

Fig. 5: Programming ECU (2 Of 3)
Courtesy of CHRYSLER LLC

- Highlight the flash file that you want to use. Hit "SELECT" and then "OK". Follow the on screen instructions.

Fig. 6: Programming ECU (3 Of 3)
Courtesy of CHRYSLER LLC

- Once the flash is complete, verify that the part number at the top of the Flash PCM screen has updated to the new part number.

NOTE: **If this flash process is interrupted or aborted, the flash should be restarted.**

11. Continue to **SECTION 2 - ADDITIONAL PCM / TCM REPLACEMENT PROCEDURES** to complete the process if the ECU has been replaced.
12. Type the necessary information on the "Authorized Modification Label" (p/n 04275086AB) and attach

near the VECI label (See **SECTION 3 - AUTHORIZED MODIFICATION LABEL** for details).

SECTION 2 - ADDITIONAL PCM / TCM REPLACEMENT PROCEDURES

Find the PCM/TCM Type for the vehicle, read and write down the steps, and then go to the step by step instructions for additional information on how to perform these procedures. See STEP-BY-STEP INSTRUCTIONS.

If a NGC3 or NGC4 PCM was replaced, perform the following additional steps and/or routines:

1. PCM Replaced - if WCM equipped
2. Learn ETC - if ETC equipped
3. Check PCM Odometer
4. Check PCM VIN - if NOT WCM equipped
5. Quicklearn - if EATX equipped

If a GPEC PCM was replaced, perform the following additional steps and/or routines:

1. If the vehicle is equipped with a CVT, ensure that the TCM has the latest software calibration available (if the vehicle is not equipped with a CVT, skip to Step 3).
2. PCM Replaced - if WCM equipped
3. Learn ETC
4. Check PCM Odometer
5. Check PCM VIN - if NOT WCM equipped
6. TCM Quicklearn - if EATX equipped

If a CVT TCM was replaced, perform the following additional steps and/or routines:

1. Initialize CVT

If an EGS TCM was replaced, perform the following additional steps and/or routines:

1. Initialize EGS

STEP-BY-STEP INSTRUCTIONS

Check PCM Odometer

From the "Home" screen, select "ECU View".

Select "PCM"

Select "Misc. Functions"

Select "Check PCM Odometer" and follow the on screen instructions.

When complete, select "Finish".

Check PCM VIN

From the "Home" screen, select "ECU View"

Select "PCM"

Select "Misc. Functions"

Select "Check PCM VIN" and follow the on screen instructions.

When complete, select "Finish"

Initialize CVT

From the "Home" screen, select "ECU View"

Select "TCM"

Select "Misc. Functions"

Select "Initialize CVT" and follow the on screen instructions.

When complete, select "Finish"

Initialize EGS

From the "Home" screen, select "ECU View"

Select "TCM"

Select "Misc. Functions"

Select "Initialize EGS" and follow the on screen instructions.

When complete, select "Finish"

Learn ETC

From the "Home" screen, select "ECU View"

Select "PCM"

Select "Misc. Functions"

Select "Learn ETC" and follow the on screen instructions.

When complete, select "Finish"

PCM Replaced

The vehicle pin (Personal Identification Number) will be required to complete the routine. This information may be obtained in three ways:

1. The original selling invoice
2. DealerCONNECT > Parts > Key Codes
3. Contacting the District Manager.

From the "Home" screen, select "ECU View"

Select "WCM"

Select "Misc. Functions"

Select "PCM Replaced" and follow the on screen instructions.

When complete, select "Finish"

Quicklearn

From the "Home" screen, select "ECU View"

Select "PCM"

Select "Misc. Functions"

Select "Quicklearn" and follow the on screen instructions.

When complete, select "Finish"

Update CVT TCM

From the "Home" screen:

Select "ECU View"

Select "TCM"

Select "More Options"

Select "ECU Flash"

Select "Browse for New File" and follow the on screen instructions.

Highlight the appropriate calibration.

Select "Download to Scantool"

Once the download is complete, select "Close" and then "Back"

Highlight the listed calibration, select "Update Controller" and follow the on screen instructions.

When the TCM update is complete, select "OK"

Verify that the part number at the top of the "Flash TCM" screen has updated to the latest level.

SECTION 3 - AUTHORIZED MODIFICATION LABEL

NOTE: The following step is required by law when reprogramming a PCM and/or TCM.

Type the necessary information on the "Authorized Modification Label" and attach near the VECI label.

Fig. 7: Authorized Modification Label
Courtesy of CHRYSLER LLC

1. Powertrain Control / Transmission Control Module Part Numbers (Insert P/Ns) Used
2. Change Authority: TSB XX--XX
3. Dealer Code: XXXXX
4. Date: XX-XX-XX

REQUIRED TOOLS/EQUIPMENT:

PART NUMBER	StarSCAN®	PART NUMBER	StarMOBILE®
NPN	Battery Charger	NPN	Battery Charger
CH9401	StarSCAN® Tool Kit	CH9801	StarMOBILE® Tool Kit
CH9404	StarSCAN® Vehicle Cable	CH9804	StarMOBILE® Vehicle Cable
-	-	-	TechCONNECT PC or equivalent

TECH TIPS and INFORMATION:

1. StarMOBILE® Standalone Diagnostic Mode is an efficient way to flash ECUs without having direct access to a network connection. It involves first copying the flash file to the StarMOBILE® device which DOES require a network connection. Once the file has been copied to the StarMOBILE® device, it can be used in a Standalone mode to flash the ECU WITHOUT a network connection.
2. To use the StarMOBILE® in Pass-Through Mode requires that your StarMOBILE® is connected to the dealerships network via a wired or wireless connection. For more information on how to use the StarMOBILE in Pass-Through Mode see the StarMOBILE® training tutorials available on 'DealerCONNECT > Service > StarSCAN® and StarMOBILE® Tools > Training Aids' link or at www.dcctools.com, under the 'Training Aids' link.
3. StarMOBILE® does not need to be connected to a vehicle when retrieving a flash file for Standalone Mode.
4. Extreme care must be taken when programming a calibration into a generic PCM. Do not randomly select a calibration. Once a calibration is selected and programmed, the controller cannot be reprogrammed to a different calibration. The ECU can only be reprogrammed to a more recent version of that calibration.
5. If the flash process is interrupted or aborted, the flash should be restarted.
6. Due to the PCM / TCM programming procedure, a DTC may be set in other ECUs within the vehicle. Some DTCs may cause the MIL to illuminate. From the "Home" screen select "System View". Then select "All DTCs". Press "Clear All Stored DTCs" if there are any DTCs shown on the list.

7. When replacing a GPEC PCM for a vehicle that is equipped with a CVT, it is extremely important that the PCM and TCM both have the latest software calibrations.
8. Do not allow the battery charger to time out or the charging rate to climb above 13.5 volts during the flash process.
9. The StarSCAN® and StarMOBILE® diagnostic tools fully support Internet connectivity and must be configured for your dealership's network. For help on setting up your StarSCAN® / StarMOBILE® for the dealership's network, refer to the StarSCAN® / StarMOBILE® Quick Start Networking Guide available on 'DealerCONNECT > Service > StarSCAN® and StarMOBILE® Tools > Online Documentation' or at www.dcctools.com, under the download center.
10. The operating software in the StarSCAN® and StarMOBILE® must be programmed with the latest software release level. The software level is visible in the blue header at the top of the StarSCAN® and StarMOBILE® Desktop Client screens. For instructions on how to update your scan tool, refer to the StarSCAN® / StarMOBILE® Software Update guide available on 'DealerCONNECT > Service > StarSCAN® and StarMOBILE® Tools > Online Documentation' or at www.dcctools.com, under the download center.

POWERTRAIN VERIFICATION TEST

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Diagnostic Test

1. SELECTING THE PROPER VERIFICATION TEST

The following verification test are for different repairs. Select the appropriate Verification test for the repair that has been completed.

Speed Control repair

Go To step 2.

Charging System repair

Go To step 3.

EVAP System repair

Go To step 4.

All other repairs

Go To step 5.

2. POWERTRAIN VERIFICATION TEST 1

- NOTE:** 1. If this vehicle is equipped with an Electronic Throttle Control system, and the APP Sensors, PCM, or Throttle Body Assembly have been replaced, use the scan tool to perform the ETC RELEARN function.
- NOTE:** 2. After completing the Powertrain Verification Test the Transmission Verification Test must be performed.
- NOTE:** 3. If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will set in the ABS Module, Airbag Module and the SKIM/SKREEM.
- NOTE:** 4. If the vehicle is equipped with a Sentry Key Remote Entry, Secret Key data must be updated. Refer to the Service Information for the PCM, SENTRY KEY REMOTE ENTRY MODULE and TRANSPONDER KEY for programming information. Using the scan tool, program the Secret Key information into the PCM using the PCM replaced function under the WCM menu.

5. Inspect the vehicle to make sure that all engine components are properly installed and connected.
6. Connect the scan tool to the data link connector and erase all codes.
7. Turn the speed control ON (if equipped, cruise light will be on).
8. Depress and release the SET Switch when the vehicle speed is greater than 56 km/h (35 mph). The speed control should engage and hold the selected speed.
9. Press and hold the RESUME/ACCEL Switch. The vehicle speed should increase by at least 3 km/h (2 mph).
10. Press and hold the COAST switch. The vehicle speed should decrease.
11. Using caution, press and release the brake pedal. The speed control should disengage.
12. Bring the vehicle speed back up to 56 km/h (35 mph).
13. Press the RESUME/ACCEL switch. The speed control should resume the previously set speed.
14. Hold down the SET switch. The vehicle should decelerate.
15. Make sure vehicle speed is greater than 56 km/h (35 mph) and release the SET Switch. The vehicle should adjust and set a new vehicle speed.

16. Press and release the CANCEL switch. The speed control should disengage.
17. Bring the vehicle speed back up above 56 km/h (35 mph) and engage speed control.
18. Turn the Speed Control Off. (Cruise light will be off). The speed control should disengage.

NOTE: OVERSHOOT/UNDERSHOOT FOLLOWING SPEED CONTROL SET.

19. If the vehicle operator repeatedly presses and releases the SET button with their foot off of the accelerator (referred to as "lift foot set"), the vehicle may accelerate and exceed the desired set speed by up to 8 km/h (5 mph).
20. It may also decelerate to less than the desired set speed, before finally achieving the desired set speed.
21. The Speed Control System has an adaptive strategy that compensates for vehicle-to-vehicle variations in speed control cable lengths.
22. When the speed control is set with the vehicles operators foot off of the accelerator pedal, the speed control thinks there is excessive speed control cable slack and adapts accordingly.
23. If the "lift foot sets" are continually used, a speed control overshoot/undershoot condition will develop.
24. To "unlearn" the overshoot/undershoot condition, the vehicle operator has to press and release the set button while maintaining the desired set speed using the accelerator pedal (not decelerating or accelerating).
25. Then turn the cruise control switch to the OFF position (or press the CANCEL button if equipped) after waiting 10 seconds.
26. This procedure must be performed approximately 10-15 times to completely unlearn the overshoot/undershoot condition.

Did the Speed Control pass the above test?

Yes

Repair is complete.

No

Check for any related Technical Service Bulletins and/or refer to the appropriate Diagnostic Procedure.

3. POWERTRAIN VERIFICATION TEST 2

1. If this vehicle is equipped with an Electronic Throttle Control system, and the APP Sensors, PCM, or Throttle Body Assembly has been replaced use a scan tool to perform the ETC RELEARN function.

- NOTE:** 2. After completing the Powertrain Verification Test the Transmission Verification Test must be performed.
- NOTE:** 3. If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will set in the ABS Module, Airbag Module and the SKIM/SKREEM.
- NOTE:** 4. If the vehicle is equipped with a Sentry Key Remote Entry, Secret Key data must be updated. Refer to the Service Information for the PCM, SENTRY KEY REMOTE ENTRY MODULE and TRANSPONDER KEY for programming information. Using the scan tool, program the Secret Key information into the PCM using the PCM replaced function under the WCM menu.

5. Inspect the vehicle to make sure that all components related to the repair are properly installed and connected.
6. With the scan tool, clear DTCs.
7. Perform generator output test. Refer to the appropriate service information as necessary.
8. Start the engine and set engine speed to 2000 RPM for at least thirty seconds.
9. Cycle the ignition key off and on.
10. With the scan tool, read the DTCs.

Are any DTCs or symptoms remaining?

Yes

Check for any Technical Service Bulletins and/or refer to the appropriate Diagnostic Procedure.

No

Repair is complete.

4. POWERTRAIN VERIFICATION TEST 3

1. Install the Miller Tool #8404 Evaporative Emission Leak Detector (EELD) according to the instructions in the previous DTC table.
2. Set the smoke/air control switch to AIR.
3. Insert the tester's AIR supply tip (clear hose) into the appropriate calibration orifice on the tester's control panel (based on DTC leak size).

4. Press the remote smoke/air start button.
5. Position the red flag on the air flow meter so it is aligned with the indicator ball.
6. When the calibration is complete, release the remote button. The EELD flow meter is now calibrated in liters per minute to the size of leak indicated by the DTC set in the PCM.
7. Install the service port adapter #8404-14 on the vehicle's service port.
8. Connect the Air supply hose from the EELD to the vehicle.
9. Press the remote button to activate AIR flow.

NOTE: **10. Larger volume fuel tanks, lower fuel levels or if the vehicle is equipped with a Flow Management Valve may indicate high flow and will require 4 to 5 minutes to fill.**

11. Compare the flow meter indicator ball reading to the red flag.
12. ABOVE the red flag indicates a leak present.
13. BELOW the red flag indicates a sealed system.

NOTE: **If this vehicle is equipped with an Electronic Throttle Control system, and the APP Sensors, PCM, or Throttle Body Assembly have been replaced, use the scan tool to perform the ETC RELEARN function.**

14. If the indicator ball shows a leak present, perform the smoke test indicated in the previous test and identify the leak and repair. Perform this verification test when the repair is complete.

Did the indicator ball indicate the a leak is present?

Yes

Repeat the DTC test to identify the leak and repair.

No

Repair is complete.

5. POWERTRAIN VERIFICATION TEST 4

NOTE: **After completing the Powertrain Verification Test the Transmission Verification Test must be performed.**

NOTE: **If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will set in the ABS Module, Airbag**

1.

1. **Module and the SKIM/SKREEM.**

NOTE: If the vehicle is equipped with a Sentry Key Remote Entry, Secret Key data must be updated. Refer to the Service Information for the PCM, SENTRY KEY REMOTE ENTRY MODULE and TRANSPONDER KEY for programming information. Using the scan tool, program the Secret Key information into the PCM using the PCM replaced function under the WCM menu.

2.

NOTE: If this vehicle is equipped with an Electronic Throttle Control system, and the APP Sensors, PCM, or Throttle Body Assembly have been replaced, use the scan tool to perform the ETC RELEARN function.

3.

NOTE: When replacing an O2 Sensor, the PCM RAM memory must be cleared, either by disconnecting the PCM C1 connector or momentarily disconnecting the Battery negative terminal.

4.

5.

6. The NGC learns the characteristics of each O2 heater element and these old values should be cleared when installing a new O2 sensor. The customer may experience driveability issues if this is not performed.
7. Inspect the vehicle to make sure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.
8. Connect the scan tool to the data link connector.
9. Make sure the fuel tank has at least a quarter tank of fuel. Turn off all accessories.
10. If the Catalyst was replaced, with the scan tool go to the Miscellaneous Menu Option "Catalyst Replaced" and press enter.
11. If a Comprehensive Component DTC was repaired, perform steps 12 - 14. If a Major OBDII Monitor DTC was repaired skip those steps and continue verification.
12. After the ignition has been off for at least 10 seconds, restart the vehicle and run 2 minutes.
13. With the scan tool, monitor the appropriate pre-test enabling conditions until all conditions have been met. Once the conditions have been met, switch screen to the appropriate OBDII monitor, (Audible beeps when the monitor is running).
14. If the repaired OBDII trouble code has reset or was seen in the monitor while on the road test, the repair is not complete. Check for any related technical service bulletins or flash updates and return to Engine Electrical Diagnostic List.
15. If the conditions cannot be duplicated, erase all DTCs with the Scan tool.
16. If another DTC has set, return to the Engine Electrical Diagnostic List and follow the path specified for that DTC.

Did the OBDII Monitor run successfully and has the Good Trip Counter changed to one or more?

Yes

Repair is complete.

No

Check for any related Technical Service Bulletins and/or refer to the appropriate Diagnostic Procedure.

2008 RESTRAINTS

Electrical Diagnostics - Liberty

Electrical Diagnostics - Liberty

B1B00-DRIVER AIRBAG SQUIB 1 CIRCUIT LOW

CIRCUIT SCHEMATIC

0195 1501

Fig. 1: Driver Airbag Squib Circuit Schematic
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

With the ignition on.

SET CONDITIONS

- Set Condition:**

The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Squib 1 circuits. The ORC will set this DTC if it detects low resistance on the Driver Squib 1 circuits.

POSSIBLE CAUSES

Possible Causes
(R43) DRIVER SQUIB 1 LINE 2 CIRCUIT SHORTED TO GROUND
(R45) DRIVER SQUIB 1 LINE 1 CIRCUIT SHORTED TO GROUND
STEERING CONTROL MODULE
DRIVER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure that the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Turn the ignition on.

Select ACTIVE or STORED DTC:

ACTIVE DTC

Go To 2.

STORED DTC

Go To 5.

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG**

Fig. 2: Checking For Shorted/Open Squib Circuits In Driver Airbag
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Driver Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-1 Jumper to the Driver Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTCs.

Does the scan tool display: B1B00-DRIVER AIRBAG SQUIB 1 CIRCUIT LOW?

Yes

Go To 3.

No

Replace the Driver Airbag in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

3. CHECK STEERING CONTROL MODULE (CLOCKSPRING) SQUIB CIRCUITS FOR A SHORT TO GROUND

Fig. 3: Checking Steering Control Module (Clockspring) Squib Circuits For Short/Open
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Fig. 4: Measuring Resistance Of The (R43/45) Driver Squib 1 Line 2/1 Circuit Between 8443-32-R

Adapter Cavity C1-9/10 And Ground
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Steering Control Module C4 connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443-32-R ORC Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the resistance of the (R43) Driver Squib 1 Line 2 circuit between the 8443-32-R Adapter cavity C1-9 and ground.

Measure the resistance of the (R45) Driver Squib 1 Line 1 circuit between 8443-32-R Adapter cavity C1-10 ground.

Is the resistance below 10k ohms for either measurement?

Yes

Repair the Driver Squib 1 circuits with resistance below 10k ohms for a short to ground.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the ORC in accordance with Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

5. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes.

Refer to DIAGNOSTIC CODE INDEX for a complete list of airbag system diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning the vehicle to the customer.

B1B01-DRIVER AIRBAG SQUIB 1 CIRCUIT HIGH

CIRCUIT SCHEMATIC

Fig. 5: Driver Airbag Squib Circuit Schematic
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

With the ignition on.

SET CONDITIONS

- Set Condition:**

The Occupant Restraint Controller (ORC) monitors the voltage on the Driver Squib 1 circuits. The ORC will set this DTC if it detects voltage on the Driver Squib 1 circuits.

POSSIBLE CAUSES

Possible Causes
(R43) DRIVER SQUIB 1 LINE 2 CIRCUIT SHORTED TO BATTERY (R45) DRIVER SQUIB 1 LINE 1 CIRCUIT SHORTED TO BATTERY STEERING CONTROL MODULE (SCM) DRIVER AIRBAG OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure that the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Turn the ignition on.

Select ACTIVE or STORED DTC:

ACTIVE DTC

Go To 2.

STORED DTC

Go To 5.

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG**

Fig. 6: Checking For Shorted/Open Squib Circuits In Driver Airbag
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Driver Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-1 Jumper to the Driver Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTCs.

Does the scan tool display: B1B01-DRIVER AIRBAG SQUIB 1 CIRCUIT HIGH?

Yes

Go To 3.

No

Replace the Driver Airbag in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

3. CHECK STEERING CONTROL MODULE (CLOCKSPRING) SQUIB CIRCUITS FOR A SHORT TO BATTERY

Fig. 7: Checking Steering Control Module (Clockspring) Squib Circuits For Short/Open
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Driver Airbag Squib connectors.

Disconnect the Steering Control Module C4 connector.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-19 Jumper to the Steering Control Module C4 connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTCs.

Does the scan tool display: B1B01-DRIVER AIRBAG SQUIB 1 CIRCUIT HIGH?

Yes

Go To 4.

No

Replace the Steering Control Module in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

4. **CHECK (R43) DRIVER SQUIB 1 LINE 2 CIRCUIT AND (R45) DRIVER SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO BATTERY**

819b33fd

Fig. 8: Measuring Voltage Of (R43) Driver Squib 1 Line 2/1 Circuit Between 8443-32-R Adapter

Cavity C1-9/10 And Ground
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Steering Control Module C4 connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443-32-R ORC Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R43) Driver Squib 1 Line 2 circuit between the 8443-32-R Adapter cavity C1-9 and ground.

Measure the voltage of the (R45) Driver Squib 1 Line 1 circuit between the 8443-32-R Adapter cavity C1-10 and ground.

Is there any voltage present for either measurement?

Yes

Repair the Driver Squib 1 circuits with voltage present for a short to battery.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the ORC in accordance with Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

5. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of airbag system diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning the vehicle to the customer.

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

With the ignition on.

SET CONDITIONS

- Set Condition:**

The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Squib 1 circuits. The ORC will set this DTC if it detects an open or high resistance on the Driver Squib 1 circuits.

POSSIBLE CAUSES

Possible Causes
(R43) DRIVER SQUIB 1 LINE 2 CIRCUIT OPEN (R45) DRIVER SQUIB 1 LINE 1 CIRCUIT OPEN STEERING CONTROL MODULE DRIVER AIRBAG OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure that the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Turn the ignition on.

Select ACTIVE or STORED DTC:

ACTIVE DTC

Go To 2.

STORED DTC

Go To 6.

2. **CHECK FOR OPEN SQUIB CIRCUITS IN DRIVER AIRBAG**

Fig. 10: Checking For Shorted/Open Squib Circuits In Driver Airbag
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Driver Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-1 Jumper to the Driver Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTCs.

Does the scan tool display: B1B02-DRIVER AIRBAG SQUIB 1 CIRCUIT OPEN?

Yes

Go To 3.

No

Replace the Driver Airbag in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. CHECK STEERING CONTROL MODULE (CLOCKSPRING) SQUIB CIRCUITS FOR AN OPEN

Fig. 11: Checking Steering Control Module (Clockspring) Squib Circuits For Short/Open
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Driver Airbag Squib connectors.

Disconnect the Steering Control Module C4 connector.

NOTE: **Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and 8443-19 Jumper to the Steering Control Module C4 connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTCs.

Does the scan tool display: B1B02-DRIVER AIRBAG SQUIB 1 CIRCUIT OPEN?

Yes

Go To 4.

No

Replace the Steering Control Module in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

4. **CHECK (R43) DRIVER SQUIB 1 LINE 2 CIRCUIT FOR AN OPEN**

81a79d5d

Fig. 12: Measuring Resistance Of (R43) Driver Squib 1 Line 2 Circuit Between Steering Control Module C4 Connector Cavity 4 And The 8443-32-R ORC Adapter Cavity C1-9
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Steering Control Module C4 connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443-32-R ORC Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the resistance of the (R43) Driver Squib 1 Line 2 circuit between the Steering Control Module

C4 connector cavity 4 and the 8443-32-R ORC Adapter cavity C1-9.

Is the resistance below 1.0 ohm?

Yes

Go To 5.

No

Repair the R43 Driver Squib 1 Line 2 circuit for an open.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

5. CHECK (R45) DRIVER SQUIB 1 LINE 1 CIRCUIT FOR AN OPEN

81a79d79

Fig. 13: Measuring Resistance Of (R45) Driver Squib 1 Line 1 Circuit Between Steering Control Module C4 Connector And 8443-32-R ORC Adapter Cavity C1-10
Courtesy of CHRYSLER LLC

Measure the resistance of the (R45) Driver Squib 1 Line 1 circuit between the Steering Control Module C4 connector and the 8443-32-R ORC Adapter cavity C1-10.

Is the resistance below 1.0 ohm?

Yes

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Replace the ORC in accordance with Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

No

Repair the (R45) Driver Squib 1 Line 1 circuit for an open.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

6. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to DIAGNOSTIC CODE INDEX for a complete list of airbag system diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram / schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning the vehicle to the customer.

B1B03-DRIVER AIRBAG SQUIB 1 CIRCUIT SHORTED TOGETHER

CIRCUIT SCHEMATIC

0195 1501

Fig. 14: Driver Airbag Squib Circuit Schematic
Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

With the ignition on.

SET CONDITIONS

- Set Condition:**

The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Squib 1 circuits. The ORC will set this DTC if it detects low resistance between the Driver Squib 1 circuits.

POSSIBLE CAUSES

Possible Causes
(R43) DRIVER SQUIB 1 LINE 2 CIRCUIT SHORTED TO (R45) DRIVER SQUIB 1 LINE 1 CIRCUIT STEERING CONTROL MODULE (SCM) DRIVER AIRBAG OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure that the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Turn the ignition on.

Select ACTIVE or STORED DTC:

ACTIVE DTC

Go To 2.

STORED DTC

Go To 5.

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG**

Fig. 15: Checking For Shorted/Open Squib Circuits In Driver Airbag
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: To avoid serious or fatal injury, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

Disconnect the Driver Airbag Squib connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-1 Jumper to the Driver Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTCs.

Does the scan tool display: B1B03-DRIVER AIRBAG SQUIB 1 CIRCUIT SHORTED TOGETHER?

Yes

Go To 3.

No

Replace the Driver Airbag in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. CHECK STEERING CONTROL MODULE C4 (CLOCKSPRING) SQUIB CIRCUITS FOR A SHORT TOGETHER

Fig. 16: Checking Steering Control Module (Clockspring) Squib Circuits For Short/Open
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the

battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Driver Airbag Squib connectors.

Disconnect the Steering Control Module C4 connector.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-19 Jumper to the Steering Control Module C4 connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTCs.

Does the scan tool display: B1B03-DRIVER AIRBAG SQUIB 1 CIRCUIT SHORTED TOGETHER?

Yes

Go To 4.

No

Replace the Steering Control Module in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

4. CHECK (R43) DRIVER SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO (R45) DRIVER SQUIB 1 LINE 1 CIRCUIT

Fig. 17: Measuring Resistance Between (R43) Driver Squib 1 Line 2 Circuit And (R45) Driver Squib 1 Line 1 Circuit At ORC 8443-32-R Adapter Cavities C1-9 And C1-10

Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Steering Control Module connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the ORC 8443-32-R Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the resistance between the (R43) Driver Squib 1 Line 2 circuit and the (R45) Driver Squib 1 Line 1 circuit at the ORC 8443-32-R Adapter cavities C1-9 and C1-10.

