuit.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Passenger Door Module.

Perform **BODY VERIFICATION TEST - VER 1** .

B185F-PASSENGER WINDOW MOTOR CONTROL CIRCUIT LOW - PDM

Circuit Schematic

0140M07

Fig. 30: Passenger Window Motor Control Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the window motor is operating.

Set Conditions

NOTE: Even though the Left Hand Drive vehicles are NOT equipped with Express Up Windows, the circuits are still named Express if the vehicle has the Driver Express Up feature.

- Set Condition:

When both Passenger Window Driver circuits (Up and Down) are grounded during a window movement command, this code will set.

Possible Causes

Possible Causes
(Q322) (LHD) RIGHT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO GROUND
(Q321) (RHD) LEFT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO GROUND
(Q312) (LHD) RIGHT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT SHORT TO GROUND
(Q311) (RHD) LEFT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT SHORT TO GROUND
(Q322) (LHD) RIGHT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORTED TO THE (Q312) RIGHT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT
(Q321) (RHD) LEFT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORTED TO THE (Q311) LEFT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT
WINDOW MOTOR SHORTED
PASSENGER DOOR MODULE (PDM)

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

NOTE: This test shows text for a Left Hand Drive (LHD) vehicle. Right Hand Drive (RHD) vehicles use the same cavities. Refer to the schematic for difference in names and circuit numbers.

Turn the ignition on.

With the scan tool, record and erase DTC's

Try to operate the Passenger Window up and down several times.

Wait 30 seconds.

With the scan tool, read DTC's.

Does the scan tool display B185F-PASSENGER WINDOW MOTOR CONTROL CIRCUIT LOW?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1**.

2. WINDOW MOTOR SHORTED

Fig. 31: Passenger Window Motor Connector
Courtesy of CHRYSLER LLC

With the scan tool, erase DTC's.

Turn the ignition off.

Disconnect the Passenger Window Motor connector.

Turn the ignition on.

Operate the passenger window switch up and down several times.

With the scan tool, read DTC's.

Does the scan tool display B185F-PASSENGER WINDOW MOTOR CONTROL CIRCUIT LOW?

No

Replace the Window Motor (regulator) in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Go To 3.

3. (Q322) RIGHT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO GROUND

Fig. 32: Measuring Resistance Between Ground And (Q322) Right Front Window Express Down Driver Circuit

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Passenger Door Module C4 connector.

Measure the resistance between Ground and the (Q322) Right Front Window Express Down Driver circuit.

Is the resistance below 1000.0 ohms?

Yes

Repair the (Q322) Right Front Window Express Down Driver circuit for a short to ground.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. (Q312) RIGHT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT SHORT TO GROUND

Fig. 33: Measuring Resistance Between Ground And (Q312) Right Front Window Express Up Driver Circuit

Courtesy of CHRYSLER LLC

Measure the resistance between Ground and the (Q312) Right Front Window Express Up Driver circuit.

Is the resistance below 1000.0 ohms?

Yes

Repair the (Q312) Right Front Window Express Up Driver circuit for a short to ground.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 5.

5. **(Q322) RIGHT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO (Q312) RIGHT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT**

Fig. 34: Measuring Resistance Between (Q322) Right Front Window Express Down Driver Circuit And (Q312) Right Front Window Express Up Driver Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between the (Q322) Right Front Window Express Down Driver circuit and the (Q312) Right Front Window Express Up Driver circuit.

Is the resistance below 1000.0 ohms?

Yes

Repair the (Q322) Right Front Window Express Down Driver circuit for a short to the (Q312) Right Front Window Express Up Driver circuit.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Passenger Door Module in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1860-PASSENGER WINDOW MOTOR CONTROL CIRCUIT HIGH - DDM

Circuit Schematic

019c7ab0

Fig. 35: Passenger Window Driver Circuits Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the module is awake.

Set Conditions

- **Set Condition:**

When both Passenger Window Driver circuits (Up and Down) are supplied with voltage during a window movement command for more than five ms, this code will set.

Possible Causes

Possible Causes
(Q322) (LHD) RIGHT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO VOLTAGE
(Q321) (RHD) LEFT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO VOLTAGE
(Q312) (LHD) RIGHT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT SHORT TO VOLTAGE
(Q311) (RHD) LEFT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT SHORT TO VOLTAGE
WINDOW MOTOR (REGULATOR)
PASSENGER DOOR MODULE (PDM)

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: This test shows text for a Left Hand Drive (LHD) vehicle. Right Hand Drive (RHD) vehicles use the same cavities. Refer to the schematic for different names and circuit numbers.

Turn the ignition on.

With the scan tool, record and erase DTC's

Try to operate the Passenger Window up and down several times.

Wait 30 seconds.

With the scan tool, read DTC's.

Does the scan tool display B1860-PASSENGER WINDOW MOTOR CONTROL CIRCUIT HIGH?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. WINDOW MOTOR SHORTED

Fig. 36: Passenger Window Motor Connector
Courtesy of CHRYSLER LLC

With the scan tool, erase DTC's.

Turn the ignition off.

Disconnect the Passenger Window Motor connector.

Turn the ignition on.

Operate the driver window switch up and down several times.

With the scan tool, read DTC's.

Does the scan tool display B1860-PASSENGER WINDOW MOTOR CONTROL CIRCUIT HIGH?

No

Replace the Passenger Window Motor (regulator) in accordance with service information.
Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Go To 3.

3. **(Q322) RIGHT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO VOLTAGE**

Fig. 37: Measuring Voltage Between (Q322) Right Front Window Express Down Driver Circuit And Ground
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Passenger Door Module C4 connector.

Turn the ignition on.

Measure the voltage between the (Q322) Right Front Window Express Down Driver circuit and Ground.

Is there any voltage present?

Yes

Repair the (Q322) Right Front Window Express Down Driver circuit for a short to voltage.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. (Q312) RIGHT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT SHORT TO VOLTAGE

Fig. 38: Measuring Voltage Between (Q312) Right Front Window Express Up Driver Circuit And Ground

Courtesy of CHRYSLER LLC

Measure the voltage between the (Q312) Right Front Window Express Up Driver circuit and Ground.

Is there any voltage present?

Yes

Repair the (Q312) Right Front Window Express Up Driver circuit for a short to voltage.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Passenger Door Module in accordance with service information.
Perform **BODY VERIFICATION TEST - VER 1** .

B1861-PASSENGER WINDOW MOTOR CONTROL CIRCUIT OPEN - DDM

Circuit Schematic

Fig. 39: Passenger Window Motor Control Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the module is awake.

Set Conditions

- **Set Condition:**

When one or both Passenger Window Driver circuits (Up and Down) are not supplied with voltage, when they should be, during a window movement command for more than five ms, this code will set.

Possible Causes

Possible Causes
(Q322) (LHD) RIGHT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT OPEN
(Q321) (RHD) LEFT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT OPEN
(Q312) (LHD) RIGHT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT OPEN
(Q311) (RHD) LEFT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT OPEN
WINDOW MOTOR (REGULATOR)
PASSENGER DOOR MODULE (PDM)

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: **This test shows text for a Left Hand Drive (LHD) vehicle. Right Hand Drive (RHD) vehicles use the same cavities. Refer to the schematic for difference names and circuit numbers.**

Turn the ignition on.

With the scan tool, record and erase DTC's

Try to operate the Passenger Window up and down several times.

Wait 30 seconds.

With the scan tool, read DTC's.

Does the scan tool display B1861-PASSENGER WINDOW MOTOR CONTROL CIRCUIT OPEN?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. WINDOW MOTOR OR CIRCUIT OPEN

Fig. 40: Checking Window Motor Or Circuit Open
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Passenger Express Window Motor connector.

Connect a test light between the (Q312) Right Front Window Express Up Driver circuit and the (Q322) Right Front Window Express Down Driver circuit

Turn the ignition on.

Operate the passenger window switch up and down several times while observing the test light.

Does the test light illuminate brightly when the switch is pressed in both directions? With the express up window, the test light will only flash momentarily each time the switch is actuated.

Yes

Replace the Passenger Window Motor (regulator) in accordance with service information.
Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 3.

3. (Q322) RIGHT FRONT WINDOW EXPRESS DOWN DRIVER CIRCUIT OPEN

81efcf6a

Fig. 41: Measuring The Resistance Of The (Q322) Right Front Window Express Down Driver Circuit Between The C4 Module Connector And The Motor Connector

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Passenger Door Module C4 connector.

Measure the resistance of the (Q322) Right Front Window Express Down Driver circuit between the C4 module connector and the motor connector.

Is the resistance below 2.0 ohms?

No

Repair the (Q322) Right Front Window Express Down Driver circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Go To 4.

4. (Q312) RIGHT FRONT WINDOW EXPRESS UP DRIVER CIRCUIT OPEN

81d0fd5a

Fig. 42: Measuring The Resistance Of The (Q312) Right Front Window Express Up Driver Circuit

Between The C4 Module Connector And The Motor Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (Q312) Right Front Window Express Up Driver circuit between the C4 module connector and the motor connector.

Is the resistance below 2.0 ohms?

No

Repair the (Q312) Right Front Window Express Up Driver circuit for an open.
Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Replace the Passenger Door Module in accordance with service information.
Perform **BODY VERIFICATION TEST - VER 1** .

B1863-WINDOW POSITION SENSOR POWER SUPPLY LOW - RHD ONLY - PDM

Circuit Schematic

01400000

Fig. 43: Passenger Window Position Sensor Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the module is awake.

Set Conditions

- **Set Condition:**

When the Passenger Window Hall Sensor Supply circuit falls below 0.8 volts for over 480 ms, this code will set.

Possible Causes

Possible Causes
(Q306) PASSENGER WINDOW HALL SENSOR SUPPLY CIRCUIT SHORT TO GROUND WINDOW MOTOR SHORTED PASSENGER DOOR MODULE (PDM)

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Passenger Window up and down several times.

Wait 30 seconds.

With the scan tool, read DTC's.

Does the scan tool display B1863-PASSENGER WINDOW POSITION SENSOR POWER SUPPLY LOW?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **WINDOW MOTOR SHORTED**

Fig. 44: Passenger Express Window Motor Connector
 Courtesy of CHRYSLER LLC

With the scan tool, erase DTC's.

Turn the ignition off.

Disconnect the Passenger Express Window Motor connector.

Turn the ignition on.

Operate the passenger window switch up and down several times.

With the scan tool, read DTC's.

Does the scan tool display B1863-PASSENGER WINDOW POSITION SENSOR POWER SUPPLY LOW?

No

Replace the Window Motor (regulator) in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Go To 3.

3. (Q306) PASSENGER WINDOW HALL SENSOR SUPPLY CIRCUIT SHORT TO GROUND

819c6053

Fig. 45: Measuring Resistance Between Ground And (Q306) Passenger Window Hall Sensor Supply Circuit

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Passenger Door Module C4 connector.

Measure the resistance between Ground and the (Q306) Passenger Window Hall Sensor Supply circuit.

Is the resistance below 1000.0 ohms?

Yes

Repair the (Q306) Passenger Window Hall Sensor Supply circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Passenger Door Module in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1864-PASSENGER WINDOW POSITION SENSOR POWER SUPPLY HIGH - RHD ONLY - PDM

Circuit Schematic

01400000

Fig. 46: Passenger Window Position Sensor Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the power is turned off to the module and it goes from being awake to sleep mode.

Set Conditions

- **Set Condition:**

When the Passenger Window Hall Sensor Supply circuit is above 1.5 volts for over 15 ms. and the power to the module has been turned off, this code will set.

Possible Causes

Possible Causes
(Q306) PASSENGER WINDOW HALL SENSOR SUPPLY CIRCUIT SHORT TO VOLTAGE PASSENGER DOOR MODULE (PDM)

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Passenger Window up and down several times.

Wait 30 seconds.

With the scan tool, read the stored DTC's.

Does the scan tool display B1864-PASSENGER WINDOW POSITION SENSOR POWER SUPPLY HIGH?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **(Q306) PASSENGER WINDOW HALL SENSOR SUPPLY CIRCUIT SHORT TO VOLTAGE**

Fig. 47: Measuring Voltage Between (Q306) Passenger Window Hall Sensor Supply Circuit And Ground

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Passenger Door Module C4 connector.

Turn the ignition on.

Measure the voltage between the (Q306) Passenger Window Hall Sensor Supply circuit and Ground.

Is there any voltage present?

Yes

Repair the (Q306) Passenger Window Hall Sensor Supply circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Passenger Door Module in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B18B5-MASTER SWITCH - FRONT LEFT WINDOW SWITCH STUCK

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

At all times.

Set Conditions

- **Set Condition:**

Whenever the module detects a Front Left Window signal from the master power window switch, for over 30 seconds, this code will set.

Possible Causes

Possible Causes
MASTER POWER WINDOW SWITCH

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Front Left Window up and down several times.

Wait 30 seconds.

With the scan tool, read DTC's.

Does the scan tool display B18B5-MASTER SWITCH-FRONT LEFT WINDOW SWITCH STUCK?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Operate the switch several more times. If the switch ever sticks, replace it.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **MASTER POWER WINDOW/DOOR LOCK SWITCH**

NOTE: Anytime this code is active, the switch must be replaced.

Repair

Replace the Express Window/Door Lock Switch in accordance with service information.
Perform **BODY VERIFICATION TEST - VER 1** .

B18B6-MASTER SWITCH - FRONT RIGHT WINDOW SWITCH STUCK

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

At all times.

Set Conditions

- **Set Condition:**

Whenever the module detects a Front Right Window signal from the master power window switch, for over 30 seconds, this code will set.

Possible Causes

Possible Causes
MASTER POWER WINDOW SWITCH

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Front Right Window up and down several times from the master switch.

Wait 30 seconds.

With the scan tool, read DTC's.

Does the scan tool display B18B6-MASTER SWITCH-FRONT RIGHT WINDOW SWITCH STUCK?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Operate the switch several more times. If the switch ever sticks, replace it.

Perform **BODY VERIFICATION TEST - VER 1** .

2. MASTER POWER WINDOW/DOOR LOCK SWITCH

NOTE: **Anytime this code is active, the switch must be replaced.**

Repair

Replace the Express Window/Door Lock Switch in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B210D-BATTERY VOLTAGE LOW - DDM/PDM

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

At all times.

Set Conditions

• **Set Condition:**

Anytime the module senses voltage input below 9.0 volts, this code will set.

Possible Causes

Possible Causes
LOW VOLTAGE ENGINE DTC (A215) (DDM), A214 (PDM) FUSED B(+) CIRCUIT HAS HIGH RESISTANCE (Z913) GROUND CIRCUIT HAS HIGH RESISTANCE DRIVER OR PASSENGER DOOR MODULE

Diagnostic Test

1. CHECK ENGINE DTC's

With the scan tool, read ENGINE DTC's

Are there any ENGINE DTC's present?

No

Go to 2.

Yes

Refer to symptom list for problems related to ENGINE.

2. TEST FOR INTERMITTENT CONDITION

With the scan tool, record and erase DTC's

Start the engine and run for 2 minutes.

With the scan tool, read DTC's. in the Door Module.

Does the scan tool display B210D-BATTERY VOLTAGE LOW?

Yes

Go To 3.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1**.

3. (A214), (A215) FUSED B(+) OR (Z913) GROUND CIRCUITS RESISTED

Disconnect all door module connectors.

Refer to connector pinouts in **SYSTEM WIRING DIAGRAMS** for the door module connectors

Test all (A214) or (A215) Fused B(+) circuits by connecting a 12-volt test light between the Fused B(+) circuit and the (Z913) Ground circuits in the door module connectors. The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

Replace the appropriate door module in accordance with Service Information.

No

Test the Fused B(+) and the Ground circuits to determine which one has the high resistance. Repair the circuit for high resistance.

Perform **BODY VERIFICATION TEST - VER 1** .

B210E-BATTERY VOLTAGE HIGH - DDM/PDM

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

At all times.

Set Conditions

- **Set Condition:**

Anytime the module senses voltage input above 15.9 volts, this code will set.

Possible Causes

Possible Causes
HIGH VOLTAGE ENGINE DTC DRIVER OR PASSENGER DOOR MODULE

Diagnostic Test

1. CHECK ENGINE DTC's

With the scan tool, read ENGINE DTC's

Are there any ENGINE DTC's present?

No

Go to 2.

Yes

Refer to symptom list for problems related to ENGINE.

2. TEST FOR INTERMITTENT CONDITION

With the scan tool, record and erase DTC's

Start the engine and run for two minutes.

With the scan tool, read DTC's.

Does the scan tool display B210E-BATTERY VOLTAGE HIGH?

Yes

Replace the appropriate Door Module in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

B225D,B225E-DOOR MODULE FRONT LEFT/RIGHT INTERNAL

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

At all times.

Set Conditions

- **Set Condition:**

Whenever the module detects an EEPROM failure

Possible Causes

Possible Causes
DRIVER OR PASSENGER DOOR MODULE

Diagnostic Test

1. **Replace the Door Module**

NOTE: Anytime this code is logged, the module must be replaced.

Repair

Replace the appropriate Door Module in accordance with service information.
Perform **BODY VERIFICATION TEST - VER 1** .

B226E-MASTER POWER WINDOW SWITCH INTERNAL

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

At all times.

Set Conditions

- **Set Condition:**

Whenever the module detects an out of range signal from the master power window switch, for over 30 seconds, this code will set.

Possible Causes

Possible Causes
See <u>DTC U113D</u>

Diagnostic Test

1. MASTER POWER WINDOW SWITCH

NOTE: Whenever this code appears, use the diagnostics for DTC U113D.

Repair

Perform diagnostic procedure for U113D. See **DIAGNOSIS AND TESTING**.

B2577-PASSENGER WINDOW NOT CALIBRATED/LOST CALIBRATION - PDM

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the window motor is operating.

Set Conditions

- **Set Condition:**

When the Door Module has lost the parameters for window travel, this code will set.

Possible Causes

Possible Causes
MODULE NOT CALIBRATED EXPRESS WINDOW SWITCH PASSENGER DOOR MODULE (PDM)

Theory Of Operation

This code will always set anytime the battery or the door module connector is disconnected.

NOTE: **If there are any other Power Window DTC's, repair them before continuing.**

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Passenger Window up and down several times.

Wait 30 seconds.

With the scan tool, read DTC's.

Does the scan tool display B2577-PASSENGER WINDOW NOT CALIBRATED/LOST CALIBRATION ?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. WINDOW MODULE NOT CALIBRATED

Run the window to the full up position and continue to hold the switch for an additional 2 seconds.

Run the window to the full down position and continue to hold the switch for an additional 2 seconds.

Again run the window to the full up position and continue to hold the switch for an additional 2 seconds.

Lower the window all the way down then press and release the switch to the express up position.

Did the window move to the full up position?

No

Go To 3.

Yes

Test complete.

3. EXPRESS SWITCH

Is the express feature inoperative from both front door switches?

Yes

Replace the Passenger Door Module.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the defective Express Window Switch assembly.

Perform **BODY VERIFICATION TEST - VER 1** .

B2578-DRIVER WINDOW NOT CALIBRATED/LOST CALIBRATION - DDM

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the window motor is operating.

Set Conditions

- **Set Condition:**

When the Door Module has lost the parameters for window travel, this code will set.

Possible Causes

Possible Causes
MODULE NOT CALIBRATED EXPRESS WINDOW SWITCH DRIVER DOOR MODULE (DDM)

This code will always set anytime the battery or the door module connector is disconnected.

NOTE: **If there are any other Power Window DTC's, repair them before continuing.**

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Driver Window up and down several times.

Wait 30 seconds.

With the scan tool, read DTC's.

Does the scan tool display B2578-DRIVER WINDOW NOT CALIBRATED/LOST CALIBRATION ?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. WINDOW MODULE NOT CALIBRATED

Run the window to the full up position and continue to hold the switch for an additional 2 seconds.

Run the window to the full down position and continue to hold the switch for an additional 2 seconds.

Again run the window to the full up position and continue to hold the switch for an additional 2 seconds.

Lower the window all the way down then press and release the switch to the express up position.

Did the window move to the full up position?

No

Go To 3.

Yes

Test complete.

3. EXPRESS WINDOW SWITCH

Turn the ignition off.

Move the Driver Express Switch from the idle position to the up position and then to the express up position.

Is there two definite detent positions felt?

Yes

Replace the Driver Door Module in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Driver Express Window Switch assembly.

Perform **BODY VERIFICATION TEST - VER 1** .

B2580-DRIVER WINDOW POSITION SENSOR(S) NO SIGNAL - DDM

Circuit Schematic

019ca95a

Fig. 48: Driver Window Position Sensor(s) Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the window motor is operating.

Set Conditions

- **Set Condition:**

When the door module does not sense a pulse from the hall sensor, during a window movement, this code will set.

Possible Causes

Possible Causes
(Q305) DRIVER WINDOW HALL SENSOR SUPPLY CIRCUIT OPEN (Q301) DRIVER WINDOW HALL SENSOR A CIRCUIT OPEN WINDOW MOTOR DRIVER DOOR MODULE (DDM)

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Driver Window up and down several times.

Wait 30 seconds.

With the scan tool, read DTC's.

Does the scan tool display B2580-DRIVER WINDOW POSITION SENSOR(S) NO SIGNAL?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **(Q305) DRIVER WINDOW HALL SENSOR SUPPLY CIRCUIT OPEN**

8193116e

Fig. 49: Driver Window Motor Connector
Courtesy of CHRYSLER LLC

With the scan tool, erase DTC's.

Turn the ignition off.

Disconnect the Driver Window Motor connector.

Measure the voltage between the (Q305) Driver Window Hall Sensor Supply circuit and Ground.

Turn the ignition on.

Is the voltage above 9.5 volts?

No

Go To 3.

Yes

Go To 4.

3. (Q305) HALL SENSOR SUPPLY CIRCUIT OPEN

819ce986

Fig. 50: Measuring Resistance Of (Q305) Driver Window Hall Sensor Supply Circuit Between Module Connector And Motor Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Driver Door Module C4 connector.

Measure the resistance of the (Q305) Driver Window Hall Sensor Supply circuit between the Module connector and the Motor connector.

Is the resistance below 2.0 ohms?

Yes

Replace the Driver Door Module in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Repair the (Q305) Driver Window Hall Sensor Supply circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1**.

4. **(Q301) DRIVER WINDOW HALL SENSOR A SIGNAL CIRCUIT OPEN**

Fig. 51: Measuring Resistance Of (Q301) Driver Window Hall Sensor A Signal Circuit Between Module Connector And Motor Connector

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Driver Door Module C4 connector.

Measure the resistance of the (Q301) Driver Window Hall Sensor A Signal circuit between the Module connector and the Motor connector.

Is the resistance below 2.0 ohms?

No

Repair the (Q301) Driver Window Hall Sensor A Signal circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Replace the Driver Window Motor (regulator) in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B2581-PASSENGER WINDOW POSITION SENSOR(S) NO SIGNAL - RHD ONLY - PDM

Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the window motor is operating.

Set Conditions

- **Set Condition:**

When the door module does not sense a pulse from the hall sensor, during a window movement, this code will set.

Possible Causes

Possible Causes
(Q306) PASSENGER WINDOW HALL SENSOR SUPPLY CIRCUIT OPEN (Q302) PASSENGER WINDOW HALL SENSOR A CIRCUIT OPEN WINDOW MOTOR (REGULATOR) PASSENGER DOOR MODULE (PDM)

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Passenger Window up and down several times.

Wait 30 seconds.

With the scan tool, read DTC's.

Does the scan tool display B2581-PASSENGER WINDOW POSITION SENSOR(S) NO SIGNAL?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **(Q306) HALL SENSOR SUPPLY CIRCUIT OPEN**

8192eae0

Fig. 53: Passenger Window Motor Connector
Courtesy of CHRYSLER LLC

With the scan tool, erase DTC's.

Turn the ignition off.

Disconnect the Passenger Window Motor connector.

Turn the ignition on.

Measure the voltage between the (Q306) Passenger Window Hall Sensor Supply circuit and Ground.

Turn the ignition on.

Is the voltage above 9.5 volts?

No

Go To 3.

Yes

Go To 4.

3. (Q306) HALL SENSOR SUPPLY CIRCUIT OPEN

819cfbaf

Fig. 54: Measuring Resistance Of (Q306) Passenger Window Hall Sensor Supply Circuit Between Module Connector And Motor Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Passenger Door Module C4 connector.

Measure the resistance of the (Q306) Passenger Window Hall Sensor Supply circuit between the Module connector and the Motor connector.

Is the resistance below 2.0 ohms?

Yes

Replace the Passenger Door Module in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (Q306) Passenger Window Hall Sensor Supply circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1**.

4. **(Q302) PASSENGER WINDOW HALL SENSOR A SIGNAL CIRCUIT OPEN**

Fig. 55: Measuring Resistance Of (Q302) Passenger Window Hall Sensor A Signal Circuit Between Module Connector And Motor Connector

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Passenger Door Module C4 connector.

Measure the resistance of the (Q302) Passenger Window Hall Sensor A Signal circuit between the Module connector and the Motor connector.

Is the resistance below 2.0 ohms?

No

Repair the (Q302) Passenger Window Hall Sensor Signal A circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Replace the Passenger Window Motor (regulator) in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the module is awake.

Set Conditions

- **Set Condition:**

When one or both door modules have lost communication with the Driver Express Window/Door Lock Switch, this code will set.

Possible Causes

Possible Causes
(D500) LIN BUS CIRCUIT SHORT TO GROUND (D500) LIN BUS CIRCUIT SHORT TO VOLTAGE (D500) LIN BUS CIRCUIT OPEN (D501) LIN BUS RETURN CIRCUIT OPEN DRIVER EXPRESS WINDOW/DOOR LOCK SWITCH DOOR MODULE (DDM)

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: If the scan tool displays any other power window DTC(s), repair them first before continuing.

Turn the ignition on.

With the scan tool, record and erase DTC's

Try to operate the Front Windows up and down several times.

Wait 30 seconds.

With the scan tool, read DTC's.

Does the scan tool display: U113D-LOST COMMUNICATION WITH MASTER POWER WINDOW SWITCH?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE LIN BUS CIRCUIT

Fig. 57: Measuring Voltage Between (D500) LIN Bus Circuit And (D501) LIN Bus Return Circuit
Courtesy of CHRYSLER LLC

With the scan tool, erase DTC's.

Turn the ignition off.

Disconnect the Driver Window/Door Lock Switch C2 connector.

Turn the ignition on.

Measure the voltage between the (D500) LIN Bus circuit and the (D501) LIN Bus Return circuit.

Is the voltage above 8.0 volts?

No

Go To 4.

Yes

Go To 3.

3. (D500) LIN BUS CIRCUIT SHORT TO VOLTAGE

Fig. 58: Measuring Voltage Between Ground And (D500) LIN Bus Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Driver Door Module C5 connector.

Turn the ignition on.

Measure the voltage between Ground and the (D500) LIN Bus circuit.

Is there any voltage present?

Yes

Repair the (D500) LIN Bus circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Driver Window/Door Lock Switch.

Perform **BODY VERIFICATION TEST - VER 1** .

4. (D501) LIN BUS RETURN CIRCUIT OPEN

Fig. 59: Using 12-Volt Test Light Connected To 12-Volts To Check (D501) LIN Bus Return Circuit In Window Switch Connector
 Courtesy of CHRYSLER LLC

Using a 12-volt test light connected to 12-volts, check the (D501) LIN Bus Return circuit in the Window Switch connector.

Does the test light illuminate brightly?

Yes

Go To 5.

No

Repair the (D501) LIN Bus Return circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

5. (D500) LIN BUS CIRCUIT SHORT TO GROUND

819d35a9

Fig. 60: Measuring Resistance Between Ground And (D500) LIN Bus Circuit In Door Module C4 Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Driver Door Module C5 connector.

Measure the resistance between Ground and the (D500) LIN Bus circuit in the Door Module C4 connector.

Is the resistance below 10,000.0 ohms?

Yes

Repair the (D500) LIN Bus circuit for a short to the ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 6.

6. (D500) LIN BUS CIRCUIT OPEN

Fig. 61: Measuring Resistance Of (D500) LIN Bus Circuit Between Door Module C5 Connector And Driver Express Window/Door Lock Switch Connector
 Courtesy of CHRYSLER LLC

Measure the resistance of the (D500) LIN Bus circuit between the Door Module C5 connector and the Driver Express Window/Door Lock Switch connector.

Is the resistance below 2.0 ohms?

No

Repair the (D500) LIN Bus circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Replace the Driver Door Module in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

2008 ACCESSORIES AND EQUIPMENT

Power Windows - Service Information - Liberty

POWER WINDOWS - SERVICE INFORMATION

DESCRIPTION

POWER WINDOWS

The power window system allows each of the door windows to be raised and lowered electrically by actuating a switch on the center console. A master switch on the front of the center console allows the driver to raise or lower each of the passenger door windows and to lock out the individual switches on the rear of the center console from operation. The power window system receives battery feed through a fuse in the Totally Integrated Power Module (TIPM), only when the ignition switch is in the RUN or ACCESSORY position.

OPERATION

POWER WINDOWS

WINDOW SWITCH

The power window switches control the battery and ground feeds to the power window motors. Both of the rear door power window switches receive their battery and ground feeds through the circuitry of the front window switch. When the power window lockout switch is in the Lock position, the battery feed for the rear door window switches is interrupted.

WINDOW MOTOR

Front door window lift motors use permanent type magnets. The B+ and ground applied at the motor terminal pins will cause the motor to rotate in one direction. Reversing current through the motor terminals will cause the motor to rotate in the opposite direction.

Refer to the **SYSTEM WIRING DIAGRAMS** article.

DIAGNOSIS AND TESTING

POWER WINDOWS

WIRING VOLTAGE TEST

The following wiring test determines whether or not voltage is continuous through the body harness to the front switch.

1. Remove the power window switch and bezel. See **REMOVAL**.
2. Disconnect wire connector from back of power window switch.
3. Switch ignition to the ON position.

4. Connect the clip end of a 12 volt test light to Pin 14 of the window switch harness connector. Touch the test light probe to Pin 10.
 - If the test light illuminates, the wiring circuit between the battery and switch is OK.
 - If the lamp does not illuminate, first check fuse 13 in the Totally Integrated Power Module (TIPM). If fuse 13 is OK, then check for a broken wire.

Refer to the **SYSTEM WIRING DIAGRAMS** article.

POWER WINDOW MOTOR TEST

NOTE: **The power window motor test does not apply to models with the auto-express feature.**

If the power window motor is receiving proper current and ground and does not operate, proceed with motor test. Refer to the **SYSTEM WIRING DIAGRAMS** article.

1. Remove front door trim panel as necessary to gain access to power window motor wire connector. Refer to **REMOVAL** .
2. Disconnect power window motor wire connector from door harness.
3. Using two jumper wires, connect one to a battery (+) source and the other to a good ground (-).
4. Connect the Negative (-) jumper probe to one of the motor connector terminals.
5. Momentarily touch the Positive (+) jumper probe to the other motor connector terminal.

When positive probe is connected the motor should rotate in one direction to either move window up or down. If window is all the way up or down the motor will grunt and the inner door panel will flex when actuated in that one direction.

6. Reverse jumper probes at the motor connector terminals and window should now move in opposite direction. If window does not move or grunt, replace the motor.

If window moved completely up or down, reverse the jumper probes and cycle window to the opposite position to verify full operation.

If motor grunts and does not move, verify that regulator is not binding.

STANDARD PROCEDURE

STANDARD PROCEDURE-EXPRESS WINDOWS

Anytime the battery is disconnected or in a run down/low voltage state, the auto-up (express) windows must be calibrated.

To calibrate the auto-express feature, perform the following:

1. Turn the Ignition to the Run position.

2. Using the scan tool, perform an ECU reset.
3. Position the window at the midpoint of travel.
4. Move the driver side front window upward until the window stalls in the full up position. Allow the window motor to stall for at least 2 seconds before releasing the switch.
5. Move the driver side front window downward until the window stalls in the full down position. Allow the window motor to stall for at least 2 second before releasing the switch.
6. Repeat steps 3, 4 and 5 for the passenger side front window.
7. Verify the windows are properly calibrated by operating the express down and up features. Repeat this procedure if the calibration failed. If unable to properly calibrate after the second attempt, check the Driver's Door Module (DDM) and Passenger's Door Module (PDM) for Diagnostic Trouble Codes (DTCs) and correct as required.

WINDOW MOTOR

REMOVAL

WINDOW MOTOR

The window motor is incorporated into the window regulator assembly. If the window motor requires replacement, the window regulator must be replaced. Refer to **REMOVAL** for front window, or **REMOVAL** for rear window.

WINDOW SWITCH

REMOVAL

WINDOW SWITCH

Fig. 1: Removing Window Switch
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.

2. Gently pry the switch from the door trim panel.
3. Disconnect electrical harness connector from switch.

INSTALLATION

WINDOW SWITCH

Fig. 2: Installing Window Switch
Courtesy of CHRYSLER LLC

1. Connect the electrical harness connector to the switch.
2. Press the switch into place.
3. Connect the battery negative cable.

POWER SEATS - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B1D62-POWER SEAT SWITCH STUCK

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

- **Set Condition:**

When the Memory Seat Module detects the Driver Seat Switch engaged in an active position for over 50 seconds, this code will set.

Possible Causes

Possible Causes
DRIVER SEAT SWITCH

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, erase all DTC's.

Press the Driver Seat Switch in all directions several times.

Wait one minute.

With the scan tool, read DTC's.

Does the scan tool display active: B1D62-POWER SEAT SWITCH STUCK?

Yes

Replace the Driver Seat Switch in accordance with the Service Information.
Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

When the Memory Seat Module detects an open Driver Seat Switch MUX circuit this code will set.

Possible Causes

Possible Causes
(P309) DRIVER SEAT HORIZONTAL/REAR RISER SWITCH MUX CIRCUIT OPEN OR SHORT TO GROUND
(P311) DRIVER SEAT FRONT RISER SWITCH MUX CIRCUIT OPEN OR SHORT TO GROUND
(P28) DRIVER SEAT SWITCH MUX RETURN CIRCUIT OPEN OR SHORT TO GROUND
(P29) DRIVER SEAT SWITCH MUX SUPPLY CIRCUIT OPEN OR SHORT TO GROUND
DRIVER SEAT SWITCH
MEMORY SEAT MODULE

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, erase all DTC's.

Press the Driver Seat Switch in all directions several times.

Wait one minute.

With the scan tool, read DTC's.

Does the scan tool display active: B1D63-POWER SEAT SWITCH OPEN?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken

wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

2. **(P309) DRIVER SEAT HORIZONTAL/REAR RISER SWITCH MUX CIRCUIT OPEN**

Fig. 2: Measuring The Resistance Of The (P309) Driver Seat Horizontal/Rear Riser Switch Mux Between The Driver Seat Switch Harness Connector And The Memory Seat Module C3 Harness Connector

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Driver Seat Switch.

Disconnect the Memory Seat Module C3 harness connector.

Measure the resistance of the (P309) Driver Seat Horizontal/Rear Riser Switch MUX between the Driver Seat Switch harness connector and the Memory Seat Module C3 harness connector.

Is the resistance below 3.0 ohms?

Yes

Go To 3.

No

Repair the (P309) Driver Seat Horizontal/Rear Riser Switch MUX for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

3. **(P311) DRIVER SEAT FRONT RISER SWITCH MUX CIRCUIT OPEN**

Fig. 3: Measuring The Resistance Of The (P311) Driver Seat Front Riser Switch Mux Between The Driver Seat Switch Harness Connector And The Memory Seat Module C3 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (P311) Driver Seat Front Riser Switch MUX between the Driver Seat Switch harness connector and the Memory Seat Module C3 harness connector.

Is the resistance below 3.0 ohms?

Yes

Go To 4.

No

Repair the (P311) Driver Seat Front Riser Switch MUX for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

4. **(P28) DRIVER SEAT SWITCH MUX RETURN CIRCUIT OPEN**

81d6a5bb

Fig. 4: Measuring The Resistance Of The (P28) Driver Seat Switch Mux Return Between The Driver Seat Switch Harness Connector And The Memory Seat Module C3 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (P28) Driver Seat Switch MUX Return between the Driver Seat Switch harness connector and the Memory Seat Module C3 harness connector.

Is the resistance below 3.0 ohms?

Yes

Go To 5.

No

Repair the (P28) Driver Seat Switch MUX Return circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

5. **(P29) DRIVER SEAT SWITCH MUX SUPPLY CIRCUIT OPEN**

81d6a533

Fig. 5: Measuring The Resistance Of The (P29) Driver Seat Switch Mux Supply Between The Driver Seat Switch Harness Connector And The Memory Seat Module C3 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (P29) Driver Seat Switch MUX Supply between the Driver Seat Switch harness connector and the Memory Seat Module C3 harness connector.

Is the resistance below 3.0 ohms?

Yes

Go To 6.

No

Repair the (P29) Driver Seat Switch MUX Supply for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

6. CHECK THE DRIVER SEAT SWITCH CIRCUIT RESISTANCES TO GROUND

81d6ae2b

Fig. 6: Measuring The Resistance Between Ground And Each Of The Driver Seat Switch Circuits At The Driver Seat Switch Harness Connector
 Courtesy of CHRYSLER LLC

Measure the resistance between ground and each of the Driver Seat Switch circuits at the Driver Seat Switch harness connector.

Is the resistance above 10k ohms for each circuit?

Yes

Go To 7.

No

Repair the circuit(s) that measured below 10k ohms for a short to ground.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

7. CHECK THE MSM SENSOR SUPPLY AND SENSOR RETURN

81d6ae3c

Fig. 7: Measuring The Voltage Between The (P29) Driver Seat Switch Mux Supply Circuit And The (P28) Driver Seat Switch Mux Return Circuit At The Driver Seat Switch Harness Connector
 Courtesy of CHRYSLER LLC

Reconnect the Memory Seat Module C3 harness connector.

Turn the ignition on.

Measure the voltage between the (P29) Driver Seat Switch MUX Supply circuit and the (P28) Driver Seat Switch MUX Return circuit at the Driver Seat Switch harness connector.

Is the voltage above 11.0 volts?

Yes

Go To. 8.

No

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

8. DRIVER SEAT HORIZONTAL SWITCH

81d6ae64

Fig. 8: Checking Driver Seat Horizontal Switch
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Reconnect the Driver Seat Switch harness connector.

Turn the ignition on.

Backprobe and measure the voltage of the (P309) Driver Seat Horizontal Rear Riser Switch MUX circuit while moving the Driver Seat Switch horizontally and the rear riser up, down.

NOTE: The Voltage readings for all positions should be between 1.0 volt and 5.0 volts.

Is the voltage between 1.0 and 5.0 volts when the Driver Seat Switch is moved to each position?

Yes

Go To 9.

No

Replace the Driver Seat Switch.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

9. DRIVER SEAT FRONT RISER SWITCH

Fig. 9: Checking Driver Seat Front Riser Switch
 Courtesy of CHRYSLER LLC

Backprobe and measure the voltage of the (P311) Driver Seat Front Riser MUX circuit while moving the Driver Seat Front Riser Switch forward and rearward.

NOTE: The Voltage readings for all positions should be between 1.0 volt and 5.0 volts.

Is the voltage between 1.0 and 5.0 volts when the Driver Seat Switch is moved to each position?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Replace the Driver Seat Switch.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

B1D6D-SEAT HORIZONTAL POSITION SENSOR CIRCUIT LOW

Circuit Schematic

01430000

Fig. 10: Seat Horizontal Position Sensor Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

When the Seat Motor is activated.

Set Conditions

- **Set Condition:**

If sensor voltage is not within a specified range this DTC will set.

Possible Causes

Possible Causes
(G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT SHORTED TO GROUND DRIVER HORIZONTAL SEAT ADJUSTER MOTOR MEMORY SEAT MODULE

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the Driver Seat Switch in the Horizontal position three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

2. **CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT VOLTAGE**

81d6e55b

Fig. 11: Measuring The Voltage Of The (G401) Driver Seat Horizontal Position Sense Circuit At The Driver Horizontal Seat Adjuster Motor Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Driver Horizontal Seat Adjuster Motor harness connector.

Actuate the seat switch in the affected position for the next step.

Measure the voltage of the (G401) Driver Seat Horizontal Position Sense circuit at the Driver Horizontal Seat Adjuster Motor harness connector.

Is the voltage above 10.0 volts?

Yes

Replace the Seat Track Horizontal Motor assembly in accordance with the Service Information.
 Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Go To 3.

3. **CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT FOR A SHORT TO GROUND**

81d6e593

Fig. 12: Measuring The Resistance Between Ground And The (G401) Driver Seat Horizontal Position Sense Circuit At The Driver Horizontal Seat Adjuster Motor Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Memory Seat Module C2 harness connector.

Measure the resistance between ground and the (G401) Driver Seat Horizontal Position Sense circuit at the Driver Horizontal Seat Adjuster Motor harness connector.

Is the resistance above 10k ohms?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (G401) Driver Seat Horizontal Position Sense circuit for a short to ground.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

B1D6E-SEAT HORIZONTAL POSITION SENSOR CIRCUIT HIGH

MEMORY SEAT MODULE

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the Driver Seat Switch in the horizontal position three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

2. **DRIVER HORIZONTAL SEAT ADJUSTER MOTOR**

Turn the ignition off.

Disconnect the Driver Horizontal Seat Adjuster Motor harness connector.

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the seat switch in the horizontal positions three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go to 3.

No

Replace the Driver Horizontal Seat Adjuster Motor assembly in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

3. **(G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 14: Measuring The Voltage Of The (G401) Driver Seat Horizontal Position Sense Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Memory Seat Module C2 harness connector.

Turn the ignition on.

Measure the voltage of the (G401) Driver Seat Horizontal Position Sense circuit.

Is there any voltage present?

Yes

Repair the (G401) Driver Seat Horizontal Position Sense circuit for a short to voltage.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Go to 4.

4. **(G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**

Fig. 15: Measuring The (G401) Driver Seat Horizontal Position Sense Circuit To Other Circuits In The Memory Seat Module C2 Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the (G401) Driver Seat Horizontal Position Sense circuit to other circuits in the Memory Seat Module C2 connector.

Is there any continuity present?

Yes

Repair the (G401) Driver Seat Horizontal Position Sense circuit for a short to another circuit.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Go to 5.

5. (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT OPEN

Fig. 16: Measuring The Resistance Of The (G401) Driver Seat Horizontal Position Sense Circuit Between The Memory Seat Module C2 Harness Connector And The Driver Horizontal Seat Adjuster Motor Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance of the (G401) Driver Seat Horizontal Position Sense circuit between the Memory Seat Module C2 harness connector and the Driver Horizontal Seat Adjuster Motor harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (G401) Driver Seat Horizontal Position Sense circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

When the Seat Motor is activated

Set Conditions

- **Set Condition:**

If sensor voltage is not within a specified range this DTC will set.

Possible Causes

Possible Causes
(G404) DRIVER SEAT VERTICAL POSITION SENSE CIRCUIT SHORTED TO GROUND FRONT DRIVER VERTICAL SEAT ADJUSTER MOTOR MEMORY SEAT MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the Driver Seat Switch in the Vertical position three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent

condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

2. CHECK THE (G404) DRIVER SEAT VERTICAL POSITION SENSE CIRCUIT VOLTAGE

Fig. 18: Measuring The Voltage Of The (G404) Driver Seat Vertical Position Sense Circuit At The Driver Vertical Seat Adjuster Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Driver Vertical Seat Adjuster Motor harness connector.

Measure the voltage of the (G404) Driver Seat Vertical Position Sense circuit at the Driver Vertical Seat Adjuster Motor harness connector.

Is the voltage above 10.0 volts?

Yes

Replace the Seat Track Vertical Motor assembly in accordance with the Service Information.
Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Go To 3.

3. CHECK THE (G404) DRIVER SEAT VERTICAL POSITION SENSE CIRCUIT FOR A SHORT TO GROUND

81d7430f

Fig. 19: Measuring The Resistance Between Ground And The (G404) Driver Seat Vertical Position Sense Circuit At The Driver Vertical Seat Adjuster Motor Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Memory Seat Module C2 harness connector.

Measure the resistance between ground and the (G404) Driver Seat Vertical Position Sense circuit at the Driver Vertical Seat Adjuster Motor harness connector.

Is the resistance above 10k ohms?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (G404) Driver Seat Vertical Position Sense circuit for a short to ground.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

When the Seat Motor is activated.

Set Conditions

- **Set Condition:**

If during motor operation the sensor voltage is not within a specified range this code will set.

Possible Causes

Possible Causes
(G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT SHORTED TO VOLTAGE
(G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT SHORTED TO ANOTHER CIRCUIT
(G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT OPEN
FRONT DRIVER VERTICAL SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the Driver Seat Switch in the Vertical position three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

2. DRIVER VERTICAL SEAT ADJUSTER MOTOR

Turn the ignition off.

Disconnect the Front Driver Vertical Seat Adjuster Motor harness connector.

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the seat switch in the Front Vertical positions three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go to 3.

No

Replace the Driver Front Vertical Seat Adjuster Motor assembly in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

3. (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT FOR A SHORT TO VOLTAGE

81d74fdd

Fig. 21: Measuring The Voltage Of The (G404) Driver Seat Front Vertical Position Sense Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Memory Seat Module C2 harness connector.

Turn the ignition on.

Measure the voltage of the (G404) Driver Seat Front Vertical Position Sense circuit.

Is there any voltage present?

Yes

Repair the (G404) Driver Seat Front Vertical Position Sense circuit for a short to voltage.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Go to 4.

4. (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Fig. 22: Measuring The (G404) Driver Seat Front Vertical Position Sense Circuit To Other Circuits In The Memory Seat Module C2 Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the (G404) Driver Seat Front Vertical Position Sense circuit to other circuits in the Memory Seat Module C2 connector.

Is there any continuity present?

Yes

Repair the (G404) Driver Seat Vertical Position Sense circuit for a short to another circuit.
Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Go to 5.

5. **(G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT OPEN**

Fig. 23: Measuring The Resistance Of The (G404) Driver Seat Front Vertical Position Sense Circuit Between The Memory Seat Module C2 Harness Connector And The Driver Vertical Seat Adjuster Motor Harness Connector

Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance of the (G404) Driver Seat Front Vertical Position Sense circuit between the

Memory Seat Module C2 harness connector and the Driver Vertical Seat Adjuster Motor harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (G404) Driver Seat Front Vertical Position Sense circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

Monitor Conditions

When Monitored:

When the Seat Motor is activated.

Set Conditions

- **Set Condition:**

If sensor voltage is not within a specified range this DTC will set.

Possible Causes

Possible Causes
(G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT SHORTED TO GROUND REAR DRIVER VERTICAL SEAT ADJUSTER MOTOR MEMORY SEAT MODULE

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the Driver Seat Switch in the Vertical position three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

2. **CHECK THE (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT VOLTAGE**

81d76392

Fig. 25: Measuring The Voltage Of The (G402) Driver Seat Rear Vertical Position Sense Circuit At The Rear Driver Vertical Seat Adjuster Motor Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Rear Driver Vertical Seat Adjuster Motor harness connector.

Turn the ignition on.

Measure the voltage of the (G402) Driver Seat Rear Vertical Position Sense circuit at the Rear Driver Vertical Seat Adjuster Motor harness connector.

Is the voltage above 10.0 volts?

Yes

Replace the Seat Track Vertical Motor assembly in accordance with the Service Information.
 Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Go To 3.

3. **CHECK THE (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT FOR A SHORT TO GROUND**

81d76405

Fig. 26: Measuring The Resistance Between Ground And The (G402) Driver Seat Rear Vertical Position Sense Circuit At The Rear Driver Vertical Seat Adjuster Motor Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Memory Seat Module C2 harness connector.

Measure the resistance between ground and the (G402) Driver Seat Rear Vertical Position Sense circuit at the Rear Driver Vertical Seat Adjuster Motor harness connector.

Is the resistance above 10k ohms?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (G402) Driver Seat Rear Vertical Position Sense circuit for a short to ground.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

(G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT OPEN
REAR DRIVER VERTICAL SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the Driver Seat Switch in the Vertical position three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

2. REAR DRIVER VERTICAL SEAT ADJUSTER MOTOR

Turn the ignition off.

Disconnect the Rear Driver Vertical Seat Adjuster Motor harness connector.

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the seat switch in the Vertical positions three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go to 3.

No

Replace the Rear Driver Vertical Seat Adjuster Motor assembly in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

3. (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT FOR A SHORT TO VOLTAGE

81d773f4

Fig. 28: Measuring The Voltage Of The (G402) Driver Seat Rear Vertical Position Sense Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Memory Seat Module C2 harness connector.

Turn the ignition on.

Measure the voltage of the (G402) Driver Seat Rear Vertical Position Sense circuit.

Is there any voltage present?

Yes

Repair the (G402) Driver Seat Rear Vertical Position Sense circuit for a short to voltage.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Go to 4.

4. (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

81d77971

Fig. 29: Measuring The Resistance Of The (G402) Driver Seat Rear Vertical Position Sense Circuit To Other Circuits In The Memory Seat Module C2 Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance of the (G402) Driver Seat Rear Vertical Position Sense circuit to other circuits in the Memory Seat Module C2 connector.

Is there any continuity present to other circuits?

Yes

Repair the (G402) Driver Seat Rear Vertical Position Sense circuit for a short to another circuit.
Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Go to 5.

5. (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT OPEN

Fig. 30: Measuring The Resistance Of The (G402) Driver Seat Rear Vertical Position Sense Circuit Between The Memory Seat Module C2 Harness Connector And The Rear Driver Vertical Seat Adjuster Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance of the (G402) Driver Seat Rear Vertical Position Sense circuit between the Memory Seat Module C2 harness connector and the Rear Driver Vertical Seat Adjuster Motor harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (G402) Driver Seat Rear Vertical Position Sense circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

B1D7B-SEAT HORIZONTAL MOTOR CONTROL CIRCUIT PERFORMANCE

Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

Whenever the Seat Motor is activated.

Set Conditions

- **Set Condition:**

If the Memory Seat Module does not detect the rotation of the seat motor this DTC will set.

Possible Causes

Possible Causes
SEAT POSITION SENSOR CIRCUIT DIAGNOSTIC TROUBLE CODES (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT OPEN (G491) DRIVER SEAT HORIZONTAL SENSOR GROUND CIRCUIT OPEN (P115) DRIVER SEAT HORIZONTAL FORWARD DRIVER (P117) DRIVER SEAT HORIZONTAL REARWARD DRIVER DRIVER HORIZONTAL SEAT ADJUSTER MOTOR MEMORY SEAT MODULE

Diagnostic Test

1. **CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES**

Turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display any seat position sensor DTC's?

Yes

Diagnose and repair the other DTC(s) first. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 2.

2. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the Driver Seat Switch in the horizontal forward and rearward position three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go To 3.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

3. CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT VOLTAGE

81d7efe3

Fig. 32: Measuring The Voltage Between The (G401) Driver Seat Horizontal Position Sense Circuit And The (G491) Driver Seat Horizontal Sensor Ground Circuit At The Driver Horizontal Seat Adjuster Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Driver Horizontal Seat Adjuster Motor harness connector.

Turn the ignition on.

Measure the voltage between the (G401) Driver Seat Horizontal Position Sense circuit and the (G491) Driver Seat Horizontal Sensor Ground circuit at the Driver Horizontal Seat Adjuster Motor harness connector.

Is the voltage above 10.0 volts?

Yes

Go To 4.

No

Go To 5.

4. CHECK THE DRIVER SEAT HORIZONTAL FORWARD/REARWARD DRIVER CIRCUIT VOLTAGE

Fig. 33: Checking The Driver Seat Horizontal Forward/Rearward Driver Circuit Voltage
Courtesy of CHRYSLER LLC

Using a 12-volt test light connect one lead to the (P115) Driver Seat Horizontal Forward Driver circuit and the other lead to (P117) Driver Seat Horizontal Rearward Driver circuit at the Driver Horizontal Seat Adjuster Motor harness connector.

Move the Driver Seat Switch in the Horizontal forward and rearward position.

Does the test light illuminate with the seat switch engaged in both positions?

Yes

Replace the track/horizontal motor assembly in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Go To 7.

5. **CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT FOR AN OPEN**

Fig. 34: Measuring The Resistance Of The (G401) Driver Seat Horizontal Position Sense Circuit Between The Memory Seat Module C2 Harness Connector And The Driver Horizontal Seat Adjuster Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Memory Seat Module C2 harness connector.

Measure the resistance of the (G401) Driver Seat Horizontal Position Sense circuit between the Driver Horizontal Seat Adjuster Motor harness connector and the Memory Seat Module C2 harness connector.

Is the resistance below 10.0 ohms?

Yes

Go To 6.

No

Repair the (G401) Driver Seat Horizontal Position Sense circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

6. **CHECK THE (G491) DRIVER SEAT HORIZONTAL SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 35: Measuring The Resistance Of The (G491) Driver Seat Horizontal Sensor Ground Circuit Between The Driver Horizontal Seat Adjuster Motor Harness Connector And The Memory Seat Module C2 Harness Connector

Courtesy of CHRYSLER LLC

Measure the resistance of the (G491) Driver Seat Horizontal Sensor Ground circuit between the Driver Horizontal Seat Adjuster Motor harness connector and the Memory Seat Module C2 harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (G491) Driver Seat Horizontal Sensor Ground circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

7. **CHECK THE (P115) DRIVER SEAT HORIZONTAL FORWARD DRIVER CIRCUIT FOR AN OPEN**

Fig. 36: Measuring The Resistance Of The (P115) Driver Seat Horizontal Forward Driver Circuit Between The Driver Horizontal Seat Adjuster Motor Harness Connector To The Memory Seat Module C2 Harness Connector
Courtesy of CHRYSLER LLC

Disconnect the Memory Seat Module C2 harness connector.

Measure the resistance of the (P115) Driver Seat Horizontal Forward Driver circuit between the Driver Horizontal Seat Adjuster Motor harness connector to the Memory Seat Module C2 harness connector.

Is the resistance below 10.0 ohms?

Yes

Go To 8.

No

Repair the (P115) Driver Seat Horizontal Forward Driver circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

8. CHECK THE (P117) DRIVER SEAT HORIZONTAL REARWARD DRIVER CIRCUIT FOR AN OPEN

Fig. 37: Measuring The Resistance Of The (P117) Driver Seat Horizontal Rearward Driver Circuit Between The Driver Horizontal Seat Adjuster Motor Harness Connector And The Memory Seat Module C2 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (P117) Driver Seat Horizontal Rearward Driver circuit between the Driver Horizontal Seat Adjuster Motor harness connector and the Memory Seat Module C2 harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (P117) Driver Seat Horizontal Rearward Driver circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

Monitor Conditions

When Monitored:

Whenever the Seat Motor is activated.

Set Conditions

- **Set Condition:**

If the Memory Seat Module does not detect the rotation of the Seat Motor this DTC will set.

Possible Causes

Possible Causes
SEAT POSITION SENSOR CIRCUIT DIAGNOSTIC TROUBLE CODES (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT OPEN (G494) DRIVER SEAT FRONT VERTICAL SENSOR GROUND CIRCUIT OPEN (P119) DRIVER SEAT FRONT VERTICAL UP DRIVER (P121) DRIVER SEAT FRONT VERTICAL DOWN DRIVER FRONT DRIVER VERTICAL SEAT ADJUSTER MOTOR MEMORY SEAT MODULE

Diagnostic Test

1. **CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES**

Turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display any seat position sensor DTC's?

Yes

Diagnose and repair the other DTC(s) first. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 2.

2. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the Driver Seat Switch in the Front Vertical up and down position three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go To 3.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

3. **CHECK THE (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT VOLTAGE**

Fig. 39: Measuring The Voltage Between The (G404) Driver Seat Front Vertical Position Sense Circuit And The (G494) Driver Seat Front Vertical Sensor Ground Circuit At The Driver Front Vertical Seat Adjuster Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Driver Front Vertical Seat Adjuster Motor harness connector.

Turn the ignition on.

Measure the voltage between the (G404) Driver Seat Front Vertical Position Sense circuit and the (G494) Driver Seat Front Vertical Sensor Ground circuit at the Driver Front Vertical Seat Adjuster Motor harness connector.

Is the voltage above 10.0 volts?

Yes

Go To 4.

No

Go To 5.

4. CHECK THE DRIVER SEAT FRONT VERTICAL UP/DOWN DRIVER CIRCUIT VOLTAGE

Fig. 40: Checking The Driver Seat Front Vertical Up/Down Driver Circuit Voltage
Courtesy of CHRYSLER LLC

Using a 12-volt test light connect one lead to the (P119) Driver Seat Front Vertical Up Driver circuit and the other lead to (P121) Driver Seat Front Vertical Down Driver circuit at the Driver Front Vertical Seat Adjuster Motor harness connector.

Move the Driver Seat Switch in the Front Vertical up and down position.

Does the test light illuminate with the seat switch engaged in both positions?

Yes

Replace the track/Front Vertical motor assembly in accordance with the Service Information.
Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Go To 7.

5. **CHECK THE (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT FOR AN OPEN**

Fig. 41: Measuring The Resistance Of The (G404) Driver Seat Front Vertical Position Sense Circuit Between The Memory Seat Module C2 Harness Connector And The Driver Vertical Seat Adjuster Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Memory Seat Module C2 harness connector.

Measure the resistance of the (G404) Driver Seat Front Vertical Position Sense circuit between the Driver Front Vertical Seat Adjuster Motor harness connector and the Memory Seat Module C2 harness connector.

Is the resistance below 10.0 ohms?

Yes

Go To 6.

No

Repair the (G404) Driver Seat Front Vertical Position Sense circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

6. **CHECK THE (G494) DRIVER SEAT FRONT VERTICAL SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 42: Measuring The Resistance Of The (G494) Driver Seat Front Vertical Sensor Ground Circuit Between The Driver Front Vertical Seat Adjuster Motor Connector And The Memory Seat Module C2 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (G494) Driver Seat Front Vertical Sensor Ground circuit between the Driver Front Vertical Seat Adjuster Motor connector and the Memory Seat Module C2 harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (G494) Driver Seat Front Vertical Sensor Ground circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

7. **CHECK THE (P119) DRIVER SEAT FRONT VERTICAL UP DRIVER CIRCUIT FOR AN OPEN**

Fig. 43: Measuring The Resistance Of The (P119) Driver Seat Front Vertical Up Driver Circuit Between The Driver Front Vertical Seat Adjuster Motor Harness Connector To The Memory Seat Module C2 Harness Connector

Courtesy of CHRYSLER LLC

Disconnect the Memory Seat Module C2 harness connector.

Measure the resistance of the (P119) Driver Seat Front Vertical Up Driver circuit between the Driver

Front Vertical Seat Adjuster Motor harness connector to the Memory Seat Module C2 harness connector.

Is the resistance below 10.0 ohms?

Yes

Go To 8.

No

Repair the (P119) Driver Seat Front Vertical Up Driver circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

8. CHECK THE (P121) DRIVER SEAT FRONT VERTICAL DOWN DRIVER CIRCUIT FOR AN OPEN

Fig. 44: Measuring The Resistance Of The (P121) Driver Seat Front Vertical Down Driver Circuit Between The Driver Front Vertical Seat Adjuster Motor Harness Connector And The Memory Seat Module C2 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (P121) Driver Seat Front Vertical Down Driver circuit between the Driver Front Vertical Seat Adjuster Motor harness connector and the Memory Seat Module C2 harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (P121) Driver Seat Front Vertical Down Driver circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

B1D83-SEAT REAR VERTICAL MOTOR CONTROL CIRCUIT PERFORMANCE

Circuit Schematic

01421000

Fig. 45: Seat Rear Vertical Position Sensor Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the Seat Motor is activated.

Set Conditions

- **Set Condition:**

If the Memory Seat Module does not detect the rotation of the Seat Motor this DTC will set.

Possible Causes

Possible Causes
SEAT POSITION SENSOR CIRCUIT DIAGNOSTIC TROUBLE CODES (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT OPEN (G492) DRIVER SEAT REAR VERTICAL SENSOR GROUND CIRCUIT OPEN (P111) DRIVER SEAT REAR VERTICAL UP DRIVER (P113) DRIVER SEAT REAR VERTICAL DOWN DRIVER REAR DRIVER VERTICAL SEAT ADJUSTER MOTOR MEMORY SEAT MODULE

Diagnostic Test

1. **CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES**

Turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display any seat position sensor DTC's?

Yes

Diagnose and repair the other DTC(s) first. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 2.

2. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the Driver Seat Switch in the Rear Vertical up and down position three times.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go To 3.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

3. **CHECK THE (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT VOLTAGE**

Fig. 46: Measuring The Voltage Between The (G402) Driver Seat Rear Vertical Position Sense Circuit And The (G492) Driver Seat Rear Vertical Sensor Ground Circuit At The Driver Rear Vertical Seat Adjuster Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Driver Rear Vertical Seat Adjuster Motor harness connector.

Turn the ignition on.

Measure the voltage between the (G402) Driver Seat Rear Vertical Position Sense circuit and the (G492) Driver Seat Rear Vertical Sensor Ground circuit at the Driver Rear Vertical Seat Adjuster Motor harness connector.

Is the voltage above 10.0 volts?

Yes

Go To 4.

No

Go To 5.

4. CHECK THE DRIVER SEAT REAR VERTICAL UP/DOWN DRIVER CIRCUIT VOLTAGE

Fig. 47: Checking The Driver Seat Rear Vertical Up/Down Driver Circuit Voltage
Courtesy of CHRYSLER LLC

Using a 12-volt test light connect one lead to the (P111) Driver Seat Rear Vertical Up Driver circuit and the other lead to (P113) Driver Seat Rear Vertical Down Driver circuit at the Driver Rear Vertical Seat Adjuster Motor harness connector.

Move the Driver Seat Switch in the Rear Vertical up and down position.

Does the test light illuminate with the seat switch engaged in both positions?

Yes

Replace the track/Rear Vertical motor assembly in accordance with the Service Information.
Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Go To 7.

5. **CHECK THE (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT FOR AN OPEN**

Fig. 48: Measuring The Resistance Of The (G402) Driver Seat Rear Vertical Position Sense Circuit Between The Memory Seat Module C2 Harness Connector And The Rear Driver Vertical Seat Adjuster Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Memory Seat Module C2 harness connector.

Measure the resistance of the (G402) Driver Seat Rear Vertical Position Sense circuit between the Driver Rear Vertical Seat Adjuster Motor harness connector and the Memory Seat Module C2 harness connector.

Is the resistance below 10.0 ohms?

Yes

Go To 6.

No

Repair the (G402) Driver Seat Rear Vertical Position Sense circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

6. **CHECK THE (G492) DRIVER SEAT REAR VERTICAL SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 49: Measuring The Resistance Of The (G492) Driver Seat Rear Vertical Sensor Ground Circuit Between The Driver Rear Vertical Seat Adjuster Motor Connector And The Memory Seat Module C2 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (G492) Driver Seat Rear Vertical Sensor Ground circuit between the Driver Rear Vertical Seat Adjuster Motor connector and the Memory Seat Module C2 harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (G492) Driver Seat Rear Vertical Sensor Ground circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

7. **CHECK THE (P111) DRIVER SEAT REAR VERTICAL UP DRIVER CIRCUIT FOR AN OPEN**

Fig. 50: Measuring The Resistance Of The (P111) Driver Seat Rear Vertical Up Driver Circuit Between The Driver Rear Vertical Seat Adjuster Motor Harness Connector To The Memory Seat Module C2 Harness Connector
Courtesy of CHRYSLER LLC

Disconnect the Memory Seat Module C2 harness connector.

Measure the resistance of the (P111) Driver Seat Rear Vertical Up Driver circuit between the Driver Rear Vertical Seat Adjuster Motor harness connector to the Memory Seat Module C2 harness connector.

Is the resistance below 10.0 ohms?

Yes

Go To 8.

No

Repair the (P111) Driver Seat Rear Vertical Up Driver circuit for an open.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

8. **CHECK THE (P113) DRIVER SEAT REAR VERTICAL DOWN DRIVER CIRCUIT FOR AN OPEN**

Fig. 51: Measuring The Resistance Of The (P113) Driver Seat Rear Vertical Down Driver Circuit Between The Driver Rear Vertical Seat Adjuster Motor Harness Connector And The Memory Seat Module C2 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (P113) Driver Seat Rear Vertical Down Driver circuit between the Driver Rear Vertical Seat Adjuster Motor harness connector and the Memory Seat Module C2 harness

connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Memory Seat Module in accordance with the Service Information.
Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (P113) Driver Seat Rear Vertical Down Driver circuit for an open.
Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

B1D9B-SEAT HORIZONTAL FRONT STOP NOT LEARNED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Whenever the Seat Motor is activated.

Set Conditions

- Set Condition:**

Seat becomes de-standardized. If the seat is not standardized, an Easy Exit/Entry function can not be performed. If seat is standardized (learn seat cushion horizontal front hardstop) and then becomes de-standardized (conditions are: seat cushion motor is 5% past the expected hard stop position or seat cushion hall sensor failure is occurred), a DTC is logged.

Possible Causes

Possible Causes
OTHER DIAGNOSTIC TROUBLE CODES SET IN THE MEMORY SEAT MODULE
SEAT STANDARDIZATION ROUTINE NOT PERFORMED

Diagnostic Test

1. CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES

Turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display any seat position sensor or circuit performance DTC's?

Yes

Diagnose and repair the other DTC(s) first. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 2.

2. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, erase all DTC's.

Move the seat in the full forward horizontal position.

With the scan tool, read DTC's.

Does the scan tool display active: B1D9B-SEAT HORIZONTAL FRONT STOP NOT LEARNED?

Yes

With the scan tool, perform the Memory Seat Module (MSM) Standard Routine.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

B210D-BATTERY VOLTAGE LOW - MSM

Circuit Schematic

Monitor Conditions

When Monitored:

Engine running, during seat motor operation.

Set Conditions

- **Set Condition:**

This code is set immediately after the Memory Seat Module (MSM) receives a low charging system voltage message over the CAN Interior Bus or detects voltage under 9.5 volts on the (A210) Fused B(+) circuit.

Possible Causes

Possible Causes
CHARGING SYSTEM VOLTAGE LOW (A210) FUSED B(+) CIRCUIT OPEN (Z913) GROUND CIRCUIT OPEN MEMORY SEAT MODULE

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **CHECK PCM FOR CHARGING SYSTEM DTC**

With the scan tool, read Powertrain Control Module DTC's.

Are there any Charging System DTC's set in the Powertrain/Engine Control Module?

Yes

(Refer to **DIAGNOSIS AND TESTING**) for Charging System diagnostic procedures.

No

Go To 2.

2. **TEST FOR INTERMITTENT CONDITION**

With the scan tool, erase all DTC's.

Turn the ignition switch to the OFF position then start the engine and operate the driver power seat.

With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes

Go To 3.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

3. (A210) FUSED B(+) CIRCUIT OPEN

Fig. 53: Measuring The Voltage On The (A210) Fused B(+) Circuit At The Memory Seat Module Harness Connector And Compare To Voltage At The Vehicles Battery
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Memory Seat Module C1 harness connector.

Start the engine and let idle.

Measure the voltage on the (A210) Fused B(+) circuit at the Memory Seat Module C1 harness connector and compare to voltage at the vehicle battery.

Is the voltage at the Memory Seat Module connector the same as measured at the battery?

Yes

Go To 4.

No

Repair the (A210) Fused B(+) circuit as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

4. (Z913) GROUND CIRCUIT OPEN

Fig. 54: Checking The (Z913) Ground Circuit At The Memory Seat Module C1 Harness Connector Using A 12-Volt Test Light Connected To 12-Volts
Courtesy of CHRYSLER LLC

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (Z913) Ground circuit at the Memory Seat Module C1 harness connector.

Does the test light illuminate brightly?

Yes

Replace the Memory Seat Module in accordance with the Service Information.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (Z913) Ground circuit as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

B210E-BATTERY VOLTAGE HIGH - MSM

Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Engine running, during seat operation.

Set Conditions

- **Set Condition:**

This code is set immediately after the Memory Seat Module (MSM) receives a high charging system voltage message over the CAN Interior Bus or detects voltage over 16.5 volts on the (A210) Fused B(+) circuit.

Possible Causes

Possible Causes
CHARGING SYSTEM VOLTAGE HIGH (A210) FUSED B(+) CIRCUIT OPEN MEMORY SEAT MODULE

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **CHECK PCM/ECM FOR CHARGING SYSTEM DTC**

With the scan tool, read Powertrain Control Module DTC's.

Are there any Charging System DTC's set in the Powertrain Control Module?

Yes

(Refer to **DIAGNOSIS AND TESTING**) for Charging System diagnostic procedures.

No

Go To 2.

2. **TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase DTC's

Turn the ignition switch to the OFF position then start the engine and let run for one minute.

Attempt to operate the Driver Power Seat.

With the scan tool, read DTC's.

Does the scan tool display active this DTC?

Yes

Go To 3.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

3. CHECK THE VOLTAGE ON THE (A210) FUSED B(+) CIRCUIT

Fig. 56: Measuring The Voltage On The (A210) Fused B(+) Circuit At The Memory Seat Module Harness Connector And Compare To Voltage At The Vehicles Battery
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Memory Seat Module harness connector.

Start the engine and let idle.

Measure the voltage on the (A210) Fused B(+) circuit at the Memory Seat Module harness connector and compare to voltage at the vehicles battery.

Is the voltage at the Memory Seat Module connector the same as measured at the battery?

Yes

Replace the Memory Seat Module in accordance with the Service Information.
Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

No

Repair the (A210) Fused B(+) circuit as necessary.
Perform **POWER SEAT SYSTEM VERIFICATION TEST - VER 1.**

B221C-MEMORY SEAT MODULE INTERNAL

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Ignition on.

Set Conditions

• **Set Condition:**

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0203-LOST COMMUNICATION WITH DOOR MODULE LEFT FRONT

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0204-LOST COMMUNICATION WITH DOOR MODULE FRONT RIGHT

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

POWER SEAT SYSTEM VERIFICATION TEST - VER 1

Diagnostic Test

1. Perform Power Seat System Verification Test

Disconnect all jumper wires and reconnect all previously disconnected components and connectors.

Ensure that all accessories are turned off.

Ensure that the battery is fully charged.

Turn the ignition on.

If either the Memory Seat Module or the Driver Horizontal Seat Adjuster Motor/Seat Track was replaced, the MSM Standard Routine must be performed using the scan tool.

With the scan tool, record and erase DTCs from all modules.

Operate the driver seat in all positions.

With the Memory Switch on the Driver's Door, program the Driver's Seat No. 1 Button to a desired position and Driver No. 2 Button to a different position.

Verify that both Memory positions can be recalled from the RKE transmitter and the Memory Switch on the Driver's Door.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select ECU View.

Check for DTCs in the modules.

Are DTCs present in any of the modules or is the original condition still present?

Yes

The repair is not complete. Refer to the related article for the DTC or symptom that is still present.

No

The repair is complete.

2008 RESTRAINTS

Service Information - Liberty

RESTRAINTS - SERVICE INFORMATION

DESCRIPTION

RESTRAINT SYSTEM

An occupant restraint system is standard factory-installed safety equipment on this vehicle. Available occupant restraints for this vehicle include both active and passive types. Active restraints are those which require the vehicle occupants to take some action to employ, such as fastening a seat belt; while passive restraints require no action by the vehicle occupants to be employed.

ACTIVE RESTRAINTS

The active restraints for this vehicle include:

- **Child Restraint Anchors** - All vehicles are equipped with three, fixed-position, child seat upper tether anchors for the second row seat. Two anchors are integral to the back of the left rear seat back panel, and one is integral to the right rear seat back panel. Two lower anchors are also provided for each outboard second row seating position. Except for the left inboard anchor, these lower anchors are integral to the seat brackets on the rear floor panel. The left inboard anchor is integral to the left seat cushion frame. The lower anchors are all accessed from the front of the second row seats, where the seat back meets the seat cushion.
- **Front Seat Belts** - Both front seating positions are equipped with three-point seat belt systems employing lower B-pillar mounted inertia latch-type emergency locking retractors, height-adjustable upper B-pillar mounted turning loops, a traveling lower seat belt anchor secured to the outboard side of the seat frame, and a traveling end-release seat belt buckle secured to the inboard side of the seat frame. The front seat belt buckles include an integral seat belt switch that detects whether the front seat belts have been fastened.
- **Second Row Seat Belts** - All second row seating positions are equipped with three-point seat belt systems. The outboard seating position belts employ lower C-pillar mounted inertia latch-type emergency locking retractors, fixed position upper C-pillar mounted turning loops and fixed lower seat belt anchors secured to the floor panel. The second row center seating position belt has an inertia latch-type emergency locking retractor that is integral to the left rear seat back panel. The second row center seating position belt lower anchor is secured to the floor panel. All three rear seat belts have fixed end-release seat belt buckles secured to the floor panel, a double buckle unit on the right side and a single buckle unit on the left side.

PASSIVE RESTRAINTS

SRS

AIRBAG

8098029e

Fig. 1: SRS Emblem
Courtesy of CHRYSLER LLC

The passive restraints available for this vehicle include the following:

Fig. 2: Instrument Panel Switch Pod
Courtesy of CHRYSLER LLC

- **Dual Front Airbags** - Multistage driver and front passenger airbags are used in this vehicle. This airbag system consists of passive, inflatable, Supplemental Restraint System (SRS) components and vehicles with this equipment can be readily identified by the **SRS - AIRBAG** logo molded into the driver airbag trim cover in the center of the steering wheel and also into the passenger airbag door on the instrument panel above the glove box. Vehicles with the airbag system can also be identified by the airbag indicator, which will illuminate in the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) for about seven seconds as a bulb test each time the ignition switch is turned to the ON position. Pyrotechnic-type seat belt tensioners are also included for the driver and passenger front seat belts of all airbag equipped vehicles to work in conjunction with the dual front and side curtain airbags.
- **Occupant Classification System** - Vehicles manufactured for sale in North America (except Mexico) also include an Occupant Classification System (OCS) with components that are located on the passenger

side front seat. These components include an Occupant Classification Module (OCM) and four seat weight sensors on the passenger side front seat. Vehicles equipped with the OCS components can be readily identified by a passenger airbag on/off indicator (4) located to the right of the hazard switch (3) in the instrument panel switch pod (1) near the base of the instrument panel center bezel.

- **Side Curtain Airbags** - Side curtain airbags are standard equipment for this vehicle when it is also equipped with dual front airbags. This airbag system consists of passive, inflatable SRS components and vehicles with this equipment can be readily identified by a molded identification trim plug with the **SRS - AIRBAG** logo located near the tops of the B and C-pillar trim.

Fig. 3: SRS System
Courtesy of CHRYSLER LLC

The SRS includes the following major components, which are described in further detail elsewhere in this service information:

Airbag Indicator - The airbag indicator is integral to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN), which is located on the instrument panel in front of the driver.

Clockspring - The clockspring is located near the top of the steering column, directly beneath the steering wheel.

Driver Airbag (4) - The driver airbag is located in the center of the steering wheel, beneath the driver airbag trim cover.

Driver Knee Blocker - The driver knee blocker is a structural unit secured to the back side of and

integral to the instrument panel steering column opening cover.

Front Impact Sensor (1) - Two front impact sensors are used on vehicles equipped with dual front airbags, one left side and one right side. One sensor is located on the back side of the front end module carrier on either side of the radiator and inboard of the headlamp within the engine compartment.

Occupant Classification Module (6) - Vehicles equipped with the Occupant Classification System (OCS) include an Occupant Classification Module (OCM) which is secured to a bracket on the inboard side of the inboard passenger side seat track riser beneath the seat cushion.

Occupant Restraint Controller (8) - The Occupant Restraint Controller (ORC) is located on a mount on the floor panel transmission tunnel rearward of the transmission gear selector, and is concealed beneath the center floor console.

Passenger Airbag (2) - The passenger airbag is located in the instrument panel, beneath the passenger airbag door on the instrument panel above the glove box on the passenger side of the vehicle.

Passenger Airbag On/Off Indicator (3) - Vehicles with the Occupant Classification System (OCS) include a passenger airbag on/off indicator which is located in the instrument panel switch pod near the base of the instrument panel lower center bezel.

Passenger Knee Blocker - The passenger knee blocker is a structural reinforcement that is integral to and concealed within the glove box door.

Seat Belt Tensioner (9 and 10) - Vehicles equipped with dual front airbags have seat belt buckle tensioners integral to both front seat belt buckle units (9) for export market vehicles, or to only the driver side front seat belt buckle for domestic market vehicles. Seat belt retractor tensioner units (10) are used in all markets on vehicles equipped with dual front airbags. The seat belt buckle tensioner units are located on the inboard rear corner of the front seat cushion frame. The seat belt retractor tensioner units are secured to the right and left inner B-pillars and concealed beneath the lower B-pillar trim.

Seat Weight Sensor (5) - Vehicles equipped with the Occupant Classification System (OCS) include four seat weight sensors, one on each corner of the passenger side front seat between the lower seat adjuster tracks and the seat track risers.

Side Curtain Airbag (12) - A side curtain airbag is secured to each inside roof side rail above the headliner, and extends from the A-pillar to just beyond the C-pillar.

Side Impact Sensor (11) - Four side impact sensors are used on vehicles equipped with side curtain airbags, two left side and two right side. One sensor is located behind the trim above the front seat belt retractor on each inner B-pillar and one is located above the second row outboard retractor on each inner C-pillar.

The ORC, the OCM, and the EMIC each contain a microprocessor and programming that allow them to communicate with each other using the Controller Area Network (CAN) data bus. This method of communication is used by the ORC for control of the airbag indicator in the EMIC. Refer to **DESCRIPTION**.

Hard wired circuitry connects the SRS components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system, and to the SRS components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

RESTRAINT SYSTEM

ACTIVE RESTRAINTS

The primary passenger restraints in this or any other vehicle are the standard equipment factory-installed seat belts and child restraint anchors. Seat belts and child restraint anchors are referred to as an active restraint because the vehicle occupants are required to physically fasten and properly adjust these restraints in order to benefit from them.

PASSIVE RESTRAINTS

The passive restraints are referred to as a Supplemental Restraint System (SRS) because they were designed and are intended to enhance the protection for the occupants of the vehicle **only** when used in conjunction with the seat belts. They are referred to as passive restraints because the vehicle occupants are not required to do anything to make them operate; however, the vehicle occupants must be wearing their seat belts in order to obtain the maximum safety benefit from the factory-installed SRS components.

The SRS electrical circuits are continuously monitored and controlled by a microprocessor and software contained within the Occupant Restraint Controller (ORC). An airbag indicator in the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) illuminates for about seven seconds as a bulb test each time the ignition switch is turned to the ON or START positions. Following the bulb test, the airbag indicator is turned ON or OFF by the ORC to indicate the status of the SRS. If the airbag indicator comes ON at any time other than during the bulb test, it indicates that there is a problem in the SRS electrical circuits. Such a problem may cause airbags not to deploy when required, or to deploy when not required.

Deployment of the SRS components depends upon the angle and severity of an impact. Deployment is not based upon vehicle speed; rather, deployment is based upon the rate of deceleration as measured by the forces of gravity (G force) upon the acceleration-type impact sensors. When an impact is severe enough, the microprocessor in the ORC signals the inflator of the appropriate airbag units to deploy their airbag cushions. The front seat belt retractor tensioners and, if equipped, buckle tensioners are provided with a deployment signal by the ORC in conjunction with the front or side curtain airbags. The side curtain airbags are provided with a deployment signal individually by the ORC based upon a side impact sensor input for the same side of the vehicle.

During a frontal vehicle impact, the knee blockers work in concert with properly fastened and adjusted seat belts to restrain both the driver and the front seat passenger in the proper position for an airbag deployment. The knee blockers also absorb and distribute the crash energy from the driver and the front seat passenger to the structure of the instrument panel. The seat belt tensioners remove the slack from the front seat belts to provide further assurance that the driver and front seat passenger are properly positioned and restrained for an airbag deployment.

Typically, the vehicle occupants recall more about the events preceding and following a collision than they do of an airbag deployment itself. This is because the airbag deployment and deflation occur very rapidly. In a typical 48 kilometer-per-hour (30 mile-per-hour) barrier impact, from the moment of impact until the airbags are fully inflated takes about 40 milliseconds. Within one to two seconds from the moment of impact, the

airbags are almost entirely deflated. The times cited for these events are approximations, which apply only to a barrier impact at the given speed. Actual times will vary somewhat, depending upon the vehicle speed, impact angle, severity of the impact, and the type of collision.

When the ORC monitors a problem in any of the SRS circuits or components, including the seat belt tensioners, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit and sends an electronic message to the EMIC to turn ON the airbag indicator. The hard wired circuits between components related to the SRS may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SRS or the electronic controls or communication between other modules and devices that provide features of the SRS. The most reliable, efficient, and accurate means to diagnose the SRS or the electronic controls and communication related to SRS operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

OCCUPANT CLASSIFICATION SYSTEM

In vehicles equipped with the Occupant Classification System (OCS), the OCS automatically suppresses or enables passenger airbag and seat belt tensioner operation based upon whether or not the passenger side front seat is occupied and, if the seat is occupied, classifies the size of the occupant and whether the seat is occupied by a child seat. The passenger airbag and seat belt tensioners are disabled when the system senses the seat is occupied by a child seat or a person below a minimum weight threshold.

The OCS has an Occupant Classification Module (OCM) that monitors inputs from the seat weight sensors under the passenger side front seat cushion. Based upon those inputs the microprocessor within the OCM classifies the occupant of the passenger side front seat. The OCM then sends electronic **occupant classification** messages to the Occupant Restraint Controller (ORC). The microprocessor and programming of the ORC determines whether to enable or disable the deployment circuits for the passenger airbag and seat belt tensioners; and, if enabled, what force level should be used to deploy each front airbag.

The OCS electrical circuits and components are continuously monitored by the OCM, and the OCM is continuously monitored by the ORC. A passenger airbag on/off indicator is located in the instrument panel switch pod near the base of the instrument panel center bezel. This indicator receives battery current whenever the ignition switch is in the ON or START positions, and illuminates only when the ORC pulls the indicator control circuit to ground. The indicator illuminates for about seven seconds as a bulb test each time the ignition switch is turned to the ON or START positions. Following the bulb test, the indicator is turned ON or OFF by the ORC based upon the electronic **occupant classification** messages received from the OCM. This indicator is illuminated whenever the seat is occupied and passenger airbag and seat belt tensioner operation has been suppressed. The indicator is turned OFF whenever the seat is empty or when the seat is occupied and the passenger airbag and seat belt tensioners are enabled.

When the OCM monitors a problem in any of the OCS circuits or components, it stores a fault code or DTC in its memory circuit and sends an electronic message to the ORC. The ORC then sends an electronic message to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) to turn ON the airbag indicator. If for any reason the OCM is unable to classify the occupant it sends an electronic

message to the ORC, and the ORC suppresses passenger airbag and seat belt tensioner operation. The hard wired circuits between components related to the OCS may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the OCS or the electronic controls or communication between other modules and devices that provide features of the OCS. The most reliable, efficient, and accurate means to diagnose the OCS or the electronic controls or communication related to OCS operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

WARNING

RESTRAINT SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS. Such repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Any wire harness containing broken, cut, burned or otherwise damaged electrically conductive SRS wiring, terminals or connector components must be removed and replaced with an entire new wire harness. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar® Parts Catalog.

WARNING: To avoid serious or fatal injury on vehicles equipped with side curtain airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service.

The ORC contains a rollover sensor, which enables the system to deploy the side curtain airbags in the event of a vehicle rollover event. If an ORC is accidentally rolled during service while still connected to battery power, the side curtain airbags will deploy. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, before performing any welding operations disconnect and isolate the battery negative (ground) cable and disconnect all wire harness connectors from the Occupant Restraint Controller (ORC). Failure to take the proper precautions could result in accidental airbag deployment and other possible damage to the Supplemental Restraint System (SRS) circuits and components.

WARNING: To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate, or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi).

WARNING: To avoid serious or fatal injury when handling a seat belt tensioner retractor, proper care should be exercised to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover.

WARNING: To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the DaimlerChrysler Mopar® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.

WARNING: To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Any time a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the DaimlerChrysler Mopar® Parts Catalog.

WARNING: To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down.

DIAGNOSIS AND TESTING

RESTRAINT SYSTEM

The hard wired circuits between modules and components related to the Supplemental Restraint System (SRS) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SRS or the electronic controls or communication between other modules and devices that provide features of the SRS. The most reliable, efficient, and accurate means to diagnose the SRS or the electronic controls and communication related to SRS operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

In addition to a diagnostic scan tool that contains the latest version of the proper diagnostic software, certain diagnostic procedures for the SRS may require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters or the Occupant Classification System (OCS) Seat Weight special tool. Refer to the appropriate diagnostic information.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

STANDARD PROCEDURE

HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS

At no time should any source of electricity be permitted near the inflator on the back of a non-deployed airbag or seat belt tensioner. When carrying a non-deployed airbag, the trim cover or airbag cushion side of the unit should be pointed away from the body to minimize injury in the event of an accidental deployment. If the airbag unit is placed on a bench or any other surface, the trim cover or airbag cushion side of the unit should be face up to minimize movement in the event of an accidental deployment.

When handling a non-deployed seat belt retractor tensioner, take proper care to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover. When handling a non-deployed seat belt buckle tensioner, take proper care to keep fingers away from the scabbard between the buckle and the tensioner unit. In addition, the Supplemental Restraint System (SRS) should be disarmed whenever any steering wheel, steering column, seat belt tensioner, airbag, impact sensor Occupant Classification System (OCS), or instrument panel components require diagnosis or service. Failure to observe this warning could result in accidental airbag deployment and possible personal injury.

All damaged, ineffective or non-deployed airbags and seat belt tensioners which are replaced on vehicles are to be handled and disposed of properly. If an airbag or seat belt tensioner unit is ineffective or damaged and non-deployed, refer to the Hazardous Substance Control System for information regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

SUPPLEMENTAL RESTRAINT STORAGE

Airbags and seat belt tensioners must be stored in their original, special container until they are used for service. Also, they must be stored in a clean, dry environment; away from sources of extreme heat, sparks, and high electrical energy. Always place or store any airbag on a surface with its trim cover or airbag cushion side facing up, to minimize movement in case of an accidental deployment.

SERVICE AFTER A SUPPLEMENTAL RESTRAINT DEPLOYMENT

Any vehicle which is to be returned to use following a Supplemental Restraint System (SRS) component deployment, must have the deployed restraints replaced. In addition, if the driver airbag has been deployed, the clockspring and the steering column must be replaced. If the passenger airbag is deployed, the passenger airbag door and both passenger airbag squib connectors must be replaced. The seat belt tensioners are deployed by the same signal that deploys either the driver and passenger front airbags or the side curtain airbags and must also be replaced if any front or side airbag has been deployed.

If a side curtain airbag has been deployed, the complete airbag unit, the headliner, as well as the upper A, B, C and D-pillar trim must be replaced. These components are not intended for reuse and will be damaged or weakened as a result of a SRS component deployment, which may or may not be obvious during a visual inspection. On vehicles with an optional sunroof, the sunroof drain tubes and hoses must be closely inspected following a side curtain airbag deployment.

It is also critical that the mounting surfaces and mounting brackets for the Occupant Restraint Controller (ORC), side impact sensors and front impact sensors be closely inspected and restored to their original conditions following any vehicle impact damage. Because the ORC and each impact sensor are used by the SRS to monitor or confirm the direction and severity of a vehicle impact, improper orientation or insecure fastening of these components may cause airbags not to deploy when required, or to deploy when not required.

Never attempt to repair the electrically conductive circuits or wiring components related to the SRS. Such repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Any wire harness containing broken, cut, burned or otherwise damaged electrically conductive SRS wiring, terminals or connector components must be removed and replaced with an entire new wire harness. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.

All other vehicle components should be closely inspected following any SRS component deployment, but are to be replaced only as required by the extent of the visible damage incurred.

AIRBAG SQUIB STATUS

Multistage airbags with multiple initiators (squibs) must be checked to determine that all squibs were used during the deployment event. The driver and passenger airbags in this vehicle are deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the driver or passenger squib 1 and squib 2 circuits to the two initiators in the airbag inflators. Typically, both initiators are used and all potentially hazardous chemicals are burned during an airbag deployment event. However, it is possible for only one initiator to be used; therefore, it is always necessary to confirm that both initiators have been used in order to avoid the improper handling or disposal of potentially live pyrotechnic or hazardous materials. The following procedure should be performed using a diagnostic scan tool to verify the status of both airbag squibs before either deployed airbag is removed from the vehicle for disposal.

CAUTION: Deployed front airbags having two initiators (squibs) in the airbag inflator may or may not have live pyrotechnic material within the inflator. Do not dispose of these airbags unless you are certain of complete deployment. Refer to the Hazardous Substance Control System for information regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

- 1. Be certain that the diagnostic scan tool contains the latest version of the proper diagnostic software. Connect the scan tool to the 16-way Data Link Connector (DLC). The DLC is located on the driver side lower edge of the instrument panel, inboard of the steering column.
- 2. Turn the ignition switch to the ON position.
- 3. Using the scan tool, read and record the active (current) Diagnostic Trouble Code (DTC) data.

Using the active DTC information, refer to the **AIRBAG SQUIB STATUS** table to determine the status of both driver and passenger airbag squibs.