Is the resistance below 10k ohms?

Yes

Repair the (R43) Driver Squib 1 Line 2 circuit for a short to the (R45) Driver Squib 1 Line 1 circuit.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the ORC in accordance with Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

5. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of airbag system

diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning the vehicle to the customer.

B1B04-DRIVER AIRBAG SQUIB 2 CIRCUIT LOW

CIRCUIT SCHEMATIC

0198 1501

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

With the ignition on.

SET CONDITIONS

- Set Condition:**

The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Squib 2 circuits. The ORC will set this DTC if it detects low resistance on the Driver Squib 2 circuits.

POSSIBLE CAUSES

Possible Causes
(R63) DRIVER SQUIB 2 LINE 1 CIRCUIT OR (R61) DRIVER SQUIB 2 LINE 2 CIRCUIT SHORTED TO GROUND STEERING CONTROL MODULE (SCM) DRIVER AIRBAG OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure that the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Turn the ignition on.

Select ACTIVE or STORED DTC:

ACTIVE DTC

Go To 2.

STORED DTC

Go To 5.

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG**

Fig. 19: Checking For Shorted/Open Squib Circuits In Driver Airbag
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Driver Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-1 Jumper to the Driver Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTCs.

Does the scan tool display: B1B04-DRIVER AIRBAG SQUIB 2 CIRCUIT LOW?

Yes

Go To 3.

No

Replace the Driver Airbag in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. CHECK STEERING CONTROL MODULE (CLOCKSPRING) SQUIB CIRCUITS FOR A SHORT TO GROUND

Fig. 20: Checking Steering Control Module (Clockspring) Squib Circuits For Short/Open
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool Jumper from the Driver Airbag Squib connectors.

Disconnect the Steering Control Module C4 connector.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-19 Jumper to the Steering Control Module C4 connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTCs.

Does the scan tool display: B1B04-DRIVER AIRBAG SQUIB 2 CIRCUIT LOW?

Yes

Go To 4.

No

Replace the Steering Control Module in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

4. **CHECK (R63) DRIVER SQUIB 2 LINE 1 CIRCUIT AND (R61) DRIVER SQUIB 2 LINE 2 CIRCUIT FOR A SHORT TO GROUND**

819b2193

Fig. 21: Measuring Resistance Of (R63/61) Driver Squib 2 Line 1 Circuit Between Ground And

ORC 8443-32-R Adapter Cavity C1-14/13

Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Steering Control Module C4 connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the ORC 8443-32-R Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the resistance of the (R63) Driver Squib 2 Line 1 circuit between ground and the ORC 8443-32-R Adapter cavity C1-14.

Measure the resistance of the (R61) Driver Squib 2 Line 2 circuit between ground and the ORC 8443-32-R Adapter cavity C1-13.

Is the resistance below 10k ohms for either measurement?

Yes

Repair the Driver Squib 2 circuits with resistance below 10k ohms for a short to ground.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the ORC in accordance with Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

5. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes.

Refer to DIAGNOSTIC CODE INDEX for a complete list of airbag system diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning the vehicle to the customer.

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

With the ignition on.

SET CONDITIONS

- Set Condition:**

The Occupant Restraint Controller (ORC) monitors the voltage on the Driver Squib 2 circuits. The ORC will set this DTC if it detects voltage on the Driver Squib 2 circuits.

POSSIBLE CAUSES

Possible Causes
(R63) DRIVER SQUIB 2 LINE 1 CIRCUIT SHORTED TO BATTERY (R61) DRIVER SQUIB 2 LINE 2 CIRCUIT SHORTED TO BATTERY STEERING CONTROL MODULE (SCM) DRIVER AIRBAG OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

- NOTE:** Ensure that the battery is fully charged.
- NOTE:** The Scan Tool, SRS Airbag Load Tool 8443 and DVOM are required to perform the following test.

Turn the ignition on.

Select ACTIVE or STORED DTC:

ACTIVE DTC

Go To 2.

STORED DTC

Go To 5.

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG**

Fig. 23: Checking For Shorted/Open Squib Circuits In Driver Airbag
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Driver Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-1 Jumper to the Driver Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTCs.

Does the scan tool display: B1B05-DRIVER AIRBAG SQUIB 2 CIRCUIT HIGH?

Yes

Go To 3.

No

Replace the Driver Airbag in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

3. CHECK STEERING CONTROL MODULE (CLOCKSPRING) SQUIB CIRCUITS FOR A SHORT TO BATTERY

Fig. 24: Checking Steering Control Module (Clockspring) Squib Circuits For Short/Open
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Driver Airbag Squib connectors.

Disconnect the Steering Control Module C4 connector.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-19 Jumper to the Steering Control Module C4 connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTCs.

Does the scan tool display: B1B05-DRIVER AIRBAG SQUIB 2 CIRCUIT HIGH?

Yes

Go To 4.

No

Replace the Steering Control Module in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

4. **CHECK (R63) DRIVER SQUIB 2 LINE 1 CIRCUIT AND (R61) DRIVER SQUIB 2 LINE 2 CIRCUIT FOR A SHORT TO BATTERY**

819b43bd

Fig. 25: Measuring Voltage Of (R63/61) Driver Squib 2 Line 1/2 Circuit Between 8443-32-R

Adapter Cavity C1-14/13 And Ground
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Steering Control Module connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the ORC 8443-32-R Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R63) Driver Squib 2 Line 1 circuit between the 8443-32-R Adapter cavity C1-14 and ground.

Measure the voltage of the (R61) Driver Squib 2 Line 2 circuit between the 8443-32-R Adapter cavity C1-13 and ground.

Is there any voltage present for either measurement?

Yes

Repair the Driver Squib 2 circuits with voltage present for a short to battery.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the ORC in accordance with Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

5. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of airbag system diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning the vehicle to the customer.

B1B06-DRIVER AIRBAG SQUIB 2 CIRCUIT OPEN

CIRCUIT SCHEMATIC

0195 1501

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

With the ignition on.

SET CONDITIONS

- Set Condition:**

The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Squib 2 circuits. The ORC will set this DTC if it detects an open or high resistance on the Driver Squib 2 circuits.

POSSIBLE CAUSES

Possible Causes
(R63) DRIVER SQUIB 2 LINE 1 CIRCUIT OPEN (R61) DRIVER SQUIB 2 LINE 2 CIRCUIT OPEN STEERING CONTROL MODULE (SCM) DRIVER AIRBAG OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure that the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Turn the ignition on.

Select ACTIVE or STORED DTC:

ACTIVE DTC

Go To 2.

STORED DTC

Go To 6.

2. **CHECK FOR OPEN SQUIB CIRCUITS IN DRIVER AIRBAG**

Fig. 27: Checking For Shorted/Open Squib Circuits In Driver Airbag
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Driver Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-1 Jumper to the Driver Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTCs.

Does the scan tool display: B1B06-DRIVER AIRBAG SQUIB 2 CIRCUIT OPEN?

Yes

Go To 3.

No

Replace the Driver Airbag in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. CHECK STEERING CONTROL MODULE (CLOCKSPRING) SQUIB CIRCUITS FOR AN OPEN

Fig. 28: Checking Steering Control Module (Clockspring) Squib Circuits For Short/Open
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Driver Airbag Squib connectors.

Disconnect the Steering Control Module C4 connector.

NOTE: **Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and 8443-19 Jumper to the Steering Control Module C4 connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTCs.

Does the scan tool display: B1B06-DRIVER AIRBAG SQUIB 2 CIRCUIT OPEN?

Yes

Go To 4.

No

Replace the Steering Control Module in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

4. **CHECK (R63) DRIVER SQUIB 2 LINE 1 CIRCUIT FOR AN OPEN**

819b4fea

Fig. 29: Measuring Resistance Of (R63) Driver Squib 2 Line 1 Circuit Between Steering Control Module C4 Connector Cavity 1 And 8443-32-R Adapter Cavity C1-14
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Steering Control Module connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the ORC 8443-32 ORC Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the resistance of the (R63) Driver Squib 2 Line 1 circuit between the Steering Control Module

C4 connector cavity 1 and the 8443-32-R Adapter cavity C1-14.

Is the resistance below 1.0 ohm?

Yes

Go To 5.

No

Repair the (R63) Driver Squib 2 Line 1 circuit for an open.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

5. CHECK (R61) DRIVER SQUIB 2 LINE 2 CIRCUIT FOR AN OPEN

819b4f3d

Fig. 30: Measuring Resistance Of (R61) Driver Squib 2 Line 2 Circuit Between Steering Control Module C4 Connector Cavity 2 And ORC 8443-32-R Adapter Cavity C1-13
Courtesy of CHRYSLER LLC

Measure the resistance of the (R61) Driver Squib 2 Line 2 circuit between the Steering Control Module C4 connector cavity 2 and the ORC 8443-32-R Adapter cavity C1-13.

Is the resistance below 1.0 ohm?

Yes

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the ORC in accordance with Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

No

Repair the (R61) Driver Squib 2 Line 2 circuit for an open.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

6. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to DIAGNOSTIC CODE INDEX for a complete list of airbag system diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning the vehicle to the customer.

MONITOR CONDITIONS

When Monitored:

With the ignition on.

SET CONDITIONS

- Set Condition:**

The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Squib 2 circuits. The ORC will set this DTC if it detects low resistance between the Driver Squib 2 circuits.

POSSIBLE CAUSES

Possible Causes
(R63) DRIVER SQUIB 2 LINE 1 CIRCUIT SHORTED TO (R61) DRIVER SQUIB 2 LINE 2 CIRCUIT STEERING CONTROL MODULE DRIVER AIRBAG OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure that the battery is fully charged.

NOTE: The Scan Tool, SRS Airbag Load Tool 8443 and DVOM are required to perform the following test.

Turn the ignition on.

Select ACTIVE or STORED DTC:

ACTIVE DTC

Go To 2.

STORED DTC

Go To 5.

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG**

Fig. 32: Checking For Shorted/Open Squib Circuits In Driver Airbag
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: To avoid serious or fatal injury, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

Disconnect the Driver Airbag Squib connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-1 Jumper to the Driver Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTCs.

Does the scan tool display: B1B07-DRIVER AIRBAG SQUIB 2 CIRCUIT SHORTED TOGETHER?

Yes

Go To 3.

No

Replace the Driver Airbag in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. CHECK STEERING CONTROL MODULE (CLOCKSPRING) SQUIB CIRCUITS FOR A SHORT TOGETHER

Fig. 33: Checking Steering Control Module (Clockspring) Squib Circuits For Short/Open
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the

battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and jumper from the Driver Airbag Squib connectors.

Disconnect the Steering Control Module C4 connector.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-19 Jumper to the Steering Control Module C4 connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTCs.

Does the scan tool display: B1B07-DRIVER AIRBAG SQUIB 2 CIRCUIT SHORTED TOGETHER?

Yes

Go To 4.

No

Replace the Steering Control Module in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

4. CHECK (R63) DRIVER SQUIB 2 LINE 1 CIRCUIT FOR A SHORT TO (R61) DRIVER SQUIB 2 LINE 2 CIRCUIT

Fig. 34: Checking Driver Squib 2 Line 1 Circuit For Short To Driver Squib 2 Line 2 Circuit
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Steering Control Module connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the ORC 8443-32-R ORC Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the resistance between the (R63) Driver Squib 2 Line 1 circuit cavity 1 and the (R61) Driver Squib 2 Line 2 circuit cavity 2 in the SCM C4 connector.

Is the resistance below 10k ohms?

Yes

Repair the (R63) Driver Squib 2 Line 1 circuit for a short to the (R61) Driver Squib 2 Line 2 circuit.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the ORC in accordance with Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

5. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of airbag system diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning the vehicle to the customer.

OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure that the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Turn the ignition on.

Select ACTIVE or STORED DTC:

ACTIVE DTC

Go To 2.

STORED DTC

Go To 4.

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG**

Fig. 36: Checking For Shorted/Open Squib Circuits In Passenger Airbag
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Passenger Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-8 Jumper to the Passenger Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTCs.

Does the scan tool display: B1B08-PASSENGER AIRBAG SQUIB 1 CIRCUIT LOW?

Yes

Go To 3.

No

Replace the Passenger Airbag in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. **CHECK (R42) PASSENGER SQUIB 1 LINE 2 CIRCUIT AND (R44) PASSENGER SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO GROUND**

819b20f9

Fig. 37: Measuring Resistance Of (R42/44) Passenger Squib 1 Line 2/1 Circuit Between ORC 8443-32-R Adapter Cavity C1-12/11 And Ground

Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool from the Passenger Airbag Squib connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the ORC 8443-32-R ORC Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the resistance of the (R42) Passenger Squib 1 Line 2 circuit between the ORC 8443-32-R Adapter cavity C1-12 and ground.

Measure the resistance of the (R44) Passenger Squib 1 Line 1 circuit between the ORC 8443-32-R Adapter cavity C1-11 and ground.

Is the resistance below 10k ohms on either circuit?

Yes

Repair the Passenger Squib 1 circuits with resistance below 10k ohms for a short to ground.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the ORC in accordance with Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

4. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of airbag system diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning the vehicle to the customer.

POSSIBLE CAUSES

Possible Causes
(R42) PASSENGER SQUIB 1 LINE 2 CIRCUIT SHORTED TO (R44) PASSENGER SQUIB 1 LINE 1 CIRCUIT PASSENGER AIRBAG OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. DETERMINE ACTIVE OR STORED DTC

- NOTE:** Ensure that the battery is fully charged.
- NOTE:** The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Turn the ignition on.

Select ACTIVE or STORED DTC:

ACTIVE DTC

Go To 2.

STORED DTC

Go To 4.

2. CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG

Fig. 46: Checking For Shorted/Open Squib Circuits In Passenger Airbag
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Passenger Airbag Squib connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-8 Jumper to the Passenger Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTCs.

Does the scan tool display: B1B0B-PASSENGER AIRBAG SQUIB 1 CIRCUIT SHORTED TOGETHER?

Yes

Go To 3.

No

Replace the Passenger Airbag in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

3. **CHECK (R42) PASSENGER SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO (R44) PASSENGER SQUIB 1 LINE 1 CIRCUIT**

819b677a

Fig. 47: Measuring Resistance Between (R42) Passenger Squib 1 Line 2 Circuit Cavity C1-12 And (R44) Passenger Squib 1 Line 1 Circuit Cavity C1-11 At ORC 8443-32-R Adapter
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Passenger Airbag Squib connectors.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443-32-R ORC Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the resistance between the (R42) Passenger Squib 1 Line 2 circuit cavity C1-12 and the (R44) Passenger Squib 1 Line 1 circuit cavity C1-11 at the ORC 8443-32-R Adapter.

Is the resistance below 10k ohms?

Yes

Repair the (R42) Passenger Squib 1 Line 2 circuit for a short to the (R44) Passenger Squib 1 Line 1 circuit.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the ORC in accordance with Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

4. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of airbag system diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning the vehicle to the customer.

B1B0C-PASSENGER AIRBAG SQUIB 2 CIRCUIT LOW

CIRCUIT SCHEMATIC

01902000

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

With the ignition on.

SET CONDITIONS

- **Set Condition:**

The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Squib 2 circuits. The ORC will set this DTC if it detects low resistance on the Passenger Squib 2 circuits.

POSSIBLE CAUSES

Possible Causes
(R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT SHORTED TO GROUND
(R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT SHORTED TO GROUND
PASSENGER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure that the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Turn the ignition on.

Select ACTIVE or STORED DTC:

ACTIVE DTC

Go To 2.

STORED DTC

Go To 4.

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG**

Fig. 49: Checking For Shorted/Open Squib Circuits In Passenger Airbag
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Passenger Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-8 Jumper to the Passenger Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTCs.

Does the scan tool display: B1B0C-PASSENGER AIRBAG SQUIB 2 CIRCUIT LOW?

Yes

Go To 3.

No

Replace the Passenger Airbag in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. **CHECK (R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT AND (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT FOR A SHORT TO GROUND**

819b281a

Fig. 50: Measuring Resistance Of (R64/62) Passenger Squib 2 Line 1/2 Circuit Between ORC 8443-32-R Adapter Cavity C1-15/16 And Ground

Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Passenger Airbag Squib connectors.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443-32-R ORC Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the resistance of the (R64) Passenger Squib 2 Line 1 circuit between ORC 8443-32-R Adapter cavity C1-15 and ground.

Measure the resistance of the (R62) Passenger Squib 2 Line 2 circuit between ORC 8443-32-R Adapter cavity C1-16 and ground.

Is the resistance below 10k ohms on either circuit?

Yes

Repair the Passenger Squib 2 circuits with resistance below 10k ohms a short to ground.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the ORC in accordance with Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

4. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of airbag system diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning the vehicle to the customer.

B1B0D-PASSENGER AIRBAG SQUIB 2 CIRCUIT HIGH

CIRCUIT SCHEMATIC

01902000

 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

With the ignition on.

SET CONDITIONS

- Set Condition:**

The Occupant Restraint Controller (ORC) monitors the voltage of the Passenger Squib 2 circuits. The ORC will set this DTC if it detects voltage on the Passenger Squib 2 circuits.

POSSIBLE CAUSES

Possible Causes
(R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT SHORTED TO BATTERY
(R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT SHORTED TO BATTERY
PASSENGER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure that the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Turn the ignition on.

Select ACTIVE or STORED DTC:

ACTIVE DTC

Go To 2.

STORED DTC

Go To 4.

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG**

Fig. 52: Checking For Shorted/Open Squib Circuits In Passenger Airbag
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Passenger Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-8 Jumper to the Passenger Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTCs.

Does the scan tool display: B1B0D-PASSENGER AIRBAG SQUIB 2 CIRCUIT HIGH?

Yes

Go To 3.

No

Replace the Passenger Airbag in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. **CHECK (R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT AND (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT FOR A SHORT TO BATTERY**

Fig. 53: Measuring Voltage Of (R64/62) Passenger Squib 2 Line 1/2 Circuit Between 8443-32-R Adapter Cavity C1-15/16 And Ground
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Passenger Airbag Squib connectors.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443-32-R ORC Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the voltage of the (R64) Passenger Squib 2 Line 1 circuit between the 8443-32-R Adapter cavity C1-15 and ground.

Measure the voltage of the (R62) Passenger Squib 2 Line 2 circuit between the 8443-32-R Adapter cavity C1-16 and ground.

Is there any voltage present on either circuit?

Yes

Repair the Passenger Squib 2 circuits with voltage present for a short to battery.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the ORC in accordance with Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

4. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of airbag system diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning the vehicle to the customer.

B1B0E-PASSENGER AIRBAG SQUIB 2 CIRCUIT OPEN

CIRCUIT SCHEMATIC

Fig. 54: Passenger Airbag Squib Circuit Schematic
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

With the ignition on.

SET CONDITIONS

- **Set Condition:**

The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Squib 2 circuits. The ORC will set this DTC if it detects an open or high resistance on the Passenger Squib 2 circuits.

POSSIBLE CAUSES

Possible Causes
(R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT OPEN
(R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT OPEN
PASSENGER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure that the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Turn the ignition on.

Select ACTIVE or STORED DTC:

ACTIVE DTC

Go To 2.

STORED DTC

Go To 5.

2. **CHECK FOR OPEN SQUIB CIRCUITS IN PASSENGER AIRBAG**

Fig. 55: Checking For Shorted/Open Squib Circuits In Passenger Airbag
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Passenger Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-8 Jumper to the Passenger Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTCs.

Does the scan tool display: B1B0E-PASSENGER AIRBAG SQUIB 2 CIRCUIT OPEN?

Yes

Go To 3.

No

Replace the Passenger Airbag in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. CHECK (R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT FOR AN OPEN

819b6bd1

Fig. 56: Measuring Resistance Of (R64) Passenger Squib 2 Line 1 Circuit Between Passenger Airbag Squib Connector And 8443-32-R ORC Adapter Cavity C1-15
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Passenger Airbag Squib connectors.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443-32-R ORC Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the resistance of the (R64) Passenger Squib 2 Line 1 circuit between the Passenger Airbag Squib connector and the 8443-32-R ORC Adapter cavity C1-15.

Is the resistance below 1.0 ohm?

Yes

Go to 4.

No

Repair the (R64) Passenger Squib 2 Line 1 circuit for an open.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

4. CHECK (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT FOR AN OPEN

819b6bd9

Fig. 57: Measuring Resistance Of (R62) Passenger Squib 2 Line 2 Circuit Between Passenger Airbag Squib Connector And 8443-32-R ORC Adapter Cavity C1-16
Courtesy of CHRYSLER LLC

Measure the resistance of the (R62) Passenger Squib 2 Line 2 circuit between the Passenger Airbag Squib connector and the 8443-32-R ORC Adapter cavity C1-16.

Is the resistance below 1.0 ohm?

Yes

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the ORC in accordance with Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Repair the (R62) Passenger Squib 2 Line 2 circuit for an open.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

5. **CHECKING STORED OR INTERMITTENT CODES**

NOTE: **Diagnose and repair all active codes before diagnosing stored codes. Refer to DIAGNOSTIC CODE INDEX for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: **To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: **To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning the vehicle to the customer.

B1B0F-PASSENGER AIRBAG SQUIB 2 CIRCUITS SHORTED TOGETHER

CIRCUIT SCHEMATIC

Fig. 58: Passenger Airbag Squib Circuit Schematic
Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

With the ignition on.

SET CONDITIONS

- Set Condition:**

The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Squib 2 circuits. The ORC will set this DTC if it detects low resistance between the Passenger Squib 2 circuits.

POSSIBLE CAUSES

Possible Causes
(R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT SHORTED TO (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT
PASSENGER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. DETERMINE ACTIVE OR STORED DTC

NOTE: Ensure that the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Turn the ignition on.

Select ACTIVE or STORED DTC:

ACTIVE DTC

Go To 2.

STORED DTC

Go To 4.

2. CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG

Fig. 59: Checking For Shorted/Open Squib Circuits In Passenger Airbag
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Passenger Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-8 Jumper to the Passenger Airbag Squib connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery

With the scan tool, read the active ORC DTCs.

Does the scan tool display: B1B0F-PASSENGER AIRBAG SQUIB 2 CIRCUIT SHORTED TOGETHER?

Yes

Go To 3.

No

Replace the Passenger Airbag in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. **CHECK (R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT FOR A SHORT TO (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT**

819b6bec

Fig. 60: Measuring Resistance Between (R64) Passenger Squib 2 Line 1 Circuit And (R62) Passenger Squib 2 Line 2 Circuit At 8443-32-R Adapter Cavities C1-15 And C1-16
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Passenger Airbag Squib connectors.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443-32-R Adapter to the ORC connectors.

NOTE: **The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.**

Measure the resistance between the (R64) Passenger Squib 2 Line 1 circuit and the (R62) Passenger Squib 2 Line 2 circuit at the 8443-32-R Adapter cavities C1-15 and C1-16.

Is the resistance below 10k ohms?

Yes

Repair the (R64) Passenger Squib 2 Line 1 circuit for a short to the (R62) Passenger Squib 2 Line 2 circuit.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the ORC in accordance with Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

4. CHECKING STORED OR INTERMITTENT CODES

NOTE: **Diagnose and repair all active codes before diagnosing stored codes. Refer to DIAGNOSTIC CODE INDEX for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning the vehicle to the customer.

B1B18-LEFT SIDE CURTAIN SQUIB 1 CIRCUIT LOW

Fig. 61: Left Side Curtain Squib Circuit
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Left Curtain Squib 1 circuits.

SET CONDITIONS

- **Set Condition:**

The ORC has detected low resistance of the Left Curtain Squib 1 circuits.

POSSIBLE CAUSES

Possible Causes
(R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT SHORTED TO GROUND
(R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT SHORTED TO GROUND
LEFT SIDE CURTAIN AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Select Active or Stored DTC.

Is the DTC active or stored?

ORC - ACTIVE DTC

Go To 2.

ORC - STORED DTC

Go To 5.

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN LEFT SIDE CURTAIN AIRBAG**

Fig. 62: Checking For Shorted/Open Squib Circuits In Left Side Curtain Airbag
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Left Side Curtain Airbag connector located in the "D" post.

WARNING: To avoid serious or fatal injury, do not place an intact undeployed curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-3 Jumper to the Left Side Curtain Airbag connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

Does the scan tool display: B1B18 LEFT SIDE CURTAIN SQUIB 1 CIRCUIT LOW?

Yes

Go To 3.

No

Replace the Left Side Curtain Airbag and pigtail harness in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. **CHECK (R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT AND (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO GROUND**

81a7aa64

Fig. 63: Measuring Resistance Of (R3/R1) Left Curtain Squib 1 Line 1/2 Circuit Between Ground And Left Side Curtain Airbag Connector

Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Left Side Curtain Airbag connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the Load Tool ORC 8443-32-R Adapter to the ORC connectors.

NOTE: **The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.**

Measure the resistance of the (R3) Left Curtain Squib 1 Line 1 circuit between ground and the Left Side Curtain Airbag connector.

Measure the resistance of the (R1) Left Curtain Squib 1 Line 2 circuit between ground and the Left Side Curtain Airbag connector.

Is the resistance below 10K ohms on either circuit?

Yes

Repair the Left Curtain Squib 1 circuits with a resistance below 10K ohms for a short to ground.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 4.

4. REPLACE THE OCCUPANT RESTRAINT CONTROLLER (ORC)

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

5. STORED ORC DTC

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

IF only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTC's present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning vehicle to customer.

B1B19-LEFT SIDE CURTAIN SQUIB 1 CIRCUIT HIGH

81a7a06

Fig. 64: Left Side Curtain Squib Circuit

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Occupant Restraint Controller (ORC) monitors the voltage on the Left Curtain Squib 1 circuits.

SET CONDITIONS

- **Set Condition:**

The ORC has detected voltage on the Left Curtain Squib 1 circuits.

POSSIBLE CAUSES

Possible Causes
(R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT SHORTED TO BATTERY (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT SHORTED TO BATTERY LEFT SIDE CURTAIN AIRBAG OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Select Active or Stored DTC.

Is the DTC active or stored?

ORC - ACTIVE DTC

Go To 2.

ORC - STORED DTC

Go To 5.

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN LEFT SIDE CURTAIN AIRBAG**

Fig. 65: Checking For Shorted/Open Squib Circuits In Left Side Curtain Airbag
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Left Side Curtain Airbag connector located in the "D" post.

WARNING: To avoid serious or fatal injury, do not place an intact undeployed curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-3 Jumper to the Left Side Curtain Airbag connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

Does the scan tool display: B1B19-LEFT SIDE CURTAIN SQUIB 1 CIRCUIT HIGH?