AIRBAG SQUIB STATUS		
IF THE ACTIVE DTC IS:	CONDITIONS	SQUIB STATUS
Driver or Passenger Squib 1 open	AND the stored DTC minutes for both Driver or Passenger squibs are within 15	Both Squib 1 and 2 were used.

Driver or Passenger Squib 2 open	minutes of each other	
Driver or Passenger Squib 1 open	AND the stored DTC minutes for Driver or Passenger Squib 2 open is GREATER than the stored DTC minutes for Driver or Passenger Squib 1 by 15 minutes or more	Squib 1 was used; Squib 2 is live.
Driver or Passenger Squib 2 open		
Driver or Passenger Squib 1 open	AND the stored DTC minutes for Driver or Passenger Squib 1 open is GREATER than the stored DTC minutes for Driver or Passenger Squib 2 by 15 minutes or more	Squib 1 is live; Squib 2 was used.
Driver or Passenger Squib 2 open		
Driver or Passenger Squib 1 open	AND Driver or Passenger Squib 2 open is NOT an active code	Squib 1 was used; Squib 2 is live.
Driver or Passenger Squib 2 open	AND Driver or Passenger Squib 1 open is NOT an active code	Squib 1 is live; Squib 2 was used.

NOTE: If none of the Driver or Passenger Squib 1 or 2 open are active codes, the status of the airbag squibs is unknown. In this case the airbag should be handled and disposed of as if the squibs were both live.

CLEANUP PROCEDURE

918M-4

Fig. 4: Wear Safety Glasses & Rubber Gloves - Typical
Courtesy of CHRYSLER LLC

Following a Supplemental Restraint System (SRS) component deployment, the vehicle interior will contain a powdery residue. This residue consists primarily of harmless particulate by-products of the small pyrotechnic charge that initiates the propellant used to deploy a SRS component. However, this residue may also contain traces of sodium hydroxide powder, a chemical by-product of the propellant material that is used to generate the inert gas that inflates the airbag. Since sodium hydroxide powder can irritate the skin, eyes, nose, or throat, be certain to wear safety glasses, rubber gloves, and a long-sleeved shirt during cleanup.

WARNING: To avoid serious or fatal injury, if you experience skin irritation during cleanup, run cool water over the affected area. Also, if you experience irritation of the nose or throat, exit the vehicle for fresh air until the irritation ceases. If irritation continues, see a physician.

Fig. 5: Vacuum Heater & A/C Outlets - Typical
Courtesy of CHRYSLER LLC

1. Begin the cleanup by using a vacuum cleaner to remove any residual powder from the vehicle interior. Clean from outside the vehicle and work your way inside, so that you avoid kneeling or sitting on a non-cleaned area.
2. Be certain to vacuum the heater and air conditioning outlets as well. Run the heater and air conditioner blower on the lowest speed setting and vacuum any powder expelled from the outlets.

CAUTION: Deployed front airbags having two initiators (squibs) in the airbag

inflator may or may not have live pyrotechnic material within the inflator. Do not dispose of these airbags unless you are certain of complete deployment. Refer to AIRBAG SQUIB STATUS. All damaged, ineffective, or non-deployed Supplemental Restraint System (SRS) components which are replaced on vehicles are to be handled and disposed of properly. If an airbag or seat belt tensioner unit is ineffective or damaged and non-deployed, refer to the Hazardous Substance Control System for information regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

3. Next, remove the deployed SRS components from the vehicle. Refer to the appropriate service removal procedures.
4. You may need to vacuum the interior of the vehicle a second time to recover all of the powder.

VERIFICATION TEST - SUPPLEMENTAL RESTRAINT SYSTEM

NOTE: The following procedure should be performed using a diagnostic scan tool to verify proper Supplemental Restraint System (SRS) operation following the service or replacement of any SRS component. In addition, if the vehicle is equipped with the Occupant Classification System (OCS) and one of the passenger front seat SRS components has been replaced, following successful completion of the SRS Verification Test procedure, perform the OCS Verification Test using a diagnostic scan tool. Refer to the appropriate diagnostic procedures.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 6: Identifying Data Link Connector (DLC) & Steering Column Opening Cover
 Courtesy of CHRYSLER LLC

1. During the following test, the battery negative cable remains disconnected and isolated, as it was during the Supplemental Restraint System (SRS) component removal and installation procedures.
2. Be certain that the diagnostic scan tool contains the latest version of the proper diagnostic software. Connect the scan tool to the 16-way Data Link Connector (DLC) (2). The DLC is located on the driver side lower edge of the instrument panel (1), inboard of the steering column.
3. Turn the ignition switch to the ON position and exit the vehicle with the scan tool.
4. Check to be certain that nobody is in the vehicle, then reconnect the battery negative cable.
5. Using the scan tool, read and record the active (current) Diagnostic Trouble Code (DTC) data.
6. Next, use the scan tool to read and record any stored (historical) DTC data.
7. If any DTC is step 5.
8. Use the scan tool to erase the stored DTC data. If any problems remain, the stored DTC data will not erase. Refer to the appropriate diagnostic information to diagnose any stored DTC that will not erase. If the stored DTC information is successfully erased, go to step 9.
9. Turn the ignition switch to the OFF position for about 15 seconds, and then back to the ON position. Observe the airbag indicator in the instrument cluster. It should light for six to eight seconds, and then go out. This indicates that the SRS is functioning normally and that the repairs are complete. If the airbag indicator fails to light, or lights and stays ON, there is still an active SRS fault or malfunction. Refer to the appropriate diagnostic information to diagnose the problem.

CHILD RESTRAINT ANCHOR

DESCRIPTION

CHILD RESTRAINT ANCHOR

Fig. 17: Lower Anchors and Tether
Courtesy of CHRYSLER LLC

This vehicle is equipped with a Lower Anchors and Tether for Children, or LATCH child restraint anchorage system. The second row seats in these vehicles are equipped with a fixed-position child restraint upper tether anchor (2) for both the center and the two outboard seating positions, and child restraint lower anchors (1) for the two outboard seating positions.

Fig. 18: Identifying Upper Tether Anchors & Molded Plastic Trim Bezel
Courtesy of CHRYSLER LLC

The upper tether anchors (1) are each integral to the second row seat back panels. These anchors are each constructed from short lengths of heavy-gauge steel wire that is securely welded into stamped steel cups that are integral to the seat back panels. There is a separate molded plastic trim bezel (2) located around each of these anchors. The child restraint upper tether anchors cannot be adjusted or repaired and, if ineffective or damaged, they must be replaced as a unit with their respective second row seat back panels.

81911332

Fig. 19: Identifying Second Row Seat Back, Lower Anchors & Seat Cushion
 Courtesy of CHRYSLER LLC

The lower anchors (2) for this vehicle are integral to their respective second row seat brackets, which are secured to the rear floor panel at the front with studs and nuts, and at the rear with screws. These anchors are each constructed from a heavy-gauge steel wire loop that is securely welded to the seat bracket. The anchor loops are located where the second row seat back (1) meets the seat cushion (3). The child restraint lower tether anchors cannot be adjusted or repaired and, if ineffective or damaged, they must be replaced as a unit with their respective second row seat brackets.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar® Parts Catalog.

OPERATION

CHILD RESTRAINT ANCHOR

All vehicles manufactured for sale in the United States and Canada are required to be equipped with a Lower Anchors and Tether for Children, or LATCH child restraint anchorage system. The second row seats in this vehicle have two pairs of anchor provisions for installing a LATCH-compatible child seat. A single seat may be mounted in the center seating position, or one in each outboard seating position.

With LATCH, child seats are secured by direct attachment to the vehicle seat structure, rather than by the seat belts. With LATCH-compatible child seats, lower anchors attach to the seat structure through heavy-gauge wire loops located at the intersection between the seat cushion and the seat back surfaces.

Three upper tether anchors are integral to the second row seat back frames to secure the top tether strap of child seats equipped with this feature. These upper tether anchors work with both LATCH-compatible and other child seats equipped with a top tether strap.

The owner's information packet in the vehicle glove box contains details and suggestions on the proper use of all of the factory-installed child restraint anchors.

CLOCKSPRING

DESCRIPTION

CLOCKSPRING

817a5ce2

Fig. 20: Steering Control Module
Courtesy of CHRYSLER LLC

The clockspring (3) for this vehicle is secured near the top of the steering column below the steering wheel. The clockspring also includes an integral, internal turn signal cancel cam and a Steering Angle Sensor (SAS) that are both serviced as a unit with the clockspring. The clockspring also supports the left (lighting) multi-function switch (1), the Steering Control Module (SCM) internal to the left multi-function switch housing (2), and the right (wiper) multi-function switch (6). Each of these switches and the jumper wire harness (5) between the two multi-function switches can be separated from and are serviced individually from the clockspring.

The clockspring case includes integral tabs for mounting the unit with three screws to the steering column lock housing as well as integral provisions for mounting and supporting both multi-function switches. The multi-function switches are each secured to the clockspring with a single screw (7). The SAS within the clockspring

includes an electronic circuit board and a microprocessor, which allows it to communicate with other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. The SAS circuitry, the clockspring, and the turn signal cancel cam are all contained within a flat, molded plastic case.

The clockspring case includes three connector receptacles that face toward the instrument panel. Within the plastic case is a spool-like molded plastic rotor with a large exposed hub. The upper surface of the rotor hub has a large center hole, two short pigtail wires with connectors, and a connector receptacle that faces toward the steering wheel. The lower surface of the rotor has an integral dowel or drive pin that also faces toward the steering wheel. Wound around the rotor spool within the case is a long ribbon-like tape that consists of several thin copper wire leads sandwiched between two thin plastic membranes. The outer end of the tape terminates at two of the connector receptacles that face the instrument panel, while the inner end of the tape terminates at the pigtail wires and connector receptacle on the hub of the clockspring rotor that face the steering wheel. The outer surface of the rotor hub rim within the clockspring case also has the integral lobes of the turn signal cancel cam.

The service replacement clockspring is shipped pre-centered and with a molded plastic locking pin (4) installed. The locking pin secures the centered clockspring rotor to the clockspring case during shipment and handling, but must be removed after the clockspring is installed on the steering column and the steering wheel is installed. See **STANDARD PROCEDURE**.

The clockspring cannot be repaired. If the clockspring is ineffective, damaged, or if the driver airbag has been deployed, the clockspring/turn signal cancel cam/SAS unit must be replaced.

OPERATION

CLOCKSPRING

The clockspring is a mechanical electrical circuit component that is used to provide continuous electrical continuity between the fixed instrument panel wire harness and certain electrical components mounted on or in the rotating steering wheel. On this vehicle the rotating electrical components include the driver airbag, the horn switch, the speed control switch, the remote radio switches and the Electronic Vehicle Information Center (EVIC) control switches, if the vehicle is so equipped. The clockspring is positioned and secured near the top of the steering column. The fixed connector receptacles on the back of the fixed clockspring case connect the clockspring to the vehicle electrical system through three take outs with connectors from the instrument panel wire harness.

The turn signal cancel cam is integral to the rim of the clockspring rotor hub within the clockspring case so it also moves with the rotation of the steering wheel. Two short, black-sleeved pigtail wires on the upper surface of the clockspring rotor connect the clockspring to the driver airbag, while a steering wheel wire harness connected to the connector receptacle on the upper surface of the clockspring rotor complete circuits to the horn switch, the speed control switch and, if the vehicle is so equipped, to the optional remote radio switches and EVIC control switches on the steering wheel. The third connector receptacle is dedicated to the inputs and outputs of the Steering Angle Sensor (SAS) internal to the clockspring case.

Like the clockspring in a timepiece, the clockspring tape has travel limits and can be damaged by being wound too tightly during full stop-to-stop steering wheel rotation. To prevent this from occurring, the clockspring is centered when it is installed on the steering column. Centering the clockspring indexes the clockspring tape to the movable steering components so that the tape can operate within its designed travel limits. However, if the steering wheel is removed from the steering column, if the clockspring is removed from the steering column, or

if the steering shaft is disconnected from the steering gear, the clockspring spool can change position relative to the other steering components. The clockspring must be re-centered following completion of this service or the tape may be damaged.

Service replacement clocksprings are shipped pre-centered and with a plastic locking pin installed. This locking pin should not be removed until the steering wheel has been installed on the steering column. If the locking pin is removed before the steering wheel is installed on a steering column, the clockspring centering procedure must be performed. See **STANDARD PROCEDURE**. Proper clockspring installation may be confirmed by viewing the SAS data using a diagnostic scan tool.

The hard wired clockspring circuits as well as the hard wired inputs and outputs of the SAS may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SAS or the electronic controls or communication between other modules and devices that provide features of the Electronic Stability Program (ESP) or Supplemental Restraint System (SRS). The most reliable, efficient, and accurate means to diagnose the SAS or the electronic controls and communication related to ESP or SRS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

STANDARD PROCEDURE

CLOCKSPRING CENTERING

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: A service replacement clockspring is shipped with the clockspring pre-centered and with a molded plastic locking pin installed. This locking pin should not be removed until the steering wheel has been installed on the steering column. If the locking pin is removed before the steering wheel is installed, the clockspring centering procedure must be performed.

NOTE: When a clockspring is installed into a vehicle without properly centering and locking the entire steering system, the Steering Angle Sensor (SAS) data does not agree with the true position of the steering system and causes the Electronic Stability Program (ESP) system to shut down. This may also damage the clockspring without any immediate malfunction. Unlike some other DaimlerChrysler vehicles, this SAS never requires calibration. However, upon each new ignition ON cycle, the steering wheel must be rotated slightly to initialize the SAS.

NOTE: Determining if the clockspring/SAS is centered is also possible electrically using the diagnostic scan tool. Steering wheel position is displayed as ANGLE with a range of up to 900 degrees. Refer to the appropriate menu item on the diagnostic scan tool.

NOTE: Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight-ahead position and that the entire steering system is locked or inhibited from rotation.

NOTE: The clockspring may be centered and the rotor may be rotated freely once the steering wheel has been removed.

Fig. 21: Identifying Clockspring Components
Courtesy of CHRYSLER LLC

1. Place the front wheels in the straight-ahead position and inhibit the steering column shaft from rotation.
2. Remove the steering wheel from the steering shaft. Refer to **REMOVAL**.
3. Rotate the clockspring rotor (1) clockwise to the end of its travel. **Do not apply excessive torque.**
4. From the end of the clockwise travel, rotate the rotor about two and one-half turns counterclockwise. Turn the rotor slightly clockwise or counterclockwise as necessary so that the clockspring airbag pigtail wires (3) and connector receptacle are at the top and the dowel or drive pin (5) is at the bottom.
5. The clockspring is now centered. Secure the clockspring rotor to the clockspring case using a locking pin (2) or some similar device to maintain clockspring centering until the steering wheel is reinstalled on the steering column.

REMOVAL

CLOCKSPRING

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering

wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: A service replacement clockspring is shipped with the clockspring pre-centered and with a molded plastic locking pin installed. This locking pin should not be removed until the steering wheel has been installed on the steering column. If the locking pin is removed before the steering wheel is installed, the clockspring centering procedure must be performed.

NOTE: When a clockspring is installed into a vehicle without properly centering and locking the entire steering system, the Steering Angle Sensor (SAS) data does not agree with the true position of the steering system and causes the Electronic Stability Program (ESP) system to shut down. This may also damage the clockspring without any immediate malfunction. Unlike some other DaimlerChrysler vehicles, this SAS never requires calibration. See STANDARD PROCEDURE.

NOTE: Determining if the clockspring/SAS is centered is also possible electrically using the diagnostic scan tool. Steering wheel position is displayed as ANGLE with a range of up to 900 degrees. Refer to the appropriate menu item on the diagnostic scan tool.

NOTE: Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight-ahead position and that the entire steering system is locked or inhibited from rotation.

Fig. 22: Replacing Clockspring
Courtesy of CHRYSLER LLC

1. Place the front wheels in the straight ahead position and inhibit the steering column shaft from rotation.
2. Disconnect and isolate the battery negative cable.
3. Remove the steering wheel from the steering shaft. Refer to **REMOVAL** .
4. If the removed clockspring is to be reused, be certain to secure the clockspring rotor to the clockspring case to maintain clockspring centering until the steering wheel is reinstalled on the steering column. If clockspring centering is not maintained, the clockspring must be centered again before the steering wheel is reinstalled. See **STANDARD PROCEDURE**.
5. Move the steering column to the fully lowered position and leave the tilt release lever in the released (down) position.
6. Remove the upper and lower shrouds from the steering column. Refer to **REMOVAL** .
7. Remove the right multi-function switch (3) from the clockspring (4). Refer to **REMOVAL** .
8. Remove the left multi-function switch (5) from the clockspring. Refer to **REMOVAL** .
9. Remove the three screws (1) that secure the clockspring to the steering column lock housing (2).

Fig. 23: Instrument Panel Wire Harness Connectors
Courtesy of CHRYSLER LLC

10. Pull the clockspring (1) away from the steering column lock housing far enough to access and disconnect the three instrument panel wire harness connectors (2) from the receptacles on the back of the clockspring case.
11. Remove the clockspring from the steering column.

INSTALLATION

CLOCKSPRING

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering

wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: A service replacement clockspring is shipped with the clockspring pre-centered and with a molded plastic locking pin installed. This locking pin should not be removed until the steering wheel has been installed on the steering column. If the locking pin is removed before the steering wheel is installed, the clockspring centering procedure must be performed.

NOTE: When a clockspring is installed into a vehicle without properly centering and locking the entire steering system, the Steering Angle Sensor (SAS) data does not agree with the true position of the steering system and causes the Electronic Stability Program (ESP) system to shut down. This may also damage the clockspring without any immediate malfunction. Unlike some other DaimlerChrysler vehicles, this SAS never requires calibration. See STANDARD PROCEDURE.

NOTE: Determining if the clockspring/SAS is centered is also possible electrically using the diagnostic scan tool. Steering wheel position is displayed as ANGLE with a range of up to 900 degrees. Refer to the appropriate menu item on the diagnostic scan tool.

NOTE: Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight-ahead position and that the entire steering system is locked or inhibited from rotation.

Fig. 24: Instrument Panel Wire Harness Connectors
Courtesy of CHRYSLER LLC

1. If a new clockspring (1) is being installed, transfer the multifunction switch jumper harness from the old clockspring or position a new jumper harness onto the new clockspring.
2. Carefully slide the clockspring down over the steering column upper shaft far enough to reconnect the three instrument panel wire harness connectors (2) to the receptacles on the back of the clockspring case.

Fig. 25: Replacing Clockspring
Courtesy of CHRYSLER LLC

3. Position the clockspring (4) onto the steering column lock housing (2).
4. Install and tighten the three screws (1) that secure the clockspring to the lock housing in the following sequence: lower right, upper left, upper right. Tighten the screws to 3 N.m (27 in. lbs.).

NOTE: Use of an improper sequence when tightening the clockspring mounting screws may result in an audible ticking noise as the steering wheel is rotated.

5. Reinstall the left multi-function switch (5) onto the clockspring. Refer to **INSTALLATION**.
6. Reinstall the right multi-function switch (3) onto the clockspring. Refer to **INSTALLATION**.
7. Reinstall the upper and lower shrouds onto the steering column. Refer to **INSTALLATION**.
8. Move the steering column back to the fully raised position and move the tilt release lever back to the locked (up) position.
9. Reinstall the steering wheel onto the steering column. Refer to **INSTALLATION**.
10. Remove the plastic locking pin that secures the clockspring rotor to the clockspring case to maintain clockspring centering.
11. Reconnect the battery negative cable.

CURTAIN AIRBAG

DESCRIPTION

SIDE CURTAIN AIRBAG

8098029e

Fig. 26: SRS Emblem
Courtesy of CHRYSLER LLC

Side curtain airbags are standard equipment for this vehicle when it is also equipped with dual front airbags. These airbags are passive, inflatable, Supplemental Restraint System (SRS) components, and vehicles with this equipment can be readily identified by a molded identification trim plug with the **SRS - AIRBAG** logo located near the tops of the B and C-pillar trim. This system is designed to reduce injuries to the vehicle occupants in the event of a side impact collision or a vehicle rollover incident.

Fig. 27: Curtain Airbag Units
Courtesy of CHRYSLER LLC

Each vehicle has two individually controlled curtain airbag units (2). These airbag units are concealed and mounted above the headliner where they are each secured to one of the roof side rails by two plastic push-in fasteners and to studs on the inner roof side rail by nuts. Each folded airbag cushion is contained within a fabric wrap and has molded plastic ramps at the B and C-pillars as well as an extruded grab handle deflector shield above the rear door opening. The airbag units extend along the roof rail from the A-pillar at the front of the vehicle to just behind the C-pillar at the rear of the vehicle.

A long tether (1) extends down the A-pillar from the front of the airbag cushion. The tether is secured to mounting holes in the inner A-pillar sheet metal with a plastic push-in routing clip and is secured to the base of the A-pillar near the belt line with a metal key engaged into a slot in the A-pillar. A plastic push-in fastener fills the A-pillar slot after the metal key is installed to prevent the key from becoming disengaged.

The hybrid-type inflator (3) for each airbag is secured to the roof rail at the rear of the airbag unit between the C-pillar and the D-pillar, and is connected to the airbag cushion by a tubular manifold. The bracket holding the inflator is secured by nuts to two studs on the inner roof side rail.

One end of a two-wire pigtail harness connects to the initiator at the forward end of the curtain airbag inflator. The other end is routed down the D-pillar with plastic push-in routing clips and connects to the body wire harness near the belt line, which connects the airbag unit to the Occupant Restraint Controller (ORC).

The side curtain airbag unit cannot be adjusted or repaired and must be replaced if deployed, ineffective, or in any way damaged. Once a side curtain airbag has been deployed, the complete airbag unit, the headliner, the upper A, B, C and D-pillar trim, and all other visibly damaged components must be replaced.

OPERATION

SIDE CURTAIN AIRBAG

Each side curtain airbag is deployed individually by an electrical signal generated by the Occupant Restraint Controller (ORC) to which it is connected through left or right curtain airbag line 1 and line 2 (or squib) circuits. The hybrid-type inflator assembly for each airbag contains a small canister of highly compressed inert gas. When the ORC sends the proper electrical signal to the airbag inflator, the electrical energy creates enough heat to ignite chemical pellets within the inflator.

Once ignited, these chemicals burn rapidly and produce the pressure necessary to rupture a containment disk in the inert gas canister. The inflator and inert gas canister are sealed and connected to a tubular manifold so that all of the released gas is directed into the folded curtain airbag cushion, causing the cushion to inflate. As the airbag cushion inflates it will drop down from the roof rail between the edge of the headliner and the side glass/body pillars to form a curtain-like cushion to protect the vehicle occupants during a side impact collision or a vehicle rollover incident.

The front tether keeps the front portion of the bag taut to the side of the vehicle, thus ensuring that the bag will deploy in the proper position. Following the airbag deployment, the airbag cushion slowly deflates by venting the inert gas through the loose weave of the cushion fabric, and the deflated cushion hangs down loosely from the roof rail.

Proper diagnosis of the side curtain airbag inflator and squib circuits requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

SIDE CURTAIN AIRBAG

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the side curtain airbag, or becoming entrapped between the side curtain airbag cushion and the headliner. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged side curtain airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for handling non-deployed supplemental restraints. If the side curtain airbag has been deployed, review the recommended procedures for service after a supplemental restraint deployment before removing the airbag from the vehicle. See STANDARD PROCEDURE.

81d651a9

Fig. 28: Inner Roof Side Rail

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the headliner from the vehicle. Refer to **REMOVAL**.
3. Disconnect the pigtail wire harness from the body wire harness connector (1) for the side curtain airbag (3) located on the inner D-pillar near the belt line.
4. Remove the seven nuts (4) that secure the side curtain airbag and the inflator bracket to the studs on the inner roof side rail (2).
5. Remove the push-in fastener that secures the side curtain airbag tether metal key in the slot near the base of the inner A-pillar.
6. Disengage the tether metal key from the A-pillar slot.
7. Disengage the plastic push-in routing clip that secures the tether to the inner A-pillar.
8. Disengage the plastic push-in routing clips that secure the pigtail wire harness to the inner D-pillar.
9. Disengage the two plastic push-in fasteners that secure the airbag unit to the inner roof side rail.
10. Remove the side curtain airbag from the vehicle as a unit.

INSTALLATION

SIDE CURTAIN AIRBAG

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS),

seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the side curtain airbag, or becoming entrapped between the side curtain airbag cushion and the headliner. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged side curtain airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for handling non-deployed supplemental restraints. If the side curtain airbag has been deployed, review the recommended procedures for service after a supplemental restraint deployment before removing the airbag from the vehicle. See STANDARD PROCEDURE.

81d651a9

Fig. 29: Inner Roof Side Rail

Courtesy of CHRYSLER LLC

1. Position the side curtain airbag (3) into the vehicle as a unit.
2. Engage the airbag inflator bracket over the studs at the rear of the inner roof side rail (2) and loosely install the nuts (4).
3. Engage the front plastic push-in fastener that secures the airbag unit to the inner roof side rail.
4. Engage the plastic push-in routing clip that secures the tether to the inner A-pillar.
5. Engage the side curtain airbag tether metal key into the slot near the base of the inner A-pillar.
6. Install a plastic push-in fastener to secure the tether metal key within the inner A-pillar slot.
7. Position the side curtain airbag mounting tabs and the inflator bracket onto the studs on the inner roof side rail.
8. Working from the rear of the vehicle to the front, install and tighten the remaining nuts that secure the side curtain airbag to the studs on the inner roof rail. Tighten all of the nuts including those that secure the inflator bracket to 8 N.m (71 in. lbs.).
9. Reconnect the pigtail wire harness (9) to the body wire harness connector (1) for the side curtain airbag located on the inner D-pillar near the belt line.
10. Engage the plastic push-in routing clips that secure the jumper wire harness to the inner D-pillar.
11. Reinstall the headliner into the vehicle. Refer to **INSTALLATION**.
12. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) verification test procedure should be performed following service of any SRS component. See **STANDARD PROCEDURE**.

DRIVER AIRBAG

DESCRIPTION

DRIVER AIRBAG

Fig. 30: Airbag Protective Trim Cover

Courtesy of CHRYSLER LLC

The injection molded, thermoplastic driver airbag protective trim cover (2) is the most visible part of the driver airbag. The driver airbag is located in the center of the steering wheel (1), where it is secured to the armature within the hub cavity of the four-spoke steering wheel. An injection molded emblem with the Jeep logo is applied to the center of the trim cover.

Fig. 31: Identifying Trim Cover, Inflator, Housing, Snap Retainers & Receptacles
Courtesy of CHRYSLER LLC

Concealed beneath the driver air bag trim cover are the folded airbag cushion, the airbag housing, the airbag inflator and the retainers that secure the inflator to the housing. The airbag cushion, housing (3), and inflator (2) are secured within an integral receptacle molded into the back of the trim cover (1). The vertical walls of this receptacle have numerous integral latch features that are inserted through numerous openings around the perimeter of the airbag housing. After the trim cover latches are fully seated in the housing a blocking tab integral to the housing is bent down to block the latch feature of the trim cover, locking the trim cover securely into place on the airbag housing. Three wire loop snap retainers (5) extend from the housing to secure the airbag to the steering wheel armature. The snap retainer at the 6 o'clock position has a distinctive V-shape to ensure proper orientation of the airbag when it is installed onto the steering wheel.

The airbag used in this vehicle is a multistage-type that complies with revised federal airbag standards to deploy with less force than those used in some prior vehicles. A radial deploying 67.3 centimeter (26.5 inch) diameter fabric airbag cushion with internal tethers is used. The airbag inflator is a dual-initiator, non-azide, pyrotechnic-type unit and is secured to the stamped metal airbag housing using four flanged hex nuts. Two keyed and color-coded connector receptacles (4) on the driver airbag inflator connect the two inflator initiators to the vehicle electrical system through two yellow-jacketed, two-wire pigtail harnesses of the clockspring.

The driver airbag cannot be repaired, and must be replaced if deployed, ineffective, or in any way damaged.

OPERATION

DRIVER AIRBAG

The multistage driver airbag is deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the driver airbag squib 1 and squib 2 circuits to the two initiators in the airbag inflator. By using two initiators, the airbag can be deployed at multiple levels of force. The force level is controlled by the ORC to

suit the monitored impact conditions by providing one of several delay intervals between the electrical signals provided to the two initiators. The longer the delay between these signals, the less forcefully the airbag will deploy.

When the ORC sends the proper electrical signals to each initiator, the electrical energy generates enough heat to initiate a small pyrotechnic charge which, in turn ignites chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce a large quantity of inert gas. The inflator is sealed to the back of the airbag housing and a diffuser in the inflator directs all of the inert gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the driver airbag trim cover will split at predetermined breakout lines, then fold back out of the way. Following an airbag deployment, the airbag cushion quickly deflates by venting the inert gas towards the instrument panel through vent holes within the fabric used to construct the back (steering wheel side) panel of the airbag cushion.

Some of the chemicals used to create the inert gas may be considered hazardous while in their solid state before they are burned, but they are securely sealed within the airbag inflator. Typically, both initiators are used and all potentially hazardous chemicals are burned during an airbag deployment event. However, it is possible for only one initiator to be used during a deployment due to an airbag system fault; therefore, it is necessary to always confirm that both initiators have been used in order to avoid the improper disposal of potentially live pyrotechnic or hazardous materials. See **STANDARD PROCEDURE**.

The inert gas that is produced when the chemicals are burned is harmless. However, a small amount of residue from the burned chemicals may cause some temporary discomfort if it contacts the skin, eyes, or breathing passages. If skin or eye irritation is noted, rinse the affected area with plenty of cool, clean water. If breathing passages are irritated, move to another area where there is plenty of clean, fresh air to breath. If the irritation is not alleviated by these actions, contact a physician.

Proper diagnosis of the driver airbag inflator and squib circuits requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

DRIVER AIRBAG

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag cushion and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

NOTE: The following procedure is for replacement of an ineffective or damaged driver airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for handling non-deployed supplemental restraints. If the driver airbag has been deployed, review the recommended procedures for service after a supplemental restraint deployment before removing the airbag from the vehicle. See STANDARD PROCEDURE.

81d67741

Fig. 32: Identifying Airbag Retainer Access Holes & Steering Wheel
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Release the steering column tilt lever and lower the column to its most downward position for easiest driver airbag removal access.

NOTE: It may be helpful to use a small mirror to aid visibility during the initial attempt to remove the driver airbag from the steering wheel.

3. There are three airbag retainer access holes (1) on the instrument panel side of the hub of the steering wheel (2), located at the two o'clock, six o'clock and ten o'clock positions. The steering wheel must be rotated to bring each of these access holes up to the twelve o'clock position of the steering column one at a time for removal access.

8166c163

Fig. 33: Identifying Flat-Bladed Screwdriver, Screwdriver Blade & Steering Wheel Hub Trim Cover

Courtesy of CHRYSLER LLC

4. Insert the tip of a short handled, flat-bladed screwdriver (1) into either of the upper (two o'clock or ten o'clock) access holes of the steering wheel hub trim cover (3) being certain to place the screwdriver blade (2) on the inboard side of the airbag snap retainer wire loop.

81d6555c

Fig. 34: Driver Airbag System

Courtesy of CHRYSLER LLC

5. Twist the screwdriver handle in either direction far enough to disengage the snap retainer wire loop (4) from the hook (2) of the steering wheel armature. At the same time, gently pull the driver airbag (3) away from the steering wheel (5) to prevent the retainer from snapping back into place over the hook once it is disengaged.
6. Repeat step 4, and step 5 at the other upper (two o'clock or ten o'clock) access hole to disengage the other upper snap retainer wire loop.
7. Repeat step 4, and step 5 at the lower (six o'clock) access hole to disengage the lower snap retainer wire

loop. The lower snap retainer wire loop has a distinctive V-shape and must always be installed onto the six o'clock hook of the steering wheel armature.

8. Pull the driver airbag away from the steering wheel far enough to access the electrical connections (1) at the back of the airbag housing.

Fig. 35: Identifying Driver Airbag, Lower Airbag Snap Retainer Wire Loop, Electrical Connections & Airbag Inflator

Courtesy of CHRYSLER LLC

CAUTION: Do not pull on the clockspring pigtail wires or pry on the connector insulator to disengage the connector from the driver airbag inflator connector receptacle. Improper removal of these pigtail wires and their connector insulators can result in damage to the airbag circuits or the connector insulators.

9. The clockspring driver airbag pigtail wire connectors (4) are secured by an integral lock to the airbag inflator (5) connector receptacles, which are located on the back of the driver airbag (1) housing. Firmly grasp and pull the lock straight out from the connector insulator, then pull the insulators straight out from the airbag inflator to disconnect them from the connector receptacles.
10. Remove the driver airbag from the steering wheel.
11. If the driver airbag has been deployed, the clockspring must be replaced. See **REMOVAL**.

INSTALLATION

DRIVER AIRBAG

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before

performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the driver airbag, or becoming entrapped between the driver airbag cushion and the driver airbag trim cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.

WARNING: To avoid serious or fatal injury, the driver airbag trim cover must never be painted. Replacement airbags are serviced with trim covers in the original colors. Paint may change the way in which the material of the trim cover responds to an airbag deployment. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged driver airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for handling non-deployed supplemental restraints. If the driver airbag has been deployed, review the recommended procedures for service after a supplemental restraint deployment before removing the airbag from the vehicle. See STANDARD PROCEDURE.

Fig. 36: Identifying Driver Airbag, Lower Airbag Snap Retainer Wire Loop, Electrical Connections & Airbag Inflator

Courtesy of CHRYSLER LLC

1. Position the driver airbag (1) close enough to the steering wheel to reconnect the electrical connections (4) to the back of the airbag housing.
2. When installing the driver airbag, reconnect the two clockspring driver airbag pigtail wire connectors to the airbag inflator (5) connector receptacles by pressing straight in on the connectors, then push the locks straight into the connectors. Be certain to engage each keyed and color-coded connector to the matching

connector receptacle.

3. Carefully position the driver airbag into the steering wheel hub. Be certain that the clockspring pigtail wires are not pinched between the driver airbag and the horn switch or the steering wheel armature.
4. Engage the lower airbag snap retainer wire loop (3) onto the lower hook of the steering wheel armature. The lower snap retainer wire loop has a distinctive V-shape and must always be installed onto the six o'clock hook of the steering wheel armature.

©199555c

Fig. 37: Driver Airbag System
Courtesy of CHRYSLER LLC

5. Roll the driver airbag (3) upwards and press firmly and evenly over the two upper snap retainer wire loop (4) locations simultaneously until they snap into place over the two upper hooks (2) of the steering wheel armature.
6. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) verification test procedure should be performed following service of any SRS component. See **STANDARD PROCEDURE**.

IMPACT SENSOR

DESCRIPTION

FRONT IMPACT SENSOR

811a4cf1

Fig. 38: Impact Sensor Components
Courtesy of CHRYSLER LLC

Two front impact sensors (1) are used on this vehicle, one each for the left and right sides of the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Each front sensor is secured with a nut to a stud on a bracket on the back of the front end module carrier on either side of the cooling module, below and inboard of the front combination lamp unit within the engine compartment. The sensor housing has an integral connector receptacle (4), an integral anti-rotation pin (3), and an integral mounting hole (2) with a metal sleeve to provide crush protection.

The right and left front impact sensors are identical in construction and calibration. A cavity in the center of the molded black plastic impact sensor housing contains the electronic circuitry of the sensor which includes an electronic communication chip and an electronic impact sensor. A nylon cover is laser-welded over the cavity to seal and protect the internal electronic circuitry and components. The front impact sensors are each connected to the vehicle electrical system through a short jumper wire harness to a dedicated take out and connector of the body wire harness.

The impact sensors cannot be repaired or adjusted and, if damaged or ineffective, they must be replaced.

SIDE IMPACT SENSOR

811a4cf1

Fig. 39: Impact Sensor Components
Courtesy of CHRYSLER LLC

Two side impact sensors (1) are used on this vehicle when it is equipped with the side curtain airbags, two each for the left and right sides of the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Each side sensor is secured with a nut to a stud on the inner right or left B-pillar above the front seat belt retractor, or to a stud on the right or left inner C-pillar just forward of the second row outboard seat belt retractor within the passenger compartment. The sensor housing has an integral connector receptacle (4), an integral anti-rotation pin (3), and an integral mounting hole (2) with a metal sleeve to provide crush protection.

The right and left side impact sensors are identical in construction and calibration. A cavity in the center of the molded black plastic impact sensor housing contains the electronic circuitry of the sensor which includes an electronic communication chip and an electronic impact sensor. A nylon cover is laser-welded over the cavity to seal and protect the internal electronic circuitry and components. The side impact sensors are each connected to the vehicle electrical system through a dedicated take out and connector of the body wire harness.

The impact sensors cannot be repaired or adjusted and, if damaged or ineffective, they must be replaced.

OPERATION

FRONT IMPACT SENSOR

The front impact sensors are electronic accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microprocessor in the Occupant Restraint Controller (ORC).

The ORC microprocessor continuously monitors all of the passive restraint system electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) and controls the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through dedicated left and right sensor plus and minus circuits from the ORC. The impact sensors and the ORC communicate by modulating the voltage in the sensor plus circuit.

The hard wired circuits between the front impact sensors and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the impact sensors or the electronic controls or communication between other modules and devices that provide features of the supplemental restraint system. The most reliable, efficient, and accurate means to diagnose the impact sensors or the electronic controls and communication related to front impact sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

SIDE IMPACT SENSOR

The side impact sensors are electronic accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microprocessor in the Occupant Restraint Controller (ORC).

The ORC microprocessor continuously monitors all of the side passive restraint system electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) and controls the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through the same left or right sensor plus and minus circuits in a series arrangement from the ORC. The impact sensors and the ORC communicate by modulating the voltage in the sensor plus circuit.

The hard wired circuits between the side impact sensors and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the impact sensors or the electronic controls or communication between other modules and devices that provide features of the supplemental restraint system. The most reliable, efficient, and accurate means to diagnose the impact sensors or the electronic controls and communication related to side impact sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

FRONT IMPACT SENSOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the front impact sensor, as it can damage the impact sensor or affect its calibration. The front impact sensor enables the system to deploy the front Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper front SRS component deployment.

NOTE: The front and side impact sensors are interchangeable.

Fig. 40: Front Impact Sensor, Body Wire Harness, Jumper Wire Harness
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Service access for the right front impact sensor is accomplished by removing the air filter housing from the engine compartment. Service access for the left front impact sensor is accomplished by raising and supporting the vehicle, then removing the access plug from the front of the left front wheel house liner.
3. Remove the nut (2) that secures the front impact sensor (3) to the stud on the bracket (6) on the back (engine compartment side) of the front end module carrier (1) below and inboard of the front lamp unit.

4. Disconnect one end of the jumper wire harness (5) from the right or left front impact sensor connector receptacle or from the body wire harness (4).
5. Remove the right or left front impact sensor from the engine compartment.

SIDE IMPACT SENSOR - B-PILLAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

NOTE: The front and side impact sensors are interchangeable.

Fig. 41: Identifying B-Pillar, Nut, Side Impact Sensor & Body Wire Harness Connector
Courtesy of CHRYSLER LLC

1. Adjust the driver or passenger side front seat to its most forward position for easiest access to the B-pillar trim.

2. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the trim from the inside of the lower right or left B-pillar (1). Refer to **REMOVAL** .
4. Remove the nut (2) that secures the side impact sensor (3) to the weld stud on the lower B-pillar.
5. Remove the sensor from the weld stud on the inner B-pillar.
6. Disconnect the body wire harness connector (4) from the sensor connector receptacle.

SIDE IMPACT SENSOR - C-PILLAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

NOTE: The front and side impact sensors are interchangeable.

Fig. 42: Identifying Nut, Side Impact Sensor, Body Wire Harness Connector & C-Pillar
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the lower trim from the inside of the lower right or left C-pillar (4). Refer to **REMOVAL** .
3. Remove the nut (1) that secures the side impact sensor (2) to the weld stud on the lower C-pillar.
4. Remove the sensor from the weld stud on the inner C-pillar.
5. Disconnect the body wire harness connector (3) for the side impact sensor from the sensor connector receptacle.

INSTALLATION

FRONT IMPACT SENSOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the front impact sensor, as it can damage the impact sensor or affect its calibration. The front impact sensor enables the system to deploy the front Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper front SRS component deployment.

NOTE: The front and side impact sensors are interchangeable.

Fig. 43: Front Impact Sensor, Body Wire Harness, Jumper Wire Harness
Courtesy of CHRYSLER LLC

1. Service access for the right front impact sensor is accomplished by removing the air filter housing from the engine compartment. Service access for the left front impact sensor is accomplished by raising and supporting the vehicle, then removing the access plug from the front of the left front wheel house liner.
2. Position the right or left front impact sensor (3) into the engine compartment.
3. Reconnect the jumper wire harness (5) to the right or left front impact sensor connector receptacle or to the body wire harness (4).
4. Position the sensor onto the stud on the bracket (6) on the back (engine compartment side) of the front end module carrier (1) below and inboard of the front lamp unit. Be certain that the anti-rotation pin on the back of the sensor is engaged in the clearance notch of the bracket and that the connector receptacle is pointed straight downward.
5. Install and tighten the nut (2) that secures the sensor to the stud on the bracket. Tighten the nut to 8 N.m (71 in. lbs.).
6. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) verification test procedure should be performed following service of any SRS component. See **STANDARD PROCEDURE.**

SIDE IMPACT SENSOR - B-PILLAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

NOTE: The front and side impact sensors are interchangeable.

Fig. 44: Identifying B-Pillar, Nut, Side Impact Sensor & Body Wire Harness Connector
Courtesy of CHRYSLER LLC

1. Reconnect the body wire harness connector (4) to the side impact sensor (3) connector receptacle.
2. Position the sensor onto the weld stud on the inner B-pillar (1). Be certain that the anti-rotation pin on the back of the sensor is engaged in the clearance hole of the B-pillar.
3. Install and tighten the nut (2) that secures the sensor to the weld stud on the inner B-pillar. Tighten the nut to 7 N.m (62 in. lbs.).
4. Reinstall the lower trim onto the inside of the B-pillar. Refer to **INSTALLATION**.
5. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) verification test procedure should be performed following service of any SRS component. See **STANDARD PROCEDURE**.

SIDE IMPACT SENSOR - C-PILLAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before

performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

NOTE: The front and side impact sensors are interchangeable.

Fig. 45: Identifying Nut, Side Impact Sensor, Body Wire Harness Connector & C-Pillar
Courtesy of CHRYSLER LLC

1. Reconnect the body wire harness connector (3) to the side impact sensor (2) connector receptacle.
2. Position the impact sensor onto the weld stud on the inner C-pillar (4). Be certain that the anti-rotation pin on the back of the sensor is engaged in the clearance hole of the C-pillar.
3. Install and tighten the nut (1) that secures the sensor to the weld stud on the inner C-pillar. Tighten the nut to 7 N.m (62 in. lbs.).
4. Reinstall the trim onto the inside of the lower C-pillar. Refer to **INSTALLATION** .
5. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) verification test procedure should be performed following service of any SRS component. See **STANDARD PROCEDURE**.

OCCUPANT CLASSIFICATION MODULE

DESCRIPTION

OCCUPANT CLASSIFICATION MODULE

Fig. 46: Occupant Classification Module
Courtesy of CHRYSLER LLC

The Occupant Classification Module (OCM) (1) is secured with two screws to a stamped metal bracket on the inboard passenger side front seat riser beneath the seat cushion. Concealed within a hollow in the center of the molded plastic OCM housing is a microprocessor and the other electronic circuitry of the module. The module housing is sealed to enclose and protect the internal electronic circuitry.

Four mounting tabs (2) and two connector receptacles (3) are integral to the OCM housing. The two mounting tabs designed to accept self tapping screws are used to secure the module to the mounting bracket, while the remaining two mounting tabs are unused in this application. The connector receptacles contain terminal pins that connect the OCM to the vehicle electrical system through dedicated take outs and connectors of the passenger side front seat wire harness.

The OCM and all of the other components of the Occupant Classification System (OCS) including the passenger side front seat, the seat weight sensors, and the seat adjusters, cushion, back, frame, foam, springs, and wiring harness are a factory-calibrated and assembled unit. Any time any one of these components is removed or replaced for any reason, the OCM must be re-calibrated using a diagnostic scan tool, the Occupant Classification Seat Weight special tool, and the Occupant Classification System Verification Test. Refer to the appropriate diagnostic procedures.

The OCM cannot be adjusted or repaired and, if damaged or ineffective, it must be replaced. The OCM software is flash programmable. A non-calibrated OCM is available for separate service replacement.

OPERATION

OCCUPANT CLASSIFICATION MODULE

The microprocessor in the Occupant Classification Module (OCM) contains the Occupant Classification System (OCS) logic circuits. The OCM uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the Controller Area Network (CAN) data bus. This method of communication is also used for OCS diagnosis and testing through the 16-way data link

connector located on the driver side lower edge of the instrument panel.

The OCM provides voltage to the four seat weight sensors located on the corners of the passenger side front seat. The OCM then monitors return inputs from each of the sensors on dedicated hard wired data communication circuits. The seat weight sensor inputs allow the OCM to determine whether the passenger side front seat is occupied and the relative size of the occupant by providing a weight-sensing reference to the load on the seat.

Pre-programmed decision algorithms and OCS calibration allow the OCM microprocessor to determine when passenger airbag protection is appropriate based upon the seat load as signaled by the seat weight sensors. When the programmed conditions are met, the OCM sends the proper electronic **occupant classification** messages over the CAN data bus to the Occupant Restraint Controller (ORC), and the ORC controls the deployment circuits for the passenger side front supplemental restraints. On vehicles so equipped, the ORC also provides a control output for the passenger airbag on/off indicator in the instrument panel based upon the electronic **occupant classification** messages it receives from the OCM.

The OCM microprocessor continuously monitors all of the OCS electrical circuits and components to determine the system readiness. If the OCM detects a monitored system fault, it sets an active and stored Diagnostic Trouble Code (DTC) and sends the appropriate electronic messages to the ORC over the CAN data bus. Then the ORC sets a DTC and sends messages to control the airbag indicator operation accordingly. An active fault only remains for the duration of the fault, or in some cases for the duration of the current ignition switch cycle, while a stored fault causes a DTC to be stored in memory by the OCM and the ORC. For some DTCs, if a fault does not recur for a number of ignition cycles, the OCM will automatically erase the stored DTC. For other internal faults, the stored DTC is latched forever.

The OCM receives battery current on a fused B(+) circuit through a fuse in the Totally Integrated Power Module (TIPM) and receives electronic **ignition switch status** messages indicating the ignition switch position over the CAN data bus. The OCM receives ground through a ground circuit and take out of the body wire harness. These connections allow the OCM to be operational whenever the ignition switch is in the ON or START positions.

The hard wired inputs and outputs for the OCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the OCM or the electronic controls and communication between other modules and devices that provide features of the OCS. The most reliable, efficient, and accurate means to diagnose the OCM or the electronic controls and communication related to OCM operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

OCCUPANT CLASSIFICATION MODULE

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before

performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: A non-calibrated Occupant Classification Module (OCM) is available for separate service replacement. The OCM and all of the other components of the Occupant Classification System (OCS) including the passenger side front seat, the seat weight sensors, and the passenger seat adjusters, cushion, back, frame, foam, springs, and wiring harness are a factory-calibrated and assembled unit. Any time any one of these components is removed or replaced for any reason, the OCM must be re-calibrated using a diagnostic scan tool, the Occupant Classification Seat Weight special tool, and the Occupant Classification System Verification Test. Refer to the appropriate diagnostic procedures.

Fig. 47: Identifying Occupant Classification Module (OCM), Inboard Passenger Side Front Seat Riser, Screws & Mounting Bracket
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Reach under the front edge of the passenger side front seat cushion to access and disconnect the two seat wire harness connectors from the Occupant Classification Module (OCM) (1) connector receptacles located on the forward-facing end of the module.
3. Remove the two screws (3) that secure the OCM to the top of the mounting bracket (4) on the inboard passenger side front seat riser (2).
4. Remove the OCM from under the passenger side front seat cushion.

INSTALLATION

OCCUPANT CLASSIFICATION MODULE

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: A non-calibrated Occupant Classification Module (OCM) is available for separate service replacement. The OCM and all of the other components of the Occupant Classification System (OCS) including the passenger side front seat, the seat weight sensors, and the passenger seat adjusters, cushion, back, frame, foam, springs, and wiring harness are a factory-calibrated and assembled unit. Any time any one of these components is removed or replaced for any reason, the OCM must be re-calibrated using a diagnostic scan tool, the Occupant Classification Seat Weight special tool, and the Occupant Classification System Verification Test. Refer to the appropriate diagnostic procedures.

Fig. 48: Identifying Occupant Classification Module (OCM), Inboard Passenger Side Front Seat Riser, Screws & Mounting Bracket

Courtesy of CHRYSLER LLC

1. Reach under the front edge of the passenger side front seat cushion to carefully position the Occupant Classification Module (OCM) (1) to the top of the mounting bracket (4) on the inboard passenger side front seat riser (2). When the OCM is correctly positioned, the connector receptacles on the module will be pointed forward.
2. Install and tighten the two screws (3) that secure the OCM to the mounting bracket. Tighten the screws to 2 N.m (20 in. lbs.).
3. Reconnect the two seat wire harness connectors to the OCM connector receptacles located on the

forward-facing end of the module. Be certain that the latches on each connector are fully engaged.

4. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) verification test procedure should be performed following service of any SRS component. See **STANDARD PROCEDURE**.
5. Following successful completion of the SRS verification test procedure, perform the Occupant Classification System Verification Test using a diagnostic scan tool. Refer to the appropriate diagnostic procedures.

OCCUPANT RESTRAINT CONTROLLER

DESCRIPTION

OCCUPANT RESTRAINT CONTROLLER

Fig. 49: Identifying Occupant Restraint Controller (ORC), Electrical Connector Receptacle, Label, Arrow & Mounting Bracket
Courtesy of CHRYSLER LLC

The Occupant Restraint Controller (ORC) (1) is secured with four screws to a molded plastic mounting bracket (5). The mounting bracket and ORC unit is then secured with two nuts and two screws to a stamped steel mounting bracket welded onto the top of the floor panel transmission tunnel between the two front seats beneath the floor console and rearward of the transmission gearshift mechanism in the passenger compartment of the vehicle. Concealed within a hollow in the center of the molded plastic ORC housing is the electronic circuitry of the ORC which includes a microprocessor, an electronic impact sensor, an electronic safing sensor, and an energy storage capacitor. A molded plastic end cover plate with a rubber O-ring seal is secured to the open end of the ORC housing with two integral latch features to enclose and protect the internal electronic circuitry and components.

An arrow (4) printed on the label (3) on the top of the ORC housing provides a visual verification of the proper orientation of the unit, and should always be pointed toward the front of the vehicle. The ORC housing has four integral mounting flanges with metal sleeves to provide crush protection. Two molded plastic electrical connector receptacles (2) are integral to the end cover plate. These receptacles connect the ORC to the vehicle electrical system through dedicated take outs and connectors from the instrument panel and the body wire

harnesses.

The impact sensor and safing sensor internal to the ORC are calibrated for the specific vehicle, and are only serviced as a unit with the ORC. The ORC cannot be repaired or adjusted and, if damaged or ineffective, it must be replaced as a unit with the molded plastic mounting bracket.

OPERATION

OCCUPANT RESTRAINT CONTROLLER

The microprocessor in the Occupant Restraint Controller (ORC) contains the Supplemental Restraint System (SRS) logic circuits and controls all of the SRS components. The ORC uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the Controller Area Network (CAN) data bus. This method of communication is used for control of the airbag indicator in the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and for SRS diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel. Refer to **OPERATION**.

The ORC microprocessor continuously monitors all of the SRS electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets an active and stored Diagnostic Trouble Code (DTC) and sends electronic messages to the EMIC over the CAN data bus to turn ON the airbag indicator. An active fault only remains for the duration of the fault, or in some cases for the duration of the current ignition switch cycle, while a stored fault causes a DTC to be stored in memory by the ORC. For some DTCs, if a fault does not recur for a number of ignition cycles, the ORC will automatically erase the stored DTC. For other internal faults, the stored DTC is latched forever.

On vehicles so equipped, the ORC provides voltage to the seat track position sensors on the inboard passenger and driver side front seat upper seat tracks. The ORC then monitors return inputs from each of the sensors on dedicated hard wired data communication circuits. The seat track position sensors provide additional logic inputs to the ORC microprocessor that allow it to determine the position of the front seat passenger and the driver relative to the front airbags for determining the force level with which to deploy the multistage front airbags.

On vehicles equipped with the Occupant Classification System (OCS), the ORC communicates with the Occupant Classification Module (OCM) over the CAN data bus. The ORC will internally disable the passenger airbag and seat belt tensioner deployment circuits if the OCM detects that the passenger side front seat is unoccupied or that it is occupied by a load that is inappropriate for an airbag deployment. The ORC also provides a control output to the passenger airbag on/off indicator through the passenger airbag indicator driver circuit. The OCM notifies the ORC when it has detected a monitored system fault and stored a DTC in its memory for any ineffective OCS component or circuit, then the ORC sets a DTC and controls the airbag indicator operation accordingly.

The ORC receives battery current through two circuits; a fused ignition switch output (run) circuit through a fuse in the Totally Integrated Power Module (TIPM), and a fused ignition switch output (run-start) circuit through a second fuse in the TIPM. The ORC receives ground through a ground circuit and take out of the instrument panel wire harness. These connections allow the ORC to be operational whenever the ignition switch is in the START or ON positions. Refer to the appropriate wiring information for additional details.

The ORC also contains an energy-storage capacitor. When the ignition switch is in the START or ON positions, this capacitor is continually being charged with enough electrical energy to deploy the SRS components for up to one second following a battery disconnect or failure. The purpose of the capacitor is to provide backup SRS protection in case there is a loss of battery current supply to the ORC during an impact.

Two sensors are contained within the ORC, an electronic impact sensor and a safing sensor. The ORC also monitors inputs from two remote front impact sensors located on the back of the right and left ends of the front end module carrier inboard of the headlamps near the front of the vehicle. The electronic impact sensors are accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. The ORC also monitors inputs from an internal rollover sensor and four additional remote impact sensors located on the left and right inner B and C-pillars to control deployment of the side curtain airbag units.

The safing sensor is an electronic accelerometer sensor within the ORC that provides an additional logic input to the ORC microprocessor. The safing sensor is used to verify the need for a SRS component deployment by detecting impact energy of a lesser magnitude than that of the primary electronic impact sensors, and must exceed a safing threshold in order for the airbags to deploy. A second safing sensor within the ORC provides confirmation to the ORC microprocessor of side impact forces. This second safing sensor is a bi-directional unit that detects impact forces from either side of the vehicle.

Pre-programmed decision algorithms in the ORC microprocessor determine when the deceleration rate as signaled by the impact sensors and the safing sensors indicate an impact that is severe enough to require SRS protection and, based upon the severity of the monitored impact, determines the level of front airbag deployment force required for each front seating position. When the programmed conditions are met, the ORC sends the proper electrical signals to deploy the dual multistage front airbags at the programmed force levels, the front seat belt tensioners and either side curtain airbag unit. For vehicles equipped with the OCS, the passenger side front airbag and seat belt tensioner will be deployed by the ORC only if enabled by the OCM messages (passenger airbag on/off indicator OFF) at the time of the impact.

The hard wired inputs and outputs for the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the ORC or the electronic controls or communication between other modules and devices that provide features of the supplemental restraint system. The most reliable, efficient, and accurate means to diagnose the ORC or the electronic controls and communication related to ORC operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

OCCUPANT RESTRAINT CONTROLLER

WARNING: To avoid serious or fatal injury on vehicles equipped with side curtain airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service. The ORC contains a rollover sensor, which enables the system to deploy the side airbags in the event of a vehicle rollover event. If an ORC is accidentally rolled during service while still connected to battery power, the side curtain airbags will deploy. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor

to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the Occupant Restraint Controller (ORC), as it can damage the impact sensor or affect its calibration. The ORC contains the impact sensor, which enables the system to deploy the SRS components. If an ORC is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper SRS component deployment.

CAUTION: On vehicles equipped with the Occupant Classification System (OCS), never replace both the Occupant Restraint Controller (ORC) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace one. Then perform the Supplemental Restraint System (SRS) verification test before replacing the other. Both the ORC and the OCM store OCS calibration data, which they transfer to one another when one of them is replaced. If both are replaced at the same time, an irreversible fault will be set in both modules.

NOTE: The Occupant Restraint Controller (ORC) should only be removed as a complete unit with the molded plastic mounting bracket. The service replacement ORC is supplied already installed on a new bracket.

Fig. 50: Identifying Screws, Nuts, Occupant Restraint Controller, ORC Mount, Body Wire Harness Connector & Instrument Panel Wire Harness Connector
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the center console from the top of the floor panel transmission tunnel. Refer to **REMOVAL** .
3. Unlatch and disconnect the body wire harness connector (5) and the instrument panel wire harness connector (6) from the Occupant Restraint Controller (ORC) (3) connector receptacles located on the forward-facing side of the module. To disconnect the wire harness connectors from the ORC, depress the release tab and lift the lever arm on each connector.
4. Remove the two nuts (2) that secure the left side of the ORC mounting bracket to the two studs on the ORC mount (4) welded onto the top of the floor panel transmission tunnel.
5. Remove the two screws (1) that secure the right side of the ORC mounting bracket to the ORC mount.
6. Remove the ORC and mounting bracket unit from the ORC mount.

INSTALLATION

OCCUPANT RESTRAINT CONTROLLER

WARNING: To avoid serious or fatal injury on vehicles equipped with side curtain airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service. The ORC contains a rollover sensor, which enables the system to deploy the side airbags in the event of a vehicle rollover event. If an ORC is accidentally rolled during service while still connected to battery power, the side curtain airbags will deploy. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the Occupant Restraint Controller (ORC), as it can damage the impact sensor or affect its calibration. The ORC contains the impact sensor, which enables the system to deploy the SRS components. If an ORC is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper SRS component deployment.

CAUTION: On vehicles equipped with the Occupant Classification System (OCS), never replace both the Occupant Restraint Controller (ORC) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace one. Then perform the Supplemental Restraint System (SRS) verification test before replacing the other. Both the ORC and the OCM store OCS calibration data, which they transfer to one another when one of them is replaced. If both are replaced at the same time, an irreversible fault will be set in both modules.

NOTE: The Occupant Restraint Controller (ORC) should only be removed as a complete unit with the molded plastic mounting bracket. The service replacement ORC is supplied already installed on a new bracket.

81a13de3

Fig. 51: Identifying Screws, Nuts, Occupant Restraint Controller, ORC Mount, Body Wire Harness

Connector & Instrument Panel Wire Harness Connector

Courtesy of CHRYSLER LLC

1. Carefully position the Occupant Restraint Controller (ORC) and mounting bracket unit (3) onto the two studs on the left side of the ORC mount (4) on the floor panel transmission tunnel. When the ORC is correctly positioned, the bracket will fit flush with the mount and the orientation arrow on the label on top of the housing will be pointed forward in the vehicle.
2. Install and tighten the two screws (1) that secure the right side of the ORC mounting bracket to the ORC mount. Tighten the screws to 10.5 N.m (95 in. lbs.).
3. Install and tighten the two nuts (2) that secure the left side of the ORC mounting bracket to the two studs on the ORC mount. Tighten the nuts to 10.5 N.m (95 in. lbs.).
4. Reconnect the instrument panel wire harness connector (6) and the body wire harness connector (5) to the ORC connector receptacles located on the forward-facing side of the module. Be certain that the latches on the connectors are each fully engaged.
5. Reinstall the center console onto the top of the floor panel transmission tunnel. Refer to **INSTALLATION**.
6. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) verification test procedure should be performed following service of any SRS component. See **STANDARD PROCEDURE**.

PASSENGER AIRBAG

DESCRIPTION

PASSENGER AIRBAG

Fig. 52: Passenger Airbag Door
Courtesy of CHRYSLER LLC

The rearward facing surface of the injection molded, thermoplastic passenger airbag door (1) is the most visible part of the passenger airbag. The passenger airbag door is located above the glove box (2) opening on the top and face of the instrument panel in front of the front seat passenger seating position. The upper and lower edges

of the airbag door are secured with integral snap features to the instrument panel base trim.

Fig. 53: Identifying Passenger Airbag Housing, Stamped Hook Formations, Airbag Cushion, Inflator Initiators, Lower Studs & Upper Studs
Courtesy of CHRYSLER LLC

Located behind the passenger airbag door within the instrument panel is the passenger airbag unit. The passenger airbag unit is secured through two lower studs (5) to the instrument panel structural support armature above the glove box opening. While the two upper studs (6) are secured to a heavy stamped steel instrument panel bracket secured to the dash panel near the lower windshield fence line.

The passenger airbag housing (1) fits into a molded receptacle on the back of the airbag door, where several stamped hook formations (2) on the upper and lower edges of the airbag housing are engaged in mating small window openings on the upper and lower flanges of the receptacle to secure the airbag door to the airbag housing. These airbag door fasteners and mounting provisions are all concealed beneath the instrument panel base trim.

The passenger airbag unit used in this vehicle is a multistage, Next Generation-type that complies with revised federal airbag standards to deploy with less force than those used in some prior vehicles. The passenger airbag unit consists of a stamped metal housing, the airbag cushion (3), and a dual initiator airbag inflator. The airbag housing contains the airbag inflator and the folded airbag cushion. An approximately 80 centimeter (31.5 inch) wide by 90 centimeter (35.5 inch) high rectangular fabric cushion with internal tethers is used.

The airbag inflator is a non-azide, hybrid-type unit that is secured to and sealed within the airbag housing. The two inflator initiators (4) are connected to the vehicle electrical system through dedicated take outs and connectors of the instrument panel wire harness with connector insulators that connect directly to the two inflator initiators. The connector insulators are uniquely keyed and color-coded to ensure they can only be connected to the correct initiator.

A service replacement passenger airbag does not include the airbag door. The passenger airbag door may be disassembled from the passenger airbag and is available for individual service replacement. The passenger airbag unit cannot be repaired and must be replaced if deployed, ineffective, or in any way damaged.

OPERATION

PASSENGER AIRBAG

The multistage passenger airbag is deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the passenger airbag squib 1 and squib 2 circuits to the two initiators of the hybrid airbag inflator. By using two initiators, the airbag can be deployed at multiple levels of force. The force level is controlled by the ORC to suit the monitored impact conditions by providing one of several delay intervals between the electrical signals provided to the two initiators. The longer the delay between these signals, the less forcefully the airbag will deploy.

When the ORC sends the proper electrical signals to each initiator, the electrical energy generates enough heat to initiate a small pyrotechnic charge which produces the pressure necessary to rupture a containment disk in an inert gas canister. The inflator and inert gas canister are sealed to the airbag cushion and a diffuser in the inflator directs all of the inert gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the passenger airbag door will split horizontally at predetermined tear seam lines concealed on the inside surface of the door. The upper half of the door pivots up and the lower half pivots down and out of the way. Following an airbag deployment, the airbag cushion quickly deflates by venting the inert gas through a vent hole in each fabric side panel of the airbag cushion.

Typically, both initiators are used during an airbag deployment event. However, it is possible for only one initiator to be used during a deployment due to an airbag system fault; therefore, it is necessary to always confirm that both initiators have been used in order to avoid the improper disposal of potentially live pyrotechnic materials. See **STANDARD PROCEDURE**.

Proper diagnosis of the passenger airbag inflator and the passenger airbag squib circuits requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

PASSENGER AIRBAG

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

NOTE: The following procedure is for replacement of an ineffective or damaged passenger airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for handling non-deployed supplemental restraints. If the passenger airbag has been deployed, review the recommended procedures for service after a supplemental restraint deployment before removing the airbag from the vehicle. See STANDARD PROCEDURE.

Fig. 54: Identifying Windshield, Instrument Panel, Screw Guide & Screws
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the top cover from the instrument panel. Refer to REMOVAL .
3. Remove the two screws (4) from the screw guide (3) on the top of the instrument panel (2) near the windshield (1) that secure the instrument panel bracket for the passenger airbag to the dash panel.
4. Using a trim stick or another suitable wide flat-bladed tool, pry the screw guide away from the top of the instrument panel far enough to disengage the two integral latch features that secure it and remove the screw guide to allow access to the trim screw that secures the passenger airbag instrument panel bracket to the instrument panel structural duct.
5. Work through the rectangular hole in the top of the instrument panel beneath the removed screw guide to access and remove the one screw that secures the center tab of the passenger airbag instrument panel bracket to the structural duct.

Fig. 55: Identifying Glove Box Latch Striker, Upper Glove Box Opening & Nuts
Courtesy of CHRYSLER LLC

6. Remove the glove box from the instrument panel. Refer to **REMOVAL** .
7. Remove the grab handle from the instrument panel. Refer to **REMOVAL** .
8. Reach up into the instrument panel above the upper glove box opening (2) to access and remove the two nuts (3) that secure the passenger airbag lower studs to the instrument panel base trim on each side of the glove box latch striker (1).
9. Using a trim stick or another suitable wide flat-bladed tool, gently pry the lower edge of the passenger airbag door rearward away from the upper glove box opening reinforcement far enough to disengage the snap features on the door from the receptacles in the instrument panel base trim.
10. Grasp the lower edge of the passenger airbag door and gently pull the door and airbag rearward far enough to disengage the upper snap features from the receptacles in the instrument panel base trim and to access the two instrument panel wire harness connections to the airbag inflators at each side of the airbag housing.

CAUTION: Do not pull on the instrument panel wire harness take outs or pry on the connector insulators to disengage the connectors from the passenger airbag inflator connector receptacles. Improper removal of these take outs and their connector insulators can result in damage to the airbag circuits or connector insulators.

11. The instrument panel passenger airbag wire harness connectors are secured by integral latches to the airbag inflator connector receptacles, which are located on the sides of the passenger airbag housing. Depress the latches on each side of each connector insulator and pull the insulators straight out from the airbag inflator to disconnect them from the connector receptacles.
12. Remove the passenger airbag, airbag door and instrument panel bracket from the instrument panel as a unit.

DISASSEMBLY

PASSENGER AIRBAG DOOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, service of this unit should be performed only by DaimlerChrysler-trained and authorized dealer service technicians. Failure to take the proper precautions or to follow the proper procedures could result in accidental, incomplete, or improper airbag deployment and possible occupant injuries.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the passenger airbag, or becoming entrapped between the passenger airbag cushion and the passenger airbag door. Failure to observe this warning could result in occupant injuries upon airbag deployment.

WARNING: To avoid serious or fatal injury, the passenger airbag door must never be painted. Replacement airbag doors are serviced in the original colors. Paint may change the way in which the material of the airbag door responds to an airbag deployment. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedures can be used to replace the passenger airbag door. If the passenger airbag is deployed, the passenger airbag unit and the airbag door must both be replaced.

Fig. 56: Identifying Passenger Airbag Door, Airbag Housing, Lower Hooks & Receptacle
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the passenger airbag from the instrument panel. See **REMOVAL**.
3. Place the passenger airbag on a suitable work surface with the passenger airbag door (1) facing down. If the airbag door will be reused, be certain to take the proper precautions to prevent the airbag door from receiving cosmetic damage during the following procedures.
4. Disengage each of the upper hooks of the airbag housing (2) from the windows in the upper wall of the receptacle (4) on the back of the airbag door. To disengage the hooks, use hand pressure to push the adjacent edge of the airbag housing firmly and evenly downward into the airbag door receptacle, while at the same time pulling outward on that edge of the receptacle wall.
5. With all of the upper hooks disengaged, roll the top of the airbag housing upward to disengage the lower hooks (3) then lift the housing, inflator and cushion from the receptacle on the back of the passenger airbag door.

PASSENGER AIRBAG INSTRUMENT PANEL BRACKET

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, service of this unit should be performed only by DaimlerChrysler-trained and authorized dealer service technicians. Failure to take the proper precautions or to follow the proper procedures could result in accidental, incomplete, or improper airbag deployment and possible occupant injuries.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the passenger airbag, or becoming entrapped between the passenger airbag cushion and the passenger airbag door. Failure to observe this warning could result in occupant injuries upon airbag deployment.

Fig. 57: Identifying Airbag Housing, Nuts & Passenger Airbag Instrument Panel Bracket
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the passenger airbag from the instrument panel. See **REMOVAL**.
3. Place the passenger airbag instrument panel bracket (3) facing up. Be certain to take the proper precautions to prevent the airbag door from receiving cosmetic damage during the following procedures.
4. Remove the two nuts (2) that secure the bracket to the two studs on the top of the airbag housing (1).
5. Remove the bracket from the studs.

ASSEMBLY

PASSENGER AIRBAG DOOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, service of this unit should be performed only by DaimlerChrysler-trained and authorized dealer service technicians. Failure to take the proper precautions or to follow the proper procedures could result in accidental, incomplete, or improper airbag deployment and possible occupant injuries.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the passenger airbag, or becoming entrapped between the passenger airbag cushion and the passenger airbag door. Failure to observe this warning could result in occupant injuries upon airbag deployment.

WARNING: To avoid serious or fatal injury, the passenger airbag door must never be painted. Replacement airbag doors are serviced in the original colors. Paint may change the way in which the material of the airbag door responds to an airbag deployment. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedures can be used to replace the passenger airbag door. If the passenger airbag is deployed, the passenger airbag unit and the airbag door must both be replaced.

Fig. 58: Identifying Passenger Airbag Door, Airbag Housing, Lower Hooks & Receptacle
Courtesy of CHRYSLER LLC

1. Place the passenger airbag door (1) on a suitable work surface with the airbag receptacle (4) facing up. Be certain to take the proper precautions to prevent the airbag door from receiving cosmetic damage during the following procedures.
2. Carefully position the passenger airbag housing (2) into the airbag door receptacle.
3. Work around the perimeter of the unit engaging each of the nine hooks (3) on the housing through the windows in the upper and lower walls of the airbag door receptacle.
4. After the passenger airbag has been assembled, try pulling the airbag door and the airbag housing away from each other. Visually verify that this action has fully seated all of the windows of the airbag door into the cradles of the airbag housing hooks.
5. Reinstall the passenger airbag into the instrument panel. See **INSTALLATION**.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, service of this unit should be performed only by DaimlerChrysler-trained and authorized dealer service technicians. Failure to take the proper precautions or to follow the proper procedures could result in accidental, incomplete, or improper airbag deployment and possible occupant injuries.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the passenger airbag, or becoming entrapped between the passenger airbag cushion and the passenger airbag door. Failure to observe this warning could result in occupant injuries upon airbag deployment.

Fig. 59: Identifying Airbag Housing, Nuts & Passenger Airbag Instrument Panel Bracket
Courtesy of CHRYSLER LLC

1. Place the passenger airbag on a suitable work surface with the housing (1) facing up. Be certain to take the proper precautions to prevent the airbag door from receiving cosmetic damage during the following procedures.
2. Carefully position the passenger airbag instrument panel bracket (3) over the two studs on the top of the airbag housing.
3. Install and tighten the two nuts (2) that secure the bracket to the studs on the housing. Tighten the nuts to 20 N.m (15 ft. lbs.).

4. Reinstall the passenger airbag onto the instrument panel. See INSTALLATION.

INSTALLATION

PASSENGER AIRBAG

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the passenger airbag, or becoming entrapped between the passenger airbag cushion and the passenger airbag door. Failure to observe this warning could result in occupant injuries upon airbag deployment.

WARNING: To avoid serious or fatal injury, the passenger airbag door must never be painted. Replacement passenger airbag units are serviced with doors in the original colors. Paint may change the way in which the material of the airbag door responds to an airbag deployment. Failure to observe this warning could result in occupant injuries upon airbag deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged passenger airbag. If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for handling non-deployed supplemental restraints. If the passenger airbag has been deployed, review the recommended procedures for service after a supplemental restraint deployment before removing the airbag from the vehicle. See STANDARD PROCEDURE.

81a2e6f9

Fig. 60: Identifying Glove Box Latch Striker, Upper Glove Box Opening & Nuts
Courtesy of CHRYSLER LLC

1. Position the passenger airbag, airbag door and instrument panel bracket to the opening in the face of the instrument panel base trim as a unit.
2. Reconnect the two connector insulators of the instrument panel wire harness take outs to the airbag inflator connector receptacles on each side of the airbag housing by pressing straight in on the connectors. Be certain to engage each keyed and color-coded connector to the matching connector receptacle. You can be certain that each connector is fully engaged in its receptacle by listening carefully for a distinct, audible click as the connector latches snap into place.
3. Slide the passenger airbag forward being certain that the instrument panel bracket is engaged between the dash panel and the instrument panel structural support at the lower windshield fence line and that the two lower studs of the airbag are engaged in the holes of the instrument panel base trim. It may be necessary to angle the forward end of the unit slightly downward and then roll it upward to engage the instrument panel bracket properly between the fence line and the structural support.
4. Reach up into the instrument panel above the upper glove box opening (2) to install and tighten the two nuts (3) that secure the passenger airbag lower studs to the instrument panel base trim on each side of the glove box latch striker (1). Tighten the nuts to 7 N.m (62 in. lbs.).
5. Reinstall the grab handle onto the instrument panel. Refer to **INSTALLATION** .
6. Reinstall the glove box into the instrument panel. Refer to **INSTALLATION** .

Fig. 61: Identifying Windshield, Instrument Panel, Screw Guide & Screws
Courtesy of CHRYSLER LLC

7. Work through the rectangular hole in the top of the instrument panel to install and tighten the one screw that secures the center tab of the passenger airbag instrument panel bracket to the instrument panel structural duct. Tighten the screw to 2.9 N.m (25 in. lbs.).
8. Position the screw guide (3) onto the top of the instrument panel (2) near the windshield (1) and, using hand pressure, press the screw guide downward until both integral latch features snap into place.
9. Install and tighten the two screws (4) through the screw guide that secure the instrument panel bracket for the passenger airbag to the dash panel. Tighten the screws to 29.5 N.m (21.5 ft. lbs.).
10. Using hand pressure, press the top of the passenger airbag door forward and downward until each snap feature on the upper edge of the airbag door is fully engaged into its receptacle in the instrument panel base trim.
11. Using hand pressure, wrap the passenger airbag door downward tightly against the instrument panel, then push forward until each snap feature on the lower edge of the airbag door is fully engaged into its receptacle in the instrument panel base trim.
12. Visually verify that each of the snap features of the airbag door is fully engaged in the instrument panel. There will be a distinct bulge in the door over any snap that is not fully engaged.
13. Reinstall the top cover onto the instrument panel. Refer to **INSTALLATION**.
14. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) verification test procedure should be performed following service of any SRS component. See **STANDARD PROCEDURE**.

PASSENGER AIRBAG ON/OFF INDICATOR

DESCRIPTION

PASSENGER AIRBAG ON/OFF INDICATOR

Fig. 62: Instrument Panel Switch Pod

Courtesy of CHRYSLER LLC

Vehicles equipped with the Occupant Classification System (OCS) include a passenger airbag on/off indicator (5), which is located just to the right of the hazard switch (3) in the center of the instrument panel switch pod (1) near the base of the instrument panel center bezel. The passenger airbag on/off indicator consists of a molded plastic housing and a rectangular dark translucent outer lens.

The opaque text **PASS AIRBAG OFF** and an opaque International Control and Display Symbol icon for **Passenger Airbag Off or Not Available** are imprinted on the back of the lens within the indicator. The dark outer lens prevents the indicator text and icon from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the lens causes the text and icon to appear silhouetted against an amber field through the translucent lens when the indicator is illuminated from behind by the LED.

The passenger airbag on/off indicator cannot be repaired or adjusted and, if ineffective or damaged, the switch pod unit must be replaced. Refer to **REMOVAL**.

OPERATION

PASSENGER AIRBAG ON/OFF INDICATOR

In the Occupant Classification System (OCS) the passenger airbag on/off indicator gives an indication when the passenger airbag and seat belt tensioner deployment circuits are disabled by the Occupant Restraint Controller (ORC). This indicator is controlled by a transistor within the ORC through a hard wired output based upon ORC programming and electronic **occupant classification** messages received by the ORC over the Controller Area Network (CAN) data bus from the Occupant Classification Module (OCM).

The passenger airbag on/off indicator Light Emitting Diode (LED) is completely controlled by the ORC. The LED receives a battery current input on a fused ignition switch output (run) circuit. Therefore, the LED will always be OFF when the ignition switch is in any position except ON. The LED only illuminates when it is provided a path to ground by the ORC transistor. The ORC will turn ON the passenger airbag on/off indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the ON position the passenger airbag on/off indicator is illuminated for about six seconds.
- **Child Seat Detected (or Load Less Than Minimum Weight Threshold) Occupant Classification Message** - Each time the ORC receives an electronic message from the OCM indicating a child seat has been detected in the passenger side front seat (or that the seat load is less than a minimum weight threshold) the passenger airbag and seat belt tensioner deployment circuits are deactivated and the passenger airbag on/off indicator will be illuminated. The indicator remains illuminated until the ORC

receives an **occupant classification** message indicating that the passenger side front seat is empty, that the seat is occupied by a load equal to or greater than a minimum weight threshold, or until the ignition switch is turned to the OFF position, whichever occurs first.

- **Load Undetermined Occupant Classification Message** - Each time the ORC receives an electronic message from the OCM indicating that a load cannot be determined in the passenger side front seat, the passenger airbag and seat belt tensioner deployment circuits are deactivated and the passenger airbag on/off indicator will be illuminated. The indicator remains illuminated until the ORC receives an **occupant classification** message indicating that the passenger side front seat is empty, that the seat is occupied by a load equal to or greater than a minimum weight threshold, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Communication Error** - If the ORC receives invalid **occupant classification** messages or no messages from the OCM, the passenger airbag on/off indicator is illuminated. The indicator remains illuminated until the ORC receives a valid message from the OCM indicating that the passenger side front seat is empty, that the seat is occupied by a load equal to or greater than a minimum weight threshold, or until the ignition switch is turned to the OFF position, whichever occurs first.

The ORC continually monitors the **occupant classification** messages from the OCM to decide whether the passenger airbag and seat belt tensioner deployment circuits should be activated or deactivated. Note that there may be several seconds of delay between changes in the detected occupant status and passenger airbag on/off indications. This is a programmed feature of the OCM used to prevent a flashing indicator condition resulting from the normal shifting of occupant weight on the passenger seat cushion. The ORC then provides the proper control output to turn the passenger airbag on/off indicator ON or OFF.

The ORC will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. The hard wired circuits between the passenger airbag on/off indicator and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the passenger airbag on/off indicator or the electronic controls and communication between other modules and devices that provide features of the OCS. The most reliable, efficient, and accurate means to diagnose the passenger airbag on/off indicator or the electronic controls and communication related to passenger airbag on/off indicator operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

SEAT BELT BUCKLE

REMOVAL

FRONT SEAT BELT BUCKLE

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar® Parts Catalog.

WARNING: To avoid serious or fatal injury on vehicles equipped with the Occupant Classification System (OCS), do not modify the front passenger seat assembly or center floor console in any way. Do not use any prior year, subsequent year, secondary or aftermarket seat trim covers. At no time should any Supplemental Restraint System (SRS) or OCS component be modified or replaced with any part except those which are specified for the particular vehicle application in the DaimlerChrysler Mopar® Parts Catalog. Failure to observe these precautions could cause an OCS miscalibration condition, which may result in the passenger airbag failing to deploy when required or deploying when not required.

WARNING: To avoid serious or fatal injury, never strike or drop a seat weight sensor or the passenger side front seat assembly to which the sensors are secured as it can damage the sensors or affect their calibration. The seat weight sensors and the passenger side front seat assembly must be handled with care to avoid damage to the sensors. Do not sit upon or place any loads upon a passenger side front seat while it is removed from its mounts in or outside of the vehicle. If an individual sensor is dropped or damaged, replace the sensor with a new and unused unit. If a seat has been dropped during removal or loaded while removed from its mounts, replace each of the seat weight sensors with new and unused units. Failure to observe this warning could result in an accidental, incomplete, or improper passenger side front Supplemental Restraint System (SRS) component deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with the Occupant Classification System (OCS), any time the passenger side front seat assembly has been removed or loosened from the vehicle for service of any vehicle component or system the Occupant Classification System (OCS) Verification Test must be performed using a diagnostic scan tool and the Occupant Classification Seat Weight special tool following reinstallation. Refer to the appropriate diagnostic procedures. Failure to

observe this warning could result in an accidental, incomplete, or improper passenger side front Supplemental Restraint System (SRS) component deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged seat belt buckle unit. The front seat belt buckle in this vehicle may include a seat belt tensioner. If the front seat belt buckle is equipped with a tensioner that is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for handling non-deployed supplemental restraints. If the seat belt tensioner has been deployed, review the recommended procedures for service after a supplemental restraint deployment before removing the unit from the vehicle. See STANDARD PROCEDURE.

Fig. 63: Identifying Front Seat Belt Buckle And Tensioner Unit, Screw & Pigtail Wire
Courtesy of CHRYSLER LLC

1. Move the front seat to its middle position for easiest access to the front seat mounting provisions.
2. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the front seat from the vehicle. Refer to REMOVAL .
4. Disconnect the seat belt tensioner (if equipped) and seat belt switch pigtail wire (3) connector from the seat wire harness connector located under the seat cushion near the inboard side of the seat.
5. Remove the screw (2) that secures the front seat belt buckle (1) lower anchor and, if equipped, the tensioner unit to the back of the inboard seat cushion frame.
6. Pull the buckle or the buckle and tensioner unit away from the inboard side of the seat while feeding the pigtail wire and connector from under the seat out through the clearance hole in the inboard seat cushion frame.
7. Remove the seat belt buckle or the buckle and tensioner from the front seat as a unit.

SECOND ROW CENTER ANCHOR AND LEFT SEAT BELT BUCKLE

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar® Parts Catalog.

Fig. 64: Second Row Center And Seat Belt Buckle Components
Courtesy of CHRYSLER LLC

NOTE: The anchor plates for the left outboard second row seat belt buckle and the second row center seat belt anchor are secured to each other by a soft metal grommet as an assembly aid during the manufacturing process and, once removed, the grommet does not require reinstallation.

1. Remove the four screws (1) that secure the second row seat cushion legs (8) to the rear floor panel (9).
2. Lift the front edge of the seat cushions (10) up against the seat backs for access to the second row center seat belt and left outboard seat belt buckle anchors (5) on the rear floor panel.
3. Remove the nut (3) that secures the center seat belt and left buckle anchors to the stud (4) on the rear floor panel.
4. Lift the anchors off of the stud on the rear floor panel.
5. Using an appropriate drill or chisel, carefully remove the soft metal grommet that secures the two anchor plates to each other.
6. Remove the second row left outboard buckle and anchor from between the seat back and the seat cushion

as a unit.

SECOND ROW CENTER AND RIGHT SEAT BELT BUCKLES

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar® Parts Catalog.

Fig. 65: Second Row Center And Seat Belt Buckle Components

Courtesy of CHRYSLER LLC

1. Remove the four screws (1) that secure the second row seat cushion legs (8) to the rear floor panel (9).
2. Lift the front edge of the seat cushions (10) up against the seat backs for access to the forward end of the right center seat bracket (7).
3. Remove the screw (6) that secures the lower anchor for the center and right seat belt buckle unit (2) to the inboard side of the right center seat bracket.
4. Remove the center and right seat belt buckle unit from between the second row seat cushions as a unit.

INSTALLATION

FRONT SEAT BELT BUCKLE

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar® Parts Catalog.

WARNING: To avoid serious or fatal injury on vehicles equipped with the Occupant Classification System (OCS), do not modify the front passenger seat assembly or center floor console in any way. Do not use any prior year, subsequent year, secondary or aftermarket seat trim covers. At no time should any Supplemental Restraint System (SRS) or OCS component be modified or replaced with any part except those which are specified for the particular vehicle application in the DaimlerChrysler Mopar® Parts Catalog. Failure to observe these precautions could cause an OCS miscalibration condition, which may result in the passenger airbag failing to deploy when required or deploying when not required.

WARNING: To avoid serious or fatal injury, never strike or drop a seat weight sensor or the passenger side front seat assembly to which the sensors are secured as it can damage the sensors or affect their calibration. The seat weight sensors and the passenger side front seat assembly must be handled with care to avoid damage to the sensors. Do not sit upon or place any loads upon a passenger side front seat while it is removed from its mounts in or outside of the vehicle. If an individual sensor is dropped or damaged, replace the sensor with a new and unused unit. If a seat has been dropped during removal or loaded while removed from its mounts, replace each of the seat weight sensors with new and unused units. Failure to observe this warning could result in an accidental, incomplete,

or improper passenger side front Supplemental Restraint System (SRS) component deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with the Occupant Classification System (OCS), any time the passenger side front seat assembly has been removed or loosened from the vehicle for service of any vehicle component or system the Occupant Classification System (OCS) Verification Test must be performed using a diagnostic scan tool and the Occupant Classification Seat Weight special tool following reinstallation. Refer to the appropriate diagnostic procedures. Failure to observe this warning could result in an accidental, incomplete, or improper passenger side front Supplemental Restraint System (SRS) component deployment.

NOTE: The following procedure is for replacement of an ineffective or damaged seat belt buckle unit. The front seat belt buckle in this vehicle may include a seat belt tensioner. If the front seat belt buckle is equipped with a tensioner that is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for handling non-deployed supplemental restraints. If the seat belt tensioner has been deployed, review the recommended procedures for service after a supplemental restraint deployment before removing the unit from the vehicle. See STANDARD PROCEDURE.

Fig. 66: Identifying Front Seat Belt Buckle And Tensioner Unit, Screw & Pigtail Wire
Courtesy of CHRYSLER LLC

1. Position the front seat belt buckle or the buckle and tensioner unit (1) to the inboard seat cushion frame.
2. Insert the seat belt tensioner (if equipped) and seat belt switch pigtail wire (3) connector under the seat through the clearance hole in the inboard seat cushion frame.
3. Position the front seat belt buckle lower anchor to the back of the inboard seat cushion frame.
4. Install and tighten the screw (2) that secures the front seat belt buckle anchor to the seat cushion frame.

Tighten the screw to 43 N.m (32 ft. lbs.).

5. Reconnect the seat belt buckle tensioner (if equipped) and the seat belt switch pigtail wire connector to the seat wire harness connector located under the seat cushion near the inboard side of the seat.
6. Reinstall the front seat into the vehicle. Refer to **INSTALLATION**.
7. If the buckle is equipped with a tensioner, do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) verification test procedure should be performed following service of any SRS component. See **STANDARD PROCEDURE**.

SECOND ROW CENTER ANCHOR AND LEFT SEAT BELT BUCKLE

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar® Parts Catalog.

Fig. 67: Second Row Center And Seat Belt Buckle Components
Courtesy of CHRYSLER LLC

NOTE: The anchor plates for the left outboard second row seat belt buckle and the second row center seat belt anchor are secured to each other by a soft metal grommet as an assembly aid during the manufacturing process and, once removed, the grommet does not require reinstallation.

1. Position the second row left outboard buckle anchor plate (5) between the seat back and the seat cushion (10).
2. Lower the second row center seat belt and left outboard seat belt buckle anchors over the stud (4) on the rear floor panel (9).
3. Install and tighten the nut (3) that secures the anchors to the stud on the rear floor panel. Tighten the nut to 62.5 N.m (46 ft. lbs.).
4. Lower the front edge of the seat cushions downward and align the seat cushion legs (8) to the holes in the rear floor panel.
5. Install and tighten the four screws (1) that secure the legs to the floor panel. Tighten the screws to 54 N.m (40 ft. lbs.).

SECOND ROW CENTER AND RIGHT SEAT BELT BUCKLES

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar® Parts Catalog.

Fig. 68: Second Row Center And Seat Belt Buckle Components
 Courtesy of CHRYSLER LLC

1. Position the center and right seat belt buckle unit (2) between the second row seat cushions (10).

2. Position the lower anchor of the seat belt buckle unit to the inboard side of the right center seat bracket (7). Be certain that the anti-rotation tab on the anchor is engaged in the notch of the bracket.
3. Install and tighten the screw (6) that secures the buckle anchor to the right center seat bracket. Tighten the screw to 55 N.m (41 ft. lbs.).
4. Lower the front edge of the seat cushions downward and align the seat cushion legs (8) to the holes in the rear floor panel (9).
5. Install and tighten the four screws (1) that secure the legs to the floor panel. Tighten the screws to 54 N.m (40 ft. lbs.).

SEAT BELT AND RETRACTOR

DESCRIPTION

AUTOMATIC LOCKING RETRACTOR

The seat belt retractors used in all seating positions include an inertia-type, emergency locking mechanism as standard equipment. However, the retractor locking mechanisms for the front passenger and both second row outboard seating positions are mechanically switchable from an emergency locking retractor to an automatic locking retractor. The primary function of this feature is to securely accommodate a child seat in any of these seating positions of the vehicle without the need for a self-cinching seat belt tip half latch plate unit or another supplemental device that would be required to prevent the seat belt webbing from unwinding freely from the retractor spool of an inertia-type emergency locking retractor mechanism.

The automatic locking mechanism is integral to the seat belt and retractor unit and is concealed beneath a molded plastic cover located on one side of the retractor spool. The automatic locking mechanism cannot be adjusted or repaired and, if ineffective or damaged, the entire seat belt and retractor unit must be replaced.

OPERATION

AUTOMATIC LOCKING RETRACTOR

The locked mode of the automatic locking retractor is engaged and the retractor is switched from operating as a standard inertia-type emergency locking retractor by first buckling the combination lap and shoulder belt buckle. Then grasp the shoulder belt and pull all of the webbing out of the retractor. Once all of the belt webbing is extracted from the spool, the retractor will automatically become engaged in the pre-locked automatic locking mode and will make a light, audible clicking or ratcheting sound as the shoulder belt is allowed to retract to confirm that the automatic locking mode is now engaged. Once the automatic locking mode is engaged, the retractor will remain locked and the belt will remain tight around whatever it is restraining.

The retractor is returned to standard emergency locking (inertia) mode by unbuckling the combination lap and shoulder belt buckle and allowing the belt webbing to be almost fully retracted onto the retractor spool. The emergency locking mode is confirmed by the absence of the light, audible clicking or ratcheting sound as the belt webbing retracts. This mode will allow the belt to unwind from and wind onto the retractor spool freely unless and until a predetermined inertia load is sensed, or until the retractor is again switched to the automatic locking mode.

STANDARD PROCEDURE

WEB STOP BUTTON REPLACEMENT

The webbing of each of the tip half seat belts in this vehicle is equipped with a molded plastic web stop button, which holds the latch plate of the seat belt tip half in a readily accessible stored position and prevents it from falling to the lower belt anchor while the belt is not in use. If this button becomes damaged or separated from the belt webbing, it may be successfully replaced using the following procedure without the need for removing or replacing the entire seat belt assembly.

The web stop button replacement kit includes two molded plastic replacement button halves: a male button half with a pointed spike in its center, and a female button half with a hole in its center. The button halves are not available separately. In addition to the button replacement kit, a pair of wheel weight pliers (such as KD Tools® #3358, Snap-on® #WWPR13A or equivalent) and a gel-type super adhesive glue (such as Mopar® Bond-All Gel #04467709 or equivalent) are required.

NOTE: **Avoid using heavy-duty, truck-style wheel weight pliers as the jaws may not close far enough to successfully complete web stop button replacement.**

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar® Parts Catalog.

Fig. 69: Seatbelt Anchor Components

Courtesy of CHRYSLER LLC

1. Carefully inspect the seat belt webbing to identify the hole or a witness mark where the original web stop button halves (2 and 5) were installed. If no distinct evidence of the prior button location is found, go to Step 2. If the original button location is clearly evident, go to Step 3.
2. Find the appropriate dimension in the WEB STOP BUTTON LOCATION table. Measure and mark that distance (4) in the center of the belt webbing from the point where the webbing is secured to the seat belt lower anchor plate (3).

WEB STOP BUTTON LOCATION	
SEATING POSITION	DIMENSION
FRONT	350 plus or minus 10 millimeters (13.78 plus or minus 0.39 inches)
SECOND ROW CENTER OR OUTBOARD	280 plus or minus 15 millimeters (11.02 plus or minus 0.59 inches)

CAUTION: Be certain that the seat belt latch plate (1) is located and secured

above the web stop button location mark before installing the replacement button.

3. Working from the side of the seat belt webbing that faces the interior of the vehicle, pierce the webbing with the spike in the center of the male button half. The male button head should face the interior of the vehicle.

Fig. 70: Gel-type Super Adhesive Glue
Courtesy of CHRYSLER LLC

4. Apply a small dot of gel-type super adhesive glue (2) around the center hole on the back side of the female button half (1).
5. Press the female button half over the spike of the male button half that protrudes through the side of the belt webbing that faces away from the interior of the vehicle.

Fig. 71: Flattening Button Half
Courtesy of CHRYSLER LLC

6. Use the flat anvil-like jaw (3) of the wheel weight pliers to flatten the sharp spike (2) of the male button half that protrudes through the female button half (1) on the back side of the belt webbing (4).

Fig. 72: Forming Button Half
Courtesy of CHRYSLER LLC

7. Carefully use the curved jaw (3) of the wheel weight pliers to compress and form the flattened spike of the male button half (2) on the back side of the seat belt webbing (1) until it is concave and entirely below the outer convex surface of the female button half.
8. Check to be certain that the web stop button is secure.

REMOVAL

FRONT SEAT BELT AND RETRACTOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar® Parts Catalog.

- NOTE:** The only component of this seat belt and retractor unit that is available for individual service replacement is the plastic web stop button that prevents the latch plate from falling to the floor while in the stored position. Refer to the instructions supplied with the service kit for the proper web stop button replacement procedures.
- NOTE:** The following procedure is for replacement of an ineffective or damaged seat belt and retractor unit. The front retractor also includes a seat belt tensioner. If the front seat belt or retractor is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for handling non-deployed supplemental restraints. If the seat belt tensioner has been deployed, review the recommended procedures for service after a supplemental restraint deployment before removing the unit from the vehicle. See STANDARD PROCEDURE.
- NOTE:** All seat belt retractors except the driver side front and the second row center retractor include a switchable automatic locking mechanism. See DESCRIPTION.

Fig. 73: Identifying Front Seat, Front Seat Belt, Screw & Seat Back Recliner Handle
Courtesy of CHRYSLER LLC

1. Adjust the front seat (1) to its most forward position for easiest access to the front seat belt (2) lower anchor and the B-pillar trim.
2. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.

Fig. 74: Identifying Seat Back Recliner Handle & Spring Clip
 Courtesy of CHRYSLER LLC

3. Using a trim stick or another suitable wide flat-bladed tool, gently pry the seat back recliner handle (1) to release the spring clip (2) and remove the handle from the recliner mechanism shaft at the rear of the outboard seat side shield. Optionally, a manual window regulator handle clip removal tool may be used to remove the spring clip from the handle before removing the handle from the recliner mechanism shaft.
4. Using a trim stick or another suitable wide flat-bladed tool, gently pry the rear edge of the seat belt anchor cover to remove it from the outboard seat side shield.
5. Remove the screw that secures the lower anchor to the outboard side of the front seat cushion frame.

Fig. 75: Identifying Height Adjuster, Seat Belt Turning Loop, Upper Trim, Lower Trim, Body Wire Harness Connector, Lower Retractor & B-Pillar
 Courtesy of CHRYSLER LLC

6. Remove the upper trim (3) from the inside of the B-pillar (7). Refer to **REMOVAL** .
7. Remove the screw that secures the seat belt turning loop (2) to the height adjuster (1) on the upper B-pillar.

8. Remove the seat belt turning loop from the height adjuster.
9. Remove the lower trim (4) from the inside of the B-pillar. Refer to **REMOVAL** .
10. Disconnect the body wire harness connector (5) from the seat belt tensioner pigtail wire connector.
11. Remove the screw that secures the lower retractor (6) bracket to the B-pillar.
12. Disengage the engagement tab on the upper retractor bracket/seat belt web guide from the engagement slot in the B-pillar.
13. Remove the front seat belt and retractor from the B-pillar as a unit.

SECOND ROW CENTER SEAT BELT AND RETRACTOR

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar® Parts Catalog.

NOTE: All seat belt retractors except the driver side front and the second row center retractor include a switchable automatic locking mechanism. See **DESCRIPTION**.

Fig. 76: Identifying Second Row Center Seat Belt Retractor, Seat Back Panel, Bezel, Screw & Anchor Unit

Courtesy of CHRYSLER LLC

NOTE: The anchor plates for the left outboard second row seat belt buckle and the second row center seat belt anchor are secured to each other by a soft metal grommet as an assembly aid during the manufacturing process and, once removed, the grommet does not require reinstallation.

1. Remove the left second row seat belt buckle and center seat belt lower anchor unit (5) from the rear floor panel and separate them from each other. See **REMOVAL**.
2. Remove the second row seat from the vehicle as a unit and place it on a suitable work surface. Be certain to take the proper precautions to prevent the trim cover from receiving cosmetic damage during the following procedures. Refer to **REMOVAL** .
3. Remove the bezel (3), trim cover and foam from the 60 percent seat back panel (2). Refer to **DISASSEMBLY** .
4. Remove the screw (4) that secures the second row center seat belt retractor (1) to the seat back panel.
5. Remove the second row center seat belt and retractor unit from the seat back panel.

SECOND ROW OUTBOARD SEAT BELT AND RETRACTOR

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar® Parts Catalog.

NOTE: All seat belt retractors except the driver side front and the second row center retractor include a switchable automatic locking mechanism. See **DESCRIPTION**.

Fig. 77: Identifying Nut, Second Row Seat Back, Outboard Seat Bracket, Stud, Rear Floor Panel, Seat Cushion & Seat Belt Lower Anchor
 Courtesy of CHRYSLER LLC

1. Reach through the outboard opening between the second row seat back (2) and seat cushion (6) to access and remove the nut (1) that secures the seat belt lower anchor (7) and the forward end of the outboard seat bracket (3) to the rear floor panel (5).
2. Remove the seat belt lower anchor from the stud (4).

Fig. 78: Identifying Inner C-Pillar, Trim, Screws, Second Row Outboard Seat Belt & Retractor
 Courtesy of CHRYSLER LLC

3. Remove the trim (2) from the inner C-pillar (1). Refer to **REMOVAL** .
4. Remove the screw (3) that secures the seat belt turning loop to the upper C-pillar.
5. Remove the quarter trim panel from the inner lower C-pillar. Refer to **REMOVAL** .
6. Remove the screw (5) that secures the retractor (6) bracket to the lower C-pillar.
7. Remove the second row outboard seat belt (4) and retractor from the C-pillar as a unit.

INSTALLATION

FRONT SEAT BELT AND RETRACTOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar® Parts Catalog.

NOTE: The only component of this seat belt and retractor unit that is available for individual service replacement is the plastic web stop button that prevents the latch plate from falling to the floor while in the stored position. Refer to the instructions supplied with the service kit for the proper web stop button replacement procedures.

NOTE: The following procedure is for replacement of an ineffective or damaged seat belt and retractor unit. The front retractor also includes a seat belt tensioner. If the front seat belt or retractor is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for handling non-deployed supplemental restraints. If the seat belt tensioner has been deployed, review the recommended procedures for service after a supplemental restraint deployment before removing the unit from the vehicle. See STANDARD PROCEDURE.

NOTE: All seat belt retractors except the driver side front and the second row center retractor include a switchable automatic locking mechanism. See DESCRIPTION.

Fig. 79: Identifying Height Adjuster, Seat Belt Turning Loop, Upper Trim, Lower Trim, Body Wire Harness Connector, Lower Retractor & B-Pillar
 Courtesy of CHRYSLER LLC

1. Position the front seat belt and retractor (6) to the inner B-pillar (7) as a unit. Be certain to engage the tab on the upper retractor bracket/seat belt web guide into the engagement slot in the lower B-pillar.
2. Install and tighten the screw that secures the lower retractor bracket to the B-pillar. Tighten the screw to 44.5 N.m (33 ft. lbs.).
3. Reconnect the body wire harness connector (5) to the seat belt tensioner pigtail wire connector.
4. Reinstall the lower trim (4) onto the inside of the B-pillar. Refer to **INSTALLATION** .
5. Position the seat belt turning loop (2) onto the height adjuster (1) on the upper B-pillar. Be certain that the seat belt webbing between the retractor and the turning loop is not twisted.
6. Install and tighten the screw that secures the seat belt turning loop to the height adjuster. Tighten the screw to 44.5 N.m (33 ft. lbs.).
7. Reinstall the upper trim (4) onto the inside of the B-pillar. Refer to **INSTALLATION** .

Fig. 80: Identifying Front Seat, Front Seat Belt, Screw & Seat Back Recliner Handle

Courtesy of CHRYSLER LLC

8. Position the front seat belt (2) lower anchor to the outboard side of the front seat (1) cushion frame. Be certain that the seat belt webbing between the turning loop and the lower anchor is not twisted.
9. Install and tighten the screw (3) that secures the lower anchor to the front seat cushion frame. Tighten the screw to 44.5 N.m (33 ft. lbs.).
10. Insert the engagement tab of the seat belt anchor cover into the front of the opening near the rear of the outboard seat side shield. Using hand pressure, press firmly and evenly on the rear of the cover until it snaps into place.
11. Align the seat back recliner handle (4) to the recliner mechanism shaft near the rear of the outboard seat side shield. Using hand pressure, press firmly and evenly on the handle until it snaps into place.
12. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) verification test procedure should be performed following service of any SRS component. See **STANDARD PROCEDURE**.

SECOND ROW CENTER SEAT BELT AND RETRACTOR

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar® Parts Catalog.

NOTE: All seat belt retractors except the driver side front and the second row center retractor include a switchable automatic locking mechanism. See **DESCRIPTION**.

Fig. 81: Identifying Second Row Center Seat Belt Retractor, Seat Back Panel, Bezel, Screw & Anchor Unit

Courtesy of CHRYSLER LLC

NOTE: The anchor plates for the left outboard second row seat belt buckle and the second row center seat belt anchor are secured to each other by a soft metal grommet as an assembly aid during the manufacturing process and, once removed, the grommet does not require reinstallation.

1. Position the second row center seat belt and retractor unit (1) onto the 60 percent seat back panel (2). Be certain to engage the tab on the retractor frame into the keyed hole in the back panel.
2. Install and tighten the screw (4) that secures the retractor to the seat back panel. Tighten the screw to 55 N.m (41 ft. lbs.).
3. Reinstall the foam, trim cover and bezel (3) onto the seat back panel. Be certain the seat belt webbing between the retractor and the bezel is not twisted. Refer to **ASSEMBLY** .
4. Reinstall the second row seat into the vehicle as a unit. Refer to **INSTALLATION** .
5. Reinstall the left second row seat belt buckle and center seat belt lower anchor unit (5) onto the rear floor panel. See **INSTALLATION**.

SECOND ROW OUTBOARD SEAT BELT AND RETRACTOR

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and

unused replacement parts listed in the DaimlerChrysler Mopar® Parts Catalog.

NOTE: All seat belt retractors except the driver side front and the second row center retractor include a switchable automatic locking mechanism. See **DESCRIPTION.**

Fig. 82: Identifying Inner C-Pillar, Trim, Screws, Second Row Outboard Seat Belt & Retractor
Courtesy of CHRYSLER LLC

1. Position the second row outboard seat belt (4) and retractor (6) to the lower inner C-pillar (1) as a unit.
2. Install and tighten the screw (5) that secures the retractor bracket to the lower C-pillar. Tighten the screw to 44.5 N.m (33 ft. lbs.).
3. Reinstall the quarter trim panel onto the lower C-pillar. Refer to **INSTALLATION**.
4. Position the seat belt turning loop to the upper C-pillar. Be certain the seat belt webbing between the retractor and the turning loop is not twisted.
5. Install and tighten the screw (3) that secures the seat belt turning loop to the upper C-pillar. Tighten the screw to 44.5 N.m (33 ft. lbs.).
6. Reinstall the trim (2) onto the upper C-pillar. Refer to **INSTALLATION**.

Fig. 83: Identifying Nut, Second Row Seat Back, Outboard Seat Bracket, Stud, Rear Floor Panel, Seat Cushion & Seat Belt Lower Anchor
 Courtesy of CHRYSLER LLC

7. Reach through the outboard opening between the second row seat back (2) and seat cushion (6) to position the lower seat belt anchor (7) over the stud (4) at the forward end of the outboard seat bracket (3) on the rear floor panel (5). Be certain the seat belt webbing between the turning loop and the lower anchor is not twisted.
8. Install and tighten the nut (1) that secures the lower seat belt anchor and the seat bracket to the stud. Tighten the nut to 62.5 N.m (46 ft. lbs.).

SEAT BELT SWITCH

DESCRIPTION

SEAT BELT SWITCH

Fig. 84: Identifying Front Seat Belt Buckle And Tensioner Unit, Screw & Pigtail Wire
 Courtesy of CHRYSLER LLC

Two different seat belt switches are used in the front seat buckles of this vehicle. The driver side uses a mechanical switch, while the passenger side is actually a Hall Effect-type sensor. The driver side switch is a small, normally open, single pole, single throw, leaf contact, momentary switch. The driver side seat belt switch is integral to the buckle of the driver side front seat belt buckle. The passenger side switch consists of a fixed-position, Hall Effect Integrated Circuit (IC) chip and a small permanent magnet that is integral to the passenger side front seat belt buckle. The front seat belt buckles (1) are located on a molded plastic scabbard and secured along with the seat belt buckle tensioner mechanism by a screw (2) near the back of the inboard front seat cushion frame.

The seat belt switches are connected to the vehicle electrical system through a two-lead pigtail wire (3) and a four-way connector shared with the buckle tensioner squib circuits on the front seat belt buckle-half, which is connected to a wire harness connector and take out of the seat wire harness routed beneath the front seat cushion. On the passenger side, a one kilohm diagnostic resistor is connected in parallel with the IC where the two pigtail wire leads connect to the IC pins.

The seat belt switches cannot be adjusted or repaired. If ineffective or damaged, the entire front seat belt buckle-half and tensioner unit must be replaced.

OPERATION

SEAT BELT SWITCH

DRIVER SIDE

The driver side front seat belt switch is a hard wired input to the Totally Integrated Power Module (TIPM), which provides electronic **driver side seat belt switch status** messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over the Controller Area Network (CAN) data bus. The EMIC controls the seat belt indicator based upon these electronic **driver side seat belt switch status** message inputs.

When the driver side front seat belt tip-half is inserted into the seat belt buckle, the switch closes the path to ground; and, when the driver side front seat belt tip-half is removed from the seat belt buckle, the switch opens the ground path. The switch is actuated by the latch mechanism within the seat belt buckle.

The seat belt switch is connected in series between ground and the seat belt switch sense input of the TIPM. The seat belt switch receives ground at all times through its pigtail wire connection to the seat wire harness from a take out of the body wire harness. An eyelet terminal connector on the body wire harness ground take out is secured beneath a ground screw on the left cowl side inner panel, beneath the instrument panel. The TIPM monitors the condition of the driver seat belt switch circuits and will send an electronic message to illuminate the airbag indicator in the EMIC then store a Diagnostic Trouble Code (DTC) for any fault that is detected.

The hard wired circuits between the driver side seat belt switch and the TIPM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the switch or the electronic controls or communication between other modules and devices that provide features of the supplemental restraint system. The most reliable, efficient, and accurate means to diagnose the driver side seat belt switch or the electronic controls and communication related to seat belt switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

PASSENGER SIDE

The passenger side front seat belt switch is a hard wired input to the Occupant Restraint Controller (ORC). A spring-loaded slide with a small window-like opening is integral to the buckle latch mechanism. When a seat belt tip-half is inserted and latched into the seat belt buckle, the slide is pushed downward and the window of the slide exposes the Hall Effect Integrated Circuit (IC) chip within the buckle. The field of the permanent magnet induces a current within the chip. The chip provides this induced current as an output to the ORC. When the seat belt is unbuckled, the spring-loaded slide moves upward and shields the IC from the field of the permanent magnet, causing the output current from the seat belt switch to be reduced.

The passenger side seat belt switch receives a clean ground from the ORC through a hard wired connection, and the ORC senses the status of the seat belt buckle by monitoring the modulation of voltage through its connection to the seat belt switch output. The ORC provides electronic **passenger side seat belt switch status** messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over the Controller Area Network (CAN) data bus. The EMIC controls the seat belt indicator based upon these electronic **passenger side seat belt switch status** message inputs. The ORC also monitors the condition of the passenger side seat belt switch circuits and will send an electronic message to illuminate the airbag indicator in the EMIC, then store a DTC for any fault that is detected.

The hard wired circuits between the passenger side seat belt switch and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the switch or the electronic controls or communication between other modules and devices that provide features of the supplemental restraint system. The most reliable, efficient, and accurate means to diagnose the passenger side seat belt switch or the electronic controls and communication related to seat belt switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

SEAT BELT TENSIONER

DESCRIPTION

SEAT BELT TENSIONER

The driver side front seat belt incorporates dual tensioners: one integral to the retractor, and one integral to the buckle. In vehicles manufactured for domestic markets, the passenger side front seat belt uses a single tensioner integral to the retractor. In vehicles manufactured for export markets, the passenger side front seat belt incorporates dual tensioners: one integral to the retractor, and one integral to the buckle.

RETRACTOR TENSIONER

80c717be

Fig. 85: Seat Belt Tensioner
Courtesy of CHRYSLER LLC

Seat belt retractor tensioners supplement the dual front and side curtain airbag system for all versions of this vehicle. These tensioners are integral to the front seat belt and retractor units (1), which are secured to the B-pillars on the right and left sides of the vehicle. The retractors are concealed beneath the molded plastic B-pillar trim. The seat belt tensioner consists primarily of a molded plastic tensioner housing (2), a tubular metal piston housing (3), a piston, a short rack gear, a set of pinion gears, a pyrotechnically activated gas generator (5), and a short pigtail wire (4).

All of these components are located on one side of the retractor spool on the outside of the retractor housing. The seat belt tensioners are controlled by the Occupant Restraint Controller (ORC) and are connected to the vehicle electrical system through dedicated take outs of the body wire harness by keyed and latching molded plastic connector insulators to ensure a secure connection.

The retractor tensioners cannot be repaired and, if ineffective or damaged, the entire front seat belt and retractor unit must be replaced. The retractor tensioners are not intended for reuse and must be replaced following any front airbag deployment. A locked retractor that will not allow the seat belt webbing to be retracted or extracted is a sure indication that the seat belt tensioner has been deployed and requires replacement. See **REMOVAL**.

BUCKLE TENSIONER

81a182a9

Fig. 86: Identifying Molded Plastic Scabbard, Buckle, Pigtail Harnesses, Steel Cylinder Tube & Bracket
 Courtesy of CHRYSLER LLC

A driver side seat belt buckle tensioner supplements the dual front and side curtain airbags for all versions of this vehicle. In vehicles manufactured for export markets, a passenger side seat belt buckle tensioner also supplements the dual front and side curtain airbags. This tensioner is integral to the front seat belt buckle unit, which is secured by a large screw to the outside of the inboard seat cushion frame of the front seat. The buckle tensioner consists primarily of a buckle (2), a molded plastic scabbard (1), a cable and piston, a cable guide and bracket (5), a steel cylinder tube (4), and a small pyrotechnically activated gas generator.

The buckle tensioner is controlled by the Occupant Restraint Controller (ORC) and is connected to the vehicle electrical system through a dedicated take out of the seat wire harness by a keyed and latching yellow molded plastic connector insulator to ensure a secure connection. The buckle tensioner connector is shared by two pigtail harnesses (3): one two-wire squib pigtail and a second two-wire pigtail for the integral seat belt switch.

The buckle tensioner cannot be repaired and, if ineffective or damaged, the entire front seat belt buckle unit must be replaced. If the front airbags have been deployed, the buckle tensioners have also been deployed. The buckle tensioners are not intended for reuse and must be replaced following any front airbag deployment. See **REMOVAL**.

OPERATION

SEAT BELT TENSIONER

The seat belt retractor and buckle tensioners are deployed by a signal generated by the Occupant Restraint Controller (ORC) through the driver or passenger seat belt tensioner line 1 and line 2 (or squib) circuits. When the ORC sends the proper electrical signal to the tensioners, the electrical energy generates enough heat to initiate a small pyrotechnic gas generator.

On the retractor tensioner, the gas generator is installed in one end of the tubular metal piston housing, which contains a piston and a small rack gear. As the gas expands, it pushes the piston and the rack gear through the tube. The rack gear engages a pinion gear that drives a gear set in the tensioner housing, which rotates the seat belt retractor spool causing the slack to be removed from the front seat belts.

On the buckle tensioner, the gas generator is installed in one end of the tubular metal piston housing, which contains a piston secured to one end of a cable. The cable is routed around an integral guide to the buckle, which is secured to the opposite end of the cable. As the gas expands, it pushes the piston and the cable through the tube and pulls the buckle downward, causing the slack to be removed from the driver side front seat belt.

Removing excess slack from the front seat belts not only keeps the occupants properly positioned for an airbag deployment following a frontal impact of the vehicle, but also helps to reduce injuries that the occupants of the front seat might experience in these situations as a result of a harmful contact with the steering wheel, steering column, instrument panel or windshield. Also, the seat belt retractor has a torsion bar mechanism that is designed to deform in order to control the loading being applied to the occupants by the seat belts during a frontal impact, further reducing the potential for occupant injuries.

The ORC monitors the condition of the seat belt tensioners through circuit resistance, and will illuminate the airbag indicator in the ElectroMechanical Instrument Cluster (EMIC) and store a Diagnostic Trouble Code (DTC) for any fault that is detected. Proper diagnosis of the seat belt tensioner gas generator and squib circuits requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

SEAT BELT TURNING LOOP ADJUSTER

REMOVAL

SEAT BELT TURNING LOOP ADJUSTER

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar® Parts Catalog.

Fig. 87: Identifying B-Pillar, Height Adjuster, Seat Belt Turning Loop & Upper Trim
Courtesy of CHRYSLER LLC

1. Remove the upper trim (4) from the inside of the B-pillar (1). Refer to **REMOVAL** .
2. Remove the screw that secures the seat belt turning loop (3) to the height adjuster (2) on the upper B-pillar.
3. Remove the seat belt turning loop from the height adjuster.
4. Remove the screw that secures the upper end of the seat belt turning loop adjuster to the upper B-pillar.
5. Pull the turning loop adjuster upward and away from the B-pillar far enough to disengage the tabs on the lower end of the adjuster from the keyed holes in the B-pillar.
6. Remove the seat belt turning loop adjuster from the B-pillar.

INSTALLATION

SEAT BELT TURNING LOOP ADJUSTER

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar® Parts Catalog.

Fig. 88: Identifying B-Pillar, Height Adjuster, Seat Belt Turning Loop & Upper Trim
Courtesy of CHRYSLER LLC

1. Position the seat belt turning loop adjuster (2) to the inner B-pillar (1).
2. Engage the tabs on the lower end of the adjuster into the keyed holes in the B-pillar.
3. Position the upper end of the turning loop adjuster against the B-pillar.
4. Install and tighten the screw that secures the seat belt turning loop adjuster to the upper B-pillar. Tighten the screw to 44.5 N.m (33 ft. lbs.).
5. Position the seat belt turning loop (3) onto the height adjuster on the upper B-pillar. Be certain that the seat belt webbing (5) between the retractor and the turning loop, and between the turning loop and the lower anchor is not twisted.
6. Install and tighten the screw that secures the seat belt turning loop to the height adjuster. Tighten the screw to 44.5 N.m (33 ft. lbs.).
7. Reinstall the upper trim (4) onto the inside of the B-pillar. Refer to **INSTALLATION**.

SEAT WEIGHT SENSOR

DESCRIPTION

SEAT WEIGHT SENSOR

Fig. 89: Identifying Sensor Mounting Flange, Threaded Mounting Stud, Stamped Metal Cage, Sensor Body & Receptacle

Courtesy of CHRYSLER LLC

The seat weight sensors are strain gauge-type units. The electronic elements of the sensor are encased within the sensor body (5) and the sensor body is located within a stamped metal cage (3). Four sensors are used in the Occupant Classification System (OCS). The sensors are located below the seat cushion between the seat adjuster track and the seat track riser at each corner of the passenger side front seat.

A threaded mounting stud (2) on each sensor body is secured by a nut to the seat track riser, and two nuts secure each sensor mounting flange (1) to two studs integral to the front and rear of the inboard and outboard passenger side lower seat adjuster tracks. A molded connector receptacle (4) integral to each sensor body is oriented towards the center of the seat and is connected to the vehicle electrical system through a dedicated connector and take out of the passenger seat wire harness beneath the seat cushion.

The seat weight sensors cannot be adjusted or repaired and, if ineffective or damaged, the entire sensor must be replaced.

OPERATION

SEAT WEIGHT SENSOR

The seat weight sensor units are designed to sense the relative weight of a load applied to the passenger side front seat, which provides a logic input to the microprocessor of the Occupant Classification Module (OCM). When any load is applied to the seat the load is transmitted through the sensor mounting stud to the sensor body (strain gauge) of each sensor, causing a change of electrical resistance through the strain gauge. These changes in resistance within the internal sensor circuitry change the sensor output voltage.

Each weight sensor receives a nominal five volts and a ground through parallel hard wired circuits from the OCM. The OCM then monitors the output voltage of each sensor on dedicated hard wired data communication circuits. The OCM also monitors the condition of the sensor circuits and will store a Diagnostic Trouble Code (DTC) for any fault that is detected, then send messages to the Occupant Restraint Controller (ORC) to illuminate the airbag indicator in the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

The hard wired circuits between the seat weight sensor and the OCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the seat weight sensors or the electronic controls and communication between other modules and devices that provide features of the Occupant Classification System (OCS). The most reliable, efficient, and accurate means to diagnose the seat weight sensors or the electronic controls and communication related to seat weight sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

SEAT WEIGHT SENSOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with the Occupant Classification System (OCS), do not modify the front passenger seat assembly or center floor console in any way. Do not use any prior year, subsequent year, secondary or aftermarket seat trim covers. At no time should any Supplemental Restraint System (SRS) or OCS component be modified or replaced with any part except those which are specified for the particular vehicle application in the DaimlerChrysler Mopar® Parts Catalog. Failure to observe these precautions could cause an OCS miscalibration condition, which may result in the passenger airbag failing to deploy when required or deploying when not required.

WARNING: To avoid serious or fatal injury, never strike or drop a seat weight sensor or the passenger side front seat assembly to which the sensors are secured as it can damage the sensors or affect their calibration. The seat weight sensors and the passenger side front seat assembly must be handled with care to avoid damage to the sensors. Do not sit upon or place any loads upon a passenger side front seat while it is removed from its mounts in or outside of the vehicle. If an individual sensor is dropped or damaged, replace the sensor with a new and unused unit. If a seat has been dropped during removal or loaded while removed from its mounts, replace each of the seat weight sensors with new and unused units. Failure to observe this warning could result in an accidental, incomplete, or improper passenger side front supplemental restraint deployment.

816a7796

Fig. 90: Removing/Installing Seat Weight Sensor
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the passenger side front seat from the vehicle. Refer to **REMOVAL** .
3. From the underside of the seat, disconnect the seat wire harness from the connector receptacles of each of the four weight sensors.
4. Disconnect the seat wire harness from the connector receptacle of the seat track position sensor located on the inboard side of the inboard seat adjuster upper track near the rear of the seat track.

CAUTION: A strain gauge alignment tool (Special Tool No. 9689) (2) must be used to secure the body of the seat weight sensor (1) from any rotation during removal or installation of the nut that secures the sensor stud to the seat track riser. In addition, the sensor fasteners should always be serviced using hand tools **ONLY**, and not electric or pneumatic power tools. Failure to observe these cautions may result in irreversible sensor damage requiring sensor replacement.

816a779e

Fig. 91: Identifying Center Fork & Tool Support Yoke
 Courtesy of CHRYSLER LLC

5. Install the strain gauge alignment tool (Special Tool 9689) on the sensors by inserting the center fork (1) of the tool between the flats on each side of the sensor body and inside of the cage, then seating the tool support yoke (2) firmly against the outside of the sensor cage.

81a1bca1

Fig. 92: Identifying Passenger Side Front Seat Adjuster, Seat Weight Sensor, Nuts & Seat Track

Risers

Courtesy of CHRYSLER LLC

6. With the alignment tool securing the body of the seat weight sensor (2), remove the nut (4) that secures the sensor stud to the seat track riser (5).
7. Transfer the special tool to each weight sensor, one at a time, and remove the nuts that secure the sensor studs to the seat track risers until all four nuts have been removed.
8. Carefully separate the seat track risers from the seat weight sensor studs.
9. Remove the two nuts (3) that secure the sensor to the studs on the lower track of the seat adjuster (1).
10. Remove the seat weight sensor from the seat adjuster.

INSTALLATION

SEAT WEIGHT SENSOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with the Occupant Classification System (OCS), do not modify the front passenger seat assembly or center floor console in any way. Do not use any prior year, subsequent year, secondary or aftermarket seat trim covers. At no time should any Supplemental Restraint System (SRS) or OCS component be modified or replaced with any part except those which are specified for the particular vehicle application in the DaimlerChrysler Mopar® Parts Catalog. Failure to observe these precautions could cause an OCS miscalibration condition, which may result in the passenger airbag failing to deploy when required or deploying when not required.

WARNING: To avoid serious or fatal injury, never strike or drop a seat weight sensor or the passenger side front seat assembly to which the sensors are secured as it can damage the sensors or affect their calibration. The seat weight sensors and the passenger side front seat assembly must be handled with care to avoid damage to the sensors. Do not sit upon or place any loads upon a passenger side front seat while it is removed from its mounts in or outside of the vehicle. If an individual sensor is dropped or damaged, replace the sensor with a new and unused unit. If a seat has been dropped during removal or loaded while removed from its mounts, replace each of the seat weight sensors with new and unused units.

Failure to observe this warning could result in an accidental, incomplete, or improper passenger side front supplemental restraint deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with the Occupant Classification System (OCS), any time the passenger side front seat assembly has been removed or loosened from the vehicle for service of any vehicle component or system the Occupant Classification System (OCS) Verification Test must be performed using a diagnostic scan tool and the Occupant Classification Seat Weight special tool following reinstallation. Refer to the appropriate diagnostic procedures. Failure to observe this warning could result in an accidental, incomplete, or improper passenger side front supplemental restraint deployment.

Fig. 93: Identifying Passenger Side Front Seat Adjuster, Seat Weight Sensor, Nuts & Seat Track Risers
Courtesy of CHRYSLER LLC

1. Position the seat weight sensor (2) over the studs on the lower track of the passenger side front seat adjuster (1).
2. Install and tighten the two nuts (3) that secure the sensor to the studs. Tighten the nuts to 28 N.m (21 ft. lbs.).
3. Carefully position the seat track risers (5) over all four seat weight sensor studs.

816a7796

Fig. 94: Removing/Installing Seat Weight Sensor
Courtesy of CHRYSLER LLC

CAUTION: A strain gauge alignment tool (Special Tool No. 9689) (2) must be used to secure the body of the seat weight sensor (1) from any rotation during removal or installation of the nut that secures the sensor stud to the seat track riser. In addition, the sensor fasteners should always be serviced using hand tools **ONLY**, and not electric or pneumatic power tools. Failure to observe these cautions may result in irreversible sensor damage requiring sensor replacement.

816a779e

Fig. 95: Identifying Center Fork & Tool Support Yoke
Courtesy of CHRYSLER LLC

4. Install the strain gauge alignment tool (Special Tool 9689) on the sensors by inserting the center fork (1) of the tool between the flats on each side of the sensor body and inside of the cage, then seating the tool support yoke (2) firmly against the outside of the sensor cage.
5. With the alignment tool securing the body of the seat weight sensor, install and tighten the nut that secures the sensor stud to the seat track riser. Tighten the nut to 44.5 N.m (33 ft. lbs.).
6. Transfer the special tool to each weight sensor, one at a time, then install and tighten the nuts that secure each of the four sensor studs to the seat track risers until all four nuts have been installed and tightened.
7. From the underside of the seat, reconnect the seat wire harness to the connector receptacle of the seat track position sensor located on the inboard side of the inboard seat adjuster upper track near the rear of the seat track.
8. Reconnect the seat wire harness to the connector receptacles of each of the four weight sensors.
9. Reinstall the passenger side front seat into the vehicle. Refer to **INSTALLATION**.
10. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) verification test procedure should be performed following service of any SRS component. See **STANDARD PROCEDURE**.
11. Following successful completion of the SRS verification test procedure, perform the Occupant Classification System (OCS) Verification Test using a diagnostic scan tool and the Occupant Classification Seat Weight special tool. Refer to the appropriate diagnostic procedures.

2008 ACCESSORIES AND EQUIPMENT

Speed Control - Liberty

SPEED CONTROL

SWITCH

REMOVAL

REMOVAL

Fig. 1: Speed Control Switch
Courtesy of CHRYSLER LLC

Mounting hole (1) uses a screw. Depending on model line, mounting holes (2) may use either two screws, or one screw and a locating pin.

WARNING:

Do not place a non-deployed airbag face down on a hard surface as the airbag will propel into the air if accidentally deployed, and could result in serious or fatal injury.

Disconnect and isolate the battery negative (ground) cable before beginning steering wheel removal or installation. This will disable the front airbag system. Failure to disconnect the battery could result in accidental front airbag module deployment and possible personal injury.

Allow the front airbag system capacitor to discharge for two minutes before removing the steering wheel or any front airbag system component.

The speed control switch is mounted in the steering wheel and wired through the clock spring device under the airbag module.

1. Adjust steering wheel until tires are in STRAIGHT-AHEAD position.

2. Remove negative battery cable.
3. Turn off ignition.
4. Remove air bag. Refer **REMOVAL** .

Fig. 2: Horn Switch

Courtesy of CHRYSLER LLC

5. Disconnect connector from clockspring.
6. Remove three mounting fasteners.
7. Remove horn switch.

80c4f3b3

Fig. 3: Switch Top Mounting Screw
Courtesy of CHRYSLER LLC

8. Remove either two or three speed control switch mounting screws (1).
9. Disconnect electrical connector.
10. Remove switch.

INSTALLATION

INSTALLATION

81914b1b

Fig. 4: Speed Control Switch
 Courtesy of CHRYSLER LLC

Mounting hole (1) uses a screw. Depending on model line, mounting holes (2) may use either two screws, or one screw and a locating pin.

80c4f3b3

Fig. 5: Switch Top Mounting Screw

Courtesy of CHRYSLER LLC

1. Connect electrical connector to speed control switch.
2. Install speed control switch mounting screws.
3. Tighten screws (1) to 1.6 N.m (15 in. lbs.). Make sure rubber seal is in place around switch.

Fig. 6: Horn Switch

Courtesy of CHRYSLER LLC

4. Install horn switch.
5. Install three mounting fasteners.
6. Connect electrical connector to clockspring.
7. Install driver airbag. Refer to **INSTALLATION** .

WARNING: Do not connect battery negative cable yet. Refer first to airbag system test. Refer to DIAGNOSIS AND TESTING .

8. Reconnect battery using Airbag System Test procedure in Restraints. Refer to **DIAGNOSIS AND TESTING** .
9. Close hood.
10. Verify vehicle and system operation.

2008 ENGINE

Starting - Electrical Diagnostics - Liberty

STARTING - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B1820-HOOD AJAR INPUT CIRCUIT HIGH

9164430

Fig. 1: Hood Ajar Switch Circuit Schematic
 Courtesy of CHRYSLER LLC

For complete wiring diagrams, refer to [SYSTEM WIRING DIAGRAMS](#) article.

When Monitored:

Continuously

Set Condition:

When the TIPM senses the Hood Ajar Switch Sense circuit is open this code will set.

Possible Causes
(G931) GROUND CIRCUIT OPEN
(G70) HOOD AJAR SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
(G70) HOOD AJAR SWITCH SENSE CIRCUIT OPEN
HOOD AJAR SWITCH OPEN
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1) TEST FOR INTERMITTENT CONDITION

NOTE: **Open the hood and ensure the Hood Ajar Switch is connected before proceeding**

With the scan tool, record and erase DTC's

Close the hood.

Cycle the ignition from on to off.

Turn the ignition on.

Open then close the hood.

With the scan tool, read DTC's.

Does the scan tool display B1820-HOOD AJAR INPUT CIRCUIT HIGH?

Yes

Go To step 2).

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2) HOOD AJAR SWITCH OPEN

Disconnect the Hood Ajar Switch harness connector.

Depress the plunger of the hood ajar switch and measure the resistance between the two terminals of the switch.

Is the resistance approximately 1K ohms?

Yes

Go To step 3).

No

Replace the Hood Ajar Switch.

Perform **BODY VERIFICATION TEST - VER 1** .

3) (G931) GROUND CIRCUIT OPEN

Fig. 2: Using 12-Volt Test Light Connected To 12-Volts To Check Ground Circuit
Courtesy of CHRYSLER LLC

Using a 12-volt Test Light connected to 12-volts, check the (G931) Ground circuit.

Does the test light illuminate?

Yes

Go To step 4).

No

Repair the (G931) Ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4) (G70) HOOD AJAR SWITCH SENSE CIRCUIT SHORT TO VOLTAGE

Fig. 3: Measuring Voltage Between (G70) Hood Ajar Switch Sense Circuit And Ground
Courtesy of CHRYSLER LLC

Disconnect the TIPM C4 connector.

Turn the ignition on.

Measure the voltage between the (G70) Hood Ajar Switch Sense circuit and ground.

Is there any voltage present?

Yes

Repair the (G70) Hood Ajar Switch Sense circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To step 5).

5) (G70) HOOD AJAR SWITCH SENSE CIRCUIT OPEN

Fig. 4: Measuring Resistance Of (G70) Hood Ajar Switch Sense Circuit Between TIPM C4 Connector And Hood Ajar Switch Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance of the (G70) Hood Ajar Switch Sense circuit between the TIPM C4 connector and the Hood Ajar Switch connector.

Is the resistance below 2.0 ohms?

Yes

Replace the Totally Integrated Module (TIPM) in accordance with the service information.
 Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (G70) Hood Ajar Switch Sense circuit for an open.
 Perform **BODY VERIFICATION TEST - VER 1** .

***REMOTE START INOPERATIVE**

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Possible Causes
REMOTE START PARAMETERS NOT MET

Diagnostic Test

1) REMOTE START PARAMETERS NOT MET / FAULTY COMPONENT

Refer to the Data Display in the scan tool to view possible causes of the inoperative Remote Start System.

Repair

See the following list below for possible causes for the inoperative Remote Start System:

- ABORT
- BATTERY VOLTAGE HIGH
- BATTERY VOLTAGE LOW
- BRAKE PRESSED
- COOLANT TEMPERATURE HIGH
- CRANK NO START
- DRIVER DOOR AJAR
- EXCESSIVE GLOW PLUG TIME (DIESEL ONLY)
- FAILED COUNTER REACHED (START)
- HAZARD LAMPS (SWITCH PRESSED)
- HOOD AJAR
- IGNITION IN RUN/START
- IGNITION NOT IN LOCK
- IGNITION SNA (SIGNAL NOT AVAILABLE FROM OTHER MODULE)
- INVALID KEY
- KEY IN IGNITION
- LEFT REAR DOOR AJAR
- LOW RPM SHUTDOWN
- MIL ON
- NO AUTOMATIC TRANSMISSION
- NO HOOD SWITCH (INOPERATIVE)
- NORMAL TIME OUT CUSTOMER ACCESS
- NORMAL TIME OUT RUN MODE (15 MINUTES)
- NOT CONFIGURED

NOT ENABLED
NOT IN PARK OR NEUTRAL
NOT PROGRAMMED
OIL PRESSURE LOW
PANIC MODE (ACTIVATED)
PASSENGER DOOR AJAR
POWER LOSS
RIGHT REAR DOOR AJAR
RKE OFF MESSAGE
RPM TOO HIGH (EXCEEDS 2500)
START COUNTER REACHED
TRUNK/LIFTGATE AJAR
VEHICLE SPEED HIGH
VTA ALARMING

If all of the previous items checked OK, and the remote starting system will not operate, refer to ***REMOTE START INOPERATIVE-ANTENNA** for further information.

***REMOTE START INOPERATIVE-ANTENNA**

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Theory of Operation

The customer may notice that the signal range of the Remote Keyless Entry (RKE) system is reduced. The RKE key fob may need to be closer than 3 meters (10 feet) before the functions available on the key fob will operate. This condition may be due to the RKE antenna. The diagnostic flow chart is provide as a diagnostic aid for dealer technician.

Diagnostic Test

1) LOCK/UNLOCK FUNCTION

NOTE: For all RKE tests, the key must be out of the ignition.

Does the Lock/Unlock function with the interior door switches?

Yes

Go To step 2).

No

Perform Power Lock/Unlock System diagnosis.

2) RKE FUNCTION AT 20 FEET

Does the RKE Function at 20 feet?

Yes

Go To step 3).

No

Go To step 4).

3) RKE FUNCTION AT 100 FEET

Does the RKE Function at 100 feet?

Yes

Test complete.

No

Replace the antenna in accordance with the service information.

4) WCM DTCS

Does the WCM display any DTCS?

Yes

Perform WCM diagnosis.

No

Go To step 5).

5) RKE FUNCTION INSIDE VEHICLE

Sit inside the vehicle.

Push the Key Fob RKE Lock/Unlock buttons.

Does the RKE Lock/Unlock work?

Yes

Go To step 6).

No

Go To step 9).

6) ANTENNA COAX CABLE NOT PROPERLY CONNECTED

Pull on the Antenna COAX cable connector at the WCM.

Did the connector come off without releasing the lock tab (not properly seated)?

Yes

Connect Antenna

Go To step 2).

No

Go To step 7).

7) VERIFY COAX CONNECTION AT WCM

Pull Antenna connector off WCM. Verify no bent pins.

Are there any bent pins?

Yes

Replace antenna.

Go To step 2).

No

Go To step 8).

8) PINCHED WIRE

Inspect the ANTENNA Lead COAX Cable for a pinched wire.

Has the COAX cable been pinched or damaged?

Yes

Replace antenna.

Go To step 2).

No

Perform WCM diagnostics.

9) RKE FUNCTION INSIDE VEHICLE

Disconnect the Antenna COAX Cable lead connector to WCM.

Sit inside the vehicle. Push the RKE Key Fob Lock/Unlock buttons.

Does the RKE Lock/Unlock work?

Yes

Replace the antenna.

No

Go To step 10).

10) CHECK FOR 12 VOLTS AT WCM

Connect the Antenna Lead to WCM.

Disconnect the WCM harness connector.

Using the appropriate wiring diagrams, check for Fused B+ at the WCM harness connector.

Is Fused B+ present?

Yes

Perform WCM diagnostics.

No

Repair the appropriate circuits.

2008 ENGINE

Starting System - Service Information - Liberty

STARTING SYSTEM

DESCRIPTION

DESCRIPTION

The Remote Starting System allows the vehicle to be started up to 300 feet (91 meters) away from the vehicle using the remote keyless entry key fob which is part of your ignition key. In order to remote start your vehicle, the hood, liftgate, and all of the doors must be closed. To remotely start your vehicle, press the "Lock" button on the key fob once, then within three seconds press the "Remote Start" button twice. To indicate that the vehicle is about to start, the parking lights will flash and the horn will sound briefly. Once the vehicle has started, the engine will run for 15 minutes. To cancel remote start, press the "Remote Start" button twice within two seconds. To enter the vehicle while the engine is running during a remote start, you must first unlock the vehicle using the "Unlock" button on the key fob. After the vehicle is unlocked, you have 60 seconds to enter the vehicle, insert the key into the ignition, and move it to the RUN position. Otherwise, the engine will cancel remote start and automatically turn off. Remote start will also cancel if any of the following occur:

- If the engine stalls or RPM exceeds 2500.

- Any engine warning lamps come on.

- The hood is opened.

- The hazard switch is pressed.

- The transmission is moved out of P (Park).

The vehicle can be started remotely up to a maximum of two times. The vehicle is also allowed a maximum of one failed start, where the remote start sequence was initiated but cancelled before the engine begins to crank. After either of these conditions, or if the Vehicle Theft Alarm is alarming, or if the PANIC button was pressed, the vehicle must be reset by inserting a valid key into the ignition and moving it to the RUN position, then back to LOCK.

STARTING SYSTEM

The starting system consists of:

- Starter relay

- Starter motor (including an integral starter solenoid)

Other components to be considered as part of starting system are:

- Battery

- Battery cables

- Ignition switch and key lock cylinder

Clutch pedal position switch (manual transmission)
Park/neutral position switch (automatic transmission)
Wire harnesses and connections.

The Battery, Starting, and Charging systems operate in conjunction with one another, and must be tested as a complete system. For correct operation of starting/charging systems, all components used in these 3 systems must perform within specifications. When attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used in each of these articles include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, volt/ohmmeter, battery charger, carbon pile rheostat (load tester), and 12-volt test lamp may be required.

Certain starting system components are monitored by the PCM and may produce a Diagnostic Trouble Code (DTC).

OPERATION

OPERATION

Remote Start Operating Conditions

In order to operate remote start, the following conditions must be met:

- Key fob sequence must be operated within a 100 meter range of the vehicle.
- The vehicle must be in Park.
- Key is not in the ignition.
- The hazard switch off.
- Vehicle Theft Alarm or Panic is not alarming.
- Doors and hood must be closed.
- The battery voltage is normal (11 to 15 volts).

Remote Start Shut Down/Deactivate Conditions

Engine will NOT start or will shut down/deactivate during any of the following conditions:

- Key in Ignition.
- Doors or hood are opened before remote unlock.
- Hazard Switch depressed.
- Panic or theft alarm active.
- Brake applied.
- A prior remote start cranked the engine , but failed to start the engine.
- Battery voltage NOT in the normal range.

- High (run away) or Low Idle (stall) RPM.
- MIL Active.
- High Engine Coolant Temperature.
- Low Engine Oil Pressure.

Initiate Remote Start

To Remote Start the vehicle:

1. Press remote button on the Key Fob twice within 5 seconds.

NOTE: Engine will run for 15 minutes after a remote start is initiated. After 15 minutes, the engine will shut off. The system allows for only two sequential remote starts without a key ignition cycle.

2. Unlock vehicle with Key Fob to enter the vehicle.
3. Put key in ignition, turn key to run position to exit remote start and enter a normal start without engine shut off.

Identification that Remote Start is Activated

To identify that Remote Start has been activated the following will occur:

- Horn will sound and lights will flash to acknowledge a start command was received.
- Park Lamps will turn on to indicate that the engine is running in remote start mode.

Terminate Remote Start

To terminate Remote Start, press Remote Start button on the Key Fob once.

NOTE: In order to avoid inadvertent shut downs, the one-time press to shut down the vehicle will be disabled for two seconds after receipt of a valid remote start request.

STARTING SYSTEM

The starting system components form two separate circuits. A high-amperage feed circuit that feeds the starter motor between 150 and 350 amperes (700 amperes - diesel engine), and a low-amperage control circuit that operates on less than 20 amperes. The high-amperage feed circuit components include the battery, the battery cables, the contact disc portion of the starter solenoid, and the starter motor. The low-amperage control circuit components include the ignition switch, the clutch pedal position switch (manual transmission), the park/neutral position switch (automatic transmission), the starter relay, the electromagnetic windings of the starter solenoid, and the connecting wire harness components.

If the vehicle is equipped with a manual transmission, it has a clutch pedal position switch installed in series between the ignition switch and the coil battery terminal of the starter relay. This normally open switch prevents

the starter relay from being energized when the ignition switch is turned to the momentary Start position, unless the clutch pedal is depressed. This feature prevents starter motor operation while the clutch disc and the flywheel are engaged. The starter relay coil ground terminal is always grounded on vehicles with a manual transmission.

If the vehicle is equipped with an automatic transmission, battery voltage is supplied through the low-amperage control circuit to the coil battery terminal of the starter relay when the ignition switch is turned to the momentary Start position. The park/neutral position switch is installed in series between the starter relay coil ground terminal and ground. This normally open switch prevents the starter relay from being energized and the starter motor from operating unless the automatic transmission gear selector is in the Neutral or Park positions.

When the starter relay coil is energized, the normally open relay contacts close. The relay contacts connect the relay common feed terminal to the relay normally open terminal. The closed relay contacts energize the starter solenoid coil windings.

The energized solenoid pull-in coil pulls in the solenoid plunger. The solenoid plunger pulls the shift lever in the starter motor. This engages the starter overrunning clutch and pinion gear with the starter ring gear on the manual transmission flywheel or on the automatic transmission torque converter or torque converter drive plate.

As the solenoid plunger reaches the end of its travel, the solenoid contact disc completes the high-amperage starter feed circuit and energizes the solenoid plunger hold-in coil. Current now flows between the solenoid battery terminal and the starter motor, energizing the starter.

Once the engine starts, the overrunning clutch protects the starter motor from damage by allowing the starter pinion gear to spin faster than the pinion shaft. When the driver releases the ignition switch to the On position, the starter relay coil is de-energized. This causes the relay contacts to open. When the relay contacts open, the starter solenoid plunger hold-in coil is de-energized.

When the solenoid plunger hold-in coil is de-energized, the solenoid plunger return spring returns the plunger to its relaxed position. This causes the contact disc to open the starter feed circuit, and the shift lever to disengage the overrunning clutch and pinion gear from the starter ring gear.

DIAGNOSIS AND TESTING

D & T REMOTE STARTING SYSTEM

Before attempting to diagnose a problem with the remote starting system, first be sure the starter motor and starter solenoid are working properly. The starter should operate with the use of the standard ignition key in the ignition switch. Any starter or solenoid problems must be repaired first.

Also be sure the engine will easily start and run with the use of the standard ignition key in the ignition switch. Any engine running, idling or driveability problems must be repaired first.

Also note that the remote start system will automatically be cancelled if any of the following occur:

- IF THE ENGINE STALLS OR RPM EXCEEDS 2500
- NORMAL TIME OUT RUN MODE (15 MINUTES)

- CUSTOMER MOVES IGNITION INTO RUN/START
- ANY VEHICLE DOOR AJAR
- TRUNK/LIFTGATE AJAR
- HOOD AJAR
- START COUNTER REACHED
- LOW RPM SHUTDOWN
- KEY IN IGNITION
- BRAKE PRESSED
- THE HAZARD SWITCH IS PRESSED
- NOT IN PARK OR NEUTRAL
- VEHICLE SPEED HIGH
- VTA ALARM TRIGGERED
- PANIC MODE ACTIVATED
- BATTERY VOLTAGE HIGH
- BATTERY VOLTAGE LOW
- LOSS OF BATTERY VOLTAGE
- MIL ON
- LOW OIL PRESSURE
- COOLANT TEMPERATURE HIGH
- CRANK NO START
- RKE OFF MESSAGE
- VEHICLE NOT CONFIGURED
- HOOD SWITCH NOT INSTALLED OR INOPERATIVE
- NO AUTOMATIC TRANSMISSION
- INVALID KEY
- IGNITION SNA
- IGNITION NOT IN LOCK
- EXCESSIVE GLOW PLUG TIME (DIESEL ONLY)
- VEHICLE IN SHIPPING MODE
- VEHICLE NOT PROGRAMMED

If all of the previous items checked OK, and the remote starting system will not operate, refer to **STARTING - ELECTRICAL DIAGNOSTICS** for further information.

STARTING SYSTEM

The battery, starting, and charging systems operate in conjunction with one another, and must be tested as a complete system. For correct starting/charging system operation, all of the components involved in these three systems must perform within specifications.

Starting System Diagnosis

CONDITION	POSSIBLE CAUSE	CORRECTION
STARTER FAILS TO OPERATE.	1. Battery discharged or faulty.	1. Refer to <u>BATTERY SYSTEM - SERVICE INFORMATION</u> . Charge or replace battery, if required.
	2. Starting circuit wiring faulty.	2. Refer to <u>SYSTEM WIRING DIAGRAMS</u> article . Test and repair starter feed and/or control circuits, if required.
	3. Starter relay faulty.	3. The starter relay is located within the TIPM (Totally Integrated Power Module). Refer to <u>*ETC INTERMITTENT NO CRANK CONDITION</u>
	4. Ignition switch faulty.	4. Refer to <u>SWITCH-IGNITION</u> and <u>CYLINDER-KEY/LOCK</u> . Replace ignition switch if required.
	5. Clutch pedal position switch faulty.	5. Refer to <u>SWITCH-CLUTCH PEDAL POSITION</u> .
	6. Park/Neutral position switch faulty or misadjusted.	6. Refer to <u>TRANSMISSION RANGE SENSOR</u> . Replace park/neutral position switch if required.
	7. Starter solenoid faulty.	7. Refer to <u>MOTOR - STARTER</u> . Replace starter motor assembly if required.
	8. Starter motor faulty.	8. If all other starting system components and circuits test OK, replace starter motor.
STARTER ENGAGES, FAILS TO TURN ENGINE.	1. Battery discharged or faulty.	1. Refer to <u>BATTERY SYSTEM - SERVICE INFORMATION</u> article . Charge or replace battery if required.
	2. Starting circuit wiring faulty.	2. Refer to <u>SYSTEM WIRING DIAGRAMS</u> article . Test and repair starter feed and/or control circuits if required.
	3. Starter motor faulty.	3. If all other starting system components and circuits test OK, replace starter motor assembly.
	4. Engine seized.	4. Refer to <u>3.7L - SERVICE INFORMATION</u> article.
STARTER ENGAGES, SPINS OUT BEFORE ENGINE STARTS.	1. Starter ring gear faulty.	1. Refer to <u>MOTOR - STARTER</u> . Remove starter motor to inspect starter ring gear. Replace starter ring gear if required.
	2. Starter motor faulty.	2. If all other starting system components and circuits test OK, replace starter motor assembly.
STARTER DOES NOT DISENGAGE.	1. Starter motor improperly installed.	1. Refer to <u>MOTOR - STARTER</u> . Tighten starter mounting hardware to

		correct torque specifications.
	2. Starter relay faulty.	2. The starter relay is located within the TIPM (Totally Integrated Power Module). Refer to <u>*NO CRANK CONDITION</u> .
	3. Ignition switch faulty.	3. Refer to <u>SWITCH-IGNITION</u> and <u>CYLINDER-KEY/LOCK</u> . Replace ignition switch if required.
	4. Starter motor faulty.	4. If all other starting system components and circuits test OK, replace starter motor.

INSPECTION

For complete starter wiring circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** article . Before removing any unit from starting system for repair or diagnosis, perform the following inspections:

WARNING: On vehicles equipped with airbags, refer to **RESTRAINTS - SERVICE INFORMATION** article , before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

Battery - Visually inspect battery for indications of physical damage and loose or corroded cable connections. Determine state-of-charge and cranking capacity of battery. Charge or replace battery if required. **Note: If equipped with diesel engine, a dual battery system may be used, and both batteries must be inspected.**

Ignition Switch - Visually inspect ignition switch for indications of physical damage and loose or corroded wire harness connections. Refer to **Ignition Switch and Key Lock Cylinder**.

Clutch Pedal Position Switch - If equipped with manual transmission, visually inspect clutch pedal position switch for indications of physical damage and loose or corroded wire harness connections. Refer to **SWITCH-CLUTCH PEDAL POSITION** .

Park/Neutral Position Switch - If equipped with automatic transmission, visually inspect park/neutral position switch for indications of physical damage and loose or corroded wire harness connections. Refer to **TRANSMISSION RANGE SENSOR** .

Starter Relay - The starter relay is located within the TIPM (Totally Integrated Power Module). Refer to ***NO CRANK CONDITION** .

Starter Motor - Visually inspect starter motor for indications of physical damage and loose or corroded wire harness connections.

Starter Solenoid - Visually inspect starter solenoid for indications of physical damage and loose or corroded wire harness connections.

Wiring - Visually inspect wire harnesses for damage. Repair or replace any faulty wiring, as required. Refer to **SYSTEM WIRING DIAGRAMS** article .

TESTING

COLD CRANKING TEST

NOTE: For complete starter wiring circuit diagrams, refer to SYSTEM WIRING DIAGRAMS article . The battery must be fully-charged and load-tested before proceeding.

Fig. 1: Connecting Volt-Ampere Tester To Battery Terminals - Typical
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - POSITIVE CLAMP
2 - NEGATIVE CLAMP
3 - INDUCTION AMMETER CLAMP |
|---|

1. Connect volt-ampere tester (1) and (2) to battery terminals. See **Fig. 1**. See instructions provided by manufacturer of volt-ampere tester being used. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, tester should be connected to battery on left side of vehicle only. Also, tester current reading must be taken from positive battery cable lead that connects to starter motor.**
2. Fully engage parking brake.
3. If equipped with manual transmission, place gearshift selector lever in Neutral position and block clutch

pedal in fully depressed position. If equipped with automatic transmission, place gearshift selector lever in Park position.

4. Verify that all lamps and accessories are turned off.
5. To prevent a gasoline engine from starting, remove either the ignition run fuse, or the fuel pump control fuse. To prevent a diesel engine from starting, disconnect the electrical connectors at both the camshaft and crankshaft position sensors.

WARNING: Attempt to start engine a few times before proceeding with following step.

NOTE: A cold engine will increase starter current (amperage) draw reading, and reduce battery voltage reading.

6. Rotate and hold ignition switch in Start position. Note cranking voltage and current (amperage) draw readings shown on volt-ampere tester.
 - If voltage reads below 9.6 volts, refer to **Starter Motor** . If starter motor is OK, refer to **Engine Diagnosis** in 9, Engine for further testing of engine. If starter motor is not OK, replace faulty starter motor.
 - If voltage reads above 9.6 volts and current (amperage) draw reads below specifications, refer to **FEED CIRCUIT TEST**.
 - If voltage reads 12.5 volts or greater and starter motor does not turn, refer to **CONTROL CIRCUIT TESTING**.
 - If voltage reads 12.5 volts or greater and starter motor turns very slowly, refer to **FEED CIRCUIT TEST**.

FEED CIRCUIT TEST

The starter feed circuit test (voltage drop method) will determine if there is excessive resistance in high-amperage feed circuit. For complete starter wiring circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** article .

When performing these tests, it is important to remember that voltage drop is giving an indication of resistance between two points at which voltmeter probes are attached.

Example: When testing resistance of positive battery cable, touch voltmeter leads to positive battery cable clamp and cable connector at starter solenoid. If you probe positive battery terminal post and cable connector at starter solenoid, you are reading combined voltage drop in positive battery cable clamp-to-terminal post connection and positive battery cable.

The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing tests, be certain that following procedures are accomplished:

Battery is fully-charged and load-tested.

Fully engage parking brake.

If equipped with manual transmission, place gearshift selector lever in Neutral position and block clutch

pedal in fully depressed position. If equipped with automatic transmission, place gearshift selector lever in Park position.

Verify that all lamps and accessories are turned off.

To prevent a gasoline engine from starting, remove Automatic ShutDown (ASD) relay. To prevent a diesel engine from starting, remove Fuel Pump Relay. These relays are located in Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

Fig. 2: Testing Battery Negative Connection Resistance - Typical
Courtesy of CHRYSLER LLC

1 - VOLTMETER
2 - BATTERY

1. Connect positive lead of voltmeter (1) to negative battery cable terminal post. Connect negative lead of voltmeter to negative battery cable clamp. See **Fig. 2**. Rotate and hold ignition switch in Start position. Observe voltmeter. If voltage is detected, correct poor contact between cable clamp and terminal post.
Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, procedure must be performed twice, once for each battery.

Fig. 3: Testing Battery Positive Connection Resistance - Typical
Courtesy of CHRYSLER LLC

1 - VOLTMETER 2 - BATTERY

2. Connect positive lead of voltmeter to positive battery terminal post. Connect negative lead of voltmeter to battery positive cable clamp. See **Fig. 3**. Rotate and hold ignition switch in Start position. Observe voltmeter. If voltage is detected, correct poor contact between cable clamp and terminal post. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, this procedure must be performed twice, once for each battery.**

Fig. 4: Testing Battery Positive Cable Resistance - Typical
Courtesy of CHRYSLER LLC

1 - BATTERY
2 - VOLTMETER
3 - STARTER MOTOR

3. Connect voltmeter to measure between battery positive terminal post and starter solenoid battery terminal stud. See **Fig. 4**. Rotate and hold ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten battery cable connection at solenoid. Repeat test. If reading is still above 0.2 volt, replace faulty positive battery cable. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, this procedure must be performed on driver side battery only.**

Fig. 5: Testing Ground Circuit Resistance - Typical
Courtesy of CHRYSLER LLC

1 - VOLTMETER
2 - BATTERY
3 - ENGINE GROUND

4. Connect voltmeter to measure between negative battery terminal post and a good clean ground on engine block. See **Fig. 5**. Rotate and hold ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten negative battery cable attachment on engine block. Repeat test. If reading is still above 0.2 volt, replace faulty negative battery cable. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, this procedure must be performed twice, once for each battery.**

Fig. 6: Testing Starter Ground - Typical
 Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - STARTER MOTOR
2 - BATTERY
3 - VOLTMETER |
|---|

5. Connect positive lead of voltmeter to starter housing. Connect negative lead of voltmeter to negative battery terminal post. See **Fig. 6**. Rotate and hold ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, correct poor starter to engine block ground contact. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, this procedure must be performed on driver side battery only.**
6. If equipped with dual battery system (certain diesel equipped models), connect positive lead of voltmeter to positive battery cable clamp on battery located on left side of vehicle. Connect negative lead of voltmeter to positive battery terminal post on battery located on right side of vehicle. Rotate and hold ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten battery cables at both batteries. Repeat test. If reading is still above 0.2 volt, replace faulty positive battery cable.

If resistance tests detect no feed circuit problems, refer to **Starter Motor** .

CONTROL CIRCUIT TESTING

The starter control circuit components should be tested in the order in which they are listed, as follows:

Starter Relay - Refer to **Starter Relay** . The starter relay is located within the TIPM (Totally Integrated Power Module). Refer to "no crank condition" in 9 - Engine - Electrical Diagnosis.

Starter Solenoid - Refer to **Starter Motor** .

Ignition Switch - Refer to **Ignition Switch and Key Lock Cylinder**

Clutch Pedal Position Switch - If equipped with manual transmission, refer to **SWITCH-CLUTCH PEDAL POSITION** .

Park/Neutral Position Switch - If equipped with automatic transmission, refer to **TRANSMISSION RANGE SENSOR** .

Wire harnesses and connections - Refer to **SYSTEM WIRING DIAGRAMS** article .

SPECIFICATIONS

SPECIFICATIONS

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.
Starter Solenoid Battery Cable Nut	11	-	100
Starter Mounting Bolts - 3.7L	54	40	-
Starter Mounting Bolts - 2.8L Diesel	41	30	-
Starter Heat Shield Mounting Bolts	6	-	55

STARTING SYSTEM

STARTER MOTOR		
Engine Application	3.7L	2.8L Diesel
Power Rating	1.2 Kilowatt	2.2 Kilowatt
* Cranking Amperage Draw Test	100 - 200 Amperes	500 Amperes
* Test at operating temperature. Cold engine, tight (new) engine, or heavy oil will increase starter amperage draw.		
**The starter is equipped with permanent magnets. Never strike the starter case to attempt to loosen a sticking/stuck armature as permanent magnets may crack or break.		

MOTOR - STARTER

DIAGNOSIS AND TESTING

STARTER MOTOR

Correct starter motor operation can be confirmed by performing the following free running bench test. This test can only be performed with starter motor removed from vehicle.

1. Remove starter motor from vehicle.
2. Mount starter motor securely in a soft-jawed bench vise. The vise jaws should be clamped on the mounting flange of starter motor. Never clamp on starter motor by field frame.
3. Connect a suitable volt-ampere tester and a 12-volt battery to starter motor in series, and set ammeter to 100 ampere scale. See instructions provided by manufacturer of volt-ampere tester being used.
4. Install jumper wire from solenoid terminal to solenoid battery terminal. The starter motor should operate. If starter motor fails to operate, replace faulty starter motor assembly.
5. Adjust carbon pile load of tester to obtain free running test voltage.
6. Note reading on ammeter and compare reading to free running test maximum amperage draw.
7. If ammeter reading exceeds maximum amperage draw specification, replace faulty starter motor assembly.

STARTER SOLENOID

Certain vehicles with certain engines may require starter motor removal for the following test.

1. If necessary, remove starter motor from vehicle.
2. Disconnect solenoid connector wiring from starter motor.

Fig. 7: SOLENOID CONTINUITY TEST
Courtesy of CHRYSLER LLC

3. Check for continuity between solenoid terminal (2) and solenoid case (3). There should be continuity. If not OK, replace faulty starter motor assembly.

REMOVAL

REMOVAL - 2.8L DIESEL

5. Position starter heat shield (2) and install two bolts (1).
6. **Four Wheel Drive Equipped:** Install front propeller shaft.
7. Lower vehicle.
8. Connect negative battery cable.

RELAY - STARTER MOTOR

DESCRIPTION

STARTER RELAY

The starter relay is an electromechanical device that switches battery current to the pull-in coil of the starter solenoid when ignition switch is turned to Start position. The starter relay is located in the Power Distribution Center (PDC) in the engine compartment. See PDC cover for relay identification and location.

The starter relay is an International Standards Organization (ISO) relay. Relays conforming to ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions.

The starter relay cannot be repaired or adjusted and, if faulty or damaged, it must be replaced.

OPERATION

STARTER RELAY

The ISO relay consists of an electromagnetic coil, a resistor or diode, and three (two fixed and one movable) electrical contacts. The movable (common feed) relay contact is held against one of the fixed contacts (normally closed) by spring pressure. When electromagnetic coil is energized, it draws the movable contact away from normally closed fixed contact, and holds it against the other (normally open) fixed contact.

When electromagnetic coil is de-energized, spring pressure returns movable contact to normally closed position. The resistor or diode is connected in parallel with electromagnetic coil within relay, and helps to dissipate voltage spikes produced when coil is de-energized.

REMOVAL

STARTER RELAY

Fig. 20: Identifying Power Distribution Center (PDC) & Left Inner Fender
Courtesy of CHRYSLER LLC

The fuel pump relay is located in the Power Distribution Center (PDC) (1). The PDC is located in the engine compartment near the left inner fender (2). Refer to label on PDC cover for relay location.

1. Remove PDC cover.
2. Remove relay from PDC.
3. Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.
4. Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.

INSTALLATION

STARTER RELAY

Fig. 21: Identifying Power Distribution Center (PDC) & Left Inner Fender
Courtesy of CHRYSLER LLC

1. Refer to Power Distribution Center (PDC) cover for starter relay location.
2. Install relay to PDC (1).
3. Install cover to PDC.

MODULE-REMOTE START ANTENNA

DESCRIPTION

MODULE - REMOTE START ANTENNA

Fig. 22: REMOTE START ANTENNA MODULE ASSEMBLY
Courtesy of CHRYSLER LLC

The Remote Start Antenna Module Assembly consists of an electrical connection to the WCM/WIN (1), a length of coaxial cable (2), two mounting clips (3) and (4), and a control module/antenna (5).

OPERATION

OPERATION

The remote start antenna is located behind the instrument cluster. The antenna interfaces with the Wireless Control Module (WCM) through a coaxial electrical cable and electrical connector. The antenna helps to amplify the signal for the Remote Keyless Entry (RKE) key fob.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in

accidental airbag deployment.

Fig. 23: Identifying Mounting Bracket, Screw, Sentry Key Remote Entry Module (SKREEM), Start Antenna Coaxial Cable Connector, Instrument Panel Wire Harness Connector & Lock Cylinder
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove but do not disconnect the right multi-function switch from the integral mounting bracket (1) on the right side of the clockspring and position it so that the Sentry Key Remote Entry Module (SKREEM) (also known as the Sentry Key Immobilizer Module/SKIM or the Wireless Control Module/WCM) mounting screw (2) may be accessed. Refer to **REMOVAL** .
3. Disconnect the instrument panel wire harness connector (5) from the SKREEM (3) connector receptacle.
4. Remove the screw (2) that secures the SKREEM to the boss on the top of the ignition lock cylinder housing (6).
5. Disengage the SKREEM antenna ring from around the ignition lock housing and remove the SKREEM from the steering column.
6. Remove the coaxial electrical cable connector (4) from the SKREEM (3).

Fig. 24: ANTENNA MODULE
Courtesy of CHRYSLER LLC

7. Remove the instrument cluster, Refer to **REMOVAL** .

NOTE: During removal of the remote start antenna note the routing location of the coaxial cable.

8. Remove the remote start antenna coaxial cable from mounting clips, if equipped.
9. Remove the screws (1) from remote start antenna module (2) and remove from instrument panel assembly.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 25: ANTENNA MODULE
 Courtesy of CHRYSLER LLC

1. Install the remote start antenna module (2), and screws (1) to instrument panel assembly. Tighten screws to 2.5 N.m (22 in. lbs.).
2. Install the instrument cluster. Refer to **INSTALLATION** .
3. Route the remote start coaxial cable in the position noted during the removal procedure.
4. Install the remote start antenna coaxial cable to mounting clips, if equipped.

Fig. 26: Identifying Mounting Bracket, Screw, Sentry Key Remote Entry Module (SKREEM), Start Antenna Coaxial Cable Connector, Instrument Panel Wire Harness Connector & Lock Cylinder
 Courtesy of CHRYSLER LLC

5. Connect remote start antenna coaxial cable connector (4) to the Sentry Key Remote Entry Module (SKREEM) (3) (also known as the Sentry Key Immobilizer Module/SKIM or the Wireless Control Module/WCM).
6. Position the SKREEM onto the steering column ignition lock housing with the antenna ring oriented around the lock cylinder (6).

7. Install and tighten the screw (2) that secures the SKREEM mounting bracket to the boss on the top of the ignition lock housing. Tighten the screw to 2 N.m (20 in. lbs.).
8. Reconnect the instrument panel wire harness connector (5) to the SKREEM connector receptacle.
9. Reinstall the right multi-function switch onto the integral mounting bracket (1) on the right side of the clockspring. Refer to **INSTALLATION** .
10. Reconnect the battery negative cable.

NOTE: On vehicles equipped with the Sentry Key Immobilizer System (SKIS), when the SKREEM is replaced with a new unit, a diagnostic scan tool **MUST** be used to initialize the new SKREEM and to program at least two Sentry Key transponders before the vehicle can be operated. Refer to **STANDARD PROCEDURE** .

NOTE: On vehicles equipped with a Tire Pressure Monitoring (TPM) system and a full-sized matching spare tire and wheel assembly, when the SKREEM or the spare tire pressure sensor is replaced with a new unit, a diagnostic scan tool **MUST** be used to run a routine that allows the SKREEM to be programmed with the ID number and location of the spare tire pressure sensor mounted in the wheel of the spare tire. This may be done using a TPM-RKE Analyzer special tool by following the programming steps outlined in the diagnostic scan tool for Program Tire Sensor ID w/TPM Tool under Miscellaneous Functions for the WCM/Wireless Control Module menu item. If a TPM-RKE Analyzer special tool is not available, the spare tire must be dismounted from its wheel to access and note the ID number on the spare tire pressure sensor so that the ID code for that sensor can be programmed into the new SKREEM. Follow the programming steps outlined in the diagnostic scan tool for Learn Spare Tire Sensor ID also found under Miscellaneous Functions for the WCM/Wireless Control Module menu item. Refer to **INSTALLATION** .

2008 STEERING

Steering - Liberty

DESCRIPTION

STEERING SYSTEM

Power steering systems consist of:

- Steering column & Intermediate Shaft
- Rack and pinion steering gear
- Belt driven hydraulic steering pump
- Pump pressure, supply and return hoses
- Oil Cooler

OPERATION

STEERING SYSTEM

The steering column intermediate shaft attaches the steering column to the gear pinion. The rotation of the pinion moves the gear rack from side-to-side. This lateral action of the rack pushes and pulls the tie rods to change the direction of the front wheels.

Power assist is provided by an engine mounted hydraulic pump. The pump supplies hydraulic fluid to the steering gear. All vehicles are equipped with an oil cooler.

DIAGNOSIS AND TESTING

POWER STEERING FLOW AND PRESSURE

80ae82e2

Courtesy of CHRYSLER LLC

- | |
|----------------------|
| 1 - TUBE |
| 2 - ADAPTER FITTINGS |
| 3 - ANALYZER |
| 4 - GAUGE HOSE |

The following procedure is used to test the operation of the power steering system on the vehicle. This test will provide the gallons per minute (GPM) or flow rate of the power steering pump along with the maximum relief pressure. Perform test any time a power steering system problem is present. This test will determine if the power steering pump or power steering gear is not functioning properly. The following pressure and flow test is performed using Power Steering Analyzer Tool kit 6815 and Adapter Kit 6893. See **Fig. 1**.

FLOW AND PRESSURE TEST

80ae82e2

Fig. 2: Analyzer With Tube & Adapter
Courtesy of CHRYSLER LLC

1 - TUBE
2 - ADAPTER FITTINGS
3 - ANALYZER
4 - GAUGE HOSE

1. Check the power steering belt to ensure it is in good condition and adjusted properly.
2. Connect pressure gauge hose from the Power Steering Analyzer to Tube 6844.
3. Connect Adapter 6826 to Power Steering Analyzer test valve end.
4. Disconnect the high pressure hose from the power steering pump.
5. Connect the tube to the pump hose fitting.
6. Connect the power steering hose from the steering gear to the adapter.
7. Open the test valve completely.
8. Start engine and let idle long enough to circulate power steering fluid through flow/pressure test gauge and to get air out of the fluid. Then shut off engine.
9. Check fluid level, add fluid as necessary. Start engine again and let idle.
10. Check for air bubbles, evacuate if necessary.

- 11. Gauge should read below 862 kPa (125 psi). If above, inspect the hoses for restrictions and repair as necessary. The initial pressure reading should be in the range of 345-552 kPa (50-80 psi).
- 12. Increase the engine speed to 1500 RPM and read the flow meter. If the flow rate (GPM) is below specification, (refer to **PUMP SPECIFICATION** chart for GPM) the pump should be replaced.

CAUTION: The following test procedure involves testing maximum pump pressure output and flow control valve operation. Do not leave valve closed for more than three seconds as the pump could be damaged.

- 13. Close valve fully three times and record highest pressure indicated each time. **All three readings must be above specifications and within 345 kPa (50 psi) of each other.**
Pressures above specifications but not within 345 kPa (50 psi) of each other, replace pump.
Pressures within 345 kPa (50 psi) of each other but below specifications, replace pump.
- 14. Open the test valve and turn the steering wheel to the extreme left and right positions three times against the stops. Record the highest pressure reading at each position. Compare readings to the pump specifications chart. If pressure readings are not within 50 psi of each other, the gear is leaking internally and must be replaced.

CAUTION: Do not force the pump to operate against the stops for more than 2 to 3 seconds at a time because, pump damage will result.

PUMP SPECIFICATION

ENGINE	RELIEF PRESSURE	FLOW RATE (GPM) AT 1500 RPM
ALL	10342 kPa, PREFERRED (1450 psi) with a MAX 1550 psi & 7929 kPa, MIN (1400 psi)	2.4 - 2.8

STEERING SYSTEM DIAGNOSIS CHARTS

NOTE: There are three diagnosis charts following that cover **NOISE, VIBRATION AND HARSHNESS (NVH) ISSUES, PERFORMANCE ISSUES, and FLUID ISSUES.**

NOISE, VIBRATION AND HARSHNESS (NVH) ISSUES

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
OBJECTIONABLE HISS OR WHISTLE WHILE TURNING STEERING WHEEL WHEN STATIONARY OR MOVING SLOWLY*	1. Damaged or mispositioned steering column shaft/coupling dash boot seal.	1. Check to ensure boot is properly installed and seals against sheet metal. Reposition or replace steering column shaft/coupling dash boot seal as necessary.
	2. Mis-routed power steering hose.	2. Check routing of power steering hoses. Ensure hoses do not come in unwanted contact with other components and objects.

	3. Restriction in pressure or return hose. 4. Noisy valve in power steering gear.	3. Using an electronic listening tool, determine if noise is coming from either pressure or return hose. Replace hose that noise is present within. 4. For evaluation and correction, see <u>DIAGNOSIS AND TESTING.</u>
RATTLE OR EXCESSIVE CLUNK**	1. Power steering gear loose on engine cradle/crossmember. 2. Loose strut assembly mounting fasteners at tower or knuckle. 3. Excessive play in outer tie rod. 4. Engine cradle/crossmember mounting fasteners loose at frame or bushings worn. 5. Wheel Mounting (Lug) nuts loose. 6. Power steering hose touching the body or frame of vehicle. 7. Stabilizer bar link joints worn (occurs with steering input only when moving, not stationary). 8. Loose lower control arm mounting bolts at engine cradle, frame or crossmember (occurs with steering input only when moving, not stationary). 9. Loose intermediate shaft or column. 10. Lower control arm pivot bushing worn (occurs with steering input only when moving, not stationary). 11. Internal power steering gear noise. 12. Loose inner tie rod.	1. Check fastener torque and tighten to specifications. Replace as necessary. Check steering wheel center following repair. 2. Check fastener torque and tighten to specifications. 3. For evaluation and correction, see <u>DIAGNOSIS AND TESTING.</u> 4. Check fastener torque and tighten to specifications. Inspect bushings and repair as necessary. 5. Inspect wheel mounting (Lug) nuts and studs and repair as necessary. Tighten nuts to specifications. 6. For evaluation and correction, see <u>DIAGNOSIS AND TESTING.</u> 7. At park, jounce only one side of vehicle front to exercise stabilizer bar. Replace stabilizer bar link. 8. Check control arm mounting bolts and tighten to specified torque. 9. Rotate intermediate (steering) shaft in relationship to gear, checking for free-play. Check column fasteners and tighten to specifications as necessary. 10. Inspect bushings for wear and replace lower control arm as necessary. 11. Drive vehicle on rough road, then steer rapidly back and forth when stopped. Replace power steering gear as necessary. 12. For evaluation and correction, see <u>DIAGNOSIS AND TESTING.</u>

-	13. Damaged engine cradle/crossmember.	13. Inspect the cradle/crossmember for cracks or other damage. Replace as necessary.
POPPING NOISE - - - - -	1. Loose steering gear mounting fasteners. 2. Loose outer tie rod mounting nut or jam nut. 3. Loose intermediate (steering) shaft coupling at gear input shaft. 4. Worn tie rod (outer or inner). 5. Worn axle half-shaft.	1. Check fasteners for proper torque and retighten as necessary. 2. Check fastener torque. Replace nuts as necessary and tighten to specifications. 3. Make sure coupling is fully seated on gear input shaft. Retighten or re-seat as necessary. 4. For evaluation and correction, see <u>DIAGNOSIS AND TESTING.</u> 5. For evaluation and correction, refer to <u>DIAGNOSIS AND TESTING .</u>
CHIRP OR SQUEAL (POWER STEERING PUMP) - - - - -	1. Loose power steering pump drive belt. 2. Pulley alignment incorrect. 3. Malfunctioning belt auto-tensioner 4. Power steering pump noisy (worn bearing/bushing noise). 5. Generator or water pump noisy.	1. Inspect belt. Replace belt if worn or glazed. Tighten/adjust power steering pump drive belt if equipped with a manual tensioner. 2. Realign accessory drives. 3. Verify belt tension. Replace belt auto-tensioner. 4. Using an electronic listening tool, determine if noise is coming from pump. Replace power steering pump as required. 5. Using an electronic listening tool, determine if noise is coming from Generator or water pump. Replace faulty component.
WHINE, GROWL, MOAN OR GROAN (POWER STEERING PUMP)*** - - -	1. Low power steering fluid level. 2. Air in power steering fluid. 3. Power steering hose touching body or frame of vehicle. 4. Wear of power steering pump internal components.	1. Fill power steering fluid reservoir to proper level and check for leaks (make sure all air is bled from the system fluid). 2. Inspect for excessive air bubbles in fluid (fluid will appear foamy and lighter in color). Inspect hoses for leaks and replace as necessary. Bleed air from fluid. See <u>STANDARD PROCEDURE.</u> 3. For evaluation and correction, see <u>DIAGNOSIS AND TESTING.</u> 4. For evaluation and correction, see <u>DIAGNOSIS AND TESTING.</u>
COLD START WHINE OR MOAN (POWER STEERING PUMP)*** -	1. Low power steering fluid level. 2. Extremely low ambient temperature (near 0 F° (-18 C°) or below)	1. Fill power steering fluid reservoir to proper level and check for leaks (make sure all air is bled from the system fluid). 2. Some noise is expected as pump attempts to pull cold, thick fluid. Noise should go away as vehicle warms up. Acceptable levels of excessive noise are one second at 0 F° (-18 C°)

		and 15 seconds at -20 F° (-29 C°). If noise is excessive, look for poor sealing on the return hose or a possible fluid leak.
SQUEAKING OR RUBBING SOUND	1. Steering column shroud or shaft rubbing. 2. Clockspring inside steering column noisy. 3. Boot/dash seal lubrication inadequate. 4. Steering gear outer tie rod noisy. 5. Steering gear internally noisy.	1. While turning the steering wheel, listen down column to locate. Check interference between moving components. Move or realign shrouds or shaft as necessary. Replace components if this does not correct problem. 2. Remove clockspring and reinstall steering wheel for testing. If noise is gone, replace clockspring. 3. Remove boot seal and recheck for noise. Lubricate seal as necessary. 4. While a helper turns the steering wheel, use an electronic listening tool to determine if noise is coming from either outer tie rod. Replace outer tie rods as necessary. 5. Remove dash seal boot, then exercise the steering wheel. If noise is still present at gear, replace steering gear.
SCRUBBING OR KNOCKING SOUND.	1. Incorrect tire or wheel size. 2. Worn motor or transmission mount. 3. Tires contacting wheel well. 4. Interference between moving steering components and other components. 5. Accessory drive pulley rubbing against another component.	1. Replace incorrect size tire or wheel with original equipment size. 2. Drive vehicle, moving accelerator pedal rapidly up and down attempting to locate noise. Try in both forward and reverse. Replace mounts as necessary. 3. Make sure wheel house is properly positioned. If not, reposition as necessary. If steering wheel is properly centered, check steering gear travel left to right by rotating the steering wheel to each stop. Steering wheel should rotate the same amount in both directions from center. If not, replace steering gear. 4. Check for bent or misaligned components. Correct or replace as necessary. 5. Check pulleys for wear. Check for worn engine or transmission mount. Reposition components or replace mounts as necessary.

NOTE: *** There is some noise in all power steering systems. One of the most common is a hissing sound evident when turning the steering wheel when at a standstill or when parking and the steering wheel is at the end of its travel. Hiss is a very high frequency noise similar to that experienced while slowly closing a water**

tap. The noise is present in every valve and results when high velocity fluid passes valve orifice edges. There is no relationship between this noise and the performance of the steering system.

NOTE: **** A light clunk may be felt or heard during steering wheel reversal while vehicle is stationary. This results from internal steering gear rack movement at the bushings and in no way affects the performance of the steering system. This movement may be felt in the steering components during steering wheel reversal.**

NOTE: ***** Power steering pump growl/moan/groan results from the development of high pressure fluid flow. Normally this noise level should not be high enough to be objectionable.**

PERFORMANCE ISSUES

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
STEERING WHEEL OR COLUMN HAS FREEPLAY/LASH/LOOSENESS (CLUNKING OR RATTLING)	1. Loose coupling pinch bolt at gear input shaft. 2. Power steering gear loose on cradle/crossmember. 3. Excessive freeplay or noise from steering column bearings. 4. Excessive intermediate (steering) shaft coupling u-joint free-play. 5. Loose or worn outer tie rod. 6. Lack of lubrication in lower ball joint or ball joint is damaged. 7. Excessive lash inside steering gear.	1. Check pinch bolt torque. Replace pinch bolt if equipped with thread locker patch and tighten to specifications. 2. Inspect gear mounting bolts. Replace if necessary and tighten to specifications. 3. Replace steering column. 4. Rotate steering wheel back-and-forth while watching coupling. Observe for free-play. Replace intermediate shaft as necessary. 5. For evaluation and correction, see <u>DIAGNOSIS AND TESTING</u> . 6. For evaluation, refer to <u>DIAGNOSIS AND TESTING</u> . Lubricate ball joint if equipped with a zerk fitting and check for function. If not equipped with a zerk fitting, test and replace ball joint as necessary. 7. Disconnect intermediate shaft and turn steering gear input shaft. Observe for any movement without a corresponding tire movement. Replace steering gear as necessary.
STEERING WHEEL HAS FORE AND AFT LOOSENESS.	1. Steering wheel retaining bolt loose.	1. Check steering wheel retaining bolt torque and tighten to specifications as

	2. Loose steering column to instrument panel fasteners. 3. Steering column lower bearing spring retainer slipped on steering column shaft.	necessary. 2. Check steering column to instrument panel fastener torque and tighten to specifications as necessary. 3. Pull steering wheel fore-and-aft while observing movement. Replace steering column as necessary.
STEERING WHEEL, DASH OR VEHICLE VIBRATES DURING STEERING MANEUVERS (ESPECIALLY AT LOW SPEED OR STANDSTILL).	1. Air in power steering fluid. 2. Tire(s) not properly inflated. 3. Excessive engine vibration. 4. Loose tie rod end jam nut. 5. Overcharged air conditioning (A/C) system. 6. Grounded, damaged or loose engine mount. 7. Loose or worn outer tie rod. 8. Steering gear noisy.	1. Inspect for excessive air bubbles in fluid (fluid will appear foamy and lighter in color). Inspect hoses for leaks and replace as necessary. Bleed air from fluid. See <u>STANDARD PROCEDURE</u>. 2. Check and inflate tires to the specified pressure. 3. Ensure that the engine is tuned properly. 4. Check torque and tighten the inner to outer tie rod jam nut to specifications. 5. Turn A/C off and verify issue goes away. Repair A/C as necessary. 6. Visually inspect for damaged or misaligned mounts. Check fastener torque. Replace, realign or retighten as necessary. 7. For evaluation and correction, see <u>DIAGNOSIS AND TESTING</u>. 8. During a parking event at 0 mph, verify there is vibration only with steering. Steer in both directions and verify that the noise follows the steering input. Check TSB's for any known issues. Replace steering gear as necessary.
STEERING CATCHES, SURGES OR STICKS IN CERTAIN POSITIONS OR IS DIFFICULT TO TURN.	1. Low power steering fluid level. 2. Tire(s) not properly inflated. 3. Loose or slipping power steering/accessory drive belt. 4. Lack of lubrication	1. Check fluid level and fill to proper level as necessary. Check for leaks. Make sure all air is bled from system. 2. Check and inflate tires to the specified pressure. 3. Verify belt tension. Replace belt auto-tensioner and belt as necessary. 4. For evaluation, refer to <u>DIAGNOSIS</u>

	in lower ball joint or ball joint is damaged. 5. Lack of lubrication in steering gear outer tie rod end(s). 6. Faulty power steering pump. 7. Excessive friction in intermediate shaft/coupler joint. 8. Excessive friction in steering column. 9. Worn or binding seat and bearing in front strut assembly. 10. Faulty steering gear.	<u>AND TESTING</u> . Lubricate ball joint if equipped with a zerk fitting and check for function. If not equipped with a zerk fitting, test and replace ball joint as necessary. 5. For evaluation and correction, see <u>DIAGNOSIS AND TESTING</u>. 6. Perform Power Steering Flow and Pressure Test. See <u>DIAGNOSIS AND TESTING</u>. Look for low or erratic flow or pressure. Replace power steering pump as necessary. 7. Disconnect intermediate shaft/coupler at steering gear and check joint for smooth operation in all directions. Replace intermediate shaft/coupler joint. 8. Disconnect intermediate shaft/coupler at steering gear. Turn steering wheel two revolutions in either direction from on center and check for smooth operation. DO NOT turn past two revolutions. Damage to the clockspring may occur. Replace steering column as necessary. 9. Disconnect outer tie rod ends from knuckles, then turn tire and wheel assembly checking for smooth operation. Replace front strut assembly seat and bearing. 10. With vehicle on hoist, tires unsupported and engine off, steer gear throughout travel and check for smooth operation. Replace steering gear (only after all previous components have been checked).
STEERING WHEEL DOES NOT RETURN TO CENTER POSITION.	1. Tire(s) not properly inflated. 2. Improper front wheel alignment. 3. Lack of lubrication in lower ball joint or ball joint is damaged.	1. Check and inflate tires to the specified pressure. 2. Check and adjust wheel alignment as necessary. 3. For evaluation, refer to <u>DIAGNOSIS AND TESTING</u> . Lubricate ball joint if equipped with a zerk fitting and check for function. If not equipped with a zerk fitting, test and replace ball joint as necessary.