Yes

Go To 3.

No

Replace the Left Side Curtain Airbag in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. **CHECK (R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT AND (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO BATTERY**

81a7aa7a

Fig. 66: Measuring Voltage Of (R3/R1) Left Curtain Squib 1 Line 1/2 Circuit Between Left Side Curtain Airbag Connector And Ground

Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Left Side Curtain Airbag connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the Load Tool ORC 8443-32-R Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the voltage of the (R3) Left Curtain Squib 1 Line 1 circuit between the Left Side Curtain Airbag connector and ground.

Measure the voltage of the (R1) Left Curtain Squib 1 Line 2 circuit between the Left Side Curtain Airbag connector and ground.

Is there any voltage present on either circuit?

Yes

Repair the Left Curtain Squib 1 circuits with voltage present for a short to battery.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 4.

4. REPLACE THE ORC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

5. STORED ORC DTC

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off then disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread,

corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning vehicle to customer.

B1B1A-LEFT SIDE CURTAIN SQUIB 1 CIRCUIT OPEN

Fig. 67: Left Side Curtain Squib Circuit
Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Left Curtain Squib 1 circuits.

SET CONDITIONS

- **Set Condition:**

The ORC has detected an open or high resistance on the Left Curtain Squib 1 circuits.

POSSIBLE CAUSES

Possible Causes
(R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT OPEN (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT OPEN LEFT SIDE CURTAIN AIRBAG OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Select Active or Stored DTC.

Is the DTC active or stored?

ORC - ACTIVE DTC

Go To 2.

ORC - STORED DTC

Go To 6.

2. **CHECK FOR OPEN SQUIB CIRCUITS IN LEFT SIDE CURTAIN AIRBAG**

Fig. 68: Checking For Shorted/Open Squib Circuits In Left Side Curtain Airbag
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Left Side Curtain Airbag connector located in the "D" post.

WARNING: To avoid serious or fatal injury, do not place an intact undeployed curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-3 Jumper to the Left Side Curtain Airbag connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

Does the scan tool display: B1B1A LEFT SIDE CURTAIN SQUIB 1 CIRCUIT OPEN?

Yes

Go To 3.

No

Replace the Left Side Curtain Airbag in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. CHECK (R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT FOR AN OPEN

81a7ab51

Fig. 69: Measuring Resistance Of (R3) Left Curtain Squib 1 Line 1 Circuit Between Left Side Curtain Airbag Connector And Load Tool ORC 8443-32-R Adapter
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Left Side Curtain Airbag connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the Load Tool ORC 8443-32-R Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the resistance of the (R3) Left Curtain Squib 1 Line 1 circuit between the Left Side Curtain Airbag connector and the Load Tool ORC 8443-32-R Adapter.

Is the resistance below 1.0 ohm?

Yes

Go To 4.

No

Repair the (R3) Left Curtain Squib 1 Line 1 circuit for an open. Then, Go To 4.

4. CHECK (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR AN OPEN

81a7aabb

Fig. 70: Measuring Resistance Of (R1) Left Curtain Squib 1 Line 2 Circuit Between Left Side Curtain Airbag Connector And Load Tool ORC 8443-32-R Adapter
Courtesy of CHRYSLER LLC

Measure the resistance of the (R1) Left Curtain Squib 1 Line 2 circuit between the Left Side Curtain Airbag connector and the Load Tool ORC 8443-32-R Adapter.

Is the resistance below 1.0 ohm?

Yes

Go To 5.

No

Repair the (R1) Left Curtain Squib 1 Line 2 circuit for an open.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

5. REPLACE THE ORC

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it

must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

6. STORED ORC DTC

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning vehicle to customer.

B1B1B-LEFT SIDE CURTAIN SQUIB 1 CIRCUIT SHORTED TOGETHER

Fig. 71: Left Side Curtain Squib Circuit
Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Left Curtain Squib 1 circuits.

SET CONDITIONS

- **Set Condition:**

The ORC has detected low resistance between the Left Curtain Squib 1 circuits.

POSSIBLE CAUSES

Possible Causes
(R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT SHORTED TO (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT
LEFT SIDE CURTAIN AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: **Ensure the battery is fully charged.**

NOTE: **The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.**

Select Active or Stored DTC.

Is the DTC active or stored?

ORC - ACTIVE DTC

Go To 2.

ORC - STORED DTC

Go To 5.

2. CHECK FOR SHORTED SQUIB CIRCUITS IN LEFT SIDE CURTAIN AIRBAG

Fig. 72: Checking For Shorted/Open Squib Circuits In Left Side Curtain Airbag
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Left Side Curtain Airbag connector located in the "D" post.

WARNING: To avoid serious or fatal injury, do not place an intact undeployed curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-3 Jumper to the Left Side Curtain Airbag connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

Does the scan tool display: B1B1B LEFT SIDE CURTAIN SQUIB 1 CIRCUIT SHORTED TOGETHER?

Yes

Go To 3.

No

Replace the Left Side Curtain Airbag in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

3. **CHECK (R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT**

81a7abb0

Fig. 73: Measuring Resistance Between (R3) Left Curtain Squib 1 Line 1 Circuit And (R1) Left Curtain Squib 1 Line 2 Circuit At Left Side Curtain Airbag Connector
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Left Side Curtain Airbag connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the Load Tool ORC 8443-32-R Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the resistance between the (R3) Left Curtain Squib 1 Line 1 circuit and the (R1) Left Curtain Squib 1 Line 2 circuit at the Left Side Curtain Airbag connector.

Is the resistance below 10K ohms?

Yes

Repair the (R3) Left Curtain Squib 1 Line 1 circuit for a short to the (R1) Left Curtain Squib 1 Line 2 circuit.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 4.

4. REPLACE THE ORC

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

5. STORED ORC DTC

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTC's present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning vehicle to customer.

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Right Curtain Squib 1 circuits.

SET CONDITIONS

- **Set Condition:**

The ORC has detected low resistance on the Right Curtain Squib 1 circuits.

POSSIBLE CAUSES

Possible Causes
(R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT SHORTED TO GROUND
(R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT SHORTED TO GROUND
RIGHT SIDE CURTAIN AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Select Active or Stored DTC.

Is the DTC active or stored?

ORC - ACTIVE DTC

Go To 2.

ORC - STORED DTC

Go To 5.

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN RIGHT SIDE CURTAIN AIRBAG**

Fig. 75: Checking For Shorted/Open Squib Circuits In Right Side Curtain Airbag
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Right Side Curtain Airbag connector located in the "D" post.

WARNING: To avoid serious or fatal injury, do not place an intact undeployed curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-3 Jumper to the Right Side Curtain Airbag connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

Does the scan tool display: B1B20-RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT LOW?

Yes

Go To 3.

No

Replace the Right Side Curtain Airbag in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. **CHECK (R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT AND (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO GROUND**

**AIRBAG-
SIDE
CURTAIN-
RIGHT**

81a80767

Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Right Side Curtain Airbag connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the Load Tool ORC 8443-32-R Adapter to the ORC connectors.

NOTE: **The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.**

Measure the resistance of the (R4) Right Curtain Squib 1 Line 1 circuit between ground and the Right Side Curtain Airbag connector.

Measure the resistance of the (R2) Right Curtain Squib 1 Line 2 circuit between ground and the Right Side Curtain Airbag connector.

Is the resistance below 10K ohms on either circuit?

Yes

Repair the Right Curtain Squib 1 circuits with a resistance below 10K ohms for a short to ground.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go to 4.

4. REPLACE THE ORC

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

5. STORED ORC DTC

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTC's present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning vehicle to customer.

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Occupant Restraint Controller (ORC) monitors the voltage on the Right Curtain Squib 1 circuits.

SET CONDITIONS

- **Set Condition:**

When the ORC detects voltage on the Right Curtain Squib 1 circuits.

POSSIBLE CAUSES

Possible Causes
(R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT SHORTED TO BATTERY (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT SHORTED TO BATTERY RIGHT SIDE CURTAIN AIRBAG OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Select Active or Stored DTC.

Is the DTC active or stored?

ORC - ACTIVE DTC

Go To 2.

ORC - STORED DTC

Go To 5.

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN RIGHT SIDE CURTAIN AIRBAG**

Fig. 78: Checking For Shorted/Open Squib Circuits In Right Side Curtain Airbag
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Right Side Curtain Airbag connector located in the "D" post.

WARNING: To avoid serious or fatal injury, do not place an intact uncoupled curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-3 Jumper to the Right Side Curtain Airbag connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

Does the scan tool display: B1B21 RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT HIGH?

Yes

Go To 3.

No

Replace the Right Side Curtain Airbag in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. **CHECK (R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT AND (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO BATTERY**

81a7ad2a

Fig. 79: Measuring Voltage Of (R4/R2) Right Curtain Squib 1 Line 1/2 Circuit Between Right Side Curtain Airbag Connector And Ground

Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Right Side Curtain Airbag connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the Load Tool ORC 8443-32-R Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the voltage of the (R4) Right Curtain Squib 1 Line 1 circuit between the Right Side Curtain Airbag connector and ground.

Measure the voltage of the (R2) Right Curtain Squib 1 Line 2 circuit between the Right Side Curtain Airbag connector and ground.

Is there any voltage present on either circuit?

Yes

Repair the Right Curtain Squib 1 circuits with voltage present for a short to battery.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

No

Go to 4.

4. REPLACE THE ORC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

5. STORED ORC DTC

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread,

corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning vehicle to customer

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Right Curtain Squib 1 circuits.

SET CONDITIONS

- **Set Condition:**

When the ORC has detects an open or high resistance on the Right Curtain Squib 1 circuits.

POSSIBLE CAUSES

Possible Causes
(R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT OPEN (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT OPEN RIGHT SIDE CURTAIN AIRBAG OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Select Active or Stored DTC.

Is the DTC active or stored?

ORC - ACTIVE DTC

Go To 2.

ORC - STORED DTC

Go To 6.

2. **CHECK FOR OPEN SQUIB CIRCUITS IN RIGHT SIDE CURTAIN AIRBAG**

Fig. 81: Checking For Shorted/Open Squib Circuits In Right Side Curtain Airbag
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Right Side Curtain Airbag connector located in the "D" post.

WARNING: To avoid serious or fatal injury, do not place an intact uncoupled curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-3 Jumper to the Right Side Curtain Airbag connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

Does the scan tool display: B1B22 RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT OPEN?

Yes

Go to 3.

No

Replace the Right Side Curtain Airbag in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. CHECK (R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT FOR AN OPEN

81a7acb4

Fig. 82: Measuring Resistance Of (R4) Right Curtain Squib 1 Line 1 Circuit Between Right Side Curtain Airbag Connector And ORC 8443-32-R Adapter
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Right Side Curtain Airbag connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the Load Tool ORC 8443-32-R Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the resistance of the (R4) Right Curtain Squib 1 Line 1 circuit between the Right Side Curtain Airbag connector and the ORC 8443-32-R Adapter.

Is the resistance below 1.0 ohm?

Yes

Go To 4.

No

Repair the (R4) Right Curtain Squib 1 Line 1 circuit for an open. Then, Go To 4.

4. CHECK (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR AN OPEN

81a7ad0b

Fig. 83: Measuring Resistance Of (R2) Right Curtain Squib 1 Line 2 Circuit Between Right Side Curtain Airbag Connector And ORC 8443-32-R Adapter
Courtesy of CHRYSLER LLC

Measure the resistance of the (R2) Right Curtain Squib 1 Line 2 circuit between the Right Side Curtain Airbag connector and the ORC 8443-32-R Adapter.

Is the resistance below 1.0 ohm?

Yes

Go To 5.

No

Repair the (R2) Right Curtain Squib 1 Line 2 circuit for an open.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

5. REPLACE THE ORC

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it

must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

6. STORED ORC DTC

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning vehicle to customer.

B1B23-RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT SHORTED TOGETHER
CIRCUIT SCHEMATIC

81a75a36

Fig. 84: Right Side Curtain Squib Circuit Schematic
Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Right Curtain Squib 1 circuits.

SET CONDITIONS

- **Set Condition:**

The ORC has detected low resistance between the Right Curtain Squib 1 circuits.

POSSIBLE CAUSES

Possible Causes
(R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT SHORTED TO (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT RIGHT SIDE CURTAIN AIRBAG OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Select Active or Stored DTC.

Is the DTC active or stored?

ORC - ACTIVE DTC

Go To 2.

ORC - STORED DTC

Go To 5.

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN RIGHT SIDE CURTAIN AIRBAG**

Fig. 85: Checking For Shorted/Open Squib Circuits In Right Side Curtain Airbag
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Right Side Curtain Airbag connector located in the "D" post.

WARNING: To avoid serious or fatal injury, do not place an intact uncoupled curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-3 Jumper to the Right Side Curtain Airbag connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

Does the scan tool display: B1B23-RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT SHORTED TOGETHER?

Yes

Go to 3.

No

Replace the Right Side Curtain Airbag in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. **CHECK (R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT**

81a7ad12

Fig. 86: Measuring Resistance Between (R4) Right Curtain Squib 1 Line 1 Circuit And (R2) Right Curtain Squib 1 Line 2 Circuit At Right Side Curtain Airbag Connector
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Right Side Curtain Airbag connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the Load Tool ORC 8443-32-R Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the resistance between the (R4) Right Curtain Squib 1 Line 1 circuit and the (R2) Right Curtain Squib 1 Line 2 circuit at the Right Side Curtain Airbag connector.

Is the resistance below 10K ohms?

Yes

Repair the (R4) Right Curtain Squib 1 Line 1 circuit for a short to the (R2) Right Curtain Squib 1 Line 2 circuit.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go to 4.

4. REPLACE THE ORC

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

5. STORED ORC DTC

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTC's present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning vehicle to customer.

B1B54-1ST ROW PASSENGER SEAT BELT SENSOR CIRCUIT LOW

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

When powered, the Occupant Restraint Controller (ORC) sends a test current to the belt switches to verify the integrity of the switch and wiring. The use of the ORC connector adapter tool in the tests below provides a test point in place of the module.

SET CONDITIONS

- **Set Condition:**

The ORC monitors the status of the seat belt switch circuits at power up and every 60 ms thereafter while the ignition is in on.

This DTC sets when the ORC detects the seat belt switch circuits have become shorted to ground for more than 2.5 seconds. This DTC transitions from active to stored when the module sees a recovery from the shorted to ground condition for greater than 5 seconds.

POSSIBLE CAUSES

Possible Causes
(R58) PASSENGER SEAT BELT SWITCH SIGNAL CIRCUIT SHORTED TO GROUND OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. DETERMINE ACTIVE OR STORED DTC

NOTE: **Ensure the battery is fully charged.**

Turn the ignition on.

With the scan tool, read all active ORC DTCs.

Is the DTC active or stored?

ORC - ACTIVE DTC

Go To 2.

ORC - STORED DTC

Perform *RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. PASSENGER SEAT BELT SWITCH SIGNAL CIRCUIT SHORTED TO GROUND

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Passenger Seat Belt Switch connector.

Disconnect the ORC connector.

NOTE: **Check connectors - Clean and repair as necessary.**

Connect the Load Tool ORC 8443-28 Adapter to the ORC connectors.

Measure the resistance of the (R58) Passenger Seat Belt Switch Signal circuit between the Load Tool ORC 8443-28 Adapter and ground.

Is the resistance below 10.0 Ohms?

Yes

Repair or replace the (R58) Passenger Seat Belt Switch Signal circuit for a short to ground in accordance with the Service Information.

Perform **VERIFICATION TEST - SUPPLEMENTAL RESTRAINT SYSTEM** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Replace the ORC in accordance with the Service Information.

Perform **VERIFICATION TEST - SUPPLEMENTAL RESTRAINT SYSTEM** .

B1B55-1ST ROW PASSENGER SEAT BELT SENSOR CIRCUIT HIGH

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the belt switches to verify the integrity of the switch and wiring. The use of the ORC connector adapter tool in the tests below provides a test point in place of the module.

MONITOR CONDITIONS

When Monitored:

The ORC monitors the status of the seat belt switch circuits at power up and every 60 ms thereafter while the ignition is in on.

SET CONDITIONS

• Set Condition:

This DTC sets when the ORC detects the seat belt switch circuits have become shorted to voltage for more than 2.5 seconds. This DTC transitions from active to stored when the module sees a recovery from the shorted to voltage condition for greater than 5 seconds.

POSSIBLE CAUSES

Possible Causes

(R58) PASSENGER SEAT BELT SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R60) PASSENGER SEAT BELT SWITCH GROUND CIRCUIT SHORTED TO VOLTAGE
(R58) PASSENGER SEAT BELT SWITCH SIGNAL CIRCUIT OPEN
(R60) PASSENGER SEAT BELT SWITCH GROUND CIRCUIT OPEN
PASSENGER SEAT BELT SWITCH
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the **PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

DIAGNOSTIC TEST

1. DETERMINE ACTIVE OR STORED DTC

NOTE: Ensure the battery is fully charged.

Turn the ignition on.

With the scan tool, read all active ORC DTCs.

Is the DTC active or stored?

ORC - ACTIVE DTC

Go To 2.

ORC - STORED DTC

Perform *RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. CHECK FOR ADDITIONAL ACTIVE SENSOR DTCS

Turn the ignition on.

With the scan tool, read all active ORC DTCs.

Are DTCs B1B8E-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT HIGH and B1B94-PASSENGER SEAT TRACK POSITION SENSOR CIRCUIT HIGH active?

Yes

Repair the (Z908) Ground circuit for an open.

Perform **VERIFICATION TEST - SUPPLEMENTAL RESTRAINT SYSTEM** .

No

Go To 3.

3. **(R58) PASSENGER SEAT BELT SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Passenger Seat Belt Switch connector.

Disconnect the ORC connector.

NOTE: Check connectors - Clean and repair as necessary.

Connect the Load Tool ORC 8443-28 Adapter to the ORC connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R58) Passenger Seat Belt Switch Signal circuit between the Load Tool ORC 8443-28 Adapter and ground.

Is there any voltage present on the circuit?

Yes

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Repair the (R58) Passenger Seat Belt Switch Signal circuit for a short to battery.

Perform **VERIFICATION TEST - SUPPLEMENTAL RESTRAINT SYSTEM** .

No

Go To 4.

4. **(R60) PASSENGER SEAT BELT SWITCH GROUND CIRCUIT SHORTED TO VOLTAGE**

Measure the voltage of the (R60) Passenger Seat Belt Switch Ground circuit between the Load Tool ORC 8443-28 Adapter and ground.

Is there any voltage present on the circuit?

Yes

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect

the battery and wait two minutes before proceeding.

Repair or replace the (R60) Passenger Seat Belt Switch Ground circuit for a short to battery in accordance with the Service Information.

Perform **VERIFICATION TEST - SUPPLEMENTAL RESTRAINT SYSTEM** .

No

Go To 5.

5. (R58) PASSENGER SEAT BELT SWITCH SIGNAL CIRCUIT FOR AN OPEN

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Passenger Seat Belt Switch connector.

Disconnect the ORC connector.

NOTE: Check connectors - Clean and repair as necessary.

Connect the Load Tool ORC 8443-28 Adapter to the ORC connectors.

Measure the resistance of the (R58) Passenger Seat Belt Switch Signal circuit between the Passenger Seat Belt Switch connector and the 8443 ORC Adapter.

Is the resistance below 1.0 ohm?

Yes

Go to 6.

No

Repair or replace the (R58) Passenger Seat Belt Switch Signal circuit in accordance with the Service Information. Then, Go to 6.

6. (R60) PASSENGER SEAT BELT SWITCH GROUND CIRCUIT FOR AN OPEN

Measure the resistance of the (R60) Passenger Seat Belt Switch Ground circuit between the Passenger Seat Belt Switch connector and the Load Tool ORC 8443-28 Adapter.

Is the resistance below 1.0 ohm?

Yes

Go to 7.

No

Repair or replace the (R60) Passenger Seat Belt Switch Ground in accordance with the Service Information.

Perform **VERIFICATION TEST - SUPPLEMENTAL RESTRAINT SYSTEM** .

7. CHECK OPERATION OF THE 1st ROW PASSENGER SEAT BELT SWITCH

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the 1st Row Passenger Seat Belt Switch.

Reconnect the vehicle body harness to the switch.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Connect the scan tool to the Data Link Connector - use the most current software available.

Use the scan tool and erase all codes in the ORC.

Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.

Wait one minute, and read active codes.

Did the active B1B56-1st ROW PASSENGER SEAT BELT SENSOR CIRCUIT OPEN DTC return?

Yes

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the ORC in accordance with the Service Information.

Perform **VERIFICATION TEST - SUPPLEMENTAL RESTRAINT SYSTEM** .

No

Repair is complete.

Perform **VERIFICATION TEST - SUPPLEMENTAL RESTRAINT SYSTEM** .

2008 RESTRAINTS

Electrical Diagnostics - Liberty

B1B70-UP-FRONT LEFT SATELLITE ACCELERATION SENSOR INTERNAL CIRCUIT SCHEMATIC

01954000

Fig. 1: Front Left/Right Satellite Acceleration Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Front Left Impact Sensor is equipped with on board diagnostics to monitor to sensor's internal circuits. If a problem is identified, the sensor sends the Front Left Impact Sensor Internal message to the Occupant Restraint Controller (ORC).

SET CONDITIONS

- **Set Condition:**

This DTC will set if the ORC receives an internal DTC from the Front Left Impact Sensor.

POSSIBLE CAUSES

Possible Causes
FRONT LEFT IMPACT SENSOR OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED FAULT CODE**

NOTE: **Ensure the battery is fully charged.**

Turn the ignition on.

Wait one minute, and read active codes.

Is the DTC: B1B70-UP-FRONT LEFT SATELLITE ACCELERATION SENSOR INTERNAL active?

Yes

Go To 2.

No

Go To 4.

2. **VERIFY OPERATION OF THE FRONT LEFT IMPACT SENSOR**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the Front Left Impact Sensor.

Reconnect the vehicle wire harness to the sensor.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Use the scan tool and erase the stored codes in all airbag system modules.

Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.

Wait one minute, and read active codes.

Did the active DTC: B1B70-UP-FRONT LEFT SATELLITE ACCELERATION SENSOR INTERNAL return?

Yes

Go To 3.

No

Repair is complete.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. REPLACE THE OCCUPANT RESTRAINT CONTROLLER

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and serious or fatal injury.

If there are no possible causes remaining, view repair.

Repair

Replace the ORC in accordance with Service Instructions.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

4. TEST FOR AN INTERMITTENT CONDITION

With the scan tool, record and erase all DTC's from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor active codes as you work through the following steps.

WARNING: To avoid serious or fatal injury, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select appropriate symptom from Symptom List.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

B1B71-UP-FRONT RIGHT SATELLITE ACCELERATION SENSOR INTERNAL

CIRCUIT SCHEMATIC

Fig. 2: Front Left/Right Satellite Acceleration Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Front Right Impact Sensor is equipped with on board diagnostics to monitor to sensor's internal circuits. If a problem is identified, the sensor sends the Front Right Impact Sensor Internal message to the Occupant Restraint Controller (ORC).

SET CONDITIONS

- **Set Condition:**

This DTC will set if the ORC receives an internal DTC from the Front Right Impact Sensor.

POSSIBLE CAUSES

Possible Causes
FRONT RIGHT IMPACT SENSOR OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED FAULT CODE**

NOTE: **Ensure the battery is fully charged.**

Turn the ignition on.

Is the DTC: B1B71-UP-FRONT RIGHT SATELLITE ACCELERATION SENSOR INTERNAL active?

Yes

Go To 2.

No

Go To 4.

2. **VERIFY OPERATION OF THE FRONT RIGHT IMPACT SENSOR**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the Front Right Impact Sensor.

Reconnect the vehicle wire harness to the sensor.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Use the scan tool and erase the stored codes in all airbag system modules.

Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.

Wait one minute, and read active codes.

Did the active DTC: B1B71-UP-FRONT RIGHT SATELLITE ACCELERATION SENSOR INTERNAL return?

Yes

Go To 3.

No

Repair is complete.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. REPLACE THE OCCUPANT RESTRAINT CONTROLLER

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and serious or fatal injury.

If there are no possible causes remaining, view repair.

Repair

Replace the ORC in accordance with Service Instructions.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

4. TEST FOR AN INTERMITTENT CONDITION

With the scan tool, record and erase all DTC's from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor active codes as you work through the following steps.

WARNING: To avoid serious or fatal injury, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select appropriate symptom from Symptom List.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Right Side Impact Sensor 1 is equipped with on board diagnostics to monitor to sensor's internal circuits. If a problem is identified, the sensor sends the Right Side Impact Sensor 1 Internal message to the Occupant Restraint Controller (ORC).

SET CONDITIONS

- **Set Condition:**

This DTC will set if the ORC receives an internal DTC from the Right Side Impact Sensor 1.

POSSIBLE CAUSES

Possible Causes
RIGHT SIDE IMPACT SENSOR 1 OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED FAULT CODE**

NOTE: Ensure the battery is fully charged.

Turn the ignition on.

Is the DTC: B1B75-RIGHT SIDE SATELLITE ACCELERATION SENSOR 1 INTERNAL active?

Yes

Go To 2.

No

Go To 4.

2. **VERIFY OPERATION OF THE RIGHT SIDE IMPACT SENSOR**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the Right Side Impact Sensor 1.

Reconnect the vehicle wire harness to the sensor.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Use the scan tool and erase the stored codes in all airbag system modules.

Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.

Wait one minute, and read active codes.

Did the active DTC: B1B75-RIGHT SIDE SATELLITE ACCELERATION SENSOR 1 INTERNAL return?

Yes

Go To 3.

No

Repair is complete.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. REPLACE THE OCCUPANT RESTRAINT CONTROLLER

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and serious or fatal injury.

If there are no possible causes remaining, view repair.

Repair

Replace the ORC in accordance with Service Instructions.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

4. TEST FOR AN INTERMITTENT CONDITION

With the scan tool, record and erase all DTC's from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor active codes as you work through the following steps.

WARNING: To avoid serious or fatal injury, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select appropriate symptom from Symptom List.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

B1B76-RIGHT SIDE SATELLITE ACCELERATION SENSOR 2 INTERNAL CIRCUIT SCHEMATIC

01a57557

Fig. 5: Right Side Satellite Acceleration Sensor Circuit Schematic
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Right Side Impact Sensor 2 is equipped with on board diagnostics to monitor to sensor's internal circuits. If a problem is identified, the sensor sends the Right Side Impact Sensor 2 Internal message to the Occupant Restraint Controller (ORC).

SET CONDITIONS

- **Set Condition:**

This DTC will set if the ORC receives an internal DTC from the Right Side Impact Sensor 2.