	4. Excessive friction in intermediate shaft/coupler joint. 5. Excessive friction in steering column. 6. Worn or binding seat and bearing in front strut assembly. 7. Excessive friction in power steering gear.	4. Disconnect intermediate shaft/coupler at steering gear and check joint for smooth operation in all directions. Replace intermediate shaft/coupler joint. 5. Disconnect intermediate shaft/coupler at steering gear. Turn steering wheel two revolutions in either direction from on center and check for smooth operation. DO NOT turn past two revolutions. Damage to the clockspring may occur. Replace steering column as necessary. 6. Disconnect steering gear outer tie rod ends at knuckles, then turn tire and wheel assembly in and out checking for smooth operation. Replace seat and bearing as necessary. 7. With vehicle on hoist, tires unsupported and engine off, steer gear throughout travel and check for smooth operation. Replace steering gear (only after all previous components have been checked).
EXCESSIVE STEERING WHEEL KICKBACK FROM ROAD INPUTS	1. Air in power steering fluid. 2. Power steering gear loose on cradle/crossmember. 3. Steering column, coupling or intermediate shaft worn or loose. 4. Power steering pump flow is too low.	1. Inspect for excessive air bubbles in fluid (fluid will appear foamy and lighter in color). Inspect hoses for leaks and replace as necessary. Bleed air from fluid. See <u>STANDARD PROCEDURE</u>. 2. Inspect gear mounting bolts. Replace if necessary and tighten to specifications. 3. Rotate steering wheel back-and-forth while inspecting intermediate shaft going into steering gear. Look for excessive free-play. Retighten if loose bolt is found. Replace steering column, coupling or intermediate shaft if necessary. 4. Perform Power Steering Flow and Pressure Test. See <u>DIAGNOSIS AND TESTING</u>. Look for low or erratic flow or pressure. Replace power steering pump as necessary.

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
LOW FLUID LEVEL WITH VISIBLE LEAK.	1. Loose power steering hose fittings or connections. 2. Damaged or missing O-ring at power steering hose tube nuts. 3. Power steering line or hose failure. 4. Power steering component leaking (reservoir, pump, gear).	1. Check torque on all tube nuts (at gear and pump). Inspect clamps at all rubber hose connections for correct position, damage and tension. Tighten tube nuts as required. Reposition or replace clamps at hose connections. Clean joints and reinspect for leaks. 2. Remove tube nut and inspect O-ring. If damaged or missing, replace O-ring. Clean joints and reinspect for leaks. 3. Clean fluid from around suspect areas. Run vehicle and inspect for leaks. Look inside reservoir to see if air is being ingested. Replace hoses as necessary. 4. Clean fluid from around suspect areas. Run vehicle and inspect for leaks. Look inside reservoir to see if air is being ingested. Replace power steering component as necessary.
AERATED FLUID.*	1. Low power steering fluid level. 2. Air leak at power steering supply hose, reservoir or pump. 3. Air leak at power steering supply hose, reservoir or pump.	1. Check fluid level and fill to proper level as necessary. Check for leaks. Make sure all air is bled from system. 2. Inspect components. Put a hand vacuum pump on the reservoir and verify that the system can keep a vacuum. System should not lose more than 1 psi in 2 minutes (make sure vacuum pump is sealed well to the reservoir). 3. Inspect components. Place a hand vacuum pump with Adapter 9688 on reservoir and verify that system can sustain vacuum. System should not lose more than 1 psi in 2 minutes (make sure vacuum pump is sealed well to the reservoir). Replace steering component as necessary.
RESERVOIR FLUID OVERFLOW OR FLUID THAT IS MILKY IN COLOR	1. Water contamination of power steering fluid.	1. Inspect fluid for milky appearance. Completely drain power steering fluid. Refill and bleed system. See <u>STANDARD PROCEDURE</u> .

NOTE: * Extremely cold temperatures may cause power steering fluid aeration. The air should work its way out of the system as the fluid warms.

STANDARD PROCEDURE

POWER STEERING SYSTEM BLEED PROCEDURE

WARNING: The fluid level should be checked with engine off to prevent injury from moving components.

CAUTION: Mopar® Power Steering Fluid + 4 or Mopar® ATF+4 Automatic Transmission Fluid is to be used in the power steering system. Both

Fluids have the same material standard specifications (MS-9602). No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if another fluid is used. Do not overfill the system.

CAUTION: If the air is not purged from the power steering system correctly, pump failure could result.

Fig. 3: HAND VACUUM PUMP ON RESERVOIR
Courtesy of CHRYSLER LLC

NOTE: Be sure the vacuum tool used in the following procedure is clean and free of any fluids.

1. Check the fluid level. As measured on the side of the reservoir, the level should indicate between MAX and MIN when the fluid is at normal ambient temperature. Adjust the fluid level as necessary. See **STANDARD PROCEDURE**.
2. Tightly insert Power Steering Cap Adapter (4), Special Tool 9688, into the mouth of the reservoir (3).

CAUTION: Failure to use a the vacuum pump reservoir (1) may allow power steering fluid to be sucked into the hand vacuum pump.

3. Attach Hand Vacuum Pump (2), Special Tool C-4207 or equivalent, with reservoir (1) attached, to the Power Steering Cap Adapter (4).

CAUTION: Do not run the engine while vacuum is applied to the power steering system. Damage to the power steering pump can occur.

NOTE: When performing the following step make sure the vacuum level is maintained during the entire time period.

4. Using Hand Vacuum Pump (2), apply 68-85 kPa (20-25 in. Hg) of vacuum to the system for a minimum of three minutes.
5. Slowly release the vacuum and remove the special tools.
6. Adjust the fluid level as necessary. Refer to step 1.
7. Repeat step 1 through step 6 until the fluid no longer drops when vacuum is applied.
8. Start the engine and cycle the steering wheel lock-to-lock three times.

NOTE: **Do not hold the steering wheel at the stops.**

9. Stop the engine and check for leaks at all connections.
10. Check for any signs of air in the reservoir and check the fluid level. If air is present, repeat the procedure as necessary.

SPECIAL TOOLS

STEERING COLUMN

COLUMN

DESCRIPTION

STEERING COLUMN

NOTE: The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.

The steering column has been designed to be serviced as an assembly. The column is connected to the steering gear with a one piece shaft. The upper half has a support bearing mounted to a bracket. The bracket mounts to the frame rail with two nuts. The shaft is serviceable. The key cylinder, switches, clock spring, trim shrouds and steering wheel are serviced separately.

OPERATION

STEERING COLUMN

Safety goggles should be worn at all times when working on steering columns.

To service the steering wheel, switches or airbag, refer to **RESTRAINTS - SERVICE INFORMATION** article and follow all WARNINGS and CAUTIONS.

WARNING: The airbag system is a sensitive, complex electro-mechanical unit. Before attempting to diagnose, remove or install the airbag system components you must first disconnect and isolate the battery negative (ground) cable. Then wait two minutes for the system capacitor to discharge. Failure to do so could result in accidental deployment of the airbag and possible

personal injury. The fasteners, screws, and bolts, originally used for the airbag components, have special coatings and are specifically designed for the airbag system. They must never be replaced with any substitutes. Anytime a new fastener is needed, replace with the correct fasteners provided in the service package or fasteners listed in the parts books.

REMOVAL

STEERING COLUMN

1. Position front wheels **straight ahead**.
2. Remove and isolate the negative ground cable from the battery.
3. Remove the airbag, refer to **REMOVAL** .

NOTE: **If equipped with cruise control, disconnect clock spring harness from the cruise switch harness on the steering wheel.**

1 - Upper Shroud 2 - Lower Shroud

11. Snap together the column shrouds (1&2) and install the mounting screws. See **Fig. 16**.

Fig. 17: Knee Blocker
Courtesy of CHRYSLER LLC

12. Install the steering column opening cover. Refer to **INSTALLATION** .

NOTE: Do not reuse the old steering wheel bolt (a new bolt must be used)

NOTE: Be certain that the steering wheel mounting bolt is tightened to the proper torque specification to ensure proper clockspring operation.

13. Install the steering wheel and tighten bolt to 54 N.m (40 ft. lbs.). See **INSTALLATION**.

NOTE: If equipped with cruise control, connect clock spring harness to cruise switch harness on the steering wheel.

14. Install the airbag, refer to **INSTALLATION** .

15. Install the negative battery terminal.

SPECIFICATIONS

TORQUE CHART

TORQUE SPECIFICATIONS

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.
Steering Wheel Bolt	54	40	-
Steering Column Mounting Bolts	17	-	150

Intermediate Shaft Lower Coupler Bolt	53	39	-
Ignition Switch Screws	2	-	17

IGNITION SWITCH

DESCRIPTION

SWITCH-IGNITION

The electrical ignition switch is located on the steering column. It is used as the main on/off switching device for most electrical components. The mechanical key cylinder is used to engage/disengage the electrical ignition switch.

DIAGNOSIS AND TESTING

SWITCH-IGNITION

ELECTRICAL DIAGNOSIS

For ignition switch electrical schematics, Refer to the appropriate service information for the component.

MECHANICAL DIAGNOSIS (KEY DIFFICULT TO ROTATE)

Vehicles equipped with an automatic transmission and a floor mounted shifter: a cable is used to connect the interlock device in the steering column assembly, to the transmission floor shift lever. This interlock system is used to lock the transmission shifter in the PARK position when the key cylinder is rotated to any position. If the ignition key is difficult to rotate to or from any position, it may not be the fault of the key cylinder or the steering column components. The brake transmission shift interlock cable may be out of adjustment. Refer to **ADJUSTMENTS** . The interlock system within the steering column is not serviceable. If repair is necessary, the steering column assembly must be replaced. See **REMOVAL**.

Vehicles equipped with a manual transmission and a floor mounted shifter: on certain models, a button is located on the steering column behind the ignition key cylinder. The button must be manually depressed to allow rotation of the ignition key cylinder to any position. If it is difficult to rotate the key to any position, the lever mechanism may be defective. This mechanism is not serviceable. If repair is necessary, the steering column assembly must be replaced. See **REMOVAL**.

REMOVAL

SWITCH-IGNITION

Fig. 18: IGNITION SWITCH SCREW
Courtesy of CHRYSLER LLC

1. Remove the steering column shrouds.

NOTE: The ignition key must be in the key cylinder for cylinder removal. The key cylinder must be removed first before removing ignition switch.

2. Remove lock cylinder. See **REMOVAL**.
3. Remove the multi-function switch.
4. Disconnect the electrical connector at the rear of the ignition switch.
5. Remove the ignition switch mounting screw (1). Use tamper proof Torx bit to remove the screw.

NOTE: Tilt arm (3) must be moved to allow removal of the switch.

6. Pull the ignition switch (2) straight out to remove from the locking tabs.

INSTALLATION

SWITCH-IGNITION

80a898b0

Fig. 19: Ignition Switch On Position
 Courtesy of CHRYSLER LLC

1. Before installing ignition switch (1), rotate the slot in the switch to the ON position (2).

818ba1a0

Fig. 20: IGNITION SWITCH SCREW
 Courtesy of CHRYSLER LLC

NOTE: Tilt arm (3) must be moved to allow installation of the switch.

2. Position the switch (2) to the column and install tamper proof screw (1). Tighten screw to 2 N.m (17 in. lbs.).
3. Connect the electrical connector to rear of ignition switch. Make sure that locking tab is fully seated into wiring connector.

NOTE: The ignition key must be in the key cylinder for cylinder installation. The key cylinder must be aligned with the ignition switch for installation.

4. Install the lock cylinder. See INSTALLATION.
5. Test the operation of the lock cylinder for smooth rotating.
6. Install the multi-function switch.
7. Install steering column lower cover.

KEY-IN IGNITION SWITCH

DESCRIPTION

SWITCH-KEY IN IGNITION

The key-in ignition switch is integral to the ignition switch, which is mounted on the left side of the steering column, opposite the ignition cylinder. It closes a path to ground for the instrument cluster chime warning circuitry when the ignition key is inserted in the ignition lock cylinder and the driver door jamb switch is closed (driver door is open). The key-in ignition switch opens the ground path when the key is removed from the ignition cylinder.

The key-in ignition switch cannot be repaired and, if faulty or damaged, the entire ignition switch must be replaced. See REMOVAL.

DIAGNOSIS AND TESTING

SWITCH-KEY-IN IGNITION

For circuit descriptions and diagrams, Refer to the appropriate service information on the individual components.

WARNING: On vehicles equipped with airbags, refer to RESTRAINTS - SERVICE INFORMATION article before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

1. Disconnect and isolate the battery negative cable. Remove the steering column shrouds. Unplug the key-in ignition switch wire harness connector from the ignition switch.
2. Check for continuity between the key-in switch sense circuit and the left front door jamb switch sense

circuit terminals of the key-in ignition switch. There should be continuity with the key in the ignition cylinder, and no continuity with the key removed from the ignition cylinder. If OK, go to step 3. If not OK, replace the faulty ignition switch assembly.

3. Check for continuity between the left front door jamb switch sense circuit cavity of the key-in ignition switch wire harness connector and a good ground. There should be continuity with the driver door open, and no continuity with the driver door closed. If OK, see the diagnosis for Instrument Cluster in this service information. If not OK, repair the circuit to the driver door jamb switch as required.

KEY CYLINDER

REMOVAL

CYLINDER-KEY

Fig. 21: LOCK CYLINDER REMOVAL
Courtesy of CHRYSLER LLC

The ignition key (1) must be in the key cylinder (2) for cylinder removal. The key cylinder must be removed first before removing ignition switch.

1. If equipped with an automatic transmission, place shifter in PARK position.
2. Remove the shroud covers.
3. Remove the remote keyless entry (SKREEM) module.
4. Remove the halo ring around the cylinder.
5. Rotate key to RUN position.
6. A release pin is located on the bottom of the key cylinder (5) with the access hole on the top of the lock cylinder housing (3).
7. Position a small screwdriver or pin punch (4) into pin access hole (5).
8. Push the pin punch (5) up while pulling key cylinder (2) from lock cylinder housing (3).

INSTALLATION

CYLINDER-KEY

Fig. 22: CYLINDER INSTALL
Courtesy of CHRYSLER LLC

The ignition key (1) must be in the key cylinder (2) for cylinder installation.

1. Install the key cylinder (2) into the housing (3) using care to align the end of the key cylinder with the ignition switch.
2. Push the key cylinder (2) in until it clicks.
3. Rotate the key to the insert position.
4. Install the halo ring around the key cylinder housing.
5. Install the (SKREEM) module.
6. Install the shroud covers.

HOUSING-LOCK CYLINDER

REMOVAL

LOCK CYLINDER HOUSING

Fig. 23: SCCM MOUNTING
Courtesy of CHRYSLER LLC

1. Access and remove the Steering Column Control Module (SCCM) (3) from the steering column (2). Refer to **REMOVAL** .

Fig. 24: SKREEM (WCM) MOUNTING SCREW
Courtesy of CHRYSLER LLC

2. Remove the screw (1) fastening the SKREEM/WCM (2) to the lock cylinder housing (3).
3. Unhook the SKREEM/WCM (2) retainer fingers from the lock cylinder housing (3) and remove it.

Fig. 25: ACCESS HOLE FOR LOCK CYLINDER REMOVAL
 Courtesy of CHRYSLER LLC

4. Insert the key (2) and turn the key cylinder (3) to the RUN position.
5. Insert an appropriate tool into the slot (1) formed into the lock cylinder housing depressing the key cylinder retaining tab.
6. Pull the key cylinder and key straight out of the lock cylinder housing as one unit.

Fig. 26: LOCK CYLINDER HOUSING MOUNTING
 Courtesy of CHRYSLER LLC

7. Using a Tamper-Proof Torx® Plus (five point) 30 bit, remove the two screws (1) fastening the lock cylinder housing (2) to the column.
8. Remove the lock cylinder housing from the steering column.

8168c203

Fig. 27: IGNITION SWITCH MOUNTING SCREW
 Courtesy of CHRYSLER LLC

9. Remove the ignition module (2) mounting screw (1).

8168c204

Fig. 28: IGNITION SWITCH REMOVAL/INSTALLATION
 Courtesy of CHRYSLER LLC

10. Pull the module (1) straight out and off the retaining tabs (2) located on the lock cylinder housing.

INSTALLATION

LOCK CYLINDER HOUSING

8168cb64

Fig. 29: IGNITION SWITCH REMOVAL/INSTALLATION
 Courtesy of CHRYSLER LLC

NOTE: Ignition module must be installed prior to lock housing installation on column. Otherwise, the tilt lever will obstruct installation of ignition switch.

1. Ensure the ignition module is in the RUN position and the actuator shaft in the lock housing is in the RUN position.
2. Align the ignition module with the pin (3), actuator shaft and retaining tabs (2) located on the lock cylinder housing. Carefully install the module, snapping it into place over the retaining tabs.

8168c203

Fig. 30: IGNITION SWITCH MOUNTING SCREW
 Courtesy of CHRYSLER LLC

3. Install the ignition module (2) mounting screw (1). Tighten the screw to 2 N.m (18 in. lbs.).

8168cbc2

Fig. 31: LOCK CYLINDER HOUSING MOUNTING
 Courtesy of CHRYSLER LLC

NOTE: Ignition module needs to be installed on lock cylinder housing before housing installation to clear tilt lever.

4. Position the lock cylinder housing in the RUN position.
5. Align the lock cylinder housing (2) with the steering column.
6. Install the two screws (1) fastening the lock cylinder housing (2) to the column. Tighten the screws to 12 N.m (110 in. lbs.).

8168cbc3e

Fig. 32: ACCESS HOLE FOR LOCK CYLINDER REMOVAL
 Courtesy of CHRYSLER LLC

7. Place the actuator in the lock cylinder housing to the RUN position (if not already there).
8. Insert the key into the key cylinder and turn the key cylinder to the RUN position.
9. Align the retaining tab on the key cylinder with the slot in the top of the lock cylinder housing.

10. Slide the key cylinder into the lock cylinder housing until the key cylinder retaining tab locks the cylinder into place.
11. Rotate the key back and forth (OFF to START), then remove and reinstall it, making sure the key cylinder and lock cylinder housing operate properly.

Fig. 33: SKREEM (WCM) MOUNTING SCREW
Courtesy of CHRYSLER LLC

12. Slide the ring of the SKREEM/WCM (2) over the lock cylinder housing (3) and engage the retainer fingers in the recesses formed on the lock cylinder housing.
13. Install the screw (1) fastening the SKREEM/WCM (2) to the lock cylinder housing (3). Tighten the screw to 2.5 N.m (22 in. lbs.).

Fig. 34: SCCM MOUNTING
Courtesy of CHRYSLER LLC

14. Install the Steering Column Control Module (SCCM) (3) and all components removed to access it. Refer to **INSTALLATION**.

15. Check operation of all steering column mounted components.

INTERMEDIATE SHAFT

REMOVAL

STEERING INTERMEDIATE SHAFT - 3.7L & DIESEL

1. Disconnect the negative battery cable.
2. Remove knee blocker cover and knee blocker, refer to **REMOVAL** .

NOTE: The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.

3. Lock the steering wheel with the tires in the straight ahead position.

Fig. 35: UPPER COUPLING
Courtesy of CHRYSLER LLC

4. Remove the lower column pinch bolt (2).
5. Lower the steering coupler (1) shaft from the column.

Fig. 36: BOOT TANGS
 Courtesy of CHRYSLER LLC

6. Remove the intermediate shaft seal by pushing in the four tangs (2) securing it to the panel.

Fig. 37: BEARING
 Courtesy of CHRYSLER LLC

Remove the nuts (2) for the intermediate shaft support bearing (1).

Fig. 38: BEARING BRACKET
Courtesy of CHRYSLER LLC

7. Remove the center support bearing bracket (3) from the mount on the shock tower (4) using a ratchet (1) with an extension (2).

Fig. 39: BRACKET NUTS
Courtesy of CHRYSLER LLC

8. Remove the nuts from the shock tower **if removing the bracket.**

Fig. 40: LOWER COUPLING
Courtesy of CHRYSLER LLC

9. Remove the lower coupler pinch bolt (3) at the steering gear.
10. Remove the coupler (2) at the steering gear.
11. Remove the intermediate shaft (1) from the vehicle.
12. Remove the center support bearing from the steering shaft (if replacing the intermediate shaft).

INSTALLATION

STEERING INTERMEDIATE SHAFT - 3.7L & DIESEL

Fig. 41: BRACKET NUTS
Courtesy of CHRYSLER LLC

1. Install the center support bearing bracket to the shock tower (if removed). Tighten to 12 N.m (106 in.lbs.).

Fig. 42: BEARING BRACKET
Courtesy of CHRYSLER LLC

2. Install the intermediate shaft to the vehicle and install and tighten the center support bearing to the bracket (3) nuts.

Fig. 43: LOWER COUPLING
Courtesy of CHRYSLER LLC

3. Install the coupler (2) at the steering gear.
4. Install the lower coupler pinch bolt (3) at the steering gear and tighten the bolt to 53 N.m (39 ft. lbs).

Fig. 44: BOOT TANGS
Courtesy of CHRYSLER LLC

5. Install the intermediate shaft seal by pushing it in securing the four tangs (2) to the panel.

Fig. 45: UPPER COUPLING
Courtesy of CHRYSLER LLC

6. Install the steering coupler shaft (1) to the column.
7. Install the upper pinch bolt (2) and tighten the bolt to 53 N.m (39 ft. lbs.).
8. Unlock the steering wheel.
9. Install the knee blocker cover and knee blocker. Refer to **INSTALLATION**.
10. Reconnect the negative battery cable.

STEERING WHEEL

REMOVAL

STEERING WHEEL

1. Disable and remove the drivers side airbag. Refer to **REMOVAL** .
2. Partially remove the steering wheel bolt and leave the bolt in the column.

Fig. 46: STEERING WHEEL PULLER
Courtesy of CHRYSLER LLC

3. Install puller special tool L-4407A puller (2) with OTC® 7929A jaws (1) or equivalent using the top of the bolt (3) to push on.

NOTE: Ensure the puller jaws (1) are seated in the pockets of the steering wheel armature.

4. Remove the steering wheel.

INSTALLATION

STEERING WHEEL

NOTE: Do not reuse the old steering wheel bolt (a new bolt must be used)

1. Install steering wheel to the column

NOTE: Be certain that the steering wheel mounting bolt is tightened to the proper torque specification to ensure proper clockspring operation.

2. Install the new steering wheel bolt. Tighten the bolt to 54 N.m (40 ft. lbs.).
3. Install the drivers side air bag. Refer to **INSTALLATION** .

GEAR

DESCRIPTION

RACK & PINION STEERING GEAR

Fig. 47: Rack & Pinion Steering Gear
Courtesy of CHRYSLER LLC

1 - TIE ROD - INNER
2 - TIE ROD - INNER
3 - TIE ROD END - OUTER LH
4 - BOOTS
5 - TIE ROD END - OUTER RH

A rack and pinion steering gear is made up of two main components, the pinion shaft and the rack. The gear cannot be adjusted or internally serviced. If a malfunction or a fluid leak occurs, the gear must be replaced as an assembly. With the exception of the outer tie rods (3&5) which are serviced separately. See **Fig. 47**.

OPERATION

RACK & PINION STEERING GEAR

The steering column intermediate shaft is attached to the gear pinion. The rotation of the pinion moves the gear rack from side-to-side. This lateral action of the rack pushes and pulls the tie rods, which are connected to the steering knuckles to change the direction of the front wheels.

DIAGNOSIS AND TESTING

POWER STEERING GEAR

NOTE: This information is designed to be used in conjunction with the diagnostic charts at the beginning of the Steering article. See **DIAGNOSIS AND TESTING.**

OBJECTIONABLE HISS OR WHISTLE POSSIBLY CAUSED BY A NOISY STEERING GEAR

1. Check and adjust power steering fluid level in the reservoir as necessary. See **STANDARD PROCEDURE.**
2. Start the vehicle and heat system by steering lock-to-lock 5 times with the engine running at 3000 RPM. Do not hold the gear against the stops for more than 5 seconds at a time.
3. Return the engine to idle speed.
4. Listen for the noise when turning the wheel slowly off center during a dry park maneuver.
5. Replace power steering gear if the hiss or whistle is present. See **REMOVAL.**

REMOVAL

RACK & PINION - 2WD

1. Siphon the power steering fluid from the power steering reservoir.

NOTE: The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.

2. Lock the steering wheel to prevent spinning of the clockspring.
3. Raise and support the vehicle.
4. Remove the tire and wheel assembly.

NOTE: Mark the alignment adjusting cams and tie rod end jam nuts on the steering gear for easier installation.

5. Remove the tie rod end nuts.
6. Separate tie rod ends from the knuckles with Puller C-3894-A.

Fig. 48: INTERMEDIATE SHAFT COUPLER
 Courtesy of CHRYSLER LLC

7. Remove the lower intermediate shaft coupler pinch bolt and slide the coupler off the gear.

Fig. 49: LINES AT GEAR
 Courtesy of CHRYSLER LLC

8. Remove the power steering lines (1&2) from the gear (3).

Fig. 50: MOUNTING BOLTS
 Courtesy of CHRYSLER LLC

9. Remove the mounting bolts (2) from the gear (1) to the front cradle.
10. Remove the steering gear (1) from the vehicle.

RACK & PINION - 4WD

1. Siphon the power steering fluid from the power steering reservoir.

NOTE: The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.

2. Lock the steering wheel to prevent spinning of the clockspring.

Fig. 51: BATTERY TRAY

Courtesy of CHRYSLER LLC

3. Disconnect the battery (3).
4. Remove the battery. Refer to **REMOVAL** .
5. Unclip the power center (2) and move it to the side out of the way to access the battery tray (1).
6. Remove the battery tray (1). Refer to **REMOVAL** .

Fig. 52: INTERMEDIATE SHAFT COUPLER
Courtesy of CHRYSLER LLC

7. Remove the lower intermediate shaft coupler pinch bolt and slide the coupler off the gear.
8. Raise and support the vehicle.
9. Remove the tire and wheel assembly.

NOTE: **Mark the alignment adjusting cams and tie rod end jam nuts on the steering gear for easier installation.**

10. Remove the tie rod end nuts.
11. Separate tie rod ends from the knuckles with Puller C-3894-A.

Fig. 53: LINES AT GEAR
Courtesy of CHRYSLER LLC

12. Remove the power steering lines (1&2) from the gear (3).

Fig. 54: MOUNTING BOLTS
Courtesy of CHRYSLER LLC

13. Remove the mounting bolts (2) from the gear (1) to the front cradle.
14. Remove the left front lower suspension arm cam/bolt and lower the control arm enough to get the axle mounting bracket bolt out. **This must be done to remove the axle mounting bracket.**
15. Remove the axle mounting bracket.
16. Remove the oil filter and trough.
17. Put the steering gear in the full right position and lower the gear out of the vehicle.
18. Remove the steering gear (1) from the vehicle.

INSTALLATION

RACK & PINION - 2WD

Fig. 55: MOUNTING BOLTS
Courtesy of CHRYSLER LLC

1. Transfer the outer tie rod ends to the new steering gear (if needed).
2. Install the steering gear (1) to the vehicle.
3. Install the gear mounting bolts (2) to the front cradle. Tighten the gear mounting bolts to 176 N.m (130 ft.lbs.).

Fig. 56: LINES AT GEAR
Courtesy of CHRYSLER LLC

4. Install the power steering lines (1&2) to the gear (1). Tighten the tube nuts to 27 N.m (20 ft.lbs.).

Fig. 57: INTERMEDIATE SHAFT COUPLER
 Courtesy of CHRYSLER LLC

5. Install the lower coupler pinch bolt and slide the coupler on to the gear. Tighten to 53 N.m (39 ft.lbs.).
6. Install the tie rod end to the knuckle and tighten the nuts to 41 N.m (30 ft.lbs.) Plus an additional 90° turn.
7. Install the tire and wheel assembly. Refer to **STANDARD PROCEDURE** .
8. Install the skid plate. Refer to **INSTALLATION** .
9. Lower the vehicle.
10. Unlock the steering wheel.
11. Fill the power steering fluid. See **STANDARD PROCEDURE**.
12. Reset the toe and center the steering wheel. Refer to **STANDARD PROCEDURE** .

RACK & PINION - 4WD

Fig. 58: MOUNTING BOLTS
 Courtesy of CHRYSLER LLC

1. Transfer the outer tie rod ends to the new steering gear (if needed).
2. Install the steering gear (1) to the vehicle.
3. Install the gear mounting bolts (2) to the front cradle. Tighten the gear mounting bolts to 176 N.m (130 ft.lbs.).

Fig. 59: LINES AT GEAR
Courtesy of CHRYSLER LLC

4. Install the power steering lines (1&2) to the gear (3). Tighten the tube nuts to 27 N.m (20 ft.lbs.).
5. Install the oil filter trough and filter.
6. Install the axle mounting bracket.
7. Install the left lower control arm into position and install the cam/bolt.
8. Install the tie rod end to the knuckle and tighten the nuts to 41 N.m (30 ft.lbs.) Plus an additional 90° turn.
9. Install the tire and wheel assembly. Refer to **STANDARD PROCEDURE**.
10. Lower the vehicle.

Fig. 60: INTERMEDIATE SHAFT COUPLER
Courtesy of CHRYSLER LLC

11. Install the lower coupler pinch bolt and slide the coupler on to the gear. Tighten to 53 N.m (39 ft.lbs.).

Fig. 61: BATTERY TRAY
Courtesy of CHRYSLER LLC

12. Install the battery tray (1). Refer to **INSTALLATION** .
13. Install the battery. Refer to **INSTALLATION** .
14. Reinstall the power center (2) back into place.
15. Reconnect the battery cables (3).
16. Unlock the steering wheel.
17. Fill the power steering fluid. See **STANDARD PROCEDURE**.
18. Perform a wheel alignment. Refer to **STANDARD PROCEDURE** .

LINKAGE

TIE ROD END

DIAGNOSIS AND TESTING

TIE ROD

Tie rod free-play can be measured using the following hand methods:

NOTE: When checking free-play, **DO NOT** rotate the tie rod. Just because a tie rod rotates easily, it is not necessarily faulty.

NOTE: Always check and repair (if necessary) outer tie rod free-play before checking inner tie rod free-play. False results can otherwise be obtained.

OUTER TIE ROD

81896F34

Fig. 63: Checking Outer Tie Rod Free Play
Courtesy of CHRYSLER LLC

Grasp the outer tie rod near the ball stud and attempt to move the tie rod straight up and down. If any free-play is felt, replace the outer tie rod. See **REMOVAL**. If no free-play is felt at the outer tie rod, attempt to move the inner tie rod in the same manner. Refer to the following procedure.

INNER TIE ROD

81896F38

Fig. 64: Checking Inner Tie Rod Free Play

Courtesy of CHRYSLER LLC

Grasp the inner tie rod near the steering gear bellows and attempt to move the tie rod straight up and down. If any free-play is felt, replace the steering gear. See **REMOVAL**.

STANDARD PROCEDURE

STEERING LINKAGE

The tie rod end and ball stud seals should be inspected during all oil changes. If a seal is damaged, replace the tie rod.

CAUTION: If any steering components are replaced or serviced an alignment must be performed, to ensure the vehicle meets all alignment specifications.

REMOVAL

OUTER TIE ROD END

Fig. 65: TIE ROD END

Courtesy of CHRYSLER LLC

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.

NOTE: Mark the outer to inner tie rod end for easier installation.

3. Loosen the tie rod end jam nut.
4. Remove the outer tie rod end nut (2).

Fig. 66: TIE ROD TOOL
Courtesy of CHRYSLER LLC

NOTE: Never use anything other than the specified tool to disassemble the ball joints & tie rods from the steering knuckle. Ball joint seal or knuckle damage can result.

5. Separate the outer tie rod end (1) from the knuckle (3) using tool 9360 (2).

NOTE: Count the number of turns when removing.

6. Remove the outer tie rod end (1) from the inner tie rod.

INSTALLATION

OUTER TIE ROD END

618a30ae

Fig. 67: TIE ROD END
Courtesy of CHRYSLER LLC

1. Install the outer tie rod end (1) to the inner tie rod end to the exact number of turns that it was removed.
2. Install the outer tie rod end (1) to the knuckle. Tighten the nut (2) to 41 N.m (30 ft.lbs.) Plus an additional 90° turn.
3. Tighten the jam nut to 75 N.m (55 ft.lbs).
4. Install the tire and wheel assembly. Refer to **STANDARD PROCEDURE** .
5. Reset the toe and center the steering wheel. Refer to **STANDARD PROCEDURE** .

PUMP

DESCRIPTION

2.8L POWER STEERING PUMP

81b9945a

Fig. 68: DIESEL PUMP
Courtesy of CHRYSLER LLC

Hydraulic pressure for the power steering system is provided by a belt driven power steering pump. The pump shaft has a bolt-on drive pulley that is belt driven by the crankshaft pulley. The reservoir is separate from the pump body. The power steering pump is connected to the steering gear by the pressure and return hoses.

3.7L POWER STEERING PUMP

80c8a8d8

Fig. 69: Power Steering Pump Assembly
Courtesy of CHRYSLER LLC

- 1 - RESERVOIR
- 2 - CAP
- 3 - PULLEY
- 4 - PUMP BODY
- 5 - RESERVOIR RETAINING CLIPS

Hydraulic pressure for the power steering system is provided by a belt driven power steering pump (4). See **Fig. 69**. The pump shaft has a pressed-on high strength plastic drive pulley (3) that is belt driven by the crankshaft pulley.

OPERATION

POWER STEERING PUMP

The power steering pump is a constant flow rate and displacement, vane-type pump. The pump internal parts operate submerged in fluid. The flow control orifice is part of the high pressure line fitting. The pressure relief valve inside the flow control valve limits the pump pressure.

NOTE: **Power steering pumps have different pressure rates and are not interchangeable with other pumps.**

DIAGNOSIS AND TESTING

POWER STEERING PUMP AND HOSES

NOTE: **This information is designed to be used in conjunction with the diagnostic charts at the beginning of the Steering article. See DIAGNOSIS AND TESTING.**

CHECKING FOR WEAR OF POWER STEERING PUMP INTERNAL COMPONENTS

1. Place gear selector in PARK (or NEUTRAL) with wheels chalked.
2. With the engine idling, have a helper turn the steering wheel.
3. Using an electronic listening tool, determine if noise is coming from the pump.
4. Increase the engine speed and have a helper turn the steering wheel. Does the noise change with load?
5. Replace the power steering pump if excessive noise is present. See **REMOVAL**.

CHECKING FOR POWER STEERING HOSES TOUCHING BODY OR FRAME OF VEHICLE

Check hoses and hose tubes as following:

Inspect hoses and hose tubes for witness marks. If witness marks are present, adjust hose(s) to the proper position by loosening, repositioning and tightening attachments to the specified torque. See **SPECIFICATIONS**. **Do not bend tubing to adjust.** Replace the hose assembly if damaged.

Check fastener torque of hose mounting brackets and tube nuts. See **SPECIFICATIONS**.

Have a helper bump the steering gear off of the stops to induce pressure fluctuations which may move the hose. If hose contact is made, adjust hose(s) to the proper position by loosening, repositioning and tightening attachments to the specified torque. See **SPECIFICATIONS**. **Do not bend tubing to adjust.** Replace the hose assembly if damaged.

REMOVAL

POWER STEERING PUMP - 2.8L DIESEL

Fig. 70: PUMP
 Courtesy of CHRYSLER LLC

1. Siphon out as much power steering fluid as possible.
2. Remove the air cleaner housing (Refer to **REMOVAL**).
3. Remove the turbo air inlet tube.
4. Remove the serpentine drive belt (3). Refer to **REMOVAL** .
5. Remove the power steering hoses (2&4).

Fig. 71: ACCESS HOLES
 Courtesy of CHRYSLER LLC

6. Remove the three bolts (2) securing the pump (1) to the engine through the pulley access holes (3).
7. Remove the pump (1) from the vehicle.

POWER STEERING PUMP - 3.7L

1. Siphon out as much power steering fluid as possible.

2. Remove the serpentine drive belt. Refer to **REMOVAL** .
3. Remove the power steering high pressure hose at the pump.
4. Remove the return hose at the pump.
5. Remove the three bolts (1) securing the pump to the engine through the holes in the pulley (3).
6. Remove the pump from the vehicle.

INSTALLATION

POWER STEERING PUMP - 2.8L DIESEL

81b98e16

Fig. 73: ACCESS HOLES
 Courtesy of CHRYSLER LLC

1. Install the pump (1) to the vehicle.
2. Install the three bolts securing the pump (1) to the engine through the access holes (3) and tighten to 28 N.m (21 ft. lbs.).

81b98caf

Fig. 74: PUMP
 Courtesy of CHRYSLER LLC

3. Install the pressure power steering hoses (2). Tighten to 31 N.m (23 ft. lbs.).
4. Reclamp the supply hose (4) to the pump (1).
5. Install the serpentine belt (3). Refer to **INSTALLATION** .
6. Install the air inlet tube.
7. Install the air cleaner housing (Refer to **REMOVAL**).
8. Refill the power steering fluid and bleed the system. See **STANDARD PROCEDURE**.

FLUID

DESCRIPTION

ATF+4, TYPE 9602

The recommended fluid for the power steering system is Mopar® ATF +4.

Mopar® ATF+4, when new is red in color. The ATF+4 is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid

condition. As the vehicle is driven, the ATF+4 will begin to look darker in color and may eventually become brown. **THIS IS NORMAL.** ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

STANDARD PROCEDURE

POWER STEERING FLUID LEVEL CHECKING

WARNING: The fluid level should be checked with engine off to prevent injury from moving components.

CAUTION: MOPAR® ATF+4 is to be used in the power steering system. No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if any other fluid is used, and do not overfill.

NOTE: Power steering reservoir does not contain a dipstick. Fluid level indicators are molded into the side of the reservoir **WITH REMOTE RESERVOIR.**

The power steering fluid level can be viewed on the dipstick attached to the filler cap. Before opening power steering system, wipe the reservoir filler cap free of dirt and debris. Remove the cap and check the fluid level on its dipstick. When the fluid is at normal ambient temperature, approximately 21°C to 27°C (70°F to 80°F), the fluid level should read between the minimum and maximum on dipstick (GAS) or Reservoir (DIESEL). Only add fluid when the vehicle is cold.

Use only Mopar® ATF+4 . Do not overfill the power steering system.

FLUID COOLER

DESCRIPTION

FLUID COOLER

81a2e4e2

Fig. 81: FLUID COOLER WITH HOSES
Courtesy of CHRYSLER LLC

The power steering fluid cooler (2) is located at the front of the vehicle. It is mounted in front of the vehicle and just rearward of the front fascia. The cooler is positioned so it is in the air flow through the front fascia of the vehicle. The cooler can be serviced without the return hoses (1).

OPERATION

POWER STEERING FLUID COOLER

81a2e4e2

Fig. 82: FLUID COOLER WITH HOSES
Courtesy of CHRYSLER LLC

The purpose of the power steering fluid cooler (2) is to keep the temperature of the power steering system fluid from rising to a level that would affect the performance of the power steering system.

The cooler used on this vehicle is referred to as a fluid-to-air type cooler. This means that the air flow across the fin/tubes of the cooler is used to extract the heat from the cooler which it has absorbed from the power steering

fluid flowing through it. The cooler is placed in series with the power steering fluid return line, between the steering gear and the power steering fluid reservoir. This lowers the temperature of the power steering fluid prior to it entering the power steering fluid reservoir where it is resupplied to the power steering pump.

REMOVAL

FLUID COOLER

Fig. 83: 4.0L COOLER MOUNTING SCREWS
Courtesy of CHRYSLER LLC

1. Siphon the power steering fluid.
2. Raise and support the vehicle.
3. Remove the hose clamps (2) from the cooler lines.
4. Remove the 3 mounting screws (3) for the cooler (1).

Fig. 84: 4.0L COOLER IN-OUT
Courtesy of CHRYSLER LLC

5. Remove the front fascia push pins and lower the fascia (2) to remove the cooler (1) from the bottom.

INSTALLATION

FLUID COOLER

81a2deb0

Fig. 85: 4.0L COOLER IN-OUT
Courtesy of CHRYSLER LLC

1. Install the cooler (1) from the bottom between the front fascia (2) and core support.
2. Install the front fascia push pins.

81a2dea3

Fig. 86: 4.0L COOLER MOUNTING SCREWS
Courtesy of CHRYSLER LLC

3. Install the 3 mounting screws (3) for the cooler (1). Tighten to 4 N.m (35 in. lbs.).
4. Install and reclamp (2) the cooler hoses to the cooler (1) using new crimp clamps.
5. Lower the vehicle.

6. Refill the power steering fluid. See **STANDARD PROCEDURE**.

HOSES

REMOVAL

PRESSURE HOSE

1. Siphon out as much power steering fluid as possible.
2. Remove air cleaner housing (Refer to **REMOVAL**).
3. Remove the washer/coolant reservoir assembly.
4. Remove the fan shroud.
5. Remove power steering belt. Refer to **REMOVAL** .

81a2e667

Fig. 87: PRESSURE HOSE 4.0L

1. Siphon the power steering fluid from the reservoir.
2. Remove the air box (Refer to **REMOVAL** .
3. Remove the return hose (2) at the reservoir (1).

4. Remove the return line at the gear (4).
5. Remove the return line mounting bracket bolts (3) at the frame.
6. Remove the return hose (2) from the vehicle.

SUPPLY HOSE -DIESEL

Fig. 96: SUPPLY HOSE
Courtesy of CHRYSLER LLC

1. Siphon the power steering fluid from the reservoir (1).
2. Remove the air box (Refer to **REMOVAL**).
3. Remove the supply hose (2) at the reservoir (1).
4. Remove the supply hose (3) at the pump (4).
5. Remove the supply hose (5) from the vehicle.

INSTALLATION

PRESSURE HOSE

81a2e687

Fig. 97: PRESSURE HOSE 4.0L
Courtesy of CHRYSLER LLC

1. Install the pressure hose (2) at the gear.
2. Install pressure line (3) into pump. Thread pressure line tube nut into pump and tighten to 31 N.m (275 in. lbs.).

81a374b7

Fig. 98: HOSE MOUNTING
Courtesy of CHRYSLER LLC

3. Install the pressure hose mounting bolts (2) to the frame. Tighten to 12 N.m (105 in. lbs.).
4. Install power steering belt. Refer to **INSTALLATION** .
5. Install the fan shroud.
6. Install the washer/coolant reservoir assembly.
7. Install air cleaner housing (Refer to **INSTALLATION**).
8. Fill and bleed power steering system. See **STANDARD PROCEDURE**.
9. Inspect for leaks.

PRESSURE HOSE - DIESEL

Fig. 99: HOSES

Courtesy of CHRYSLER LLC

1. Install the pressure hose (1) to the vehicle.
2. Install the pressure hose mounting bracket bolts (3) to the frame.
3. Install the pressure hose at the gear (4).
4. Install the pressure line (1) at the pump (2).
5. Install the airbox (Refer to **INSTALLATION**).
6. Refill the power steering fluid.
7. Bleed the power steering system. See **STANDARD PROCEDURE**.
8. Check for leaks.

RETURN COOLER TO RESERVOIR

Fig. 100: 4.0L COOLER MOUNTING SCREWS

Courtesy of CHRYSLER LLC

1. Install the hose to the vehicle.
2. Install the 3 push pins and install the front fascia into position.
3. Install the hose to the cooler (1) and reclamp (2) with a new hose crimp clamp.

Fig. 101: ROUTING CLIP

Courtesy of CHRYSLER LLC

4. Install the return hose assembly routing clip (1).

Fig. 102: RETURN HOSE

Courtesy of CHRYSLER LLC

5. Install a new hose clamp for the cooler to reservoir hose (2) to the reservoir (1).
6. Lower the vehicle.
7. Fill and bleed power steering system. See **STANDARD PROCEDURE**.

8. Inspect for leaks.

RETURN GEAR TO COOLER

Fig. 103: ROUTING CLIP
Courtesy of CHRYSLER LLC

1. Install the return hose/line at the mounting clip (1).

Fig. 104: 4.0L COOLER MOUNTING SCREWS

2. Install return hose to the steering gear.
3. Install return hose to the cooler (1) and reclamp (2) with a new crimp clamp.
4. Install the fan shroud.
5. Install the washer/coolant reservoir assembly.
6. Install air cleaner housing (Refer to **INSTALLATION**).

7. Fill and bleed power steering system. See **STANDARD PROCEDURE**.
8. Inspect for leaks.

RETURN LINE DIESEL

Fig. 105: RETURN HOSE
Courtesy of CHRYSLER LLC

1. Install the return hose (2) to the vehicle
2. Install the return hose mounting bracket bolts (3) to the frame.
3. Install the return hose at the gear (4).
4. Install the return hose (2) at the reservoir (1).
5. Install the airbox (Refer to **INSTALLATION**).
6. Refill the power steering fluid.
7. Bleed the power steering system. See **STANDARD PROCEDURE**.
8. Check for leaks.

SUPPLY HOSE DIESEL

Fig. 106: SUPPLY HOSE
 Courtesy of CHRYSLER LLC

1. Install the supply hose (5) to the reservoir (1) and pump (4).
2. Reclamp the supply hose at the pump (3).
3. Reclamp the supply hose at the reservoir (2).
4. Install the airbox (Refer to **INSTALLATION**).
5. Refill the power steering fluid.
6. Bleed the power steering system. See **STANDARD PROCEDURE**.
7. Check for leaks.

PULLEY

REMOVAL

PULLEY - DIESEL ENGINE

Fig. 107: PULLEY
Courtesy of CHRYSLER LLC

1. Remove the air cleaner box (Refer to **REMOVAL**).
2. Remove the air inlet tube.
3. Remove the serpentine drive belt (2).
4. Remove the three bolts (3) securing the pulley (1) to the pump (4).

PULLEY- GAS ENGINE

80d687b0

Fig. 108: Removing Pulley
Courtesy of CHRYSLER LLC

CAUTION: Do not reuse the old power steering pump pulley it is not intended for reuse. A new pulley must be installed if removed.

1. Remove air cleaner housing (Refer to **REMOVAL**).
2. Remove the washer/coolant reservoir assembly.
3. Remove the fan shroud.
4. Remove power steering belt. Refer to **REMOVAL** .

5. Remove the pulley (2) from the pump using (OTC® 7185) power steering pulley removal tool or equivalent (3).

INSTALLATION

PULLEY - DIESEL ENGINE

Fig. 109: PULLEY

Courtesy of CHRYSLER LLC

1. Install the pulley (1) to the pump shaft.
2. Install the three bolts (3) securing the pulley (1) to the pump (4). Tighten to 47 N.m (35 ft. lbs.).
3. Install the serpentine belt (2).
4. Install the air inlet tube.
5. Install the air cleaner box (Refer to **INSTALLATION**).

PULLEY - GAS ENGINE

80d687bd

Fig. 110: Installing Pulley
Courtesy of CHRYSLER LLC

CAUTION: Do not reuse the old power steering pump pulley it is not intended for reuse. A new pulley must be installed if removed.

1. Replace the pulley (2) if it's bent, cracked, or loose.
2. Install the pulley (2) on the pump (1) using (OTC ® 7771) power steering pulley installation tool or equivalent (3) making sure it is flush with the end of the shaft. Ensure the tool and pulley remain aligned with the pump shaft.
3. Install the air box assembly (Refer to **INSTALLATION**).
4. Install power steering belt. Refer to **INSTALLATION** .
5. Install the fan shroud.
6. Install the washer/coolant reservoir assembly.
7. Install air cleaner housing (Refer to **INSTALLATION**)

RESERVOIR

DESCRIPTION

RESERVOIR

81b98c17

Fig. 111: FLUID RESERVOIR DIESEL

- | |
|---|
| 1 - FLUID RESERVOIR
2 - RETURN HOSES |
|---|

1. Install the reservoir (1) to the mounting bracket.
2. Install and tighten the bolt to 12 N.m (9 ft. lbs.).
3. Install the hoses (2).
4. Refill the power steering fluid and check for leaks. See **STANDARD PROCEDURE**.

2008 SUSPENSION

Suspension - Liberty

DIAGNOSIS AND TESTING

SUSPENSION AND STEERING SYSTEM

CONDITION	POSSIBLE CAUSES	CORRECTION
FRONT END NOISE	1. Loose or worn wheel bearings. 2. Loose or worn steering or suspension components.	1. Replace wheel bearings. 2. Tighten or replace components as necessary.
EXCESSIVE PLAY IN STEERING	1. Loose or worn wheel bearings. 2. Loose or worn steering or suspension components. 3. Loose or worn steering gear.	1. Replace wheel bearings. 2. Tighten or replace components as necessary. 3. Adjust or replace steering gear.
FRONT WHEELS SHIMMY	1. Loose or worn wheel bearings. 2. Loose or worn steering or suspension components. 3. Tires worn or out of balance. 4. Alignment.	1. Replace wheel bearings. 2. Tighten or replace components as necessary. 3. Replace or balance tires. 4. Align vehicle to specifications.
VEHICLE INSTABILITY	1. Loose or worn wheel bearings. 2. Loose or worn steering or suspension components. 3. Tire pressure. 4. Alignment.	1. Replace wheel bearings. 2. Tighten or replace components as necessary. 3. Adjust tire pressure. 4. Align vehicle to specifications.
EXCESSIVE STEERING EFFORT	1. Loose or worn steering gear. 2. Power steering fluid low. 3. Column coupler binding. 4. Tire pressure. 5. Alignment.	1. Adjust or replace steering gear. 2. Add fluid and repair leak. 3. Replace coupler. 4. Adjust tire pressure. 5. Align vehicle to specifications.
VEHICLE PULLS TO ONE SIDE DURING BRAKING	1. Uneven tire pressure. 2. Worn brake components. 3. Air in brake line.	1. Adjust tire pressure. 2. Repair brakes as necessary. 3. Repair as necessary.
VEHICLE LEADS OR DRIFTS FROM STRAIGHT AHEAD DIRECTION ON UNCROWNED ROAD	1. Radial tire lead. 2. Brakes dragging. 3. Weak or broken spring. 4. Uneven tire pressure. 5. Wheel Alignment. 6. Loose or worn steering or suspension components. 7. Cross caster out of spec.	1. Cross front tires. 2. Repair brake as necessary. 3. Replace spring. 4. Adjust tire pressure. 5. Align vehicle. 6. Repair as necessary. 7. Align vehicle.
KNOCKING, RATTLING OR SQUEAKING	1. Worn shock bushings. 2. Loose, worn or bent	1. Replace shock. 2. Inspect, tighten or replace

	steering/suspension components. 3. Shock valve.	components as necessary. 3. Replace shock.
IMPROPER TRACKING	Loose, worn or bent steering/suspension components. -	Inspect, tighten or replace components as necessary. -

WHEEL ALIGNMENT

DESCRIPTION

WHEEL ALIGNMENT

NOTE: Suspension components with rubber/urethane bushings should be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.

Fig. 1: Wheel Alignment Measurements - Caster, Camber, Toe & Thrust Angle
 Courtesy of CHRYSLER LLC

1 - FRONT OF VEHICLE
2 - STEERING AXIS INCLINATION
3 - PIVOT POINT
4 - TOE-IN

Wheel alignment involves the correct positioning of the wheels in relation to the vehicle. The positioning is accomplished through suspension and steering linkage adjustments. An alignment is considered essential for efficient steering, good directional stability and to minimize tire wear. The most important measurements of an alignment are caster, camber and toe.

CAUTION: Never attempt to modify suspension or steering components by heating or bending.

NOTE: Periodic lubrication of the front suspension/steering system components may be required. Rubber bushings must never be lubricated.

OPERATION

WHEEL ALIGNMENT

CASTER is the forward or rearward tilt of the steering knuckle from vertical. Tilting the top of the knuckle forward provides negative caster. Tilting the top of the knuckle rearward provides positive caster. Positive caster promotes directional stability. This angle enables the front wheels to return to a straight ahead position after turns. See **Fig. 1**.

CAMBER is the inward or outward tilt of the wheel relative to the center of the vehicle. Tilting the top of the wheel inward provides negative camber. Tilting the top of the wheel outward provides positive camber. Incorrect camber will cause wear on the inside or outside edge of the tire. See **Fig. 1**.

TOE is the difference between the leading inside edges and trailing inside edges of the front tires. Wheel toe position out of specification cause's unstable steering, uneven tire wear and steering wheel off-center. The wheel toe position is the **final** front wheel alignment adjustment. See **Fig. 1**.

THRUST ANGLE is the angle of the rear axle relative to the centerline of the vehicle. Incorrect thrust angle can cause off-center steering and excessive tire wear. This angle is not adjustable, damaged component(s) must be replaced to correct the thrust angle. See **Fig. 1**.

STANDARD PROCEDURE

CAMBER AND CASTER ADJUSTMENT

Fig. 2: Identifying Lower Control Arm, Control Arm Pivot Bolts & Rail Brackets
 Courtesy of CHRYSLER LLC

Camber and caster angle adjustments involve changing the position of the lower control arm cam bolts (3).

COMPLETE WHEEL ALIGNMENT

Fig. 3: Identifying Lower Control Arm, Control Arm Pivot Bolts & Rail Brackets
 Courtesy of CHRYSLER LLC

Camber and caster angle adjustments involve changing the position of the lower suspension arm cam bolts (3).

CASTER

Moving the rear position of the cam bolt in or out, will change the caster angle significantly and camber angle only slightly. To maintain the camber angle while adjusting caster, move the rear cam bolt in or out. Then move the front cam bolt slightly in the opposite direction.

To increase positive caster angle, move the rear position cam bolt outward (from the engine). Move the front

cam bolt inward (toward the engine) slightly until the specified camber angle is obtained.

CAMBER

Move the rear position cam bolt outward (from the engine). Move the forward position cam bolt inward (toward the engine).

After adjustment is made tighten the cam bolt nuts to proper torque specification.

TOE ADJUSTMENT

80cdf759

Fig. 4: Tie Rod End
Courtesy of CHRYSLER LLC

The wheel toe position adjustment is the final adjustment.

1. Start the engine and turn wheels both ways before straightening the wheels. Secure the steering wheel with the front wheels in the straight-ahead position.
2. Turn off engine.
3. Loosen the tie rod jam nuts (1).

NOTE: Each front wheel should be adjusted for one-half of the total toe position

specification. This will ensure the steering wheel will be centered when the wheels are positioned straight-ahead.

4. Adjust the wheel toe position by turning the tie rod as necessary.
5. Tighten the tie rod jam nut (1) to 75 N.m (55 ft. lbs.).
6. Verify the specifications.

HEIGHT MEASUREMENT

CURB HEIGHT

NOTE: The suspension is non-adjustable.

The vehicle suspension height should be measured before performing wheel alignment procedure. Also when front suspension components have been replaced. This measure must be performed with the vehicle supporting it's own weight and taken on both sides of the vehicle.

Front and rear curb heights are not adjustable. The spring selections at assembly determine curb height for acceptable appearance of the vehicle. Curb height dimensions assume full fluids (including fuel) and zero passengers. Refer to the CURB HEIGHT SPECIFICATIONS table below for front curb height dimensions.

Vehicle curb height audits should be performed utilizing the following procedure:

1. Drive the vehicle straight and forward on a non-tacky surface for a minimum of 20 feet to neutralize track width.
2. Bounce the front of the vehicle five times.
3. Measure and record the dimensions

Fig. 5: Front Curb Height
Courtesy of CHRYSLER LLC

4. Front - On each side of the vehicle, measure the distance from the center of the front lower control arm

- bushing bolt (1) to the ground (3) **Record the measurement** . Next measure the distance from the spindle center (2) to the ground (3) **Record the measurement**.
5. Take the two measurements and subtract them to get the curb height specification.

Fig. 6: Identifying Jounce Cup & Strike Surface
Courtesy of CHRYSLER LLC

REAR CURB HEIGHT Rear curb height is defined by the relative vertical distance between the top of the lower spring seat strike surface and the bottom of the jounce cup (true metal to metal jounce travel). This is to be measured vertically inside the coil from the point intersecting the inboard edge and the for/aft center of the jounce cup (1) down to the strike surface (2).

CURB HEIGHT SPECIFICATIONS

MODEL	FRONT	FRONT CROSS HEIGHT	REAR	REAR CROSS (LEFT - RIGHT)
ALL	62 mm ± 10 mm 2.44 in. ± 0.39 in	0 mm ± 7 mm 0 in. ± 0.27 in	107 mm ± 10 mm 4.21 in. ± 0.39 in.	0 mm ± 7 mm 0 in. ± 0.27 in.

TOE ADJUSTMENT

The wheel toe position adjustment is the final adjustment.

1. Start the engine and turn wheels both ways before straightening the wheels. Secure the steering wheel with the front wheels in the straight-ahead position.
2. Turn off the engine.

80cdf759

Fig. 7: Tie Rod End
Courtesy of CHRYSLER LLC

3. Loosen the tie rod jam nuts (1).

NOTE: Each front wheel should be adjusted for one-half of the total toe position specification. This will ensure the steering wheel will be centered when the wheels are positioned straight-ahead.

4. Adjust the wheel toe position by turning the tie rod as necessary. See **Fig. 7**.
5. Tighten the tie rod jam nut (1) to 75 N.m (55 ft. lbs.).
6. Verify the specifications.

SPECIFICATIONS

FRONT

DESCRIPTION

FRONT SUSPENSION

Fig. 8: Front Suspension
Courtesy of CHRYSLER LLC

NOTE: Suspension components with rubber/urethane bushings should be tightened with the full weight of the vehicle at normal ride height. It is important to have the springs supporting the full weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.

The front suspension is designed to allow each wheel to adapt to different road surfaces independently. The wheels are mounted to hub bearings on the steering knuckle spindles (5). The hub bearings are sealed and lubricated for life. The steering knuckles turn (pivot) on ball joints integral to the outboard portion of the upper

control arms (3) and pressed into the lower control arm. The ball joints and outer tie rods are lubricated for life.

WARNING

REAR SUSPENSION

WARNING: Suspension components with rubber bushings must be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort will be affected and cause premature bushing wear.

NOTE: Never use anything other than the specified tool to disassemble the ball joints & tie rods from the steering knuckle. Ball joint seal or knuckle damage can result.

BUSHINGS

REMOVAL

BUSHINGS-CLEVIS BRACKET

1. Remove the tire and wheel assembly.
2. Remove the disc brake rotor. Refer to **REMOVAL** .
3. Remove the wheel speed sensor. Refer to **REMOVAL** .
4. Remove the lower stabilizer link at the lower control arm.
5. Remove the lower clevis bolt at the control arm.

Fig. 20: Upper Ball Joint Separation
 Courtesy of CHRYSLER LLC

6. Remove the upper ball joint nut.
7. Separate the upper ball joint from the knuckle using special tool 9360 separator (2).
8. Lower the control arm enough to install the press tool.

Fig. 21: Clevis Bushing Removal
 Courtesy of CHRYSLER LLC

NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.

9. Press the bushing (3) out using special tools C-4212F (Press) (1), 9956 (receiver) (4) and 9653-1 (driver) (2).

Fig. 22: LCA Bushing Removal
 Courtesy of CHRYSLER LLC

1. Remove the lower control arm. See **REMOVAL**.
2. Secure the control arm in a vise.

NOTE: **Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.**

3. Press the bushing (4) out using special tools C-4212F (Press) (1), 9334-5 (Receiver) (2) and 9603-3 (Driver) (5).

BUSHINGS-STABILIZER BAR

1. Raise vehicle on hoist.
2. Remove the stabilizer bushing clamps.
3. Remove the stabilizer bushings from the stabilizer bar.

INSTALLATION

BUSHINGS-CLEVIS BRACKET

NOTE: **Suspension components with rubber/urethane bushings should be tightened with the full weight of the vehicle at normal ride height. It is important to have the springs supporting the full weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.**

Fig. 23: Clevis Bushing Install
Courtesy of CHRYSLER LLC

NOTE: **Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.**

1. Install the new clevis bracket bushing (4) into the lower control arm (3) using special tools C-4212F (Press) (1), 9957-2 (Depth Gauge) (2), 9957-1 (driver) (5).
2. Install the upper ball joint to the knuckle and tighten the nut to 41 N.m (30 ft. lbs.) plus an additional 90° turn.
3. Install the clevis bolt to the lower control arm and tighten the bolt to 150 N.m (110 ft. lbs.).
4. Install the stabilizer link lower bolt to the control arm and tighten the bolt to 102 N.m (75 ft. lbs.).
5. Install the wheel speed sensor. Refer to **INSTALLATION** .
6. Install the disc brake rotor. Refer to **INSTALLATION** .
7. Install the tire and wheel assembly. Refer to **STANDARD PROCEDURE** .
8. Lower the vehicle.

BUSHINGS-LOWER CONTROL ARM

NOTE: **Suspension components with rubber/urethane bushings should be tightened with the full weight of the vehicle at normal ride height. It is important to have the springs supporting the full weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.**

Fig. 24: LCA Bushing Install
Courtesy of CHRYSLER LLC

NOTE: **Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.**

1. Install the new lower control arm bushings (3) into the lower control arm (4) using tools C-4212F (Press) (1), 9603-1 (driver) (2) and 9969-1 (receiver) (5) making sure the receiver cup is properly centered for the bushing to be pressed in to the proper depth.
2. Remove the control arm from the vise.
3. Install the lower control arm. See **INSTALLATION**.
4. Perform a wheel alignment. See **STANDARD PROCEDURE**.

BUSHINGS-STABILIZER BAR

NOTE: **Suspension components with rubber/urethane bushings should be tightened with the full weight of the vehicle at normal ride height. It is important to have the springs supporting the full weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.**

1. Install the stabilizer bushings to the stabilizer bar.
2. Install the stabilizer bushing clamps. Tighten the nuts to 149 N.m (110 ft. lbs.).
3. Lower the vehicle.

HUB/BEARING

REMOVAL

HUB/BEARING

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the caliper adapter. Refer to **REMOVAL** .

CAUTION: Never allow the disc brake caliper to hang from the brake hose. Damage to the brake hose will result. Provide a suitable support to hang the caliper securely.

4. Remove the disc brake rotor. Refer to **REMOVAL** .
5. Remove the wheel speed sensor. Refer to **REMOVAL** .

Fig. 25: View Of Hub/Bearing Mounting Bolts
Courtesy of CHRYSLER LLC

6. Remove the axle shaft nut. (if equipped with four wheel drive)
7. Remove the three mounting bolts (1) for the hub/bearing assembly.
8. Remove the hub/bearing.

INSTALLATION

HUB/BEARING

Fig. 26: View Of Hub/Bearing Mounting Bolts
Courtesy of CHRYSLER LLC

1. Install the hub/bearing assembly to the vehicle.
2. Install the three mounting bolts (1) for the hub/bearing. Tighten the bolt to 130 N.m (96 ft. lbs.).
3. Install the axle shaft nut. Tighten the nut to 135 N.m (100 ft. lbs.). (if equipped with four wheel drive)
4. Install the wheel speed sensor to the hub. Tighten the bolt to 13.5 N.m (10 ft. lbs.). Refer to **INSTALLATION** .
5. Install the disc brake rotor. Refer to **INSTALLATION** .
6. Install the disc brake caliper adapter. Tighten the nut to 135 N.m (100 ft. lbs.). Refer to **INSTALLATION** .
7. Install the tire and wheel assembly. Refer to **STANDARD PROCEDURE** .

KNUCKLE

REMOVAL

KNUCKLE

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the caliper adapter. Refer to **REMOVAL** .

CAUTION: Never allow the disc brake caliper to hang from the brake hose. Damage to the brake hose will result. Provide a suitable support to hang the caliper securely.

4. Remove the disc brake rotor. Refer to **REMOVAL** .
5. Remove the wheel speed sensor. Refer to **REMOVAL** .
6. Remove the axle shaft nut. (if equipped with four wheel drive)

618a30ae

Fig. 27: Identifying Tie Rod End & Steering Knuckle
Courtesy of CHRYSLER LLC

7. Remove the outer tie rod nut (2).

Fig. 28: Identifying Tie Rod, Steering Knuckle & Special Tool 9360
 Courtesy of CHRYSLER LLC

8. Separate the outer tie rod end (1) from the steering knuckle (3) using tool 9360 (2). Refer to **REMOVAL** .

Fig. 29: Lower Ball Joint Separation
 Courtesy of CHRYSLER LLC

9. Remove the lower ball joint nut.
10. Separate the lower ball joint from the suspension arm using tool C-4150A (3).

Fig. 30: Upper Ball Joint Separation
Courtesy of CHRYSLER LLC

11. Remove the upper ball joint nut.
12. Separate the upper ball joint from the knuckle using tool 9360 (2).

NOTE: **Inspect the seal side surface of the upper ball joint, lower ball joint & outer tie rod knuckle bosses. If any significant grooves or gouges are present (or heavily scratched) Replace the steering knuckle.**

13. Remove the knuckle (3) from the vehicle.
14. Remove the hub/bearing. (if needed). See **REMOVAL**.

INSTALLATION

KNUCKLE

CAUTION: The ball joint stud taper must be **CLEAN** and **DRY** before installing into the knuckle. Clean the stud taper with mineral spirits to remove dirt and grease.

1. Install the hub/bearing. (if removed from the knuckle). See **INSTALLATION**.
2. Install the knuckle to the vehicle.
3. Install the upper ball joint nut. Tighten the nut to 41 N.m (30 ft. lbs.) plus an additional 90° turn.
4. Install the lower ball joint nut. Tighten the nut to 54 N.m (40 ft. lbs.) plus an additional 90° turn.

618a30ae

Fig. 31: Identifying Tie Rod End & Steering Knuckle
Courtesy of CHRYSLER LLC

5. Install the outer tie rod end (1) to the steering knuckle and install the nut (2). Tighten the nut (2) to 41 N.m (30 ft. lbs.) plus an additional 90° turn. Refer to **INSTALLATION** .
6. Install the axle shaft nut. Tighten the nut to 136 N.m (100 ft. lbs.) (if equipped with four wheel drive).
7. Install the wheel speed sensor. Refer to **INSTALLATION** .
8. Install the disc brake rotor. Refer to **INSTALLATION** .
9. Install the caliper adapter. Refer to **INSTALLATION** .
10. Install the tire and wheel assembly. Refer to **STANDARD PROCEDURE** .
11. Perform a wheel alignment. See **STANDARD PROCEDURE**.

LOWER BALL JOINT

DIAGNOSIS AND TESTING

LOWER BALL JOINT

1. Raise the front of the vehicle. Place safety floor stands under both lower control arms as far outboard as possible. Lower the vehicle to allow the stands to support some or all of the vehicle weight.
2. Mount a dial indicator solidly to the topside of the lower control arm and then zero the dial indicator.
3. Position the indicator plunger against the bottom surface of the steering knuckle.

NOTE: **The dial indicator plunger must be perpendicular to the machined surface of the steering knuckle.**

4. Position a pry bar under the tire assembly. Pry upwards on the tire assembly.
5. If the travel exceeds 0.5 mm (0.020 in.), replace the lower ball joint. See **REMOVAL**.

REMOVAL

LOWER BALL JOINT

Fig. 32: Identifying Tie Rod, Steering Knuckle & Special Tool 9360
Courtesy of CHRYSLER LLC

1. Remove the tire and wheel assembly.
2. Remove the brake caliper and rotor. Refer to **REMOVAL** .
3. Separate the tie rod (1) from the steering knuckle (3) using special tool 9360 (2). Refer to **REMOVAL** .

Fig. 33: Upper Ball Joint Separation
Courtesy of CHRYSLER LLC

4. Separate the upper ball joint from the knuckle (3) using special tool 9360 (2).

8195c260

Fig. 34: Lower Ball Joint Separation
Courtesy of CHRYSLER LLC

5. Separate the lower ball joint (2) from the steering knuckle (1) using special tool 8677 (3).
6. Remove the steering knuckle. See **REMOVAL**.

81485d02

Fig. 35: Removing Lower Ball Joint
Courtesy of CHRYSLER LLC

NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.

7. Press the ball joint from the lower control arm (3) using special tools C-4212-F (PRESS) (1), C-4212-3 (Driver) (2) and 9654-3 (Receiver) (4).

INSTALLATION

LOWER BALL JOINT

81485d06

Fig. 36: Installing Lower Ball Joint
Courtesy of CHRYSLER LLC

- 1 - C-4212-F PRESS
- 2 - 9654-2 RECEIVER
- 3 - LOWER CONTROL ARM
- 4 - BALL JOINT
- 5 - 9654-1 DRIVER

NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.

1. Install the ball joint (4) into the control arm (3) and press in using special tools C-4212-F (press) (1),

9654-1 (Driver) (5) and 9654-2 (Receiver) (2).

2. Stake the ball joint flange in four evenly spaced places around the ball joint flange, using a chisel and hammer.
3. Install the steering knuckle. See **INSTALLATION**.
4. Install the tie rod end into the steering knuckle. Refer to **INSTALLATION**.
5. Install and tighten the halfshaft nut to 136 N.m (100 ft. lbs.). (If Equipped).
6. Install the brake caliper and rotor. Refer to **INSTALLATION**.
7. Install the tire and wheel assembly. Refer to **STANDARD PROCEDURE**.
8. Check the vehicle ride height. See **STANDARD PROCEDURE**.
9. Perform a wheel alignment. See **STANDARD PROCEDURE**.

LOWER CONTROL ARM

REMOVAL

LOWER CONTROL ARM

1. Raise and support the vehicle.
2. Remove the wheel and tire assembly.

Fig. 37: Identifying Stabilizer Bar Link & Bolts
Courtesy of CHRYSLER LLC

3. Remove the stabilizer bar link (2). See **REMOVAL**.

Fig. 38: Clevis Bracket
Courtesy of CHRYSLER LLC

4. Remove the shock absorber lower clevis bolt (4). See **REMOVAL**.

Fig. 39: Lower Ball Joint Separation
Courtesy of CHRYSLER LLC

5. Remove the lower ball joint nut (2). Separate ball joint from the steering knuckle (1) with Remover 8677 (3).

Fig. 40: Identifying Lower Control Arm, Control Arm Pivot Bolts & Rail Brackets
 Courtesy of CHRYSLER LLC

NOTE: Marking the lower control arm pivot bolts front and rear will aid in the assembly procedure.

6. Remove the control arm pivot bolts (3) and suspension arm from frame rail brackets (1).
7. Remove the lower control arm (2) from the vehicle.

INSTALLATION

LOWER CONTROL ARM

Fig. 41: Identifying Lower Control Arm, Control Arm Pivot Bolts & Rail Brackets
 Courtesy of CHRYSLER LLC

1. Position the lower control arm (2) at the frame rail brackets. Install the cam/pivot bolts (3) and nuts. Tighten the nuts finger-tight.

CAUTION: The ball joint stud taper must be **CLEAN** and **DRY** before installing into the knuckle. Clean the stud taper with mineral spirits to remove dirt and grease.

2. Install the ball joint into the steering knuckle, and tighten the nut to 54 N.m (40 ft. lbs.) plus an additional 90° turn.

Fig. 42: Clevis Bracket
Courtesy of CHRYSLER LLC

3. Install shock absorber lower clevis bolt/nut (4). Tighten the nut to 150 N.m (110 ft. lbs.) **with full vehicle weight**.

Fig. 43: Identifying Stabilizer Bar Link & Bolts
Courtesy of CHRYSLER LLC

4. Install the stabilizer bar link lower bolt (2) Tighten the bolt to 102 N.m (75 ft. lbs.) **with full vehicle weight**. . See INSTALLATION.

Fig. 44: Identifying Lower Control Arm, Control Arm Pivot Bolts & Rail Brackets
Courtesy of CHRYSLER LLC

5. Align the marks front and rear (1) at the cam/pivot bolts (3) and tighten the nuts. Tighten the nuts to 170 N.m (125 ft. lbs.) **with full vehicle weight**.
6. Install the wheel and tire assembly. Refer to STANDARD PROCEDURE .
7. Remove the support and lower the vehicle.
8. Perform a wheel alignment. See STANDARD PROCEDURE.

SHOCK

REMOVAL

SHOCK - LEFT SIDE

Fig. 45: Identifying Battery Tray, Power Center & Battery
Courtesy of CHRYSLER LLC

1. Disconnect the battery (3).
2. Remove the battery. Refer to **REMOVAL** .
3. Unclip the power center (2) and move it to the side out of the way to access the battery tray (1).
4. Remove the battery tray (1). Refer to **REMOVAL** .
5. Remove the four upper shock mounting nuts.
6. Raise and support the vehicle.
7. Remove the left tire and wheel assembly.
8. Remove the caliper and support. Refer to **REMOVAL** .

Fig. 46: Clevis Bracket
Courtesy of CHRYSLER LLC

9. Remove the lower bolt (4) at the lower control arm securing the clevis bracket (3).

Fig. 47: Identifying Stabilizer Bar Link & Bolts
 Courtesy of CHRYSLER LLC

10. Remove the stabilizer link bolt (2) at the lower control arm. See **REMOVAL**.

Fig. 48: Upper Ball Joint Separation
 Courtesy of CHRYSLER LLC

11. Remove the upper ball joint nut.
12. Separate the upper ball joint from the knuckle (3) using remover 9360 (2).

Fig. 49: Identifying Steering Knuckle, Remover 9360, Shock Assembly & Knuckle
 Courtesy of CHRYSLER LLC

13. Push downward on the steering knuckle (3) and support the knuckle (4) this will allow access to remove the shock.
14. Remove the shock assembly (1) from the vehicle.
15. Remove the spring from the shock (if needed). See **REMOVAL**.

SHOCK - RIGHT SIDE

1. Remove the air box. Refer to **REMOVAL** .
2. Remove the four upper shock mounting nuts.
3. Raise and support the vehicle.
4. Remove the right side tire assembly.
5. Remove the caliper and support. Refer to **REMOVAL** .

Fig. 50: Clevis Bracket

Courtesy of CHRYSLER LLC

6. Remove the lower bolt (4) at the lower control arm securing the clevis bracket (3).

Fig. 51: Identifying Stabilizer Bar Link & Bolts
Courtesy of CHRYSLER LLC

7. Remove the stabilizer link bolt (2) at the lower control arm. See **REMOVAL**.

Fig. 52: Upper Ball Joint Separation
Courtesy of CHRYSLER LLC

8. Remove the upper ball joint nut.
9. Separate the upper ball joint from the knuckle (3) using remover 9360 (2).

Fig. 53: Identifying Steering Knuckle, Remover 9360, Shock Assembly & Knuckle
 Courtesy of CHRYSLER LLC

10. Pull downward on the knuckle and support the knuckle (4) to allow access.
11. Remove the shock assembly (1) from the vehicle.
12. Remove the spring from the shock (if needed). See **REMOVAL**.

INSTALLATION

SHOCK - LEFT SIDE

Fig. 54: Identifying Steering Knuckle, Remover 9360, Shock Assembly & Knuckle
 Courtesy of CHRYSLER LLC

1. Install the spring to the shock (if removed). See **INSTALLATION**.
2. Install the shock assembly (1) to the vehicle.
3. Install the four upper shock mounting nuts. Tighten the nuts to 108 N.m (80 ft. lbs.).

4. Raise the knuckle (3) into place and reconnect the upper ball joint nut. Tighten the nut to 41 N.m (30 ft. lbs.) plus an additional 90° turn.

Fig. 55: Clevis Bracket
Courtesy of CHRYSLER LLC

5. Install the clevis bracket bolt (4) at the lower control arm. See **INSTALLATION**. Tighten the bolt to 150 N.m (110 ft. lbs.) **with full vehicle weight.** .
6. Install the caliper. Refer to **INSTALLATION** .

Fig. 56: Identifying Stabilizer Bar Link & Bolts
Courtesy of CHRYSLER LLC

7. Install the lower stabilizer link (1) at the lower control arm. Tighten the bolt (2) to 102 N.m (75 ft. lbs.) **with full vehicle weight.** . See **INSTALLATION**.

8. Install the left tire and wheel assembly. Refer to **STANDARD PROCEDURE** .
9. Lower the vehicle.

Fig. 57: Identifying Battery Tray, Power Center & Battery
Courtesy of CHRYSLER LLC

10. Install the battery tray (1). Refer to **INSTALLATION** .
11. Install the battery. Refer to **INSTALLATION** .
12. Reinstall the power center (2) back into place.
13. Reconnect the battery cables (3).

SHOCK - RIGHT SIDE

Fig. 58: Identifying Steering Knuckle, Remover 9360, Shock Assembly & Knuckle
Courtesy of CHRYSLER LLC

1. Install the spring to the shock (if removed). See **INSTALLATION**.

2. Install the shock assembly (1) to the vehicle.
3. Install the four upper shock mounting nuts. Tighten the nuts to 108 N.m (80 ft. lbs.).
4. Raise the knuckle (3) into place and reconnect the upper ball joint nut. Tighten the nut to 41 N.m (30 ft. lbs.) plus an additional 90° turn.

Fig. 59: Clevis Bracket
Courtesy of CHRYSLER LLC

5. Install the clevis bracket bolt (4) at the lower control arm. See **INSTALLATION**. Tighten the bolt to 150 N.m (110 ft. lbs.) **with full vehicle weight.** .

Fig. 60: Identifying Stabilizer Bar Link & Bolts
Courtesy of CHRYSLER LLC

6. Install the caliper. Refer to **INSTALLATION** .

7. Install the lower stabilizer link bolt (2) at the lower control arm. Tighten the bolt to 102 N.m (75 ft. lbs.) **with full vehicle weight.** . See INSTALLATION.
8. Install the right tire and wheel assembly. Refer to STANDARD PROCEDURE .
9. Lower the vehicle.
10. Install the airbox. Refer to INSTALLATION .

SPRING

REMOVAL

SPRING

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the shock. Refer to the proper side shock removal procedure being worked on. See REMOVAL.

80c62e85

Fig. 61: Spring Compressor
Courtesy of CHRYSLER LLC

1 - SPRING COMPRESSOR

2 - SPRING

4. Secure the shock assembly into a Pentastar® Service Equipment W-7200 Spring compressor (1). See **Fig. 61**
5. Compress the spring (2).
6. Remove the shock mount nut.
7. Remove the shock from the spring compressor.
8. Transfer the necessary parts to the type of repair being done (Insulator, Spring, shock and mount).

INSTALLATION

SPRING

80c62e85

Fig. 62: Spring Compressor
Courtesy of CHRYSLER LLC

1 - SPRING COMPRESSOR

1. Install the shock to the spring (2) and spring compressor (1), After the transfer of the necessary parts to the type of repair being done (Insulator, Spring, shock and mount).
2. Install the shock mounting nut. Tighten the bolt to 41 N.m (30 ft. lbs.).
3. Loosen the compressed spring (2).
4. Remove the shock assembly from the spring compressor (1).
5. Install the shock to the vehicle. See **INSTALLATION**.
6. Install the tire and wheel assembly. Refer to **STANDARD PROCEDURE**.
7. Remove the support and lower the vehicle.

CLEVIS BRACKET

REMOVAL

CLEVIS BRACKET

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the disc brake rotor. Refer to **REMOVAL**.
4. Remove the wheel speed sensor. Refer to **REMOVAL**.

8195b064

Fig. 63: Clevis Bracket
Courtesy of CHRYSLER LLC

5. Remove the lower clevis bolt (4) at the lower control arm.
6. Remove the upper clevis bolt (2) at the shock.
7. Remove the lower stabilizer link bolt at the lower control arm.
8. Remove the upper ball joint nut.
9. Separate the upper ball joint from the knuckle using remover 9360.

10. Swing the knuckle downward to allow clearance to remove the clevis bracket (3).
11. Remove the clevis bracket (3) from the vehicle.

INSTALLATION

CLEVIS BRACKET

Fig. 64: Clevis Bracket
Courtesy of CHRYSLER LLC

1. Install the clevis bracket upper bolt (2) to the shock (1). Tighten the bolt (2) to 108 N.m (80 ft. lbs.).
2. Raise the knuckle to the upper ball joint.
3. Install the nut to the upper ball joint. Tighten the nut to 41 N.m (30 ft. lbs.) plus an additional 90° turn.
4. Install the clevis bracket lower bolt (4) to the lower control arm. Tighten the bolt (4) to 150 N.m (110 ft. lbs.) **with full vehicle weight.**
5. Install the lower stabilizer link bolt at the lower control arm. Tighten the bolt to 102 N.m (75 ft. lbs.) **with full vehicle weight.**
6. Install the wheel speed sensor. Refer to **INSTALLATION** .
7. Install the disc brake rotor. Refer to **INSTALLATION** .
8. Install the tire and wheel assembly. Refer to **STANDARD PROCEDURE** .
9. Lower the vehicle.

STABILIZER BAR

REMOVAL

STABILIZER BAR

Fig. 65: Identifying Stabilizer Bar Link & Bolts
 Courtesy of CHRYSLER LLC

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the stabilizer link (1) bolts at the stabilizer bar.

Fig. 66: Stabilizer Bar Bracket
 Courtesy of CHRYSLER LLC

4. Remove the stabilizer bushing bracket nuts (2).
5. Remove the stabilizer bar bushing brackets (3) from the frame.
6. Remove the stabilizer bar (1) from the vehicle.

INSTALLATION

STABILIZER BAR

Fig. 67: Stabilizer Bar Bracket
Courtesy of CHRYSLER LLC

1. Install the stabilizer bar (1) to the vehicle.
2. Install the stabilizer bar bushing brackets (3). Tighten the nuts (2) to 149 N.m (110 ft. lbs.).

Fig. 68: Identifying Stabilizer Bar Link & Bolts
Courtesy of CHRYSLER LLC

3. Install the stabilizer link (1) bolts and bushings at the stabilizer bar. Tighten the bolt to 115 N.m (85 ft. lbs.) **with full vehicle weight.**
4. Install the tire and wheel assembly. Refer to **STANDARD PROCEDURE**.
5. Lower the vehicle.

STABILIZER LINK

REMOVAL

STABILIZER LINK

Fig. 69: Identifying Stabilizer Bar Link & Bolts
Courtesy of CHRYSLER LLC

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the stabilizer link bolt (2) at the lower control arm.
4. Remove the stabilizer link bolt at the stabilizer bar.
5. Remove the stabilizer link (1).

INSTALLATION

STABILIZER LINK

Fig. 70: Identifying Stabilizer Bar Link & Bolts
Courtesy of CHRYSLER LLC

1. Install the stabilizer link (1).
2. Install the stabilizer link bolt at the stabilizer bar. Tighten the bolt to 115 N.m (85 ft. lbs.) **with full vehicle weight.**
3. Install the stabilizer link bolt (2) at the lower control arm. Tighten the bolt (2) to 102 N.m (75 ft. lbs.) **with full vehicle weight.**
4. Install the tire and wheel assembly. Refer to **STANDARD PROCEDURE** .

UPPER CONTROL ARM

REMOVAL

UPPER CONTROL ARM - LEFT

1. Raise and support the vehicle.
2. Remove the left side tire and wheel assembly.

8195c284

Fig. 71: Upper Ball Joint Separation
 Courtesy of CHRYSLER LLC

3. Remove the upper ball joint nut.
4. Separate the upper ball joint from the steering knuckle (3) using remover 9360 (2).

81a2a2d2

Fig. 72: Identifying Battery Tray, Power Center & Battery
 Courtesy of CHRYSLER LLC

5. Lower the vehicle.
6. Remove the battery. Refer to **REMOVAL** .
7. Unclip the power center (2) and move it to the side out of the way.
8. Remove the battery tray (1). Refer to **REMOVAL** .

Fig. 73: Pivot Bolts
Courtesy of CHRYSLER LLC

9. Remove the upper control arm rear nut (2) by using a ratchet and extension under the steering shaft (3).
10. Remove the upper control arm front bolt.
11. Remove the upper control arm from the vehicle.

UPPER CONTROL ARM - RIGHT

1. Raise and support the vehicle.
2. Remove the right side tire and wheel assembly.
3. Remove the upper ball joint nut.

Fig. 74: Upper Ball Joint Separation
Courtesy of CHRYSLER LLC

4. Separate the upper ball joint from the steering knuckle (3) using remover 9360 (2).

5. Lower the vehicle.
6. Remove the air box assembly. Refer to **REMOVAL** .
7. Remove the upper control arm rear bolt/nut.
8. Remove the upper control arm front bolt/nut.
9. Remove the upper control arm from the vehicle.

INSTALLATION

UPPER CONTROL ARM - LEFT

Fig. 75: Pivot Bolts

Courtesy of CHRYSLER LLC

1. Install the upper control arm to the vehicle.
2. Install the upper control arm front flag bolt (1). Tighten the nut (2) to 122 N.m (90 ft. lbs.) **with full vehicle weight.**
3. Install the upper control arm rear flag bolt. Tighten the nut to 122 N.m (90 ft. lbs.) **with full vehicle weight.**

Fig. 76: Identifying Battery Tray, Power Center & Battery
Courtesy of CHRYSLER LLC

4. Install the battery tray (1). Refer to **INSTALLATION** .
5. Install the battery. Refer to **INSTALLATION** .
6. Reclip and mount the power center (2).
7. Install the upper ball joint nut. Tighten the nut to 41 N.m (30 ft. lbs.) plus an additional 90° turn.
8. Install the left side tire and wheel assembly. Refer to **STANDARD PROCEDURE** .
9. Lower the vehicle.
10. Set the toe. See **STANDARD PROCEDURE**.

UPPER CONTROL ARM - RIGHT

1. Install the upper control arm to the vehicle.
2. Install the upper control arm front flag bolt. Tighten the nut to 122 N.m (90 ft. lbs.) **with full vehicle weight**.
3. Install the upper control arm rear flag bolt. Tighten the nut to 122 N.m (90 ft. lbs.) **with full vehicle weight**.
4. Install the air box. Refer to **INSTALLATION** .
5. Install the upper ball joint nut. Tighten the nut to 41 N.m (30 ft. lbs.) plus an additional 90° turn.
6. Install the right side tire and wheel assembly. Refer to **STANDARD PROCEDURE** .
7. Lower the vehicle.
8. Set the toe. See **STANDARD PROCEDURE**.

REAR

DESCRIPTION

REAR SUSPENSION

81a37bfb

Fig. 77: Rear Suspension Components
 Courtesy of CHRYSLER LLC

NOTE: Suspension components with rubber/urethane bushings should be tightened with the full weight of the vehicle at normal ride height. It is important to have the springs supporting the full weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.

The rear suspension is comprised of :

- Drive axle
- Shock absorbers (1)
- Coil springs (2)
- Lower suspension arms (5)
- Upper suspension arm
- Stabilizer bar (4)
- Stabilizer link (3)
- Track bar (6)

WARNING

REAR SUSPENSION

WARNING: Suspension components with rubber bushings must be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort will be affected and cause premature bushing wear.

DIAGNOSIS AND TESTING

REAR SUSPENSION

CONDITION	POSSIBLE CAUSES	CORRECTION
VEHICLE INSTABILITY	1. Loose or worn wheel bearings. 2. Loose, worn or bent suspension components. 3. Tire pressure.	1. Replace wheel bearings. 2. Inspect, tighten or replace components as necessary. 3. Adjust tire pressure.
VEHICLE PULLS TO ONE SIDE	1. Weak or broken spring. 2. Alignment. 3. Tires. 4. Brakes.	1. Replace spring. 2. Align vehicle to specifications. 3. Replace tires. 4. Repair as necessary.
KNOCKING, RATTLING OR SQUEAKING	1. Worn shock bushings. 2. Loose shock mounting. 3. Shock valve. 4. Loose upper ball joint. 5. Loose, worn or bent suspension components.	1. Replace shock. 2. Tighten to specifications. 3. Replace shock. 4. Replace ball joint. 5. Inspect, tighten or replace components as necessary.
IMPROPER TRACKING	1. Loose, worn or bent suspension components. 2. Bent axle.	1. Inspect, tighten or replace components as necessary. 2. Replace axle.

SPECIFICATIONS

TORQUE SPECIFICATIONS CHART

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.
Shock Absorber Upper Bolt	108	80	-
Shock Absorber Lower Nut	115	85	-
Upper Control Arm to Body Nut	95	70	-
Upper Control Arm to Axle Nut	95	70	-
Lower Control Arm to Body Nut	163	120	-

BUSHINGS

REMOVAL

STABILIZER BAR BUSHINGS

1. Raise and support vehicle.
2. Remove the stabilizer bushing clamp.
3. Remove the bushing from the stabilizer bar.

INSTALLATION

STABILIZER BAR BUSHINGS

1. Install the bushing to the stabilizer bar.
2. Install the stabilizer bar bushing retainer clamp and bolts. Tighten the bolts to 47 N.m (35 ft. lbs.) **with full vehicle weight**.
3. Lower the vehicle.

SHOCK

DESCRIPTION

SHOCK ABSORBERS

Fig. 82: Rear Suspension Components
Courtesy of CHRYSLER LLC

The top of the shock absorbers (1) are bolted to the body. The bottom of the shocks are bolted to the axle brackets. The standard shocks have conventional twin tube construction and are low pressure gas charged. Gas charging prevents cavitation during rough road operation.

OPERATION

SHOCK ABSORBERS

The shock absorbers dampen jounce and rebound motion of the vehicle over various road conditions and limit rebound suspension travel.

REMOVAL

SHOCK ABSORBER

Fig. 83: Identifying Upper Bolt, Shock Absorber & Axle Bracket
 Courtesy of CHRYSLER LLC

1. Raise and support the vehicle. Position a hydraulic jack under the axle to support the axle.
2. Remove the upper bolt (1) from the frame bracket.
3. Remove the lower bolt and nut from the axle bracket (3). Remove the shock absorber (2).

INSTALLATION

SHOCK ABSORBER

Fig. 84: Identifying Upper Bolt, Shock Absorber & Axle Bracket
 Courtesy of CHRYSLER LLC

1. Install the shock absorber (2) in the frame bracket and install the bolt (1).
2. Install the shock absorber (2) in the axle bracket (3) and install the bolt.
3. Tighten the upper mounting bolt/nut to 108 N.m (80 ft. lbs.). Tighten the lower mounting bolt/nut to 115 N.m (85 ft. lbs.) **with full vehicle weight.**

4. Remove the supports and lower the vehicle.

SPRING

REMOVAL

COIL SPRING

80c86f68

Fig. 85: Coil Spring
Courtesy of CHRYSLER LLC

1. Raise and support the vehicle. Position a hydraulic jack under the axle to support the axle.
2. Remove the shock absorber lower bolt from the axle bracket.
3. Lower the hydraulic jack and tilt the axle and remove the coil spring (3). See **Fig. 85**.
4. Remove and inspect the upper and lower spring isolators (1). See **Fig. 85**.

INSTALLATION

COIL SPRING

80c86f68

Fig. 86: Coil Spring
Courtesy of CHRYSLER LLC

1. Install the upper isolator (1). See **Fig. 85**.
2. Install the lower isolator. See **Fig. 85**.
3. Pull down on the axle and position the coil spring (3) in the lower isolator.

CAUTION: Ensure the spring is positioned on the lower isolator.

4. Raise the axle with the hydraulic jack.
5. Install the shock absorber to the axle bracket and tighten to 115 N.m (85 ft. lbs.).
6. Remove the supports and lower the vehicle.

JOUNCE BUMPER

REMOVAL

JOUNCE BUMPER

80c86f37

Fig. 87: Jounce Bumper
Courtesy of CHRYSLER LLC

1. Remove the shock. See **REMOVAL**.
2. Remove the coil spring. See **REMOVAL**.
3. Pull the jounce bumper downwards to remove. See **Fig. 87**

INSTALLATION

JOUNCE BUMPER

80c86f37

Fig. 88: Jounce Bumper
Courtesy of CHRYSLER LLC

1. Install the jounce bumper into the mount by twisting the bumper into place. See **Fig. 87**.
2. Install the coil spring. See **INSTALLATION**.
3. Install the shock. See **INSTALLATION**.

STABILIZER BAR

REMOVAL

STABILIZER BAR

Fig. 89: Stab Bar & Link
 Courtesy of CHRYSLER LLC

1. Raise and support the vehicle.
2. Remove the stabilizer nut (3) at the bar (5).
3. Remove the stabilizer links (4) from the stabilizer bar (5).
4. Remove the stabilizer bar bolts (1) from the axle.
5. Remove the stabilizer bar (5).

INSTALLATION

STABILIZER BAR

Fig. 90: Stab Bar & Link
 Courtesy of CHRYSLER LLC

1. Position the stabilizer bar (5) on the axle. Ensure the bar is centered with equal spacing on both sides. Tighten the bolts (1) to 47 N.m (35 ft. lbs.).

2. Install the stabilizer links (3) to the bar (5). Tighten the nuts (3) to 88 N.m (65 ft. lbs.) **with full vehicle weight**.
3. Remove support and lower the vehicle.

STABILIZER LINK

REMOVAL

STABILIZER LINK

Fig. 91: Upper Stab Bolt
Courtesy of CHRYSLER LLC

1. Raise and support the vehicle.
2. Support the rear axle with a jack.
3. Remove the rear tire **right side only**.
4. Remove the upper link (2) bolt at the frame.

Fig. 92: Stab Bar & Link
Courtesy of CHRYSLER LLC

5. Remove the lower link nut (3) at the stabilizer bar (5).
6. Remove stabilizer link (4).

INSTALLATION

STABILIZER LINK

Fig. 93: Upper Stab Bolt
Courtesy of CHRYSLER LLC

1. Install the upper bolt (2) for the stabilizer link (1) to the frame and tighten to 102 N.m (75 ft. lbs.).

Fig. 94: Stab Bar & Link
Courtesy of CHRYSLER LLC

2. Install the stabilizer link (4) to the stabilizer bar (5).

3. Install the nut (3) and tighten to 115 N.m (85 ft. lbs.) **with full vehicle weight**.
4. Install the spare tire **right side only**.
5. Remove the jack and lower the vehicle.

MASS DAMPER

REMOVAL

MASS DAMPER

1. Raise and support the vehicle.
2. Support the rear axle with a jack.

Fig. 95: Stab Bar & Link
Courtesy of CHRYSLER LLC

3. Remove the lower link nut (3) at the stabilizer bar (5).
4. Remove the mass damper (7).
5. Remove stabilizer bar (5) from the link (4).
6. Remove the retainer (6).

INSTALLATION

MASS DAMPER

81a8c95d

Fig. 96: Mass Damper
Courtesy of CHRYSLER LLC

1. Install the retainer (2) to the stabilizer link (1).
2. Install the stabilizer bar (3) over the retainer (2).
3. Install the mass damper (4) to the stabilizer link stud.
4. Install the nut (5) and tighten to 115 N.m (85 ft. lbs.) **with full vehicle weight**.
5. Remove the jack and lower the vehicle.

LOWER CONTROL ARM

DESCRIPTION

LOWER SUSPENSION ARMS AND BUSHINGS

81a37bfb

Fig. 97: Rear Suspension Components
Courtesy of CHRYSLER LLC

The lower suspension arms (5) are tubular steel and use a voided round bushing at the arm on the axle side. The body side uses a solid round bushing.

OPERATION

LOWER SUSPENSION ARMS AND BUSHINGS

The bushings provide isolation from the axle. The arms mount to the unibody frame rail bracket and the axle brackets. The arm and bushings provide location and react to loads.

REMOVAL

LOWER SUSPENSION ARM - LEFT SIDE

Fig. 98: Identifying Bolt/Nut, Lower Suspension Arm, Fuel Tank & Frame Rail
Courtesy of CHRYSLER LLC

1. Raise the vehicle and support the rear axle.
2. Remove the fuel tank (3). Refer to **REMOVAL** .
3. Remove the lower suspension arm nut and bolt from the axle bracket.
4. Remove the nut and bolt (1) from the frame rail (4) and remove the lower suspension arm (2).

LOWER SUSPENSION ARM - RIGHT SIDE

1. Raise the vehicle and support the rear axle.
2. Remove the lower suspension arm nut and bolt from the axle bracket.

3. Remove the exhaust from the mid and rear hanger rubber isolators to allow the exhaust system to lower enough to remove the bolt at the frame rail.
4. Remove the nut (1) and bolt (8) from the frame rail and remove the lower suspension arm (9).

INSTALLATION

LOWER SUSPENSION ARM - LEFT SIDE

Fig. 100: Identifying Bolt/Nut, Lower Suspension Arm, Fuel Tank & Frame Rail
Courtesy of CHRYSLER LLC

NOTE: All torques should be done with vehicle on the ground with full vehicle weight.

1. Position the lower suspension arm (2) in the frame rail (4).
2. Install the frame rail bracket bolt and nut (1). Tighten to 163 N.m (120 ft. lbs.) **with full vehicle weight.**
3. Position the lower suspension arm in the axle bracket.
4. Install the axle bracket bolt and nut. Tighten to 203 N.m (150 ft. lbs.) **with full vehicle weight.**
5. Install the fuel tank. Refer to **INSTALLATION** .
6. Remove the supports and lower the vehicle.

LOWER SUSPENSION ARM - RIGHT SIDE

NOTE: All torques should be done with vehicle on the ground with full vehicle weight.

813ff419

- 4 - JOUNCE BUMPER RETAINER
- 5 - BOLT
- 6 - JOUNCE BUMPER
- 7 - UPPER FLAG BOLT
- 8 - LOWER FLAG BOLT
- 9 - LOWER SUSPENSION ARM

1. Position the lower suspension arm (9) in the frame rail.
2. Install the frame rail bracket bolt (8) and nut (1). Tighten to 163 N.m (120 ft. lbs.) **with full vehicle weight.**

3. Install the exhaust back in the mid and rear hanger rubber isolators.
4. Position the lower suspension arm in the axle bracket.
5. Install the axle bracket bolt and nut. Tighten to 203 N.m (150 ft. lbs.) **with full vehicle weight**.
6. Remove the supports and lower the vehicle.

UPPER CONTROL ARM

DESCRIPTION

UPPER SUSPENSION ARM, BUSHINGS, AND BALL JOINT

The suspension arm uses bushings to isolate road noise. The suspension arm is bolted through bushings to a bracket at the body and axle.

OPERATION

UPPER SUSPENSION ARM, BUSHINGS, AND BALL JOINT

The upper suspension arm provides fore/aft and lateral location of the rear axle. The suspension arm travel is limited through the use of jounce bumpers in compression and shock absorbers in rebound.

REMOVAL

UPPER SUSPENSION ARM - LEFT SIDE

81a56807

Fig. 102: Identifying Nut/Bolt & Upper Suspension Arm
Courtesy of CHRYSLER LLC

1. Raise and support the vehicle.
2. Support the rear axle.
3. Lower the fuel tank in order to gain access to the bolt. Refer to **REMOVAL** .
4. Remove the upper suspension arm nut and bolt from the axle bracket.

5. Remove the nut and bolt (1) from the frame rail and remove the upper suspension arm (2).

UPPER SUSPENSION ARM - RIGHT SIDE

81a5629e

Fig. 103: Upper Suspension Arm
Courtesy of CHRYSLER LLC

1. Raise and support the vehicle.
2. Support the rear axle.
3. Remove the upper suspension arm nut and bolt (1) from the axle bracket.
4. Remove the nut (3) and flag bolt from the frame rail and remove the upper suspension arm (2).

INSTALLATION

UPPER SUSPENSION ARM - LEFT SIDE

81a56807

Fig. 104: Identifying Nut/Bolt & Upper Suspension Arm
Courtesy of CHRYSLER LLC

NOTE: All torques should be done with vehicle on the ground with full vehicle weight.

1. Position the upper suspension arm (2) in the frame rail bracket.
2. Install the mounting bolt and nut (1) Tighten to 95 N.m (70 ft. lbs.) **with full vehicle weight.**
3. Position the upper suspension arm in the axle bracket.
4. Install the mounting bolt and nut. Tighten to 115 N.m (85 ft. lbs.) **with full vehicle weight.**
5. Raise the fuel tank back into place and secure. Refer to INSTALLATION .
6. Remove the supports and lower the vehicle.

UPPER SUSPENSION ARM - RIGHT SIDE

Fig. 105: Upper Suspension Arm
Courtesy of CHRYSLER LLC

NOTE: All torques should be done with vehicle on the ground with full vehicle weight.

1. Position the upper suspension arm (2) in the frame rail bracket.
2. Install the mounting flag bolt and nut (3). Tighten to 95 N.m (70 ft. lbs.) **with full vehicle weight.**
3. Position the upper suspension arm (2) in the axle bracket.
4. Install the mounting bolt and nut (1). Tighten to 115 N.m (85 ft. lbs.) **with full vehicle weight.**
5. Remove the supports and lower the vehicle.

TRACK BAR

REMOVAL

TRACK BAR

Fig. 106: Identifying Track Bar, Flag Bolt/Nut & Frame Bracket
 Courtesy of CHRYSLER LLC

1. Raise and support the vehicle. Position a hydraulic jack under the axle to support the axle.
2. Remove the track bar flag bolt and nut (1) from the frame bracket (2).

Fig. 107: Identifying Track Bar, Bolt/Nut & Axle Bracket
 Courtesy of CHRYSLER LLC

3. Remove the track bar bolt and nut (2) from the axle bracket (3).
4. Remove the track bar (1).

INSTALLATION

TRACK BAR

Fig. 108: Identifying Track Bar, Flag Bolt/Nut & Frame Bracket
 Courtesy of CHRYSLER LLC

1. Install the track bar (3) to the vehicle.
2. Install the track bar bolt and nut (1) in the frame bracket (2).

Fig. 109: Identifying Track Bar, Bolt/Nut & Axle Bracket
 Courtesy of CHRYSLER LLC

3. Install the track bar (1) into the axle bracket (3).
4. Install the track bar bolt and nut (2) in the axle bracket.
5. Remove the supports and lower the vehicle.
6. Tighten the body side mounting bolt/nut to 183 N.m (135 ft. lbs.). Tighten the axle side mounting bolt/nut to 176 N.m (130 ft. lbs.) **with full vehicle weight.**

TIRE PRESSURE MONITORING - ELECTRICAL DIAGNOSIS

DIAGNOSIS AND TESTING

C0077-LOW TIRE PRESSURE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

- **Set Condition:**

A low pressure condition will exist when the tire pressure falls below or is equal to the low pressure threshold value as specified for the vehicle.

Possible Causes

Possible Causes
INTERMITTENT PERFORMANCE DTC INCORRECT TIRE PRESSURE TIRE PRESSURE SENSOR WCM (SKREEM)

Diagnostic Test

1. DTC STATUS

NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.

NOTE: If the following conditions are present:

- Low Tire Pressure DTC
- Tire Pressure Sensor Internal DTC
- Spare Tire is not equipped with a Tire Pressure Sensor
- Spare Tire is currently on the vehicle

Repair the tire and place it back on the vehicle.

Test drive the vehicle.

Turn the ignition on.

Is the TPM telltale lamp/Low pressure EVIC message on at this time?

Yes

Go to 2.

No

Go to 5.

2. LOW TIRE PRESSURE

NOTE: The DTC can be caused by many different factors and might not be a sensor/transmitter or a WCM (SKREEM) fault. Interference from other elements will over power the sensor/transmitter RF frequency making erratic operation to the TPM system. Check the vehicle for aftermarket accessories that could compromise the RF frequency signal before diagnosing the TPM system.

NOTE: Seasonal temperature changes will affect tire pressure, and may have caused the tire pressure to fall below the low pressure warning threshold. Tire pressure should always be set based on cold inflation tire pressure (placard). This is defined as the tire pressure after a vehicle has not been driven for more then 3 hours, and in outside ambient temperatures.

Correct all tire pressure to the recommended specifications and wait 2 minutes.

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h. (24 km/h).

Use a TPM-RKE Analyzer tool 9936 to scan each tire pressure sensor, and make sure the Sensor IDs matches what is programmed into the WCM. The Sensor Identifications are located under "Data Display" for the "WCM Wireless Control Module". If the sensor IDs does not match, following the programming steps outlined in the diagnostic scan tool for "Program Tire Sensor ID w/TPM Tool" under "Miscellaneous Functions" for the "WCM/Wireless Control Module" menu item.

NOTE: When scanning a sensor with a TPM-RKE Analyzer 9936 , replace the TPM sensor if the results show a "Damaged Accel", "Damaged Temp", or "Damaged Press".

Is the TPM telltale lamp/Low pressure EVIC message on at this time?

Yes

Go to 3.

No

Test Complete.

3. TIRE PRESSURE SENSOR

NOTE: Before continuing, ensure the tire is free from any leaks or damage that would cause a low tire pressure condition. If a problem is found, repair as necessary and retest.

With the scan tool, go under "Data Display" for the "WCM Wireless Control Module" and find the compensated tire pressure values. Located underneath each Sensor Identification locations. If any compensated tire pressure values are equal or lower then the Tire Low Pressure Threshold. The corresponding TPM sensor needs to be located and replaced.

NOTE: **The following tests are used to locate the Tire Pressure Sensor/Transmitter that is setting the low pressure fault. If the tires have been rotated, the Tire Pressure Sensor/Transmitter are no longer in sequence from the factory. Faults are linked to the sensor/transmitter IDs. You MUST locate the correct Tire Pressure Sensor/Transmitter that set the fault before continuing. Use one or more of the following methods below.**

METHOD 1: Use a TPM-RKE Analyzer tool 9936 to scan each tire pressure sensor. If a suspected sensor has been located, lower the tire pressure to 20 PSI, wait for 2 minutes, and check the scan tool for changes to any compensated tire pressure values.

If there was a pressure change to any compensated tire pressure values, check to make sure that the TPM-RKE Analyzer is set correctly, and repeat the process on each wheel on the vehicle until the faulty Sensor/Transmitter has been identified.

NOTE: **When scanning a sensor with a TPM-RKE Analyzer 9936 , replace the TPM sensor if the results show a "Damaged Accel", "Damaged Temp", or "Damaged Press".**

METHOD 2: Starting with the left front wheel, deflate the tire to 20 PSI, wait 2 minutes, and check the scan tool for changes to any compensated tire pressure values.

If there was a pressure change to any compensated tire pressure value, repeat this process on each wheel on the vehicle until the faulty Sensor/Transmitter has been identified.

Has the malfunctioning/faulty TPM sensor been located?

Yes

Replace the Tire Pressure sensor.
Perform **TPM VERIFICATION**.

No

Go To 4.

4. WIRELESS CONTROL MODULE

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

With the scan tool, read WCM/SKREEM DTC(s).

Drive the vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time the system will learn the sensor IDs.

Are there any DTC(s) present?

Yes

Repair not complete, refer to the appropriate symptom.

Perform **TPM VERIFICATION**.

No

Repair is complete.

5. INTERMITTENT TIRE PRESSURE SENSOR DTC

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h. (24 km/h).

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes

Repair as necessary.

Perform **TPM VERIFICATION**.

No

Test complete.

C1501-TIRE PRESSURE SENSOR 1 INTERNAL

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Theory Of Operation

The tire pressure sensor actively monitors the air pressure and air temperature inside the tire, the sensor internal battery status, and the radial acceleration of the wheel. Each sensor has a unique ID code. The sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Wireless Control Module

(SKREEM).

Monitor Conditions

When Monitored:

With vehicle speed greater than 15 MPH (24 km/h).

Set Conditions

- Set Condition:

The WCM (SKREEM) will monitor the signals from the four active road tire sensors. A loss of signal error is detected when eight consecutive blocks of data are not received or cannot be accurately decoded within a maximum period of 10 minutes. An internal sensor hardware error condition will be set when an error in the accelerometer, pressure sensor, or temperature sensor is detected.

Possible Causes

Possible Causes
WRONG SENSOR TEMPORARY SPARE TIRE IN USE OUTSIDE INTERFERENCE TIRE PRESSURE SENSOR WIRELESS CONTROL MODULE (SKREEM)

Diagnostic Test

1. DTC STATUS IS ACTIVE

NOTE: If the following conditions are present:

- Tire Pressure Sensor Internal DTC (Active)
- Spare Tire is not equipped with a Tire Pressure Sensor
- Spare Tire is currently on the vehicle

Repair the tire and place it back on the vehicle.

Test drive the vehicle.

If the DTC(s) reset continue with the diagnostic procedure.

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Is the DTC status Active at this time?

Yes

Go to 2.

No

Go to 4.

2. TIRE PRESSURE SENSOR

NOTE: When working with vehicles equipped with the base tire pressure monitoring system the correct tire that set the fault must be identified. Following the below procedure will help in identifying the correct tire.

1. Set all tire pressures to the recommended specifications and recheck for fault/alert.

2. Turn the ignition on.

3. Starting with the left front wheel, deflate the tire to 20 PSI and wait 2 minutes. The fault will set once the pressure has reached 20 PSI within the 2 minute time frame.

4. If the TPM fault was detected and not associated to this Sensor/Transmitter, repeat the process until the faulty Sensor/Transmitter has been identified.

Once a fault/alert has set, it will establish the location of the tire pressure sensor/transmitter. Repeat steps until the applicable Tire Pressure Sensor/Transmitter has been located.

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes

Go to 3.

No

Test Complete.

Perform **TPM VERIFICATION**.

3. **WIRELESS CONTROL MODULE (SKREEM)**

View repair.

Repair

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

Perform **TPM VERIFICATION**.

4. **INTERMITTENT TIRE PRESSURE SENSOR DTC**

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes

Return to the beginning of this test and perform the diagnostic procedure as necessary.

No

Test complete.

Perform **TPM VERIFICATION**.

C1502-TIRE PRESSURE SENSOR 2 INTERNAL

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The tire pressure sensor actively monitors the air pressure and air temperature inside the tire, the sensor internal battery status, and the radial acceleration of the wheel. 1. DTC STATUS IS ACTIVE

NOTE: If the following conditions are present:

- Tire Pressure Sensor Internal DTC (Active)
- Spare Tire is not equipped with a Tire Pressure Sensor
- Spare Tire is currently on the vehicle

Repair the tire and place it back on the vehicle.

Test drive the vehicle.

If the DTC(s) reset continue with the diagnostic procedure.

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Is the DTC status Active at this time?

Yes

Go to 2.

No

Go to 4.

2. TIRE PRESSURE SENSOR

NOTE: When working with vehicles equipped with the base tire pressure monitoring system the correct tire that set the fault must be identified. Following the below procedure will help in identifying the correct tire.

1. Set all tire pressures to the recommended specifications and recheck for fault/alert.

2. Turn the ignition on.

3. Starting with the left front wheel, deflate the tire to 20 PSI and wait 2 minutes. The fault will set once the pressure has reached 20 PSI within the 2 minute time frame.

4. If the TPM fault was detected and not associated to this Sensor/Transmitter, repeat the process until the faulty Sensor/Transmitter has been identified.

Once a fault/alert has set, it will establish the location of the tire pressure sensor/transmitter. Repeat steps until the applicable Tire Pressure Sensor/Transmitter has been located.

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes

Go to 3.

No

Test Complete.

Perform **TPM VERIFICATION**.

3. **WIRELESS CONTROL MODULE (SKREEM)**

Repair

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

Perform **TPM VERIFICATION**.

4. **INTERMITTENT TIRE PRESSURE SENSOR DTC**

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes

Return to the beginning of this test and perform the diagnostic procedure as necessary.

No

Test complete.

Perform **TPM VERIFICATION**.

C1503-TIRE PRESSURE SENSOR 3 INTERNAL

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The tire pressure sensor actively monitors the air pressure and air temperature inside the tire, the sensor internal battery status, and the radial acceleration of the wheel. Each sensor has a unique ID code. The sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Wireless Control Module

(SKREEM).

Monitor Conditions

When Monitored:

With vehicle speed greater than 15 MPH (24 km/h).

Set Conditions

- Set Condition:

The WCM (SKREEM) will monitor the signals from the four active road tire sensors. A loss of signal error is detected when eight consecutive blocks of data are not received or cannot be accurately decoded within a maximum period of 10 minutes. An internal sensor hardware error condition will be set when an error in the accelerometer, pressure sensor, or temperature sensor is detected.

C1506-LEFT FRONT TIRE PRESSURE TRIGGER MODULE PERFORMANCE

Circuit Schematic

Fig. 1: Left Front Tire Pressure Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

The Tire Pressure Trigger Module is used to automatically learn the location of each wheel sensor on the vehicle. The module is controlled and activated in sequence by the Wireless Control Module (TPM) over a LIN bus. When activated, the module will generate a 125 KHz signal of sufficient field strength to trigger the tire pressure sensor and force a RF transmission from the sensor.

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

- **Set Condition:**

The WCM (TPM) will monitor the messages from each Tire Pressure Trigger Module over the LIN bus. If any of the messages are not received, or are received other than as expected, a DTC will set. When the condition is corrected, or is no longer detected, as acknowledged via a LIN bus message, the WCM will reset the appropriate trigger module fault status.

C151D-TIRE PRESSURE SENSOR LOCATION UNDETERMINED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The vehicle sensor locate process occurs after the vehicle sits at zero speed for more than 19 min. The tire pressure monitor system will determine the sensor positions while driving at speeds above 15 MPH (24 Km/h). This process can take up to 10 min. to determine sensor positions.

Monitor Conditions

When Monitored:

During vehicle sensor locate process.

Set Conditions

- **Set Condition:**

Must fail vehicle sensor locate process 3 times in a row.

Possible Causes

Possible Causes
(D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO VOLTAGE
(D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND
(D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE
FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE
GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE
(D508) COM-LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN
TIRE PRESSURE TRIGGER MODULE POWER AND GROUND
TPM SENSOR
WCM

Diagnostic Test

1. **OTHER DTC'S SET**

Repair all other DTC's first.

Is this DTC still active after all other DTC's repaired?

Yes

Go To 2.

No

Test Complete.

Perform **TPM VERIFICATION**.

2. **VERIFY DTC IS ACTIVE**

NOTE: **Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

Turn the ignition on.

With the scan tool, read and record WCM DTCs.

With the scan tool, erase WCM DTCs.

Cycle the ignition switch.

With the scan tool, read WCM DTCs.

Does this DTC reset?

Yes

Go To 3.

No

Perform the Stored Lost Communication test procedure. Refer to **DIAGNOSIS AND TESTING** .

Perform **BODY VERIFICATION TEST - VER 1** .

3. (D508) COM-LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN

Turn the ignition off.

Disconnect the Tire Pressure Trigger Module.

Disconnect the WCM.

With an ohmmeter measure the resistance of the (D508) COM-LIN TIRE PRESSURE MONITOR LAN CIRCUIT.

Is the resistance below 5 Ohms?

Yes

Go To 4.

No

Repair or replace the open circuit.

Perform **TPM VERIFICATION**.

4. FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE

Fig. 13: Checking Fused Ignition Switch Output (Run) Circuit For Open Or High Resistance
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Tire Pressure Transponder harness connector.

Disconnect the Sentry Key Remote Entry Module harness connector.

Turn the ignition on.

Using a 12-volt test light connect to ground, check the Fused Ignition Switch Output (Run) circuit.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

Go to 5.

No

Repair the Fused Ignition Switch Output (Run) circuit for an open circuit or high resistance.

Perform **TPM VERIFICATION**.

5. **GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE**

Fig. 14: Checking Ground Circuit(s) For Open Or High Resistance
 Courtesy of CHRYSLER LLC

Using a 12-volt test light connect to battery voltage, probe each of the Ground circuit(s).

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

Go to 6.

No

Repair the Ground circuit(s) for an open circuit or high resistance.

Perform **TPM VERIFICATION**.

6. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO VOLTAGE

**TRANSPONDER-
TIRE PRESSURE**

81834811

Fig. 15: Checking COM - LIN Tire Pressure Monitor LAN Circuit For Short To Voltage
Courtesy of CHRYSLER LLC

Turn the ignition on.

Measure the voltage of the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

Is there any voltage present?

Yes

Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to voltage.

No

Go to 7.

Perform **TPM VERIFICATION**.

7. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND

8183481b

Fig. 16: Checking COM - LIN Tire Pressure Monitor LAN Circuit For Short To Ground
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance between ground and the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

Is the resistance below 5.0 ohms?

Yes

Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to ground.
 Perform **TPM VERIFICATION**.

No

Go to 8.

8. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE

Fig. 17: Checking COM - LIN Tire Pressure Monitor LAN Circuit Open Or High Resistance
 Courtesy of CHRYSLER LLC

Use a jumper wire with one end connected to ground and the other to the (D508) COM - LIN Tire Pressure Monitor LAN circuit in the Front Left Pressure Tire Transponder harness connector.

Using a 12-Volt test light connected to battery voltage, probe the (D508) COM - LIN Tire Pressure Monitor LAN circuit in the TPM harness connector.

NOTE: The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.

Does the test light illuminate bright?

Yes

Go to 9.

No

Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for an open circuit or high resistance.

Perform **TPM VERIFICATION**.

9. POWER AND GROUND CIRCUIT OPEN

Turn the ignition on.

With a voltmeter measure the voltage between the power and ground circuit at the Trigger Module.

Is the voltage at least the same as battery voltage?

Yes

Go To 10.

No

Repair the open circuit.

Perform **TPM VERIFICATION**.

10. CHECK FOR ADDITIONAL TRIGGER MODULE COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs "Logged Against" the WCM?

Yes

Replace/update the WCM in accordance with the service information.

Perform **TPM VERIFICATION**.

No

Replace the Tire pressure trigger Module in accordance with the service information.

Perform **TPM VERIFICATION**.

U1114-LOST COMMUNICATION WITH LEFT FRONT TIRE PRESSURE TRIGGER MODULE

Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed

Set Conditions

- Set Condition:**

If the WCM fails to receive bus messages from the Tire pressure trigger module for two consecutive counts of trigger module not responding to a communication check.

Possible Causes

Possible Causes
(D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO VOLTAGE
(D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND
(D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE
(F943) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE
(Z907) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE
(D508) COM-LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN
TIRE PRESSURE TRIGGER MODULE POWER AND GROUND
WCM

Diagnostic Test

1. DTC STATUS

Ensure every trigger module connector is connected and WCM connected.

Turn the ignition on.

With the scan tool, run the "Trigger Module Test Routine" under "Miscellaneous Functions" for the "WCM" and follow the procedure.

NOTE: Three trigger modules are located in three of the four wheel wells on the vehicle to provide the WCM/SKREEM with the location of the tire pressure sensors on the vehicle. A fourth transponder is not necessary in the remaining wheel well due to the process-of-elimination theory. Once the system knows the location of the first three sensors it assumes the location of the fourth tire pressure sensor. The locations of the trigger modules can vary for each vehicle. Make sure the vehicle has trigger modules, and that are in the right locations. After every repair, the trigger module test routine must be rerun in order to verify the fix.

Did the Left Front Trigger Module have NO as a result?

Yes

Go To 2.

No

Repair intermittent condition.

2. (F943) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE

Fig. 19: Checking Fused Ignition Switch Output (Run) Circuit For Open Or High Resistance
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Tire Pressure Transponder harness connector.

Turn the ignition on.

Using a 12-volt test light connect to ground, check the (F943) Fused Ignition Switch Output (Run) circuit.

NOTE: **The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

Is the test light illuminated and bright?

Yes

Go to 3.

No

Repair the (F943) Fused Ignition Switch Output (Run) circuit for an open circuit or high resistance.

Perform **TPM VERIFICATION**.

3. (Z907) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE

Fig. 20: Checking Ground Circuit(s) For Open Or High Resistance
Courtesy of CHRYSLER LLC

Using a 12-volt test light connect to battery voltage, probe each of the (Z907) Ground circuit(s).

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

Go to 4.

No

Repair the (Z907) Ground circuit(s) for an open circuit or high resistance.

Perform **TPM VERIFICATION**.

4. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO VOLTAGE

**TRANSPONDER-
TIRE PRESSURE**

81834811

Fig. 21: Checking COM - LIN Tire Pressure Monitor LAN Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect both tire pressure transponder harness connectors.

Turn the ignition on.

Measure the voltage of the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

Is there any voltage present?

Yes

Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to voltage.
Perform **TPM VERIFICATION**.

No

Go to 5.

5. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND

8183481b

Fig. 22: Checking COM - LIN Tire Pressure Monitor LAN Circuit Short To Ground
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance between ground and the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

Is the resistance below 5.0 ohms?

Yes

Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to ground.
 Perform **TPM VERIFICATION**.

No

Go to 6.

6. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE

Fig. 23: Checking Fused Ignition Switch Output (Run) Circuit
 Courtesy of CHRYSLER LLC

Use a jumper wire with one end connected to ground and the other to the (D508) COM - LIN Tire Pressure Monitor LAN circuit in the WCM/SKREEM harness connector.

Using a 12-Volt test light connected to battery voltage, probe the (D508) COM - LIN Tire Pressure Monitor LAN circuit in the TPM harness connector.

NOTE: The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.

Does the test light illuminate bright?

Yes

Go to 7.

No

Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for an open circuit or high resistance.

Perform **TPM VERIFICATION**.

7. TIRE PRESSURE TRIGGER MODULE

Turn the ignition off.

Replace the appropriate Tire Pressure Trigger Module in accordance with the Service Information.

With the scan tool, run the "Trigger Module Test Routine" under "Miscellaneous Functions" for the

"WCM" and follow the procedure.

Did the Left Front Trigger Module have NO as a result?

Yes

Go To 8.

No

Go To 9.

8. WIRELESS CONTROL MODULE (SKREEM)

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

Drive the vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time the system will learn the sensor IDs.

With the scan tool, read WCM/SKREEM DTC(s).

Are there any DTC(s) present?

Yes

Repair not complete, refer to the appropriate DTC.

No

Repair complete.

Perform **TPM VERIFICATION**.

9. INTERMITTENT TIRE PRESSURE TRIGGER MODULE DTC

The conditions necessary to set this DTC are not present or has been corrected.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Are there any DTC(s) present?

Yes

Repair not complete, refer to the appropriate DTC.

Perform **TPM VERIFICATION**.

No

Test complete.

Perform **TPM VERIFICATION**.

U1115-LOST COMMUNICATION WITH RIGHT FRONT TIRE PRESSURE TRIGGER MODULE

Circuit Schematic

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed

Set Conditions

- Set Condition:**

If the WCM fails to receive bus messages from the Tire pressure trigger module for two consecutive counts of trigger module not responding to a communication check.

(D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE
(F943) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE
(Z908) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE
(D508) COM-LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN
TIRE PRESSURE TRIGGER MODULE POWER AND GROUND
WCM

Diagnostic Test

1. **DTC STATUS**

Ensure every trigger module connector is connected and WCM connected.

Turn the ignition on.

With the scan tool, run the "Trigger Module Test Routine" under "Miscellaneous Functions" for the "WCM" and follow the procedure.

NOTE: Three trigger modules are located in three of the four wheel wells on the vehicle to provide the WCM/SKREEM with the location of the tire pressure sensors on the vehicle. A fourth transponder is not necessary in the remaining wheel well due to the process-of-elimination theory. Once the system knows the location of the first three sensors it assumes the location of the fourth tire pressure sensor. The locations of the trigger modules can vary for each vehicle. Make sure the vehicle has trigger modules, and that are in the right locations. After every repair, the trigger module test routine must be rerun in order to verify the fix.

Did the Right Front Trigger Module have NO as a result?

Yes

Go To 2.

No

Repair intermittent condition.

2. (F943) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE

Fig. 25: Checking Fused Ignition Switch Output (Run) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Tire Pressure Transponder harness connector.

Turn the ignition on.

Using a 12-volt test light connect to ground, check the (F943) Fused Ignition Switch Output (Run) circuit.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

Go to 3.

No

Repair the (F943) Fused Ignition Switch Output (Run) circuit for an open circuit or high resistance.

Perform **TPM VERIFICATION**.

3. **(Z908) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE**

81d42c76

Fig. 26: Checking Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER LLC

Using a 12-volt test light connect to battery voltage, probe each of the (Z908) Ground circuit(s).

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

Go to 4.

No

Repair the (Z908) Ground circuit(s) for an open circuit or high resistance.

Perform **TPM VERIFICATION**.

4. **(D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO VOLTAGE**

81834811

Fig. 27: Checking Voltage Of COM - LIN Tire Pressure Monitor LAN Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect both tire pressure transponder harness connectors.

Turn the ignition on.

Measure the voltage of the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

Is there any voltage present?

Yes

Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to voltage.

Perform **TPM VERIFICATION**.

No

Go to 5.

5. **(D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND**

8183481b

Fig. 28: Checking Resistance Between Ground & COM - LIN Tire Pressure Monitor LAN Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance between ground and the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

Is the resistance below 5.0 ohms?

Yes

Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to ground.
 Perform **TPM VERIFICATION**.

No

Go to 6.

6. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE

Fig. 29: Checking COM - LIN Tire Pressure Monitor LAN Circuit For Open Or High Resistance
 Courtesy of CHRYSLER LLC

Use a jumper wire with one end connected to ground and the other to the (D508) COM - LIN Tire Pressure Monitor LAN circuit in the WCM/SKREEM harness connector.

Using a 12-Volt test light connected to battery voltage, probe the (D508) COM - LIN Tire Pressure Monitor LAN circuit in the TPM harness connector.

NOTE: **The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.**

Does the test light illuminate bright?

Yes

Go to 7.

No

Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for an open circuit or high resistance.

Perform **TPM VERIFICATION**.

7. TIRE PRESSURE TRIGGER MODULE

Turn the ignition off.

Replace the appropriate Tire Pressure Trigger Module in accordance with the Service Information.

With the scan tool, run the "Trigger Module Test Routine" under "Miscellaneous Functions" for the

"WCM" and follow the procedure.

Did the Right Front Trigger Module have NO as a result?

Yes

Go To 8.

No

Go To 9.

8. WIRELESS CONTROL MODULE (SKREEM)

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

Drive the vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time the system will learn the sensor IDs.

With the scan tool, read WCM/SKREEM DTC(s).

Are there any DTC(s) present?

Yes

Repair not complete, refer to the appropriate DTC.

No

Repair complete.

Perform **TPM VERIFICATION**.

9. INTERMITTENT TIRE PRESSURE TRIGGER MODULE DTC

The conditions necessary to set this DTC are not present or has been corrected.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Are there any DTC(s) present?

Yes

Repair not complete, refer to the appropriate DTC.

Perform **TPM VERIFICATION**.

No

Test complete.

Perform **TPM VERIFICATION**.

U1116-LOST COMMUNICATION WITH LEFT REAR TIRE PRESSURE TRIGGER MODULE

Circuit Schematic

(F943) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE
(Z919) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE
(D508) COM-LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN
TIRE PRESSURE TRIGGER MODULE POWER AND GROUND
WCM

Diagnostic Test

1. DTC STATUS

Ensure every trigger module connector is connected.

Turn the ignition on.

With the scan tool, run the "Trigger Module Test Routine" under "Miscellaneous Functions" for the "WCM" and follow the procedure.

NOTE: Three trigger modules are located in three of the four wheel wells on the vehicle to provide the WCM/SKREEM with the location of the tire pressure sensors on the vehicle. A fourth transponder is not necessary in the remaining wheel well due to the process-of-elimination theory. Once the system knows the location of the first three sensors it assumes the location of the fourth tire pressure sensor. The locations of the trigger modules can vary for each vehicle. Make sure the vehicle has trigger modules, and that are in the right locations. After every repair, the trigger module test routine must be rerun in order to verify the fix.

Did the Left Rear Trigger Module have NO as a result?

Yes

Go To 2.

No

Repair intermittent condition.

2. (F943) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE

Fig. 31: Checking Fused Ignition Switch Output (Run) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition on.

Using a 12-volt test light connect to ground, check the (F943) Fused Ignition Switch Output (Run) circuit.

NOTE: **The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

Is the test light illuminated and bright?

Yes

Go to 3.

No

Repair the (F943) Fused Ignition Switch Output (Run) circuit for an open circuit or high resistance.

Perform **TPM VERIFICATION**.

3. **(Z919) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE**

Fig. 32: Checking Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER LLC

Using a 12-volt test light connect to 12 volts, check each of the (Z919) Ground circuit(s).

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

Go to 4.

No

Repair the (Z919) Ground circuit(s) for an open circuit or high resistance.

Perform **TPM VERIFICATION**.

4. **(D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO VOLTAGE**

81834811

Fig. 33: Checking Voltage Of COM - LIN Tire Pressure Monitor LAN Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect all three tire pressure transponder harness connectors.

Disconnect the Sentry Key Remote Entry Module harness connector.

Turn the ignition on.

Measure the voltage of the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

Is there any voltage present?

Yes

Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to voltage.
 Perform **TPM VERIFICATION**.

No

Go to 5.

5. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND

8183481b

Fig. 34: Checking Resistance Between Ground & COM - LIN Tire Pressure Monitor LAN Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance between ground and the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

Is the resistance below 5.0 ohms?

Yes

Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to ground.
 Perform **TPM VERIFICATION**.

No

Go to 6.

6. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE

Use a jumper wire with one end connected to ground and the other to the (D508) COM - LIN Tire Pressure Monitor LAN circuit in the Front Left Pressure Tire Transponder harness connector.

Using a 12-Volt test light connected to battery voltage, probe the (D508) COM - LIN Tire Pressure Monitor LAN circuit in the SKREEM harness connector.

NOTE: **The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.**

Does the test light illuminate bright?

Yes

Go to 7.

No

Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for an open circuit or high resistance.

Perform **TPM VERIFICATION**.

7. (D508) COM-LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN

Turn the ignition off.

Disconnect the Tire Pressure Trigger Module.

Disconnect the WCM.

With an ohmmeter measure the resistance of the (D508) COM-LIN TIRE PRESSURE MONITOR LAN CIRCUIT.

Is the resistance below 5 Ohms?

Yes

Go To 8.

No

Repair or replace the open circuit.

Perform **TPM VERIFICATION**.

8. POWER AND GROUND CIRCUIT OPEN

Turn the ignition on.

With a voltmeter measure the voltage between the power and ground circuit at the Trigger Module.

Is the voltage at least the same as battery voltage?

Yes

Go To 9.

No

Repair the open circuit.

Perform **TPM VERIFICATION**.

9. CHECK FOR ADDITIONAL TRIGGER MODULE COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs "Logged Against" the WCM?

Yes

Replace/update the WCM in accordance with the service information.

Perform **TPM VERIFICATION**.

No

Replace the Tire pressure trigger Module in accordance with the service information.

Perform **TPM VERIFICATION**.

***STORED LOST COMMUNICATION DTCS**

817b72f8

Fig. 35: Stored Lost Communication DTC's
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Battery voltage between 10 and 16 volts.

IOD fuse installed.

TIPM is configured correctly.

Set Conditions

- **Set Condition:**

Bus messages not received for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED CAN C BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES TIPM NOT CONFIGURED CORRECTLY POWER OR GROUND FROM THE REPORTING MODULE MODULE THAT SET THIS DTC PREVIOUS SERVICE PERFORMED WITHIN THE LAST 100 KEY CYCLES (FUSE/RELAYS REMOVED, WIRING SERVICE, BATTERY DISCONNECT) LOW BATTERY/JUMP START CONDITION IOD FUSE WAS REMOVED DURING SHIPPING CHECK FOR RELATED TSB'S

Diagnostic Test

1. VERIFY DTC IS STORED

NOTE: Stored faults may indicate a customer perceived intermittent condition.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

With the scan tool, read stored DTC's.

Is this DTC stored?

Yes

Go To step 2.

No

Diagnose the active DTC. Refer to **DIAGNOSTIC CODE INDEX** for a list of the symptoms.

2. CHECK THE ENVIRONMENTAL DATA

With the scan tool, read the loss of communication environmental data.

Does the loss of communication environmental odometer data match up to any of the previous service procedures listed in the possible causes or are there any stored CAN B or C hardware electrical, battery, ignition voltage, VIN missing/mismatch, TIPM configuration DTC's present with matching environmental data?

Yes

These DTC's may have been the result of other service procedures performed. Clear DTC's.

No

Go To step 3.

3. VERIFY INTERMITTENT LOST COMMUNICATION DTC - WIRING CONCERNS

Turn the ignition on.

With the scan tool, select Network View and select Advanced.

Is there more than one ECU with stored DTC's "Logged Against" the module and one or more lost communication DTC's stored in the offending module?

Yes

Verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals. Repair as necessary.

No

Go To step 4.

4. VERIFY INTERMITTENT LOST COMMUNICATION DTC - OFFENDING MODULE

Turn the ignition on.

With the scan tool, select Network View and select Advanced.

Is there more than one ECU with stored DTC's "Logged Against" the module and NO lost communication DTC's stored in the offending module?

Yes

Check for TSB(s) related to this offending module.

No

Go To step 5.

5. VERIFY INTERMITTENT LOST COMMUNICATION DTC - REPORTING MODULE

Turn the ignition on.

With the scan tool, select Network View and select Advanced.

Is there ONLY ONE ECU with stored DTC's "Logged Against" the module?

Yes

Check for TSB(s) related to the module that set this DTC.

No

Verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals. Repair as necessary.

STANDARD PROCEDURE

TPM VERIFICATION

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Diagnostic Test

1. TPM

Was the WCM/SKREEM replaced during the test procedure?

Yes

Go to step 2.

No

Go to step 3.

2. **WCM/SKREEM**

NOTE: When entering the PIN, care should be taken because the SKREEM will only allow three consecutive attempts to enter the correct PIN. If three consecutive incorrect PIN's are entered the SKREEM will Lock Out the scan tool. To exit Lock Mode, the ignition key must remain in the Run position for one hour. All accessories must be off. A battery charger connected to the battery during this time period is recommended.

1. Reconnect the previously removed and/or disconnected components and connectors.
2. Obtain the vehicle's unique Personal Identification Number (PIN) assigned to its original SKREEM. This number can be obtained from the vehicle invoice or from the Chrysler Customer Center (Phone 1-800-992-1997).
3. With the scan tool, select Miscellaneous Functions, WCM/Wireless Control Module. Then select the desired procedure and follow the display on the scan tool.
4. If the WCM/SKREEM was replaced, all the customer's keys must be programmed to the new module. Use the scan tool and the Program Key procedure
5. With the scan tool, erase all DTCs. Perform 5 ignition key cycles, leaving the key on for at least 90 seconds per cycle.
6. Drive the vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time the system will learn the new sensor ID code and will clear any DTC(s) automatically.
7. With the scan tool, read WCM/SKREEM DTC(s).

Are there any DTC(s) present?

Yes

Repair not complete, refer to the appropriate symptom.

No

Repair is complete.

3. **WIRE REPAIR**

Was the repair a wire repair?

Yes

Go To step 5.

No

Go To step 4.

4. **TIRE PRESSURE SENSOR/TIRE PRESSURE TRANSPONDER REPLACE**

1. Reconnect the previously removed and/or disconnected components and connectors.
2. If available, use a TPM-RKE Analyzer tool with the Scan Tool to program the WCM/SKREEM with the tire pressure sensors ID's on the vehicle, or perform step 3.
3. Drive the vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time the system will learn the new sensor ID's.
4. With the scan tool, read TPM DTC(s).

Are there any DTC(s) present?

Yes

Repair not complete, refer to the appropriate symptom.

No

Repair is complete.

5. **WIRE REPAIR**

Ensure every trigger module connector is connected and WCM is connected.

Turn the ignition on.

With the scan tool, run the "Trigger Module Test Routine" under "Miscellaneous Functions" for the "WCM" and follow the procedure.

NOTE: Three trigger modules are located in three of the four wheel wells on the vehicle to provide the WCM/SKREEM with the location of the tire pressure sensors on the vehicle. A fourth transponder is not necessary in the remaining wheel well due to the process-of-elimination theory. Once the system knows the location of the first three sensors it assumes the location of the fourth tire pressure sensor. The locations of the trigger modules can vary for each vehicle. Make sure the vehicle has trigger modules, and that are in the right locations. After every repair, the trigger module test routine must be rerun in order to verify the fix.

Did any of the three Trigger Modules have NO as a result?

Yes

Return to the DTC test.

No

Repair complete.

2008 SUSPENSION

Tires/Wheels - Service Information - Liberty

DIAGNOSIS AND TESTING

TIRE AND WHEEL RUNOUT

Fig. 1: Checking Radial Runout
Courtesy of CHRYSLER LLC

Radial runout is the difference between the high and low points on the tire or wheel.

8120009c

Fig. 2: Checking Wheel Lateral Runout
Courtesy of CHRYSLER LLC

Lateral runout is the **wobble** of the tire or wheel.

Lateral runout of more than 2.0 mm (.080 inch) measured near the shoulder of the tire may cause the vehicle to shake.

81200093

Fig. 3: Checking Wheel Radial Runout
 Courtesy of CHRYSLER LLC

Radial runout of more than 1.5 mm (.060 inch) measured at the center line of the tread may cause the vehicle to shake.

Sometimes radial runout can be reduced. Relocate the wheel and tire assembly on the mounting studs (See METHOD 1). If this does not reduce runout to an acceptable level, the tire can be rotated on the wheel. (See **METHOD 2 (RELOCATE TIRE ON WHEEL)**).

METHOD 1 (RELOCATE WHEEL ON HUB)

1. Drive vehicle 10-15 minutes at highway speed' to adequately warm tire to eliminate tire flat spotting from a parked position.
2. Check wheel bearings and adjust if adjustable or replace if necessary.

3. Check the wheel mounting surface.
4. Rotate wheel on the mounting, two studs over from the original position.
5. Tighten wheel nuts in a crossing pattern until all are properly torqued, to eliminate brake distortion.
6. Check radial runout. If still excessive, mark tire sidewall, wheel, and stud at point of maximum runout and proceed to Method 2.

METHOD 2 (RELOCATE TIRE ON WHEEL)

NOTE: Rotating the tire on wheel is particularly effective when there is runout in both tire and wheel.

81200093

Fig. 4: Checking Wheel Radial Runout
Courtesy of CHRYSLER LLC

1. Remove tire from wheel and mount wheel on service dynamic balance machine.
2. Check the wheel radial runout.

Fig. 5: Checking Wheel Lateral Runout
Courtesy of CHRYSLER LLC

3. Check the wheel lateral runout.
STEEL WHEELS: Radial runout 0.6096 mm (0.024 in.), Lateral runout 0.762 mm (0.030 in.) (maximum)
ALUMINUM WHEELS: Radial runout 0.3556 mm (0.14 in.), Lateral runout 0.508 mm (0.020 in.) (maximum)
4. If point of greatest wheel lateral runout is near original chalk mark, remount tire 180 degrees. Recheck runout.

STANDARD PROCEDURE

MATCH MOUNTING

Wheels and tires that are mounted means that the high spot of the tire is matched to the low spot on the wheel rim. Each are marked with a bright colored temporary label on the outboard surface for alignment. The wheel is also marked permanently on the inside of the rim in the tire well. This permanent mark may be a paint dot or line, a permanent label or a stamped impression such as an X. An optional location mark is a small spherical indentation on the vertical face of the outboard flange on some non styled base steel wheels. The tire must be removed to locate the permanent mark on the inside of the wheel.

Before dismounting a tire from its wheel, a reference mark should be placed on the tire at the valve stem location. This reference will ensure that it is remounted in the original position on the wheel.

8120029d

Fig. 6: Marking Tire And Wheel To Indicate High Spot
Courtesy of CHRYSLER LLC

1. Remove the tire and wheel assembly from the vehicle and mount on a service dynamic balance machine.
2. Measure the total runout on the center of the tire tread rib (3) with a dial indicator. Record the indicator

reading. Mark the tire to indicate the high spot (2). Place a mark on the tire at the valve stem (4) location (1).

Fig. 7: Remounting Tire 180 Degrees on Rim
Courtesy of CHRYSLER LLC

3. Break down the tire and remount it 180 degrees on the rim (1)(2).
4. Measure the total indicator runout again. Mark the tire to indicate the high spot.

Fig. 8: Remounting Tire 90 Degrees on Rim
Courtesy of CHRYSLER LLC

5. If runout is still excessive, the following procedures must be done.

If the high spot is within 101.6 mm (4.0 in.) of the first spot and is still excessive, replace the tire.

If the high spot is within 101.6 mm (4.0 in.) of the first spot on the wheel, the wheel may be out of specifications.

If the high spot is NOT within 101.6 mm (4.0 in.) of either high spot, draw an arrow on the tread from second high spot (1) to first (2). Break down the tire and remount it 90 degrees on rim in that direction. This procedure will normally reduce the runout to an acceptable amount, if not replace the rim.

TIRE AND WHEEL BALANCE

It is recommended that a two plane service dynamic balancer be used when a tire and wheel assembly require balancing. Refer to balancer operation instructions for proper cone mounting procedures. Typically use front cone mounting method for steel wheels. For aluminum wheel use back cone mounting method without cone spring.

NOTE: Static should be used only when a two plane balancer is not available.

NOTE: Cast aluminum and forged aluminum wheels require coated balance weights and special alignment equipment.

Wheel balancing can be accomplished with either on or off vehicle equipment. When using on-vehicle balancing equipment, remove the opposite wheel/tire. Off-vehicle balancing is recommended.

Fig. 9: Static Balancing
Courtesy of CHRYSLER LLC

NOTE: 20" wheels do not have an outer flange. Apply adhesive weights on midplane surface

For static balancing, find the location of the heavy spot (1) causing the imbalance (5). Counter balance wheel directly opposite the heavy spot. Determine weight required to counter balance the area of imbalance (4). Place half of this weight on the **inner** rim flange (3) and the other half on the **outer** rim flange (3).

Fig. 10: Dynamic Balancing
 Courtesy of CHRYSLER LLC

For dynamic balancing (3), the balancing equipment is designed to locate the amount of weight to be applied to both the inner and outer rim flange (2).

TIRE ROTATION

Fig. 11: Tire Rotation Pattern
Courtesy of CHRYSLER LLC

Tires on the front and rear operate at different loads and perform different steering, driving, and braking functions. For these reasons they wear at unequal rates and tend to develop irregular wear patterns. These effects can be reduced by rotating the tires at regular intervals. The benefits of tire rotation are:

- Increase tread life
- Maintain traction levels
- A smooth, quiet ride

The suggested method of tire rotation is shown in graphic. Other rotation methods can be used, but they will not provide all the tire longevity benefits.

SPECIFICATIONS

TORQUE CHART

CAUTION: DO NOT USE CHROME PLATED LUG NUTS WITH CHROME PLATED WHEELS.

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.
Wheel Lug Nut	136 ± 20	100 ± 15	-
Spare Tire Winch	39	28	250

TIRES

DESCRIPTION

FULL SIZE

The spare is a full usage wheel with a matching tire. It can be used within the (posted legal) speed limits or distance limitations as of the rest of the vehicles four tires. Refer to Owner's Manual for complete details.

RADIAL-PLY TIRES

Radial-ply tires improve handling, tread life and ride quality, and decrease rolling resistance.

Radial-ply tires must always be used in sets of four. Under no circumstances should they be used on the front only. They may be mixed with temporary spare tires when necessary. A maximum speed of 80 KPH (50 MPH) is recommended while a temporary spare is in use.

Radial-ply tires have the same load-carrying capacity as other types of tires of the same size. They also use the same recommended inflation pressures.

The use of oversized tires, either in the front or rear of the vehicle, can cause vehicle drive train failure. This could also cause inaccurate wheel speed signals when the vehicle is equipped with Anti-Lock Brakes.

The use of tires from different manufactures on the same vehicle is NOT recommended. The proper tire pressure should be maintained on all four tires.

REPLACEMENT TIRES

The original equipment tires provide a proper balance of many characteristics such as:

- Ride
- Noise
- Handling
- Durability
- Tread life
- Traction
- Rolling resistance
- Speed capability

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

WARNING: Failure to equip the vehicle with tires having adequate speed capability can result in sudden tire failure.

SPARE / TEMPORARY TIRE

The temporary spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 80 KMH (50 MPH). when using the temporary spare tire. Refer to Owner's Manual for complete details.

TIRE INFLATION PRESSURES

Fig. 12: Identifying Under Inflated Tire
Courtesy of CHRYSLER LLC

WARNING: Over or under inflated tires can affect vehicle handling and tread wear. This may cause the tire to fail suddenly, resulting in loss of vehicle control.

Under inflation will cause rapid shoulder wear (1), tire flexing, and possible tire failure.

Fig. 13: Identifying Over Inflated Tire
Courtesy of CHRYSLER LLC

Over inflation will cause rapid center wear (1) reduction in the tire's ability to cushion shocks.

Improper inflation can cause:

- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride
- Vehicle drift

For proper tire pressure specification refer to the tire label placard usually located on the drivers door latch pillar.

TIRE PRESSURE FOR HIGH SPEED

Refer to the Vehicles Owners Manual package.

TIRES

Tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

Driving habits have more effect on tire life than any other factor. Careful drivers will obtain in most cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe brake applications
- High speed driving
- Excessive speeds on turns
- Striking curbs and other obstacles

Radial-ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval. See **STANDARD PROCEDURE**. This will help to achieve a greater tread life.

TIRE IDENTIFICATION

Fig. 14: Identifying Tire Identification Information
Courtesy of CHRYSLER LLC

Tire type, size, aspect ratio and speed rating are encoded in the letters and numbers imprinted on the side wall of the tire. Refer to the chart to decipher the tire identification code.

Performance tires have a speed rating letter after the aspect ratio number. The speed rating is not always printed on the tire sidewall. These ratings are:

- Q** up to 99 mph
- S** up to 112 mph
- T** up to 118 mph
- U** up to 124 mph
- H** up to 130 mph
- V** up to 149 mph
- W** (consult the tire manufacturer for the specific speed rating)
- Z** more than 149 mph (consult the tire manufacturer for the specific speed rating)

An All Season type tire will have either **M + S**, **M & S** or **M-S** (indicating mud and snow traction) imprinted on the side wall.

TIRE CHAINS

Tire snow chains may be used on **certain** models. Refer to the Owner's Manual for more information.

DIAGNOSIS AND TESTING

PRESSURE GAUGES

A quality air pressure gauge is recommended to check tire pressure. After checking the air pressure, replace valve cap finger tight.

TIRE NOISE OR VIBRATION

Radial-ply tires are sensitive to force impulses caused by improper mounting, vibration, wheel defects, or possibly tire imbalance.

To find out if tires are causing the noise or vibration, drive the vehicle over a smooth road at varying speeds. Note the noise level during acceleration and deceleration. The engine, differential and exhaust noises will change as speed varies, while the tire noise will usually remain constant.

TIRE WEAR PATTERNS

CONDITION	1. RAPID WEAR AT SHOULDERS	2. RAPID WEAR AT CENTER	CRACKED TREADS	WEAR ON ONE SIDE	FEATHERED EDGE	BALD SPOTS	SCALLOPED WEAR
EFFECT							
CAUSE	UNDER-INFLATION OR LACK OF ROTATION	OVER-INFLATION OR LACK OF ROTATION	UNDER-INFLATION OR EXCESSIVE SPEED*	EXCESSIVE CAMBER	INCORRECT TOE	UNBALANCED WHEEL OR TIRE DEFECT*	LACK OF ROTATION OF TIRES OR WORN OR OUT-OF-ALIGNMENT SUSPENSION.
CORRECTION	ADJUST PRESSURE TO SPECIFICATIONS WHEN TIRES ARE COOL ROTATE TIRES			ADJUST CAMBER TO SPECIFICATIONS	ADJUST TOE-IN TO SPECIFICATIONS	DYNAMIC OR STATIC BALANCE WHEELS	ROTATE TIRES AND INSPECT SUSPENSION

* HAVE TIRE INSPECTED FOR FUTURE USE.

Fig. 15: Identifying Tire Wear Patterns
Courtesy of CHRYSLER LLC

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.

Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other.

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread.

TIRE/VEHICLE LEAD

Use the following Vehicle Lead Diagnosis And Correction Chart to diagnose and correct a vehicle lead or drift problem.

812014c7

Fig. 16: Vehicle Lead Diagnosis & Correction Chart
Courtesy of CHRYSLER LLC

Fig. 17: Identifying Tread Wear Indicators
Courtesy of CHRYSLER LLC

Tread wear indicators (3) are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators (3) will appear as a 13 mm (1/2 in.) band.

Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

STANDARD PROCEDURE

TIRE REPAIR AREA

Fig. 18: Identifying Tire Repair Area
Courtesy of CHRYSLER LLC

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area (1). The tire should be replaced if the puncture is located in the sidewall.

Deflate tire completely before removing the tire from the wheel. Use lubrication such as a mild soap solution when dismounting or mounting tire. Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle, and tighten to proper torque specification.

CLEANING

TIRES

Remove the protective coating on the tires before delivery of a vehicle. This coating may cause deterioration of

the tires.

To remove the protective coating, apply warm water and let it soak for a few minutes. Afterwards, scrub the coating away with a soft bristle brush. Steam cleaning may also be used to remove the coating.

NOTE: **DO NOT use gasoline, mineral oil, oil-based solvent or a wire brush for cleaning.**

3. Install the spare tire onto the winch.
4. Turn the winch (2) to raise the tire.
5. Install the plastic access (1) cover.

WHEELS

DESCRIPTION

WHEEL DESIGN

Fig. 23: Identifying Wheel/Rim Design
Courtesy of CHRYSLER LLC

The rim size is on the vehicle safety certification label located on the drivers door shut face. Original equipment wheels/rims are designed for operation up to the specified maximum vehicle capacity.

All models use stamped steel, cast aluminum or forged aluminum wheels. Every wheel has raised sections between the rim flanges (1) and rim drop well (3) called safety humps.

Initial inflation of the tire forces the bead over these raised sections. In case of rapid loss of air pressure, the raised sections help hold the tire on the wheel.

The wheel studs and nuts are designed for specific applications. All aluminum and some steel wheels have wheel stud nuts with an enlarged nose. This enlarged nose is necessary to ensure proper retention of the wheels. Do not use replacement studs or nuts with a different design or lesser quality.

DIAGNOSIS AND TESTING

WHEEL INSPECTION

Inspect wheels for:

Excessive run out

Dents or cracks

Damaged wheel lug nut holes

Air Leaks from any area or surface of the rim

NOTE: **Do not attempt to repair a wheel by hammering, heating or welding.**

If a wheel is damaged an original equipment replacement wheel should be used. When obtaining replacement wheels, they should be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

WARNING: Failure to use equivalent replacement wheels may adversely affect the safety and handling of the vehicle. Used wheels are not recommended. The service history of the wheel may have included severe treatment or very high mileage. The rim could fail without warning.

WARNING: DaimlerChrysler corporation does not recommend that customers use "reconditioned" wheels (wheels that have been damaged and repaired) because they can result in a sudden catastrophic wheel failure which could cause loss of control and result in injury or death.

For Clarification:

Cosmetic refinishing for the purpose of repairing a superficial flaw is an acceptable procedure providing it is limited to paint or clear coat only, the wheel is not modified in any way, and there is no exposure to paint curing heat over 200 degrees Fahrenheit.

Damaged wheels are those which have been bent, broken, cracked or sustained some other physical damage which may have compromised the wheel structure

Repaired indicates that the wheel has been modified through bending, welding, heating, straightening, or material removal to rectify damage.

Re-plating of chrome plated wheels is not an acceptable procedure nor is chrome plating of original equipment painted or polished wheels, as this may alter mechanical properties and affect fatigue life.

STANDARD PROCEDURE

WHEEL INSTALLATION

The wheel studs and nuts are designed for specific applications. They must be replaced with equivalent parts.

Do not use replacement parts of lesser quality or a substitute design. All aluminum and some steel wheels have wheel stud nuts which feature an enlarged nose. This enlarged nose is necessary to ensure proper retention of the aluminum wheels.

NOTE: Do not use chrome plated lug nuts with chrome plated wheels.

81a8c92e

Fig. 24: Removing/Installing Wheel
Courtesy of CHRYSLER LLC

Before installing the wheel, be sure to remove any build up of corrosion on the wheel mounting surfaces (1). Ensure wheels (2) are installed with good metal-to-metal contact. Improper installation could cause loosening of wheel nuts. This could affect the safety and handling of your vehicle.

To install the wheel (2), first position it properly on the mounting surface (1). All wheel nuts (3) should then be tightened just snug.

80fa8998

Fig. 25: Lug Nut Tightening Pattern
Courtesy of CHRYSLER LLC

Gradually tighten them in sequence to the proper torque specification. See **Fig. 25**. **Never use oil or grease on studs or nuts.**

WHEEL REPLACEMENT

The wheel studs and nuts are designed for specific applications. They must be replaced with equivalent parts. Do not use replacement parts of lesser quality or a substitute design. All aluminum and some steel wheels have wheel stud nuts which feature an enlarged nose. This enlarged nose is necessary to ensure proper retention of the aluminum wheels.

NOTE: Do not use chrome plated lug nuts with chrome plated wheels.

Before installing the wheel, be sure to remove any build up of corrosion on the wheel mounting surfaces. Ensure wheels are installed with good metal-to-metal contact. Improper installation could cause loosening of wheel nuts. This could affect the safety and handling of your vehicle.

To install the wheel, first position it properly on the mounting surface. All wheel nuts should then be tightened just snug. Gradually tighten them in sequence to the proper torque specification. **Never use oil or grease on studs or nuts.**

Wheels must be replaced if they have:

- Excessive runout
- Bent or dented
- Leak air through welds
- Have damaged bolt holes

Wheel repairs employing hammering, heating, or welding are not allowed.

Original equipment wheels are available through your dealer. Replacement wheels from any other source should be equivalent in:

- Load carrying capacity
- Diameter
- Pilot Bore Diameter
- Width
- Offset
- Mounting configuration

Failure to use equivalent replacement wheels may affect the safety and handling of your vehicle. Replacement with **used** wheels is not recommended. Their service history may have included severe treatment.

Courtesy of CHRYSLER LLC

- | |
|---------------------------------|
| 1 - STUD
2 - PARK BRAKE SHOE |
|---------------------------------|

1. Install the new stud (1) into the hub flange by rotating the stud (1) in between the hub/bearing and park brake shoes (2).
2. Install the three washers onto the stud, then install the lug nut with the flat side of the nut against the washers.
3. Tighten the lug nut until the stud is pulled into the hub flange. Verify that the stud is properly seated into the flange.
4. Remove the lug nut and washers.

5. Install the brake rotor and caliper. Refer to **INSTALLATION** .
6. Install the wheel and tire assembly, use new lug nut on stud or studs that were replaced.
7. Remove the support and lower vehicle.

TIRE PRESSURE MONITORING SYSTEM

DESCRIPTION

BASE TIRE PRESSURE MONITORING

This system will consist of Tire Pressure Monitoring (TPM) sensors attached to each wheel through the valve stem mounting hole, a Wireless Control Module (WCM) and a yellow TPM telltale lamp. A TPM sensor shall be installed in the spare wheel if the vehicle is equipped with a matching full size spare wheel and tire assembly.

PREMIUM - TIRE PRESSURE MONITORING

The system will consist of tire pressure monitoring sensors attached to each wheel through the valve stem mounting hole, a wireless control module (WCM), three wheel sensor transponders located in three of the four wheel wells (Left Front, Right Front, and Left Rear), a re-configurable dot matrix display module (EVIC), and a yellow telltale.

TIRE PRESSURE MONITORING

The Tire Pressure Monitoring (TPM) system monitors air pressure in the four road tires (excludes spare). Pressure in the spare tire is not monitored. The base system does not specify how many tires are low or where they are located. The premium system does so.

There are two types of TPM available for this vehicle, a base system and a premium system.

The Base TPM system consists of tire pressure monitoring sensors attached to each road wheel through the valve stem mounting hole, a central receiver module (WIN) and an indicator lamp.

The Premium TPM system consists of tire pressure monitoring sensors attached to each road wheel through the valve stem mounting hole, a wireless control module (WIN) three wheel sensor transponders located in three of the four wheel wells, an electronic display, and an indicator lamp.

The receiver circuit for the TPM system is integrated into the WIN for non remote start vehicles. **for factory installed remote start vehicles the antenna is external.** Commonly referred to as the Wireless Control Module (WCM), the WIN also includes the Ignition Node, the Remote Keyless Entry (RKE) receiver and the Sentry Key Immobilizer (SKIM) receiver. All receivers share a number of common components. The WIN decodes the RF signals transmitted by each of the vehicle's tire pressure sensors. The decoded information is used to determine if "warning" or "fault" conditions exist within the TPM system.

Upon detection of a warning or fault condition, the WIN will send a request to the module that controls the indicator lamp (and the text display if equipped with the Premium system) via the vehicle bus system to illuminate or flash the indicator lamp. Also, upon detection of a warning or fault condition, the electronic

display will send a request to sound the "chime". A chime will only be requested once per ignition cycle per warning or fault condition detected.

The WIN will store all warning and fault conditions, placard pressure values and low-pressure threshold values (lamp ON and OFF) in memory that can be accessed through diagnostic communication. If new sensors are introduced to the vehicle, the data stored for the sensor being replaced will be deleted.

The WIN will store all wheel sensor ID's and locations and faults in memory that can be accessed through diagnostic communication. All other data values transmitted from each active wheel sensor (not the spare tire) shall be stored in the WIN memory.

The WIN automatically learns and stores the sensors's ID while driving "within 10 minutes continuously above 15 mph (24 km/h)" after a sensor has been replaced. The learning sequence will initiate when the vehicle has been stopped for more than 20 minutes.

WIRELESS CONTROL MODULE (WCM)

The receiver circuit for the TPM system is integrated into the WCM for non-remote start vehicles. For factory installed remote start vehicles, the remote start antenna is external to the WCM. In addition to Tire Pressure Monitoring System (TPMS), The WCM can also include the Remote Keyless Entry (RKE) receiver, Remote Start (if equipped), and the Sentry Key Immobilizer (SKIM) receiver. All four receivers share a number of common components. The WCM decodes the RF signals transmitted by each of the vehicle's tire pressure sensors. The decoded information is used to determine if "warning" or "fault" conditions exist within the TPM system.

The WCM communicates with the module that controls the "TPM telltale lamp" and the text display (Premium system), via the vehicle bus system.

Upon detection of a warning or fault condition, the WCM will send a request to illuminate or flash the yellow TPM telltale. Also, upon detection of a warning or fault condition, the display module will send a request to sound the "chime". A chime will only be requested once per ignition cycle per warning or fault condition detected.

The WCM will store all warning and fault conditions, placard pressure values, low-pressure threshold values and low pressure threshold hysteresis values in memory that can be accessed through diagnostic communication. If new sensors are introduced to the vehicle, the data stored for the sensor being replaced will be deleted.

The WCM will store all wheel sensor ID's and locations and faults in memory that can be accessed through diagnostic communication. All other data values transmitted from each active wheel sensor (not the spare tire) shall be stored in the WCM memory.

The WCM automatically learns and stores the sensor's ID while driving "within 10 minutes continuously above 15 m.p.h. (24 Km/h)" after a sensor has been replaced. A new sensor ID can also be programmed directly into the WCM by using a RKE-TPM Analyzer in conjunction with a Scan Tool. Once the new sensor ID has been programmed, the RKE-TPM Analyzer can be used to update the TPMS by activating the sensor.

The learning sequence will initiate when the vehicle has been stopped for more then 20 minutes.

OPERATION

BASE - TIRE PRESSURE MONITORING

The tire pressure monitoring system (TPMS) is designed to operate without loss of function for all OEM tire construction for this vehicle. Tire Pressure Monitoring Sensors, mounted to each road wheel as part of the valve stem, transmit an RF signal indicating their individual pressure to a receiver located in the Wireless Control Module (WCM), commonly referred to as the Sentry Key Remote Entry Module (SKREEM). These transmissions occur approximately once every minute at speeds over 15 mph (24 km/h). Refer to **SENSOR - TIRE PRESSURE**. If the TPM system detects that the tire pressure in any road tire is going low, beyond the Low Pressure (lamp) ON threshold (see placard table under **TPM THRESHOLD PRESSURES**), the TPM system will continuously illuminate an indicator lamp. If a system fault is detected, the indicator lamp will flash on/off for 75 seconds and then remains on solid.

If the WCM detects a warning or fault condition at ignition key "on" it will wait ten seconds +/- 10 % before sending the first request to illuminate the yellow telltale. This will assure that the display module has concluded its bulb check period. The display module will request a chime once per ignition cycle for each "warning" or "fault" condition detected. A "warning" or "fault" condition will remain enabled until the problem causing the condition is corrected and removed/reset.

The WCM shall continuously monitor for the receipt of tire pressure RF message transmissions from the wheel sensors during both the ignition key "on" and key "off" cycles. The wheel sensor ID's and the location of each sensor (e.g. Tire 1, Tire 2 etc.) are stored in the WCM non-volatile memory during the initial Manufacturing Plant Process, or during a service procedure, as required. The recommended "placard pressure", "low-pressure threshold" and "Hysteresis Pressure Values" for the tires installed on the vehicle, are stored in the WCM non-volatile memory during the initial Manufacturing Plant Process, or during a service procedure, as required.

The TPM System will continue to warn the driver of low tire pressure as long as the condition exists, and will not turn off the indicator lamp until the tire pressure is at or above the Low Pressure (lamp) OFF threshold (see placard table under **TPM THRESHOLD PRESSURES**). The system will automatically update and the TPM warning lamp will extinguish once the updated tire pressures have been received.

The tire pressure will vary with temperature by about 1 psi (6.9 kPa) for every 12°F (6.5°C). This means that when the outside temperature decreases, the tire pressure will decrease. Tire pressure should always be set based on cold inflation tire pressure (placard pressure). This is defined as the tire pressure after a vehicle has not been driven for more than 3 hours - and in outside ambient temperature. The tire pressure will also increase as the vehicle is driven - this is normal and there should be no adjustment for this increased pressure. For a system fault, the system will return to normal once the WCM receives a valid transmission from that sensor location

PREMIUM TIRE PRESSURE MONITORING

The operation and lamp/chime strategy for a premium tire pressure monitoring system (TPMS) is the same as the base TPMS, but the premium TPMS can display text messages and a graphic display of the tire pressure on the information cluster. If a low pressure condition is detected, in addition to a chime and the indicator lamp turning ON, a low pressure text message indicating which tire is low will be displayed in the instrument cluster for 3 seconds. This text message will be followed by a graphic display of the pressure value(s) with the low tire (s) flashing. Once pressure in the suspect tire raises above the Low Pressure (lamp) OFF Threshold (see placard table under **TPM THRESHOLD PRESSURES**), the lamp will go out and the system returns to normal within

approximately two minutes time. If a system fault is detected, in addition to the flashing lamp, a "Service Tire Press.System" text message will be displayed in the instrument cluster, and the graphic display will have "- -" in place of the pressure value. The system will return to normal once the WCM receives a valid transmission from that sensor location

A Premium Tire Pressure Monitoring System (TPMS) determines the location of the tire pressure sensors by using transponders located in three of the four wheel wells on the vehicle. A fourth transponder is not necessary in the remaining wheel well due to the process of elimination theory. Once the system knows the location of the first three sensors, it assumes the location of the fourth tire pressure sensor, and update the graphic display when necessary. For more information, Refer to **TRANSPONDER** .

For both the premium and base TPMS, the recommended "Placard Pressure", "Low-pressure Threshold" and "Hysteresis Pressure Values" for the tires installed on the vehicle, are stored in the WCM non-volatile memory during the initial Manufacturing Plant Process, or during a service procedure, as required. To determine the pressure thresholds for a vehicle, refer to the Tire Inflation Pressure (Placard) Label, and then apply the placard pressure to the following table. The Low Pressure OFF Threshold is defined as the Low Pressure ON Threshold plus the Hysteresis Pressure Value.

TPM THRESHOLD PRESSURES

NOTE: **To determine the pressure thresholds for a vehicle, refer to the Tire Inflation Pressure (Placard) Label found on the Driver's B-Pillar, then apply the placard pressure to the following table.**

Placard Pressure (Cold) (PSI)	Low Pressure ON Threshold (PSI)	Low Pressure OFF Threshold (PSI)
28	22	26

DIAGNOSIS AND TESTING

TIRE PRESSURE MONITORING SYSTEM

NOTE: Tire pressure may increase from 2 to 6 psi (14 to 41 kPa) during normal driving conditions. Do NOT reduce this normal pressure build up.

NOTE: Tire pressure will vary with temperature by about 1 psi (6.9 kPa) for every 12 F (6.5 C). This means that when the outside temperature decreases, the tire pressure will also decrease. Tire pressure should always be set based on cold inflation tire pressure. For details, see DESCRIPTION.

When diagnosing a tire pressure issue, always check air pressure in the tires first with a known accurate air gauge. Adjust air pressure as necessary to that listed on the Tire Inflation Pressure Label (Placard) provided with the vehicle (usually applied to the driver's side B-pillar). After adjusting air pressure in a tire on the vehicle, allow approximately two minutes for the message or indicator lamp to go out.

Check the tire pressure indicator lamp in the instrument cluster. If the lamp is illuminating continuously, proceed as listed below. If the indicator lamp is flashing on/off for 75 seconds and then remains on solid, a system fault was detected. Refer to the appropriate diagnostic information.

If air pressure in any tire is low, inspect all the tires for leaks. A water "dunk tank" or other water test may be used to check for leaks around the sensor as long as any water at the valve core is removed once the procedure is completed. The water can be easily expelled from the core area by pushing in on the core for several seconds, allowing escaping air to drive out any moisture. Reinflate the tire as necessary. Always make sure the original valve stem cap is securely installed to keep moisture out of the sensor.

If the gauge-read pressure in the tires does not indicate a tire pressure issue, refer to the appropriate diagnostic information.

SENSOR

DESCRIPTION

SENSOR - TIRE PRESSURE

6198b1ba

Fig. 31: View Of Schrader Sensor
Courtesy of CHRYSLER LLC

- NOTE:

On vehicles equipped with Tire Pressure Monitoring System, one tire pressure sensor (6) is mounted to each wheel in place of the traditional tire valve stem. Each sensor has an internal battery that lasts up to 10 years. The battery is not serviceable. At the time of battery failure, the sensor must be replaced. The TPM system operates on a 315 or 433 MHz radio frequency. The 315 MHz sensors can be easily identified by a black sensor body, with (an oval insignia) (1). The 433 MHz sensors can be identified by a grey sensor body with an oval insignia.
- NOTE:

If replacing the WCM, the spare tire must be dismounted from its wheel to access and note the spare tire pressure sensor ID. Then follow the programming steps outlined in the diagnostic scan tool for "Learn Spare Tire Sensor ID" under Miscellaneous Functions for the WCM wireless control module menu item as appropriate. In addition, the placard pressure thresholds must be updated in the new WCM. Go to "Update Pressure Thresholds" under

Miscellaneous Functions for the WCM wireless control module and follow the procedure.

On vehicles equipped with Tire Pressure Monitoring System, one tire pressure sensor (6) is mounted to each wheel in place of the traditional tire valve stem. Each sensor has an internal battery that lasts up to 10 years. The battery is not serviceable. At the time of battery failure, the sensor must be replaced.

The TPM system operates on a 315 MHz radio frequency. The 315 MHz sensors can be easily identified by a black sensor body, with (an oval insignia) (1) and a grey valve cap (2).

The Export TPM system operates on a 433 MHz radio frequency. The 433 MHz sensors can be easily identified by a gray sensor body (with an oval insignia) and a black valve cap (2).

CAUTION: Although 315 MHz and 433 MHz sensors are identical in size and shape, they are not interchangeable. Always make sure the correct sensor is being used.

NOTE: Domestic vehicles, use the 315 MHz TPM sensors with the BLACK sensor body. For Export vehicles, use the 433 MHz TPM sensors with the GREY sensor body. Although 315 MHz and 433 MHz sensors are identical in size and shape, they are not interchangeable. Always make sure the correct color sensor is being used. A RKE-TPM Analyzer can be used to determine the sensor's frequency without having to dismount the tire.

NOTE: If aftermarket wheels are installed and do not contain tire pressure sensors, the system will not function properly and the driver will be continuously notified of a system malfunction.

The TPM sensors are designed for original style factory wheels. **It is not recommended to install a tire pressure sensor in an aftermarket wheel. (This could cause sealing and system performance issues).**

8198b1ba

Fig. 32: View Of Schrader Sensor

Courtesy of CHRYSLER LLC

The serviceable components of the tire pressure sensor are:

Sensor-To-Wheel Seal (4)

Valve Stem Cap (2)

Valve Stem Core

Valve Stem Nut (3)

The valve stem caps and cores used are specifically designed for the tire pressure monitoring sensors. Although similar to standard valve stem caps and cores, they are different. The valve stem cap has a special seal inside to keep moisture and corrosion out. The valve stem core has a special nickel coating to protect from corrosion.

OPERATION

SENSOR - TIRE PRESSURE

The battery operated tire pressure sensor is both a transmitter and a receiver. The TPM sensor can be forced to transmit if using a special tool such as a TPM-RKE Analyzer, or from a transponder. Refer to **TRANSPONDER** The TPM-RKE Analyzer has the ability to change the sensor's operating mode and to diagnose a faulty TPM sensor. Using a TPM-RKE Analyzer can take up to a minute to force a transmission from a sensor. The TPM sensor can be in one of the following modes:

Sleep Mode - A new TPM sensor will be in this mode. If placed on the vehicle as a road tire, the TPM sensor will transmit once every 20 seconds when the vehicle is driven at speeds over 15 mph (24 km/h). If the vehicle is not moving, the sensor will only transmit on a pressure change greater than 1 psi (6.9 kPa). Driving the vehicle continuously at speeds over 15 mph (24 km/h) for more than 4 minutes will change the sensor state into 30 BLOCK MODE. The TPM sensor will not return to SLEEP MODE. Now, if the vehicle has been stopped for 20 minutes, the TPM sensor state will change to PARK MODE.

Park Mode - This is the correct operating mode when the vehicle is not moving. The sensor will transmit once every 13 hours to update the WCM, or will transmit on a 1 PSI delta change. The sensors will internally take a measurement of the tire pressure every minute to determine a change in tire pressure

30 Block Mode - If the vehicle has been stopped for more than 20 minutes, or if the sensor's operating mode was forced to Park Mode using a TPM-RKE Analyzer, the sensor's operating mode will transition from Park Mode to 30 Block Mode once the vehicle is driven over 15 mph. In this mode, the sensor will transmit once every 15 seconds when the vehicle is driven at speeds over 15 mph (24 km/h) for the first 30 transmissions. After about 8 minutes of continuous driving above 15 mph (24 km/h), the sensor's mode will change to Drive Mode

Drive Mode - In this mode, the sensor will transmit once every minute when the vehicle is driven at speeds over 15 mph (24 km/h). At any time that the vehicle speed drops below 15 mph, the sensor will not transmit. The sensor mode will still be in drive mode when the sensor reaches speeds over 15 mph (24 km/h). If the vehicle has been stationary for more than 20 minutes, the TPM sensor will change to PARK MODE.

Each sensor's (transmitter) broadcast is uniquely coded so that the wireless control module (WCM) can monitor the state of each of the sensors on the four rotating road wheels. The WCM can automatically learn and store

the sensor's ID while driving "within 10 minutes continuously above 15 m.p.h. (24 Km/h)" after a sensor has been replaced, The vehicle must be stationary for more then 20 minutes in order to initiate the learning sequence.

The sensor IDs can also be programmed using the TPM-RKE Analyzer Tool. Scan each TPM sensor at each road wheel, and store each Sensor ID in the correct location. (LEFT FRONT, LEFT REAR, RIGHT FRONT, and RIGHT REAR) Connect the TPM-RKE Analyzer Tool to the Scan Tool. Then follow the programming steps outlined in the diagnostic Scan Tool for "Program Tire Pressure Sensor ID w/ TPM Tool" under "MISC" for the "WCM/WIRELESS CONTROL MODULE".

CAUTION

SENSOR - TIRE PRESSURE

CAUTION: The TPMS has been optimized for the original equipment tires and wheels. TPMS pressures have been established for the tire size equipped on your vehicle. Undesirable system operation or sensor damage may result when using replacement equipment that is not of the same size, type, and/or style. After-market wheels can cause sensor damage. Do not use aftermarket tire sealants or balance beads if your vehicle is equipped with a TPMS, as damage to the sensors may result.

NOTE: After inspecting or adjusting the tire pressure always reinstall the valve stem cap. This will prevent moisture and dirt from entering the valve stem, which could damage the Tire Pressure Monitoring Sensor.

CAUTION: Tire pressure sensor valve stem caps and cores are specially designed for the sensors. Due to risk of corrosion, do not use a standard valve stem cap or core in a tire pressure sensor in place of the original equipment style sensor cap and core.

CAUTION: After inspecting or adjusting the tire pressure always reinstall the valve stem cap. This will prevent moisture and dirt from entering the valve stem, which could damage the Tire Pressure Monitoring Sensor.

CAUTION: Any time a sensor is to be reinstalled in a wheel, a new seal, cap and valve core must be installed on the stem to ensure air tight sealing.

NOTE: TPM thresholds have been established for the original tire size equipped on the vehicle. Use original size tires only to maintain system accuracy.

DIAGNOSIS AND TESTING

SENSOR - TIRE PRESSURE

NOTE: Tire pressure may increase from 14 to 41 kPa (2 to 6 psi) during normal driving conditions. Do NOT reduce this normal pressure build up.

Check the tire pressure yellow telltale in the instrument cluster. If the yellow telltale is illuminating continuously, proceed as listed below. If the yellow telltale is flashing on/off for 60 seconds, once every ten minutes, there is a system fault detected. Refer to the appropriate diagnostic information.

When diagnosing a tire pressure issue, always check air pressure in the tires first with a known accurate air gauge. Adjust air pressure as necessary to that listed on the Tire Inflation Pressure Label (Placard) provided with the vehicle (usually applied to the driver's side B-pillar). After adjusting air pressure in a tire, allow approximately two minutes for the message or yellow telltale to go out.

If air pressure in any tire is low, inspect **all** the tires for leaks. A water "dunk tank" or other water test may be used to check for a leak around the tire assembly and sensor as long as any water at the valve core is removed once the procedure is completed. The water can be easily expelled from the core area by pushing in on the core for several seconds, allowing escaping air to drive out any moisture. Reinflate the tire as necessary. Always make sure the original valve stem cap is securely installed to keep moisture out of the sensor.

If the gauge-read pressure in the tires does not indicate a tire pressure issue, refer to the appropriate diagnostic information.

REMOVAL

SENSOR - TIRE PRESSURE

1. Raise and support vehicle.
2. Remove the tire and wheel assembly. See STANDARD PROCEDURE.

8198b1ba

Fig. 33: View Of Schrader Sensor
Courtesy of CHRYSLER LLC

CAUTION: The cap (2) used on this valve stem contains an O-ring seal to

prevent contamination and moisture from entering the valve stem. Retain this valve stem cap for reuse. Do not substitute a regular valve stem cap in its place.

CAUTION: The valve stem used on this vehicle is made of aluminum and the core is nickel plated brass. The original valve stem core must be reinstalled and not substituted with a valve stem core made of a different material. This is required to prevent corrosion in the valve stem caused by the different metals.

Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - TIRE PRESSURE SENSOR
2 - WHEEL
3 - NUT (WITH WASHER) |
|--|

3. Let the air out of the tire.
4. Remove the nut (3).
5. Push the sensor into the tire (1) (so the sensor is loose inside the tire).
6. Remove the tire from the rim.
7. Retrieve the sensor (1) from the tire.

INSTALLATION

SENSOR - TIRE PRESSURE

Fig. 35: View Of Schrader Sensor
 Courtesy of CHRYSLER LLC

- NOTE:** If replacing the spare tire pressure sensor, take the time now to write down the tire pressure sensor ID.
- NOTE:** Before reinstalling an existing tire pressure sensor (6), replace valve cap (2), nut (3), valve core and sensor seal (4) to ensure proper sealing.
- NOTE:** The notch/flat should be lined up together and facing towards the wheel during installation.

1. Wipe area clean around sensor/valve stem mounting hole in wheel. Make sure surface of wheel is not damaged.

Fig. 36: Installing Sensor To Wheel
 Courtesy of CHRYSLER LLC

- | |
|--------------------------|
| 1 - TIRE PRESSURE SENSOR |
| 2 - WHEEL |
| 3 - NUT (WITH WASHER) |

2. Insert sensor (1) through wheel (2) as shown in graphic keeping pressure against rear of metal valve stem (See Arrow in illustration). Potted side of sensor is to be positioned toward wheel. Damage to the sensor may occur if the sensor is installed incorrectly.

NOTE: A flat on the seal seat is used to key the seat to the sensor housing. The notch/flat should be lined up together and facing towards the wheel during installation.

3. Install sensor nut (3) and hand tighten.

NOTE: Before tightening sensor nut, push downward on sensor housing (2) in an attempt to make it flush with interior contour of wheel (1).