POSSIBLE CAUSES

Possible Causes
RIGHT SIDE IMPACT SENSOR 2 OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED FAULT CODE**

NOTE: Ensure the battery is fully charged.

Turn the ignition on.

Is the DTC: B1B76-RIGHT SIDE SATELLITE ACCELERATION SENSOR 2 INTERNAL active?

Yes

Go To 2.

No

Go To 4.

2. **VERIFY OPERATION OF THE RIGHT SIDE IMPACT SENSOR 2**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the Right Side Impact Sensor 2.

Reconnect the vehicle wire harness to the sensor.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Use the scan tool and erase the stored codes in all airbag system modules.

Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.

Wait one minute, and read active codes.

Did the active DTC: B1B76-RIGHT SIDE SATELLITE ACCELERATION SENSOR 2 INTERNAL return?

Yes

Go To 3.

No

Repair is complete.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. REPLACE THE OCCUPANT RESTRAINT CONTROLLER

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and serious or fatal injury.

If there are no possible causes remaining, view repair.

Repair

Replace the ORC in accordance with Service Instructions.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

4. TEST FOR AN INTERMITTENT CONDITION

With the scan tool, record and erase all DTC's from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram / schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor active codes as you work through the following steps.

WARNING: To avoid serious or fatal injury, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select appropriate symptom from Symptom List.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

B1B78-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT PERFORMANCE

CIRCUIT SCHEMATIC

8189c07

Fig. 6: Passenger Seat Weight Sensor Circuit Schematic
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

When CAN ignitions status is Run or Signal Not Available (SNA), during auto zero and while performing the Occupant Classification Module System Verification Test.

SET CONDITIONS

- **Set Condition:**

During the Occupant Classification Module system verification test: if the module detects that the sensor input is less than 1.4 volts or greater than 3.6 volts. During auto zero: if the module detects that the sensor input is less than 1 volt or greater than 4 volts.

POSSIBLE CAUSES

Possible Causes
PASSENGER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED LEFT-FRONT PASSENGER SEAT WEIGHT SENSOR DAMAGE TO THE PASSENGER SEAT STRUCTURE, RISER ASSEMBLY, CROSSMEMBERS, SEAT TRACKS, FLOOR PAN OCCUPANT CLASSIFICATION MODULE (OCM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)**

NOTE: **Ensure that the battery is fully charged.**

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

Yes

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 2.

2. **VERIFY THAT DTC B1B78-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT PERFORMANCE IS ACTIVE**

With the scan tool, read OCM DTCs.

Does the scan tool display active: B1B78-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT PERFORMANCE?

Yes

Go To 3.

No

Go To 6.

3. **INSPECT PASSENGER SEAT HARNESS WIRES AND CONNECTORS**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Are any of these conditions present?

Yes

Replace the Passenger Seat Harness in accordance with the Service Information.
Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Go To 4.

4. **PERFORM THE OCM VERIFICATION TEST**

NOTE: Ensure that the battery is fully charged.

NOTE: The Occupant Classification Seat Weights 9077 are required to perform this test.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the *OCM SYSTEM VERIFICATION TEST to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR DTCs?

Yes

Go To 5.

No

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1 .

5. **PERFORM SEAT WEIGHT SENSOR VERIFICATION TEST**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Verify that all of the Seat Weight Sensor mounting screws are tightened to torque specification. Refer to SEAT WEIGHT SENSOR for specification.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all

tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the ***OCM SYSTEM VERIFICATION TEST** to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR PERFORMANCE?

Yes

Perform ***DIAGNOSIS AND CHECKOUT PROCEDURE FOR SEAT WEIGHT SENSORS** .

No - But Other DTCs Present

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No Active DTCs Present

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

6. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of airbag system diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Perform ***OCM SYSTEM VERIFICATION TEST** . Erase all codes before returning vehicle to customer.

B1B79-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT LOW

CIRCUIT SCHEMATIC

**SENSOR-
SEAT
WEIGHT-
LEFT
FRONT**

**MODULE-
OCCUPANT
CLASSIFICATION C2
(EXCEPT EXPORT)**

01025101

Fig. 7: Passenger Seat Weight Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

While the CAN bus ignition status is in IGN_RUN, the module checks the sensor input ranges.

SET CONDITIONS

- **Set Condition:**

If the module detects that the sensor input is less than $3.4 \pm 6\%$ of the (R701) Seat Weight Sensor 5 Volt circuit voltage. This DTC will also set if the (R701) Seat Weight Sensor 5 Volt circuit is shorted to ground. However, this condition would prevent communication with the OCM and cause a Lost Communication With OCM DTC to set in other modules. Also, this DTC will remain active after the condition that set this fault is no longer present. This condition is referred to as latching the DTC for the ignition cycle. Cycling the ignition key will change the status from active to stored if the condition that set the fault is no longer present.

POSSIBLE CAUSES

Possible Causes
ACTIVE B1B79 DTC AND B1B7A DTC AT THE SAME TIME
PASSENGER SEAT HARNESS IMPROPERLY ROUTED
PASSENGER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN
PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED
(R717) LT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(R717) LT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT OPEN
(R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT OPEN
LEFT-FRONT SEAT WEIGHT SENSOR
OCCUPANT CLASSIFICATION MODULE (OCM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)**

NOTE: **Ensure that the battery is fully charged.**

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

Yes

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 2.

2. VERIFY THAT DTC B1B79-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT LOW IS ACTIVE

With the scan tool, read OCM DTCs.

Does the scan tool display active: B1B79-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT LOW?

Yes

Go To 3.

No

Go To 10.

3. VERIFY THAT B1B7A-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT HIGH DTC AND B1B79-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT LOW DTC ARE ACTIVE AT THE SAME TIME

With the scan tool, read OCM DTCs.

Does the scan tool display active: B1B7A-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT HIGH AND B1B79-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT LOW AT THE SAME TIME?

Yes

Perform B1B79-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT HIGH diagnostic test.

No

Go To 4.

4. INSPECT PASSENGER SEAT HARNESS WIRES AND CONNECTORS

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram / schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

NOTE: **Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Are any of these conditions present?

Yes

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Go To 5.

5. VERIFY THAT PASSENGER SEAT HARNESS IS ROUTED CORRECTLY

Verify that the Passenger Seat Harness is routed correctly.

Is the Passenger Seat Harness routed correctly?

Yes

Go To 6.

No

Reroute the Passenger Seat Harness as necessary.

Perform ***OCM SYSTEM VERIFICATION TEST** .

6. CHECK VOLTAGE OF (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT

81825811

Fig. 8: Checking Voltage Of Seat Weight Sensor 5 Volt Circuit
Courtesy of CHRYSLER LLC

Disconnect the Left-Front Seat Weight Sensor connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R701) Seat Weight Sensor 5 Volt circuit.

Is the voltage above 4.8 volts?

Yes

Go To 7.

No

Go To 9.

7. **CHECK (R717) LT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

81825815

Fig. 9: Measuring Resistance Of The (R717) Left-Front Seat Weight Sensor Signal Circuit Between Ground And OCM C2 Connector
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the OCM C2 connector.

Measure the resistance of the (R717) LT-FT Seat Weight Sensor Signal circuit between ground and the OCM C2 connector.

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Is the resistance below 5.0 ohms?

Yes

Replace the Passenger Seat Harness in accordance with the Service Information.
 Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Go To 8.

8. CHECK (R717) LT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR AN OPEN

81825819

Fig. 10: Measuring Resistance Of (R717) Lt-Ft Seat Weight Sensor Signal Circuit Between OCM C2 Connector And Left-Front Seat Weight Sensor Connector
 Courtesy of CHRYSLER LLC

Measure the resistance of the (R717) LT-FT Seat Weight Sensor Signal circuit between the OCM C2 connector and the Left-Front Seat Weight Sensor connector.

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Is the resistance below 5.0 ohms?

Yes

Replace the Left-Front Seat Weight Sensor in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

If DTC B1B79-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT LOW returns active, replace the OCM in accordance with the Service Information.

No

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

9. **CHECK (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT FOR AN OPEN**

8182581e

Fig. 11: Measuring Resistance Of (R701) Seat Weight Sensor 5-Volt Circuit Between OCM C2 Connector And Left-Front Seat Weight Sensor Connector
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the OCM connectors.

Measure the resistance of the (R701) Seat Weight Sensor 5 Volt circuit between the OCM C2 connector and the Left-Front Seat Weight Sensor connector.

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Is the resistance below 5.0 ohms?

Yes

Replace the OCM in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

10. **CHECKING STORED OR INTERMITTENT CODES**

NOTE: **Diagnose and repair all active codes before diagnosing stored codes. Refer to DIAGNOSTIC CODE INDEX for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Perform ***OCM SYSTEM VERIFICATION TEST** . Erase all codes before returning vehicle to customer.

B1B7A-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT HIGH

CIRCUIT SCHEMATIC

**SENSOR-
SEAT
WEIGHT-
LEFT
FRONT**

**MODULE-
OCCUPANT
CLASSIFICATION C2
(EXCEPT EXPORT)**

01025101

Fig. 12: Passenger Seat Weight Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

While the CAN bus ignition status is in IGN_RUN, the module checks the sensor input ranges.

SET CONDITIONS

- **Set Condition:**

If the module detects that the sensor input is greater than $96 \pm 0.6\%$ of the (R701) Seat Weight Sensor 5 Volt circuit voltage. Note that this DTC will remain active after the condition that set this fault is no longer present. Performing the Occupant Classification Module System Verification Test will change the status from active to stored if the condition that set the fault is no longer present.

POSSIBLE CAUSES

Possible Causes
PASSENGER SEAT HARNESS IMPROPERLY ROUTED PASSENGER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED (R717) LT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE (R717) LT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT SHORTED TO (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT (R728) SEAT WEIGHT SENSOR GROUND CIRCUIT OPEN LEFT-FRONT SEAT WEIGHT SENSOR OCCUPANT CLASSIFICATION MODULE (OCM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, & BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)**

NOTE: **Ensure that the battery is fully charged.**

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

Yes

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of

symptoms.

No

Go To 2.

2. PREFORM OCM VERIFICATION

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the *OCM SYSTEM VERIFICATION TEST Occupant Classification Module System Verification Test to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

Does the scan tool display active: B1B7A-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT HIGH?

Yes

Go To 3.

No

Go To 9.

3. VERIFY SENSOR TORQUE

Verify that all of the Seat Weight Sensor mounting screws are tightened to torque specification. Refer to SEAT WEIGHT SENSOR for specification.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the *OCM SYSTEM VERIFICATION TEST to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

Does the scan tool display active: B1B7A-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT HIGH?

Yes

Go To 4.

No

Go To 9.

4. INSPECT PASSENGER SEAT HARNESS WIRES AND CONNECTORS

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram / schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Are any of these conditions present?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.
Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Go To 5.

5. VERIFY THAT PASSENGER SEAT HARNESS IS ROUTED CORRECTLY

Verify that the Passenger Seat Harness is routed correctly.

Is the Passenger Seat Harness routed correctly?

Yes

Go To 6.

No

Reroute the Passenger Seat Harness as necessary.

Perform ***OCM SYSTEM VERIFICATION TEST** .

6. **CHECK (R717) LT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

81825823

Fig. 13: Measuring Voltage Of (R717) Left-Front Seat Weight Sensor Signal Circuit
Courtesy of CHRYSLER LLC

Disconnect the OCM C2 connector.

Measure the voltage of the (R717) LT-FT Seat Weight Sensor Signal circuit.

NOTE: **Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Is the voltage above 0.2 volt?

Yes

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Go To 7.

7. **CHECK (R717) LT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT**

Fig. 14: Measuring Resistance Between (R717) LT-FT Seat Weight Sensor Signal Circuit And (R701) Seat Weight Sensor 5 Volt Circuit
Courtesy of CHRYSLER LLC

Disconnect the Left-Front Seat Weight Sensor connector.

Measure the resistance between the (R717) LT-FT Seat Weight Sensor Signal circuit and the (R701) Seat Weight Sensor 5 Volt circuit.

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Is the resistance below 5.0 ohms?

Yes

Replace the Passenger Seat Harness in accordance with the Service Information.
Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Go To 8.

8. **CHECK (R728) SEAT WEIGHT SENSOR GROUND CIRCUIT FOR AN OPEN**

81825918

Fig. 15: Measuring Resistance Of (R728) Seat Weight Sensor Ground Circuit Between OCM C2 Connector And Left-Front Seat Weight Sensor Connector
 Courtesy of CHRYSLER LLC

Measure the resistance of the (R728) Seat Weight Sensor Ground circuit between the OCM C2 connector and the Left-Front Seat Weight Sensor connector.

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Is the resistance below 5.0 ohms?

Yes

Replace the OCM in accordance with the Service Information.
 Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

9. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of airbag system diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Perform ***OCM SYSTEM VERIFICATION TEST** . Erase all codes before returning vehicle to customer.

MONITOR CONDITIONS

When Monitored:

When CAN ignitions status is Run or SNA, during auto zero and while performing the Occupant Classification Module System Verification Test.

SET CONDITIONS

- **Set Condition:**

During the occupant classification module system verification test: if the module detects that the sensor input is less than 1.4 volts or greater than 3.6 volts. During auto zero: if the module detects that the sensor input is less than 1 volt or greater than 4 volts.

POSSIBLE CAUSES

Possible Causes
PASSENGER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED RIGHT-FRONT PASSENGER SEAT WEIGHT SENSOR DAMAGE TO THE PASSENGER SEAT STRUCTURE, RISER ASSEMBLY, CROSSMEMBERS, SEAT TRACKS, FLOOR PAN OCCUPANT CLASSIFICATION MODULE (OCM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)**

NOTE: **Ensure that the battery is fully charged.**

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

Yes

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 2.

2. **VERIFY THAT DTC B1B7D-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT PERFORMANCE IS ACTIVE**

With the scan tool, read OCM DTCs.

Does the scan tool display active: B1B7D-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT PERFORMANCE?

Yes

Go To 3.

No

Go To 6.

3. **INSPECT PASSENGER SEAT HARNESS WIRES AND CONNECTORS**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram / schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Are any of these conditions present?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Go To 4.

4. **PERFORM THE OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST**

NOTE: Ensure that the battery is fully charged.

NOTE: The Occupant Classification Seat Weights 9077 are required to perform this test.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the *OCM SYSTEM VERIFICATION TEST to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR DTCs?

Yes

Go To 5.

No

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1 .

5. PERFORM OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Verify that all of the Seat Weight Sensor mounting screws are tightened to specification. Refer to SEAT WEIGHT SENSOR for specification.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all

tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the ***OCM SYSTEM VERIFICATION TEST** to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR PERFORMANCE DTCs?

Yes

Perform the ***DIAGNOSIS AND CHECKOUT PROCEDURE FOR SEAT WEIGHT SENSORS**.

No

But Other DTCs Present

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

No Active DTCs Present

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

6. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of airbag system diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Perform ***OCM SYSTEM VERIFICATION TEST** . Erase all codes before returning vehicle to customer.

B1B7E-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT LOW

CIRCUIT SCHEMATIC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

While the CAN bus ignition status is in IGN_RUN, the module checks the sensor input ranges.

SET CONDITIONS

• Set Condition:

If the module detects that the sensor input is less than $3.4 \pm 0.6\%$ of the (R701) Seat Weight Sensor 5 Volt circuit voltage. This DTC will also set if the (R701) Seat Weight Sensor 5 Volt circuit is shorted to ground. However, this condition would prevent communication with the OCM and cause a Lost Communication With OCM DTC to set in other modules. Also, this DTC will remain active after the condition that set this fault is no longer present. This condition is referred to as latching the DTC for the ignition cycle. Cycling the ignition key will change the status from active to stored if the condition that set the fault is no longer present.

POSSIBLE CAUSES

Possible Causes
ACTIVE B1B7E DTC AND B1B7F DTC AT THE SAME TIME
PASSENGER SEAT HARNESS IMPROPERLY ROUTED
PASSENGER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN
PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED
(R718) RT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(R718) RT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT OPEN
(R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT OPEN
RIGHT-FRONT SEAT WEIGHT SENSOR
OCCUPANT CLASSIFICATION MODULE (OCM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)**

NOTE: **Ensure that the battery is fully charged.**

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

Yes

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 2.

2. VERIFY THAT DTC B1B7E-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT LOW IS ACTIVE

With the scan tool, read OCM DTCs.

Does the scan tool display active: B1B7E-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT LOW?

Yes

Go To 3.

No

Go To 10.

3. VERIFY THAT DTC B1B7F-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT HIGH AND B1B7E-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT LOW ARE BOTH ACTIVE

With the scan tool, read OCM DTCs.

Does the scan tool display active: B1B7F-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT HIGH?

Yes

Perform **B1B7F-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT HIGH** diagnostic test.

No

Go To 4.

4. INSPECT PASSENGER SEAT HARNESS WIRES AND CONNECTORS

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram / schematic as a guide, inspect the Passenger Seat Harness wiring and

connectors. Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Are any of these conditions present?

Yes

NOTE: **Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Go To 5.

5. VERIFY THAT PASSENGER SEAT HARNESS IS ROUTED CORRECTLY

Verify that the Passenger Seat Harness is routed correctly.

Is the Passenger Seat Harness routed correctly?

Yes

Go To 6.

No

Reroute the Passenger Seat Harness as necessary.

Perform ***OCM SYSTEM VERIFICATION TEST** .

6. CHECK VOLTAGE OF (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT

81825930

Fig. 18: Measuring Voltage Of (R701) Seat Weight Sensor 5 Volt Circuit
Courtesy of CHRYSLER LLC

Disconnect the Right-Front Seat Weight Sensor connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R701) Seat Weight Sensor 5 Volt circuit.

Is the voltage above 4.8 volts?

Yes

Go To 7.

No

Go To 9.

7. **CHECK (R718) RT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

81825934

Fig. 19: Measuring Resistance Of (R718) RT-FT Seat Weight Sensor Signal Circuit Between OCM C2 Connector Cavity 5 And Ground
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the OCM C2 connector.

Measure the resistance of the (R718) RT-FT Seat Weight Sensor Signal circuit between the OCM C2 connector cavity 5 and ground.

Is the resistance below 5.0 ohms?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Go To 8.

8. CHECK (R718) RT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR AN OPEN

Courtesy of CHRYSLER LLC

Measure the resistance of the (R718) RT-FT Seat Weight Sensor Signal circuit between the OCM C2 connector cavity 5 and the Right-Front Seat Weight Sensor connector cavity 2.

Is the resistance below 5.0 ohms?

Yes

Replace the Right-Front Seat Weight Sensor in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

If DTC B1B7E-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT LOW returns active, replace the OCM in accordance with the Service Information.

No

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

9. **CHECK (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT FOR AN OPEN**

81825940

Fig. 21: Measuring Resistance Of (R701) Seat Weight Sensor 5 Volt Circuit Between OCM C2 Connector Cavity 1 And Right-Front Seat Weight Sensor Connector Cavity 3
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the OCM C2 connector.

Measure the resistance of the (R701) Seat Weight Sensor 5 Volt circuit between the OCM C2 connector cavity 1 and the Right-Front Seat Weight Sensor connector cavity 3.

Is the resistance below 5.0 ohms?

Yes

Replace the OCM in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

NOTE: **Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

10. **CHECKING STORED OR INTERMITTENT CODES**

NOTE: **Diagnose and repair all active codes before diagnosing stored codes. Refer to DIAGNOSTIC CODE INDEX for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: **To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chaffed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: **To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Perform ***OCM SYSTEM VERIFICATION TEST** . Erase all codes before returning vehicle to customer.

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

While the CAN bus ignition status is in IGN_RUN, the module checks the sensor input ranges.

SET CONDITIONS

• Set Condition:

If the module detects that the sensor input is greater than $96 \pm 0.6\%$ of the (R701) Seat Weight Sensor 5 Volt circuit voltage. Note that this DTC will remain active after the condition that set this fault is no longer present. Performing the Occupant Classification Module System Verification Test will change the status from active to stored if the condition that set the fault is no longer present.

POSSIBLE CAUSES

Possible Causes
PASSENGER SEAT HARNESS IMPROPERLY ROUTED
PASSENGER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN
PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED
(R718) RT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R718) RT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT SHORTED TO (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT
(R728) SEAT WEIGHT SENSOR GROUND CIRCUIT OPEN
RIGHT-FRONT SEAT WEIGHT SENSOR
OCCUPANT CLASSIFICATION MODULE (OCM)

DIAGNOSTIC TEST

- CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)

NOTE: Ensure that the battery is fully charged.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTC.

Does the scan tool display any active DTC relating to internal faults, ignition faults, or battery faults?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of

symptoms.

No

Go To 2.

2. VERIFY OCM

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the *OCM SYSTEM VERIFICATION TEST to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTC.

Does the scan tool display active: B1B7F-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT HIGH?

Yes

Go To 3.

No

Go To 9.

3. VERIFY SENSOR TORQUE

Verify that all of the Seat Weight Sensor mounting screws are tightened to specification. Refer SEAT WEIGHT SENSOR .

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the *OCM SYSTEM VERIFICATION TEST to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTC.

Does the scan tool display active: B1B7F-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT HIGH?

Yes

Go To 4.

No

Go To 9.

4. INSPECT PASSENGER SEAT HARNESS WIRES AND CONNECTORS

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram / schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Are any of these conditions present?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.
Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Go To 5.

5. VERIFY THAT PASSENGER SEAT HARNESS IS ROUTED CORRECTLY

Verify that the Passenger Seat Harness is routed correctly.

Is the Passenger Seat Harness routed correctly?

Yes

Go To 6.

No

Reroute the Passenger Seat Harness as necessary.

Perform ***OCM SYSTEM VERIFICATION TEST** .

6. **CHECK (R718) RT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

819e6447

Fig. 23: Measuring Voltage Of The (R718) Right-Front Seat Weight Sensor Signal Circuit
Courtesy of CHRYSLER LLC

Disconnect the OCM C2 connector.

Measure the voltage of the (R718) RT-FT Seat Weight Sensor Signal circuit.

Is the voltage above 0.2 volt?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Go To 7.

7. **CHECK (R718) RT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT**

81825959

Fig. 24: Measuring Resistance Between (R718) Right-Front Seat Weight Sensor Signal Circuit And (R701) Seat Weight Sensor 5-Volt Circuit
Courtesy of CHRYSLER LLC

Disconnect the Right-Front Seat Weight Sensor connector.

Measure the resistance between the (R718) RT-FT Seat Weight Sensor Signal circuit and the (R701) Seat Weight Sensor 5 Volt circuit.

Is the resistance below 5.0 ohms?

Yes

NOTE: **Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Go To 8.

8. **CHECK (R728) SEAT WEIGHT SENSOR GROUND CIRCUIT FOR AN OPEN**

8182595d

Fig. 25: Measuring Resistance Of (R728) Seat Weight Sensor Ground Circuit Between OCM C2 Connector And Right-Front Seat Weight Sensor Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (R728) Seat Weight Sensor Ground circuit between the OCM C2 connector and the Right-Front Seat Weight Sensor connector.

Is the resistance below 5.0 ohms?

Yes

Replace the OCM in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

9. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of airbag system diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTC.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTC present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Perform ***OCM SYSTEM VERIFICATION TEST** . Erase all codes before returning vehicle to customer.

2. VERIFY THAT DTC B1B83-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT LOW IS ACTIVE

With the scan tool, read OCM DTCs.

Does the scan tool display active: B1B83-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT LOW?

Yes

Go To 3.

No

Go To 10.

3. VERIFY THAT B1B83-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT LOW DTC AND B1B84-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT HIGH DTC ARE ACTIVE AT THE SAME TIME

With the scan tool, read OCM DTCs.

Does the scan tool display active: B1B83-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT LOW AND B1B84-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT HIGH AT THE SAME TIME?

Yes

Perform **B1B84-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT HIGH** diagnostic test.

Perform ***OCM SYSTEM VERIFICATION TEST** .

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 4.

4. INSPECT PASSENGER SEAT HARNESS WIRES AND CONNECTORS

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram / schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Are any of these conditions present?

Yes

NOTE: **Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 5.

5. VERIFY THAT PASSENGER SEAT HARNESS IS ROUTED CORRECTLY

Verify that the Passenger Seat Harness is routed correctly.

Is the Passenger Seat Harness routed correctly?

Yes

Go To 6.

No

Reroute the Passenger Seat Harness as necessary.

Perform ***OCM SYSTEM VERIFICATION TEST** .

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

6. CHECK VOLTAGE OF (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT

81825982

Fig. 28: Measuring Voltage Of (R701) Seat Weight Sensor 5 Volt Circuit
Courtesy of CHRYSLER LLC

Disconnect the Left-Rear Seat Weight Sensor connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R701) Seat Weight Sensor 5 Volt circuit.

Is the voltage above 4.8 volts?

Yes

Go To 7.

No

Go To 9.

7. **CHECK (R705) LT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

81825989

Fig. 29: Measuring Resistance Of (R705) LT-RR Seat Weight Sensor Signal Circuit Between Ground And OCM C2 Connector
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the OCM C2 connector.

Measure the resistance of the (R705) LT-RR Seat Weight Sensor Signal circuit between ground and the OCM C2 connector.

Is the resistance below 5.0 ohms?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 8.

8. CHECK (R705) LT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR AN OPEN

8182598d

Fig. 30: Measuring Resistance Of (R705) LT-RR Seat Weight Sensor Signal Circuit Between OCM C2 Connector And Left-Rear Seat Weight Sensor Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (R705) LT-RR Seat Weight Sensor Signal circuit between the OCM C2 connector and the Left-Rear Seat Weight Sensor connector.

Is the resistance below 5.0 ohms?

Yes

Replace the Left-Rear Seat Weight Sensor in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** . If DTC B1B83-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT LOW returns active, replace the OCM in accordance with the Service Information.

No

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the

condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

9. CHECK (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT FOR AN OPEN

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the OCM C2 connector.

Measure the resistance of the (R701) Seat Weight Sensor 5 Volt circuit between the OCM C2 connector and the Left-Rear Seat Weight Sensor connector.

Is the resistance below 5.0 ohms?

Yes

Replace the OCM in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

10. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to DIAGNOSTIC CODE INDEX for a complete list of airbag system diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram / schematic as a guide, inspect the related wiring and connectors for chafed,

pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Perform ***OCM SYSTEM VERIFICATION TEST** . Erase all codes before returning vehicle to customer.

CIRCUIT SCHEMATIC

**SENSOR-
SEAT
WEIGHT-
LEFT
REAR**

**MODULE-
OCCUPANT
CLASSIFICATION C2
(EXCEPT EXPORT)**

910350a

Fig. 31: Passenger Seat Weight Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

While the CAN bus ignition status is in IGN_RUN, the module checks the sensor input ranges.

SET CONDITIONS

• Set Condition:

If the module detects that the sensor input is greater than $96 \pm 0.6\%$ of the (R701) Seat Weight Sensor 5 Volt circuit voltage. Note that this DTC will remain active after the condition that set this fault is no longer present. Performing the Occupant Classification Module System Verification Test will change the status from active to stored if the condition that set the fault is no longer present.

POSSIBLE CAUSES

Possible Causes
PASSENGER SEAT HARNESS IMPROPERLY ROUTED
PASSENGER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN
PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED
(R705) LT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R705) LT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT SHORTED TO (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT
(R728) SEAT WEIGHT SENSOR GROUND CIRCUIT OPEN
LEFT-REAR SEAT WEIGHT SENSOR
OCCUPANT CLASSIFICATION MODULE (OCM)

DIAGNOSTIC TEST

1. CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)

NOTE: Ensure that the battery is fully charged.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTC.

Does the scan tool display any active DTC relating to internal faults, ignition faults, or battery faults?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of

symptoms.

No

Go To 2.

2. VERIFY THAT DTC B1B84-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT HIGH IS ACTIVE

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the *OCM SYSTEM VERIFICATION TEST to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTC.

Does the scan tool display active: B1B84-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT HIGH?

Yes

Go To 3.

No

Go To 9.

3. VERIFY THAT DTC B1B84-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT HIGH IS ACTIVE

Verify that all of the Seat Weight Sensor mounting screws are tightened to torque specification. Refer to SEAT WEIGHT SENSOR for specification.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the *OCM SYSTEM VERIFICATION

TEST to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTC.

Does the scan tool display active: B1B84-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT HIGH?

Yes

Go To 4.

No

Go To 9.

4. INSPECT PASSENGER SEAT HARNESS WIRES AND CONNECTORS

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram / schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Are any of these conditions present?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Go To 5.

5. VERIFY THAT PASSENGER SEAT HARNESS IS ROUTED CORRECTLY

Verify that the Passenger Seat Harness is routed correctly.

Is the Passenger Seat Harness routed correctly?

Yes

Go To 6.

No

Reroute the Passenger Seat Harness as necessary.

Perform ***OCM SYSTEM VERIFICATION TEST** .

6. **CHECK (R705) LT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

818259ae

Fig. 32: Measuring Voltage Of (R705) Left-Rear Seat Weight Sensor Signal Circuit
Courtesy of CHRYSLER LLC

Disconnect the OCM C2 connector.

Measure the voltage of the (R705) LT-RR Seat Weight Sensor Signal circuit.

Is the voltage above 0.2 volt?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Go To 7.

7. **CHECK (R705) LT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT**

818259b5

Fig. 33: Measuring Resistance Between (R705) LT-RR Seat Weight Sensor Signal Circuit And (R701) Seat Weight Sensor 5 Volt Circuit

Courtesy of CHRYSLER LLC

Disconnect the Left-Rear Seat Weight Sensor connector.

Measure the resistance between the (R705) LT-RR Seat Weight Sensor Signal circuit and the (R701) Seat Weight Sensor 5 Volt circuit.

Is the resistance below 5.0 ohms?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Go To 8.

8. **CHECK (R728) SEAT WEIGHT SENSOR GROUND CIRCUIT FOR AN OPEN**

819f250c

Fig. 34: Measuring Resistance Of (R728) Seat Weight Sensor Ground Circuit Between OCM C2 Connector And Left-Rear Seat Weight Sensor Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (R728) Seat Weight Sensor Ground circuit between the OCM C2 connector and the Left-Rear Seat Weight Sensor connector.

Is the resistance below 5.0 ohms?

Yes

Replace the OCM in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

9. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of airbag system diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTC.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram / schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTC present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Perform ***OCM SYSTEM VERIFICATION TEST** . Erase all codes before returning vehicle to customer.

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

When CAN ignitions status is Run or SNA, during auto zero and while performing the Occupant Classification Module System Verification Test.

SET CONDITIONS

- **Set Condition:**

During the occupant classification module system verification test: if the module detects that the sensor input is less than 1.4 volts or greater than 3.6 volts. During auto zero: if the module detects that the sensor input is less than 1 volt or greater than 4 volts.

POSSIBLE CAUSES

Possible Causes
PASSENGER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED RIGHT-REAR PASSENGER SEAT WEIGHT SENSOR DAMAGE TO THE PASSENGER SEAT STRUCTURE, RISER ASSEMBLY, CROSSMEMBERS, SEAT TRACKS, FLOOR PAN OCCUPANT CLASSIFICATION MODULE (OCM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)**

NOTE: **Ensure that the battery is fully charged.**

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

Yes

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 2.

2. **VERIFY THAT DTC B1B87-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR PERFORMANCE IS ACTIVE**

With the scan tool, read OCM DTCs.

Does the scan tool display active: B1B87-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR PERFORMANCE?

Yes

Go To 3.

No

Go To 6.

3. **INSPECT PASSENGER SEAT HARNESS WIRES AND CONNECTORS**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram / schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Are any of these conditions present?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.
Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Go To 4.

4. **PERFORM THE OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST**

NOTE: Ensure that the battery is fully charged.

NOTE: The Occupant Classification Seat Weights 9077 are required to perform this test.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the *OCM SYSTEM VERIFICATION TEST to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR DTCs?

Yes

Go To 5.

No

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1 .

5. **PERFORM OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Verify that all of the Seat Weight Sensor mounting screws are tightened to specification. Refer to SEAT WEIGHT SENSOR for specification.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all

tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the ***OCM SYSTEM VERIFICATION TEST** to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

Does the scan tool display any active: PASSENGER SEAT WEIGHT SENSOR PERFORMANCE DTCs?

Yes

Perform the ***DIAGNOSIS AND CHECKOUT PROCEDURE FOR SEAT WEIGHT SENSORS**.

No

But Other DTCs Present

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

No Active DTCs Present

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

6. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of airbag system diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Perform ***OCM SYSTEM VERIFICATION TEST** . Erase all codes before returning vehicle to customer.

OCCUPANT
CLASSIFICATION C2
(EXCEPT EXPORT)**

010355a2

Fig. 36: Passenger Seat Weight Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

While the CAN bus ignition status is in IGN_RUN, the module checks the sensor input ranges.

SET CONDITIONS

• Set Condition:

If the module detects that the sensor input is less than $3.4 \pm 0.6\%$ of the (R701) Seat Weight Sensor 5 Volt circuit voltage. This DTC will also set if the (R701) Seat Weight Sensor 5 Volt circuit is shorted to ground. However, this condition would prevent communication with the OCM and cause a Lost Communication With OCM DTC to set in other modules. Also, this DTC will remain active after the condition that set this fault is no longer present. This condition is referred to as latching the DTC for the ignition cycle. Cycling the ignition key will change the status from active to stored if the condition that set the fault is no longer present.

POSSIBLE CAUSES

Possible Causes
ACTIVE B1B88 DTC AND B1B89 DTC AT THE SAME TIME
PASSENGER SEAT HARNESS IMPROPERLY ROUTED
PASSENGER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN
PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED

(R706) RT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT OPEN
(R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT OPEN
RIGHT-REAR SEAT WEIGHT SENSOR
OCCUPANT CLASSIFICATION MODULE (OCM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)**

NOTE: **Ensure that the battery is fully charged.**

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

Yes

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 2.

2. VERIFY THAT DTC B1B88-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT LOW IS ACTIVE

With the scan tool, read OCM DTCs.

Does the scan tool display active: B1B88-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT LOW?

Yes

Go To 3.

No

Go To 10.

3. VERIFY THAT DTC B1B88-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT LOW AND B1B89-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT HIGH ARE ACTIVE AT THE SAME TIME

With the scan tool, read OCM DTCs.

Does the scan tool display active: B1B88-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT LOW DTC AND B1B89-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT HIGH DTC AT THE SAME TIME?

Yes

Perform **B1B89-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT HIGH** diagnostic test.

No

Go To 4.

4. INSPECT PASSENGER SEAT HARNESS WIRES AND CONNECTORS

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram / schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Are any of these conditions present?

Yes

NOTE: **Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 5.

5. VERIFY THAT PASSENGER SEAT HARNESS IS ROUTED CORRECTLY

Verify that the Passenger Seat Harness is routed correctly.

Is the Passenger Seat Harness routed correctly?

Yes

Go To 6.

No

Reroute the Passenger Seat Harness as necessary.

Perform ***OCM SYSTEM VERIFICATION TEST** .

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

6. CHECK VOLTAGE OF (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT

81825998

Fig. 37: Measuring Voltage Of (R701) Seat Weight Sensor 5 Volt Circuit
Courtesy of CHRYSLER LLC

Disconnect the Right-Rear Seat Weight Sensor connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R701) Seat Weight Sensor 5 Volt circuit.

Is the voltage above 4.8 volts?

Yes

Go To 7.

No

Go To 9.

7. **CHECK (R706) RT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

8182599e

Fig. 38: Measuring Resistance Of (R706) RT-RR Seat Weight Sensor Signal Circuit Between Ground And OCM C2 Connector
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the OCM C2 connector.

Measure the resistance of the (R706) RT-RR Seat Weight Sensor Signal circuit between ground and the OCM C2 connector.

Is the resistance below 5.0 ohms?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 8.

8. CHECK (R706) RT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR AN OPEN

818259b9

Fig. 39: Measuring Resistance Of (R706) RT-RR Seat Weight Sensor Signal Circuit Between OCM C2 Connector And Right-Rear Seat Weight Sensor Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (R706) RT-RR Seat Weight Sensor Signal circuit between the OCM C2 connector and the Right-Rear Seat Weight Sensor connector.

Is the resistance below 5.0 ohms?

Yes

Replace the Right-Rear Seat Weight Sensor in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** . If DTC B1B88-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT LOW returns active, replace the OCM in accordance with the Service Information.

No

NOTE: **Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

9. CHECK (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT FOR AN OPEN

818259bd

Fig. 40: Measuring Resistance Of (R701) Seat Weight Sensor 5 Volt Circuit Between OCM C2 Connector And Right-Rear Seat Weight Sensor Connector
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the OCM C2 connector.

Measure the resistance of the (R701) Seat Weight Sensor 5 Volt circuit between the OCM C2 connector and the Right-Rear Seat Weight Sensor connector.

Is the resistance below 5.0 ohms?

Yes

Replace the OCM in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

10. CHECKING STORED OR INTERMITTENT CODES

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram / schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Perform ***OCM SYSTEM VERIFICATION TEST** . Erase all codes before returning vehicle to customer.

CIRCUIT HIGH

CIRCUIT SCHEMATIC

Fig. 41: Passenger Seat Weight Sensor Circuit Schematic

Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

While the CAN bus ignition status is in IGN_RUN, the module checks the sensor input ranges.

SET CONDITIONS

- Set Condition:**

If the module detects that the sensor input is greater than $96 \pm 0.6\%$ of the (R701) Seat Weight Sensor 5 Volt circuit voltage. Note that this DTC will remain active after the condition that set this fault is no longer present. Performing the Occupant Classification Module System Verification Test will change the status from active to stored if the condition that set the fault is no longer present.

POSSIBLE CAUSES

Possible Causes
PASSENGER SEAT HARNESS IMPROPERLY ROUTED
PASSENGER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN
PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED
(R706) RT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R706) RT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT SHORTED TO (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT
(R728) SEAT WEIGHT SENSOR GROUND CIRCUIT OPEN
RIGHT-REAR SEAT WEIGHT SENSOR
OCCUPANT CLASSIFICATION MODULE (OCM)

DIAGNOSTIC TEST

- CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)**

NOTE: **Ensure that the battery is fully charged.**

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

Yes

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 2.

2. PERFORM THE OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST

NOTE: Ensure that the battery is fully charged.

NOTE: The Occupant Classification Seat Weights 9077 are required to perform this test.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the ***OCM SYSTEM VERIFICATION TEST** to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR DTCs?

Yes

Go To 3.

No

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

3. **VERIFY THAT DTC B1B89-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT HIGH IS ACTIVE**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Verify that all of the Seat Weight Sensor mounting screws are tightened to specification. Refer to **SEAT WEIGHT SENSOR** for specification.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the ***OCM SYSTEM VERIFICATION TEST** to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

Does the scan tool display active: B1B89-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT HIGH?

Yes

Go To 4.

No

Go To 9.

4. **INSPECT PASSENGER SEAT HARNESS WIRES AND CONNECTORS**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram / schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Are any of these conditions present?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.
Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Go To 5.

5. VERIFY THAT PASSENGER SEAT HARNESS IS ROUTED CORRECTLY

Verify that the Passenger Seat Harness is routed correctly.

Is the Passenger Seat Harness routed correctly?

Yes

Go To 6.

No

Reroute the Passenger Seat Harness as necessary.

Perform ***OCM SYSTEM VERIFICATION TEST** .

6. CHECK (R706) RT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

818259c2

Fig. 42: Measuring Voltage Of (R706) RT-RR Seat Weight Sensor Signal Circuit

Courtesy of CHRYSLER LLC

Disconnect the OCM C2 connectors.

Measure the voltage of the (R706) RT-RR Seat Weight Sensor Signal circuit.

Is the voltage above 0.2 volt?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Go To 7.

7. CHECK (R706) RT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT

Disconnect the Right-Rear Seat Weight Sensor connector.

Measure the resistance between the (R706) RT-RR Seat Weight Sensor Signal circuit and the (R701) Seat Weight Sensor 5 Volt circuit.

Is the resistance below 5.0 ohms?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Go To 8.

8. CHECK (R728) SEAT WEIGHT SENSOR GROUND CIRCUIT FOR AN OPEN

Measure the resistance of the (R728) Seat Weight Sensor Ground circuit between the OCM C2 connector and the Right-Rear Seat Weight Sensor connector.

Is the resistance below 5.0 ohms?

Yes

Replace the OCM in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

NOTE: **Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

9. CHECKING STORED OR INTERMITTENT CODES

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chaffed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Perform ***OCM SYSTEM VERIFICATION TEST** . Erase all codes before returning vehicle to customer.

B1B8D-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT LOW

CIRCUIT SCHEMATIC

Fig. 43: Driver Seat Track Position Sensor Circuit Schematic
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

While the CAN bus ignition status is in IGN_RUN and the module is configured for a Driver Seat Track Position Sensor, the module checks the sensor input current ranges.

SET CONDITIONS

- **Set Condition:**

If the module detects that the sensor input is less than or equal to 0.3 ma. This DTC may set when the current is between 0.3 mA and 2.0 mA.

POSSIBLE CAUSES

Possible Causes
DRIVER SEAT HARNESS IMPROPERLY ROUTED
DRIVER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN
DRIVER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT, PUSHED OUT, SPREAD, CORRODED, CONTAMINATED
(R261) DRIVER SEAT POSITION SENSOR DATA CIRCUIT SHORTED TO GROUND
(R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT SHORTED TO GROUND
(R261) DRIVER SEAT POSITION SENSOR DATA CIRCUIT OPEN
(R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT OPEN
DRIVER SEAT TRACK POSITION SENSOR
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. IDENTIFYING VEHICLE EQUIPMENT

NOTE: **Ensure the battery is fully charged.**

Turn the ignition on.

With the scan tool, read ORC active DTCs.

Does the scan tool display active DTC: B1B8D-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT LOW?

Yes

Go To 2.

No

Go To 7.

2. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT RESTRAINT CONTROLLER (ORC)**

With the scan tool, read Occupant restraint Controller (ORC) DTCs.

Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

Yes

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 3.

3. **INSPECT DRIVER SEAT HARNESS WIRES AND CONNECTORS**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the driver seat harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Are any of these conditions present?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the driver seat harness in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 4.

4. **VERIFY THAT DRIVER SEAT HARNESS IS ROUTED CORRECTLY**

Verify that the driver seat harness is routed correctly.

Is the Driver Seat Harness routed correctly?

Yes

Go To 5.

No

Reroute the driver seat harness as necessary.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

5. **CHECK (R261) DRIVER SEAT POSITION SENSOR DATA CIRCUIT AND (R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT FOR A SHORT TO GROUND**

819f5b13

Fig. 44: Measuring Resistance Between Ground And (R261/263) Driver Seat Position Sensor Data Circuit Cavity 1/2

Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the ORC connectors.

Connect the 8443-32-R ORC Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the resistance between ground and the (R261) Driver Seat Position Sensor Data circuit cavity 1.

Measure the resistance between ground and the (R263) Driver Seat Position Sensor Voltage circuit cavity 2.

Is the resistance below 10k ohms on either circuit?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Driver Seat Harness in accordance with the service information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

No

Go To 6.

6. **CHECK (R261) DRIVER SEAT POSITION SENSOR DATA CIRCUIT AND (R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT FOR AN OPEN**

819f5c3c

Fig. 45: Measuring Resistance Of (R261) Driver Seat Position Sensor Data Circuit Between ORC-C2 Connector Cavity C2-24 And Driver Seat Track Position Sensor Connector Cavity 1
Courtesy of CHRYSLER LLC

819f5c26

Fig. 46: Measuring Resistance Of (R263) Driver Seat Position Sensor Voltage Circuit Between ORC-C2 Connector Cavity C1-23 And Driver Seat Track Position Sensor Connector Cavity 2
Courtesy of CHRYSLER LLC

Measure the resistance of the (R261) Driver Seat Position Sensor Data circuit between the ORC-C2 connector cavity C2-24 and the Driver Seat Track Position Sensor connector cavity 1.

Measure the resistance of the (R263) Driver Seat Position Sensor Voltage circuit between the ORC-C2 connector cavity C1-23 and the Driver Seat Track Position Sensor connector cavity 2.

Is the resistance of either circuit above 5.0 ohms?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Driver Seat Harness in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Replace the Occupant Restraint Controller (ORC) in accordance with the service information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

7. TEST FOR AN INTERMITTENT CONDITION

With the scan tool, record and erase all DTC's from the OCM.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

WARNING: To avoid serious or fatal injury, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate symptom from Symptom List.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

B1B8E-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT HIGH CIRCUIT SCHEMATIC

0100003

Fig. 47: Driver Seat Track Position Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

While the CAN bus ignition status is in IGN_RUN and the module is configured for a Driver Seat Track Position Sensor, the module checks the sensor input current ranges.

SET CONDITIONS

- **Set Condition:**

If the module detects that the sensor input is greater than or equal to 20.5 mA. This DTC may set when the current is between 17 mA and 20.5 mA.

POSSIBLE CAUSES

Possible Causes
DRIVER SEAT HARNESS IMPROPERLY ROUTED
DRIVER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN
DRIVER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT, PUSHED OUT, SPREAD, CORRODED, CONTAMINATED
(R261) DRIVER SEAT POSITION SENSOR DATA CIRCUIT SHORTED TO VOLTAGE
(R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT SHORTED TO VOLTAGE
(R261) DRIVER SEAT POSITION SENSOR DATA CIRCUIT SHORTED TO (R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT
DRIVER SEAT TRACK POSITION SENSOR
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **IDENTIFYING VEHICLE EQUIPMENT**

NOTE: **Ensure the battery is fully charged.**

Turn the ignition on.

With the scan tool, read ORC active DTC.

Does the scan tool display active DTC: B1B8E-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT HIGH?

Yes

Go To 2.

No

Go To 8.

2. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT RESTRAINT CONTROLLER (ORC)**

With the scan tool, read Occupant Restraint Controller (ORC) DTC.

Does the scan tool display any active DTC relating to internal faults, ignition faults, or battery faults?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 3.

3. **INSPECT DRIVER SEAT HARNESS WIRES AND CONNECTORS**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the driver seat harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Are any of these conditions present?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the driver seat harness in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 4.

4. **VERIFY THAT DRIVER SEAT HARNESS IS ROUTED CORRECTLY**

Verify that the driver seat harness is routed correctly.

Is the Driver Seat Harness routed correctly?

Yes

Go To 5.

No

Reroute the driver seat harness as necessary.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

5. **CHECK FOR DTC B1B8E-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT HIGH WITH DRIVER SEAT TRACK POSITION SENSOR DISCONNECTED**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Driver Seat Track Position Sensor connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Wait two minutes, and then with the scan tool, read ORC DTC.

Does the scan tool display: B1B8E-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT HIGH?

Yes

Go To 6.

No

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the Driver Seat Track Position Sensor in accordance with the service information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

6. **CHECK (R261) DRIVE SEAT POSITION SENSOR DATA CIRCUIT AND (R263) DRIVE SEAT POSITION SENSOR VOLTAGE CIRCUIT FOR A SHORT TO VOLTAGE**

819f5d13

Fig. 48: Measuring Voltage Of (R261/263) Driver Seat Position Sensor Data/Voltage Circuit Between Driver Seat Track Position Sensor Connector And Ground
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the ORC connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R261) Driver Seat Position Sensor Data circuit at the Driver Seat Track Position Sensor connector cavity 1.

Measure the voltage of the (R263) Driver Seat Position Sensor Voltage circuit at the Driver Seat Track Position Sensor connector cavity 2.

Is the voltage above 0.2 volts on either circuit?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the Driver Seat Harness in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 7.

7. **CHECK (R261) DRIVER SEAT POSITION SENSOR DATA CIRCUIT FOR A SHORT TO (R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT**

819f5cf6

Fig. 49: Measuring Resistance Between (R261) Driver Seat Position Sensor Data Circuit And (R263) Driver Seat Position Sensor Voltage Circuit In Driver Seat Track Position Sensor Connector

Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Measure the resistance between the (R261) Driver Seat Position Sensor Data circuit cavity 1 and the (R263) Driver Seat Position Sensor Voltage circuit cavity 2 in the Driver Seat Track Position Sensor connector.

Is the resistance below 10k ohms?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Driver Seat Harness in accordance with the service information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Replace the ORC in accordance with the Service information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

8. **TEST FOR AN INTERMITTENT CONDITION**

With the scan tool, record and erase all DTC from the OCM.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

WARNING: To avoid serious or fatal injury, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTC present?

Yes

Select the appropriate symptom from Symptom List.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

B1B8F-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT OPEN

CIRCUIT SCHEMATIC

0100003

Fig. 50: Driver Seat Track Position Sensor Circuit Schematic
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

While the CAN bus ignition status is in IGN_RUN and the module is configured for a Seat Track Position Sensor, the module checks the sensor input current ranges.

SET CONDITIONS

- Set Condition:

This DTC may set when the module detects that the sensor input current is below 1 mA.

POSSIBLE CAUSES

Possible Causes
DRIVER SEAT HARNESS IMPROPERLY ROUTED
DRIVER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN
DRIVER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT, PUSHED OUT, SPREAD, CORRODED, CONTAMINATED
(R261) DRIVER SEAT POSITION SENSOR DATA CIRCUIT SHORTED TO VOLTAGE
(R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT SHORTED TO VOLTAGE
(R261) DRIVER SEAT POSITION SENSOR DATA CIRCUIT SHORTED TO (R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT
DRIVER SEAT TRACK POSITION SENSOR
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

- CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT RESTRAINT CONTROLLER (ORC)

With the scan tool, read Occupant Restraint Controller (ORC) DTC.

Does the scan tool display any active DTC relating to internal faults, ignition faults, or battery faults?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 2.

- VERIFY THAT DTC B1B8F-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT OPEN IS

ACTIVE

Does the scan tool display active: B1B8F-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT OPEN?

Yes

Go To 3.

No

Go To 8.

3. INSPECT DRIVER SEAT HARNESS WIRES AND CONNECTORS

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the Driver Seat Harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Are any of these conditions present?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if any of these conditions exist

Replace the Driver Seat Harness in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

No

Go To 4.

4. VERIFY THAT DRIVER SEAT HARNESS IS ROUTED CORRECTLY

Verify that the Driver Seat Harness is routed correctly.

Is the Driver Seat Harness routed correctly?

Yes

Go To 5.

No

Reroute the Driver Seat Harness as necessary.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

5. **CHECK FOR DTC B1B8F-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT OPEN WITH DRIVER SEAT TRACK POSITION SENSOR DISCONNECTED**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Driver Seat Track Position Sensor connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Wait two minutes, and then with the scan tool, read ORC DTC.

Does the scan tool display: B1B8F-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT OPEN?

Yes

Go To 6.

No

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the Driver Seat Track Position Sensor in accordance with the service information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

6. **CHECK (R261) DRIVER SEAT POSITION SENSOR DATA CIRCUIT AND (R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT FOR A SHORT TO VOLTAGE**

819f5d13

Fig. 51: Measuring Voltage Of (R261/263) Driver Seat Position Sensor Data/Voltage Circuit Between Driver Seat Track Position Sensor Connector And Ground
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the ORC connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R261) Driver Seat Position Sensor Data circuit between the Driver Seat Track Position Sensor connector and ground.

Measure the voltage of the (R263) Driver Seat Position Sensor Voltage circuit between the Driver Seat Track Position Sensor connector and ground.

Is the voltage above 0.2 volts on either circuit?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if any of these conditions exist

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the Driver Seat Harness in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 7.

7. **CHECK (R261) DRIVER SEAT POSITION SENSOR DATA CIRCUIT FOR A SHORT TO (R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT**

819f5cf6

Fig. 52: Measuring Resistance Between (R261) Driver Seat Position Sensor Data Circuit And (R263) Driver Seat Position Sensor Voltage Circuit In Driver Seat Track Position Sensor Connector

Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Measure the resistance between the (R261) Driver Seat Position Sensor Data circuit and the (R263) Driver Seat Position Sensor Voltage circuit in the Driver Seat Track Position Sensor connector.

Is the resistance below 10k ohms?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if any of these conditions exist

Replace the Driver Seat Harness in accordance with the service information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Replace the ORC in accordance with the Service information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

8. **TEST FOR AN INTERMITTENT CONDITION**

With the scan tool, record and erase all DTC from the ORC.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

WARNING: To avoid serious or fatal injury, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTC present?

Yes

Select the appropriate symptom from Symptom List.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

B1B93-PASSENGER SEAT TRACK POSITION SENSOR CIRCUIT LOW
CIRCUIT SCHEMATIC

01900005

Fig. 53: Passenger Seat Track Position Sensor Circuit Schematic
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

While the CAN bus ignition status is in IGN_RUN and the module is configured for a Passenger Seat Track Position Sensor, the module checks the sensor input current ranges.

SET CONDITIONS

- **Set Condition:**

If the module detects that the sensor input is less than or equal to 0.3 ma. This DTC may set when the current is between 0.3 mA and 2.0 mA.