4. While holding sensor in position, tighten sensor nut to 6 N.m (53 in. lbs.).

CAUTION: Over-tightening the sensor to as much as 10 N.m (88 in. lbs.) may result in sensor separation from the valve stem. Under this condition, the sensor may still function, however, the condition should be corrected immediately.

5. Mount tire on wheel following tire changer manufacturers instructions, paying special attention to the following to avoid damaging tire pressure sensor:

Fig. 37: Mounting Tire Using Rotating Wheel Machine
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - HEAD OF CHANGER LOCATED HERE
2 - VALVE STEM |
|--|

- Rotating Wheel Tire Changers- Once the wheel is mounted to the changer, position the sensor valve stem (2) approximately 180° from the head of the changer (located at 1) in a clockwise direction before rotating the wheel (also in a clockwise direction) to mount the tire. Use this procedure on both the upper and lower tire beads.

Fig. 38: Mounting Tire Using Rotating Tool Machine
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - VALVE STEM
2 - INSTALLATION END OF
MOUNTING/DISMOUNTING TOOL
3 - BEAD BREAKER (KEEP CLEAR OF SENSOR) |
|---|

- Rotating Tool Tire Changers - Position the wheel on the changer so that the sensor valve stem (1) is located approximately 180° clockwise from the installation end of the mounting/dismounting tool (2) once the tool is mounted for tire installation. Make sure the sensor is clear of the lower bead breaker area (3) to avoid damaging the sensor when the breaker rises. Rotate the tool (2) in a counterclockwise direction to mount the tire. Use this procedure on both the upper and lower tire beads.
- Adjust air pressure to that listed on Tire Inflation Pressure Label (Placard) provided with vehicle (usually applied to driver's side B-pillar). Make sure **original style** valve stem cap is securely installed to keep moisture out of sensor.
 - Install tire and wheel assembly on vehicle. See **STANDARD PROCEDURE**.
 - Lower vehicle.
 - If the vehicle has been stationary for more than 20 minutes, drive the vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time, the system will

learn the new sensor ID. A new sensor ID can also be programmed directly into the WCM by using a RKE-TPM Analyzer in conjunction with a Scan Tool. Once the new sensor ID has been programmed, the RKE-TPM Analyzer can be used to update the TPMS by activating the sensor.

NOTE: If a sensor cannot be trained, refer to appropriate diagnostic information.

TRANSPONDER

DESCRIPTION

TRANSPONDER - TIRE PRESSURE

A transponder is located in three of the four wheel wells of the vehicle to provide the WCM/SKREEM with the location of the tire pressure sensors on the vehicle. The transponders are located in the left front, right front and left rear wheel wells. A fourth transponder is not necessary in the remaining wheel well due to the process-of-elimination theory. Once the system knows the location of the first three sensors it assumes the location of the fourth tire pressure sensor is in the left rear tire.

OPERATION

TRANSPONDER - TIRE PRESSURE

Transponders located in three of the four wheel wells of the vehicle provide the Wireless Control Module (WCM) commonly referred to as the Sentry Key Remote Entry Module (SRKEEM) with the location of the tire pressure sensors on the vehicle. The transponders are located in the left front, right front and left rear wheel wells. A fourth transponder is not necessary in the remaining wheel well due to the process-of-elimination theory. Once the system knows the location of the first three sensors it assumes the location of the fourth tire pressure sensor is in the left rear tire.

REMOVAL

FRONT

Fig. 39: Front Transponder

Courtesy of CHRYSLER LLC

1. Raise and support the vehicle.
2. Remove the front part wheel well housing cover and pull it back toward the tire to gain access to the transponder.
3. Remove the mounting nuts (2) for the transponder (1) from the mounting bracket.
4. Disconnect the electrical connector (3) and remove the transponder (1) from the vehicle.

REAR

Fig. 40: REAR TRANSPONDER
Courtesy of CHRYSLER LLC

1. Raise and support the vehicle.
2. Disconnect the electrical connector (1).
3. Remove the mounting nuts (3) for the transponder (4).
4. Remove the transponder (4) from the bracket (2).

INSTALLATION

FRONT

Fig. 41: Front Transponder
Courtesy of CHRYSLER LLC

1. Reconnect the electrical connector (3) to the transponder (1).
2. Install the transponder (1) to the mounting bracket and install the mounting nuts (2). Tighten nuts to 3 N.m (25 in. lbs.).
3. Install the front part of the wheel well housing cover.
4. Lower the vehicle.

REAR

Fig. 42: REAR TRANSPONDER
Courtesy of CHRYSLER LLC

1. Install the transponder (4) to the bracket (2) and install the mounting nuts (3). Tighten to 3 N.m (25 in. lbs.).
2. Reconnect the electrical connector (1) to the transponder (4).
3. Lower the vehicle.

TRACTION CONTROL, 4WD, & AWD

Jeep - 1974-11

* PLEASE READ THIS FIRST *

Placing a non-compatible vehicle on a single-axle dynamometer could result in a safety hazard to technicians and damage to vehicle. Vehicles which use All-Wheel Drive (AWD) or traction control may not be clearly marked. Use common sense and take all necessary precautions when placing any vehicle on the dynamometer. Determine between full-time 4WD and All-Wheel Drive (AWD) for testing purposes. The following tables include information related to full-time 4WD and AWD vehicles, and how to disable the traction control system (if disengageable).

WARNING: DO NOT operate vehicle on a 2-wheel dynamometer if the DO NOT TEST column is marked.

(1) Cannot be shifted to 2WD.

(2) Shift transfer case lever into 2H position.

- (3) Press ESP control switch (button with sliding car icon) located on center of instrument panel. ESP/TCS indicator light will illuminate.
- (4) ESC Off (Partial ESC Mode): ESC Off switch is located in the center console. In "Partial Off" mode, the TCS portion of ESC, except for the limited slip feature, has been disabled and the "ESC Activation/Malfunction Indicator Light" will be illuminated. All other stability features of ESC function normally, with the exception of engine power reduction. "Partial Off" mode is intended to be used if the vehicle is in deep snow, sand, or gravel conditions and more wheel spin than ESC would normally allow is required to gain traction.
- (5) This vehicle has several types of 4WD option; Selec-Trac, Command-Trac, and Quadra Trac. All option types can be shifted into 2WD

Command Trac® II with the new MP1522 two-speed, part-time four-wheel drive transfer case is the entry level four-wheel drive system. Functionally, the system performs the same way as other two-speed, part-time transfer cases. The most significant difference is electric shift, engaged with a console-mounted switch.

Command Trac® II is a part-time four-wheel drive system - 2WD High is the usual driving mode, with the front axle spinning freely and a power directed to the road rear wheels. Selecting 4WD High Lock, via the console-mounted switch, locks the front and rear driveshafts together; the two then rotate at the same and provide a 50

front/50 rear torque split. It is for use only on slippery or loose surfaces, such as snow or dirt. Driving on dry roads can result in driveline binding, resulting in undesirable driving dynamics and potential vehicle damage. It can be engaged at speeds under 55 MPH. A Neutral mode permits towing without having to disconnect the drive shafts. A pushpin button is provided to shift the transfer case into Neutral. For severe off-road situations, 4WD Low can be engaged at speeds of 2-3 MPH. The front and rear drive shafts are locked together, and a second gear set multiplies torque by 2.72:1, providing traditional Jeep capability.

The MP1522 transfer case provides the following benefits:

- Electric shift operation, with a console-mounted switch that replaces the shift lever typical of systems with mechanical linkage.

- Command Trac® II with smooth operation and improved NVH control compared to systems with mechanical linkage.

- Traditional 2WD, 4WD Lock, Neutral and 4WD Low operation modes, and shift-on-the-fly capability. 4WD Low operation mode provides an advantage over vehicles equipped with a single-speed all-wheel drive transfer case.

- Enhanced traction and stability provided by the Traction Control and Electronic Stability Program (ESP) working in tandem with four-wheel drive, including Hill Start Assist, Hill Descent Control and Trailer Sway Control.

- Maintenance-free.

OPERATING RANGES

Transfer case operating ranges are:

- Operating positions: 2WD - 4WD LOCK- N - 4WD LOW.

- 2WD - 2 Wheel Drive.

- 4WD LOCK- 4 High Part Time.

- N - Transfer case neutral for 4-wheel flat recreational towing.

- 4WD LOW- Low range (2.72:1) part time mode.

OPERATION

TRANSFER CASE - MP1522

Selecting 4WD High Lock, via the console-mounted switch, locks the front and rear driveshafts together; the two then rotate at the same and provide a 50 front/50 rear torque split. It is for use only on slippery or loose surfaces, such as snow or dirt. Driving on dry roads can result in driveline binding, resulting in undesirable driving dynamics and potential vehicle damage.

Command Trac® II is a part-time four-wheel drive system - 2WD High is the usual driving mode, with the front axle spinning freely and a power directed to the road rear wheels.

A Neutral mode permits towing without having to disconnect the drive shafts. A pushpin button is provided to shift the transfer case into Neutral.

For severe off-road situations, 4WD Low can be engaged at speeds of 2-3 MPH. The front and rear drive shafts are locked together, and a planetary gear set multiplies torque by 2.72:1, providing traditional Jeep capability.

DIAGNOSIS AND TESTING

TRANSFER CASE - MP1522

DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
Transfer case difficult to shift or will not shift into desired range.	1) Transfer case electronically controlled shift system malfunction.	1) Verify proper operation per the appropriate diagnostic information.
	2) Insufficient or incorrect lubricant.	2) Drain and refill transfer case with the correct quantity of Mopar® ATF+4.
	3) Internal transfer case components binding, worn, or damaged.	3) Repair or replace components as necessary.
Transfer case noisy in all drive modes.	1) Insufficient or incorrect lubricant.	1) Drain and refill transfer case with the correct quantity of Mopar® ATF+4.
	2) Internal transfer case components binding, worn, or damaged.	2) Repair or replace components as necessary.
Transfer case noisy while in, or jumps out of, 4WD LOW.	1) Transfer case not completely engaged in 4WD LOW position.	1) While rolling 2-3 MPH and the transmission in NEUTRAL shift the transfer case to the 2WD or 4WD LOCK position, and then back into the 4WD LOW position.
	2) Range fork, input gear, or range sleeve damaged, inserts worn, or fork is binding on the shift rail.	2) Repair or replace components as necessary.
	3) Low range gear worn or damaged.	3) Repair or replace components as necessary.
Lubricant leaking from transfer case seals or vent.	1) Transfer case overfilled.	1) Drain lubricant to the correct level.
	2) Transfer case vent closed or restricted.	2) Clean or replace vent tube as necessary. Check for kink or restriction in vent tube hose.
	3) Transfer case seals damaged or installed incorrectly.	3) Replace suspect seals. Inspect and replace, if necessary, the seal slinger on the output flange associated with the damaged seal.

REMOVAL

TRANSFER CASE - MP1522

- | |
|---|
| <ul style="list-style-type: none">1 - TRANSFER CASE2 - NUTS3 - TRANSMISSION |
|---|

4 - TRANSFER CASE VENT TUBE

4. Support transmission (3) with jack stand.
5. Remove rear crossmember and skid plate, if equipped.
6. Remove rear support cushion.
7. Disconnect front propeller shaft from transfer case at companion flange. Remove rear propeller shaft from vehicle. Refer to **REMOVAL**.

CAUTION: Do not allow propshafts to hang at attached end. Damage to joint can result.

8. Disconnect the transfer case shift motor and mode sensor electrical harness connector.
9. Disconnect transfer case vent hose (4). See **Fig. 3**.
10. Support transfer case (1) with transmission jack.
11. Secure transfer case to jack with chains.
12. Remove nuts (2) attaching transfer case to transmission.
13. Pull transfer case and jack rearward to disengage transfer case.
14. Remove transfer case from under vehicle.

CLEANING

TRANSFER CASE

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M™ all purpose cleaner. Use compressed air to remove solvent residue from

oil feed passages in the case halves, retainers, gears, and shafts.

INSPECTION

INSPECTION-TRANSFER CASE

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil® thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

ASSEMBLY

TRANSFER CASE - MP1522

NOTE: Lubricate all seals with MOPAR® ATF+4 prior to installation.

SENSOR-MODE

DESCRIPTION

MODE SENSOR

Fig. 109: MP1522 Transfer Case External Components
Courtesy of CHRYSLER LLC

- | |
|---|
| <ul style="list-style-type: none">1 - DETENT ASSEMBLY2 - DRAIN PLUG3 - SHIFT MOTOR/MODE SENSOR4 - FILL PLUG5 - DAMPER (if equipped)6 - REAR FLANGE7 - REAR FLANGE NUT |
|---|

The transfer case mode sensor, also known as "Encoder" (3) which is integrated into the shift motor assembly, provides the Drivetrain Control Module (DTCM) feedback about the position of the transfer case. The sensor consists of a linear analog position sensor that converts the motor output shaft position into a DC signal. The sensor may rotate a full 360 degrees. The DTCM must supply 5V DC ($\pm 2.5\%$) to the sensor whenever the DTCM is not in sleep mode and monitors the shift motor position. The sensor position is monitored when the ignition is in the RUN position and for TBD seconds after the ignition is shifted to the ACC position. The sensor is mechanically linked to the shaft of the cam which allows the transfer case to shift. The mode sensor will draw less than 30 mA of current during operation.

OPERATION

MODE SENSOR

NOTE: All the parameter voltages referred to in the following information are calibrated items in the controller software and are subject to change.

During normal vehicle operation, the DTCM monitors the mode sensor outputs at least every 2 milliseconds when the shift motor is stationary or active. The mode sensor position will be considered invalid by the DTCM if the voltage is greater than 3.51 V or if it is less than 1.52 V. The DTCM shall consider t-case position based on the MODE SENSOR VOLTAGES table listed below.

MODE SENSOR VOLTAGES

Transfer Case Position	Voltage
4WD LOW	3.298 - 3.440
Neutral	2.729 - 2.871
4WD Lock	2.159 - 2.301
2WD	1.599 - 1.741

SWITCH-TRANSFER CASE SELECTOR

DESCRIPTION

TRANSFER CASE SELECTOR SWITCH

Fig. 110: PART-TIME 4WD ELECTRONIC TC SWITCH
Courtesy of CHRYSLER LLC

1 - 4WD LOW POSITION

- 2 - 4WD LOCK POSITION
- 3 - 2WD POSITION
- 4 - NEUTRAL POSITION

The selector switch assembly is mounted in the left side of the shifter assembly and consists of a momentary contact T-handle for shifts to and from 2WD, 4WD LOCK and 4WD LOW and a recessed push pin button for shifts into and out of NEUTRAL.

ASSEMBLY-SHIFT MOTOR/MODE SENSOR

DESCRIPTION

SHIFT MOTOR/MODE SENSOR ASSEMBLY

Fig. 111: MP1522 Transfer Case External Components
Courtesy of CHRYSLER LLC

- 1 - DETENT ASSEMBLY
- 2 - DRAIN PLUG
- 3 - SHIFT MOTOR/MODE SENSOR
- 4 - FILL PLUG
- 5 - DAMPER (if equipped)
- 6 - REAR FLANGE
- 7 - REAR FLANGE NUT

The shift motor (3) is an electromechanical device consisting of a DC permanent magnet motor, a gear train and an analog position sensor. The shift motors' overall function is to move and lock a gear that moves the range fork found in the transfer case. This allows the transfer case to be shifted electrically to multiple operating positions (4WD LOW, 4WD LOCK and 2WD). The operating current of the shift motor under stall conditions

is 30 amps maximum at 72° F with 13.5 volts, at the motor leads.

OPERATION

SHIFT MOTOR/MODE SENSOR ASSEMBLY

Shifting in the transfer case occurs when a Pulse Width Modulated (PWM) voltage is supplied to the shift motor by the Drivetrain Control Module (DTCM). A linear analog position sensor located inside the shift motor, provides the DTCM with the motors' angular, rotational position. With this information, the DTCM continuously knows the motors' position, and therefore allows it to accurately control the motors' operation, including voltage polarity which is used to control motor direction.

REMOVAL

SHIFT MOTOR/MODE SENSOR ASSEMBLY

NOTE: New shift motor assemblies are shipped in the **NEUTRAL** position. If a new shift motor assembly must be installed, it will be necessary to shift the transfer case to the **NEUTRAL** position prior to motor installation.

The Select-Trac® II is the MP3022 two-speed, on-demand, active four-wheel drive transfer case that provides optimum traction for a wide range of conditions, while maximizing driver convenience. When operating in 4WD Auto mode, this sophisticated system anticipates and prevents slip by redirecting torque as necessary, up to 100 percent to either the front or rear axle if needed.

For added traction capability when traversing steep grades, rough terrain or extremely poor traction surfaces, the transfer case includes a 4WD Low mode. This second speed gear multiplies engine torque 2.72 times and locks the clutch pack for maximum traction.

Electric shifting between 4WD AUTO and 4WD Low is effected with a console-mounted switch. A pushpin button is used to shift to Neutral mode.

The MP3022 transfer case provides the following benefits:

- Active, on-demand four-wheel drive requires no driver input.

- Instantly anticipates slip and preemptively redirects torque as needed.

- Vehicle stability under all conditions because torque is constantly being transferred.

- 4WD Low operation mode provides an advantage over vehicles equipped with a single-speed all-wheel drive transfer case.

- Electric shifting between 4WD Auto and 4WD Low provides smooth operation and improved NVH control compared to systems with mechanical linkage.

- Enhanced traction and stability provided by the Traction Control and Electronic Stability Program (ESP) working in tandem with four-wheel-drive.

- A robust design and sealing for reliability.

- Maintenance-free.

- A neutral mode permits flat towing.

OPERATING RANGES

Transfer case operating ranges are:

Operating positions: 2WD - 4WD Auto - N - 4WD Low.

2WD = 2 wheel drive.

4WD Auto = Electronically controlled wet clutch for torque biasing.

N = Transfer case neutral for 4-wheel flat recreational towing.

4WD Low = Low range (2.72:1) part time mode.

The 4WD Low range is for off road use only. It is not for use on hard surface roads unless the road surface is wet, slippery, or covered by ice and snow.

The low range reduction gear system is operative in 4WD Low range only. This range is for extra pulling power in off road situations. Low range reduction ratio is 2.72:1.

OPERATION

TRANSFER CASE

ACTIVE TRANSFER CASE CONTROLS

Controls for the MP3022 transfer case active clutch (torque biasing device) are located in the Final Drive Control Module (FDCM) and communicated on the Controller Area Network (CAN) C bus. The FDCM monitors multiple vehicle sensors to anticipate conditions which may result in wheel slip or reduced performance and preemptively adjusts torque split to front and rear axles as needed. The FDCM also compares wheel speeds at the front and rear axles to detect wheel slippage. A complete vehicle dynamics model, or algorithm, calculates slip at each tire for given vehicle-operating conditions. When wheel slip is detected, pressure applied to the transfer case clutch pack can be increased or decreased to apply increased torque to the axle with higher traction.

TRANSFER CASE MODES

The transfer case operates in active full-time four-wheel drive (4WD AUTO) unless the driver chooses 4WD Low, 2WD or Neutral.

ELECTRIC SHIFT MECHANISM

The electronically controlled wet clutch pack uses an electric motor to actuate an internal gear train, clutch cam, and low range barrel cam. The clutch cam actuates the clutch levers that apply normal force to the multi-disc wet clutch pack. The clutch discs are alternately splined to the front and rear drive shafts. When normal force is applied to this clutch pack, torque is transferred to equalize speed differences between front and rear axles.

Transfer of torque from one wheel to the other on an axle is accomplished by using Brake Traction Control. Under the right conditions the vehicle can be driven by just one wheel.

ELECTRONIC STABILITY PROGRAM (ESP)

Standard Electronic Stability Program (ESP) works with the four-wheel drive system to enhance traction and control through three new features: Hill Descent, Hill Start Assist and Trailer Sway Control.

DIAGNOSIS AND TESTING

TRANSFER CASE - MP3022

DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
Transfer case difficult to shift or will not shift into desired range.	1) Transfer case electronically controlled shift system malfunction.	1) Verify proper operation per the appropriate diagnostic information.
	2) Insufficient or incorrect lubricant.	2) Drain and refill transfer case with the correct quantity of Mopar® ATF +4.
	3) Internal transfer case components binding, worn, or damaged.	3) Repair or replace components as necessary.
Transfer case noisy in all drive modes.	1) Insufficient or incorrect lubricant.	1) Drain and refill transfer case with the correct quantity of Mopar® ATF+4.
	2) Internal transfer case components binding, worn, or damaged.	2) Repair or replace components as necessary.
Transfer case noisy while in, or jumps out of, 4LO.	1) Transfer case not completely engaged in 4LOW position.	1) While rolling 2-3 MPH and the transmission in NEUTRAL shift the transfer case to the 4WD AUTO position, and then back into the 4LOW position.
	2) Range fork, input gear, or range sleeve damaged, inserts worn, or fork is binding on the shift rail.	2) Repair or replace components as necessary.
	3) Low range gear worn or damaged.	3) Repair or replace components as necessary.
Lubricant leaking from transfer case seals or vent.	1) Transfer case overfilled.	1) Drain lubricant to the correct level.
	2) Transfer case vent closed or restricted.	2) Clean or replace vent as necessary.
	3) Transfer case seals damaged or installed incorrectly.	3) Replace suspect seals. Inspect and replace, if necessary, the seal slinger on the output flange associated with the damaged seal.

54. Remove the tabbed thrust washer from the planetary gear.

CLEANING

TRANSFER CASE

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M™ all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

INSPECTION

INSPECTION-TRANSFER CASE

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil® thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

ASSEMBLY

TRANSFER CASE -MP3022

NOTE: If the transfer case assembly is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the Quick Learn Procedure using the Scan Tool.

1 - FILL PLUG
2 - DRAIN PLUG

7. Install the rear support cushion.
8. Install rear crossmember and skid plate, if equipped.
9. Remove transmission jack and support stand.
10. Connect front propeller shaft and install rear propeller shaft. Refer to **INSTALLATION** .
11. Install the transfer case drain plug (2). Tighten plug to 20-34 N.m (15-25 ft. lbs.)
12. Fill transfer case with correct fluid. See **STANDARD PROCEDURE**. Check transmission fluid level. Correct as necessary.
13. Install the transfer case fill plug (1). Tighten the plug to 20-34 N.m (15-25 ft. lbs.).
14. Connect the shift motor and encoder electrical connectors.
15. Lower vehicle and verify transfer case shift operation.

FLUID

STANDARD PROCEDURE

FLUID DRAIN/REFILL

The fill and drain plugs are both in the rear case.

81c5220

Fig. 166: DRAIN AND FILL PLUGS

- | |
|---------------------------------|
| 1 - FILL PLUG
2 - DRAIN PLUG |
|---------------------------------|

1. Raise vehicle. Ensure that the vehicle is level on the hoist.
2. Position drain pan under transfer case.
3. Remove fill plug (1) and drain plug (2) and drain lubricant completely.
4. Install drain plug (2). Tighten plug to 20-34 N.m (15-25 ft. lbs.).
5. Fill transfer case to bottom edge of fill plug opening with MOPAR® ATF+4
6. Install and tighten fill plug (1). Tighten plug to 20-34 N.m (15-25 ft. lbs.).
7. Lower vehicle.

SEAL-FRONT INPUT SHAFT-MP3022

REMOVAL

REMOVAL

1. Remove the transfer case from the vehicle. See **REMOVAL**.
2. Remove the front input shaft seal with a suitable pry tool or a screw mounted in a slide hammer.

INSTALLATION

INSTALLATION

NOTE: Lubricate all seals with MOPAR® ATF+4 prior to installation.

81cc61a2

|--|
| 1 - HOLDER C-3281
2 - REAR COMPANION FLANGE |
|--|

6. Using Holder C-3281 (1), install the rear companion flange (2) nut. Tighten the nut to 122-176 N.m (90-130 ft. lbs.).
7. Install the rear propeller shaft. Refer to **INSTALLATION** .
8. Check the transfer case fluid level. See **STANDARD PROCEDURE**. Correct as necessary.

SENSOR-ENCODER

DESCRIPTION

MODE SENSOR

81ca20e1

Fig. 177: MP3022 TRANSFER CASE

- 1 - SHIFT MOTOR

2 - ID TAG

3 - ENCODER

The transfer case Encoder (3) provides the Final Drive Control Module (FDCM) feedback about the position of the transfer case. The sensor consists of a linear analog position sensor that converts the motor output shaft position into a DC signal. The sensor may rotate a full 360 degrees. The FDCM must supply 5VDC (+/- 0.5v) to the sensor whenever the FDCM is not in sleep mode and monitors the shift motor position. The sensor position is monitored when the ignition is in the RUN position and for 10 seconds after the ignition is shifted to the OFF position. The sensor is mechanically linked to the shaft of the cam which allows the transfer case to shift. The mode sensor will draw less than 20 mA of current during operation.

OPERATION

MODE SENSOR

During normal vehicle operation, the DTCM monitors the mode sensor outputs at least every 2 milliseconds when the shift motor is stationary or active. The mode sensor position will be considered invalid by the DTCM if the voltage is greater than 4.75 V or if it is less than 0.25 V.

NOTE: All the parameter voltages referred to in the following information are calibrated items in the controller software and are subject to change.

The DTCM shall consider Transfer Case position based on the MODE SENSOR VOLTAGES table listed below:

MODE SENSOR VOLTAGES

TRANSFER CASE POSITION	Voltage
4WD LOW	0.25 - 0.80
NEUTRAL	1.10 - 1.25
2H	1.45 - 2.00
4WD AUTO (ACTIVE)	2.00 - 4.75

REMOVAL

REMOVAL

81c8d63c

Fig. 178: ENCODER
Courtesy of CHRYSLER LLC

1. Remove the wiring harness electrical connector from the encoder.
2. Remove the screws securing the encoder to the rear transfer case housing.
3. Remove the encoder from the transfer case.

81c8d644

Fig. 179: ENCODER O-RING
Courtesy of CHRYSLER LLC

4. Remove the o-ring seal from the encoder.

INSTALLATION

INSTALLATION

81c8d644

Fig. 180: ENCODER O-RING
Courtesy of CHRYSLER LLC

1. Install a **NEW** o-ring seal onto the encoder.

81c8d63c

Fig. 181: ENCODER
Courtesy of CHRYSLER LLC

NOTE: Before installing the encoder onto the transfer case, be certain to align the encoder shaft to the shift shaft and the dowel on the encoder to the hole in the case accordingly.

2. Install the encoder onto the rear transfer case housing.
3. Install the encoder screws. Tighten the screws to 5-8 N.m (44-71 in. lbs.).
4. Install the electrical wiring harness connector onto the encoder.

ASSEMBLY-SHIFT MOTOR

DESCRIPTION

SHIFT MOTOR/MODE SENSOR ASSEMBLY

81ca20e1

Fig. 182: MP3022 TRANSFER CASE
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - SHIFT MOTOR
2 - ID TAG
3 - ENCODER |
|--|

The shift motor (1) is an electromechanical device consisting of a DC permanent magnet motor and a position holding brake. The shift motors' overall function is to move and lock a gear that moves the range fork and clutch lever found in the transfer case. This allows the transfer case to be shifted electrically to multiple operating positions (4WD AUTO, 4WD LOW and 2WD). The operating current of the shift motor under stall conditions is 30 amps maximum at 72° F with 13.5 volts, at the motor leads.

OPERATION

OPERATION-SHIFT MOTOR

81ca20e1

Fig. 183: MP3022 TRANSFER CASE
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - SHIFT MOTOR
2 - ID TAG
3 - ENCODER |
|--|

Shifting in the transfer case occurs when a Pulse Width Modulated (PWM) voltage is supplied to the shift motor (1) by the Final Drive Control Module (FDCM). A linear analog position sensor (Encoder) (3) located on the rear transfer case housing, provides the FDCM with the motors' angular, rotational position. With this information, the FDCM continuously knows the motors' position, and therefore allows it to accurately control the motors' operation, including voltage polarity which is used to control motor direction.

The electronically controlled wet clutch pack uses an electric motor to actuate an internal gear train, clutch cam, and low range barrel cam. The clutch cam actuates the clutch levers that apply normal force to the multi-disc wet clutch pack. The clutch disks are alternately splined to the front and rear outputs. When normal force is applied to this clutch pack, torque is transferred to equalize speed differences between front and rear axles.

REMOVAL

REMOVAL-SHIFT MOTOR

NOTE: New shift motor assemblies are shipped in the **NEUTRAL** position. If a new shift motor assembly must be installed, it will be necessary to shift the transfer case to the **NEUTRAL** position prior to motor installation.

81c8d717

Fig. 184: SHIFT MOTOR
Courtesy of CHRYSLER LLC

1. Disengage the wiring harness electrical connector from the shift motor.
2. Remove the bolts holding the shift motor onto the transfer case.
3. Remove the shift motor from the transfer case.

81c8d71b

Fig. 185: SHIFT MOTOR O-RING
Courtesy of CHRYSLER LLC

4. Remove the o-ring seal from the shift motor.

INSTALLATION

INSTALLATION-SHIFT MOTOR

81c8d7fb

Fig. 186: SHIFT MOTOR O-RING
Courtesy of CHRYSLER LLC

1. Install a **NEW** shift motor o-ring seal onto the shift motor.

81c8d7f7

Fig. 187: SHIFT MOTOR
Courtesy of CHRYSLER LLC

NOTE: Before installing the shift motor onto the transfer case, make certain that the shift motor shaft aligns with the transfer case worm shaft accordingly.

2. Install the shift motor onto the transfer case.
3. Install the shift motor bolts. Tighten the shift motor bolts to 13 N.m (9 ft. lbs.).
4. Install the electrical wiring harness connector onto the shift motor.

SWITCH-TRANSFER CASE SELECTOR

DESCRIPTION

TRANSFER CASE SELECTOR SWITCH

81cb396a

Fig. 188: MP3022 TRANSFER CASE SWITCH
Courtesy of CHRYSLER LLC

- | |
|---|
| <p>1 - 4WD LOW POSITION
2 - 4WD AUTO POSITION
3 - 2WD POSITION
4 - NEUTRAL POSITION</p> |
|---|

Electric shifting between 4WD Auto and 4WD Low is accomplished with a console-mounted switch. A pushpin button is used to shift to Neutral mode.

VEHICLE THEFT SECURITY - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B1A20-PRE-ARM TIMEOUT

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

During the VTSS pre-arm process.

Set Conditions

- Set Condition:**

If the VTSS pre-arm sequence is interrupted within 16 seconds after securing the vehicle.

Possible Causes

Possible Causes
INTERMITTENT PROBLEM WITH FUSED (B+) TO CLUSTER
INTERMITTENT PROBLEM WITH CAN INTERIOR BUS CIRCUITS TO CLUSTER

Diagnostic Test

1. DETERMINING IF DTC IS CURRENT

NOTE: **Diagnose any related Communication DTC(s) before continuing.**

With a scan tool, read and record DTC(s).

With the scan tool, clear DTC(s).

Turn the ignition off and remove the key from the ignition.

Lock and close all doors to allow the VTSS to go from pre-arm to armed status and wait one minute.

Disarm the VTSS.

Using the scan tool, read ITM DTC(s).

Does the DTC reset?

Yes

Remove the Cluster and inspect the Fused B (+) and both CAN INTERIOR BUS circuits for spread terminals, corrosion or intermittent opens.

Perform **BODY VERIFICATION TEST - VER 1** .

No

DTC is not active at this time. Test complete.

Perform **BODY VERIFICATION TEST - VER 1** .

B1A24-KEY NOT PROGRAMMED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Possible Causes

Possible Causes
KEY NOT PROGRAMMED
SENTRY KEY REMOTE ENTRY MODULE (SKREEM)

Diagnostic Test

- PROGRAM ALL OF THE IGNITION KEYS**

Turn the ignition on.

With the scan tool, attempt to program the key(s) into the SKREEM.

Was the programming of the key(s) successful?

Yes

Perform **SKREEM/SKIM VERIFICATION TEST**.

No

Replace the ignition key and attempt to program it into the SKREEM. If the DTC resets, replace and program the Sentry Key Remote Entry Module (SKREEM) in accordance with the Service Information.

NOTE: **If this vehicle is equipped with a Steering Column Lock Module, it must be replaced along with the SKREEM.**

Perform **SKREEM/SKIM VERIFICATION TEST**.

B1A25-INVALID KEY

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

At ignition on and during Key Programming Mode.

Set Conditions

• **Set Condition:**

When the Sentry Key Remote Entry Module (SKREEM) does not receive a transponder response after 8 consecutive transponder read attempts within 2.0 seconds. When the key that is being used is programmed for a different vehicle.

Possible Causes

Possible Causes
KEY THAT HAS BEEN PREVIOUSLY PROGRAMMED FOR ANOTHER VEHICLE
MULTIPLE KEY OPERATION
IGNITION KEY

SENTRY KEY REMOTE ENTRY MODULE (SKREEM) INTERMITTENT WIRING HARNESS PROBLEM

Diagnostic Test

1. DETERMINING IF DTC IS CURRENT

NOTE: Verify the key being used is the proper key for this vehicle and a blank key. If the key being programmed is not blank (one that has been programmed for another vehicle) this fault will set.

With the scan tool, read and record the SKREEM DTCs.

With the scan tool, erase the SKREEM DTCs

NOTE: Perform the following test several times to ensure the DTC is current.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM DTCs.

Does the scan tool display the DTC that was previously erased?

Yes

Go To 2.

No

Go To 6.

2. CHECKING FOR MULTIPLE KEYS

Are there multiple vehicle ignition keys available?

Yes

Go To 3.

No

Go To 4.

3. MULTIPLE KEY OPERATION

NOTE: Perform the following steps using one of the vehicle ignition keys. When finished, repeat the procedure using each of the other vehicle keys, one at a time.

With the scan tool, erase the SKREEM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on

With the scan tool, read the SKREEM DTCs.

Is the DTC present for all ignition keys?

Yes

Replace and program the Sentry Key Remote Entry Module in accordance with the Service Information.

Perform **SKREEM/SKIM VERIFICATION TEST**.

No

Replace the ignition key(s) that cause the SKIM DTC.

Perform **SKREEM/SKIM VERIFICATION TEST**.

4. REPROGRAM KEY

With the scan tool, attempt to reprogram the ignition key to the SKREEM.

With the scan tool, erase the SKREEM DTCs.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM DTCs.

Does the DTC set again?

Yes

Go To 5.

No

Test complete.

5. **PROGRAM NEW IGNITION KEY**

Replace the ignition key with a new key.

With the scan tool, program the new ignition key to the SKREEM.

With the scan tool, erase the SKREEM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM DTCs.

Does the DTC set again?

Yes

Replace and program the Sentry Key Remote Entry Module in accordance with the Service Information.

Perform **SKREEM/SKIM VERIFICATION TEST**.

No

Test complete.

6. **INTERMITTENT WIRING HARNESS PROBLEM**

Turn the ignition off.

NOTE: Check the following items:

- Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
- Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
- Refer to any Technical Service Bulletins (TSB) that may apply.

Were any problems found?

Yes

Repair wiring harness/connectors as necessary.

Perform **SKREEM/SKIM VERIFICATION TEST**.

No

Test Complete.

B1A26-MAXIMUM NUMBER OF KEYS PROGRAMMED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- Set Condition:**

When the maximum number of keys (8) have been programmed into the Sentry Key Remote Entry Module (SKREEM).

Possible Causes

Possible Causes
MAXIMUM AMOUNT OF KEY PROGRAMMED INTO SKREEM SENTRY KEY REMOTE ENTRY MODULE (SKREEM)

Diagnostic Test

1. REPROGRAM ALL IGNITION KEYS

- NOTE:**

This procedure will clear all the key information from the SKREEM. It is important to obtain all of the customer's ignition keys so they may be reprogrammed into the module.
- NOTE:**

If the total number of keys already programmed is equal to Eight and another Key is trying to be programmed, this fault is valid. Explain to the customer no more Keys are allowed to be programmed.

Turn the ignition on.

With the scan tool, clear all the key information in the SKREEM.

Program the all of the customer keys into the SKREEM (maximum eight).

Did the "Maximum Number of Keys Programmed" display again?

Yes

Replace and program the Sentry Key Remote Entry Module (SKREEM) in accordance with the Service Information.

NOTE: **If this vehicle is equipped with a Steering Column Lock Module it must be replaced along with the SKREEM.**

Perform **SKREEM/SKIM VERIFICATION TEST**.

No

Programming of the keys was successful. Test complete.

Perform **SKREEM/SKIM VERIFICATION TEST**.

B1A27-SKREEM PROGRAMMING PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Possible Causes

Possible Causes
SENTRY KEY REMOTE ENTRY MODULE (SKREEM)

Diagnostic Test

1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

NOTE: **Before continuing, review and check for the following:**

- **Review the repair history of the vehicle.**
- **Ensure that the vehicle has the correct PCM and SKREEM installed**

by verifying the part numbers.

- **With the scan tool, ensure that the PCM and SKREEM are programmed correctly. Compare the PCM VIN to the SKREEM VIN and ensure the two VINs match.**

With the scan tool, clear DTCs.

Perform 5 ignition cycles, leaving the ignition switch on for a minimum of 90 seconds per cycle.

With the scan tool, read DTCs.

Does the DTC reset?

Yes

Replace and program the Sentry Key Remote Entry Module (SKREEM) in accordance with the Service Information.

NOTE: **If this vehicle is equipped with a Steering Column Lock Module, it must be replaced along with the SKREEM.**

Perform **SKREEM/SKIM VERIFICATION TEST**.

No

The DTC is not active at this time. Test complete.

B1A28-ECM MISMATCH WITH SKIM

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

At ignition on, after ignition on during any rolling code handshake that occurs with the PCM due to a SKIM or PCM reset.

Set Conditions

- **Set Condition:**

When a PCM/ECM STATUS message with a Valid Key status is not received by the SKIM within 3.5 seconds of transmitting the last Valid Key Code message to the PCM/ECM.

Possible Causes

Possible Causes
VERIFYING PCM VIN INTERMITTENT WIRING HARNESS PROBLEM PCM

Diagnostic Test

1. DETERMINING IF DTC IS CURRENT

With the scan tool, erase the SKREEM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on and wait 2 minutes.

With the scan tool, read the SKREEM DTCs.

Does the scan tool display the DTC that was previously erased?

Yes

Go To 2.

No

Go To 4.

2. VERIFYING THE PCM VIN

Turn the ignition on.

With the scan tool, select Engine system from the main menu.

Display and record the Vehicle Identification Number.

NOTE: Ensure that a VIN has been programmed into the PCM. If a VIN is not displayed, attempt to program the PCM with the correct VIN before continuing.

Does the VIN recorded from the PCM match the VIN of the vehicle?

Yes

Go To 3.

No

Using the scan tool perform the PCM Replace procedure to update the VIN in the PCM.

Perform **SKREEM/SKIM VERIFICATION TEST**.

3. **REPLACE SKREEM AND CHECK DTC'S**

Turn the ignition off.

Replace and program the Sentry Key Remote Entry Module (SKREEM) in accordance with the Service Information.

Turn the ignition on.

With the scan tool, display and clear all PCM and SKREEM DTC's.

Perform 5 ignition key cycles leaving the ignition key on for 90 seconds per cycle.

With the scan tool, check for SKREEM DTCs.

Does the scan tool display the same DTC?

Yes

Replace and program the Powertrain Control Module in accordance with the Service Information.

Perform **SKREEM/SKIM VERIFICATION TEST**.

No

The repair is complete.

Perform **SKREEM/SKIM VERIFICATION TEST**.

4. **INTERMITTENT**

Turn the ignition off.

NOTE: Check for the following conditions:

- Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
- Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
- Refer to any Technical Service Bulletins (TSB) that may apply.

Were any problems found?

Yes

Repair wiring harness/connectors as necessary.
Perform **SKREEM/SKIM VERIFICATION TEST**.

No

Test Complete.

B1A29-SKIM BASESTATION MISMATCH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

At ignition on, after ignition on during any rolling code handshake that occurs with the PCM due to a SKIM/SKREEM or PCM reset.

Set Conditions

- **Set Condition:**

When a PCM STATUS message with a Valid Key status is not received by the SKIM within 3.5 seconds of transmitting the last Valid Key Code message to the PCM.

Possible Causes

Possible Causes
VERIFYING PCM VIN INTERMITTENT WIRING HARNESS PROBLEM PCM

Diagnostic Test

1. DETERMINING IF DTC IS CURRENT

With the scan tool, erase the SKREEM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on and wait 2 minutes.

With the scan tool, read the SKREEM DTCs.

Does the scan tool display the DTC that was previously erased?

Yes

Go To 2.

No

Go To 4.

2. VERIFYING THE PCM VIN

Turn the ignition on.

With the scan tool, select Engine system from the main menu.

Display and record the Vehicle Identification Number.

NOTE: **Ensure that a VIN has been programmed into the PCM. If a VIN is not displayed, attempt to program the PCM with the correct VIN before continuing.**

Does the VIN recorded from the PCM match the VIN of the vehicle?

Yes

Go To 3.

No

Using the scan tool perform the PCM Replace procedure to update the VIN in the PCM.

Perform **SKREEM/SKIM VERIFICATION TEST**.

3. REPLACE SKREEM AND CHECK DTCS

Turn the ignition off.

Replace and program the Sentry Key Remote Entry Module in accordance with the Service Information.

Turn the ignition on.

With the scan tool, display and clear all PCM and SKREEM DTCs.

Perform 5 ignition key cycles leaving the ignition key on for 90 seconds per cycle.

With the scan tool, check for SKREEM DTCs.

Does the scan tool display the same DTC?

Yes

Using the scan tool perform the PCM Replace procedure to update the VIN in the PCM.
Perform **SKREEM/SKIM VERIFICATION TEST**.

No

The repair is complete.
Perform **SKREEM/SKIM VERIFICATION TEST**.

4. INTERMITTENT

Turn the ignition off.

NOTE: Check for the following conditions:

- Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
- Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
- Refer to any Technical Service Bulletins (TSB) that may apply.

Were any problems found?

Yes

Repair wiring harness/connectors as necessary.
Perform **SKREEM/SKIM VERIFICATION TEST**.

No

Test Complete.

B1A37-SECURITY TRANSMITTER SENSOR CIRCUIT LOW

Circuit Schematic

01929000

Fig. 1: Intrusion Transmitter Sensor Signal Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

When the VTSS is armed.

Set Conditions

- **Set Condition:**

If the current flow on the sensor signal circuit is above a specified range this DTC will set.

Possible Causes

Possible Causes
(A645) INTRUSION TRANSMITTER SENSOR SIGNAL CIRCUIT SHORTED TO GROUND INTRUSION SENSOR TRANSMITTER INTRUSION TRANSCEIVER MODULE

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's.

Turn the ignition off and remove the key from the ignition.

Close all doors and arm the VTSS and wait two minutes.

Disarm the VTSS turn the ignition on.

Turn the ignition on and with the scan tool, read DTC's.

Does the scan tool display B1A37-SECURITY TRANSMITTER SENSOR CIRCUIT LOW ?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **INTRUSION SENSOR TRANSMITTER**

**TRANSMITTER-
INTRUSION
SENSOR
(VTSS)**

815f27f2

Fig. 2: Checking Intrusion Sensor Transmitter Input
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Intrusion Sensor Transmitter connector.

Turn the ignition on and with the scan tool, erase DTC's.

Turn the ignition off and remove the key from the ignition.

Close all doors and arm the VTSS and wait two minutes.

Disarm the VTSS turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display B1A41-SECURITY TRANSMITTER SENSOR CIRCUIT OPEN?

Yes

Replace the Intrusion Sensor Transmitter.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK THE (A645) INTRUSION TRANSMITTER SENSOR SIGNAL CIRCUIT SHORT TO GROUND

81b4a481

Fig. 3: Measuring Resistance Between Ground And (A645) Intrusion Transmitter Sensor Signal Circuit At Intrusion Transceiver Module Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Intrusion Transceiver Module connector.

Measure the resistance between ground and the (A645) Intrusion Transmitter Sensor Signal circuit at the Intrusion Transceiver Module connector.

Is the resistance below 5.0 ohms?

Yes

Repair the (A645) Intrusion Transmitter Sensor Signal circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Intrusion Transceiver Module in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1A38-SECURITY TRANSMITTER SENSOR CIRCUIT HIGH

Circuit Schematic

01929000

Fig. 4: Intrusion Transmitter Sensor Signal Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

When the VTSS is armed.

Set Conditions

- **Set Condition:**

If the current flow on the sensor signal circuit is above a specified range this DTC will set.

Possible Causes

Possible Causes
(A645) INTRUSION TRANSMITTER SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE INTRUSION TRANSCEIVER MODULE

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's.

Turn the ignition off and remove the key from the ignition.

Close all doors and arm the VTSS and wait two minutes.

Disarm the VTSS turn the ignition on.

Turn the ignition on and with the scan tool, read DTC's.

Does the scan tool display B1A38-SECURITY TRANSMITTER SENSOR CIRCUIT HIGH ?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK THE (A645) INTRUSION TRANSMITTER SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE**

81b4e75b

Fig. 5: Measuring For Voltage Between Chassis Ground And (A645) Intrusion Transmitter Sensor Signal Circuit At Intrusion Transceiver Module Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Intrusion Sensor Transmitter connector

Disconnect the Intrusion Transceiver Module connector.

Turn the ignition on.

Measure for voltage between chassis ground and the (A645) Intrusion Transmitter Sensor Signal circuit at the Intrusion Transceiver Module connector.

Is there any voltage present?

Yes

Repair the (A645) Intrusion Transmitter Sensor Signal circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Intrusion Transceiver Module in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1A3A-SECURITY RECEIVER SENSOR CIRCUIT LOW

Circuit Schematic

Fig. 6: Intrusion Receiver Sensor Signal Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

When the VTSS is armed.

Set Conditions

• **Set Condition:**

If the current flow on the sensor signal circuit is above a specified range this DTC will set.

Possible Causes

Possible Causes
(G460) INTRUSION RECEIVER SENSOR SIGNAL CIRCUIT SHORTED TO GROUND INTRUSION SENSOR RECEIVER INTRUSION TRANSCEIVER MODULE

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's.

Turn the ignition off and remove the key from the ignition.

Close all doors and arm the VTSS and wait two minutes.

Disarm the VTSS turn the ignition on.

Turn the ignition on and with the scan tool, read DTC's.

Does the scan tool display B1A3A-SECURITY RECEIVER SENSOR CIRCUIT LOW ?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. INTRUSION SENSOR RECEIVER

**RECEIVER-
INTRUSION
SENSOR
(VTSS)**

815f21f1

Fig. 7: Checking Sensor Receiver Input
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Intrusion Sensor Receiver connector.

Turn the ignition on and with the scan tool, erase DTC's.

Turn the ignition off and remove the key from the ignition.

Close all doors and arm the VTSS and wait two minutes.

Disarm the VTSS turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display B1A44-SECURITY RECEIVER SENSOR CIRCUIT OPEN?

Yes

Replace the Intrusion Sensor Receiver.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK THE (G460) INTRUSION RECEIVER SENSOR SIGNAL CIRCUIT SHORT TO GROUND**

MODULE-
INTRUSION
TRANSCIEVER
(VTSS)

81b544fc

Fig. 8: Measuring Resistance Between Ground And (G460) Intrusion Receiver Sensor Signal Circuit At Intrusion Transceiver Module Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Intrusion Transceiver Module connector.

Measure the resistance between ground and the (G460) Intrusion Receiver Sensor Signal circuit at the Intrusion Transceiver Module connector.

Is the resistance below 5.0 ohms?

Yes

Repair the (G460) Intrusion Receiver Sensor Signal circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Intrusion Transceiver Module in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1A3B-SECURITY RECEIVER SENSOR CIRCUIT HIGH

Circuit Schematic

01344096

Fig. 9: Intrusion Receiver Sensor Signal Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

When the VTSS is armed.

Set Conditions

- **Set Condition:**

If the current flow on the sensor signal circuit is above a specified range this DTC will set.

Possible Causes

Possible Causes
(G460) INTRUSION RECEIVER SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE INTRUSION TRANSCIEVER MODULE

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's.

Turn the ignition off and remove the key from the ignition.

Close all doors and arm the VTSS and wait two minutes.

Disarm the VTSS turn the ignition on.

Turn the ignition on and with the scan tool, read DTC's.

Does the scan tool display B1A3B-SECURITY RECEIVER SENSOR CIRCUIT HIGH ?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK THE (G460) INTRUSION RECEIVER SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE**

81b55694

Fig. 10: Measuring For Voltage Between Chassis Ground And (G460) Intrusion Receiver Sensor Signal Circuit At Intrusion Transceiver Module Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Intrusion Sensor Receiver connector.

Disconnect the Intrusion Transceiver Module connector.

Measure for voltage between chassis ground and the (G460) Intrusion Receiver Sensor Signal circuit at the Intrusion Transceiver Module connector.

Is there any voltage present?

Yes

Repair the (G460) Intrusion Receiver Sensor Signal circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Intrusion Transceiver Module in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

Circuit Schematic

Fig. 11: Siren Signal Control Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

81658799

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously with the engine over 600 RPM.

Set Conditions

- **Set Condition:**

When the internal battery within the siren does not charge as expected, the ITM sets this code.

Possible Causes

Possible Causes
VEHICLE STORED WITH NO BATTERY VOLTAGE FOR EXTENDED PERIOD OF TIME SIREN

Diagnostic Test

1. **DETERMINING IF DTC IS CURRENT**

With a scan tool, read and record DTC(s).

With the scan tool, clear DTC(s).

Start the engine and allow it to idle for 2 minutes then turn the engine off.

Using the scan tool, read DTC(s).

Does the DTC reset?

Yes

Go To 2.

No

DTC is not active at this time. Test complete.

2. **VEHICLE STORED WITH NO BATTERY VOLTAGE FOR EXTENDED PERIOD OF TIME**

NOTE: If the vehicle was allowed to sit with no battery voltage for an extended period of time the back up battery located in the siren may discharge and need to be recharged.

Was the vehicle battery power just restored after the vehicle was stored with no power for an extended period of time?

Yes

Allow the vehicle to sit with a fully charged battery for two hours then restart this procedure.

No

Replace the Siren the in accordance with the Service Information. Refer to **STANDARD PROCEDURE** .

B1A3D-SIREN BATTERY / LOSS OF POWER SUPPLY

Circuit Schematic

011556700

Fig. 12: Siren Signal Control Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously with the VTSS armed.

Set Conditions

- **Set Condition:**

If the ITM detects incorrect voltage at the siren this code will set.

Possible Causes

Possible Causes
HARNESS TAMPERING / INTERMITTENT CONDITION (A100) FUSED B(+) CIRCUIT (Z908) GROUND OPEN SIREN

Diagnostic Test

1. **INSPECT SIREN HARNESS**

Inspect the wiring harness to the siren for any signs of tampering or intermittent condition.

Were there any problems found?

Yes

Repair wiring as necessary.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 2.

2. **DETERMINING IF DTC IS CURRENT**

With a scan tool, read and record DTC(s).

With the scan tool, clear DTC(s).

Turn the ignition off and remove the key from the ignition.

Lock and close all doors to allow the VTSS to go from pre-arm to armed status and wait one minute.

Disarm the VTSS.

Using the scan tool, read DTC(s).

Does the DTC reset?

Yes

Go To 3.

No

DTC is not active at this time. Test complete.

Perform **BODY VERIFICATION TEST - VER 1** .

3. CHECK THE (A100) FUSED B(+) CIRCUIT AT THE SIREN

81b5710d

Fig. 13: Using 12-Volt Test Light Connected To Ground To Check (A100) Fused B(+) Circuit At Siren Connector

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Siren connector.

Using a 12-volt test light connected to ground, check the (A100) Fused B(+) circuit at the siren connector.

Does the test light illuminate brightly?

Yes

Go To 4.

No

Repair the (A100) Fused B(+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. CHECK THE (Z908) GROUND CIRCUIT AT THE SIREN

81b57129

Fig. 14: Using 12-Volt Test Light Connected To 12-Volts To Check (Z908) Ground Circuit At Siren Connector

Courtesy of CHRYSLER LLC

Using a 12-volt test light connected to 12-volts, check the (Z908) Ground circuit at the siren connector.

Does the test light illuminate brightly?

Yes

Replace the Siren in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (Z908) Ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

B1A3E-SIREN/ITM MISMATCH

Circuit Schematic

Fig. 15: Siren Signal Control Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

While the VTSS is armed.

Set Conditions

- **Set Condition:**

When the learned Siren information stored in the ITM does not match.

Possible Causes

Possible Causes
SIREN

Diagnostic Test

1. **DETERMINING IF DTC IS CURRENT**

NOTE: **Diagnose any related Communication DTC(s) before continuing.**

With a scan tool, read and record DTC(s).

With the scan tool, clear DTC(s).

Turn the ignition off and remove the key from the ignition.

Lock and close all doors to allow the VTSS to go from pre-arm to armed status and wait one minute.

Disarm the VTSS.

Using the scan tool, read DTC(s).

Does the DTC reset?

Yes

Inspect wiring from ITM to Siren for an intermittent open condition. Check connector terminals for back out, corrosion or loose terminal contact. If OK, Replace the Siren.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go to 2.

2. INTERMITTENT CONDITION

NOTE: Check for any of the follow conditions:

- Poor wire to terminal connection
- Corroded terminals
- Backed out or loose terminals
- Broken wire internal to the insulation

Were there any problems found?

Yes

Repair the wiring as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

No

DTC is not active at this time. Test complete.

B1A3F-ITM ARMING SEQUENCE PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

During the VTSS pre-arm process.

Set Conditions

- **Set Condition:**

ITM arming process did not complete in a predetermined amount time.

Possible Causes

Possible Causes
INTERMITTENT CAN INTERIOR BUS COMMUNICATION SOFTWARE UPDATE FOR ITM OR TIPM

Diagnostic Test

1. DETERMINING IF DTC IS CURRENT

NOTE: Diagnose any related Communication DTC(s) before continuing.

With a scan tool, read and record DTC(s).

With the scan tool, clear DTC(s).

Turn the ignition off and remove the key from the ignition.

Lock and close all doors to allow the VTSS to go from pre-arm to armed status and wait one minute.

Disarm the VTSS.

Using the scan tool, read ITM DTC(s).

Does the DTC reset?

Yes

Check for and correct any CAN INTERIOR Bus DTC's set in the ITM or the TIPM. Also check for related software updates for the ITM and/or TIPM.

Perform **BODY VERIFICATION TEST - VER 1** .

No

DTC is not active at this time. Test complete.

Perform **BODY VERIFICATION TEST - VER 1** .

B1A41-SECURITY TRANSMITTER SENSOR CIRCUIT OPEN

Circuit Schematic

01939000

Fig. 16: Intrusion Transmitter Sensor Signal Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

When the VTSS is armed.

Set Conditions

- **Set Condition:**

If the voltage current is below a specified range this DTC will set.

Possible Causes

Possible Causes
(A645) INTRUSION TRANSMITTER SENSOR SIGNAL CIRCUIT OPEN (G945) SENSOR GROUND CIRCUIT OPEN INTRUSION SENSOR TRANSMITTER OPEN/MISSING INTRUSION TRANSCEIVER MODULE

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's.

Turn the ignition off and remove the key from the ignition.

Close all doors and arm the VTSS and wait one minute.

Disarm the VTSS turn the ignition on and wait one minute.

With the scan tool, read DTC's.

Does the scan tool display B1A41-SECURITY TRANSMITTER SENSOR CIRCUIT OPEN?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE (A645) INTRUSION TRANSMITTER SENSOR SIGNAL CIRCUIT VOLTAGE

Fig. 17: Measuring Voltage Between (A645) Intrusion Sensor Signal Circuit And (G945) Sensor Ground Circuit
Courtesy of CHRYSLER LLC

Disconnect the Intrusion Sensor Transmitter connector.

NOTE: Check connectors - Clean/repair as necessary.

Turn the ignition on.

With the scan tool actuate the Intrusion Sensor Transmitter.

Measure the voltage between (A645) Intrusion Sensor Signal circuit and (G945) Sensor Ground circuit.

Is the voltage above 10.0 volts

Yes

Go To 3.

No

Go To 4.

3. CHECK THE INTRUSION SENSOR TRANSMITTER

Turn the ignition off.

Install a known good Intrusion Sensor Transmitter.

Turn the ignition on.

With the scan tool erase DTC's.

Turn the ignition off and remove the key from the ignition.

Close all doors and arm the VTSS and wait one minute.

Disarm the VTSS turn the ignition on and wait one minute.

With the scan tool, read DTC's.

Does the scan tool display B1A41-SECURITY TRANSMITTER SENSOR CIRCUIT OPEN?

Yes

Replace the Intrusion Transceiver Module in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the original Intrusion Sensor Transmitter.

Perform **BODY VERIFICATION TEST - VER 1** .

4. CHECK THE (A645) INTRUSION TRANSMITTER SENSOR SIGNAL WIRE

Fig. 18: Measuring Resistance Of (A645) Intrusion Transmitter Sensor Signal Circuit Between Intrusion Sensor Transmitter Connector And Intrusion Transceiver Module Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Intrusion Transceiver Module connector.

Measure the resistance of the (A645) Intrusion Transmitter Sensor Signal circuit between the Intrusion Sensor Transmitter connector and the Intrusion Transceiver Module connector.

Is the resistance below 5.0 ohms?

Yes

Repair the (A645) Intrusion Transmitter Sensor Signal circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 5.

5. **CHECK THE (G945) SENSOR GROUND WIRE FOR AN OPEN**

Fig. 19: Measuring Resistance Of (G945) Sensor Ground Circuit From Intrusion Sensor Transmitter Connector To Intrusion Transceiver Module Connector
Courtesy of CHRYSLER LLC

Ensure Ignition off.

Measure the resistance of the (G945) Sensor Ground circuit from the Intrusion Sensor Transmitter connector to the Intrusion Transceiver Module connector.

Is the resistance below 5.0 ohms?

Yes

Replace the Intrusion Transceiver Module in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (G945) Sensor Ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

B1A42-SECURITY TRANSMITTER SENSOR CIRCUIT SHORTED TOGETHER

Circuit Schematic

01929000

Fig. 20: Intrusion Transmitter Sensor Signal Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

During the VTSS pre-arm process.

Set Conditions

- **Set Condition:**

If the voltage current is below a specified range this DTC will set.

Possible Causes

Possible Causes
INTRUSION SENSOR TRANSMITTER (A645) INTRUSION TRANSMITTER SENSOR SIGNAL SHORTED TO (G945) SENSOR GROUND INTRUSION TRANSCEIVER MODULE

Diagnostic Test

1. **DETERMINING IF DTC IS CURRENT**

NOTE: **Diagnose any related Communication DTC(s) before continuing.**

With a scan tool, read and record DTC(s).

With the scan tool, clear DTC(s).

Turn the ignition off and remove the key from the ignition.

Lock and close all doors to allow the VTSS to go from pre-arm to armed status and wait one minute.

Disarm the VTSS.

Using the scan tool, read DTC(s).

Does the DTC reset?

Yes

Go To 2.

No

DTC is not active at this time. Test complete.
Perform **BODY VERIFICATION TEST - VER 1** .

2. INTRUSION SENSOR TRANSMITTER

Disconnect the Intrusion Sensor Transmitter connector.

NOTE: **Check connectors - Clean/repair as necessary.**

Connect a known good Intrusion Sensor Transmitter.

Turn the ignition on.

With the scan tool, clear DTC(s).

Turn the ignition off and remove the key from the ignition.

Lock and close all doors to allow the VTSS to go from pre-arm to armed status and wait one minute.

Disarm the VTSS.

Using the scan tool, read DTC(s).

Does the DTC reset?

Yes

Go To 3.

No

Replace the original Intrusion Sensor Transmitter.

Perform **BODY VERIFICATION TEST - VER 1** .

3. CHECK THE (A645) INTRUSION TRANSMITTER SENSOR SIGNAL WIRE FOR A SHORT TO (G945) SENSOR GROUND

**TRANSMITTER-
INTRUSION
SENSOR
(VTSS)**

815f6290

Fig. 21: Measuring Resistance Between (A645) Intrusion Transmitter Sensor Signal Circuit To (G945) Sensor Ground Circuit In Intrusion Sensor Transmitter Connector

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Intrusion Sensor Transceiver connector.

Disconnect the Intrusion Transceiver Module connector.

Measure the resistance between the (A645) Intrusion Transmitter Sensor Signal circuit to the (G945) Sensor Ground circuit in the Intrusion Sensor Transmitter connector.

Is the resistance below 5.0 ohms?

Yes

Repair the (A645) Intrusion Transmitter Sensor Signal circuit for a short to the (G945) Sensor Ground circuit.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Intrusion Transceiver Module in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1A43-SECURITY TRANSMITTER SENSOR RETURN CIRCUIT LOW

Circuit Schematic

01929000

Fig. 22: Intrusion Transmitter Sensor Signal Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

During the VTSS pre-arm process.

Set Conditions

- **Set Condition:**

The Intrusion Transceiver Module detects a short to ground condition on the sensor ground circuit.

Possible Causes

Possible Causes
INTRUSION SENSOR TRANSMITTER (G945) SENSOR GROUND CIRCUIT SHORTED TO GROUND
INTRUSION TRANSCEIVER MODULE

Diagnostic Test

1. **DETERMINING IF DTC IS CURRENT**

NOTE: **Diagnose any related Communication DTC(s) before continuing.**

With a scan tool, read and record DTC(s).

With the scan tool, clear DTC(s).

Turn the ignition off and remove the key from the ignition.

Lock and close all doors to allow the VTSS to go from pre-arm to armed status and wait one minute.

Disarm the VTSS.

Using the scan tool, read DTC(s).

Does the DTC reset?

Yes

Go To 2.

Perform **BODY VERIFICATION TEST - VER 1** .

No

DTC is not active at this time. Test complete.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK THE (G945) SENSOR GROUND CIRCUIT SHORTED TO GROUND**

**TRANSMITTER-
INTRUSION
SENSOR
(VTSS)**

815f66fb

Fig. 23: Measuring Resistance Between Ground And (G945) Sensor Ground Circuit At Intrusion Sensor Transmitter Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Intrusion Sensor Transmitter connector.

Disconnect the Intrusion Transceiver Module connector.

Measure the resistance between ground and the (G945) Sensor Ground circuit at the Intrusion Sensor Transmitter connector.

Is the resistance below 5.0 ohms?

Yes

Repair the (G945) Sensor Ground circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Intrusion Transceiver Module in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1A44-SECURITY RECEIVER SENSOR CIRCUIT OPEN

Circuit Schematic

01344096

Fig. 24: Intrusion Receiver Sensor Signal Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

When the VTSS is armed.

Set Conditions

- **Set Condition:**

If the voltage current is below a specified range this DTC will set.

Possible Causes

Possible Causes
(G460) INTRUSION RECEIVER SENSOR SIGNAL CIRCUIT OPEN
(G946) SENSOR GROUND CIRCUIT OPEN
INTRUSION SENSOR RECEIVER OPEN/MISSING
INTRUSION TRANSCEIVER MODULE

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's.

Turn the ignition off and remove the key from the ignition.

Close all doors and arm the VTSS and wait one minute.

Disarm the VTSS turn the ignition on and wait one minute.

With the scan tool, read DTC's.

Does the scan tool display B1A44-SECURITY RECEIVER SENSOR CIRCUIT OPEN?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE (G460) INTRUSION RECEIVER SENSOR SIGNAL CIRCUIT VOLTAGE

Fig. 25: Measuring Voltage Between (G460) Intrusion Receiver Sensor Signal Circuit And (G946) Sensor Ground Circuit
Courtesy of CHRYSLER LLC

Disconnect the Intrusion Sensor Receiver connector.

NOTE: Check connectors - Clean/repair as necessary.

Turn the ignition on.

With the scan tool actuate the Intrusion Sensor Receiver.

Measure the voltage between (G460) Intrusion Receiver Sensor Signal circuit and (G946) Sensor Ground circuit.

Is the voltage above 10.0 volts

Yes

Go To 3.

No

Go To 4.

3. CHECK THE INTRUSION SENSOR RECEIVER

Turn the ignition off.

Install a known good Intrusion Sensor Receiver.

Turn the ignition on.

With the scan tool erase DTC's.

Turn the ignition off and remove the key from the ignition.

Close all doors and arm the VTSS and wait one minute.

Disarm the VTSS turn the ignition on and wait one minute.

With the scan tool, read DTC's.

Does the scan tool display B1A44-SECURITY RECEIVER SENSOR CIRCUIT OPEN?

Yes

Replace the Intrusion Transceiver Module in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the original Intrusion Sensor Receiver.

Perform **BODY VERIFICATION TEST - VER 1** .

4. CHECK THE (G460) INTRUSION RECEIVER SENSOR SIGNAL WIRE

Fig. 26: Measuring Resistance Of (G460) Intrusion Receiver Sensor Signal Circuit Between Intrusion Sensor Receiver Connector And Intrusion Transceiver Module Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Intrusion Transceiver Module connector.

Measure the resistance of the (G460) Intrusion Receiver Sensor Signal circuit between the Intrusion Sensor Receiver connector and the Intrusion Transceiver Module connector.

Is the resistance below 5.0 ohms?

Yes

Repair the (G460) Intrusion Receiver Sensor Signal circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 5.

Perform **BODY VERIFICATION TEST - VER 1**.

5. **CHECK THE (G946) SENSOR GROUND WIRE FOR AN OPEN**

81b5adf2

Fig. 27: Measuring Resistance Of (G946) Sensor Ground Circuit From Intrusion Sensor Receiver Connector To Intrusion Transceiver Module Connector
Courtesy of CHRYSLER LLC

Ensure Ignition is off.

Measure the resistance of the (G946) Sensor Ground circuit from the Intrusion Sensor Receiver connector to the Intrusion Transceiver Module connector.

Is the resistance below 5.0 ohms?

Yes

Replace the Intrusion Transceiver Module in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (G946) Sensor Ground circuit for an open.
Perform **BODY VERIFICATION TEST - VER 1** .

B1A45-SECURITY RECEIVER SENSOR CIRCUIT SHORTED TOGETHER

Circuit Schematic

01344006

Fig. 28: Intrusion Receiver Sensor Signal Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

During the VTSS pre-arm process.

Set Conditions

- **Set Condition:**

If the voltage current is below a specified range this DTC will set.

Possible Causes

Possible Causes
INTRUSION SENSOR RECEIVER (G460) INTRUSION RECEIVER SENSOR SIGNAL SHORTED TO (G946) SENSOR GROUND INTRUSION TRANSCIEVER MODULE

Diagnostic Test

1. **DETERMINING IF DTC IS CURRENT**

NOTE: **Diagnose any related Communication DTC(s) before continuing.**

With a scan tool, read and record DTC(s).

With the scan tool, clear DTC(s).

Turn the ignition off and remove the key from the ignition.

Lock and close all doors to allow the VTSS to go from pre-arm to armed status and wait one minute.

Disarm the VTSS.

Using the scan tool, read DTC(s).

Does the DTC reset?

Yes

Go To 2.

No

DTC is not active at this time. Test complete.
Perform **BODY VERIFICATION TEST - VER 1** .

2. INTRUSION SENSOR RECEIVER

Disconnect the Intrusion Sensor Receiver connector.

NOTE: **Check connectors - Clean/repair as necessary.**

Connect a known good Intrusion Sensor Receiver.

Turn the ignition on.

With the scan tool, clear DTC(s).

Turn the ignition off and remove the key from the ignition.

Lock and close all doors to allow the VTSS to go from pre-arm to armed status and wait one minute.

Disarm the VTSS.

Using the scan tool, read DTC(s).

Does the DTC reset?

Yes

Go To 3.

No

Replace the original Intrusion Sensor Receiver.

Perform **BODY VERIFICATION TEST - VER 1** .

3. CHECK THE (G460) INTRUSION RECEIVER SENSOR SIGNAL WIRE FOR A SHORT TO (G946) SENSOR GROUND

RECEIVER-
INTRUSION
SENSOR
(VTSS)

81b5e687

Fig. 29: Measuring Resistance Between (G460) Intrusion Receiver Sensor Signal Circuit To (G946) Sensor Ground Circuit In Intrusion Sensor Receiver Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Intrusion Sensor Transceiver connector.

Disconnect the Intrusion Transceiver Module connector.

Measure the resistance between the (G460) Intrusion Receiver Sensor Signal circuit to the (G946) Sensor Ground circuit in the Intrusion Sensor Receiver connector.

Is the resistance below 5.0 ohms?

Yes

Repair the (G460) Intrusion Receiver Sensor Signal circuit for a short to the (G946) Sensor Ground circuit.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Intrusion Transceiver Module in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

Circuit Schematic

01344096

Fig. 30: Intrusion Receiver Sensor Signal Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

During the VTSS pre-arm process.

Set Conditions

- **Set Condition:**

The Intrusion Transceiver Module detects a short to ground condition on the sensor ground circuit.

Possible Causes

Possible Causes
INTRUSION SENSOR RECEIVER (G946) SENSOR GROUND CIRCUIT SHORTED TO GROUND INTRUSION TRANSCIEVER MODULE

Diagnostic Test

1. **DETERMINING IF DTC IS CURRENT**

NOTE: **Diagnose any related Communication DTC(s) before continuing.**

With a scan tool, read and record DTC(s).

With the scan tool, clear DTC(s).

Turn the ignition off and remove the key from the ignition.

Lock and close all doors to allow the VTSS to go from pre-arm to armed status and wait one minute.

Disarm the VTSS.

Using the scan tool, read DTC(s).

Does the DTC reset?

Yes

Go to 2.
Perform **BODY VERIFICATION TEST - VER 1** .

No

DTC is not active at this time. Test complete.

Perform **BODY VERIFICATION TEST - VER 1**.

2. **CHECK THE (G946) SENSOR GROUND CIRCUIT SHORTED TO GROUND**

815f70da

Fig. 31: Measuring Resistance Between Ground And (G946) Sensor Ground Circuit At Intrusion Sensor Receiver Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Intrusion Sensor Receiver connector.

Disconnect the Intrusion Transceiver Module connector.

Measure the resistance between ground and the (G946) Sensor Ground circuit at the Intrusion Sensor Receiver connector.

Is the resistance below 5.0 ohms?

Yes

Repair the (G946) Sensor Ground circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Intrusion Transceiver Module in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1A47-SECURITY TRANSMITTER/RECEIVER SENSOR RETURN CIRCUIT HIGH

Circuit Schematic

01344ed0

Fig. 32: Security Transmitter/Receiver Sensor Return Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

During the VTSS pre-arm process.

Set Conditions

- **Set Condition:**

The Intrusion Transceiver Module detects a short to battery condition on the sensor ground circuit.

Possible Causes

Possible Causes
TRANSMITTER (G945) SENSOR GROUND CIRCUIT SHORTED TO BATTERY
RECEIVER (G946) SENSOR GROUND CIRCUIT SHORTED TO BATTERY
INTRUSION TRANSCIEVER MODULE

Diagnostic Test

1. **DETERMINING IF DTC IS CURRENT**

NOTE: **Diagnose any related Communication DTC(s) before continuing.**

With a scan tool, read and record DTC(s).

With the scan tool, clear DTC(s).

Turn the ignition off and remove the key from the ignition.

Lock and close all doors to allow the VTSS to go from pre-arm to armed status and wait one minute.

Disarm the VTSS.

Using the scan tool, read DTC(s).

Does the DTC reset?

Yes

Go to 2.

No

DTC is not active at this time. Test complete.
Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE (G946) SENSOR GROUND CIRCUIT SHORT TO BATTERY

815fa5cf

Fig. 33: Measuring Voltage Of (G946) Sensor Ground Circuit In Intrusion Sensor Receiver Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Intrusion Sensor Receiver connector.

Disconnect the Intrusion Transceiver Module connector.

Turn the ignition on.

Measure the voltage of the (G946) Sensor Ground circuit in the Intrusion Sensor Receiver connector.

Is there any voltage present?

Yes

Repair the (G946) Sensor Ground circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK THE (G945) SENSOR GROUND CIRCUIT SHORT TO BATTERY

**TRANSMITTER-
INTRUSION
SENSOR
(VTSS)**

815fa564

Fig. 34: Measuring Voltage Of Sensor Ground Circuit In Intrusion Sensor Transmitter Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Intrusion Sensor Transmitter connector.

Turn the ignition on.

Measure the voltage of the (G945) Sensor Ground circuit in the Intrusion Sensor Transmitter connector.

Is there any voltage present?

Yes

Repair the (G945) Sensor Ground circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Intrusion Transceiver Module in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

B210A-SYSTEM VOLTAGE LOW (WCM)

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Ignition key in the run position.

Set Conditions

- **Set Condition:**

The Sentry Key Remote Entry Module (SKREEM) has detected the system voltage is below 9 volts.

Possible Causes

Possible Causes
FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN
FUSED (B+) CIRCUIT OPEN
SENTRY KEY REMOTE ENTRY MODULE (SKREEM)

Diagnostic Test

1. DETERMINING IF DTC IS CURRENT

NOTE: **Diagnose any related Powertrain DTC(s) before continuing.**

With a scan tool, read and record DTC(s).

With the scan tool, clear DTC(s).

Perform 5 ignition cycles, leaving the ignition switch on for a minimum of 90 seconds per cycle.

Using the scan tool, read DTC(s).

Does the DTC reset?

Yes

Go To 3.

No

Go to 2.

2. INTERMITTENT CONDITION

NOTE: Check for any of the follow conditions:

- Poor wire to terminal connection
- Corroded terminals
- Backed out or loose terminals
- Broken wire internal to the insulation
- Dirty (partial) module ground

With the ignition on, wiggle the related wires.

Using a scan tool, read DTC(s).

Does the DTC reset?

Yes

Repair the wiring as necessary.

Perform **SKREEM/SKIM VERIFICATION TEST**.

No

DTC is not active at this time. Test complete.

3. FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN

NOTE: Check the related fuses to the Fused Ignition Switch Output (Run-Start) circuit. If the fuse is found to be open repair the circuit for a shorted condition.

Turn the ignition off.

Disconnect the SKREEM harness connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, probe the Fused Ignition Switch Output (Run-Start) circuit in the SKREEM harness connector.

Does the test light illuminate brightly?

Yes

Go to 4.

No

Repair the Fused Ignition Switch Output (Run-Start) circuit for an open.

Perform **SKREEM/SKIM VERIFICATION TEST**.

4. FUSED (B+) CIRCUIT OPEN

Turn the ignition off.

Using a 12 volt test light connected to ground, probe the Fused (B+) circuit in the SKREEM harness connector.

Does the test light illuminate brightly?

Yes

Go to 5.

No

Repair the Fused (B+) circuit for an open.

Perform **SKREEM/SKIM VERIFICATION TEST**.

5. SKREEM

NOTE: Repeat the below procedure for both the Fused Ignition Switch Output (Run-Start) circuit and the Fused (B+) circuit.

NOTE: A dirty (partial) ground can cause abnormal conditions within a system. Ensure the module has a good ground before continuing.

Turn the ignition off.

Reconnect the SKREEM connector.

Back probe the Fused Ignition Switch Output (Run-Start) circuit and then the Fused (B+) circuit.

Start the engine.

Using the scan tool, view battery voltage under Data Display in the Engine category.

Compare the voltage on the scan tool to the voltage reading on the voltmeter.

Is the voltage on the scan tool equal to the voltmeter reading +/- .5 volt?

Yes

Replace and program the Sentry Key Remote Entry Module (SKREEM) in accordance with the Service Information.

Perform **SKREEM/SKIM VERIFICATION TEST**.

No

Repair the circuit(s) that indicated the incorrect voltage.

Perform **SKREEM/SKIM VERIFICATION TEST**.

B210B-SYSTEM VOLTAGE HIGH (WCM)

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Ignition key in the run position.

Set Conditions

• **Set Condition:**

The Sentry Key Remote Entry Module (SKREEM) has detected the system voltage above 16 volts.

Possible Causes

Possible Causes
FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT
SENTRY KEY REMOTE ENTRY MODULE (SKREEM)

Diagnostic Test

1. DETERMINING IF DTC IS CURRENT

NOTE: Diagnose any related Powertrain DTC(s) before continuing.

With a scan tool, read and record DTC(s).

With the scan tool, clear DTC(s).

Perform 5 ignition cycles, leaving the ignition switch on for a minimum of 90 seconds per cycle.

Using the scan tool, read DTC(s).

Does the DTC reset?

Yes

Go To 3.

No

Go to 2.

2. INTERMITTENT CONDITION

NOTE: Check for any of the follow conditions:

- **Poor wire to terminal connection**
- **Corroded terminals**
- **Backed out or loose terminals**
- **Broken wire internal to the insulation**
- **Dirty (partial) module ground**

With the ignition on, wiggle the related wires.

Using a scan tool, read DTC(s).

Does the DTC reset?

Yes

Repair the wiring as necessary.

Perform **SKREEM/SKIM VERIFICATION TEST.**

No

DTC is not active at this time. Test complete.

3. FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SHORTED TO BATTERY

VOLTAGE

NOTE: **A dirty (partial) ground can cause abnormal conditions within a system. Ensure the module has a good ground before continuing.**

Turn the ignition off.

Disconnect the SKREEM harness connector.

Using a 12 volt test light connected to ground, probe the Fused Ignition Switch Output (Run-Start) circuit in the SKREEM harness connector.

Does the test light illuminate brightly?

Yes

Repair the Fused Ignition Switch Output (Run-Start) circuit for a short to voltage.
Perform **SKREEM/SKIM VERIFICATION TEST**.

No

Replace and reprogram the SKREEM in accordance with the Service Information.
Perform **SKREEM/SKIM VERIFICATION TEST**.

B210D-BATTERY VOLTAGE LOW (WCM)

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Ignition key in any position but run.

Set Conditions

- **Set Condition:**

The Sentry Key Remote Entry Module (SKREEM) has detected the Fused (B+) input voltage below 9 volts with the Key in any position except for RUN.

Possible Causes

Possible Causes
FUSED (B+) CIRCUIT OPEN

Diagnostic Test

1. DETERMINING IF DTC IS CURRENT

NOTE: Diagnose any related Powertrain DTC(s) before continuing.

With a scan tool, read and record DTCs.

With the scan tool, clear DTCs.

Perform 5 ignition cycles, leaving the ignition switch on for a minimum of 90 seconds per cycle.

Using the scan tool, select View DTCs.

Does the DTC reset?

Yes

Go To 3.

No

Go to 2.

2. INTERMITTENT CONDITION

NOTE: Check for any of the follow conditions:

- Poor wire to terminal connection
- Corroded terminals
- Backed out or loose terminals
- Broken wire internal to the insulation
- Dirty (partial) module ground

With the ignition on, wiggle the related wires.

Using a scan tool, View DTC(s).

Does the DTC reset?

Yes

Repair the wiring as necessary.

Perform **SKREEM/SKIM VERIFICATION TEST**.

No

DTC is not active at this time. Test complete.

3. **FUSED (B+) CIRCUIT OPEN**

NOTE: Check the related fuses to the Fused (B+) circuit. If the fuse is found to be open repair the circuit for a shorted condition.

Turn the ignition off.

Disconnect the SKREEM harness connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, probe the Fused (B+) circuit in the SKREEM harness connector.

Does the test light illuminate brightly?

Yes

Go to 4.

No

Repair the Fused (B+) circuit for an open.

Perform **SKREEM/SKIM VERIFICATION TEST**.

4. **SKREEM**

NOTE: A dirty (partial) ground can cause abnormal conditions within a system. Ensure the module has a good ground before continuing.

Turn the ignition off.

Reconnect the SKREEM connector

Back probe the Fused (B+) circuit.

Start the engine.

Using the scan tool, view battery voltage under Data Display in the Engine category.

Compare the voltage on the scan tool to the voltage reading on the voltmeter.

Is the voltage on the scan tool equal to the voltmeter reading +/- .5 volt?

Yes

Replace and program the SKREEM in accordance with the Service Information.
Perform **SKREEM/SKIM VERIFICATION TEST**.

No

Repair the Fused (B+) circuit for high resistances.
Perform **SKREEM/SKIM VERIFICATION TEST**.

B210E-BATTERY VOLTAGE HIGH (WCM)

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Ignition key in any position but run.

Set Conditions

- **Set Condition:**

The Sentry Key Remote Entry Module (SKREEM) has detected the Fused (B+) input voltage above 16 volts in all Key Positions except for RUN.

Possible Causes

Possible Causes
VEHICLE CHARGING SYSTEM
SENTRY KEY REMOTE ENTRY MODULE (SKREEM)

Diagnostic Test

1. DETERMINING IF DTC IS CURRENT

CAUTION: Diagnose and repair all Powertrain DTCs before continuing.

Turn the ignition on.

With the scan tool, record and erase the SKREEM DTCs.

Perform 5 ignition cycles, leaving the ignition switch on for a minimum of 90 seconds per cycle.

Using the scan tool, read the SKREEM DTCs.

Does the DTC reset?

Yes

Replace and program the SKREEM in accordance with the Service Information.
Perform **SKREEM/SKIM VERIFICATION TEST**.

No

The DTC is not active at this time. Test complete.

B2204-ECU CONFIGURATION MISMATCH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

• **Set Condition:**

The WCM receives different information than is configured within the module. Examples include Model Year, Country Code, Body Style, Platform, Remote Start, Sun Roof.

Possible Causes

Possible Causes
SENTRY KEY REMOTE ENTRY MODULE (SKREEM)

Diagnostic Test

1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

NOTE: Before continuing, review and check for the following:

- Review the repair history of the vehicle.
- Ensure that the vehicle has the correct PCM and SKREEM installed by verifying the part numbers.
- With the scan tool, ensure that the PCM and SKREEM are programmed correctly. Compare the PCM VIN to the SKREEM VIN and ensure the two VINs match.

With the scan tool, clear DTCs.

Perform 5 ignition cycles, leaving the ignition switch on for a minimum of 90 seconds per cycle.

With the scan tool, select View DTCs.

Does the DTC reset?

Yes

Replace and program the SKREEM in accordance with the Service Information.

NOTE: If this vehicle is equipped with a Steering Column Lock Module, it must be replaced along with the SKREEM.

Perform **SKREEM/SKIM VERIFICATION TEST**.

No

The DTC is not active at this time. Test complete.

B2205-ORIGINAL VIN MISSING/MISMATCH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

At ignition on, after ignition on during any rolling code handshake that occurs with the PCM due to a SKIM or PCM reset.

Set Conditions

• **Set Condition:**

A valid key is recognized but the programmed VIN does not match between the WCM and PCM/ECM.

Possible Causes

Possible Causes
VERIFYING PCM VIN INTERMITTENT WIRING HARNESS PROBLEM PCM

Diagnostic Test

1. DETERMINING IF DTC IS CURRENT

With the scan tool, erase the SKREEM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on and wait 2 minutes.

With the scan tool, read the SKREEM DTCs.

Does the scan tool display the DTC that was previously erased?

Yes

Go To 2.

No

Go To 4.

2. VERIFYING THE PCM VIN

Turn the ignition on.

With the scan tool, select Engine system from the main menu.

Display and record the Vehicle Identification Number.

NOTE: Ensure that a VIN has been programmed into the PCM. If a VIN is not displayed, attempt to program the PCM with the correct VIN before continuing.

Does the VIN recorded from the PCM match the VIN of the vehicle?

Yes

Go To 3.

No

Replace and program the Sentry Key Remote Entry Module in accordance with the Service Information.

Perform **SKREEM/SKIM VERIFICATION TEST**.

3. **REPLACE SKREEM AND CHECK DTC'S**

Turn the ignition off.

Replace and program the Sentry Key Remote Entry Module in accordance with the Service Information.

Turn the ignition on.

With the scan tool, display and clear all PCM and SKREEM DTC's.

Perform 5 ignition key cycles leaving the ignition key on for 90 seconds per cycle.

With the scan tool, check for SKREEM DTCs.

Does the scan tool display the same DTC?

Yes

Replace and program the Powertrain Control Module in accordance with the Service Information.

Perform **SKREEM/SKIM VERIFICATION TEST**.

No

The repair is complete.

Perform **SKREEM/SKIM VERIFICATION TEST**.

4. **INTERMITTENT**

Turn the ignition off.

NOTE: Check for the following conditions:

- Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
- Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
- Refer to any Technical Service Bulletins (TSB) that may apply.

Were any problems found?

Yes

Repair wiring harness/connectors as necessary.
Perform **SKREEM/SKIM VERIFICATION TEST**.

No

Test Complete.

B2206-CURRENT VIN MISSING/MISMATCH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Anytime the ignition key is in the ON position.

Set Conditions

- **Set Condition:**

VIN stored in Intrusion Transceiver Module does not match the VIN stored in the Cluster.

Possible Causes

Possible Causes
INTRUSION TRANSCIEVER MODULE SWAPPED FROM DIFFERENT VEHICLE

Diagnostic Test

1. DETERMINING IF DTC IS CURRENT

With a scan tool, read and record DTC(s).

With the scan tool, clear DTC(s).

Turn the ignition off and remove the key from the ignition.

Lock and close all doors to allow the VTSS to go from pre-arm to armed status and wait one minute.

Disarm the VTSS.

Using the scan tool, read ITM DTC(s).

Does the DTC reset?

Yes

Using the scan tool under Miscellaneous functions initialize the Intrusion Transceiver Module.
Perform **BODY VERIFICATION TEST - VER 1** .

No

DTC is not active at this time. Test complete.
Perform **BODY VERIFICATION TEST - VER 1** .

B2224-SKREEM INTERNAL

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

Sentry Key Remote Entry Module (SKREEM) watchdog resets.

Possible Causes

Possible Causes
SENTRY KEY REMOTE ENTRY MODULE (SKREEM)

Diagnostic Test

1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

NOTE: Before continuing, review and check for the following:

- Review the repair history of the vehicle.
- Ensure that the vehicle has the correct PCM and SKREEM installed by verifying the part numbers.

- **With the scan tool, ensure that the PCM and SKREEM are programmed correctly. Compare the PCM VIN to the SKREEM VIN and ensure the two VINs match.**

With the scan tool, clear DTCs.

Perform 5 ignition cycles, leaving the ignition switch on for a minimum of 90 seconds per cycle.

With the scan tool, read DTCs.

Does the DTC reset?

Yes

Replace and program the Sentry Key Remote Entry Module (SKREEM) in accordance with the Service Information.

NOTE: **If this vehicle is equipped with a Steering Column Lock Module, it must be replaced along with the SKREEM.**

Perform **SKREEM/SKIM VERIFICATION TEST**.

No

The DTC is not active at this time. Test complete.

B2229-SKREEM INTERNAL - SKIM IMMOBILIZER

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

When the Antenna diagnostic test fails.

Possible Causes

Possible Causes

Diagnostic Test

1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

NOTE: Before continuing, review and check for the following:

- Review the repair history of the vehicle.
- Ensure that the vehicle has the correct PCM and SKREEM installed by verifying the part numbers.
- With the scan tool, ensure that the PCM and SKREEM are programmed correctly. Compare the PCM VIN to the SKREEM VIN and ensure the two VINs match.

With the scan tool, clear DTCs.

Perform 5 ignition cycles, leaving the ignition switch on for a minimum of 90 seconds per cycle.

With the scan tool, read DTCs.

Does the DTC reset?

Yes

Replace and program the Sentry Key Remote Entry Module (SKREEM) in accordance with the Service Information.

NOTE: If this vehicle is equipped with a Steering Column Lock Module, it must be replaced along with the SKREEM.

Perform SKREEM/SKIM VERIFICATION TEST.

No

The DTC is not active at this time. Test complete.

B222A-VEHICLE LINE MISMATCH

Additional Wiring

For complete wiring diagrams refer to SYSTEM WIRING DIAGRAMS.

Monitor Conditions

When Monitored:

Anytime the ignition key is in the ON position.

Set Conditions

- **Set Condition:**

If the Intrusion Transceiver Module is not configured.

Possible Causes

Possible Causes
INTRUSION TRANSCIEVER MODULE CONFIGURATION

Diagnostic Test

1. **CONFIGURE THE INTRUSION TRANSCIEVER MODULE**

Using the scan tool under miscellaneous functions perform the initialization procedure for the Intrusion Transceiver Module.

With the scan tool, clear DTC(s).

Turn the ignition off and remove the key from the ignition.

Lock and close all doors to allow the VTSS to go from pre-arm to armed status and wait one minute.

Disarm the VTSS.

Using the scan tool, read DTC(s).

Does the DTC reset?

Yes

Replace the Intrusion Transceiver Module in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test complete.

Perform **BODY VERIFICATION TEST - VER 1** .

B223C-INTRUSION TRANSCIEVER MODULE INTERNAL

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Ignition on.

Set Conditions

- **Set Condition:**

Internal Intrusion Transceiver Module test failed.

Possible Causes

Possible Causes
INTRUSION TRANSCIVER MODULE

Diagnostic Test

1. **DETERMINING IF DTC IS CURRENT**

With a scan tool, read and record DTC(s).

With the scan tool, clear DTC(s).

Turn the ignition off and remove the key from the ignition.

Lock and close all doors to allow the VTSS to go from pre-arm to armed status and wait one minute.

Disarm the VTSS.

Using the scan tool, read ITM DTC(s).

Does the DTC reset?

Yes

Replace the Intrusion Transceiver Module in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

DTC is not active at this time. Test complete.
Perform **BODY VERIFICATION TEST - VER 1** .

B2254-COLUMN LOCK MODULE INTERNAL

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Ignition key in the run position.

Set Conditions

- **Set Condition:**

The alarm message fails three times.

Possible Causes

Possible Causes
SENTRY KEY REMOTE ENTRY MODULE (SKREEM)

Diagnostic Test

1. **VERIFY THAT THE DTC IS ACTIVE**

Turn the ignition on.

NOTE: Before continuing, review and check for the following:

- The battery voltage must be above 10 volts.
- Review the repair history of the vehicle.
- Ensure that the PCM and SKREEM are programmed correctly.
Compare the PCM VIN to the SKREEM VIN and ensure the two VINs match.

With the scan tool, clear DTCs.

Perform 5 ignition cycles, leaving the ignition switch on for a minimum of 90 seconds per cycle.

With the scan tool, read DTCs.

Is the DTC active?

Yes

Replace and program the SKREEM and Steering Column Lock Module in accordance with the Service Information.

Perform **SKREEM/SKIM VERIFICATION TEST**.

No

The DTC is not active at this time. Test complete.

U0100-LOST COMMUNICATION WITH ECM/PCM

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure. Perform the No Response From ECM or PCM procedure.

Possible Causes

Possible Causes
(A935) FUSED B(+) CIRCUIT OPEN (A306) FUSED B(+) CIRCUIT OPEN Z906 GROUND CIRCUIT OPEN (D508) COM-LIN (TPM) LAN CIRCUIT OPEN STEERING COLUMN-LOCK MODULE

Diagnostic Test

1. DETERMINING IF DTC IS CURRENT

With the scan tool, read and record the SKREEM DTCs.

With the scan tool, erase the SKREEM DTCs

NOTE: **Perform the following test several times to ensure the DTC is current.**

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM DTCs.

Does the scan tool display the DTC that was previously erased?

Yes

Go To 2.

No

The conditions that set the DTC are no longer present. Inspect the wiring harness and related connectors for damage, pin push out or corrosion.

2. (A935) FUSED B(+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Steering Column-Lock Module harness connector.

Using a 12-volt test light connected to ground, probe the (A935) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes

Go To 3.

No

Repair the (A935) Fused B(+) circuit for an open.

Perform **SKREEM/SKIM VERIFICATION TEST.**

3. (A306) FUSED B(+) CIRCUIT OPEN

Using a 12-volt test light connected to ground, probe the (A306) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes

Go To 4.

No

Repair the (A306) Fused B(+) circuit for an open.

Perform **SKREEM/SKIM VERIFICATION TEST.**

4. (Z906) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z906) Ground circuit.

Does the test light illuminate brightly?

Yes

Go To 5.

No

Repair the (Z906) Ground circuit for an open.

Perform **SKREEM/SKIM VERIFICATION TEST**.

5. (D508) COM-LIN (TPM) LAN CIRCUIT OPEN

Disconnect the SKREEM/WCM harness connector.

Measure the resistance of the (D508) COM-LIN (TPM) LAN circuit between the SKREEM/WCM harness connector and the Steering Column-Lock Module connector.

Is resistance below 5.0 ohms?

Yes

Replace the Sentry Key Remote Entry Module/Steering Column-Lock Module in accordance with the service information.

Perform **SKREEM/SKIM VERIFICATION TEST**.

No

Repair the (D508) COM-LIN (TPM) LAN circuit for an open.

Perform **SKREEM/SKIM VERIFICATION TEST**.

U110D-LOST COMMUNICATION WITH SECURITY SIREN

Circuit Schematic

011556700

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously while the VTSS is armed.

Set Conditions

- **Set Condition:**

If the Intrusion Transceiver Module does not receive messages from the Siren.

Possible Causes

Possible Causes
INTERMITTENT CONDITION (A100) FUSED B+ CIRCUIT OPEN (Z908) GROUND CIRCUIT OPEN (D96) SIREN SIGNAL CONTROL CIRCUIT SHORT TO BATTERY (D96) SIREN SIGNAL CONTROL CIRCUIT OPEN (D96) SIREN SIGNAL CONTROL CIRCUIT SHORT TO GROUND SIREN INTRUSION TRANSCIVER MODULE

Diagnostic Test

1. **INTERMITTENT DTC**

With the scan tool, erase the current Intrusion Transceiver Module DTC's.

Turn the ignition off.

Arm the VTSS and wait 1 minute.

Disarm the VTSS and turn the ignition on.

Does the scan tool display the same DTC?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced, pinched or partially broken wires.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **(A100) FUSED B+ OPEN**

81b5710d

Fig. 36: Using 12-Volt Test Light Connected To Ground To Check (A100) Fused B(+) Circuit At Siren Connector

Courtesy of CHRYSLER LLC

Gain access to the VTSS Siren.

Disconnect the Siren connector.

Using a 12-volt test light connected to ground, check the (A100) Fused B(+) circuit in the Siren connector.

Does the test light illuminate brightly?

Yes

Go To 3.

No

Repair the (A100) Fused B+ circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

3. **(Z908) GROUND CIRCUIT OPEN**

81b57129

Fig. 37: Using 12-Volt Test Light Connected To 12-Volts To Check (Z908) Ground Circuit At Siren Connector
Courtesy of CHRYSLER LLC

Using a 12-volt test light connected to 12-volts, check the (Z908) Ground circuit at the siren connector.

Does the test light illuminate brightly?

Yes

Go To 4.

No

Repair the (Z908) Ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. FAULTY SIREN

81b5b679

Fig. 38: Using Scope Input Cable CH7058, Cable To Probe Adapter CH7062, And Red/Black Test Probes

Courtesy of CHRYSLER LLC

Use the DRBIII® and set up as follows:

Use the Scope input cable CH7058, Cable to Probe adapter CH7062, and the red and black test probes.

Connect the scope input cable to the channel one connector on the DRBIII®. Attach the red and black leads and the cable to probe adapter to the scope input cable.

Select DRBIII® Stand-alone.

Select lab scope.

Select Live.

Select 12 volt square wave.

Press F2 for Scope.

Press F2 and use the down arrow to set voltage range to 20 volts. Press F2 again when complete.

Disconnect the Siren connector.

Connect the black lead to the chassis ground. Connect the red lead to the (D96) Siren Signal Control circuit in the Siren connector.

Close all doors and arm the VTSS.

Observe the voltage displayed on the DRBIII® Lab Scope.

Is there a voltage square wave present 1 to 2 seconds?

Yes

Connect a known good siren and try to reset the DTC. If the DTC does not reset the original siren needs to be replaced. If the DTC does reset replace the Intrusion Transceiver Module in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 5.

5. (D96) SIREN SIGNAL CONTROL CIRCUIT SHORT TO BATTERY

81b5b67d

Fig. 39: Measuring Voltage Of (D96) Siren Signal Control Circuit
Courtesy of CHRYSLER LLC

Disconnect the Siren harness connector.

Measure the voltage of the (D96) Siren Signal Control circuit.

Is there any voltage present?

Yes

Repair the (D96) Siren Signal Control circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 6.

6. (D96) SIREN SIGNAL CONTROL CIRCUIT SHORT TO GROUND

81b5b682

Fig. 40: Measuring Resistance Between Ground And (D96) Siren Signal Control Circuit
Courtesy of CHRYSLER LLC

Disconnect the Siren harness connector.

Disconnect the Intrusion Transceiver Module harness connector.

Measure the resistance between ground and the (D96) Siren Signal Control circuit.

Is the resistance above 5.0 ohms?

Yes

Go To 7.

No

Repair the (D96) Siren Signal Control circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

7. (D96) SIREN SIGNAL CONTROL CIRCUIT OPEN

81b5b686

Fig. 41: Measuring Resistance Of (D96) Siren Signal Control Circuit Between Intrusion Transceiver Module And Siren Connector
 Courtesy of CHRYSLER LLC

Disconnect the Intrusion Transceiver Module harness connector.

Measure the resistance of the (D96) Siren Signal Control circuit between the Intrusion Transceiver Module and the Siren connector.

Is the resistance below 5.0 ohms?

Yes

Replace the Intrusion Transceiver Module in accordance with the Service Information.
 Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (D96) Siren Signal Control circuit for an open.
 Perform **BODY VERIFICATION TEST - VER 1** .

U1416-IMPLAUSIBLE SECURITY SIREN SIGNAL RECEIVED

Additional Wiring

For complete wiring diagrams refer to SYSTEM WIRING DIAGRAMS .

Monitor Conditions

When Monitored:

While the VTSS is armed.

Set Conditions

- **Set Condition:**

When the learned Siren information stored in the ITM does not match.

Possible Causes

Possible Causes
INTERMITTENT CONDITION SIREN

Diagnostic Test

1. **DETERMINING IF DTC IS CURRENT**

NOTE: **Diagnose any related Communication DTC(s) before continuing.**

With a scan tool, read and record DTC(s).

With the scan tool, clear DTC(s).

Turn the ignition off and remove the key from the ignition.

Lock and close all doors to allow the VTSS to go from pre-arm to armed status and wait one minute.

Disarm the VTSS.

Using the scan tool, read ITM DTC(s).

Does the DTC reset?

Yes

Inspect wiring from ITM to Siren for an intermittent open condition. Check connector terminals for

push out, corrosion or loose terminal contact. If OK, replace the Siren.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go to 2.

2. INTERMITTENT CONDITION

NOTE: Check for any of the follow conditions:

- **Poor wire to terminal connection**
- **Corroded terminals**
- **Pushed out or loose terminals**
- **Broken wire internal to the insulation**

Were there any problems found?

Yes

Repair the wiring as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

No

DTC is not active at this time. Test complete.

STANDARD PROCEDURE

SKREEM/SKIM VERIFICATION TEST

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Diagnostic Test

1. SKREEM/SKIM VERIFICATION

NOTE: When entering the PIN, care should be taken because the SKREEM will only allow 3 consecutive attempts to enter the correct PIN. If 3 consecutive incorrect PIN's are entered the SKREEM will Lock Out the scan tool. To exit Lock Mode, the ignition key must remain in the Run position for 1 hour. All accessories must be off. A battery charger connected to the battery during this time period is recommended.

NOTE: On vehicles equipped with a premium Tire Pressure Monitoring (TPM) system, when the SKREEM and/or the spare tire pressure sensor is replaced with a new unit, a diagnostic scan tool **MUST** be used to run a routine that allows the SKREEM to be programmed with the ID number and location of the spare tire pressure sensor mounted in the wheel of the spare tire. Follow the programming steps outlined in the diagnostic scan tool for "Learn Spare Tire Sensor ID" under "Miscellaneous Functions" for the "WCM/Wireless Control Module" menu item as appropriate. In addition, if the SKREEM is replaced, the spare tire must be dismounted from its wheel to access and note the ID number on the spare tire pressure sensor so that the ID code for that sensor can be programmed into the new SKREEM.

1. Reconnect the previously disconnected components and connectors.
2. Obtain the vehicle's unique Personal Identification Number (PIN) assigned to its original SKREEM. This number can be obtained from the vehicle invoice or from the DaimlerChrysler Customer Center (Phone 1-800-992-1997).

NOTE: If the PCM and the SKREEM are replaced at the same time, program the PCM VIN into the PCM first.

NOTE: During PCM/ECM replacement, use the following steps to ensure transfer of the secret key information from the SKREEM to the new PCM. The PCM stores this information only. If the SKREEM ever needs to be replaced, the secret key information can be retrieved from the PCM and then transferred to the SKREEM for security use.

3. First replace the PCM/ECM with the original WCM still connected to the vehicle.
4. Using the appropriate service information program the new PCM/ECM. (This will ensure the Secret Key Transfer from the original WCM into the new PCM/ECM).
5. Now replace and program the WCM (if necessary). This will retain the Secret Key from the PCM/ECM back into the new WCM.
6. With the scan tool, select Miscellaneous Functions, WCM/Wireless Control Module. Then select the desired procedure and follow the display on the scan tool.
7. If the vehicle is equipped with Tire Pressure Monitoring System program the Placard Pressure Values into the WCM/SKREEM.
8. Ensure all the customer's keys have been programmed into the new module if necessary.
9. With the scan tool, erase all DTCs. Perform 5 ignition key cycles, leaving the key on for at least 90 seconds per cycle.
10. With the scan tool, read SKREEM DTC(s).

NOTE: If this vehicle is equipped with a Steering Column Lock Module, it must be replaced along with the SKREEM.

Are there any SKREEM DTC(s) present?

Yes

Repair not complete, refer to the appropriate symptom.

No

Repair is complete.

2008 ACCESSORIES AND EQUIPMENT

Vehicle Theft Security - Service Information - Liberty

VEHICLE THEFT SECURITY - SERVICE INFORMATION

DESCRIPTION

VEHICLE THEFT SECURITY SYSTEM

81d4a711

Fig. 1: Vehicle Theft Security System
Courtesy of CHRYSLER LLC

The Vehicle Theft Security System (VTSS) is an available factory-installed feature on this vehicle. The VTSS is comprised of two primary subsystems: the optional Vehicle Theft Alarm (VTA) and the standard Sentry Key Immobilizer System (SKIS). The VTA is an active system that provides visual and audible responses as deterrents to and warnings of unauthorized vehicle tampering. The SKIS is a passive system that effectively immobilizes the vehicle against unauthorized operation. Following are paragraphs which describe the various components that are included in each of these subsystems of the VTSS.

Certain functions and features of the VTSS rely upon resources shared with or controlled by other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. Other modules that may affect VTSS operation are:

- **ElectroMechanical Instrument Cluster** - The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) provides security indicator control. Refer to **DESCRIPTION** .
- **Powertrain Control Module** - The Powertrain Control Module (PCM) provides the SKIS engine control logic.
- **Totally Integrated Power Module (3)** - The Totally Integrated Power Module (TIPM) is located in the engine compartment, near the battery. The TIPM monitors door, liftgate and hood ajar switch status and provides the VTA system logic. Refer to **DESCRIPTION** .

Except for the Sentry Key transponders, which rely upon Radio Frequency (RF) communication, hard wired circuitry connects the VTA and SKIS components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the SKIS components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

VEHICLE THEFT ALARM

The VTA is available in two different configurations for this vehicle: One configuration is designed for vehicles manufactured for sale in North America; while the other configuration is designed for vehicles manufactured for sale in markets outside of North America, also referred to as export markets within the context of this service information. In addition, the VTA for export is available in two versions: base and premium. All vehicles equipped with VTA are also equipped with the Remote Keyless Entry (RKE) system and the Sentry Key Immobilizer System (SKIS), regardless of their market destination.

The North American and export base version of the VTA system provides perimeter vehicle protection by monitoring the vehicle doors, the ignition switch, the liftgate, the liftgate flip-up glass and, for vehicles built for certain markets where it is required equipment, the hood. If unauthorized vehicle use or tampering is detected, these systems respond by pulsing the vehicle horn as an audible deterrent and flashing certain exterior lamps as a visual deterrent.

The export premium version of the VTA system is only available in vehicles manufactured for sale in certain export markets where it is required equipment. The export premium version of the VTA provides the same perimeter protection features as the base version, but adds interior vehicle intrusion protection. The export premium VTA also replaces the pulsing horn feature of the base version with an alarm siren as the audible deterrent, while retaining the flashing exterior lamps as the visual deterrent.

The VTA includes the following major components, which are described in further detail elsewhere in this service information:

- **Door Ajar Switches (7)** - A door ajar switch is integral to the door latch mechanism of each front and rear door. Refer to **DESCRIPTION** .
- **Flip-Up Glass Ajar Switch (10)** - A flip-up glass ajar switch is integral to the liftgate flip-up glass latch, located on the liftgate below the glass opening near the center. Refer to **DESCRIPTION** .

- **Hood Ajar Switch (1)** - A hood ajar switch is located on a bracket integral to the left side of the front end module carrier within the engine compartment of vehicles built for sale in certain export markets where it is required equipment.
- **Intrusion Module (9)** - An intrusion module is located on the left inner D-pillar in the passenger compartment of vehicles built for sale in certain export markets where it is required equipment.
- **Liftgate Ajar Switch (11)** - A liftgate ajar switch is integral to the latch for the liftgate in the vehicle. Refer to **DESCRIPTION**.
- **Security Indicator (4)** - A security indicator is integral to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). Refer to **DESCRIPTION**.
- **Siren (2)** - An alarm siren is located on the back of the front end module carrier in the engine compartment just below the inboard side of the right combination lamp housing of vehicles built for sale in certain export markets where it is required equipment.

SENTRY KEY IMMOBILIZER SYSTEM

The Sentry Key Immobilizer System (SKIS) is standard factory-installed equipment on this vehicle. The SKIS provides passive vehicle protection by preventing the engine from operating unless a valid electronically encoded key is detected in the ignition lock cylinder.

The SKIS includes the following major components, which are described in further detail elsewhere in this service information:

- **Security Indicator** - A security indicator is integral to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN). Refer to **DESCRIPTION**.
- **Sentry Key Remote Entry Module (5)** - The Sentry Key REMote Entry Module (SKREEM) (also known as the Sentry Key Immobilizer Module/SKIM or the Wireless Control Module/WCM) is located on the right side of the steering column near the ignition lock cylinder housing and an integral molded plastic antenna ring circles the ignition lock cylinder like a halo. The SKREEM and its antenna are concealed beneath the shrouds on the steering column. See **DESCRIPTION**.
- **Sentry Key Transponder** - The Sentry Key transponder is contained within the Remote Keyless Entry (RKE) transmitter integral to the head of the ignition key. See **DESCRIPTION**.

OPERATION

VEHICLE THEFT SECURITY SYSTEM

The Vehicle Theft Security System (VTSS) is divided into two basic subsystems: Vehicle Theft Alarm (VTA) and Sentry Key Immobilizer System (SKIS). Following are paragraphs that briefly describe the operation of each of these two subsystems.

VEHICLE THEFT ALARM

The Totally Integrated Power Module (TIPM) is used on this vehicle to control and integrate many of the functions and features included in the Vehicle Theft Alarm (VTA). In the VTA system, the TIPM receives inputs indicating the status of the door ajar switches, the ignition switch, the liftgate ajar switch, the flip-up glass ajar switch and the power lock switches. In vehicles built for certain export markets where it is required,

the hood ajar switch provides a hard wired input to the TIPM and the intrusion module provides electronic message inputs to the TIPM over the Controller Area Network (CAN) data bus. The TIPM processes the information from all of these inputs, and sends electronic messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over the CAN data bus to control the security indicator as appropriate. The TIPM internally controls the output to the hazard warning lamps and sends a control output to energize or de-energize the horn relay as appropriate. On vehicles with an intrusion module, the horn output of the TIPM is replaced by an output of the siren module that is controlled by the intrusion module.

The hard wired circuits between components related to the VTA system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the VTA system or the electronic controls or communication between modules and devices that provide some features of the VTA system. The most reliable, efficient, and accurate means to diagnose the VTA system or the electronic controls and communication related to VTA system operation requires the use of a diagnostic scan tool. See the **Vehicle Theft Security System** menu item on the scan tool.

Following are paragraphs that briefly describe the operation of each of the VTA features.

ENABLING

The TIPM must have the VTA function electronically enabled in order for the VTA to perform as designed. The logic in the TIPM keeps its VTA function dormant until it is enabled using a diagnostic scan tool. The VTA function of the TIPM is enabled on vehicles equipped with the VTA option at the factory, but a service replacement TIPM must be VTA-enabled by the dealer using a diagnostic scan tool.

ARMING

Passive arming of the VTA occurs when the vehicle is exited with the key removed from the ignition switch, the headlamps are turned OFF, and the doors are locked while they are open using the power lock switch. Active arming occurs when the LOCK button on the Remote Keyless Entry (RKE) transmitter is depressed to lock the vehicle. For active arming to occur, the doors, the liftgate and the flip-up glass must be closed and the ignition switch must be in the OFF position when the RKE transmitter LOCK button is depressed. The power lock switch will not function if the key is in the ignition switch or the headlamps are turned ON with the driver side front door open.

Pre-arming of the VTA is initiated when a door, the liftgate or the flip-up glass is open when the vehicle is locked using a power door lock switch or when the RKE transmitter LOCK button is depressed. Pre-arming will not occur if the key is in the ignition switch or the headlamps are turned ON with the driver side front door open. When the VTA is pre-armed, the arming sequence is delayed until all of the doors, the liftgate and the flip-up glass have been closed. The VTA will remain in pre-armed mode for up to 16 seconds after all doors, the liftgate and the flip-up glass have been closed.

Once the VTA begins the passive or active arming sequence, the security indicator in the instrument cluster will flash rapidly for about 16 seconds. This indicates that VTA arming is in progress. If the ignition switch is turned

to the ON position, if a door, the liftgate or the flip-up glass is unlocked or opened by any means, or if the RKE PANIC button (if equipped) is depressed during the 16 second arming process, the security indicator will stop flashing and the arming process will abort. Once the arming sequence is successfully completed, the security indicator will flash at a slower rate, indicating that the VTA is armed.

On vehicles equipped with the hood ajar switch, the VTA arming sequence will occur regardless of whether the hood is open or closed, but the security indicator will illuminate solid and the underhood area will not be protected unless the hood is closed when the VTA arming sequence begins. Also, if the status of the hood ajar switch changes from open to closed during the 16 second arming process, the security indicator will switch from solid to flashing and the VTA arming sequence will abort. Once the arming process is successfully completed, the security indicator will flash at a slower rate, indicating that the VTA is armed.

DISARMING

For vehicles built for the North American market, passive disarming of the VTA occurs by inserting a valid Sentry Key Immobilizer System (SKIS) key into the ignition lock cylinder or by turning the ignition switch to the ON position. Active disarming of the VTA for all markets occurs when the vehicle is unlocked by depressing the UNLOCK button of the RKE transmitter. Once the alarm has been activated, either disarming method will also deactivate the alarm. Depressing the PANIC button (if equipped) on the RKE transmitter will **not** disarm the VTA.

POWER-UP MODE

When the armed VTA senses that the battery has been disconnected and reconnected, it enters its power-up mode. In the power-up mode, the alarm system remains armed following a battery failure or disconnect. If the VTA was armed prior to a battery disconnect or failure, the technician or vehicle operator will have to actively or passively disarm the alarm system after the battery is reconnected. The power-up mode will also apply if the battery goes dead while the system is armed and battery jump-starting is attempted. The VTA will be armed until the technician or vehicle operator has actively or passively disarmed the alarm system. If the VTA is in the disarmed mode prior to a battery disconnect or failure, it will remain disarmed after the battery is reconnected or replaced, or if jump-starting is attempted.

ALARM

The VTA alarm output varies by the version of the VTA with which the vehicle is equipped. In all cases, the alarm provides both visual and audible outputs; however, the time intervals of these outputs vary by the requirements of the market for which the vehicle is manufactured. In all cases, the visual output will be a flashing ON and OFF of the exterior lamps. For vehicles equipped with the North American or the export base version of the VTA, the audible output will be a pulsing of the horn. For vehicles with the export premium version of the VTA, the audible output will be a cycling of the alarm siren. The inputs that will trigger the alarm include the ignition switch, the door ajar switches, the liftgate ajar switch, the flip-up glass ajar switch and, in vehicles built for certain markets where they are required, the hood ajar switch and the intrusion module.

TAMPER ALERT

The VTA tamper alert feature will pulse the horn three times upon VTA disarming if the alarm was triggered and has since timed out. This feature alerts the vehicle operator that the VTA alarm was activated while the vehicle was unattended.

INTRUSION ALARM

The intrusion alarm is an exclusive feature of the export premium version of the VTA, which is only available in certain markets where it is required. When the VTA is armed, the intrusion module uses hard wired outputs to control an ultrasonic transmitter and receiver which allows the module to monitor the interior of the vehicle for movement. If motion is detected, the intrusion module sends an electronic message to the TIPM over the CAN data bus to invoke the visual alarm features, and sends an electronic message to the alarm siren in the engine compartment over a dedicated serial bus to invoke the audible alarm feature.

The motion detect feature of the intrusion module can be disabled by depressing the LOCK button on the RKE transmitter 3 times within 15 seconds during VTA arming, while the security indicator is still flashing rapidly. The VTA provides a single short siren chirp as an audible confirmation that the motion detect disable request has been received.

The intrusion module must be electronically enabled in order for the intrusion alarm to perform as designed. The intrusion alarm function of the intrusion module is enabled on vehicles equipped with this option at the factory, but a service replacement module must be configured and enabled by the dealer using a diagnostic scan tool. The intrusion module monitors the condition of the transmitter and receiver sensors as well as the siren, and will store fault information in the form of a Diagnostic Trouble Code (DTC) if a system malfunction is detected. The intrusion module may be diagnosed, and any stored DTC can be retrieved using a diagnostic scan tool.

SENTRY KEY IMMOBILIZER SYSTEM

The Sentry Key Immobilizer System (SKIS) is designed to provide passive protection against unauthorized vehicle use by disabling the engine after about two seconds of running whenever any method other than a valid Sentry Key is used to start the vehicle. The SKIS is considered a passive protection system because it is always active when the ignition system is energized and does not require any customer intervention. The SKIS uses Low Frequency (LF) Radio Frequency (RF) communication to obtain confirmation that the key in the ignition switch is a valid key for operating the vehicle. The microprocessor-based SKIS hardware and software also uses electronic messages to communicate with other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. Refer to **OPERATION** .

Pre-programmed Sentry Key transponders are provided with the vehicle from the factory. Each Sentry Key REMote Entry Module (SKREEM) (also known as the Sentry Key Immobilizer Module/SKIM or the Wireless Control Module/WCM) will recognize a maximum of eight Sentry Keys. If the customer would like additional keys other than those provided with the vehicle, they may be purchased from any authorized dealer. These additional keys must be programmed to the SKREEM in the vehicle in order for the system to recognize them as valid keys. This can be done by the dealer using a diagnostic scan tool or, if Customer Learn programming is an available SKIS feature in the market where the vehicle was purchased, the customer can program the additional keys, as long as at least two valid Sentry Keys are already available. See **STANDARD PROCEDURE**.

The SKREEM performs a self-test of the SKIS each time the ignition switch is turned to the ON position, and will store fault information in the form of a Diagnostic Trouble Code (DTC) if a system malfunction is detected. The SKREEM will also send an electronic message to the instrument cluster if a fault is detected, and the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) illuminates the security indicator as appropriate.

The hard wired circuits between components related to the SKIS may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SKIS or the electronic controls or communication between other modules and devices that provide some features of the SKIS. The most reliable, efficient, and accurate means to diagnose the SKIS or the electronic controls and communication related to SKIS operation requires the use of a diagnostic scan tool.

DIAGNOSIS AND TESTING

VEHICLE THEFT SECURITY SYSTEM

The Vehicle Theft Security System (VTSS) is divided into two basic subsystems: Vehicle Theft Alarm (VTA) and Sentry Key Immobilizer System (SKIS). Following are the recommended procedures for diagnosis of each of these two subsystems.

VEHICLE THEFT ALARM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired circuits between components related to the VTA system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the VTA system or the electronic controls or communication between other modules and devices that provide some features of the VTA system. The most reliable, efficient, and accurate means to diagnose the VTA system or the electronic controls and communication related to VTA system operation requires the use of a diagnostic scan tool. See the **Vehicle Theft Security System** menu item on the scan tool.

SENTRY KEY IMMOBILIZER SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component

diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired circuits between components related to the SKIS may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SKIS or the electronic controls or communication between other modules and devices that provide some features of the SKIS. The most reliable, efficient, and accurate means to diagnose the SKIS or the electronic controls and communication related to SKIS operation requires the use of a diagnostic scan tool.

SENTRY KEY IMMOBILIZER SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
SECURITY INDICATOR FAILS TO LIGHT DURING BULB TEST	1. Ineffective Light-Emitting Diode (LED). 2. Ineffective fuse. 3. Ineffective ground circuit. 4. Ineffective battery feed circuit. 5. Ineffective ignition feed circuit.	1. Use a diagnostic scan tool to perform the instrument cluster actuator test. 2. Check the SKREEM/WCM fused B(+) fuse and the fused ignition switch output (run-start) fuse in the Totally Integrated Power Module (TIPM). Replace the fuses, if required. 3. Test and repair the open ground circuit at the connector for the SKREEM, if required. 4. Test and repair the open battery feed circuit at the connector for the SKREEM, if required. 5. Test and repair the open ignition feed circuit at the connector for the SKREEM, if required.
SECURITY INDICATOR FLASHES FOLLOWING BULB TEST	1. Invalid key in ignition switch lock cylinder. 2. Key-related fault.	1. Replace the key with a known valid key. 2. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis.
SECURITY INDICATOR LIGHTS SOLID FOLLOWING BULB TEST	1. SKIS system malfunction/fault detected. 2. SKIS system ineffective.	1. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis. 2. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis.

STANDARD PROCEDURE

SENTRY KEY TRANSPONDER PROGRAMMING

All Sentry Keys included with the vehicle are pre-programmed to work with the Sentry Key Immobilizer System (SKIS) when it is shipped from the factory. The Sentry Key REMote Entry Module (SKREEM) (also known as the Sentry Key Immobilizer Module/SKIM or the Wireless Control Module/WCM) may be programmed to recognize up to a total of eight Sentry Keys. When programming a blank Sentry Key transponder, the key must first be cut to match the ignition switch lock cylinder in the vehicle for which it will be used. Once the additional or new key has been cut, the SKREEM must be programmed to recognize it as a valid key. There are two possible methods to program the SKREEM to recognize a new or additional valid key, the Secured Access Method and the Customer Learn Method. Following are the details of these two programming methods.

SECURED ACCESS METHOD

The Secured Access method applies to all vehicles. This method requires the use of a diagnostic scan tool. This method will also require that you have access to the unique four-digit PIN code that was assigned to the original SKREEM. The PIN code **must** be used to enter the Secured Access Mode in the SKREEM. This PIN number may be obtained from the vehicle owner, from the original vehicle invoice, or from the DaimlerChrysler Customer Center. Refer to **STANDARD PROCEDURE** .

CUSTOMER LEARN METHOD

NOTE: **The Customer Learn feature is only available on domestic vehicles, or those vehicles which have a U.S. country code designator. This programming method also requires access to at least two valid Sentry Keys. If two valid Sentry Keys are not available, or if the vehicle does not have a U.S. country code designator, the Secured Access Method MUST be used to program new or additional valid keys to the SKREEM.**

The Customer Learn programming method procedures are as follows:

1. Obtain the blank Sentry Key(s) that are to be programmed as valid keys for the vehicle. Cut the blank key (s) to match the ignition switch lock cylinder mechanical key codes.
2. Insert one of the two valid Sentry Keys into the ignition switch and turn the ignition switch to the ON position.
3. After the ignition switch has been in the ON position for longer than 3 seconds, but no more than 15 seconds, cycle the ignition switch back to the OFF position. Replace the first valid Sentry Key in the ignition switch lock cylinder with the second valid Sentry Key and turn the ignition switch back to the ON position. The second valid Sentry Key must be inserted in the lock cylinder within 15 seconds of removing the first valid key.
4. About 10 seconds after the completion of step 3, the security indicator in the instrument cluster will start to flash and a single audible chime will sound to indicate that the system has entered the Customer Learn programming mode.
5. Within 60 seconds of entering the Customer Learn programming mode, turn the ignition switch to the OFF position, replace the valid Sentry Key with a blank Sentry Key transponder, and turn the ignition

switch back to the ON position.

6. About 10 seconds after the completion of step 5, a single audible chime will sound and the security indicator will stop flashing, stay ON solid for 3 seconds, then turn OFF to indicate that the blank Sentry Key has been successfully programmed. The SKIS will immediately exit the Customer Learn programming mode. After the ignition is cycled the vehicle may be started using the newly programmed valid Sentry Key.

Each of these steps must be repeated and completed in their entirety for each additional Sentry Key that is to be programmed. If the above steps are not completed in the given sequence, or within the allotted time, the SKIS will exit the Customer Learn programming mode and the programming will be unsuccessful. The SKREEM will also automatically exit the Customer Learn programming mode if it sees a non-blank Sentry Key transponder when it should see a blank, if it has already programmed 8 valid Sentry Keys, or if the ignition switch is turned to the OFF position for more than about 50 seconds.

NOTE: If an attempt is made to start the vehicle while in the Customer Learn mode (security indicator flashing), the SKIS will respond as though the vehicle were being started with an invalid key. In other words, the engine will stall after about two seconds of operation. No faults will be set.

NOTE: Once a Sentry Key has been programmed as a valid key to a vehicle, it cannot be programmed as a valid key for use on any other vehicle.

SKIS INITIALIZATION

The Sentry Key Immobilizer System (SKIS) must be initialized following a Sentry Key REmote Entry Module (SKREEM) (also known as the Sentry Key Immobilizer Module/SKIM or the Wireless Control Module/WCM) replacement. SKIS initialization requires the use of a diagnostic scan tool. Initialization will also require that you have access to the unique four-digit PIN code that was assigned to the original SKREEM. The PIN code **must** be used to enter the Secured Access Mode in the SKREEM. This PIN number may be obtained from the vehicle owner, from the original vehicle invoice, or from the DaimlerChrysler Customer Center. Refer to **STANDARD PROCEDURE** .

NOTE: If a Powertrain Control Module (PCM) is replaced on a vehicle equipped with the Sentry Key Immobilizer System (SKIS), the unique Secret Key data must be transferred from the Sentry Key REmote Entry Module (SKREEM) (also known as the Sentry Key Immobilizer Module/SKIM or the Wireless Control Module/WCM) to the new PCM using the appropriate programming procedure. This procedure also requires the use of a diagnostic scan tool and the unique four-digit PIN code to enter the Secured Access Mode in the SKREEM. Refer to the appropriate service and diagnostic information for the proper PCM replacement procedure.

SWITCH-HOOD AJAR

DESCRIPTION

HOOD AJAR SWITCH

81428481

Fig. 2: Hood Ajar Switch
 Courtesy of CHRYSLER LLC

The hood ajar switch is a normally closed, single pole, spring-loaded plunger actuated switch. This switch has two unique versions that are used in two different applications. One switch is used only on vehicles equipped

with the Vehicle Theft Alarm (VTA) system for sale in certain export markets where protection of the underhood area is required equipment. The second switch is used only on domestic vehicles equipped with an optional remote starter system.

The molded plastic switch body (5) has an integral molded connector receptacle (1) on the lower end containing two terminal pins. The switch is connected to the vehicle electrical system through a dedicated take out of the engine compartment wire harness. Two integral latches (2) lock the switch into a keyed mounting hole in an a molded plastic cup-like adapter that, in turn snaps into a horizontal bracket that extends rearward from the top of the front end module carrier, to the left of center at the front of the engine compartment. The underside of the hood panel inner reinforcement actuates the switch plunger as the hood panel is closed.

The switch plunger (3) extends through a mounting collar (4) and a sleeve-like retainer ring on the upper end of the switch body. The retainer ring has a one time, self-adjustment feature that is activated after the switch is installed by closing the hood. The retainer ring is also color-coded to aid in identifying the switch application. A dark brown retainer ring identifies the underhood security switch application, while a white retainer ring identifies the remote starter system application.

An installed hood ajar switch cannot be readjusted or repaired. If the switch is damaged, ineffective, or requires readjustment, it must be replaced with a new unit.

OPERATION

HOOD AJAR SWITCH

The hood ajar switches are interchangeable physically, but not functionally. In each case, the hood ajar switch is a normally closed switch that is held open as the spring-loaded switch plunger is depressed by the inner hood panel reinforcement when the hood panel is closed and latched. When the hood is opened, the spring-loaded switch plunger extends from the switch body and the switch contacts are closed.

In the underhood security application (export vehicles only - dark brown retainer ring), the switch is connected in series between ground and the hood ajar switch sense input of the Totally Integrated Power Module (TIPM). The TIPM uses an internal resistor pull up to monitor the state of the hood ajar switch contacts.

In the remote starter system application (domestic vehicles only - white retainer ring) the switch has a 1 kilohm diagnostic resistor connected in parallel to the switch contacts between the two switch terminals. The switch is connected in series between an output of the TIPM and the hood ajar switch sense input of the TIPM. The TIPM continually monitors this circuit and will store a Diagnostic Trouble Code (DTC) for any fault that it detects.

The components of the switch self-adjustment feature include an integral stop on the shaft of the plunger and a ribbed, ratcheting sleeve-like retainer ring at the top of the switch body from which the plunger extends. With the switch mounting collar secured in its mounting hole, the plunger is depressed by the hood inner reinforcement as the hood is closed. As the plunger is depressed, the plunger stop contacts the top of the retainer ring and it is driven downward, ratcheting through the switch mounting collar until the hood is fully closed and latched. The ribs on the retainer ring are engaged within the mounting collar to maintain this adjusted position.

The hood ajar switch as well as the hard wired circuits between the switch and the TIPM may be diagnosed using conventional diagnostic tools and procedures. However, conventional diagnostic methods will not prove

conclusive in the diagnosis of the electronic controls or communication between modules and other devices related to hood ajar switch operation that provide some features of the export vehicle theft or domestic remote starter systems. The most reliable, efficient, and accurate means to diagnose the electronic controls and communication related to hood ajar switch operation requires the use of a diagnostic scan tool.

REMOVAL

HOOD AJAR SWITCH

Fig. 3: Switch And Adapter
Courtesy of CHRYSLER LLC

1. Unlatch and open the hood.
2. Disconnect and isolate the battery negative cable.
3. From below the mounting tab of the front end module carrier (3) on the left side of the engine compartment, compress the sides of the adapter (1) far enough to push the hood ajar switch (2) and adapter up through the mounting tab.
4. Pull the switch and adapter up through the hole in the mounting tab far enough to access and disconnect the wire harness connector (4) from the switch connector receptacle.
5. From the bottom of the adapter, squeeze the two switch latch tabs together and push the switch up through the adapter.
6. Remove the hood ajar switch from the vehicle.

INSTALLATION

HOOD AJAR SWITCH

Fig. 4: Switch And Adapter
Courtesy of CHRYSLER LLC

1. Position the hood ajar switch (2) to the mounting hole in the adapter (1).
2. Press the switch down through the adapter mounting hole until the integral switch latch tabs lock it into place.
3. Pull the wire harness connector (4) up through the mounting tab of the front end module carrier mounting tab (3) and reconnect it to the switch connector receptacle.
4. Insert the switch and adapter into the mounting tab and press them downward until the adapter snaps into place.
5. Reconnect the battery negative cable.
6. Close and latch the hood.

INTRUSION MODULE

DESCRIPTION

INTRUSION MODULE

81598867

Fig. 5: Identifying Intrusion Module
Courtesy of CHRYSLER LLC

An intrusion module (1) is part of the premium version of the Vehicle Theft Alarm (VTA) in the Vehicle Theft Security System (VTSS). The premium version of the VTA is only available in vehicles built for certain markets, where the additional features offered by this system are required. The intrusion module is located in the passenger compartment. This unit is designed to work in conjunction with the intrusion sensor transmitter and intrusion sensor receiver to provide interior motion detection and serves as the interface between the Totally Integrated Power Module (TIPM), the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and the alarm siren.

The molded plastic intrusion module housing has two integral mounts (2) that are secured by two push-in plastic fasteners to the left inner D-pillar just below the belt line. The module is concealed beneath the quarter inner trim panel. Concealed within the molded plastic housing is the circuitry of the module, which includes a microprocessor. The module is connected through an integral connector receptacle (3) to the vehicle electrical system by a take out and connector of the body wire harness.

The intrusion module unit cannot be adjusted or repaired and, if ineffective or damaged, it must be replaced.

OPERATION

INTRUSION MODULE

The microprocessor in the intrusion module contains the motion detection logic circuits and controls all of the features of the premium version of the Vehicle Theft Alarm (VTA). The module uses On-Board Diagnostics (OBD) and can communicate with other modules in the vehicle as well as with a diagnostic scan tool using the Controller Area Network (CAN) data bus. This method of communication is used by the module to communicate with the Totally Integrated Power Module (TIPM) and for diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel. The intrusion module also communicates with the alarm siren over a dedicated serial bus circuit.

The intrusion module microprocessor continuously monitors inputs from the intrusion sensor transmitter and receiver as well as inputs from the TIPM and the alarm siren module. The module energizes the intrusion sensor transmitter, which transmits ultrasonic signals into the vehicle cabin through a transmit transducer, then monitors the current draw of the transmitter to detect problems with the transmitter and transmitter circuits. The module also energizes the intrusion sensor receiver, which listens to the ultrasonic signals through a receive transducer as they bounce off of objects in the vehicle interior, then monitors the current draw of the receiver for data signals and to detect problems with the receiver and receiver circuits. If an object is moving in the interior, a detection circuit in the module senses this movement through the modulation of the returning data signals from the receiver.

If movement is detected while the VTA is armed, the intrusion module sends an electronic status message to the TIPM over the CAN data bus to flash the exterior lighting, and sends an electronic message to the alarm siren module over a dedicated serial bus line to sound the siren. When the TIPM detects a breach in the perimeter protection through a door, liftgate or hood ajar switch input, it flashes the exterior lighting and sends an electronic message to the intrusion module and the module sends an electronic message to the alarm siren module over a dedicated serial bus line to sound the siren.

The module also monitors message inputs from the alarm siren module for siren battery or siren input/output circuit tamper alerts, and for siren battery condition alerts, then sets active and stored Diagnostic Trouble Codes (DTC) for any monitored system faults it detects. An active fault only remains for the current ignition switch cycle, while a stored fault causes a DTC to be stored in memory by the intrusion module. If a fault does not recur for 50 ignition cycles, the module will automatically erase the stored DTC.

The intrusion module is connected to the vehicle electrical system through the body wire harness. The module receives battery current through a fuse in the TIPM, and receives ground through the body wire harness. These connections allow the module to remain operational, regardless of the ignition switch position.

The hard wired circuits of the intrusion module may be diagnosed using conventional diagnostic tools and procedures. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the intrusion module or the electronic controls or communication between modules and other devices that provide some features of the VTA. The most reliable, efficient, and accurate means to diagnose the intrusion module or the electronic controls and communication related to intrusion module operation requires the use of a diagnostic scan tool.

REMOVAL

INTRUSION MODULE

Fig. 6: Identifying Intrusion Module , Left Inner D-Pillar, Plastic Push-In Fasteners & Body Wire Harness

Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Partially remove the trim from the inside of the left inner D-pillar (3). Refer to **REMOVAL** .
3. Disconnect the take out of the body wire harness (2) from the connector receptacle on the forward-facing side of the intrusion module (1).
4. Remove the two plastic push-in fasteners (4) that secure the module to the inner D-pillar.
5. Remove the module from the inner D-pillar.

INSTALLATION

INTRUSION MODULE

Fig. 7: Identifying Intrusion Module , Left Inner D-Pillar, Plastic Push-In Fasteners & Body Wire

Harness
Courtesy of CHRYSLER LLC

1. Position the intrusion module (1) onto the left inner D-pillar (3).
2. Install the two plastic push-in fasteners (4) that secure the module to the inner D-pillar.
3. Reconnect the take out of the body wire harness (2) to the connector receptacle on the forward-facing side of the module.
4. Reinstall the trim onto the inside of the left inner D-pillar. Refer to **INSTALLATION** .
5. Reconnect the battery negative cable.

INTRUSION SENSOR

DESCRIPTION

INTRUSION SENSOR RECEIVER

8159832b

Fig. 8: Intrusion Sensor Receiver
Courtesy of CHRYSLER LLC

An intrusion sensor receiver (1) is part of the premium version of the Vehicle Theft Alarm (VTA) in the Vehicle Theft Security System (VTSS). The premium version of the VTA is only available in vehicles built for certain markets, where the additional features offered by this system are required. This unit is designed to work in conjunction with the intrusion sensor transmitter to provide interior motion detection inputs to the intrusion module, which serves as the interface between the Totally Integrated Power Module (TIPM), the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and the alarm siren.

The receiver is located in the passenger compartment, where it is concealed above the headliner. A molded plastic mounting bracket with three integral latch features is secured to the right front corner of the mini-overhead console housing and engages three latch tabs integral to the receiver housing. The ultrasonic receiver transducer (2) is aimed through a small dedicated round opening in the right side of the overhead console forward of the reading lamps and is the only evidence of the receiver that is visible from the passenger

compartment.

Concealed within the molded plastic receiver housing is the circuitry of the receiver which includes the receive transducer. The receiver is connected through an integral connector receptacle (3) to the vehicle electrical system by a take out and connector of the overhead wire harness that is integral to the headliner.

The intrusion sensor receiver cannot be adjusted or repaired and, if ineffective or damaged, it must be replaced. The receiver mounting bracket is serviced as a unit with the overhead console.

INTRUSION SENSOR TRANSMITTER

81596364

Fig. 9: Intrusion Sensor Transmitter
Courtesy of CHRYSLER LLC

An intrusion sensor transmitter (2) is part of the premium version of the Vehicle Theft Alarm (VTA) in the Vehicle Theft Security System (VTSS). The premium version of the VTA is only available in vehicles built for

certain markets, where the additional features offered by this system are required. This unit is designed to work in conjunction with the intrusion sensor receiver to provide interior motion detection inputs to the intrusion module, which serves as the interface between the Totally Integrated Power Module (TIPM), the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and the alarm siren.

The transmitter is located in the passenger compartment, where it is concealed above the headliner. A molded plastic mounting bracket with two locating pins engages the holes in two locating tabs (4) integral to the transmitter housing and the housing is secured in place by two latch features integral to the bracket. Only a small dedicated molded plastic transducer trim bezel secured by a snap fit to the tubular ultrasonic transducer housing and extends vertically downward from the base of the transmitter housing is visible below the right rear corner of the headliner. The trim bezel has a small round opening that faces the front of the vehicle through which the transducer is aimed.

Concealed within the molded plastic transmitter housing is the circuitry of the transmitter which includes an ultrasonic transmit transducer (1). The transmitter is connected through an integral connector receptacle (3) to the vehicle electrical system by a take out and connector of the overhead wire harness that is integral to the headliner.

The intrusion sensor transmitter cannot be adjusted or repaired and, if ineffective or damaged, it must be replaced. The transmitter mounting bracket is serviced as a unit with the headliner. The transducer trim bezel is available for separate service replacement.

OPERATION

INTRUSION SENSOR RECEIVER

The intrusion sensor receiver operates only when it is energized by the intrusion module. The receiver monitors ultrasonic signals generated in the vehicle cabin by the intrusion sensor transmitter through a receive transducer. The receiver listens to the ultrasonic signals as they bounce off of objects in the vehicle interior and provides input signals to the intrusion module. If an object is moving in the interior, a detection circuit in the intrusion module senses this movement through the modulation of the returning signals that occur due to the Doppler effect. The intrusion module monitors the current draw of the receiver circuits to determine the condition of the receiver and, if the draw is too high or too low, it will store a Diagnostic Trouble Code (DTC) for any fault that is detected.

The hard wired circuits for the intrusion sensor receiver may be diagnosed using conventional diagnostic tools and procedures. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the intrusion sensor receiver or the electronic controls and communication between other modules and devices that provide some features of the VTA system. The most reliable, efficient, and accurate means to diagnose the intrusion sensor receiver or the electronic controls and communication related to intrusion sensor receiver operation requires the use of a diagnostic scan tool.

INTRUSION SENSOR TRANSMITTER

The intrusion sensor transmitter operates only when it is energized by the intrusion module. The transmitter generates ultrasonic signals into the vehicle cabin through a transmit transducer. Then the intrusion sensor receiver listens to the returning signals as they bounce off of objects in the vehicle interior and provides input

signals to the intrusion module. If an object is moving in the interior, a detection circuit in the intrusion module senses this movement through the modulation of the returning signals that occur due to the Doppler effect. The intrusion module monitors the current draw of the transmitter circuits to determine the condition of the transmitter and, if the draw is too high or too low, it will store a Diagnostic Trouble Code (DTC) for any fault that is detected.

The hard wired circuits for the intrusion sensor transmitter may be diagnosed using conventional diagnostic tools and procedures. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the intrusion sensor transmitter or the electronic controls or communication between other modules and devices that provide some features of the VTA system. The most reliable, efficient, and accurate means to diagnose the intrusion sensor transmitter or the electronic controls and communication related to intrusion sensor transmitter operation requires the use of a diagnostic scan tool.

REMOVAL

INTRUSION SENSOR RECEIVER

Fig. 10: Removing/Installing Intrusion Sensor Receiver
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the overhead console from the headliner. Refer to **REMOVAL** .
3. Locate the intrusion sensor receiver (1) in the mounting bracket (4) on the right front corner of the overhead console housing (3).
4. Disconnect the take out of the overhead wire harness from the connector receptacle (5) on the rearward end of the receiver housing.
5. Release the three latch features (2) of the mounting bracket and disengage the receiver from the bracket.

INTRUSION SENSOR TRANSMITTER

Fig. 11: Remove/Install Bezel
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Pull the bezel (1) straight down from the headliner (3) to unsnap it from the transducer housing (2) of the intrusion sensor transmitter. Be certain to take the appropriate precautions not to soil or damage the headliner.
3. Remove the trim from the upper liftgate opening. Refer to **REMOVAL** .
4. Partially remove the quarter trim panel from both upper D-pillars. Refer to **REMOVAL** .

Fig. 12: Remove/Install Intrusion Sensor Transmitter
Courtesy of CHRYSLER LLC

5. Carefully pull down the right rear edge of the headliner (1) from the upper liftgate opening far enough to reach between the headliner and the roof panel to access the transmitter (2) and mounting bracket (4) on the headliner substrate.
6. Disconnect the take out of the overhead wire harness (1) from the connector receptacle on the right side

of the transmitter housing.

7. Release the two latch features (3) of the mounting bracket and disengage the transmitter from the locating pins of the bracket.
8. Remove the transmitter from between the headliner and the roof panel.

INSTALLATION

INTRUSION SENSOR RECEIVER

Fig. 13: Removing/Installing Intrusion Sensor Receiver
Courtesy of CHRYSLER LLC

1. Position the intrusion sensor receiver (1) to the mounting bracket (4) on the right front corner of the overhead console housing (3).
2. Press the receiver down until the three latch features (2) of the bracket are fully engaged.

3. Reconnect the take out of the overhead wire harness to the connector receptacle (5) on the rearward end of the receiver housing.
4. Reinstall the overhead console onto the headliner. Refer to **INSTALLATION**.
5. Reconnect the battery negative cable.

INTRUSION SENSOR TRANSMITTER

Fig. 14: Remove/Install Intrusion Sensor Transmitter
Courtesy of CHRYSLER LLC

1. Carefully pull down the right rear edge of the headliner from the upper liftgate opening far enough to reach between the headliner and the roof panel to position the intrusion sensor transmitter (2) over the locating pins of the mounting bracket (4) on the headliner substrate.
2. Press the transmitter down until the two latch features (3) of the mounting bracket are fully engaged.

3. Reconnect the take out of the overhead wire harness (1) to the connector receptacle on the right side of the transmitter housing.
4. Reinstall the quarter trim panel onto both upper D-pillars. Refer to **INSTALLATION** .
5. Reinstall the trim onto the upper liftgate opening. Refer to **INSTALLATION** .

Fig. 15: Remove/Install Bezel
Courtesy of CHRYSLER LLC

6. Position the bezel (1) over the transducer housing (2) of the intrusion sensor transmitter and press it straight upward until it snaps into place against the headliner (3). Be certain to take the appropriate precautions not to soil or damage the headliner.
7. Reconnect the battery negative cable.

SENTRY KEY REMOTE ENTRY MODULE

DESCRIPTION

SENTRY KEY REMOTE ENTRY MODULE

Fig. 16: Identifying Sentry Key Remote Entry Module
Courtesy of CHRYSLER LLC

The Sentry Key Remote Entry Module (SKREEM) (3) (also known as the Sentry Key Immobilizer Module/SKIM or the Wireless Control Module/WCM) is the primary component of the Sentry Key Immobilizer System (SKIS). It is also the receiver for the Remote Keyless Entry (RKE) system and the Tire Pressure Monitor (TPM) system. The SKREEM is located on the right side of the steering column near the ignition lock cylinder housing and is concealed beneath the column shrouds. The molded black plastic housing for the SKREEM has an integral molded plastic halo-like antenna ring (1) that extends from one side. When the SKREEM is properly installed, the antenna ring is oriented around the circumference of the ignition lock cylinder housing.

A single integral connector receptacle (4) is located adjacent to the antenna ring on the SKREEM housing. An integral molded plastic mounting tab (2) on the SKREEM housing has a hole in the center through which a screw passes to secure the unit to the steering column lock housing. The SKREEM is connected to the vehicle electrical system through a single take out and connector of the instrument panel wire harness.

The SKREEM cannot be adjusted or repaired. If ineffective or damaged, the entire SKREEM unit must be replaced.

OPERATION

SENTRY KEY REMOTE ENTRY MODULE

The Sentry Key Remote Entry Module (SKREEM) (also known as the Sentry Key Immobilizer Module/SKIM or the Wireless Control Module/WCM) contains a Radio Frequency (RF) transceiver and a microprocessor. The SKREEM transmits RF signals to, and receives RF signals from the Sentry Key transponder through a tuned antenna enclosed within the molded plastic antenna ring integral to the SKREEM housing. If this antenna ring is not mounted properly around the ignition lock cylinder housing, communication problems between the SKREEM and the transponder may arise. These communication problems will result in Sentry Key transponder-related faults.

The SKREEM also serves as the Remote Keyless Entry (RKE) RF receiver and, if the vehicle is so equipped, the receiver for the Tire Pressure Monitoring (TPM) system. Refer to **DESCRIPTION** for power locks, or **DESCRIPTION** for Tire Pressure Monitoring. The SKREEM communicates over the Controller Area Network (CAN) data bus with the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN), the Powertrain Control Module (PCM), the Totally Integrated Power Module (TIPM) or the diagnostic scan tool.

The SKREEM and the PCM both use software that includes a rolling code algorithm strategy, which helps to reduce the possibility of unauthorized Sentry Key Immobilizer System (SKIS) disarming. The rolling code algorithm ensures security by preventing an override of the SKIS through the unauthorized substitution of the SKREEM or the PCM. However, the use of this strategy also means that replacement of either the SKREEM or the PCM units will require a system initialization procedure to restore system operation.

The SKREEM retains in memory the ID numbers of any Sentry Key transponder that is programmed into it. A maximum of eight Sentry Key transponders can be programmed into the SKREEM. For added system security, each SKREEM is programmed with a unique Secret Key code. This code is stored in memory, sent over the CAN data bus to the PCM, and is encoded to the transponder of every Sentry Key that is programmed into the SKREEM. Therefore, the Secret Key code is a common element that is found in every component of the SKIS.

Another security code, called a PIN, is used to gain access to the SKREEM Secured Access Mode. The Secured Access Mode is required during service to perform the SKIS initialization and Sentry Key transponder programming procedures. The SKREEM also stores the Vehicle Identification Number (VIN) in its memory, which it learns through a CAN data bus message from the PCM during SKIS initialization.

In the event that a SKREEM replacement is required, the Secret Key code can be transferred to the new SKREEM from the PCM using the diagnostic scan tool and the SKIS initialization procedure. Proper completion of the SKIS initialization will allow the existing Sentry Keys to be programmed into the new SKREEM so that new keys will not be required. In the event that the original Secret Key code cannot be recovered, SKREEM replacement will also require new Sentry Keys. The diagnostic scan tool will alert the technician during the SKIS initialization procedure if new Sentry Keys are required.

When the key is inserted into the ignition switch and when the ignition switch is turned to the ON position, the SKREEM transmits an RF signal to excite the transponder in the ignition key. The SKREEM then waits for an RF signal response from the transponder. If the response received identifies the key as valid, the SKREEM sends an electronic **valid key** message over the CAN data bus. If the response received identifies the key as invalid or if no response is received from the key transponder, the SKREEM sends an **invalid key** message. The PCM will enable or disable engine operation based upon the status of the SKREEM messages. It is important to note that the default condition in the PCM is an **invalid key** ; therefore, if no message is received from the SKREEM by the PCM, the engine will be disabled and the vehicle immobilized after two seconds of running.

The SKREEM also sends electronic **security indicator** request messages to the EMIC over the CAN data bus to tell the EMIC how to operate the security indicator. The **security indicator** request message from the SKREEM tells the EMIC to turn the indicator ON for about three seconds each time the ignition switch is turned to the ON position as a bulb test. After completion of the bulb test, the SKREEM sends **security indicator** request messages to the EMIC to turn the indicator OFF, turn the indicator ON, or to flash the indicator ON and OFF. If the security indicator flashes or stays ON solid after the bulb test, it signifies a SKIS fault. If the SKREEM detects a system malfunction or the SKIS has become ineffective, the security indicator will stay ON solid. If the SKREEM detects an invalid key or if a key transponder-related fault exists, the

security indicator will flash. If the vehicle is equipped with the Customer Learn transponder programming feature, the SKREEM will also send messages to the EMIC to flash the security indicator whenever the Customer Learn programming mode is being utilized. See **STANDARD PROCEDURE**.

The SKIS performs a self-test each time the ignition switch is turned to the ON position, and will store fault information in the form of a Diagnostic Trouble Code (DTC) in SKREEM memory if a system malfunction is detected. The hard wired circuits of the SKREEM may be diagnosed using conventional diagnostic tools and procedures. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SKREEM or the electronic controls or communication between other modules and devices that provide some features of the SKIS. The most reliable, efficient, and accurate means to diagnose the SKREEM or the electronic controls and communication related to SKREEM operation requires the use of a diagnostic scan tool.

REMOVAL

SENTRY KEY REMOTE ENTRY MODULE

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 17: Identifying Sentry Key Remote Entry Module
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove but do not disconnect the right multi-function switch from the integral mounting bracket (1) on the right side of the clockspring and position it so that the Sentry Key REmote Entry Module (SKREEM) (also known as the Sentry Key Immobilizer Module/SKIM or the Wireless Control Module/WCM)

mounting screw (2) may be accessed. Refer to **REMOVAL** .

3. Disconnect the instrument panel wire harness connector (4) from the SKREEM (3) connector receptacle.
4. Remove the screw that secures the SKREEM to the boss on the top of the ignition lock cylinder housing (5).
5. Disengage the SKREEM antenna ring from around the ignition lock housing and remove the SKREEM from the steering column.

INSTALLATION

SENTRY KEY REMOTE ENTRY MODULE

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 18: Identifying Sentry Key Remote Entry Module
Courtesy of CHRYSLER LLC

1. Position the Sentry Key Remote Entry Module (SKREEM) (3) (also known as the Sentry Key Immobilizer Module/SKIM or the Wireless Control Module/WCM) onto the steering column ignition lock housing with the antenna ring oriented around the lock cylinder (5).
2. Install and tighten the screw (2) that secures the SKREEM mounting bracket to the boss on the top of the ignition lock housing. Tighten the screw to 2 N.m (20 in. lbs.).
3. Reconnect the instrument panel wire harness connector (4) to the SKREEM connector receptacle.
4. Reinstall the right multi-function switch onto the integral mounting bracket (1) on the right side of the

clockspring. Refer to **INSTALLATION** .

5. Reconnect the battery negative cable.

NOTE: On vehicles equipped with the Sentry Key Immobilizer System (SKIS), when the SKREEM is replaced with a new unit, a diagnostic scan tool **MUST** be used to initialize the new SKREEM and to program at least two Sentry Key transponders before the vehicle can be operated. See **STANDARD PROCEDURE**.

NOTE: On vehicles equipped with a Tire Pressure Monitoring (TPM) system and a full-sized matching spare tire and wheel assembly, when the SKREEM or the spare tire pressure sensor is replaced with a new unit, a diagnostic scan tool **MUST** be used to run a routine that allows the SKREEM to be programmed with the ID number and location of the spare tire pressure sensor mounted in the wheel of the spare tire. This may be done using a TPM-RKE Analyzer special tool by following the programming steps outlined in the diagnostic scan tool for Program Tire Sensor ID w/TPM Tool under Miscellaneous Functions for the WCM/Wireless Control Module menu item. If a TPM-RKE Analyzer special tool is not available, the spare tire must be dismounted from its wheel to access and note the ID number on the spare tire pressure sensor so that the ID code for that sensor can be programmed into the new SKREEM. Follow the programming steps outlined in the diagnostic scan tool for Learn Spare Tire Sensor ID also found under Miscellaneous Functions for the WCM/Wireless Control Module menu item. Refer to **INSTALLATION** .

SIREN

DESCRIPTION

SIREN

Fig. 19: Identifying Alarm Siren Module, Integral Connector Receptacle & Mounting Hole
Courtesy of CHRYSLER LLC

An alarm siren module (1) is part of the premium version of the Vehicle Theft Alarm (VTA) in the Vehicle Theft Security System (VTSS). The premium version of the VTA is only available in vehicles built for certain markets, where the additional features offered by this system are required. This unit is designed to provide the audible alert requirements for the premium VTA.

The alarm siren module consists of microprocessor-based electronic control circuitry, the siren, and a nickel metal hydride backup battery. All of the alarm module components are protected and sealed within a molded plastic housing. An integral connector receptacle (2) extends from the housing and connects the unit to the vehicle electrical system through a dedicated take out and connector of the front end module wire harness. The housing also has a threaded insert within a mounting hole (3) through which a screw secures it to the front end module carrier.

The siren is located on the engine compartment side of the front end module carrier, just behind the outboard side of the right front combination lamp unit housing. A single screw secures the siren module to a mounting tab of the front end module carrier.

The alarm siren module cannot be repaired or adjusted and, if ineffective or damaged, it must be replaced.

OPERATION

SIREN

The microprocessor within the alarm siren module provides the siren unit features and functions based upon internal programming and electronic **arm** and **disarm** messages received from the intrusion module over a dedicated serial bus communication circuit. The siren module receives battery voltage on a fused B(+) circuit through a fuse in the Totally Integrated Power Module (TIPM), and receives a path to ground through a ground circuit in the front end module wire harness. These connections allow the siren to remain operational, regardless of the ignition switch position.

When the premium version of the Vehicle Theft Alarm (VTA) is armed, the siren module continuously monitors electronic message inputs from the intrusion module to sound its internal siren. While armed, the siren also enters its auto-detect mode. While in the auto-detect mode, if the siren module detects that its power supply or communication circuits are being tampered with or have been sabotaged, it will sound an audible alarm and continue to operate through an on-board backup battery. If the siren module is in its disarmed mode when its power supply or communication circuits are interrupted, the siren will not sound.

The state of charge of the siren module backup battery is automatically maintained. The battery is trickle charged approximately 2 minutes during every hour of operation through the battery voltage and ground circuits to the siren module.

The siren will self-detect problems with its internal and external power supply and communication circuits, then send electronic messages indicating the problem to the intrusion module upon receiving an **arm** or **disarm** request message. The intrusion module will store a Diagnostic Trouble Code (DTC) for any detected alarm siren module fault. The DTC can then be retrieved with a diagnostic scan tool through the 16-way Data Link Connector (DLC) located under the driver side lower edge of the instrument panel over the Controller Area Network (CAN) data bus.

The hard wired inputs and outputs for the alarm siren module may be diagnosed using conventional diagnostic

tools and procedures. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the alarm siren module or the electronic controls or communication between other modules and devices that provide some features of the VTA system. The most reliable, efficient, and accurate means to diagnose the alarm siren module or the electronic controls and communication related to alarm siren module operation requires the use of a diagnostic scan tool.

REMOVAL

SIREN

Fig. 20: Alarm Siren Module, Module Carrier, Lamp Unit Housing
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Locate the alarm siren module (3) on the engine compartment side of the front end module carrier (1), just below the outboard side of the right front combination lamp unit housing (2).
3. Disconnect the front end module wire harness connector from the connector receptacle (4) for the siren.
4. Remove the right front combination lamp unit from the front of the vehicle. Refer to **REMOVAL** .
5. From the front of the vehicle, remove the screw that secures the siren to the mounting tab of the front end module carrier located behind the right front combination lamp unit.
6. Remove the siren from the engine compartment side of the carrier.

INSTALLATION

SIREN

Fig. 21: Alarm Siren Module, Module Carrier, Lamp Unit Housing
Courtesy of CHRYSLER LLC

1. Position the alarm siren module (3) to the engine compartment side of the mounting tab of the front end module carrier (1) located behind the right front combination lamp unit (2).
2. From the front of the vehicle, install and tighten the screw that secures the siren to the carrier. Tighten the screw to 14 N.m (10 ft. lbs.).
3. Reinstall the right front combination lamp unit onto the front of the vehicle. Refer to **INSTALLATION**.
4. Reconnect the front end module wire harness connector to the connector receptacle (4) of the siren.
5. Reconnect the battery negative cable.

NOTE: If the alarm siren module has been replaced with a new unit, a diagnostic scan tool **MUST** be used to initialize and configure the new unit in the intrusion module before the Vehicle Theft Security System (VTSS) can operate as designed. Follow the programming steps outlined in the diagnostic scan tool for **INITIALIZE SIREN** under **MISCELLANEOUS FUNCTIONS** for the **INTRUSION TRANSCIEVER MODULE/ITM** menu item as appropriate.

TRANSPONDER KEY

DESCRIPTION

TRANSPONDER KEY

Fig. 22: Identifying Ignition Key SKIS Components
Courtesy of CHRYSLER LLC

Each ignition key (2) used in the Sentry Key Immobilizer System (SKIS) has a transponder chip included on the circuit board (4) beneath the cover (1) of the integral Remote Keyless Entry (RKE) transmitter (3). In addition to having to be cut to match the mechanical coding of the ignition lock cylinder and programmed for operation of the RKE system, each new Sentry Key has a unique transponder identification code that is permanently programmed into it by the manufacturer, and which must be programmed into the Sentry Key Remote Entry Module (SKREEM) (also known as the Wireless Control Module/WCM) to be recognized by the SKIS as a valid key.

The Sentry Key transponder cannot be adjusted or repaired. If ineffective or damaged, the entire key and RKE transmitter unit must be replaced.

OPERATION

TRANSPONDER KEY

When the ignition switch is turned to the ON position, the Sentry Key Remote Entry Module (SKREEM) (also

known as the Wireless Control Module/WCM) communicates through its antenna with the Sentry Key transponder using a Radio Frequency (RF) signal. The SKREEM then listens for a RF response from the transponder through the same antenna. The Sentry Key transponder chip is within the range of the SKREEM transceiver antenna ring when it is inserted into the ignition lock cylinder. The SKREEM determines whether a valid key is present in the ignition lock cylinder based upon the response from the transponder. If a valid key is detected, that fact is communicated by the SKREEM to the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus, and the PCM allows the engine to continue running. If the PCM receives an **invalid key** message, or receives no message from the SKREEM over the CAN data bus, the engine will be disabled after about two seconds of operation. The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) will also respond to the **invalid key** message on the CAN data bus by flashing the security indicator ON and OFF.

Each Sentry Key has a unique transponder identification code permanently programmed into it by the manufacturer. Likewise, the SKREEM has a unique Secret Key code programmed into it by the manufacturer. When a Sentry Key is programmed into the memory of the SKREEM, the SKREEM stores the transponder identification code from the Sentry Key, and the Sentry Key learns the Secret Key code from the SKREEM. Once the Sentry Key learns the Secret Key code of the SKREEM, it is permanently stored in the memory of the transponder. Therefore, once a Sentry Key has been programmed to a particular vehicle, it cannot be used on any other vehicle. See **STANDARD PROCEDURE**.

The Sentry Key Immobilizer System (SKIS) performs a self-test each time the ignition switch is turned to the ON position, and will store key-related fault information in the form of a Diagnostic Trouble Code (DTC) in SKREEM memory if a Sentry Key transponder problem is detected. The Sentry Key transponder chip can be diagnosed, and any stored DTC can be retrieved using a diagnostic scan tool.

WIPERS/WASHERS - ELECTRICAL/DIAGNOSTICS

DIAGNOSIS AND TESTING

B2304-WIPER PARK SWITCH INPUT CIRCUIT LOW

Circuit Schematic

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The Totally Integrated Power Module (TIPM) detects a short to ground on the Wiper Park Switch Sense circuit.

Possible Causes

Possible Causes
(W7) WIPER PARK SWITCH SENSE CIRCUIT SHORT TO GROUND FRONT WIPER MOTOR TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1) INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Cycle the Wiper Switch on and off 3 times.

With the scan tool, read DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2) FRONT WIPER MOTOR.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2) FRONT WIPER MOTOR

Turn the ignition off.

Disconnect the Front Wiper Motor harness connector.

Turn the ignition on.

Wait 30 seconds.

With the scan tool, read the Front Wiper Park Switch Sense.

Does the Front Wiper Park Switch Sense display: False?

Yes

Replace the Front Wiper Motor in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3).

3) CHECK (W7) WIPER PARK SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Measure the resistance between ground and the (W7) Wiper Park Sense Circuit.

Is the resistance above 10k ohms?

Yes

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (W7) Wiper Park Switch Sense circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

B2305-WIPER PARK SWITCH INPUT CIRCUIT HIGH

Circuit Schematic

For complete wiring diagrams, refer to **SYSTEM WIRING DIAGRAMS** article.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The Totally Integrated Power Module (TIPM) does not detect a change from High to Low voltage on the Wiper Park Switch Sense Circuit.

Possible Causes

Possible Causes
(W7) WIPER PARK SWITCH SENSE CIRCUIT OPEN
(W7) WIPER PARK SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE
FRONT WIPER MOTOR
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1) INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Cycle the Wiper Switch on and off 3 times.

With the scan tool, read DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2).

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2) (W7) WIPER PARK SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Front Wiper Motor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, probe the (W7) Wiper Park Switch Sense circuit.

Does the test light illuminate brightly?

Yes

Repair the (W7) Wiper Park Switch Sense circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3).

3) CHECK THE FRONT WIPER MOTOR

Connect a jumper wire between the (W7) Wiper Park Switch Sense circuit and ground.

With the scan tool, read the Front Wiper Park Switch Sense.

Does the Front Wiper Park Switch Sense display: True?

Yes

Replace the Front Wiper Motor in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4).

4) CHECK (W7) WIPER PARK SWITCH SENSE CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Measure the resistance of the (W7) Wiper Park Switch Sense circuit between the Front Wiper Motor harness connector and the TIPM C7 harness connector.

Is the resistance below 10.0 ohms?

Yes

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (W7) Wiper Park Switch Sense circuit for an open.
Perform **BODY VERIFICATION TEST - VER 1** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The Totally Integrated Power Module (TIPM) detects a short to ground on the Rear Wiper Park Switch Sense circuit.

Possible Causes

Possible Causes
(W17) REAR WIPER PARK SWITCH SENSE CIRCUIT SHORTED TO GROUND REAR WIPER MOTOR TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1) INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Rear Wipers on then off.

With the scan tool, read DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2).

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2) REAR WIPER MOTOR

Turn the ignition off.

Disconnect the Rear Wiper Motor harness connector.

Turn the ignition on.

With the scan tool, read the Rear Wiper Park Switch Sense.

Does the Rear Wiper Park Switch Sense display: True?

Yes

Replace the Rear Wiper Motor in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3).

3) CHECK (W17) REAR WIPER PARK SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Measure the resistance between ground and the (W17) Rear Wiper Park Switch Sense Circuit.

Is the resistance above 10k ohms?

Yes

Replace the TIPM in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (W7) Wiper Park Switch Sense circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

HEADLAMP WASHER RELAY
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1) INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all DTC's.

Turn the Headlamp Washers on.

With the scan tool, read DTC's.

Does the scan tool display active: B2324-HEADLAMP WASHER MOTOR CONTROL CIRCUIT HIGH?

Yes

Go To 2).

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2) CHECK HEADLAMP WASHER RELAY

Turn the ignition off.

Remove the Headlamp Washer relay.

Turn the ignition on.

Turn the Headlamp Washers on.

With the scan tool, read DTC's.

Does the scan tool display active: B2324-HEADLAMP WASHER MOTOR CONTROL CIRCUIT HIGH?

Yes

Go To 3).

No

Go To 5).

3) (W24) HEADLAMP WASHER RELAY CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Measure the resistance of the (W24) Headlamp Washer Relay Control circuit between the Headlamp Washer Relay connector and the TIPM C3 harness connector.

Is the resistance below 10.0 ohms?

Yes

Go To 4).

No

Repair the (W24) Headlamp Washer Relay Control circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4) (W24) HEADLAMP WASHER RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (W24) Headlamp Washer Relay Control circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (W24) Headlamp Washer Relay Control circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

5) HEADLAMP WASHER RELAY

Turn the ignition off.

Replace the Headlamp Washer relay with a known good relay.

Turn the ignition on.

Turn the Headlamp Washers on.

With the scan tool, read DTC's.

Does the scan tool display active: B2324-HEADLAMP WASHER MOTOR CONTROL CIRCUIT HIGH?

Yes

Go To 6).

No

Test Complete.

Perform **BODY VERIFICATION TEST - VER 1** .

6) (W23) HEADLAMP WASHER MOTOR CONTROL CIRCUIT OPEN

Turn the ignition off.

Remove the Headlamp Washer relay.

Disconnect the Headlamp Washer Motor harness connector.

Measure the resistance of the (W23) Headlamp Washer Motor Control circuit at the Headlamp Washer Motor harness connector and the Headlamp Washer Relay connector.

Is the resistance below 10.0 ohms?

Yes

Go To 7).

No

Repair the (W23) Headlamp Washer Motor Control circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

7) (W23) HEADLAMP WASHER MOTOR CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (W23) Headlamp Washer Motor Control circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (W23) Headlamp Washer Motor Control circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Headlamp Washer Motor in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

WIPERS/WASHERS - SERVICE INFORMATION

DESCRIPTION

FRONT WIPER AND WASHER SYSTEM

81d8ae0a

Fig. 1: Wiper And Washer System
Courtesy of CHRYSLER LLC

An electrically operated intermittent front wiper and washer system is standard factory-installed safety equipment on this vehicle. The wiper and washer system includes the following major components, which are described in further detail elsewhere in this service information:

- **ElectroMechanical Instrument Cluster** - The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) is located on the instrument panel directly in front of the driver. Refer to **DESCRIPTION** .
- **Front Washer Nozzle (3)** - Two fluidic front washer nozzles with integral check valves are secured by integral latch features to dedicated openings in the hood panel near the base of the windshield.
- **Front Washer Plumbing** - The plumbing for the washer system consists of rubber hoses and molded

rubber or plastic fittings. The plumbing is routed across the front of the engine compartment to the right side of the engine compartment from the washer reservoir on the left side of the cooling module, and through the cowl plenum panel to the underside of the hood panel and the washer nozzles.

- **Front Wiper Arms And Blades (5)** - The two front wiper arms are secured with nuts to the threaded ends of the two wiper pivot shafts, which extend through the cowl plenum cover/grille panel located near the base of the windshield. The two equal length front wiper blades are each secured to their equal length wiper arms with an integral latch, and are parked on the glass near the bottom of the windshield when the wiper system is not in operation.
- **Front Wiper Module (4)** - The wiper pivot shafts are the only visible components of the front wiper module. The remainder of the module is concealed within the cowl plenum area beneath the cowl plenum cover/grille panel. The wiper module includes the wiper module bracket, three rubber-isolated wiper module mounts, the wiper motor, the wiper motor crank arm, the two wiper drive links, and the two wiper pivots.
- **Right Multi-Function Switch (6)** - The right (wiper) multi-function switch and the left (lighting) multi-function switch are secured to brackets integral to the clockspring housing on the top of the steering column just below the steering wheel. The right multi-function switch is connected by a short jumper harness to the Steering Control Module (SCM), which is internal to the left multi-function switch housing. Only the switch control stalk extending from the right side of the steering column is visible, while the remainder of the switch is concealed beneath the steering column shrouds. The right multi-function switch is dedicated to providing all of the driver controls for both the front and rear wiper and washer systems.
- **Steering Control Module** - The Steering Control Module (SCM) is internal to the left multi-function switch housing, which is secured to a bracket integral to the left side of the clockspring housing on the top of the steering column just below the steering wheel. Only the left switch control stalk extending from the left side of the steering column is visible, while the remainder of the switch housing containing the SCM is concealed beneath the steering column shrouds. Refer to **DESCRIPTION** .
- **Totally Integrated Power Module (2)** - The Totally Integrated Power Module (TIPM) is located in the engine compartment, near the battery. Refer to **DESCRIPTION** .
- **Washer Pump/Motor** - The reversible electric washer pump/motor unit is located in a dedicated hole on the lower outboard side of the washer reservoir, on the left side of the cooling module fan shroud. This single reversible washer pump/motor provides washer fluid to either the front or rear washer system plumbing, depending upon the direction of the pump motor rotation.
- **Washer Reservoir (1)** - The washer reservoir is integral to the coolant reserve bottle, which sits astride the fan shroud of the cooling module. The reservoir filler cap is accessed from the left front corner of the engine compartment.

Hard wired circuitry connects the front wiper and washer system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the front wiper and washer system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

REAR WIPER AND WASHER SYSTEM

81d81f31

Fig. 2: Wiper And Washer System
 Courtesy of CHRYSLER LLC

An electrically operated fixed interval intermittent rear wiper and washer system is standard factory-installed equipment on this vehicle. The rear wiper and washer system includes the following major components, which are described in further detail elsewhere in this service information:

- **ElectroMechanical Instrument Cluster** - The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) is located on the instrument panel directly in front of the driver. Refer to **DESCRIPTION**.
- **Rear Washer Nozzle (4)** - A fluidic rear washer nozzle is secured by integral latch features to a mounting hole on the right side of the Center High Mounted Stop Lamp (CHMSL) on the liftgate outer panel above the liftgate flip-up glass opening.
- **Rear Washer Plumbing** - The plumbing for the rear washer system consists of rubber hoses and molded rubber or plastic fittings. The plumbing is routed across the front of the engine compartment to the right side of the engine compartment from the washer pump and reservoir on the left side of the cooling module, and through the dash into the passenger compartment. Then it is routed up the right cowl side and A-pillar to the headliner, and above the headliner to the upper liftgate opening header, then through the upper inner liftgate panel to the rear washer nozzle.
- **Rear Wiper Arm And Blade (6)** - The single rear wiper arm is secured by a nut directly to the rear wiper motor output shaft, which extends through the center of the liftgate outer panel near the base of the liftgate flip-up glass. The rear wiper blade is secured to the rear wiper arm with an integral latch, and is parked off of the glass when the rear wiper system is not in operation.

- **Rear Wiper Arm Park Ramp** - The molded rubber rear wiper arm park ramp is secured with a screw to the liftgate outer panel to the right of the rear wiper motor output shaft. When the rear wiper system is not in operation, the rear wiper arm is parked off of the glass on this ramp so that it will not interfere with or be damaged by the liftgate flip-up glass operation.
- **Rear Wiper Motor (5)** - The rear wiper motor includes the motor bracket and three rubber-isolated mounting tabs. The wiper motor output shaft is the only visible component of the rear wiper motor. The remainder of the motor is concealed by the liftgate inner trim just below the liftgate glass opening.
- **Right Multi-Function Switch (3)** - The right (wiper) multi-function switch and the left (lighting) multi-function switch are secured to brackets integral to the clockspring housing, on the top of the steering column just below the steering wheel. The right multi-function switch is connected by a short jumper harness to the Steering Control Module (SCM), which is internal to the left multi-function switch housing. Only the switch control stalk extending from the right side of the steering column is visible, while the remainder of the switch is concealed beneath the steering column shrouds. The right multi-function switch is dedicated to providing all of the driver controls for both the front and rear wiper and washer systems.
- **Steering Control Module** - The Steering Control Module (SCM) is internal to the left multi-function switch housing, which is secured to a bracket integral to the left side of the clockspring housing on the top of the steering column just below the steering wheel. Only the left switch control stalk extending from the left side of the steering column is visible, while the remainder of the switch housing containing the SCM is concealed beneath the steering column shrouds. Refer to **DESCRIPTION** .
- **Totally Integrated Power Module (2)** - The Totally Integrated Power Module (TIPM) is located in the engine compartment, near the battery. Refer to **DESCRIPTION** .
- **Washer Pump/Motor** - The reversible electric washer pump/motor unit is located in a dedicated hole on the lower outboard side of the washer reservoir, on the left side of the cooling module fan shroud. This single reversible washer pump/motor provides washer fluid to either the front or rear washer system plumbing, depending upon the direction of the pump motor rotation.
- **Washer Reservoir (1)** - The washer reservoir is integral to the coolant reserve bottle, which sits astride the fan shroud of the cooling module. The reservoir filler cap is accessed from the left front corner of the engine compartment.

Hard wired circuitry connects the rear wiper and washer system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the rear wiper and washer system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

FRONT WIPER AND WASHER SYSTEM

Fig. 3: Right (Wiper) Multi-Function Switch
 Courtesy of CHRYSLER LLC

The front wiper and washer system is designed to provide the vehicle operator with a convenient, safe, and reliable means of maintaining visibility through the windshield glass. The various components of this system are designed to convert electrical energy produced by the vehicle electrical system into the mechanical action of the wiper blades to wipe the outside surface of the glass, as well as into the hydraulic action of the washer system to apply washer fluid stored in an on-board reservoir to the area of the glass to be wiped. When combined, these components provide the means to effectively maintain clear visibility for the vehicle operator by removing excess accumulations of rain, snow, bugs, mud, or other minor debris from the outer surface of the windshield glass that might be encountered while driving the vehicle under numerous types of inclement operating conditions.

The vehicle operator initiates all front and rear wiper and washer system functions with the control stalk of the right (wiper) multi-function switch (1) that extends from the right side of the steering column, just below the steering wheel. Rotating the control knob (2) on the end of the control stalk, selects the OFF, DELAY, LOW, or HIGH front wiper system operating modes. In the DELAY mode, the control knob also allows the vehicle operator to select from one of five intermittent wipe delay intervals.

Pulling the control stalk rearward actuates the momentary front washer system switch, which selects the WASH and WIPE-AFTER-WASH modes, depending upon when and how long the switch is held closed. Pushing the control stalk downward actuates a momentary switch and selects the MIST mode, which cycles the wiper blades for as long as the switch is held closed then completes the current cycle and parks the blades at the base of the windshield after the switch is released.

The right multi-function switch provides hard wired analog and resistor multiplexed inputs to the Steering Control Module (SCM) internal to the left (lighting) multi-function switch housing for all of the wiper and washer system functions. The SCM then sends electronic **wiper** and **washer switch** status messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN), over a Local Interface Network (LIN) data bus. The EMIC responds to the SCM inputs by sending electronic **wiper** and **washer system** request messages to the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus requesting the appropriate wiper and washer system operating modes.

Front wiper and washer system operation is completely controlled by the SCM, EMIC and TIPM logic circuits, and that logic will only allow these systems to operate when the ignition switch is in the ACCESSORY or ON positions. The TIPM uses intelligent, high current, self-protected high side switches to control wiper system operation by energizing or de-energizing the wiper motor low and high speed brushes. The TIPM uses an H-bridge circuit to control the operation of the reversible washer pump/motor unit. The right multi-function switch circuitry receives battery current and a clean ground output from the SCM, then provides analog and multiplexed inputs to the SCM to indicate the selected front wiper and front washer system mode.

The hard wired circuits and components of the front wiper and washer system may be diagnosed using conventional diagnostic tools and procedures. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the front wiper and washer system or the electronic controls or communication between other modules and devices that provide some features of the front wiper and washer system. The most reliable, efficient, and accurate means to diagnose the front wiper and washer system or the electronic controls and communication related to front wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

OPERATING MODES

Following are paragraphs that briefly describe the operation of each of the front wiper and washer system operating modes.

CONTINUOUS WIPE MODE

When the LOW position of the control knob on the control stalk of the right (wiper) multi-function switch is selected the SCM sends an electronic **wiper switch low** status message to the EMIC over the LIN data bus, the EMIC relays an electronic **wiper switch low** request message to the TIPM over the CAN data bus, then the TIPM directs battery current to the low speed brush of the wiper motor, causing the wipers to cycle at low speed.

When the HIGH position of the control knob is selected the SCM sends an electronic **wiper switch high** status message to the EMIC, the EMIC relays an electronic **wiper switch high** request message to the TIPM, then the TIPM directs battery current to the high speed brush of the wiper motor, causing the wipers to cycle at high speed.

When the OFF position of the multi-function switch control knob is selected, the SCM sends an electronic **wiper switch off** status message to the EMIC, the EMIC relays an electronic **wiper switch off** request message to the TIPM, then one of two events will occur. The event that occurs depends upon the position of the wiper blades on the windshield at the moment that the control knob OFF position is selected.

If the wiper blades are in the down position on the windshield when the OFF position is selected, the park switch that is integral to the wiper motor is closed to ground, which provides a hard wired park switch sense input to the TIPM. The TIPM then de-energizes the wiper motor and the wiper motor ceases to operate. If the wiper blades are not in the down position on the windshield at the moment the OFF position is selected, the park switch is an open circuit and the TIPM continues running the wiper motor at low speed until the wiper blades are in the down position on the windshield and the park switch input to the TIPM is again closed to ground.

INTERMITTENT WIPE MODE

When the control knob on the control stalk of the right (wiper) multi-function switch is moved to one of the five DELAY interval positions the SCM sends an electronic **wiper switch delay interval** status message to the EMIC, the EMIC relays an electronic **wiper switch delay interval** request message to the TIPM, then the TIPM electronic intermittent wipe logic circuit responds by calculating the correct length of time between wiper sweeps based upon the selected delay interval input.

The TIPM monitors the changing state of the wiper motor park switch through a hard wired park switch sense input. This input allows the TIPM to determine the proper intervals at which to energize and de-energize the wiper motor intermittently for one low speed cycle at a time.

The TIPM logic is also programmed to provide vehicle speed sensitivity to the selected intermittent wipe delay intervals. In order to provide this feature the TIPM monitors electronic **vehicle speed** messages from the Controller Antilock Brake (CAB) or the Powertrain Control Module (PCM) and doubles the selected delay interval whenever the vehicle speed is about 16 kilometers-per-hour (10 miles-per-hour) or less.

MIST WIPE MODE

When the control stalk of the right (wiper) multi-function switch is moved downward to the momentary MIST position, the SCM sends an electronic **wiper mist mode** status message to the EMIC, the EMIC relays an electronic **wiper mist mode** request message to the TIPM, then the TIPM energizes the low speed brush of the wiper motor for as long as the switch is held closed, then de-energizes the motor when the state of the switch changes to open, parking the wiper blades near the base of the windshield. The TIPM can operate the front wiper motor in this mode for only one low speed cycle at a time, or for an indefinite number of sequential low speed cycles, depending upon how long the switch is held closed.

WASH MODE

When the control stalk of the right (wiper) multi-function switch is pulled rearward to the front momentary WASH position for more than about one-half second with the wiper system operating, the SCM sends an electronic **washer switch** status message to the EMIC, the EMIC relays an electronic **washer switch** request message to the TIPM, then the TIPM directs battery current and ground to the washer pump/motor. This will cause the washer pump/motor to be energized in the front wash direction for as long as the switch is held closed (up to approximately 10 seconds) and to be de-energized when the control stalk is released.

When the control stalk is pulled rearward to the front momentary WASH position while the front wiper system is operating in one of the DELAY interval positions, the washer pump/motor operation is the same. However, the TIPM also overrides the selected delay interval and operates the front wiper motor in a continuous low speed mode for as long as the control stalk is held in the front momentary WASH position, then reverts to the selected delay interval several wipe cycles after the control stalk is released. If the WASH switch is held closed for more than approximately 10 seconds, the TIPM will suspend washer pump/motor operation until the control stalk is released for about 2 seconds and then cycled back to the WASH position.

WIPE-AFTER-WASH MODE

When the control stalk of the right (wiper) multi-function switch is pulled rearward to the front momentary WASH position for more than about one-half second while the wiper system is not operating, the SCM sends an electronic **washer switch** status message to the EMIC, the EMIC relays an electronic **washer switch** request message to the TIPM, and the TIPM directs battery current and ground to the washer pump/motor and energizes

the wiper motor in a continuous low speed mode for as long as the switch is held closed (up to approximately 10 seconds). When the control stalk is released, the TIPM de-energizes the washer pump/motor immediately, but allows the wiper motor to operate for two or three additional wipe cycles before it de-energizes the wiper motor and parks the wiper blades near the base of the windshield.

If the control stalk is held rearward for more than about 10 seconds, the TIPM will suspend washer pump/motor operation until the stalk is released for about 2 seconds and then cycled back to the WASH position; however, the wipers will continue to operate for as long as the switch is held closed. The TIPM monitors the changing state of the wiper motor park switch through a hard wired wiper park switch sense circuit input. This input allows the TIPM to count the number of wipe cycles that occur after the control stalk is released, and to determine the proper interval at which to de-energize the wiper motor to complete the WIPE-AFTER-WASH mode cycle.

REAR WIPER AND WASHER SYSTEM

Fig. 4: Right (Wiper) Multi-Function Switch
Courtesy of CHRYSLER LLC

The rear wiper and washer system is designed to provide the vehicle operator with a convenient, safe, and reliable means of maintaining visibility through the liftgate flip-up glass. The various components of this system are designed to convert electrical energy produced by the vehicle electrical system into the mechanical action of the wiper blade to wipe the outside surface of the glass, as well as into the hydraulic action of the washer system to apply washer fluid stored in an on-board reservoir to the area of the glass to be wiped. When combined, these components provide the means to effectively maintain clear visibility for the vehicle operator by removing excess accumulations of rain, snow, bugs, mud, or other minor debris from the outer surface of the liftgate flip-up glass that might be encountered while driving the vehicle under numerous types of inclement operating conditions.