POSSIBLE CAUSES

Possible Causes
PASSENGER SEAT HARNESS IMPROPERLY ROUTED PASSENGER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT, PUSHED OUT, SPREAD, CORRODED, CONTAMINATED (R262) PASSENGER SEAT POSITION SENSOR DATA CIRCUIT SHORTED TO GROUND (R264) PASSENGER SEAT POSITION SENSOR VOLTAGE CIRCUIT SHORTED TO GROUND (R262) PASSENGER SEAT POSITION SENSOR DATA CIRCUIT OPEN (R264) PASSENGER SEAT POSITION SENSOR VOLTAGE CIRCUIT OPEN PASSENGER SEAT TRACK POSITION SENSOR OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. IDENTIFYING VEHICLE EQUIPMENT

NOTE: **Ensure the battery is fully charged.**

Turn the ignition on.

With the scan tool, read ORC active DTCs.

Does the scan tool display active DTC: B1B93-PASSENGER SEAT TRACK POSITION SENSOR CIRCUIT LOW?

Yes

Go To 2.

No

Go To 7.

2. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT RESTRAINT CONTROLLER (ORC)**

With the scan tool, read Occupant restraint Controller (ORC) DTCs.

Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

Yes

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 3.

3. **INSPECT PASSENGER SEAT HARNESS WIRES AND CONNECTORS**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the passenger seat harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Are any of these conditions present?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the passenger seat harness in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 4.

4. **VERIFY THAT PASSENGER SEAT HARNESS IS ROUTED CORRECTLY**

Verify that the passenger seat harness is routed correctly.

Is the Passenger Seat Harness routed correctly?

Yes

Go To 5.

No

Reroute the passenger seat harness as necessary.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

5. **CHECK (R262) PASSENGER SEAT POSITION SENSOR DATA CIRCUIT AND (R264) PASSENGER SEAT POSITION SENSOR VOLTAGE CIRCUIT FOR A SHORT TO GROUND**

Fig. 54: Checking Seat Position Sensor Data-Passenger Circuit & Seat Position Sensor Voltage-Passenger Circuit For Short To Ground

Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the ORC connectors.

Install the 8443-32-R ORC Adapter to the ORC-C2

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the resistance between ground and the (R262) Passenger Seat Position Sensor Data circuit cavity 1.

Measure the resistance between ground and the (R264) Passenger Seat Position Sensor Voltage circuit

cavity 2.

Is the resistance below 10k ohms on either circuit?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the passenger seat harness in accordance with the service information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 6.

6. CHECK (R262) PASSENGER SEAT POSITION SENSOR DATA CIRCUIT AND (R264) PASSENGER SEAT POSITION SENSOR VOLTAGE CIRCUIT FOR AN OPEN

SENSOR-
SEAT TRACK
POSITION-
PASSENGER
(EXCEPT EXPORT)

C2-17

ORC ADAPTER
8443-32-L

Fig. 56: Measuring Resistance Of (R264) Passenger Seat Position Sensor Voltage Circuit Between 8443-32-R ORC Adapter Cavity C2-18 And Passenger Seat Track Position Sensor Connector

Cavity 2

Courtesy of CHRYSLER LLC

Measure the resistance of the (R262) Passenger Seat Position Sensor Data circuit between the 8443-32-R ORC Adapter cavity C2-17 and the Passenger Seat Track Position Sensor connector cavity 1.

Measure the resistance of the (R264) Passenger Seat Position Sensor Voltage circuit between the 8443-32-R ORC Adapter cavity C2-18 and the Passenger Seat Track Position Sensor connector cavity 2.

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Is the resistance of either circuit above 5.0 ohms?

Yes

Replace the passenger seat harness in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Replace the Occupant Restraint Controller (ORC) in accordance with the service information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

7. TEST FOR AN INTERMITTENT CONDITION

With the scan tool, record and erase all DTC's from the OCM.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

WARNING: To avoid serious or fatal injury, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate symptom from Symptom List.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

B1B94-PASSENGER SEAT TRACK POSITION SENSOR CIRCUIT HIGH CIRCUIT SCHEMATIC

01900005

Fig. 57: Passenger Seat Track Position Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

While the CAN bus ignition status is in IGN_RUN and the module is configured for a Passenger Seat Track Position Sensor, the module checks the sensor input current ranges.

SET CONDITIONS

- Set Condition:

If the module detects that the sensor input is greater than or equal to 20.5 mA. This DTC may set when the current is between 17 mA and 20.5 mA.

POSSIBLE CAUSES

Possible Causes
PASSENGER SEAT HARNESS IMPROPERLY ROUTED PASSENGER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT, PUSHED OUT, SPREAD, CORRODED, CONTAMINATED (R262) PASSENGER SEAT POSITION SENSOR DATA CIRCUIT SHORTED TO VOLTAGE (R264) PASSENGER SEAT POSITION SENSOR VOLTAGE CIRCUIT SHORTED TO VOLTAGE (R262) SEAT POSITION SENSOR DATA-PASSENGER CIRCUIT SHORTED TO (R264) SEAT POSITION SENSOR VOLTAGE-PASSENGER CIRCUIT PASSENGER SEAT TRACK POSITION SENSOR OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. IDENTIFYING VEHICLE EQUIPMENT

NOTE: **Ensure the battery is fully charged.**

Turn the ignition on.

With the scan tool, read ORC active DTCs.

Does the scan tool display active DTC: B1B94-PASSENGER SEAT TRACK POSITION SENSOR CIRCUIT HIGH?

Yes

Go To 2.

No

Go To 8.

2. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT RESTRAINT CONTROLLER (ORC)**

With the scan tool, read Occupant Restraint Controller (ORC) DTCs.

Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

Yes

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 3.

3. **INSPECT PASSENGER SEAT HARNESS WIRES AND CONNECTORS**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the passenger seat harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Are any of these conditions present?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the passenger seat harness in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 4.

4. **VERIFY THAT PASSENGER SEAT HARNESS IS ROUTED CORRECTLY**

Verify that the Passenger Seat Harness is routed correctly.

Is the Passenger Seat Harness routed correctly?

Yes

Go To 5.

No

Reroute the Passenger Seat Harness as necessary.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

5. **CHECK FOR DTC B1B94-PASSENGER SEAT TRACK POSITION SENSOR CIRCUIT HIGH WITH PASSENGER SEAT TRACK POSITION SENSOR DISCONNECTED**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Passenger Seat Track Position Sensor connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Wait two minutes, and then with the scan tool, read ORC DTCs.

Does the scan tool display: B1B94-PASSENGER SEAT TRACK POSITION SENSOR CIRCUIT HIGH?

Yes

Go To 6.

No

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the Passenger Seat Track Position Sensor in accordance with the service information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

6. **CHECK (R262) PASSENGER SEAT POSITION SENSOR DATA CIRCUIT AND (R264) PASSENGER SEAT POSITION SENSOR VOLTAGE CIRCUIT FOR A SHORT TO VOLTAGE**

81876d50

Fig. 58: Checking Passenger Seat Position Sensor Data Circuit & Passenger Seat Position Sensor Voltage Circuit For Short To Voltage
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the both ORC connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R262) Passenger Seat Position Sensor Data circuit at the Passenger Seat Track Position Sensor connector.

Measure the voltage of the (R263) Passenger Seat Position Sensor Voltage circuit at the Passenger Seat Track Position Sensor connector.

Is the voltage above 0.2 volts on either circuit?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 7.

7. **CHECK (R262) PASSENGER SEAT POSITION SENSOR DATA CIRCUIT FOR A SHORT TO (R264) PASSENGER SEAT POSITION SENSOR VOLTAGE CIRCUIT**

81876d62

Fig. 59: Checking Passenger Seat Position Sensor Data Circuit

Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Measure the resistance between the (R262) Passenger Seat Position Sensor Data circuit and the (R264) Passenger Seat Position Sensor Voltage circuit in the Passenger Seat Track Position Sensor connector.

Is the resistance below 10k ohms?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the passenger seat harness in accordance with the service information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Replace the ORC in accordance with the Service information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

8. TEST FOR AN INTERMITTENT CONDITION

With the scan tool, record and erase all DTC's from the OCM.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

WARNING: To avoid serious or fatal injury, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate symptom from Symptom List.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

B1B95-PASSENGER SEAT TRACK POSITION SENSOR CIRCUIT OPEN

CIRCUIT SCHEMATIC

Fig. 60: Passenger Seat Track Position Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

While the CAN bus ignition status is in IGN_RUN and the module is configured for a Seat Track Position Sensor, the module checks the sensor input current ranges.

SET CONDITIONS

- **Set Condition:**

This DTC may set when the module detects that the sensor input current is below 1 mA.

POSSIBLE CAUSES

Possible Causes
PASSENGER SEAT HARNESS IMPROPERLY ROUTED
PASSENGER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN
PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT, PUSHED OUT, SPREAD, CORRODED, CONTAMINATED
(R262) PASSENGER SEAT POSITION SENSOR DATA CIRCUIT SHORTED TO VOLTAGE
(R264) PASSENGER SEAT POSITION SENSOR VOLTAGE CIRCUIT SHORTED TO VOLTAGE
(R262) PASSENGER SEAT POSITION SENSOR DATA CIRCUIT SHORTED TO (R264) SEAT POSITION SENSOR VOLTAGE-PASSENGER CIRCUIT
PASSENGER SEAT TRACK POSITION SENSOR
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT RESTRAINT CONTROLLER (ORC)**

With the scan tool, read Occupant Restraint Controller (ORC) DTCs.

Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

Yes

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 2.

2. VERIFY THAT DTC B1B95-PASSENGER SEAT TRACK POSITION SENSOR CIRCUIT OPEN IS ACTIVE

Does the scan tool display active: B1B95-PASSENGER SEAT TRACK POSITION SENSOR CIRCUIT OPEN?

Yes

Go To 3.

No

Go To 8.

3. INSPECT PASSENGER SEAT HARNESS WIRES AND CONNECTORS

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Are any of these conditions present?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if any of these conditions exist

Replace the Passenger Seat Harness in accordance with the Service Information.
Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

No

Go To 4.

4. VERIFY THAT PASSENGER SEAT HARNESS IS ROUTED CORRECTLY

Verify that the Passenger Seat Harness is routed correctly.

Is the Passenger Seat Harness routed correctly?

Yes

Go To 5.

No

Reroute the Passenger Seat Harness as necessary.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

5. **CHECK FOR DTC B1B95-PASSENGER SEAT TRACK POSITION SENSOR CIRCUIT OPEN WITH PASSENGER SEAT TRACK POSITION SENSOR DISCONNECTED**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Passenger Seat Track Position Sensor connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Wait two minutes, and then with the scan tool, read ORC DTCs.

Does the scan tool display: B1B95-PASSENGER SEAT TRACK POSITION SENSOR CIRCUIT OPEN?

Yes

Go To 6.

No

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the Passenger Seat Track Position Sensor in accordance with the service information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

6. **CHECK (R262) PASSENGER SEAT POSITION SENSOR DATA CIRCUIT AND (R264) PASSENGER SEAT POSITION SENSOR VOLTAGE CIRCUIT FOR A SHORT TO VOLTAGE**

81876d50

Fig. 61: Checking Passenger Seat Position Sensor Data Circuit & Passenger Seat Position Sensor Voltage Circuit For Short To Voltage
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the ORC connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R262) Passenger Seat Position Sensor Data circuit between the Passenger Seat Track Position Sensor connector and ground.

Measure the voltage of the (R264) Passenger Seat Position Sensor Voltage circuit between the Passenger Seat Track Position Sensor connector and ground.

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if any of these conditions exist

Is the voltage above 0.2 volts on either circuit?

Yes

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 7.

7. **CHECK (R262) SEAT POSITION SENSOR DATA-PASSENGER CIRCUIT FOR A SHORT TO (R264) SEAT POSITION SENSOR VOLTAGE-PASSENGER CIRCUIT**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

81876d62

Fig. 62: Checking Passenger Seat Position Sensor Data Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between the (R262) Passenger Seat Position Sensor Data circuit and the (R264) Passenger Seat Position Sensor Voltage circuit in the Passenger Seat Track Position Sensor connector.

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if any of these conditions exist

Is the resistance below 10k ohms?

Yes

Replace the Passenger Seat Harness in accordance with the service information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Replace the ORC in accordance with the Service information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

8. TEST FOR AN INTERMITTENT CONDITION

With the scan tool, record and erase all DTC's from the ORC.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

WARNING: To avoid serious or fatal injury, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate symptom from Symptom List.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

B1B97-PASSENGER SEAT TRACK POSITION SENSOR CONFIGURATION MISMATCH

CIRCUIT SCHEMATIC

910259M

Fig. 63: Seat Track Position Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

With the ignition on the OCM monitors the Seat Track Position Sensors (STPS) circuits.

SET CONDITIONS

- Set Condition:

If the module detects current on the Seat Track Position Sensors circuits and the module is not configured for STPS.

POSSIBLE CAUSES

Possible Causes
SEAT TRACK POSITION SENSORS (STPS) WIRING OCCUPANT CLASSIFICATION MODULE (OCM)

DIAGNOSTIC TEST

- CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)

NOTE: Ensure the battery is fully charged.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

Yes

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 2.

- VERIFY THAT B1B97-PASSENGER SEAT TRACK POSITION SENSOR CONFIGURATION MISMATCH IS ACTIVE

With the scan tool, erase OCM DTCs.

Turn the ignition off, wait 10 seconds and then turn the ignition on.

Wait 2 minutes, and then with the scan tool, read OCM DTCs.

Does the scan tool display active: B1B97-PASSENGER SEAT TRACK POSITION SENSOR CONFIGURATION MISMATCH?

Yes

Go To 3.

No

Perform ***OCM SYSTEM VERIFICATION TEST** .

3. **VERIFY WIRING**

Turn the ignition off.

Inspect the passenger seat wiring for Seat Position Sensors.

Are Seat Position Sensor(s) present?

Yes

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Replace the OCM in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Perform ***OCM SYSTEM VERIFICATION TEST** .

B1BA5-AIRBAG SQUIB CONFIGURATION MISMATCH

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

With the ignition on.

SET CONDITIONS

- **Set Condition:**

If an Occupant Restraint Controller (ORC) configured for vehicles without side airbags is installed in a vehicle with side airbags.

POSSIBLE CAUSES

Possible Causes
TOTALLY INTEGRATED POWER MODULE (TIPM)
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. VERIFY THAT DTC B1BA5-AIRBAG SQUIB CONFIGURATION MISMATCH IS ACTIVE

NOTE: Ensure the battery is fully charged.

Turn the ignition on.

With the scan tool, read ORC DTCs.

Does the scan tool display active: B1BA5-AIRBAG SQUIB CONFIGURATION MISMATCH?

Yes

Go To 2.

No

Go To 5.

2. CHECK FOR ACTIVE TIPM DTC

Verify that the vehicle is equipped with a Occupant Classification System (OCS).

With the scan tool, read the active TIPM DTCs.

Is active TIPM DTCs present?

Yes

Diagnose and repair the active TIPM DTCs.

Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 3.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

3. CHECK ORC PART NUMBER WITH SCAN TOOL

With the scan tool, select ECU View, select ORC, select ECU Details, and read the ORC part number.

Is the part number correct for the vehicle?

Yes

Go To 4.

No

Replace the ORC in accordance with Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

4. CHECK VIN WITH SCAN TOOL

With the scan tool, read the VIN.

Is the correct VIN displayed?

Yes

Replace the ORC in accordance with Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

No

Replace or reprogram the Totally Integrated Power Module (TIPM) in accordance with Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

5. TEST FOR INTERMITTENT CONDITION

With the scan tool, record and erase all DTCs from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the

battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor active codes as you work through the following steps.

WARNING: To avoid serious or fatal injury, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

Does the scan tool display any ACTIVE DTCs?

Yes

Select appropriate symptom from Symptom List.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

2008 RESTRAINTS

Electrical Diagnostics - Liberty

B1BA6-OCCUPANT CLASSIFICATION UNDETERMINED

MONITOR CONDITIONS

When Monitored:

With the ignition on.

SET CONDITIONS

- **Set Condition:**

Because other DTC have made occupant detection impossible. This DTC will set in addition to all sensor and module DTC and will be erased when the repairs are completed.

DIAGNOSTIC TEST

Refer to **B1BA7-OCCUPANT CLASSIFICATION SYSTEM VERIFICATION REQUIRED** for the diagnostic test procedure.

B1BA7-OCCUPANT CLASSIFICATION SYSTEM VERIFICATION REQUIRED

OCCUPANT CLASSIFICATION SEAT WEIGHTS

Fig. 1: OCS Seat Weights MRL #9077
Courtesy of CHRYSLER LLC

MONITOR CONDITIONS

When Monitored:

With the CAN ignition status as IGN_RUN, the module tries to detect potentially damaging events and monitors the CAN Bus for the Impact messages (crash event causing one or more airbag or pretensioner

to deploy) or upon detecting an Offset Event (if equipped).

SET CONDITIONS

- **Set Condition:**

This DTC will set if the module detects a potentially damaging event or the Impact messages from the CAN Bus input.

POSSIBLE CAUSES

Possible Causes
B1BA7-OCS VERIFICATION REQUIRED DTC ACTIVE

DIAGNOSTIC TEST

1. CHECK FOR OCCUPANT CLASSIFICATION MODULE (OCM) ACTIVE DTC:

- ACTIVE INTERNAL FAULTS
- IGNITION FAULTS
- BATTERY FAULT
- SEAT WEIGHT SENSOR DTC

NOTE: **Ensure the battery is fully charged.**

Turn the ignition on.

With the scan tool, read Occupant Classification Module (OCM) DTC.

Does the scan tool display any active DTC listed above?

Yes

Diagnose and repair the DTC. Refer to the Table of Contents in this Section for a complete list of symptoms.

No

Go To 2.

2. VERIFY THAT DTC B1BA7-OCCUPANT CLASSIFICATION SYSTEM VERIFICATION REQUIRED IS ACTIVE

With the scan tool, read OCM DTC.

Does the scan tool display active: B1BA7-OCCUPANT CLASSIFICATION SYSTEM VERIFICATION REQUIRED?

Yes

Go To 3.

No

Go To 5.

3. **PERFORM OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST**

Verify that the passenger seat is empty.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the Occupant Classification Module System Verification Test to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, proceed as follows.

With the scan tool, read OCM DTC.

Does the scan tool display active: B1BA7-OCCUPANT CLASSIFICATION SYSTEM VERIFICATION REQUIRED?

Yes

Go To 4.

No - But Other DTC Present

Diagnose and repair the DTC. Refer to the Table of Contents in this Section for a complete list of symptoms.

No - No Active DTC Present

Perform ***OCM SYSTEM VERIFICATION TEST** .

4. **PERFORM SENSOR TORQUE TEST**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Verify that the passenger seat is empty.

Verify that all of the Seat Weight Sensor mounting screws are tightened to torque specification. Refer to Group 23 for specification.

To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the Occupant Classification Module System Verification Test to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, proceed as follows.

With the scan tool, read OCM DTC.

Does the scan tool display active: B1BA7-OCCUPANT CLASSIFICATION SYSTEM VERIFICATION REQUIRED?

Yes

Perform the *Diagnosis/Checkout Procedure For Seat Weight Sensors.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No - But Other DTC Present

Diagnose and repair the DTC. Refer to the Table of Contents in this Section for a complete list of symptoms.

No - Active DTC Present

Perform ***OCM SYSTEM VERIFICATION TEST** .

5. CHECK FOR ACTIVE DTC B1BA8-OCM SYSTEM OUT OF CALIBRATION/NOT CALIBRATED

With the scan tool, read OCM DTC.

Does the scan tool display active: B1BA8-OCM SYSTEM OUT OF CALIBRATION/NOT CALIBRATED?

Yes

Diagnose and repair the DTC. Refer to the Table of Contents in this Section for a complete list of symptoms.

No

Perform ***OCM SYSTEM VERIFICATION TEST** .

B1BA8-OCM SYSTEM OUT OF CALIBRATION/NOT CALIBRATED

OCCUPANT CLASSIFICATION SEAT WEIGHTS

Fig. 2: OCS Seat Weights MRL #9077
Courtesy of CHRYSLER LLC

MONITOR CONDITIONS

When Monitored:

While the CAN bus ignition status is IGN_RUN or signal not available.

SET CONDITIONS

- **Set Condition:**

This DTC will set if the module has initiated a re-zero and did not successfully complete the system verification, a system verification routine has been aborted or a update option table from flash routine has been completed.

DIAGNOSTIC TEST

1. **PERFORM OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST**

Verify that the passenger seat is empty.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the Occupant Classification Module System Verification Test to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, proceed as follows.

With the scan tool, read OCM DTC.

Does the scan tool display any active DTC?

Yes

Go To 2.

Yes

But Other DTC Present?
Diagnose and repair the DTC. Refer to the Table of Contents in this Section for a complete list of symptoms.

No

No Active DTC Present?
Perform ***OCM SYSTEM VERIFICATION TEST** .

2. **PERFORM SENSOR TORQUE TEST**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Verify that the passenger seat is empty.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Verify that all of the Seat Weight Sensor mounting screws are tightened to torque specification. Refer to Group 23 for specification.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the Occupant Classification Module System Verification Test to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, proceed as follows.

With the scan tool, read OCM DTC.

Does the scan tool display any active DTC?

Yes

Perform the *Diagnosis/Checkout Procedure For Seat Weight Sensors.

Yes

But Other DTC Present?

Diagnose and repair the DTC. Refer to the Table of Contents in this Section for a complete list of symptoms.

No

No Active DTC Present?

Perform *OCM SYSTEM VERIFICATION TEST .

**B1BAA-OCCUPANT CLASSIFICATION MODULE CONFIGURATION
MISMATCH**

CIRCUIT SCHEMATIC

Fig. 3: Occupant Classification Module Circuit Schematic
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

While the CAN bus ignition status is IGN_RUN.

SET CONDITIONS

- **Set Condition:**

This DTC will set if the ORC is not configured for Occupant Classification Module (OCM) and the OCM is active on the CAN Bus. Note: Because all ORCs are originally configured for the OCM the ORC must learn the not equipped with OCM state from the TIPM.

POSSIBLE CAUSES

Possible Causes
LOSS OF COMMUNICATION BETWEEN ORC AND TIPM
MISSING CAN BUS CONFIGURATION MESSAGE
CORRUPT CONFIGURATION MESSAGE
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE B1BAA-OCCUPANT CLASSIFICATION MODULE CONFIGURATION MISMATCH**

With the scan tool, read Occupant Restraints Controller (ORC) DTCs.

Does the scan tool display an active: B1BAA-OCCUPANT CLASSIFICATION MODULE CONFIGURATION MISMATCH DTCs?

Yes

Go To 2.

No

Go To 5.

2. **CHECKING FOR CORRUPT CONFIGURATION MESSAGE**

With the scan tool, read Occupant Restraints Controller (ORC) DTCs.

Does the scan tool display an active: U1414-IMPLAUSIBLE/MISSING ECU NETWORK CONFIGURATION DATA DTCs?

Yes

Perform the U1414-IMPLAUSIBLE/MISSING ECU NETWORK CONFIGURATION DATA diagnostic test.

No

Go To 3.

3. CHECKING FOR LOSS OF CAN BUS CONFIGURATION MESSAGE

With the scan tool, read Occupant Restraints Controller (ORC) DTCs.

Does the scan tool display an active U1415-IMPLAUSIBLE/MISSING VEHICLE CONFIGURATION DATA DTCs?

Yes

Perform the U1415-IMPLAUSIBLE/MISSING VEHICLE CONFIGURATION DATA diagnostic test.

No

Go To 4.

4. CHECKING FOR LOSS OF COMMUNICATION WITH THE TIPM

With the scan tool, read Occupant Restraints Controller (ORC) DTCs.

Does the scan tool display an active: U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (TOTALLY INTEGRATED POWER MODULE)?

Yes

Perform the U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE. Refer to **DIAGNOSIS AND TESTING** .

No

Go To 6.

5. VERIFYING STORED B1BAA-OCCUPANT CLASSIFICATION MODULE CONFIGURATION MISMATCH DTC

With the scan tool, record and erase all DTC's from the Occupant Restraint Controller.

Turn the ignition off, and wait 15 seconds, then turn the ignition on.

Wait one minute, and read active and stored codes.

Does the scan tool display an active or stored B1BAA-OCCUPANT CLASSIFICATION MODULE CONFIGURATION MISMATCH DTCs?

Yes

For active DTC-Go To 2.

Yes

For stored-Go To 6.

No

Perform ***OCM SYSTEM VERIFICATION TEST** .

6. REPLACE THE ORC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

B1BBA-PASSENGER SEAT WEIGHT SENSOR SUPPLY CIRCUIT

CIRCUIT SCHEMATIC

Fig. 4: Occupant Classification Module Circuit Schematic
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

While the CAN bus ignition status is in IGN_RUN, the module checks the sensor supply.

SET CONDITIONS

- **Set Condition:**

If the OCM detects that the sensor supply shorted.

NOTE: **A shorted supply circuit will cause a 'NO RESPONSE FROM OCM' condition.**

POSSIBLE CAUSES

Possible Causes
OCS SUPPLY CIRCUIT SHORTED OCCUPANT CLASSIFICATION MODULE (OCM)

DIAGNOSTIC TEST

1. **VERIFY THAT B1BBA-PASSENGER SEAT WEIGHT SENSOR SUPPLY CIRCUIT DTC IS ACTIVE**

With the scan tool, read OCM DTCs.

Does the scan tool display active: B1BBA-PASSENGER SEAT WEIGHT SENSOR SUPPLY CIRCUIT?

Yes

Replace the OCM in accordance with the Service Information.
Perform the B1BA7-OCCUPANT CLASSIFICATION SYSTEM VERIFICATION REQUIRED diagnostic test.

No

Go To 2.

2. **INSPECT PASSENGER SEAT HARNESS WIRES AND CONNECTORS**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Are any of these conditions present?

Yes

NOTE: **Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Go To 3.

3. TEST FOR INTERMITTENT CONDITION

With the scan tool, record and erase all DTCs from the OCM.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

WARNING: To avoid serious or fatal injury, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate symptom from Symptom List.

No

No problem found at this time. Perform the Occupant Classification Module System Verification Test in this Section. Erase all codes before returning vehicle to customer.

B1BBB-PASSENGER SEAT WEIGHT SENSOR INPUTS SHORTED TOGETHER

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

While the CAN bus ignition status is in IGN_RUN.

SET CONDITIONS

- **Set Condition:**

If the OCM detects any two sensors voltages below 20 mV for 10 minutes while any other sensor is greater than 40 mV. Note: 1 A/D count is equal to 5 mV.

NOTE: **A shorted supply circuit will cause a "NO RESPONSE FROM OCM" condition.**

POSSIBLE CAUSES

Possible Causes
OCS SENSOR CIRCUITS SHORTED TOGETHER OCCUPANT CLASSIFICATION MODULE (OCM)

DIAGNOSTIC TEST

1. **VERIFY THAT B1BBB-PASSENGER SEAT WEIGHT SENSOR INPUTS SHORTED TOGETHER DTC IS ACTIVE**

With the scan tool, read OCM DTCs.