The vehicle operator initiates all front and rear wiper and washer system functions with the control stalk (1) of the right (wiper) multi-function switch that extends from the right side of the steering column, just below the steering wheel. Rotating the control sleeve (3) on the control stalk to the OFF or INTERMITTENT detent positions or the momentary WASH position selects the rear wiper and washer system operating modes.

The right multi-function switch provides hard wired analog and resistor multiplexed inputs to the Steering Control Module (SCM) integral to the left (lighting) multi-function switch for all of the wiper and washer system functions. The SCM then sends electronic **rear wiper/washer switch** status messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over a Local Interface Network (LIN) data bus. The EMIC then sends electronic **rear wiper/washer switch** request messages to the Totally Integrated Power Module (TIPM) over the Controller Area Network (CAN) data bus requesting the appropriate rear wiper and washer system operating modes.

Rear wiper and washer system operation is completely controlled by the SCM, EMIC and TIPM logic circuits, and that logic will only allow these systems to operate when the ignition switch is in the ACCESSORY or ON positions, plus a delay after the ignition switch is turned to any other position long enough to allow the rear wiper motor to park the rear wiper blade off of the liftgate flip-up glass. The TIPM uses intelligent, high current, self-protected high side switches to control wiper system operation by energizing or de-energizing the rear wiper motor. The TIPM uses an H-bridge circuit to control the operation of the reversible washer pump/motor unit. The right multi-function switch circuitry receives a clean ground output from the SCM on a multi-function switch return circuit, then provides analog and resistor multiplexed inputs to the SCM to indicate the selected rear wiper and rear washer system mode.

The hard wired circuits and components of the rear wiper and washer system may be diagnosed using conventional diagnostic tools and procedures. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the rear wiper and washer system or the electronic controls or communication between other modules and devices that provide some features of the rear wiper and washer system. The most reliable, efficient, and accurate means to diagnose the rear wiper and washer system or the electronic controls and communication related to rear wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

OPERATING MODES

Following are paragraphs that briefly describe the operation of each of the rear wiper and washer system operating modes.

INTERMITTENT WIPE MODE

When the INTERMITTENT WIPE position of the control sleeve on the control stalk of the right multi-function switch is selected, the SCM sends an electronic **rear wiper switch** status message to the EMIC over the LIN data bus, then the EMIC relays an electronic **rear wiper switch** request message to the TIPM over the CAN data bus, and the TIPM directs battery current to the rear wiper motor at fixed delay intervals to enable the rear wiper motor intermittent wipe mode.

WASH MODE

When the control sleeve of the right multi-function switch is rotated counterclockwise past the INTERMITTENT detent position to the momentary rear WASH position, the SCM sends an electronic **rear washer switch** status message to the EMIC over the LIN data bus, then the EMIC relays an electronic **rear washer switch** request message to the TIPM over the CAN data bus, and the TIPM directs battery current to the rear wiper motor and directs battery current and ground to the washer pump/motor unit. These outputs will cause the washer pump motor and the rear wiper motor to operate continuously for as long as the switch is held closed up to approximately 10 seconds. The washer pump is de-energized as soon as the control sleeve is

released, but the rear wiper motor continues to operate for two to three continuous cycles before reverting to the fixed delay interval operation. The TIPM uses a hard wired output from a park switch internal to the rear wiper motor as an additional logic input to monitor the position of the rear wiper blade on the glass and to control the number of continuous wiper sweeps following washer operation.

DIAGNOSIS AND TESTING

FRONT WIPER AND WASHER SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

If the front wiper motor operates, but the wipers do not move on the windshield, replace the ineffective front wiper module. If the washer pump/motor operates, but no washer fluid is dispensed on the glass; or, if the wipers operate, but chatter, lift, or do not clear the glass, clean and inspect the front wiper and washer system components as required. See CLEANING and INSPECTION.

The hard wired front wiper and washer system circuits and components may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the front wiper and washer system or the electronic controls or communication between other modules and devices that provide some features of the front wiper and washer system. The most reliable, efficient, and accurate means to diagnose the front wiper and washer system or the electronic controls and communication related to front wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

NOTE: The front wiper and washer switches are integral to the right multi-function switch. The right multi-function switch is hard wired to the left multi-function switch/Steering Control Module (SCM), which communicates with the ElectroMechanical Instrument Cluster (EMIC)/Cab Compartment Node (CCN) over the Local Interface Network (LIN) data bus. Before performing any of the following tests, determine whether the other functions of the right and left multi-function switch/SCM are operational. If only the right multi-function switch functions are inoperative, test and repair the right multi-function switch or the jumper harness between the right and left multi-function switches before attempting to repair the Front Wiper and Washer System. If both the right and left multi-function switch/SCM functions are ineffective, diagnose and repair

that problem before attempting to repair the Front Wiper and Washer System.

CONDITION	POSSIBLE CAUSES	CORRECTION
WIPER MOTOR DOES NOT OPERATE IN ANY SWITCH POSITION	1. Ineffective motor ground circuit. 2. Ineffective motor feed circuits. 3. Ineffective right multi-function switch. 4. Ineffective SCM inputs or outputs. 5. Ineffective EMIC (CCN) inputs or outputs. 6. Ineffective TIPM inputs or outputs. 7. Ineffective wiper motor.	1. Test and repair open wiper motor ground circuit if required. 2. Test and repair low speed and high speed feed circuits between TIPM and front wiper motor if required. 3. Test and replace ineffective right multi-function switch if required. 4. Use a diagnostic scan tool to test the SCM inputs and outputs. Refer to the appropriate diagnostic information. 5. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information. 6. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information. 7. Test and replace open or shorted wiper motor as required.
WIPERS DO NOT PARK CORRECTLY	1. Ineffective wiper motor park switch input circuit. 2. Ineffective TIPM inputs or outputs. 3. Ineffective wiper motor park switch.	1. Test and repair wiper park switch input circuit between TIPM and front wiper motor if required. 2. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information. 3. Test and replace ineffective wiper motor if required.
WIPER MOTOR OPERATES SLOWLY IN ALL SWITCH POSITIONS	1. Ineffective wiper motor. 2. Amperage draw too low. 3. Amperage draw too high.	1. Check amperage draw with linkage disconnected from wiper motor crank arm. Correct draw should be about 6 amperes. If incorrect, refer to the appropriate Possible Cause that follows: 2. Test and repair shorted low and high speed feed circuits if required. 3. With linkage disconnected from wiper motor crank arm check linkage and pivots for binding. If binding is detected, repair or replace front wiper module if required. If no linkage binding detected, replace the front wiper motor if required.
WIPERS RUN AT HIGH SPEED WITH SWITCH LOW SPEED SELECTED OR AT LOW SPEED WITH SWITCH	1. Ineffective motor feed circuit wiring.	1. Test and repair low speed and high speed feed circuits between TIPM and front wiper motor if required.

HIGH SPEED SELECTED		
WASHER PUMP DOES NOT OPERATE	1. Ineffective washer pump ground circuit. 2. Ineffective washer pump feed circuits. 3. Ineffective right multi-function switch. 4. Ineffective SCM inputs or outputs. 5. Ineffective EMIC (CCN) inputs or outputs. 6. Ineffective TIPM inputs or outputs. 7. Ineffective washer pump.	1. Test and repair open washer pump ground circuit if required. 2. Test and repair washer pump feed circuits between TIPM and washer pump if required. 3. Test and replace ineffective right multi-function switch if required. 4. Use a diagnostic scan tool to test the SCM inputs and outputs. Refer to the appropriate diagnostic information. 5. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information. 6. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information. 7. Test and replace open or shorted washer pump if required.

REAR WIPER AND WASHER SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

If the rear wiper motor operates, but the wiper motor output shaft does not move, replace the ineffective rear wiper motor. If the washer pump/motor operates, but no washer fluid is dispensed on the glass; or, if the wiper operates, but chatters, lifts, or does not clear the glass, clean and inspect the rear wiper and washer system components as required. See **CLEANING** and **INSPECTION**.

The hard wired rear wiper and washer system circuits and components may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the rear wiper and washer system or the electronic controls or communication between other modules and devices that provide some features of the rear wiper and washer system. The most reliable, efficient, and accurate means to diagnose the rear wiper and washer system or the electronic controls and communication related to rear wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

NOTE: The rear wiper and washer switches are integral to the right multi-function switch. The right multi-function switch is hard wired to the left multi-function switch/Steering Control Module (SCM), which communicates with the ElectroMechanical Instrument Cluster (EMIC)/Cab Compartment Node (CCN) over the Local Interface Network (LIN) data bus. Before performing any of the following tests, determine whether the other functions of the right and left multi-function switch/SCM are operational. If only the right multi-function switch functions are inoperative, test and repair the right multi-function switch or the jumper harness between the right and left multi-function switches before attempting to repair the Rear Wiper and Washer System. If both the right and left multi-function switch/SCM functions are ineffective, diagnose and repair that problem before attempting to repair the Rear Wiper and Washer System.

CONDITION	POSSIBLE CAUSES	CORRECTION
WIPER MOTOR DOES NOT OPERATE IN ANY SWITCH POSITION	1. Ineffective motor ground circuit. 2. Ineffective motor feed circuits. 3. Ineffective right multi-function switch. 4. Ineffective SCM inputs or outputs. 5. Ineffective EMIC (CCN) inputs or outputs. 6. Ineffective TIPM inputs or outputs. 7. Ineffective wiper motor.	1. Test and repair open wiper motor ground circuit if required. 2. Test and repair motor feed circuit between TIPM and rear wiper motor if required. 3. Test and replace ineffective right multi-function switch if required. 4. Use a diagnostic scan tool to test the SCM inputs and outputs. Refer to the appropriate diagnostic information. 5. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information. 6. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information. 7. Test and replace open or shorted wiper motor if required.
WIPER DOES NOT PARK CORRECTLY	1. Ineffective wiper motor park switch input circuit. 2. Ineffective TIPM inputs or outputs. 3. Ineffective wiper motor park switch.	1. Test and repair wiper park switch input circuit between TIPM and front wiper motor if required. 2. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information. 3. Test and replace ineffective wiper motor if required.
WIPER MOTOR OPERATES SLOWLY	1. Ineffective wiper motor.	1. Check amperage draw with wiper arm disconnected from rear wiper motor output shaft. Correct draw should be about 6 amperes. If incorrect, refer to the appropriate Possible Cause that follows: 2. Test and repair shorted rear wiper

	2. Amperage draw too low. 3. Amperage draw too high.	motor signal and fused ignition switch output (run - accessory) circuits if required. 3. With wiper arm disconnected from wiper motor output shaft check for binding between output shaft and rubber grommet in liftgate. If binding is detected, lubricate or replace grommet if required. If no binding is detected, replace the wiper motor if required.
WASHER PUMP DOES NOT OPERATE	1. Ineffective washer pump ground circuit. 2. Ineffective washer pump feed circuits. 3. Ineffective right multi-function switch. 4. Ineffective SCM inputs or outputs. 5. Ineffective EMIC (CCN) inputs or outputs. 6. Ineffective TIPM inputs or outputs. 7. Ineffective washer pump.	1. Test and repair open washer pump ground circuit if required. 2. Test and repair washer pump feed circuits between TIPM and washer pump if required. 3. Test and replace ineffective right multi-function switch if required. 4. Use a diagnostic scan tool to test the SCM inputs and outputs. Refer to the appropriate diagnostic information. 5. Use a diagnostic scan tool to test the EMIC (CCN) inputs and outputs. Refer to the appropriate diagnostic information. 6. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information. 7. Test and replace open or shorted washer pump if required.

CLEANING

FRONT WIPER AND WASHER SYSTEM

WIPER SYSTEM

CAUTION: Protect the rubber squeegees of the wiper blades from any petroleum-based cleaners, solvents, or contaminants. These products can rapidly deteriorate the rubber squeegees.

The squeegees of wiper blades exposed to the elements for a long time tend to lose their wiping effectiveness. Periodic cleaning of the squeegees is suggested to remove any deposits of salt or road film. The wiper blades, arms, and windshield glass should only be cleaned using a sponge or soft cloth and windshield washer fluid, a mild detergent, or a non-abrasive cleaner. If the wiper blades continue to leave streaks, smears, hazing, or beading on the glass after thorough cleaning of the squeegees and the glass, the entire wiper blade assembly must be replaced.

WASHER SYSTEM

CAUTION: Never introduce petroleum-based cleaners, solvents, or contaminants into the washer system. These products can rapidly deteriorate the rubber seals and hoses of the washer system, as well as the rubber squeegees of the wiper blades.

CAUTION: Never use compressed air to flush the washer system plumbing. Compressed air pressures are too great for the washer system plumbing components and will result in further system damage. Never use sharp instruments to clear a plugged washer nozzle or damage to the nozzle orifice and improper nozzle spray patterns will result.

If the washer system is contaminated with foreign material, drain the washer reservoir by removing the washer pump/motor unit from the reservoir. Clean foreign material from the inside of the washer pump inlet filter screen and the washer reservoir using clean washer fluid, a mild detergent, or a non-abrasive cleaner. Flush foreign material from the washer system plumbing by first disconnecting the washer hose from the washer nozzle, then running the washer pump/motor to run clean washer fluid or water through the system. A plugged or restricted washer nozzle should be carefully back-flushed using compressed air. If the washer nozzle obstruction cannot be cleared, replace the washer nozzle.

REAR WIPER AND WASHER SYSTEM

WIPER SYSTEM

The squeegee of a wiper blade exposed to the elements for a long time tends to lose its wiping effectiveness. Periodic cleaning of the squeegee is suggested to remove any deposits of salt or road film. The wiper blade, arm, and liftgate glass should only be cleaned using a sponge or soft cloth and windshield washer fluid, a mild detergent, or a non-abrasive cleaner. If the wiper blade continues to leave streaks, smears, hazing, or beading on the glass after thorough cleaning of the squeegees and the glass, the entire wiper blade assembly must be replaced.

CAUTION: Protect the rubber squeegee of the wiper blade from any petroleum-based cleaners, solvents, or contaminants. These products can rapidly deteriorate the rubber squeegee.

WASHER SYSTEM

If the washer system is contaminated with foreign material, drain the washer reservoir by removing the washer pump/motor from the reservoir. Clean foreign material from the inside of the washer pump/motor inlet filter screen and the washer reservoir using clean washer fluid, a mild detergent, or a non-abrasive cleaner. Flush foreign material from the washer system plumbing by first disconnecting the washer hose from the rear washer nozzle, then running the washer pump/motor to run clean washer fluid or water through the system. A plugged or restricted rear washer nozzle should be carefully back-flushed using compressed air. If the washer nozzle obstruction cannot be cleared, replace the rear washer nozzle.

CAUTION: Never introduce petroleum-based cleaners, solvents, or contaminants into the washer system. These products can rapidly deteriorate the rubber seals and hoses of the washer system, as well as the rubber squeegee of

the wiper blade.

CAUTION: Never use compressed air to flush the washer system plumbing. Compressed air pressures are too great for the washer system plumbing components and will result in further system damage. Never use sharp instruments to clear a plugged washer nozzle or damage to the nozzle orifice and improper nozzle spray patterns will result.

INSPECTION

FRONT WIPER AND WASHER SYSTEM

WIPER SYSTEM

809ac961

Fig. 5: Inspecting Wiper Blades
Courtesy of CHRYSLER LLC

The wiper blades and wiper arms should be inspected periodically, not just when wiper performance problems are experienced. This inspection should include the following points:

1. Carefully inspect the wiper blades for any indications of worn or uneven edges (1), foreign material deposits (2), hardening or cracking (3), deformation or fatigue (4), or splitting (5). Inspect the wiper blade support components and the wiper arms for damage (6) or corrosion. If the wiper arms and blades are

contaminated with any foreign material, clean them and the glass as required. See **CLEANING**. If a wiper blade or arm is damaged, or if corrosion is evident, replace the affected wiper arm or blade with a new unit. Do not attempt to repair a wiper arm or blade that is damaged or corroded.

2. Carefully lift the wiper blade off of the glass. Note the action of the wiper arm hinge. The wiper arm should pivot freely at the hinge, but with no lateral looseness evident. If there is any binding evident in the wiper arm hinge, or if there is evident lateral play in the wiper arm hinge, replace the wiper arm.

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

3. Once proper hinge action of the wiper arm is confirmed, check the hinge for proper spring tension. Remove the wiper blade from the wiper arm. Either place a small postal scale between the blade end of the wiper arm and the glass, or carefully lift the blade end of the arm away from the glass using a small fish scale. On vehicles with unequal wiper arm lengths, be certain that measurements on both arms are taken at a point an equal distance from their wiper arm hinge pins. Compare the scale readings between the right and left wiper arms. Replace a wiper arm if it has comparatively lower spring tension, as evidenced by a lower scale reading.
4. After cleaning and inspecting the wiper components and the glass, if the wiper blade still fails to clear the glass without smearing, streaking, chattering, hazing, or beading, replace the wiper blade.

WASHER SYSTEM

The washer system components should be inspected periodically, not just when washer performance problems are experienced. This inspection should include the following points:

1. Check for ice or other foreign material in the washer reservoir. If contaminated, clean and flush the washer system. See **CLEANING**.
2. Inspect the washer plumbing for pinched, leaking, deteriorated, or incorrectly routed hoses and damaged or disconnected hose fittings. Replace damaged or deteriorated hoses and hose fittings. Leaking washer hoses can sometimes be repaired by cutting the hose at the leak and splicing it back together using an in-line connector fitting. Similarly, sections of deteriorated hose can be cut out and replaced by splicing in new sections of hose using in-line connector fittings. Whenever routing a washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts. Also, sharp bends that might pinch the washer hose must be avoided.

REAR WIPER AND WASHER SYSTEM

WIPER SYSTEM

Fig. 6: Inspecting Wiper Blades
Courtesy of CHRYSLER LLC

The rear wiper blade and wiper arm should be inspected periodically, not just when wiper performance problems are experienced. This inspection should include the following points:

1. Carefully inspect the wiper blade for any indications of worn or uneven edges (1), foreign material deposits (2), hardening or cracking (3), deformation or fatigue (4), or splitting (5). Inspect the wiper blade support components and the wiper arm for damage (6). If the wiper arm and blade are contaminated with any foreign material, clean them and the glass as required. See **CLEANING**. If the wiper blade or arm is damaged, replace it with a new unit. Do not attempt to repair a wiper arm or blade that is damaged or corroded.
2. Carefully lift the wiper blade off of the glass. Note the action of the wiper arm hinge. The wiper arm should pivot freely at the hinge, but with no lateral looseness evident. If there is any binding evident in the wiper arm hinge, or there is evident lateral play in the wiper arm hinge, replace the wiper arm.

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

3. Once proper hinge action of the wiper arm is confirmed, check the hinge for proper spring tension. The spring tension of the wiper arm should be sufficient to cause the rubber squeegee to conform to the curvature of the glass. Replace a wiper arm if it has insufficient spring tension to maintain contact between the squeegee and the glass.
4. After cleaning and inspecting the wiper components and the glass, if the wiper blade still fails to clear the glass without smearing, streaking, chattering, hazing, or beading, replace the wiper blade.

The washer system components should be inspected periodically, not just when washer performance problems are experienced. This inspection should include the following points:

1. Check for ice or other foreign material in the washer reservoir. If contaminated, clean and flush the washer system. See **CLEANING**.
2. Inspect the washer plumbing for pinched, leaking, deteriorated, or incorrectly routed hoses and damaged or disconnected hose fittings. Replace damaged or deteriorated hoses and hose fittings. Leaking washer hoses can sometimes be repaired by cutting the hose at the leak and splicing it back together using an in-line connector fitting. Similarly, sections of deteriorated hose can be cut out and replaced by splicing in new sections of hose using in-line connector fittings. Whenever routing a washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts. Also, sharp bends that might pinch the washer hose must be avoided.

RIGHT MULTI-FUNCTION SWITCH

DESCRIPTION

RIGHT MULTI-FUNCTION SWITCH

Fig. 7: Right (Wiper) Multi-Function Switch
 Courtesy of CHRYSLER LLC

The right (wiper) multi-function switch is located on the right side of the steering column, just below the steering wheel. This switch is the primary control for the front and rear wiper and washer systems. The only visible components of the switch are the control stalk (1), control knob (2) and control sleeve (3) that extend through the steering column shrouds on the right side of the column. The remainder of the switch including its mounting provisions and electrical connection are concealed beneath the shrouds.

Fig. 8: Steering Control Module
 Courtesy of CHRYSLER LLC

The switch housing and controls (6) are constructed of molded black plastic. Each of the switch controls has white International Control and Display Symbol graphics applied to it, which clearly identify its many functions. A single screw (7) through a mounting tab integral to the back of the switch housing, and a slide tab integral to the bottom of the switch housing secure the switch to the mounting bracket integral to the

clockspring (3). A single connector receptacle containing seven terminal pins is integral to the inboard end of the switch housing and is connected by a jumper wire harness (5) directly to the Steering Control Module (SCM), which is internal to the housing (2) of the left multi-function switch (1).

The right (wiper) multi-function switch provides the vehicle operator with a control interface for the following wiper and washer system functions:

- **Continuous Front Wipers** - The right multi-function switch control knob provides detent switching for two continuous front wipe modes, low speed or high speed.
- **Intermittent Front Wipers** - The right multi-function switch control knob provides detent switching for the intermittent front wipe mode with five minor detent delay interval positions.
- **Front Wiper Mist Mode** - The right multi-function switch control stalk includes momentary switching of the front wiper motor low speed circuit to provide a mist mode features (sometimes referred to as pulse wipe), which allows the vehicle operator to momentarily operate the front wipers for one or more complete cycles.
- **Front Washer Mode** - The right multi-function switch control stalk provides momentary switching for control of the front washer system operation.
- **Intermittent Rear Wipe Mode** - The right multi-function switch control sleeve provides detent switching for a single fixed interval intermittent rear wiper mode.
- **Rear Washer Mode** - The right multi-function switch control sleeve provides two momentary switch positions for control of rear washer system operation.

The right multi-function switch cannot be adjusted or repaired. If any function of the switch is ineffective, or if the switch is damaged, the entire switch unit must be replaced. The clockspring (with the multi-function switch mounting bracket), the left multi-function switch (with the SCM), the right multi-function switch and the jumper wire harness are each available for separate service replacement.

OPERATION

RIGHT MULTI-FUNCTION SWITCH

The right (wiper) multi-function switch uses a combination of resistor multiplexing and conventional analog switching to control the many functions and features it provides. The switch receives a clean ground from the Steering Control Module (SCM), then provides resistor multiplexed and conventional analog return outputs to the SCM to indicate the selected switch positions. The SCM then sends electronic **switch status** messages over a Local Interface Network (LIN) data bus to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN), and the EMIC relays electronic **wiper** and **washer switch** request messages over the Controller Area Network (CAN) data bus to other electronic modules in the vehicle.

If the SCM detects no inputs from the right multi-function switch, it transmits an electronic **Signal Not Available (SNA)** status message over the LIN data bus. The SNA status signals the EMIC to request other electronic modules to implement a fail-safe mode of operation for the front and rear wiper systems. The fail-safe mode will maintain the last selected front and rear wiper system operation for the remainder of the current ignition cycle, after which both wiper systems will default to OFF.

The right multi-function switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. However, the most reliable, efficient and accurate means to

diagnose this component requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

Following are descriptions of how the right multi-function switch is operated to control the many front and rear wiper and washer system functions and features it provides:

- **Front Wiper Control** - The control knob on the end of the right multi-function switch control stalk is rotated to one of the two continuous wiper detents, to one of five intermittent wiper detents, or to the OFF position to select the front wiper mode. The SCM reads the input from the right multi-function switch and sends electronic **wiper switch** status messages over the LIN data bus to the EMIC, which relays an electronic **wiper switch** request message over the CAN data bus to other electronic modules in the vehicle.
- **Front Wiper Mist Mode** - The front wiper mist mode is requested when the right multi-function switch control stalk is depressed downward towards the floor to a momentary MIST position. The front wiper motor will continue to operate, one complete cycle at a time, for as long as the control stalk is held in this position. The SCM reads the resistor multiplexed input from the right multi-function switch and sends an electronic **wiper switch** status message over the LIN data bus to the EMIC, which relays an electronic **wiper switch** request message over the CAN data bus to other electronic modules in the vehicle.
- **Front Washer Control** - The right multi-function switch control stalk is pulled rearward towards the steering wheel to a momentary WASH position to activate the washer pump/motor in the front washer mode. The washer pump/motor will continue to operate for as long as the control stalk is held in this position. The SCM reads the resistor multiplexed input from the right multi-function switch and sends an electronic **washer switch** status message over the LIN data bus to the EMIC, which relays an electronic **washer switch** request message over the CAN data bus to other electronic modules in the vehicle.
- **Rear Wiper Control** - The rear wiper mode is selected when the right multi-function switch control sleeve is rotated to the fixed interval intermittent rear wipe detent position, or the OFF detent position. The SCM reads the input from the right multi-function switch and sends an electronic **wiper switch** status message over the LIN data bus to the EMIC, which relays an electronic **wiper switch** request message over the CAN data bus to other electronic modules in the vehicle.
- **Rear Washer Control** - The right multi-function switch control sleeve is rotated to one of two momentary WASH positions, either fully forward or fully rearward, to activate the washer pump/motor in the rear washer mode. The washer pump/motor will continue to operate in the rear washer mode until the control sleeve is released. The SCM reads the input from the right multi-function switch and sends an electronic **washer switch** status message over the LIN data bus to the EMIC, which relays an electronic **washer switch** request message over the CAN data bus to other electronic modules in the vehicle.

DIAGNOSIS AND TESTING

RIGHT MULTI-FUNCTION SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to

disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 9: Right Multi-Function Switch Connector
Courtesy of CHRYSLER LLC

The right multi-function switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the Steering Control Module (SCM) or the electronic controls or communication between other modules and devices that provide some features of the front and rear wiper and washer systems. The most reliable, efficient and accurate means to diagnose the SCM or the electronic controls and communication related to SCM operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

1. Remove the right multi-function switch from the integral mounting bracket on the right side of the clockspring. See **REMOVAL**.
2. Using an ohmmeter, test the resistance between the terminals of the switch as shown in the three FUNCTION TESTS tables. For all functions except those of the control stalk the values should be either less than 100 ohms (switch CLOSED) or greater than 1 megohm (switch OPEN).

CONTROL STALK FUNCTION TESTS			
FUNCTION	PINS		RESISTANCE
	1	7	
Front Wash	X	X	10000 Ohms
Front Mist	X	X	5490 Ohms

CONTROL KNOB FUNCTION TESTS			
FUNCTION	BETWEEN PIN 7 (GROUND) AND PINS		
	4	5	6
Off	CLOSED	CLOSED	OPEN
Front Delay 1	CLOSED	CLOSED	CLOSED
Front Delay 2	CLOSED	OPEN	CLOSED
Front Delay 3	OPEN	OPEN	CLOSED
Front Delay 4	OPEN	CLOSED	CLOSED
Front Delay 5	OPEN	CLOSED	OPEN

Front Wiper Low	OPEN	OPEN	OPEN
Front Wiper High	CLOSED	OPEN	OPEN

CONTROL SLEEVE FUNCTION TESTS		
FUNCTION	BETWEEN PIN 7 (GROUND) AND PINS	
	2	3
Off	CLOSED	OPEN
Rear Wipe	CLOSED	CLOSED
Rear Wash	OPEN	CLOSED

- If the switch fails any of the tests, replace the ineffective right multi-function switch as required. If the switch tests okay, but the switch input to the Steering Control Module (SCM) remains incorrect, be certain to check for a short or open in the jumper harness between the right multi-function switch and the SCM.

REMOVAL

RIGHT MULTI-FUNCTION SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 10: Right Multi-Function Switch Remove/Install
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove both the upper and lower shrouds from the steering column. Refer to **REMOVAL** .
3. Remove the screw (2) that secures the right multi-function switch (1) to the mounting bracket integral to the right side of the clockspring (3) on the steering column.
4. Slide the switch away from the clockspring far enough to disengage the slide tabs on the switch housing from the channel formations in the mounting bracket.

Fig. 11: Right Multi-Function Switch Harness Connector
Courtesy of CHRYSLER LLC

5. Disconnect the jumper wire harness connector (1) from the connector receptacle on the inboard end of the right multi-function switch (2).
6. Remove the switch from the clockspring (3).

INSTALLATION

RIGHT MULTI-FUNCTION SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 12: Right Multi-Function Switch Harness Connector
 Courtesy of CHRYSLER LLC

1. Position the right multi-function switch (2) close enough to the mounting bracket (3) integral to the right side of the clockspring to reconnect the jumper wire harness connector (1) to the connector receptacle on the inboard side of the switch housing.
2. Align the slide tabs on the switch housing with the channel formations integral to the clockspring mounting bracket, then slide the switch into the bracket until it is firmly seated.

Fig. 13: Right Multi-Function Switch Remove/Install
 Courtesy of CHRYSLER LLC

3. Install and tighten the screw (2) that secures the mounting tab on the back of the right multi-function switch (1) to the mounting bracket on the clockspring (3). Tighten the screw to 1 N.m (10 in. lbs.).
4. Reinstall the upper and lower shrouds onto the steering column. Refer to **INSTALLATION** .
5. Reconnect the battery negative cable.

WASHER HOSES/TUBES

DESCRIPTION

FRONT WASHER PLUMBING

Fig. 14: Left-Hand Drive
Courtesy of CHRYSLER LLC

Fig. 15: Right-Hand Drive
Courtesy of CHRYSLER LLC

The front washer plumbing consists of a small diameter rubber hose (8) that is routed from the barbed outlet nipple of the reversible electric washer pump/motor unit on the washer reservoir on the left side of the engine compartment side by side with the rear washer hose and the front end module wiring across the cooling module at the front to the right side of the engine compartment. The front washer hose is then routed along with the front end module wiring across the top of the right front inner wheel house to the cowl plenum assembly where

they pass through a rubber grommet in the front of the plenum panel into the plenum area.

Within the plenum area, the front washer hose is connected by an in-line plastic connector to the hood washer hose (7). The hood hose is routed through a rubber grommet (5) on left-hand drive vehicles, or through a metal S-clip (6) on right-hand drive vehicles out of the plenum area toward the upper hinge bracket on the left side of the hood panel (1). Molded plastic routing clips and a metal S-clip secure the hoses to the upper hinge bracket and the left side of the inner hood reinforcement. The washer nozzle hose is then secured within the rear channel bracket for the hood silencer on the underside of the inner hood reinforcement cowl between the two front washer nozzles (2).

A molded rubber tee fitting (3) connects the hood washer hose to the right washer nozzle, while a molded rubber elbow (4) connects the hose to the left washer nozzle.

Washer hose is available for service only as roll stock, which must then be cut to length. The molded plastic or rubber washer hose fittings cannot be repaired. If these fittings are ineffective or damaged, they must be replaced.

REAR WASHER PLUMBING

Fig. 16: Identifying Headliner Hose, Rubber Grommet & Small Diameter Rubber Hose
Courtesy of CHRYSLER LLC

The rear washer plumbing consists of small diameter rubber hose (3) that is routed from the barbed outlet nipple of the reversible electric washer pump/motor unit on the washer reservoir on the left side of the engine compartment side by side with the front washer hose and the front end module wiring across the cooling module at the front to the right side of the engine compartment. The rear washer hose is then routed along with the front end module wiring across the top of the right front inner wheel house to the dash panel, where an in-line plastic fitting connects the rear washer hose to the headliner hose (1), which passes into the passenger compartment through a rubber grommet (2).

Fig. 17: Identifying Headliner & Headliner Hose
 Courtesy of CHRYSLER LLC

The headliner hose is routed below the instrument panel in the passenger compartment near the right cowl side inner panel and up the right A-pillar to the headliner (2). The headliner hose is glued to the headliner substrate and routed along the right roof side rail to the rear of the vehicle. At the rear of the vehicle, the headliner hose passes through rubber grommets and a hole at the rear portion of the roof rear inner header panel and the upper liftgate inner panel where it is connected to the rear washer nozzle in the Center High Mounted Stop Lamp (CHMSL).

The headliner washer hose is integral to the headliner unit and, if ineffective or damaged, the headliner unit must be replaced. However, the headliner hose can be cut and spliced with a plastic in-line connector fitting to facilitate headliner removal without the need to remove the instrument panel. Refer to **REMOVAL**.

Washer hose is available for service only as roll stock, which must then be cut to length. The molded plastic washer hose fittings cannot be repaired. If these fittings are ineffective or damaged, they must be replaced.

OPERATION

FRONT WASHER PLUMBING

Washer fluid in the washer reservoir is pressurized and fed by the washer pump/motor through the front washer system plumbing and fittings to the two front washer nozzles. Whenever routing the washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts; and, sharp bends that might pinch the hose must be avoided.

REAR WASHER PLUMBING

Washer fluid in the washer reservoir is pressurized and fed by the washer pump/motor through the rear washer system plumbing and fittings to the rear washer nozzle located in the Center High Mounted Stop Lamp (CHMSL) on the upper outer liftgate panel above the liftgate glass opening. Whenever routing the washer hose

or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts; and, sharp bends that might pinch the hose must be avoided.

WASHER NOZZLE

DESCRIPTION

FRONT WASHER NOZZLE

Fig. 18: Front Washer Nozzle
Courtesy of CHRYSLER LLC

The fluidic front washer nozzles (2) are constructed of molded plastic and include an integral check valve. Each nozzle has two integral latches (4) that secure them in dedicated holes in the hood panel near the base of the windshield. The domed upper surface of the washer nozzle is visible on the outside of the hood panel, and the dual nozzle orifices (1) are oriented towards the windshield glass.

An integral diaphragm type check valve is contained within the body of each nozzle. A rubber seal (3) seals the nozzle to the outer surface of the hood panel. The washer plumbing fitting (5) for the washer nozzle extends below the hood panel and is accessible from the engine compartment.

The front washer nozzles cannot be adjusted or repaired and, if ineffective or damaged, they must be replaced.

REAR WASHER NOZZLE

81590594

Fig. 19: Rear Washer Nozzle
Courtesy of CHRYSLER LLC

The fluidic rear washer nozzle (1) is constructed of molded plastic. The rear washer nozzle is secured by two integral latch features (3) within a mounting hole integral to the Center High-Mounted Stop Lamp (CHMSL) on the outer liftgate panel above the liftgate glass opening. The domed outer surface of the washer nozzle is visible on the exterior surface of the CHMSL lens, and the nozzle orifice (5) is oriented downward towards the liftgate glass.

A rubber gasket (2) seals the nozzle to the outer surface of the CHMSL lens. The washer plumbing fitting (4) for the washer nozzle extends behind the lamp and is concealed between the liftgate inner and outer panels.

The rear washer nozzle cannot be adjusted or repaired and, if ineffective or damaged, it must be replaced.

OPERATION

FRONT WASHER NOZZLE

The two front washer nozzles are designed to dispense washer fluid into the wiper pattern area on the outside of the windshield glass. Pressurized washer fluid is fed to each nozzle from the washer reservoir by the washer pump/motor unit through a single hose, which is attached to a barbed nipple on each washer nozzle below the inner hood panel. A fluidic matrix within the washer nozzle causes the pressurized washer fluid to be emitted from the nozzle orifice as an oscillating stream to more effectively cover a larger area of the glass to be cleaned.

The integral check valve in each nozzle prevents washer fluid from draining out of the washer supply hoses back to the washer reservoir. This drain-back would result in a lengthy delay after the washer switch is actuated until washer fluid was dispensed through the nozzles, because the washer pump would have to refill the washer plumbing from the reservoir to the nozzles. Such a drain-back condition could also result in water, dirt, or other outside contaminants being siphoned into the washer system through the washer nozzle orifice. This water could subsequently freeze and plug the nozzle, while other contaminants could interfere with proper nozzle operation and cause improper nozzle spray patterns. In addition, the check valve prevents washer fluid from siphoning through the washer nozzles after the washer pump stops operating.

When the washer pump pressurizes and pumps washer fluid from the reservoir through the washer plumbing, the fluid pressure unseats a diaphragm from over a sump well within the nozzle by overriding the spring pressure applied to it by a piston. With the diaphragm unseated, washer fluid is allowed to flow toward the nozzle orifice. When the washer pump stops operating, the spring pressure on the piston seats the diaphragm over the sump well in the nozzle and fluid flow in either direction within the washer plumbing is prevented.

REAR WASHER NOZZLE

The rear washer nozzle is designed to dispense washer fluid into the wiper pattern area on the outside of the rear flip-up glass. Pressurized washer fluid is fed to the nozzle from the washer reservoir by the washer pump/motor through a single hose, which is attached to a barbed nipple on the back of the rear washer nozzle. A fluidic matrix within the washer nozzle causes the pressurized washer fluid to be emitted from the nozzle orifice as an oscillating stream to more effectively cover a larger area of the glass to be cleaned.

REMOVAL

FRONT WASHER NOZZLE

Fig. 20: Identifying Underside Of Hood & Front Washer Nozzle

Courtesy of CHRYSLER LLC

1. From the underside of the hood (1), remove the push-in retainers that secure the hood silencer pad to the inner hood reinforcement as necessary to access the front washer nozzle (2) hose connections.
2. Disconnect the hose from the barbed nipple of the front washer nozzle.
3. From the underside of the hood, release the integral latches of the front washer nozzle and push the nozzle out through the mounting hole toward the top side of the hood.
4. Remove the nozzle from the top of the hood panel.

REAR WASHER NOZZLE

Fig. 21: Identifying Center High-Mounted Stop Lamp (CHMSL), Integral Latch Features & Barbed Nipple

Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the Center High-Mounted Stop Lamp (CHMSL) (1) from the liftgate outer panel. Refer to **REMOVAL**.
3. Disconnect the rear washer supply hose from the barbed nipple (3) on the back of the rear washer nozzle.
4. From the back of the CHMSL housing, depress the two integral latch features (2) of the nozzle, and push the nozzle out through the face of the lamp lens.

INSTALLATION

FRONT WASHER NOZZLE

Fig. 22: Identifying Underside Of Hood & Front Washer Nozzle
 Courtesy of CHRYSLER LLC

1. Position the front washer nozzle (2) to the mounting hole on the outside of the hood panel (1).
2. Align the anti-rotation tab of the nozzle with the anti-rotation notch in the mounting hole.
3. Using hand pressure, push firmly and evenly on the top of the nozzle until the integral latches lock into place on the underside of the hood.
4. From the underside of the hood, reconnect the washer hose to the barbed nipple of the nozzle.
5. Reinstall the push-in retainers that secure the hood silencer pad to the inner hood reinforcement.

REAR WASHER NOZZLE

Fig. 23: Identifying Center High-Mounted Stop Lamp (CHMSL), Integral Latch Features & Barbed Nipple
 Courtesy of CHRYSLER LLC

1. Be certain that the rubber gasket is installed around the base of the rear washer nozzle and that it is in good condition.

2. Insert the nozzle nipple (3) through the mounting hole from the face of the Center High-Mounted Stop Lamp (CHMSL) lens (1) with the nozzle orifice oriented downward.
3. Using hand pressure, press the nozzle firmly and evenly into the mounting hole until both integral latch features (2) are fully engaged on the back of the CHMSL housing.
4. Reconnect the rear washer supply hose to the barbed nipple of the nozzle.
5. Reinstall the CHMSL onto the liftgate outer panel. Refer to **INSTALLATION** .
6. Reconnect the battery negative cable.

WASHER PUMP/MOTOR

DESCRIPTION

WASHER PUMP/MOTOR

Fig. 24: Identifying Washer Pump/Motor Components

Courtesy of CHRYSLER LLC

The washer pump/motor unit is located on the top of a sump area on the left outboard side of the washer reservoir, which is integral to the coolant reserve bottle on the left side of the cooling module in the engine compartment. A small permanently lubricated and sealed reversible electric motor (3) is coupled to the rotor-type washer pump (4). The use of an integral valve body (7) allows the washer pump/motor unit to provide washer fluid to either the front or the rear washer systems, depending upon the direction of the motor/pump impeller rotation.

An inlet nipple (6) on the pump housing passes through a rubber grommet seal/filter screen installed in a dedicated mounting hole of the washer reservoir sump. The filter screen prevents most debris from entering the pump housing. When the pump is installed in the reservoir the front barbed outlet nipple (5) on the pump valve body housing connects the unit to the front washer hose, and the rear barbed outlet nipple (8) connects the unit to the rear washer hose. The letters **F** and **R** molded into the valve body housing adjacent to each nipple provide further clarification of the nipple assignments.

The washer pump/motor unit is retained on the reservoir by the interference fit between the pump inlet nipple and the grommet seal, which is a light press fit. The top of the washer pump is also secured to the washer reservoir by the use of a snap fit between the motor housing and a receptacle molded into the reservoir that allows for mounting of the washer pump without the use of fasteners. An integral connector receptacle (1) on the top of the motor housing connects the unit to the vehicle electrical system through a dedicated take out and connector of the headlamp and dash wire harness.

The washer pump/motor unit cannot be repaired. If ineffective or damaged, the entire washer pump/motor unit must be replaced.

OPERATION

WASHER PUMP/MOTOR

Fig. 25: Identifying Pump/Motor Operation
Courtesy of CHRYSLER LLC

The washer pump/motor unit features a reversible electric motor. The direction of the motor is controlled by hard wired outputs from the momentary front and rear washer switch circuitry contained within the right (wiper) control stalk of the multi-function switch. When battery current and ground are applied to the two pump motor terminals, the motor rotates in one direction. When the polarity of these connections is reversed, the motor rotates in the opposite direction.

When the pump motor is energized, the rotor-type pump pressurizes the washer fluid and forces it through one of the two pump outlet nipples, and into the front or rear washer plumbing. Washer fluid is drawn through the pump inlet nipple from the washer reservoir to the inlet port of the washer pump housing. An integral valve body is located in a housing on the outlet port side (2) of the pump housing. A diaphragm (4) in this valve body controls which washer system plumbing receives the washer fluid being pressurized by the pump. When the pump is not operating the diaphragm is biased to close all washer fluid flow in the rear washer system and, in this way it also performs the function of the rear washer system check valve.

When the pump impeller (1) rotates in the counterclockwise direction (viewed from the bottom), the biased diaphragm is sealing off the rear washer system outlet and nipple so the pressurized washer fluid is pushed out through the pump front outlet port and the front washer outlet nipple (5). When the pump impeller rotates in the clockwise direction (viewed from the bottom), pressurized washer fluid is pushed out through the pump rear outlet port and moves the diaphragm to open the rear washer outlet nipple and seal off the front washer outlet nipple, then the pressurized washer fluid is pushed out through the rear washer outlet nipple (3).

The washer pump/motor unit and the hard wired circuits between the motor and the multi-function switch may be diagnosed using conventional diagnostic tools and procedures.

REMOVAL

WASHER PUMP/MOTOR

NOTE: The washer pump/motor can be removed from the washer reservoir without removing the reservoir from the vehicle.

Fig. 26: Identifying Washer Reservoir, Motor Housing, Front End Module Wire Harness Connector & Washer Hoses

Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Siphon the washer fluid from the washer reservoir (1) on the left side of the cooling module in the engine compartment into a clean container for reuse.
3. Disconnect the front end module wire harness connector (3) from the washer pump/motor unit connector

receptacle on the top of the motor housing (2).

4. Disconnect the two washer hoses (4 and 5) from the two washer pump/motor unit outlet nipples.
5. Firmly grasp the top of the washer pump/motor housing and pull it lightly outward from the washer reservoir far enough to disengage the top of the motor from the receptacle in the reservoir. Care must be taken not to damage the reservoir.
6. Pull the washer pump/motor unit straight up and out of the washer reservoir far enough to disengage the inlet nipple from the rubber grommet seal/filter screen in the reservoir.
7. Remove the rubber grommet seal/filter screen for the washer pump from the pump mounting hole in the washer reservoir and discard.

INSTALLATION

WASHER PUMP/MOTOR

Fig. 27: Identifying Washer Reservoir, Motor Housing, Front End Module Wire Harness Connector & Washer Hoses

Courtesy of CHRYSLER LLC

1. Install a new rubber grommet seal/filter screen unit into the washer pump mounting hole in the washer reservoir (1). Always use a new rubber grommet seal/filter screen on the reservoir.
2. Position the inlet nipple of the washer pump (2) to the rubber grommet seal/filter screen in the washer reservoir.
3. Using hand pressure, press firmly and evenly downward on the washer pump/motor unit until the inlet nipple is fully seated in the rubber grommet seal/filter screen in the pump mounting hole of the reservoir.
4. Align the top of the washer pump/motor housing with the receptacle in the washer reservoir.
5. Using hand pressure, press firmly and evenly on the top of washer pump/motor unit until the motor housing snaps into the reservoir receptacle.
6. Reconnect the front (5) and rear (4) washer hoses to the two barbed pump outlet nipples.
7. Reconnect the front end module wire harness connector (3) for the washer pump/motor unit to the connector receptacle on the top of the motor housing.
8. Reconnect the battery negative cable.

9. Refill the washer reservoir with the washer fluid siphoned from the reservoir during the removal procedure.

WASHER RESERVOIR

DESCRIPTION

WASHER RESERVOIR

The molded translucent plastic washer fluid reservoir is integral to the engine coolant overflow bottle. This unit sits astride the top of the fan shroud at the front of the engine compartment, with the washer reservoir on the left side of the shroud and the coolant overflow bottle on the right. A single washer fluid reservoir is used for both the front and rear washer systems.

A bright yellow plastic filler cap with a rubber seal and an International Control and Display Symbol icon for **Windshield Washer** and the text **WASHER FLUID ONLY** molded into it snaps over the open end of the washer reservoir filler neck. The cap hinges on and is secured to a molded-in hook formation on the top of the reservoir just behind the filler neck when it is removed for inspecting or adjusting the fluid level in the reservoir.

There is a dedicated hole on the top of a sump area and an integral molded receptacle on the lower left facing side of the reservoir provided for the mounting of the washer/pump motor unit. These features allow for mounting of the washer pump/motor unit without the use of fasteners.

The washer reservoir is serviced only as a unit with the engine coolant reserve bottle. The washer reservoir cannot be repaired and, if ineffective or damaged, the coolant reserve bottle/washer reservoir unit must be replaced. The grommet seal/filter screen for the washer pump/motor unit and the filler cap are each available for individual service replacement.

OPERATION

WASHER RESERVOIR

The washer fluid reservoir provides a secure, on-vehicle storage location for a large reserve of washer fluid for operation of the front and rear washer systems. The washer reservoir filler neck provides a clearly marked and readily accessible point from which to add washer fluid to the reservoir. The washer/pump motor unit is located in a sump area near the bottom of the reservoir to be certain that washer fluid will be available to the pump as the fluid level in the reservoir becomes depleted. The washer pump/motor unit is mounted above the lowest position in the sump.

WIPER ARM

DESCRIPTION

FRONT WIPER ARM

Fig. 28: Front Wiper Arm
Courtesy of CHRYSLER LLC

The front wiper arms are the rigid members located between the wiper pivots that protrude from the cowl plenum cover/grille panel near the base of the windshield and the wiper blades on the windshield glass. These wiper arms feature an over-center hinge that allows easy access to the windshield glass for cleaning. The wiper arm has a die cast metal pivot end (4) with a large tapered mounting hole (5) at one end. A molded black plastic cap fits over the wiper arm retaining nut to conceal the nut and this mounting hole following wiper arm installation.

The wide end of a tapered, stamped steel channel (3) hinges on and is secured with a hinge pin (6) to the blade end of the wiper arm pivot end. One end of a long, rigid, stamped steel strap (2) with a small hole near its pivot end is riveted and crimped within the narrow end of the stamped steel channel. The tip of the wiper blade end of this strap is bent back under itself to form a small hook (1). Concealed within the stamped steel channel, one end of a long tension spring is engaged with a wire hook on the underside of the die cast pivot end, while the other end of the spring is hooked through the small hole in the steel strap. The entire wiper arm has a satin black finish applied to all of its visible surfaces.

A wiper arm cannot be adjusted or repaired. If damaged or ineffective, the entire wiper arm unit must be replaced.

REAR WIPER ARM

81d85c67

Fig. 29: Rear Wiper Arm
Courtesy of CHRYSLER LLC

The rear wiper arm (1) is the rigid member located between the rear wiper motor output shaft that protrudes through the liftgate outer panel below the center of the liftgate flip-up glass opening and the rear wiper blade. The wiper arm is constructed of molded black plastic. A hinged pivot end is a die cast metal piece with a tapered hole that receives the wiper motor output shaft and is secured to the output shaft by the arm retaining nut. The hinge has an over-center action to provide ease of service of the wiper blade. A molded plastic wiper arm support (2) is integral to the lower surface of the wiper arm and extends downward from the arm.

A molded black plastic nut cap (3) with integral snap features fits over the wiper arm pivot end to conceal the nut and mounting provisions following wiper arm installation. The wiper arm hinge and tension spring are concealed on the underside of the wide end of the arm, while an integral receptacle feature concealed on the underside of the narrow end of the wiper arm accepts the pivot pin of the rear wiper blade unit with a tight snap fit.

The rear wiper arm cannot be adjusted or repaired. If damaged or ineffective, the entire wiper arm unit must be replaced.

OPERATION

FRONT WIPER ARM

The front wiper arms are designed to mechanically transmit the motion from the wiper pivots to the wiper blades. The wiper arm must be properly indexed to the wiper pivot in order to maintain the proper wiper blade travel on the glass. The tapered mounting hole in the wiper arm pivot end interlocks with the serrations on the tapered outer circumference of the wiper pivot shaft, allowing positive engagement and finite adjustment of this connection.

The mounting nuts lock the wiper arms to the threaded studs of the wiper pivot shafts. The spring-loaded wiper arm hinge controls the down-force applied through the tip of the wiper arm to the wiper blade on the glass. The hook formation on the tip of the wiper arm provides a cradle for securing and latching the wiper blade pivot block to the wiper arm.

REAR WIPER ARM

The rear wiper arm is designed to mechanically transmit the motion from the rear wiper motor output shaft to the rear wiper blade. The wiper arm must be properly indexed to the motor output shaft in order to maintain the proper wiper blade travel on the glass. The wiper arm support is designed to lift and support the rear wiper arm and blade off of the glass when they are parked. This support and the park ramp on the liftgate outer panel below the glass upon which the support rests also provide an alignment reference to ensure accurate rear wiper arm installation.

The tapered hole in the wiper arm pivot end interlocks with the serrations on the outer circumference of the tapered motor output shaft, allowing positive engagement and finite adjustment of this connection. A hex nut secures the wiper arm pivot end to the threads on the rear wiper motor output shaft and the plastic cap snaps over this connection for a neat appearance. The spring-loaded wiper arm hinge controls the down-force applied through the tip of the wiper arm to the wiper blade on the glass. The latch formation on the underside of the wiper arm provides a cradle for securing and latching the wiper blade pivot pin to the wiper arm.

REMOVAL

FRONT WIPER ARM

Fig. 30: Identifying Front Wiper Arms, Plastic Nut Cap, Nut & Wiper Alignment Lines
Courtesy of CHRYSLER LLC

1. Lift the front wiper arm (1) to its over-center position to hold the wiper blade off of the glass and relieve the spring tension on the wiper arm to pivot shaft connection.
2. Carefully pry the plastic nut cap (2) off of the pivot end of the wiper arm.
3. Remove the nut (3) that secures the wiper arm to the wiper pivot shaft (4).

80a953dc

Fig. 31: Disengaging Wiper Arm from Pivot Shaft
Courtesy of CHRYSLER LLC

4. If necessary, use a suitable battery terminal puller (3) to disengage the wiper arm (1) from the pivot shaft (2).
5. Remove the front wiper arm pivot end from the pivot shaft.

REAR WIPER ARM

81d87ee2

Fig. 32: Molded Plastic Nut Cap, Wiper Arm, Nut, Rear Wiper Motor Output Shaft
Courtesy of CHRYSLER LLC

1. Unsnap and remove the molded plastic nut cap (4) from the pivot end of the wiper arm (3).
2. Remove the nut (5) that secures the wiper arm to the rear wiper motor output shaft (1).

80a953dc

Fig. 33: Wiper Arm Puller - Typical
Courtesy of CHRYSLER LLC

3. Use a slight rocking action to disengage the rear wiper arm (1) pivot end from the output shaft (2) and remove the wiper arm. If necessary, a battery terminal puller (3) may be used to disengage the wiper arm from the output shaft splines.
4. Remove the rear wiper arm pivot end from the motor output shaft.

INSTALLATION

FRONT WIPER ARM

NOTE: Be certain that the wiper motor is in the park position before attempting to install the front wiper arms. Turn the ignition switch to the ON position and move the right (wiper) multi-function switch control knob to its OFF position. If the wiper pivots move, wait until they stop moving, then turn the ignition switch back to the OFF position. The front wiper motor is now in its park position.

Fig. 34: Identifying Front Wiper Arms, Plastic Nut Cap, Nut & Wiper Alignment Lines
 Courtesy of CHRYSLER LLC

1. The front wiper arms (1) must be indexed to the pivot shafts with the front wiper motor in the park position to be properly installed. Position the wiper arm pivot ends onto the wiper pivot shafts (4) so that the tip of the wiper blade is aligned with the wiper alignment lines (5) located near the lower margin of the windshield glass.
2. Once the wiper blade is aligned, lift the wiper arm away from the windshield slightly to relieve the spring tension on the pivot end and push the pivot end of the wiper arm down firmly and evenly over the pivot shaft.
3. Install and tighten the nut (3) that secures the wiper arm to the pivot shaft. Tighten the nut to 24 N.m (18 ft. lbs.).
4. Wet the windshield glass, then operate the front wipers. Turn the front wipers OFF, then check for the correct wiper arm position and readjust as required.
5. Reinstall the plastic nut cap (2) onto the wiper arm pivot nut.

REAR WIPER ARM

NOTE: Be certain that the rear wiper motor is in the park position before attempting to install the rear wiper arm. Turn the ignition switch to the ON position and move the rear wiper switch to its OFF position. If the wiper motor output shaft moves, wait until it stops moving, then turn the ignition switch back to the OFF position. The wiper motor is now in its park position.

81d87ee2

Fig. 35: Molded Plastic Nut Cap, Wiper Arm, Nut, Rear Wiper Motor Output Shaft
Courtesy of CHRYSLER LLC

1. The rear wiper arm (3) must be indexed to the rear wiper motor output shaft (1) with the motor in the park position to be properly installed. Place the wiper arm onto the liftgate with the wiper arm support positioned on the park ramp (2) and the tapered mounting hole on the pivot end of the arm positioned over the rear wiper motor output shaft.
2. With the rear wiper arm properly indexed, push the tapered mounting hole on the pivot end of the wiper arm down over the output shaft.
3. Install and tighten the nut (5) that secures the rear wiper arm to the output shaft. Tighten the nut to 28 N.m (21 ft. lbs.).
4. Position and snap the molded plastic nut cap (4) over the nut on the pivot end of the rear wiper arm.
5. Wet the liftgate flip-up glass and operate the rear wiper. Turn the rear wiper switch to the OFF position, then check for correct wiper arm park position with the arm located off the glass and the arm support in the park ramp. Readjust as required.

WIPER ARM PARK RAMP

REMOVAL

WIPER ARM PARK RAMP

Fig. 36: Rear Wiper Arm Support
 Courtesy of CHRYSLER LLC

1. Disengage the rear wiper arm support from the wiper arm park ramp (2) on the right side of the liftgate just below the rear flip-up glass.
2. Lift the wiper arm and blade away from the liftgate until the wiper arm hinge is in its over-center position.
3. Remove the trim panel from the liftgate inner panel. Refer to **REMOVAL** .
4. Remove the nut (1) that secures the wiper arm park ramp to the liftgate outer panel.
5. Remove the wiper arm park ramp from the liftgate outer panel.

INSTALLATION

WIPER ARM PARK RAMP

Fig. 37: Rear Wiper Arm Support
 Courtesy of CHRYSLER LLC

1. Position the wiper arm park ramp (2) onto the liftgate outer panel.
2. Install and tighten the nut (1) that secures the wiper arm park ramp to the liftgate outer panel. Tighten the nut to 6.5 N.m (58 in. lbs.).
3. Reinstall the trim panel onto the liftgate inner panel. Refer to **INSTALLATION** .
4. Lower the rear wiper arm and blade and place the wiper arm support onto the wiper arm park ramp.

WIPER BLADE

DESCRIPTION

FRONT WIPER BLADE

Fig. 38: Front Wiper Blade
 Courtesy of CHRYSLER LLC

Each front wiper blade is secured by an integral latching pivot block (2) to the hook formation on the tip of each wiper arm, and rests on the glass near the base of the windshield when the wipers are not in operation. The wiper blade consists of the following components:

- **Superstructure (1)** - The superstructure includes several stamped steel bridges and links with claw formations (4) that grip the wiper blade element. Also included in this unit is the latching, molded plastic pivot block that secures the superstructure to the wiper arm. On vehicles manufactured for export markets, the driver side front wiper blade has an additional molded black plastic airfoil secured to the superstructure, which is oriented toward the base of the windshield when the front wipers are in their parked position. All of the metal components of the wiper blade have a satin black finish applied.
- **Element (3)** - The wiper element or squeegee is the resilient rubber member of the wiper blade that contacts the glass.
- **Flexor** - The flexor is a rigid metal component running along the length of each side of the wiper element where it is gripped by the claws of the superstructure.

All vehicles have interchangeable windshield wiper blades with non-replaceable rubber elements (squeegees), except those export vehicles with an airfoil on the wiper blade superstructure. The blades are 47.50 centimeter

(18.70 inch) long. The wiper blades cannot be adjusted or repaired and, if ineffective, worn, or damaged the entire wiper blade unit must be replaced.

REAR WIPER BLADE

Fig. 39: Rear Wiper Blade
Courtesy of CHRYSLER LLC

The rear wiper blade is secured by an integral pivot pin (2) to the latch formations within the underside of the rear wiper arm, and rests off the glass on a park ramp on the liftgate near the base of the liftgate flip-up glass when the rear wiper system is not in operation. The rear wiper blade consists of the following components:

- **Superstructure (1)** - The superstructure includes a stamped steel bridge and links with claw formations that grip the wiper blade element. Also included in this unit is the pivot pin, which secures the superstructure to the wiper arm. All of the metal components of the wiper blade have a satin black finish applied.
- **Element (4)** - The wiper element or squeegee is the resilient rubber member of the wiper blade that contacts the glass.
- **Flexor (3)** - The flexor is a rigid metal component running along the length of each side of the wiper element where it is gripped by the claws of the superstructure.

The rear wiper blade is 30.45 centimeters (11.98 inches) long with a non-replaceable rubber element (squeegee). The wiper blade cannot be adjusted or repaired. If ineffective, worn or damaged the entire wiper blade unit must be replaced.

OPERATION

FRONT WIPER BLADE

The wiper blades are moved back and forth across the glass by the wiper arms when the wipers are being operated. The wiper blade superstructure is the flexible frame that grips the wiper blade element and evenly distributes the force of the spring-loaded wiper arm along the length of the element. The combination of the wiper arm force and the flexibility of the superstructure makes the element conform to and maintain proper

contact with the glass, even as the blade is moved over the varied curvature that may be encountered across the glass surface.

The wiper element flexor provides the claws of the blade superstructure with a rigid, yet flexible component on the element which can be gripped. The rubber element is designed to be stiff enough to maintain an even cleaning edge as it is drawn across the glass, yet resilient enough to conform to the glass surface and flip from one cleaning edge to the other each time the wiper blade changes directions. The airfoil used on the driver side wiper blade of vehicles manufactured for certain markets is designed to reduce the lifting effect caused by air moving over the vehicle at higher highway speeds.

REAR WIPER BLADE

The rear wiper blade is moved back and forth across the glass by the wiper arm when the rear wiper system is in operation. The wiper blade superstructure is the flexible frame that grips the wiper blade element and evenly distributes the force of the spring-loaded wiper arm along the length of the element. The combination of the wiper arm force and the flexibility of the superstructure makes the element conform to and maintain proper contact with the glass, even as the blade is moved over the varied curvature found across the glass surface.

The wiper element flexor provides the claws of the blade superstructure with a rigid, yet flexible component on the element which can be gripped. The rubber element is designed to be stiff enough to maintain an even cleaning edge as it is drawn across the glass, but resilient enough to conform to the glass surface and flip from one cleaning edge to the other each time the wiper blade changes directions.

REMOVAL

FRONT WIPER BLADE

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

Fig. 40: Remove/Install Front Wiper Arm
Courtesy of CHRYSLER LLC

NOTE: The notched end of the wiper element flexor should always be oriented towards the end of the wiper blade that is nearest to the wiper pivot.

1. Lift the wiper arm (2) to raise the wiper blade and element (6) off of the glass, until the wiper arm hinge is in its over-center position.
2. To remove the blade from the arm, depress the latch release tab (4) on the pivot block (3) under the tip of the arm and slide the blade away from the tip towards the pivot end of the arm far enough to disengage the pivot block from the hook formation (5) on the end of the arm.
3. Extract the hook formation on the tip of the wiper arm through the opening in the wiper blade superstructure (1) just ahead of the pivot block.
4. Gently lower the tip of the wiper arm onto the glass.

REAR WIPER BLADE

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

Fig. 41: Rear Wiper Arm Support
Courtesy of CHRYSLER LLC

1. Disengage the rear wiper arm support from the rear wiper arm park ramp on the right side of the liftgate just below the flip-up glass opening.
2. Lift the rear wiper arm (1) to the over-center hinge position, which will raise the wiper blade and element away from the liftgate and the flip-up glass.
3. To remove the blade (2) from the arm, swing the end of the wiper blade nearest to the wiper motor away from the wiper arm to its travel limit.
4. Now press the end of the wiper blade nearest to the wiper motor away from the wiper arm against its stop far enough to unsnap the wiper blade pivot pin (3) from the latch features on the underside of the wiper arm.

INSTALLATION

FRONT WIPER BLADE

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

Fig. 42: Remove/Install Front Wiper Arm
 Courtesy of CHRYSLER LLC

NOTE: The notched end of the wiper element flexor should always be oriented towards the end of the wiper blade that is nearest to the wiper pivot.

1. Lift the wiper arm (2) off of the windshield glass, until the wiper arm hinge is in its over-center position.
2. Position the wiper blade near the hook formation (5) on the tip of the arm with the notched end of the wiper element flexor oriented towards the end of the wiper arm that is nearest to the wiper pivot.
3. Insert the hook formation on the tip of the arm through the opening in the blade superstructure (1) ahead of the pivot block (3) far enough to engage the pivot block into the hook.
4. Slide the pivot block up into the hook formation on the tip of the wiper arm until the latch release tab (4) snaps into its locked position. Latch engagement will be accompanied by an audible click.
5. Gently lower the wiper blade and element (6) onto the glass.

REAR WIPER BLADE

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

Fig. 43: Rear Wiper Blade
 Courtesy of CHRYSLER LLC

1. Position the rear wiper blade (2) under the rear wiper arm (1), aligning the pivot pin (3) near the center of

the blade superstructure with the latch features on the underside of the arm.

2. Squeeze the arm and blade together until the blade pivot pin snaps into the latch features of the arm.
3. Gently lower the wiper arm and place the arm support in the park ramp on the liftgate.

WIPER MODULE

DESCRIPTION

FRONT WIPER MODULE

Fig. 44: Front Wiper Module Components
Courtesy of CHRYSLER LLC

The front wiper module is secured within the cowl plenum panel beneath the cowl plenum cover/grille panel. The ends of the wiper pivot shafts (3) protrude through dedicated openings in the cowl plenum cover/grille panel to drive the wiper arms and blades and are the only visible components of the front wiper module.

The front wiper module consists of the following major components:

- **Bracket** - The front wiper module bracket consists of a long tubular steel main member that has a die cast pivot bracket formation near each end where the two wiper pivots are secured. A die cast mounting bracket for the wiper motor (4) is secured with two screws near the center of the main member. Each of the two wiper pivot brackets secures the module to the cowl plenum with a screw through a rubber insulator (1), and a third rubber insulator on the motor bracket secures the module with a nut to a stud located in the bottom of the cowl plenum.
- **Crank Arm (6)** - The front wiper motor crank arm is a stamped steel unit with a hole on the driven end that is secured to the wiper motor output shaft with a nut, and has a ball stud secured to the drive end.
- **Linkage (2)** - Two tubular steel drive links connect the wiper motor crank arm to the wiper pivot lever arms. The right side drive link has a plastic socket-type bushing on each end. The left side drive link has a plastic socket-type bushing on one end, and a plastic sleeve-type bushing on the other end. The socket-type bushing on one end of each drive link is snap-fit over the ball stud on the lever arm of its respective pivot. The left side drive link sleeve-type bushing end is then fit over the motor crank arm ball stud, and

the other socket-type bushing of the right side drive link is snap-fit over the exposed end of the wiper motor crank arm ball stud.

- **Motor** - The front wiper motor is secured with two screws near the center of the main tubular member of the wiper module bracket, and through a rubber insulator to a stud in the bottom of the cowl plenum. An integral connector receptacle (5) connects the motor to the vehicle electrical system through a take out and connector of the front end module wire harness. A nut secures the wiper motor crank arm to the motor output shaft. The two-speed permanent magnet wiper motor features an integral transmission, an internal park switch, and an internal automatic resetting circuit breaker.
- **Pivots** - The two front wiper pivots are secured within the die cast pivot brackets on the outboard ends of the wiper module main member. The lever arms that extend from the center of the pivot shafts each have a ball stud on their end. The upper end of each pivot shaft where the wiper arms will be fastened each is tapered and serrated with a threaded stud formation at the tip. The lower ends of the pivot shafts are installed through lubricated bushings in the pivot brackets and are secured with snap rings.

The front wiper module cannot be adjusted or repaired. If any component of the module is ineffective or damaged, the entire front wiper module unit must be replaced.

OPERATION

FRONT WIPER MODULE

The front wiper module operation is controlled by the battery current inputs received by the wiper motor through the Totally Integrated Power Module (TIPM). The wiper motor speed is controlled by current flow to either the low speed or the high speed set of brushes. The park switch is a single pole, single throw, momentary switch within the wiper motor that is mechanically actuated by the wiper motor transmission components. The park switch alternately closes the wiper park switch sense circuit to ground or to battery current, depending upon the position of the wipers on the glass. This feature allows the motor to complete its current wipe cycle after the wiper system has been turned OFF, and to park the wiper blades in the lowest portion of the wipe pattern. The automatic resetting circuit breaker protects the motor from overloads.

The wiper motor crank arm, the two wiper linkage members and the two wiper pivots mechanically convert the rotary output of the wiper motor to the back and forth wiping motion of the wiper arms and blades on the glass.

The hard wired inputs and outputs of the front wiper motor may be diagnosed using conventional diagnostic tools and procedures. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the front wiper motor or the electronic controls or communication between other modules and devices that provide some features of the front wiper and washer system. The most reliable, efficient, and accurate means to diagnose the front wiper motor or the electronic controls and communication related to front wiper motor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

FRONT WIPER MODULE

Fig. 45: Identifying Screws, Nut, Cowl Plenum, Weld Stud, Wiper Motor & Wire Harness Connector
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove both front wiper arms from the wiper pivots. See REMOVAL.
3. Remove the cowl plenum cover/grille panel from over the cowl plenum. Refer to REMOVAL.
4. Disconnect the wire harness connector (6) for the front wiper motor (5) from the motor connector receptacle.
5. Remove the two screws (1) that secure the ends of the front wiper module bracket to the cowl plenum (3).
6. Remove the nut (2) that secures the front wiper motor bracket rubber insulator to the weld stud (4) located on the bottom of the cowl plenum.
7. Remove the front wiper module from the cowl plenum as a unit.

INSTALLATION

FRONT WIPER MODULE

Fig. 46: Identifying Screws, Nut, Cowl Plenum, Weld Stud, Wiper Motor & Wire Harness Connector
Courtesy of CHRYSLER LLC

1. Position the front wiper module into the cowl plenum (3) as a unit.
2. Position the front wiper motor bracket rubber insulator over the weld stud (4) located on the bottom of the cowl plenum.
3. Loosely install the two screws (1) that secure the ends of the front wiper module bracket to the cowl plenum. Tighten the outboard screw, followed by the inboard screw. Tighten the screws to 8 N.m (72 in. lbs.).
4. Install and tighten the nut (2) that secures the front wiper motor bracket rubber insulator to the two weld stud on the bottom of the cowl plenum. Tighten the nut to 7.5 N.m (67 in. lbs.).
5. Reconnect the wire harness connector (6) for the front wiper motor (5) to the motor connector receptacle.
6. Reinstall the cowl plenum cover/grille panel over the cowl plenum. Refer to **INSTALLATION**.

NOTE: Be certain to turn the ignition switch to the ON position, then turn the front wiper switch ON and OFF again to cycle the wiper motor and linkage to their natural park position before reinstalling the front wiper arms onto the wiper pivots.

7. Reinstall both front wiper arms onto the wiper pivots. See **INSTALLATION**.
8. Reconnect the battery negative cable.

WIPER MOTOR

DESCRIPTION

REAR WIPER MOTOR

81d8b1ce

Fig. 47: Rear Wiper Motor
Courtesy of CHRYSLER LLC

The rear wiper motor (1) is concealed within the liftgate, below the liftgate flip-up glass and behind the liftgate inner trim panel. The end of the motor output shaft (3) that extends through the liftgate outer panel to drive the rear wiper arm and blade is the only visible component of the rear wiper motor. A rubber bezel and grommet is engaged within the output shaft hole of the liftgate outer panel and seals the output shaft where it passes through the panel. An integral connector receptacle (4) connects the rear wiper motor to the vehicle electrical system through a dedicated take out and connector of the liftgate wire harness. The rear wiper motor consists of the following major components:

- **Bracket (2)** - The rear wiper motor bracket consists of a stamped metal mounting plate for the wiper motor that is secured with screws to the wiper motor housing, and through three rubber isolators (5) to the liftgate inner panel.
- **Motor** - The single-speed permanent magnet rear wiper motor is secured with screws to the rear wiper motor bracket. The wiper motor includes an integral transmission, a motor output shaft, an automatic resetting circuit breaker, and the rear wiper motor park switch that provides a depressed park position to park the rear wiper blade off of the glass.

The rear wiper motor cannot be adjusted or repaired. If any component of the motor is ineffective or damaged, the entire rear wiper motor unit must be replaced. The motor output shaft bezel and grommet is available for individual service replacement.

OPERATION

REAR WIPER MOTOR

The rear wiper motor operation is controlled by the Totally Integrated Power Module (TIPM), which uses intelligent, high current, self-protected high side switches to control rear wiper system operation for energizing or de-energizing the rear wiper motor. The TIPM uses internal programming and electronic messages received over the Controller Area Network (CAN) data bus from the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) to provide the appropriate rear wiper and washer system operating modes. The EMIC uses electronic messages received from the Steering Control Module (SCM) over a Local Interconnect Network (LIN) data bus to determine when to send electronic rear wiper system requests to the TIPM.

The rear wiper motor park switch is a single pole, single throw, momentary switch within the wiper motor that is mechanically actuated by the wiper motor transmission components. The park switch alternately closes and opens a path to ground for the rear wiper motor electronic control logic circuitry of the TIPM, depending upon the position of the rear wiper blade on the liftgate flip-up glass. This input allows the electronic logic circuits of the TIPM to control all of the electronic features of rear wiper motor operation and to keep the motor energized long enough to complete its current wipe cycle and park the wiper blade off of the glass after the wiper system or the ignition switch has been turned OFF. The TIPM also receives an external control input from the flip-up glass ajar switch sense circuit. If the TIPM senses that the flip-up glass is ajar, it will not allow the rear wiper motor to operate.

The rear wiper motor is grounded at all times through a take out in the body wire harness that is secured to a ground location in the passenger compartment. The automatic resetting circuit breaker protects the motor from overloads. The rear wiper motor transmission converts the rotary output of the wiper motor to the back and forth wiping motion of the rear wiper arm and blade on the liftgate flip-up glass.

The hard wired inputs and outputs of the rear wiper motor may be diagnosed using conventional diagnostic tools and procedures. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the rear wiper motor or the electronic controls or communication between other modules and devices that provide some features of the rear wiper and washer system. The most reliable, efficient, and accurate means to diagnose the rear wiper motor or the electronic controls and communication related to rear wiper motor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REAR WIPER MOTOR

Fig. 48: Rear Wiper Motor Output Shaft
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the rear wiper arm from the rear wiper motor output shaft. See **REMOVAL**.

NOTE: **The output shaft bezel and grommet (1) does not have to be removed to remove the rear wiper motor from the liftgate.**

3. Remove the trim panel from the liftgate inner panel (2). Refer to **REMOVAL**.
4. Disconnect the wire harness connector from the rear wiper motor (2).
5. Remove the three screws (3) that secure the motor mounting bracket to the liftgate inner panel.
6. Remove the motor from the liftgate.
7. Remove the bezel and rubber grommet (1) on the outer liftgate panel from the output shaft clearance hole.
Be certain to take proper precautions to protect the outer liftgate panel and its paint finish from damage during this procedure.

INSTALLATION

REAR WIPER MOTOR

Fig. 49: Rear Wiper Motor Output Shaft
Courtesy of CHRYSLER LLC

1. If the output shaft bezel and grommet (1) were removed from the outside of the liftgate, install the rubber bezel and grommet into the rear wiper motor output shaft clearance hole of the liftgate outer panel.
2. Position the rear wiper motor and bracket unit (2) onto the liftgate inner panel as a unit.
3. Install and tighten the three screws (3) that secure the mounting bracket to the liftgate. Tighten the screws to 5.5 N.m (49 in. lbs.).
4. Reconnect the wire harness connector to the motor connector receptacle.
5. Reinstall the trim panel onto the liftgate inner panel. Refer to **INSTALLATION**.
6. Reinstall the rear wiper arm onto the output shaft. See **INSTALLATION**.
7. Reconnect the battery negative cable.

2008 ELECTRICAL

Wiring Diagram Information - Liberty

WIRING DIAGRAM INFORMATION

DESCRIPTION

CIRCUIT FUNCTIONS

All circuits in the diagrams use an alpha/numeric code to identify the wire and it's function. To identify which circuit code applies to a system, refer to the CIRCUIT IDENTIFICATION CODE CHART. This chart shows the main circuits only and does not show the secondary codes that may apply to some models.

CIRCUIT IDENTIFICATION CODE CHART

CIRCUIT	FUNCTION
A	BATTERY FEED
B	BRAKE CONTROLS
C	CLIMATE CONTROLS
D	DIAGNOSTIC CIRCUITS
E	DIMMING ILLUMINATION CIRCUITS
F	FUSED CIRCUITS
G	MONITORING CIRCUITS (GAUGES)
H	MULTIPLE
I	NOT USED
J	OPEN
K	POWERTRAIN CONTROL MODULE
L	EXTERIOR LIGHTING
M	INTERIOR LIGHTING
N	MULTIPLE
O	NOT USED
P	POWER OPTION (BATTERY FEED)
Q	POWER OPTIONS (IGNITION FEED)
R	PASSIVE RESTRAINT
S	SUSPENSION/STEERING
T	TRANSMISSION/TRANSAXLE/TRANSFER CASE
U	OPEN
V	SPEED CONTROL, WIPER/WASHER
W	WIPERS
X	AUDIO SYSTEMS
Y	TEMPORARY
Z	GROUND

CIRCUIT INFORMATION

Each wire shown in the diagrams contains a code which identifies the main circuit, a specific part of the main circuit, gage of wire, and color. An example would be **A 2 18 LB/YL** . This is a Battery Feed circuit, level two, eighteen gauge, light blue with a yellow tracer.

WIRE COLOR CODE CHART

COLOR CODE	COLOR
BL	BLUE
BK	BLACK
BR	BROWN
DB	DARK BLUE
DG	DARK GREEN
GY	GRAY
LB	LIGHT BLUE
LG	LIGHT GREEN
OR	ORANGE
PK	PINK
RD	RED
TN	TAN
VT	VIOLET
WT	WHITE
YL	YELLOW
*	WITH TRACER

CONNECTOR, GROUND AND SPLICE INFORMATION

CAUTION: Not all connectors are serviced. Some connectors are serviced only with a harness. A typical example might be the Supplemental Restraint System connectors. Always check parts availability before attempting a repair.

IDENTIFICATION

In-line connectors are identified by a number, as follows:

In-line connectors located in the engine compartment are C100 series numbers.

In-line connectors located in the instrument panel area are C200 series numbers.

In-line connectors located in the body are C300 series numbers.

Jumper harness connectors are C400 series numbers.

Grounds and ground connectors are identified with a "G" and follow the same series numbering as the in-line connectors.

Splices are identified with an "S" and follow the same series numbering as the in-line connectors. In addition, S001-S099 numbers are located in the engine compartment.

Component connectors are identified by the component name instead of a number. Multiple connectors on a component use a C1, C2, etc. identifier.

LOCATIONS

CONNECTOR/GROUND/SPLICE LOCATION article contains connector/ground/splice location illustrations. The illustrations contain the connector name (or number)/ground number/splice number and component identification. Connector/ground/splice location charts reference the figure numbers of the illustrations.

The abbreviation T/O is used in the component location section to indicate a point in which the wiring harness branches out to a component. The abbreviation N/S means Not Shown in the illustrations

HOW TO USE WIRING DIAGRAMS

DaimlerChrysler Corporation wiring diagrams are designed to provide information regarding the vehicles wiring content. In order to effectively use the wiring diagrams to diagnose and repair DaimlerChrysler Corporation vehicles, it is important to understand all of their features and characteristics.

Diagrams are arranged such that the power (B+) side of the circuit is placed near the top of the diagram, and the ground (B-) side of the circuit is placed near the bottom of the diagram.

All switches, components, and modules are shown in the at rest position with the doors closed and the key removed from the ignition.

Components are shown two ways. A solid line around a component indicates that the component is complete. A dashed line around the component indicates that the component is being shown is not complete. Incomplete components have a reference number to indicate the location where the component is shown complete.

It is important to realize that no attempt is made on the diagrams to represent components and wiring as they appear on the vehicle. For example, a short piece of wire is treated the same as a long one. In addition, switches and other components are shown as simply as possible, with regard to function only.

DIAGRAMS ARE ARRANGED WITH THE POWER B+ SIDE OF THE CIRCUIT NEAR THE TOP, AND THE GROUND SIDE OF THE CIRCUIT NEAR THE BOTTOM

The System shown here is an EXAMPLE ONLY. It does not represent the actual circuit shown in the WIRING DIAGRAM.

SECTION IDENTIFICATION AND INFORMATION

The wiring diagrams are grouped into individual sections. If a component is most likely found in a particular group, it will be shown complete (all wires, connectors, and pins) within that group. For example, the Auto Shutdown Relay is most likely to be found in **BUZZERS, RELAYS & TIMERS** , so it is shown there

complete. It can, however, be shown partially in another group if it contains some associated wiring.

Splice diagrams in **CONNECTOR/GROUND/SPLICE LOCATION** article show the entire splice and provide references to other sections the splices serves. This service information only contains splice diagrams that are not shown in their entirety somewhere else in the wiring diagrams.

CONNECTOR PIN-OUTS shows each connector and the circuits involved with that connector. The connectors are identified using the name/number on the diagram.

WARNING

WARNINGS

WARNINGS provide information to prevent personal injury and vehicle damage. Below is a list of general warnings that should be followed any time a vehicle is being serviced.

WARNING: Always wear safety glasses for eye protection.

WARNING: Use safety stands anytime a procedure requires being under a vehicle.

WARNING: Be sure that the ignition switch always is in the off position, unless the procedure requires it to be on.

WARNING: Set the parking brake when working on any vehicle. An automatic transmission should be in park. A manual transmission should be in neutral.

WARNING: Operate the engine only in a well-ventilated area.

WARNING: Keep away from moving parts when the engine is running, especially the fan and belts.

WARNING: To prevent serious burns, avoid contact with hot parts such as the radiator, exhaust manifold(s), tail pipe, catalytic converter and muffler.

WARNING: Do not allow flame or sparks near the battery. Gases are always present in and around the battery.

WARNING: Always remove rings, watches, loose hanging jewelry and avoid loose

clothing.

DIAGNOSIS AND TESTING

WIRING HARNESS

TROUBLESHOOTING TOOLS

When diagnosing a problem in an electrical circuit there are several common tools necessary. These tools are listed and explained below.

Jumper Wire - This is a test wire used to connect two points of a circuit. It can be used to bypass an open in a circuit.

WARNING: Never use a jumper wire across a load, such as a motor, connected between a battery feed and ground.

Voltmeter - Used to check for voltage on a circuit. Always connect the black lead to a known good ground and the red lead to the positive side of the circuit.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking voltages in these circuits, use a meter with a 10 - megohm or greater impedance rating.

Ohmmeter - Used to check the resistance between two points of a circuit. Low or no resistance in a circuit means good continuity.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking resistance in these circuits use a meter with a 10 - megohm or greater impedance rating. In addition, make sure the power is disconnected from the circuit. Circuits that are powered up by the vehicle's electrical system can cause damage to the equipment and provide false readings.

948W-233

Fig. 4: Probing Tool
Courtesy of CHRYSLER LLC

- | |
|-----------------------|
| 1 - SPECIAL TOOL 6801 |
| 2 - PROBING END |

Probing Tools - These tools are used for probing terminals in connectors. Select the proper size tool from Special Tool Package 6807, and insert the probing end (2) into the terminal being tested. Use the other end of the tool (1) to insert the meter probe.

INTERMITTENT AND POOR CONNECTIONS

Most intermittent electrical problems are caused by faulty electrical connections or wiring. It is also possible for a sticking component or relay to cause a problem. Before condemning a component or wiring assembly, check the following items.

Connectors are fully seated

Spread terminals, or terminal push out

Terminals in the wiring assembly are fully seated into the connector/component and locked into position

Dirt or corrosion on the terminals. Any amount of corrosion or dirt could cause an intermittent problem

Damaged connector/component casing exposing the item to dirt or moisture

Wire insulation that has rubbed through causing a short to ground

Some or all of the wiring strands broken inside of the insulation

Wiring broken inside of the insulation

TROUBLESHOOTING WIRING PROBLEMS

When troubleshooting wiring problems there are six steps which can aid in the procedure. The steps are listed and explained below. Always check for non-factory items added to the vehicle before doing any diagnosis. If the vehicle is equipped with these items, disconnect them to verify these add-on items are not the cause of the problem.

1. Verify the problem.
2. Verify any related symptoms. Do this by performing operational checks on components that are in the same circuit. Refer to **SYSTEM WIRING DIAGRAMS** article.
3. Analyze the symptoms. Use the wiring diagrams to determine what the circuit is doing, where the problem most likely is occurring and where the diagnosis will continue.
4. Isolate the problem area.
5. Repair the problem area.
6. Verify the proper operation. For this step, check for proper operation of all items on the repaired circuit. Refer to the **SYSTEM WIRING DIAGRAMS** article.

STANDARD PROCEDURE

ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES

80ce3d47

Fig. 5: Electrostatic Discharge Symbol

Courtesy of CHRYSLER LLC

All ESD sensitive components are solid state and a symbol is used to indicate this. When handling any component with this symbol, comply with the following procedures to reduce the possibility of electrostatic charge build up on the body and inadvertent discharge into the component. If it is not known whether the part is ESD sensitive, assume that it is.

1. Always touch a known good ground before handling the part. This should be repeated while handling the part and more frequently after sliding across a seat, sitting down from a standing position, or walking a distance.
2. Avoid touching electrical terminals of the part, unless instructed to do so by a written procedure.
3. When using a voltmeter, be sure to connect the ground lead first.
4. Do not remove the part from it's protective packing until it is time to install the part.
5. Before removing the part from it's package, ground the package to a known good ground on the vehicle.

TESTING FOR A SHORT TO GROUND

1. Remove the fuse and disconnect all items involved with the fuse.
2. Connect a test light or a voltmeter across the terminals of the fuse.
3. Starting at the fuse block, wiggle the wiring harness about six to eight inches apart and watch the voltmeter/test lamp.
4. If the voltmeter registers voltage or the test lamp glows, there is a short to ground in that general area of the wiring harness.

TESTING FOR A SHORT TO GROUND ON FUSES POWERING SEVERAL LOADS

1. Refer to **SYSTEM WIRING DIAGRAMS** article and disconnect or isolate all items on the suspected fused circuits.
2. Replace the blown fuse.
3. Supply power to the fuse by turning ON the ignition switch or reconnecting the battery.
4. Start connecting or energizing the items in the fuse circuit one at a time. When the fuse blows the circuit with the short to ground has been isolated.

TESTING FOR A VOLTAGE DROP

Fig. 6: Testing for Voltage Drop
Courtesy of CHRYSLER LLC

1. Connect the positive lead of the voltmeter to the side of the circuit closest to the battery.
2. Connect the other lead of the voltmeter to the other side of the switch, component or circuit.
3. Operate the item.
4. The voltmeter will show the difference in voltage between the two points.

TESTING FOR CONTINUITY

948W-195

Fig. 7: Testing for Continuity
Courtesy of CHRYSLER LLC

1 - FUSE REMOVED FROM CIRCUIT

1. Remove the fuse (1) for the circuit being checked or, disconnect the battery.
2. Connect one lead of the ohmmeter to one side of the circuit being tested
3. Connect the other lead to the other end of the circuit being tested. Low or no resistance means good continuity.

TESTING OF VOLTAGE POTENTIAL

Fig. 8: Testing for Voltage
Courtesy of CHRYSLER LLC

1. Connect the ground lead of a voltmeter to a known good ground.
2. Connect the other lead of the voltmeter to the selected test point. The vehicle ignition may need to be turned ON to check voltage. Refer to the appropriate test procedure.

SPECIAL TOOLS

WIRING/TERMINAL

- 11 - TYCO CONNECTOR

6. Position the connector locking finger away from the terminal using the proper special tool. Pull on the wire to remove the terminal from the connector.

INSTALLATION

CONNECTOR

1. Insert the removed terminal in the same cavity on the repair connector.
2. Repeat steps for each terminal in the connector, being sure that all wires are inserted into the proper cavities. For additional connector pin-out identification, refer to **SYSTEM WIRING DIAGRAMS** article.
3. When the connector is re-assembled, the secondary terminal lock must be placed in the locked position to prevent terminal push out.
4. Replace dress cover (if applicable).
5. Connect connector to its mating half/component.
6. Connect battery and test all affected systems.

DIODE

REMOVAL

DIODE

948W-197

Fig. 16: Diode Identification
Courtesy of CHRYSLER LLC

1 - CURRENT FLOW
2 - BAND AROUND DIODE INDICATES CURRENT FLOW
3 - DIODE AS SHOWN IN THE DIAGRAMS

1. Disconnect the battery.
2. Locate the diode in the harness, and remove the protective covering.
3. Remove the diode from the harness, pay attention to the current flow direction (1) (2) (3).

INSTALLATION

DIODE

1. Remove the insulation from the wires in the harness. Only remove enough insulation to solder in the new

diode.

2. Install the new diode in the harness, making sure current flow is correct. If necessary, refer to the appropriate wiring diagram for current flow.
3. Solder the connection together using rosin core type solder only. **Do not use acid core solder.**
4. Tape the diode to the harness using electrical tape. Make sure the diode is completely sealed from the elements.
5. Reconnect the battery and test affected systems.

TERMINAL

REMOVAL

WIRE TERMINAL

1. Follow steps for removing terminals described in CONNECTOR **REMOVAL**.
2. Cut the wire 6 inches from the back of the connector.

INSTALLATION

WIRE TERMINAL

1. Select a wire from the terminal repair kit that best matches the color and gage of the wire being repaired.
2. Cut the repair wire to the proper length and remove one-half (1/2) inch of insulation.
3. Splice the repair wire to the wire harness (see wire splicing procedure). See **STANDARD PROCEDURE**.
4. Insert the repaired wire into the connector.
5. Install the connector locking wedge, if required, and reconnect the connector to its mating half/component.
6. Re-tape the wire harness starting at 1-1/2 inches behind the connector and 2 inches past the repair.
7. Connect battery and test all affected systems.

WIRE

STANDARD PROCEDURE

WIRE SPLICING

When splicing a wire, it is important that the correct gage be used as shown in the wiring diagrams.

80c4f3f1

Fig. 17: Splice Band
Courtesy of CHRYSLER LLC

1 - SPLICE BAND

1. Remove one-half (1/2) inch of insulation from each wire that needs to be spliced.
2. Place a piece of adhesive lined heat shrink tubing on one side of the wire. Make sure the tubing will be long enough to cover and seal the entire repair area.
3. Place the strands of wire overlapping each other inside of the splice clip (1).

80bf334d

Fig. 18: Crimping Tool
Courtesy of CHRYSLER LLC

1 - CRIMPING TOOL

4. Using crimping tool (1), Mopar p/n 05019912AA, crimp the splice clip and wires together.

Fig. 19: Solder Splice
Courtesy of CHRYSLER LLC

1 - SOLDER
2 - SPLICE BAND
3 - SOLDERING IRON

5. Solder (3) the connection (2) together using rosin core type solder (1) only.

CAUTION: DO NOT USE ACID CORE SOLDER.

Fig. 20: Heat Shrink Tube

Courtesy of CHRYSLER LLC

1 - SEALANT 2 - HEAT SHRINK TUBE

6. Center the heat shrink tubing (2) over the joint and heat using a heat gun. Heat the joint until the tubing is tightly sealed and sealant (1) comes out of both ends of the tubing.