Does the scan tool display active: B1BBB-PASSENGER SEAT WEIGHT SENSOR INPUTS SHORTED TOGETHER ?

Yes

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the OCM in accordance with the Service Information.

Perform the B1BA7-OCCUPANT CLASSIFICATION SYSTEM VERIFICATION REQUIRED diagnostic test.

No

Go To 2.

2. **INSPECT PASSENGER SEAT HARNESS WIRES AND CONNECTORS**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Are any of these conditions present?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Go To 3.

3. **TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from the OCM.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

WARNING: To avoid serious or fatal injury, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate symptom from Symptom List.

No

No problem found at this time. Perform the Occupant Classification Module System Verification Test in this Section. Erase all codes before returning vehicle to customer.

B1BBC-OCS NEGATIVE SYSTEM WEIGHT

OCCUPANT CLASSIFICATION SEAT WEIGHTS

Fig. 5: Identifying OCS Seat Weights
Courtesy of CHRYSLER LLC

MONITOR CONDITIONS

When Monitored:

While the CAN bus ignition status is in IGN_RUN, the module checks the sensor input ranges.

SET CONDITIONS

- **Set Condition:**

If the module detects a seat weight sensor input with the total seat weight below -6.5 kg +/- 1kg.

POSSIBLE CAUSES

Possible Causes
DAMAGE TO THE PASSENGER SEAT STRUCTURE, RISER ASSEMBLY, CROSSMEMBERS, SEAT TRACKS, FLOOR PAN OBJECT UNDER SEAT OR REAR SEAT FOLDED DOWN AND RESTING AGAINST PASSENGER SEAT OCCUPANT CLASSIFICATION MODULE (OCM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE OCM DTCs**

- ACTIVE INTERNAL DTC
- IGNITION DTC
- BATTERY DTC
- SEAT WEIGHT SENSOR DTC

NOTE: **Ensure the battery is fully charged.**

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

Does the scan tool display any active DTCs listed above?

Yes

Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

No

Go To 2.

2. **ACTIVE OR STORED DTC**

With the scan tool, read OCM DTCs.

Does the scan tool display active: B1BBC-OCS NEGATIVE SYSTEM WEIGHT?

Yes

Go To 3.

No

Go To 5.

3. **PERFORM OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST**

Verify that the passenger seat is empty.

NOTE: **Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the Occupant Classification Module System Verification Test to completion.**

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, proceed as follows.

With the scan tool, read OCM DTCs.

Does the scan tool display active: B1BA8-OCS NOT CALIBRATED DTC?

Yes

Go To 4.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

DTCs are Present?

Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

No

No Active DTCs Present?

Perform ***OCM SYSTEM VERIFICATION TEST** .

4. VERIFY SEAT WEIGHT SENSOR TORQUE

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Verify that all of the Seat Weight Sensor mounting screws are tightened to torque specification. Refer to Group 23 for specification.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the Occupant Classification Module System Verification Test to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, proceed as follows.

With the scan tool, read OCM DTCs.

Does the scan tool display active: B1BA8-OCS NOT CALIBRATED DTC?

Yes

Perform the *Diagnosis/Checkout Procedure For Seat Weight Sensors.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

DTCs are Present?

Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

No

No Active DTCs Present?

Perform ***OCM SYSTEM VERIFICATION TEST** .

5. **STORED B1BBC-OCS NEGATIVE SYSTEM WEIGHT DTC**

With the scan tool, record and erase all DTCs from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTC's present?

Yes

Select appropriate symptom from Symptom List.

No

No problem found at this time. Perform the Occupant Classification Module System Verification Test in this Section. Erase all codes before returning vehicle to customer.

B1BBD-OCM CURRENT CONFIGURATION TABLE UNPROGRAMMED

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

If the Configuration Table is not programmed at the supplier or when the checksum is invalid.

SET CONDITIONS

- **Set Condition:**

This DTC will set if the Occupant Classification Module (OCM) was received unprogrammed from the supplier, the vehicle line was not identified correctly or if the flash procedure was not completed successfully

POSSIBLE CAUSES

Possible Causes
NEW OCCUPANT CLASSIFICATION MODULE
INTERNAL CHECKSUM FAILURE

DIAGNOSTIC TEST

1. **MODULE CONFIGURATION**

Does the scan tool display B1BBD-OCM CURRENT CONFIGURATION TABLE UNPROGRAMMED?

Yes

Perform the B1BA7-OCS VERIFICATION REQUIRED diagnostic procedure.

No

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the OCM in accordance with the service information.
With the scan tool, perform *OCM SYSTEM VERIFICATION TEST.

B1BC7-DEPLOYMENT DATA RECORD FULL

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

With the ignition on. The Occupant Restraint Controller (ORC) on board diagnostics continuously monitors the deployment register.

The register counts the number of airbag deployment for this vehicle.

SET CONDITIONS

- **Set Condition:**

This DTC will set if the ORC deployment register increments to 3.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

View repair.

Repair

Replace the Occupant Restraint Controller in accordance with the service information.
Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

B1BCF-ROLL OVER SENSOR

MONITOR CONDITIONS

When Monitored:

With the ignition on. The module's on board diagnostics continuously performs internal circuit tests.

SET CONDITIONS

- **Set Condition:**

This DTC will set if the module identifies an out of range Roll Over Sensor circuit.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER

DIAGNOSTIC TEST

1. REPLACE OCCUPANT RESTRAINT CONTROLLER

Turn the ignition on.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take proper precautions could result in accidental airbag deployment and serious or fatal injury.

When this code is set, view repair.

Repair

Replace the Occupant Restraint Controller in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

B1C23-PASSENGER SEAT WEIGHT 3 - LEFT FRONT CONFIGURATION MISMATCH

OCCUPANT CLASSIFICATION SEAT WEIGHTS

Fig. 6: OCS Seat Weights
Courtesy of CHRYSLER LLC

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Occupant Classification Module (OCM) monitors the position of each Seat Weight Sensor. The sensor identification is mapped to the sensor position during the OCM SYSTEM

VERIFICATION TEST.

SET CONDITIONS

- **Set Condition:**

This DTC will set if the module detects one or more new Seat Weight Sensors or if the existing sensors are moved to a new position.

POSSIBLE CAUSES

Possible Causes
NEW SEAT WEIGHT SENSOR INSTALLED
EXISTING SEAT WEIGHT SENSOR MOVED TO A NEW POSITION

DIAGNOSTIC TEST

1. PERFORM OCM SYSTEM VERIFICATION TEST

Verify that the passenger seat is empty.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the Occupant Classification Module System Verification Test to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, proceed as follows.

With the scan tool, read OCM DTC.

Does the scan tool display active: B1C23-PASSENGER SEAT WEIGHT 3 - LEFT FRONT CONFIGURATION MISMATCH?

Yes

Go To 2.

No

DTC are Present

Diagnose and repair the DTC. Refer to the Table of Contents in this Section for a complete list of symptoms.

No

No Active DTC Present

Perform ***OCM SYSTEM VERIFICATION TEST** .

2. **PERFORM SENSOR TORQUE TEST**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Verify that the passenger seat is empty.

Verify that all of the Seat Weight Sensor mounting screws are tightened to torque specification. Refer to Group 23 for specification.

To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the Occupant Classification Module System Verification Test to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, proceed as follows.

With the scan tool, read OCM DTC.

Does the scan tool display active: B1C23-PASSENGER SEAT WEIGHT 3 - LEFT FRONT CONFIGURATION MISMATCH?

Yes

Perform the *Diagnosis/Checkout Procedure For Seat Weight Sensors.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

DTC are Present

Diagnose and repair the DTC. Refer to the Table of Contents in this Section for a complete list of symptoms.

No

No Active DTC Present

Perform ***OCM SYSTEM VERIFICATION TEST** .

**B1C24-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT
CONFIGURATION MISMATCH**

OCCUPANT CLASSIFICATION SEAT WEIGHTS

Fig. 7: OCS Seat Weights MRL #9077
Courtesy of CHRYSLER LLC

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Occupant Classification Module (OCM) monitors the position of each Seat Weight Sensor. The sensor identification is mapped to the sensor position during the OCM SYSTEM

VERIFICATION TEST.

SET CONDITIONS

- **Set Condition:**

This DTC will set if the module detects one or more new Seat Weight Sensors or if the existing sensors are moved to a new position.

POSSIBLE CAUSES

Possible Causes
NEW SEAT WEIGHT SENSOR INSTALLED
EXISTING SEAT WEIGHT SENSOR MOVED TO A NEW POSITION

DIAGNOSTIC TEST

1. PERFORM OCM SYSTEM VERIFICATION TEST

Verify that the passenger seat is empty.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the Occupant Classification Module System Verification Test to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, proceed as follows.

With the scan tool, read OCM DTC.

Does the scan tool display active: B1C24-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT CONFIGURATION MISMATCH?

Yes

Go To 2.

No

DTC are Present

Diagnose and repair the DTC. Refer to the Table of Contents in this Section for a complete list of symptoms.

No

No Active DTC Present

Perform ***OCM SYSTEM VERIFICATION TEST** .

2. **PERFORM SENSOR TORQUE TEST**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Verify that the passenger seat is empty.

Verify that all of the Seat Weight Sensor mounting screws are tightened to torque specification. Refer to Group 23 for specification.

To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the Occupant Classification Module System Verification Test to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, proceed as follows.

With the scan tool, read OCM DTC.

Does the scan tool display active: B1C24-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT CONFIGURATION MISMATCH?

Yes

Perform the *Diagnosis/Checkout Procedure For Seat Weight Sensors.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

DTC are Present

Diagnose and repair the DTC. Refer to the Table of Contents in this Section for a complete list of symptoms.

No

No Active DTC Present

Perform ***OCM SYSTEM VERIFICATION TEST** .

**B1C25-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR
CONFIGURATION MISMATCH**

OCCUPANT CLASSIFICATION SEAT WEIGHTS

Fig. 8: OCS Seat Weights MRL #9077
Courtesy of CHRYSLER LLC

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Occupant Classification Module (OCM) monitors the position of each Seat Weight Sensor. The sensor identification is mapped to the sensor position during the OCM SYSTEM

VERIFICATION TEST.

SET CONDITIONS

- **Set Condition:**

This DTC will set if the module detects one or more new Seat Weight Sensors or if the existing sensors are moved to a new position.

POSSIBLE CAUSES

Possible Causes
NEW SEAT WEIGHT SENSOR INSTALLED
EXISTING SEAT WEIGHT SENSOR MOVED TO A NEW POSITION

DIAGNOSTIC TEST

1. PERFORM OCM SYSTEM VERIFICATION TEST

Verify that the passenger seat is empty.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the Occupant Classification Module System Verification Test to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, proceed as follows.

With the scan tool, read OCM DTC.

Does the scan tool display active: B1C25-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR CONFIGURATION MISMATCH?

Yes

Go To 2.

No

DTC are Present

Diagnose and repair the DTC. Refer to the Table of Contents in this Section for a complete list of symptoms.

No

No Active DTC Present

Perform ***OCM SYSTEM VERIFICATION TEST** .

2. **PERFORM SENSOR TORQUE TEST**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Verify that the passenger seat is empty.

Verify that all of the Seat Weight Sensor mounting screws are tightened to torque specification. Refer to Group 23 for specification.

To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the Occupant Classification Module System Verification Test to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, proceed as follows.

With the scan tool, read OCM DTC.

Does the scan tool display active: B1C25-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR CONFIGURATION MISMATCH?

Yes

Perform the *Diagnosis/Checkout Procedure For Seat Weight Sensors.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

DTC are Present

Diagnose and repair the DTC. Refer to the Table of Contents in this Section for a complete list of symptoms.

No

No Active DTC Present

Perform ***OCM SYSTEM VERIFICATION TEST** .

B1C26-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR CONFIGURATION MISMATCH

OCCUPANT CLASSIFICATION SEAT WEIGHTS

Fig. 9: OCS Seat Weights MRL #9077
Courtesy of CHRYSLER LLC

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Occupant Classification Module (OCM) monitors the position of each Seat Weight Sensor. The sensor identification is mapped to the sensor position during the OCM SYSTEM

VERIFICATION TEST.

SET CONDITIONS

- **Set Condition:**

This DTC will set if the module detects one or more new Seat Weight Sensors or if the existing sensors are moved to a new position.

POSSIBLE CAUSES

Possible Causes
NEW SEAT WEIGHT SENSOR INSTALLED
EXISTING SEAT WEIGHT SENSOR MOVED TO A NEW POSITION

DIAGNOSTIC TEST

1. PERFORM OCM SYSTEM VERIFICATION TEST

Verify that the passenger seat is empty.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the Occupant Classification Module System Verification Test to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, proceed as follows.

With the scan tool, read OCM DTC.

Does the scan tool display active: B1C26-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR CONFIGURATION MISMATCH?

Yes

Go To 2.

No

DTC are Present

Diagnose and repair the DTC. Refer to the Table of Contents in this Section for a complete list of symptoms.

No

No Active DTC Present

Perform ***OCM SYSTEM VERIFICATION TEST** .

2. **PERFORM SENSOR TORQUE TEST**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Verify that the passenger seat is empty.

Verify that all of the Seat Weight Sensor mounting screws are tightened to torque specification. Refer to Group 23 for specification.

To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the Occupant Classification Module System Verification Test to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, proceed as follows.

With the scan tool, read OCM DTC.

Does the scan tool display active: B1C26-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR CONFIGURATION MISMATCH?

Yes

Perform the *Diagnosis/Checkout Procedure For Seat Weight Sensors.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

DTC are Present

Diagnose and repair the DTC. Refer to the Table of Contents in this Section for a complete list of symptoms.

No

No Active DTC Present

Perform ***OCM SYSTEM VERIFICATION TEST** .

B1C38-1ST ROW DRIVER RETRACTOR PRETENSIONER CIRCUIT LOW

CIRCUIT SCHEMATIC

013506000

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Driver Seat Belt Retractor Tensioner circuits.

SET CONDITIONS

- **Set Condition:**

The ORC has detected low resistance on the Driver Seat Belt Retractor Tensioner circuits.

POSSIBLE CAUSES

Possible Causes
(R55) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT SHORTED TO GROUND
(R53) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT SHORTED TO GROUND
DRIVER SEAT BELT RETRACTOR TENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Select Active or Stored DTC.

Is the DTC active or stored?

ORC - ACTIVE DTC

Go To 2.

ORC - STORED DTC

Go To 5.

2. **CHECK FOR SHORTED DRIVER SEAT BELT RETRACTOR TENSIONER**

Fig. 11: Connecting 8443 Load Tool And 8443-10 Jumper To Driver Seat Belt Retractor Tensioner Connector
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Driver Seat Belt Retractor Tensioner connector.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-10 Jumper to the Driver Seat Belt Retractor Tensioner connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

Does the scan tool display: B1C38-1ST ROW DRIVER RETRACTOR PRETENSIONER

CIRCUIT LOW?

Yes

Go To 3.

No

Replace the Driver Seat Belt Retractor Tensioner in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

3. **CHECK (R55) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT AND (R53) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT FOR A SHORT TO GROUND**

819b8507

Fig. 12: Measuring Resistance Of (R55/R53) Driver Seat Belt Retractor Tensioner Line 1 Circuit Between Driver Seat Belt Retractor Tensioner Connector And Ground
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Driver Seat Belt Retractor Tensioner connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the Load Tool ORC 8443-32-R Adapter to the ORC connector.

NOTE: **The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.**

Measure the resistance of the (R55) Driver Seat Belt Retractor Tensioner Line 1 circuit between the Driver Seat Belt Retractor Tensioner connector and ground.

Measure the resistance of the (R53) Driver Seat Belt Retractor Tensioner Line 1 circuit between the Driver Seat Belt Retractor Tensioner connector and ground.

Is the resistance below 10K ohms on either circuit?

Yes

Repair the Driver Seat Belt Retractor Tensioner circuits for a short to ground.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 4.

4. REPLACE THE ORC

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

5. STORED ORC DTC

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTC's present?

Yes

Select the appropriate diagnostic procedure from the Table of Contents in this section.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Occupant Restraint Controller (ORC) monitors the voltage on the Driver Seat Belt Retractor Tensioner circuits.

SET CONDITIONS

- **Set Condition:**

The ORC detects voltage on the Driver Seat Belt Retractor Tensioner circuits.

POSSIBLE CAUSES

Possible Causes
(R55) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT SHORTED TO BATTERY
(R53) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT SHORTED TO BATTERY
DRIVER SEAT BELT RETRACTOR TENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Select Active or Stored DTC.

Is the DTC active or stored?

ORC - ACTIVE DTC

Go To 2.

ORC - STORED DTC

Go To 5.

2. **CHECK FOR SHORTED DRIVER SEAT BELT RETRACTOR TENSIONER**

Fig. 14: Connecting 8443 Load Tool And 8443-10 Jumper To Driver Seat Belt Retractor Tensioner Connector

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Driver Seat Belt Tensioner connector.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-10 Jumper to the Driver Seat Belt Retractor Tensioner connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

Does the scan tool display: B1C39-1ST ROW DRIVER RETRACTOR PRETENSIONER

CIRCUIT HIGH?

Yes

Go To 3.

No

Replace the Driver Seat Belt Retractor Tensioner in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

3. **CHECK (R55) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT AND (R53) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT FOR A SHORT TO BATTERY**

819b9c4f

Fig. 15: Measuring Voltage Of (R55/53) Driver Seat Belt Retractor Tensioner Line 1/2 Circuit Between Driver Seat Belt Tensioner Connector And Ground
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Driver Seat Belt Retractor Tensioner connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the Load Tool ORC 8443-32-R Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the voltage of the (R55) Driver Seat Belt Retractor Tensioner Line 1 circuit between the Driver Seat Belt Tensioner connector and ground.

Measure the voltage of the (R53) Driver Seat Belt Retractor Tensioner Line 2 circuit between the Driver Seat Belt Tensioner connector and ground.

Is there any voltage present on either circuit?

Yes

Repair the Driver Seat Belt Retractor Tensioner circuits with voltage present for a short to battery.
Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

No

Go To 4.

4. REPLACE THE ORC

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

5. STORED ORC DTC

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from the Table of Contents in this section.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Driver Seat Belt Retractor Tensioner circuits.

SET CONDITIONS

- **Set Condition:**

The ORC has detected an open or high resistance on the Driver Seat Belt Retractor Tensioner circuits.

POSSIBLE CAUSES

Possible Causes
(R55) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT OPEN
(R53) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT OPEN
DRIVER SEAT BELT RETRACTOR TENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Select Active or Stored DTC.

Is the DTC active or stored?

ORC - ACTIVE DTC

Go To 2.

ORC - STORED DTC

Go To 6.

2. **CHECK FOR DRIVER SEAT BELT RETRACTOR TENSIONER CIRCUIT OPEN**

Fig. 17: Connecting 8443 Load Tool And 8443-10 Jumper To Driver Seat Belt Retractor Tensioner Connector
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Driver Seat Belt Retractor Tensioner connector.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-10 Jumper to the Driver Seat Belt Retractor Tensioner connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

Does the scan tool display: B1C3A-1ST ROW DRIVER RETRACTOR PRETENSIONER

CIRCUIT OPEN?

Yes

Go To 3.

No

Replace the Driver Seat Belt Retractor Tensioner in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

3. CHECK (R55) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT FOR AN OPEN

819b9ac2

Fig. 18: Measuring Resistance Of (R55) Driver Seat Belt Retractor Tensioner Line 1 Circuit Between Driver Seat Belt Retractor Tensioner Connector And ORC 8443-32-R Adaptor
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Driver Seat Belt Retractor Tensioner connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the Load Tool 8443-32-R ORC Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the resistance of the (R55) Driver Seat Belt Retractor Tensioner Line 1 circuit between the Driver Seat Belt Retractor Tensioner connector and the ORC 8443-32-R Adapter.

Is the resistance below 1.0 ohm?

Yes

Go To 4.

No

Repair the (R55) Driver Seat Belt Retractor Tensioner Line 1 circuit for and open. Then Go To 4.

4. CHECK (R53) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT FOR AN OPEN

819b9ad2

Fig. 19: Measuring resistance of (R53) Driver Seat Belt Retractor Tensioner Line 1 circuit between Driver Seat Belt Retractor Tensioner connector and ORC 8443-32-R Adaptor
 Courtesy of CHRYSLER LLC

Measure the resistance of the (R53) Driver Seat Belt Retractor Tensioner Line 1 circuit between the Driver Seat Belt Retractor Tensioner connector and the ORC 8443-32-R Adapter.

Is the resistance below 1.0 ohm?

Yes

Go To 5.

No

Repair the (R53) Driver Seat Belt Retractor Tensioner Line 1 circuit for and open.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

5. REPLACE THE ORC

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it

must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

6. STORED ORC DTC

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from the Table of Contents in this section.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Driver Seat Belt Buckle Tensioner connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC 8443-32-R Adapter to the ORC connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R271) Driver Seat Belt Buckle Tensioner Line 1 circuit between the Driver Seat Belt Buckle Tensioner connector cavity 1 and ground.

Measure the voltage of the (R273) Driver Seat Belt Buckle Tensioner Line 2 circuit between the Driver Seat Belt Buckle Tensioner connector cavity 2 and ground.

Is there any voltage present on either circuit?

Yes

Repair the Driver Seat Belt Buckle Tensioner circuits with voltage present for a short to battery.
Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 4.

4. REPLACE THE ORC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

5. STORED ORC DTC

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread,

corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from the Table of Contents in this section.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Driver Seat Belt Buckle Tensioner circuits.

SET CONDITIONS

- **Set Condition:**

The ORC has detected an open or high resistance on the Driver Seat Belt Buckle Tensioner circuits.

POSSIBLE CAUSES

Possible Causes
(R271) DRIVER SEAT BELT BUCKLE TENSIONER LINE 1 CIRCUIT OPEN
(R273) DRIVER SEAT BELT BUCKLE TENSIONER LINE 2 CIRCUIT OPEN
DRIVER SEAT BELT BUCKLE TENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: **Ensure the battery is fully charged.**

NOTE: **The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.**

Select Active or Stored DTC.

Is the DTC active or stored?

ORC - ACTIVE DTC

Go To 2.

ORC - STORED DTC

Go To 6.

2. **CHECK FOR OPEN DRIVER SEAT BELT BUCKLE TENSIONER**

Fig. 30: Connecting 8443 Load Tool And 8443-20 Jumper To Driver Seat Belt Buckle Tensioner Connector
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Driver Seat Belt Buckle Tensioner connector.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-20 Jumper to the Driver Seat Belt Buckle Tensioner connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

Does the scan tool display: B1C3F-1ST ROW DRIVER SEAT BELT BUCKLE PRETENSIONER

CIRCUIT OPEN?

Yes

Go To 3.

No

Replace the Driver Seat Belt Buckle Tensioner in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

3. CHECK (R271) DRIVER SEAT BELT BUCKLE TENSIONER LINE 1 CIRCUIT FOR AN OPEN

81a8eb75

Fig. 31: Measuring Resistance Of (R271) Driver Seat Belt Buckle Tensioner Line 1 Circuit Between Driver Seat Belt Buckle Tensioner Connector Cavity 1 And ORC 8443-32-R Adaptor Cavity C2-11
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Driver Seat Belt Buckle Tensioner connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC 8443-32-R Adapter to the ORC connectors.

Measure the resistance of the (R271) Driver Seat Belt Buckle Tensioner Line 1 circuit between the Driver Seat Belt Buckle Tensioner connector cavity 1 and the ORC 8443-32-R Adapter cavity C2-11.

Is the resistance below 1.0 ohm?

Yes

Go To 4.

No

Repair the (R55) Driver Seat Belt Buckle Tensioner Line 1 circuit for and open. Then Go To 4.

4. CHECK (R53) DRIVER SEAT BELT BUCKLE PRETENSIONER VOLTAGE CIRCUIT FOR AN OPEN

81a8eb79

Fig. 32: Measuring Resistance Of (R273) Driver Seat Belt Buckle Tensioner Line 2 Circuit Between Driver Seat Belt Buckle Tensioner Connector Cavity 2 And ORC 8443-32-R Adaptor Cavity 12
Courtesy of CHRYSLER LLC

Measure the resistance of the (R273) Driver Seat Belt Buckle Tensioner Line 2 circuit between the Driver Seat Belt Buckle Tensioner connector cavity 2 and the ORC 8443-32-R Adapter cavity 12.

Is the resistance below 1.0 ohm?

Yes

Go To 5.

No

Repair the (R53) Driver Seat Belt Buckle Tensioner Line 2 circuit for and open.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

5. REPLACE THE ORC

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it

must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

6. STORED ORC DTC

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from the Table of Contents in this section.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

DIAGNOSTIC TEST

1. SELECT ACTIVE OR STORED DTC

NOTE: Ensure the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Select Active or Stored DTC.

Is the DTC active or stored?

ORC - ACTIVE DTC

Go To 2.

ORC - STORED DTC

Go To 5.

2. CHECK FOR SHORTED DRIVER SEAT BELT BUCKLE TENSIONER

Fig. 34: Connecting 8443 Load Tool And 8443-20 Jumper To Driver Seat Belt Buckle Tensioner Connector
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Driver Seat Belt Buckle Tensioner connector.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-20 Jumper to the Driver Seat Belt Buckle Tensioner connector.

WARNING: To avoid serious or fatal injury, turn the ignition on then reconnect the battery.

With the scan tool, read the active ORC DTC's.

Does the scan tool display: B1C40-1ST ROW DRIVER SEAT BELT BUCKLE PRETENSIONER

CIRCUIT SHORTED TOGETHER?

Yes

Go To 3.

No

Replace the Driver Seat Belt Buckle Pretensioner in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

3. **CHECK (R271) DRIVER SEAT BELT BUCKLE TENSIONER LINE 1 CIRCUIT FOR A SHORT TO (R273) DRIVER SEAT BELT BUCKLE TENSIONER LINE 2 CIRCUIT**

81a8eb7e

Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Driver Seat Belt Buckle Tensioner connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC 8443-32-R Adapter to the ORC connectors.

Measure the resistance between the (R271) Driver Seat Belt Buckle Tensioner Line 1 circuit cavity 1 and the (R273) Driver Seat Belt Buckle Tensioner Line 2 circuit cavity 2 at the Driver Seat Belt Buckle Tensioner connector.

Is the resistance below 10K ohms?

Yes

Repair the (R55) Driver Seat Belt Buckle Tensioner Line 1 circuit for a short to the (R53) Driver Seat Belt Buckle Tensioner Line 2 circuit.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 4.

4. REPLACE THE ORC

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

5. STORED ORC DTC

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Select Active or Stored DTC.

Is the DTC active or stored?

ORC - ACTIVE DTC

Go To 2.

ORC - STORED DTC

Go To 5.

2. **CHECK FOR SHORTED PASSENGER SEAT BELT RETRACTOR TENSIONER**

Fig. 37: Connecting 8443 Load Tool And 8443-10 Jumper To Passenger Seat Belt Retractor Tensioner Connector
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Passenger Seat Belt Retractor Tensioner connector.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-10 Jumper to the Passenger Seat Belt Retractor Tensioner connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

Does the scan tool display: B1C47-1ST ROW PASSENGER RETRACTOR PRETENSIONER CIRCUIT LOW?

Yes

Go To 3.

No

Replace the Passenger Seat Belt Retractor Tensioner in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

3. **CHECK (R56) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT AND (R54) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT FOR A SHORT TO GROUND**

819b9c95

Fig. 38: Measuring Resistance Of (R56/54) Passenger Seat Belt Retractor Tensioner Line 1/2 Circuit Between Passenger Seat Belt Retractor Pretensioner/Tensioner Connector And Ground
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Passenger Seat Belt Retractor Tensioner connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC 8443-32-R Adapter to the ORC connectors.

NOTE: **The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.**

Measure the resistance of the (R56) Passenger Seat Belt Retractor Tensioner Line 1 circuit between the Passenger Seat Belt Retractor Pretensioner connector and ground.

Measure the resistance of the (R54) Passenger Seat Belt Retractor Tensioner Line 2 circuit between the Passenger Seat Belt Retractor Tensioner connector and ground.

Is the resistance below 10K ohms on either circuit?

Yes

Repair the Passenger Seat Belt Retractor Tensioner circuits shorted to ground.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 4.

4. REPLACE THE ORC

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

5. STORED ORC DTC

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Seat Belt Retractor Tensioner circuits.

SET CONDITIONS

- **Set Condition:**

The ORC has detected an open or high resistance on the Passenger Seat Belt Retractor Tensioner circuits.

POSSIBLE CAUSES

Possible Causes
(R56) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT OPEN
(R54) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT OPEN
PASSENGER SEAT BELT RETRACTOR TENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Select Active or Stored DTC.

Is the DTC active or stored?

ORC - ACTIVE DTC

Go To 2.

ORC - STORED DTC

Go To 6.

2. **CHECK FOR PASSENGER SEAT BELT RETRACTOR TENSIONER CIRCUIT OPEN**

Fig. 43: Connecting 8443 Load Tool And 8443-10 Jumper To Passenger Seat Belt Retractor Tensioner Connector
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Passenger Seat Belt Retractor Tensioner connector.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-10 Jumper to the Passenger Seat Belt Retractor Tensioner connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

Does the scan tool display: B1C49-1ST ROW PASSENGER RETRACTOR PRETENSIONER CIRCUIT OPEN?

Yes

Go To 3.

No

Replace the Passenger Seat Belt Retractor Tensioner in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

3. CHECK (R56) PASSENGER SEAT BELT RETRACTOR TENSIONER DATA CIRCUIT FOR AN OPEN

819b99de

Fig. 44: Measuring Resistance Of (R56) Passenger Seat Belt Retractor Tensioner Line 1 Circuit Between Passenger Seat Belt Retractor Tensioner Connector And ORC 8443-32-R Adaptor
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Passenger Seat Belt Retractor Tensioner connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the Load Tool ORC 8443-32-R Adapter to the ORC connectors.

Measure the resistance of the (R56) Passenger Seat Belt Retractor Tensioner Line 1 circuit between the Passenger Seat Belt Retractor Tensioner connector and the ORC 8443-32-R Adapter.

Is the resistance below 1.0 ohm?

Yes

Go To 4.

No

Repair the (R506) Passenger Seat Belt Retractor Pretensioner Line 1 circuit for and open. Then Go To 4.

4. CHECK (R54) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT FOR AN OPEN

819b9a62

Fig. 45: Measuring Resistance Of (R54) Passenger Seat Belt Retractor Tensioner Line 2 Circuit Between Passenger Seat Belt Retractor Tensioner Connector And ORC 8443-32-R Adaptor
 Courtesy of CHRYSLER LLC

Measure the resistance of the (R54) Passenger Seat Belt Retractor Tensioner Line 2 circuit between the Passenger Seat Belt Retractor Tensioner connector and the ORC 8443-32-R Adapter.

Is the resistance below 1.0 ohm?

Yes

Go To 5.

No

Repair the (R54) Passenger Seat Belt Retractor Tensioner Line 2 circuit for and open.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

5. REPLACE THE ORC

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it

must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

6. STORED ORC DTC

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: TO AVOID SERIOUS OR FATAL INJURY, TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: TO AVOID SERIOUS OR FATAL INJURY, TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from the Table of Contents in this section.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

DIAGNOSTIC TEST

1. SELECT ACTIVE OR STORED DTC

NOTE: Ensure the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Select Active or Stored DTC.

Is the DTC active or stored?

ORC - ACTIVE DTC

Go To 2.

ORC - STORED DTC

Go To 5.

2. CHECK FOR SHORTED PASSENGER SEAT BELT RETRACTOR TENSIONER

Fig. 47: Connecting 8443 Load Tool And 8443-10 Jumper To Passenger Seat Belt Retractor Tensioner Connector
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Passenger Seat Belt Tensioner connector.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-10 Jumper to the Passenger Seat Belt Retractor Tensioner connector.

WARNING: To avoid serious or fatal injury, turn the ignition on then reconnect the battery.

With the scan tool, read the active ORC DTC's.

Does the scan tool display: B1C4A-1ST ROW PASSENGER RETRACTOR PRETENSIONER CIRCUIT SHORTED TOGETHER?

Yes

Go To 3.

No

Replace the Passenger Seat Belt Retractor Tensioner in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

3. **CHECK (R56) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT FOR A SHORT TO (R54) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT**

819b9a2a

Fig. 48: Measuring Resistance Between (R56) Passenger Seat Belt Retractor Tensioner Line 1 Circuit And (R54) Passenger Seat Belt Retractor Tensioner Line 2 Circuit At Passenger Seat Belt Retractor Tensioner Connector
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Passenger Seat Belt Retractor Tensioner connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the Load Tool ORC 8443-32-R Adapter to the ORC connectors.

NOTE: **The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.**

Measure the resistance between the (R56) Passenger Seat Belt Retractor Tensioner Line 1 circuit and the (R54) Passenger Seat Belt Retractor Tensioner Line 2 circuit at the Passenger Seat Belt Retractor Tensioner connector.

Is the resistance below 10K ohms?

Yes

Repair the (R56) Passenger Seat Belt Retractor Tensioner Line 1 circuit for a short to the (R54) Passenger Seat Belt Retractor Tensioner Line 2 circuit.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 4.

4. REPLACE THE ORC

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

5. STORED ORC DTC

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTC's present?

Yes

Select the appropriate diagnostic procedure from the Table of Contents in this section.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

2008 RESTRAINTS

Electrical Diagnostics - Liberty

B1C4C-1ST ROW PASSENGER SEAT BELT BUCKLE PRETENSIONER CIRCUIT LOW

CIRCUIT SCHEMATIC

01a06506

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Seat Belt Buckle Tensioner circuits.

SET CONDITIONS

- **Set Condition:**

The ORC has detected low resistance on the Passenger Seat Belt Buckle Tensioner circuits.

POSSIBLE CAUSES

Possible Causes
(R272) PASSENGER SEAT BELT BUCKLE TENSIONER LINE 1 CIRCUIT SHORTED TO GROUND
(R274) PASSENGER SEAT BELT BUCKLE TENSIONER LINE 2 CIRCUIT SHORTED TO GROUND
PASSENGER SEAT BELT BUCKLE TENSIONER OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Select Active or Stored DTC.

Is the DTC active or stored?

ORC - ACTIVE DTC

Go To 2.

ORC - STORED DTC

Go To 5.

2. **CHECK FOR SHORTED PASSENGER SEAT BELT BUCKLE TENSIONER CIRCUIT**

Fig. 2: Connecting 8443 Load Tool And 8443-20 Jumper To Passenger Seat Belt Buckle Tensioner Connector
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Passenger Seat Belt Buckle Tensioner connector.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-20 Jumper to the Passenger Seat Belt Buckle Tensioner connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTCs.

Does the scan tool display: B1C4C-1ST ROW PASSENGER SEAT BELT BUCKLE

PRETENSIONER CIRCUIT LOW

Yes

Go To 3.

No

Replace the Passenger Seat Belt Buckle Tensioner in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

3. **CHECK (R272) PASSENGER SEAT BELT BUCKLE TENSIONER LINE 1 CIRCUIT AND (R274) PASSENGER SEAT BELT TENSIONER LINE 2 CIRCUIT FOR A SHORT TO GROUND**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Passenger Seat Belt Buckle Tensioner connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC 8443-32-R Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the resistance of the (R272) Passenger Seat Belt Buckle Tensioner Line 1 circuit between the Passenger Seat Belt Buckle Tensioner connector cavity 2 and ground.

Measure the resistance of the (R274) Passenger Seat Belt Buckle Tensioner Line 2 circuit between the Passenger Seat Belt Buckle Tensioner connector cavity 2 and ground.

Is the resistance below 10K ohms on either circuit?

Yes

Repair the Passenger Seat Belt Buckle Tensioner circuits with a resistance below 10K ohms for a short to ground.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

No

Go To 4.

4. REPLACE THE ORC

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

5. STORED ORC DTC

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTC's present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning vehicle to customer.

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Occupant Restraint Controller (ORC) monitors the voltage on the Passenger Seat Belt Buckle Tensioner circuits.

SET CONDITIONS

- **Set Condition:**

The ORC detects voltage on the Passenger Seat Belt Buckle Tensioner circuits.

POSSIBLE CAUSES

Possible Causes
(R272) PASSENGER SEAT BELT BUCKLE TENSIONER LINE 1 CIRCUIT SHORTED TO BATTERY
(R274) PASSENGER SEAT BELT BUCKLE TENSIONER LINE 2 CIRCUIT SHORTED TO BATTERY
PASSENGER SEAT BELT BUCKLE TENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Select Active or Stored DTC.

Is the DTC active or stored?

ORC - ACTIVE DTC

Go To 2.

ORC - STORED DTC

Go To 5.

2. **CHECK FOR SHORTED PASSENGER SEAT BELT BUCKLE TENSIONER**

Fig. 4: Connecting 8443 Load Tool And 8443-20 Jumper To Passenger Seat Belt Buckle Tensioner Connector
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Passenger Seat Belt Buckle Tensioner connector.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-20 Jumper to the Passenger Seat Belt Buckle Tensioner connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

Does the scan tool display: B1C4D-1ST ROW PASSENGER SEAT BELT BUCKLE

PRETENSIONER CIRCUIT HIGH?

Yes

Go To 3.

No

Replace the Passenger Seat Belt Buckle Tensioner in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

3. **CHECK (R272) PASSENGER SEAT BELT BUCKLE TENSIONER LINE 1 CIRCUIT AND (R274) PASSENGER SEAT BELT BUCKLE TENSIONER LINE 2 CIRCUIT FOR A SHORT TO BATTERY**

81a8eb2b

Fig. 5: Measuring Voltage Of (R272/R274) Passenger Seat Belt Buckle Tensioner Line 1/2 Circuit Between Passenger Seat Belt Buckle Tensioner Connector Cavity 2/1 And Ground
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Passenger Seat Belt Buckle Tensioner connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC 8443-32-R Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R272) Passenger Seat Belt Buckle Tensioner Line 1 circuit between the Passenger Seat Belt Buckle Tensioner connector cavity 2 and ground.

Measure the voltage of the (R274) Passenger Seat Belt Buckle Tensioner Line 2 circuit between the Passenger Seat Belt Buckle Tensioner connector cavity 1 and ground.

Is there any voltage present on either circuit?

Yes

Repair the Passenger Seat Belt Buckle Tensioner circuits with voltage present for a short to battery.
Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

No

Go To 4.

4. **REPLACE THE ORC**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

5. **STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning vehicle to customer.

B1C4E-1ST ROW PASSENGER SEAT BELT BUCKLE PRETENSIONER CIRCUIT OPEN

CIRCUIT SCHEMATIC

01a06506

Fig. 6: Passenger Seat Belt Buckle Tensioner Circuits Schematic

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Seat Belt Buckle Tensioner circuits.

SET CONDITIONS

- **Set Condition:**

The ORC has detected an open or high resistance on the Passenger Seat Belt Buckle Tensioner circuits.

POSSIBLE CAUSES

Possible Causes
(R272) PASSENGER SEAT BELT BUCKLE TENSIONER LINE 1 CIRCUIT OPEN
(R274) PASSENGER SEAT BELT BUCKLE TENSIONER LINE 2 CIRCUIT OPEN
PASSENGER SEAT BELT BUCKLE PRETENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Ensure the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Select Active or Stored DTC.

Is the DTC active or stored?

ORC - ACTIVE DTC

Go To 2.

ORC - STORED DTC

Go To 6.

2. **CHECK FOR OPEN PASSENGER SEAT BELT BUCKLE TENSIONER**

Fig. 7: Connecting 8443 Load Tool And 8443-20 Jumper To Passenger Seat Belt Buckle Tensioner Connector
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Passenger Seat Belt Buckle Tensioner connector.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-20 Jumper to the Passenger Seat Belt Buckle Tensioner connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

Does the scan tool display: B1C4E-1ST ROW PASSENGER SEAT BELT BUCKLE

PRETENSIONER CIRCUIT OPEN?

Yes

Go To 3.

No

Replace the Passenger Seat Belt Buckle Tensioner in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

3. CHECK (R272) PASSENGER SEAT BELT BUCKLE TENSIONER LINE 1 CIRCUIT FOR AN OPEN

81a8eb36

Fig. 8: Measuring Resistance Of (R272) Passenger Seat Belt Buckle Tensioner Line/1 Circuit Between Passenger Seat Belt Buckle Tensioner Connector Cavity 2 And ORC 8443-32-R Adapter Cavity C2-10

Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Passenger Seat Belt Buckle Tensioner connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC 8443-32-R Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the resistance of the (R272) Passenger Seat Belt Buckle Tensioner Line 1 circuit between the Passenger Seat Belt Buckle Tensioner connector cavity 2 and the ORC 8443-32-R Adapter cavity C2-10.

Is the resistance below 1.0 ohm?

Yes

Go To 4.

No

Repair the (R272) Passenger Seat Belt Buckle Tensioner Line 1 circuit for and open. Then Go To 4.

4. CHECK (R274) PASSENGER SEAT BELT BUCKLE TENSIONER LINE 2 CIRCUIT FOR AN OPEN

81a8eb2f

Fig. 9: Measuring Resistance Of (R274) Passenger Seat Belt Buckle Tensioner Line 2 Circuit Between Passenger Seat Belt Buckle Tensioner Connector Cavity 1 And ORC 8443-32-R Adapter Cavity C2-9

Courtesy of CHRYSLER LLC

Measure the resistance of the (R274) Passenger Seat Belt Buckle Tensioner Line 2 circuit between the Passenger Seat Belt Buckle Tensioner connector Cavity 1 and the ORC 8443-32-R Adapter cavity C2-9.

Is the resistance below 1.0 ohm?

Yes

Go To 5.

No

Repair the (R274) Passenger Seat Belt Buckle Tensioner Line 2 circuit for and open.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1 .**

5. REPLACE THE ORC

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

6. STORED ORC DTC

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning vehicle to customer.

**B1C4F-1ST ROW PASSENGER SEAT BELT BUCKLE PRETENSIONER
CIRCUIT SHORTED TOGETHER**

CIRCUIT SCHEMATIC

01a06506

Fig. 10: Passenger Seat Belt Buckle Tensioner Circuits Schematic
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Seat Belt Buckle Tensioner circuits.

SET CONDITIONS

- **Set Condition:**

The ORC has detected low resistance between the Passenger Seat Belt Buckle Tensioner circuits.

POSSIBLE CAUSES

Possible Causes
(R272) PASSENGER SEAT BELT BUCKLE TENSIONER LINE 1 CIRCUIT SHORTED TO (R274) PASSENGER SEAT BELT BUCKLE TENSIONER LINE 2 CIRCUIT PASSENGER SEAT BELT BUCKLE TENSIONER OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. SELECT ACTIVE OR STORED DTC

NOTE: Ensure the battery is fully charged.

NOTE: The scan tool, SRS Airbag Load Tool 8443, and DVOM are required to perform the following test.

Select Active or Stored DTC.

Is the DTC active or stored?

ORC - ACTIVE DTC

Go To 2.

ORC - STORED DTC

Go To 5.

2. CHECK FOR SHORTED PASSENGER SEAT BELT BUCKLE TENSIONER

Fig. 11: Connecting 8443 Load Tool And 8443-20 Jumper To Passenger Seat Belt Buckle Tensioner Connector
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Passenger Seat Belt Buckle Tensioner connector.

NOTE: Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and 8443-20 Jumper to the Passenger Seat Belt Buckle Tensioner connector.

WARNING: To avoid serious or fatal injury, turn the ignition on then reconnect the battery.

With the scan tool, read the active ORC DTC's.

Does the scan tool display: B1C4F-1ST ROW PASSENGER SEAT BELT BUCKLE

PRETENSIONER CIRCUIT SHORTED TOGETHER?

Yes

Go To 3.

No

Replace the Passenger Seat Belt Buckle Tensioner in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

3. **CHECK (R272) PASSENGER SEAT BELT BUCKLE TENSIONER LINE 1 CIRCUIT FOR A SHORT TO (R274) PASSENGER SEAT BELT BUCKLE TENSIONER LINE 2 CIRCUIT**

81a8eb3d

Fig. 12: Measuring Resistance Between (R272) Passenger Seat Belt Buckle Pretensioner Line 1 Circuit Cavity 1 And (R274) Passenger Seat Belt Buckle Tensioner Line 2 Circuit Cavity 1 And 2 At Passenger Seat Belt Buckle Tensioner Connector
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Passenger Seat Belt Buckle Tensioner connector.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the Load Tool ORC 8443-32-R Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

Measure the resistance between the (R272) Passenger Seat Belt Buckle Pretensioner Line 1 circuit cavity 1 and the (R274) Passenger Seat Belt Buckle Tensioner Line 2 circuit cavity 1 and 2 at the Passenger Seat Belt Buckle Tensioner connector.

Is the resistance below 10K ohms?

Yes

Repair the (R272) Passenger Seat Belt Buckle Tensioner Line 1 circuit for a short to the (R274) Passenger Seat Belt Buckle Tensioner Line 2 circuit.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 4.

4. REPLACE THE ORC

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

5. STORED ORC DTC

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTC's present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning vehicle to customer.

B210D-BATTERY VOLTAGE LOW

CIRCUIT SCHEMATIC

01a03106

Fig. 13: Occupant Classification Module (OCM) Circuit Schematic
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

While the Occupant Classification Module (OCM) CAN bus ignition status received is RUN or signal not available, the module checks the (A417) Fused B(+) circuit voltage input range.

SET CONDITIONS

- **Set Condition:**

If the OCM detects that the battery voltage is less than or equal to 6.25 volts $\pm$ 0.25 volt.

POSSIBLE CAUSES

Possible Causes
OCM (A27) FUSED B(+) CIRCUIT OPEN
VEHICLE CHARGING SYSTEM
OCCUPANT CLASSIFICATION MODULE (ORC)

DIAGNOSTIC TEST

1. VERIFY THAT DTC B210D-BATTERY VOLTAGE LOW IS ACTIVE

NOTE: Ensure the battery is fully charged.

NOTE: Troubleshoot any PCM charging/cranking DTCs before proceeding.

Turn the ignition on.

With the scan tool, read the Occupant Classification Module (OCM) DTCs.

Does the scan tool display active: B210D-BATTERY VOLTAGE LOW IS ACTIVE?

Yes

Go To 2.

No

Go To 3.

2. CHECK VOLTAGE OF OCM (A27) FUSED B(+) CIRCUIT.

81a931f8

Fig. 14: Measuring Voltage Between Ground And (A27) Fused B(+) Circuit Cavity 1 Of OCM C1 Connector
 Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the OCM connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Measure the voltage between Ground and the (A27) Fused B(+) circuit cavity 1 of the OCM C1 connector.

Is the voltage above 6.5 volts circuit?

Yes

Replace the OCM in accordance with the service information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No

Repair the (A27) Fused B(+) circuit for an open or high resistance.

Perform ***OCM SYSTEM VERIFICATION TEST** .

3. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of airbag system diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Does the scan tool display any ACTIVE DTCs?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Erase all codes before returning vehicle to customer.

B210E-BATTERY VOLTAGE HIGH

CIRCUIT SCHEMATIC

01a03106

Fig. 15: Occupant Classification Module (OCM) Circuit Schematic
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

While the CAN bus ignition status received is RUN or SNA (Signal Not Available), the module checks the (A27) Fused B(+) circuit voltage input range.

SET CONDITIONS

- **Set Condition:**

If the Occupant Classification Module (OCM) detects battery voltage greater than or equal to 24.25 ± 0.25 volts for 10 seconds.

POSSIBLE CAUSES

Possible Causes
VEHICLE CHARGING SYSTEM
OCCUPANT CLASSIFICATION MODULE (OCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

Turn the ignition on.

With the scan tool, read OCM DTCs.

Does the scan tool display active: B210E-BATTERY VOLTAGE HIGH?

Yes

Go To 2.

No

Go To 4.

2. **CHECK THE BATTERY VOLTAGE TO THE OCCUPANT CLASSIFICATION MODULE**

With the scan tool in Data Display, read OCM battery voltage.

Is the battery voltage greater than 24.0 ± 0.25 volts?

Yes

Go To 3.

No

Replace the OCM in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

3. CHECK FOR CHARGING SYSTEM RELATED DTCs IN THE POWERTRAIN CONTROL MODULE (PCM)

With the scan tool in ECU View, select PCM and check for any Charging System related DTCs.

Does the scan tool display any Charging System related DTCs?

Yes

Diagnose and repair the DTCs. Refer to **DIAGNOSIS AND TESTING** .

No

Replace the OCM in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

4. TEST FOR INTERMITTENT CONDITION

With the scan tool, record and erase all DTCs from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

Does the scan tool display any ACTIVE DTCs?

Yes

Select appropriate symptom from Symptom List.

No

No problem found. Erase all codes before returning vehicle to customer.

B212C-IGNITION RUN/START INPUT CIRCUIT OPEN

CIRCUIT SCHEMATIC

MONITOR CONDITIONS

When Monitored:

With the ignition in the Run-Start position.

SET CONDITIONS

- **Set Condition:**

If voltage on the (F201) Fused Run/Start Relay Output circuit drops below 6.0 ± 0.25 volts.

POSSIBLE CAUSES

Possible Causes
(F201) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN
(F201) FUSED RUN/START RELAY OUTPUT CIRCUIT SHORTED TO GROUND
OPEN TIPM FUSE 35
TOTALLY INTEGRATED POWER MODULE (TIPM)
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **VERIFY THAT DTC B212C-IGNITION RUN/START INPUT CIRCUIT OPEN IS ACTIVE IN THE ORC.**

NOTE: **Ensure the battery is fully charged.**

Turn the ignition on.

Wait 10 seconds.

With the scan tool, read Occupant Restraint Controller (ORC) DTCs.

Does the scan tool display active: B212C-IGNITION RUN/START INPUT CIRCUIT OPEN?

Yes

Go To 2.

No

Go To 8.

2. **INSPECT AIRBAG RUN-START FUSE**

Turn the ignition off.

Remove the Airbag Run-Start TIPM Fuse 35 from the TIPM and inspect the fuse.

NOTE: Check connectors - Clean and repair as necessary.

Is the Run/Start fuse open?

Yes

Go To 3.

No

Go To 5.

3. CHECK (F201) FUSED RUN/START RELAY OUTPUT CIRCUIT RESISTANCE

81a40d47

Fig. 17: Measuring Resistance Of (F201) Fused Run/Start Relay Output Circuit Between TIPM Run-Start Fuse M16 Output Terminal And Ground
Courtesy of CHRYSLER LLC

Measure the resistance of the (F201) Fused Run - Start Relay Output circuit between the Airbag Run-Start TIPM Fuse 35 (output side) terminal and ground.

Is the resistance below 100.0 ohms?

Yes

Go To 4.

No

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Replace Airbag Run-Start TIPM Fuse 35.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

4. **CHECK (F201) FUSED RUN/START RELAY OUTPUT CIRCUIT RESISTANCE WITH ORC DISCONNECTED**

81a40d47

Fig. 18: Measuring Resistance Of (F201) Fused Run/Start Relay Output Circuit Between TIPM Run-Start Fuse M16 Output Terminal And Ground

Courtesy of CHRYSLER LLC

WARNING: If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect both ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the Load Tool ORC 8443-32-R Adapter to the ORC connectors.

Measure the resistance of the (F201) Fused Run - Start Relay Output circuit between C2-32 of the 8443-32-R Adapter and ground.

Is the resistance below 100.0 ohms?

Yes

Repair the (F201) Fused Run - Start Relay Output circuit for a short to ground.

Replace the Airbag Run-Start TIPM Fuse 35.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Replace the ORC in accordance with the Service Information.

Replace the Airbag Run-Start TIPM Fuse 35.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

5. CHECK AIRBAG RUN - START TIPM FUSE 35 SUPPLY VOLTAGE

81a40d9a

Fig. 19: Measuring Voltage Of Run/Start Relay Output Circuit Between TIPM Run-Start Fuse M16 Supply Terminal And Ground
Courtesy of CHRYSLER LLC

Turn the ignition on.

Measure the voltage between the Airbag Run-Start TIPM Fuse 35 (supply side) terminal and ground.

Is the voltage above 6.0 volts?

Yes

Go To 6.

No

Replace the TIPM in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1**.

6. **CHECK (F201) FUSED RUN - START RELAY OUTPUT CIRCUIT FOR AN OPEN**

81a40da9

Fig. 20: Measuring Voltage Of (F201) Fused Run Start Relay Output Circuit Between ORC 8443-32-R Adapter Cavity C2-32 And Ground

Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Reinstall the Airbag Run-Start TIPM Fuse 35.

Disconnect the both ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Install the Airbag Load tool ORC 8443-32-R Adapter to the ORC connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Measure the voltage of the (F201) Fused Run - Start Relay Output circuit between the 8443-32-R connector cavity C2-32 and ground.

Is the voltage above 6.0 volts?

Yes

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

No

Go To 7.

7. **CHECK (F201) FUSED RUN - START RELAY OUTPUT CIRCUIT FOR AN OPEN**

81a40db0

Fig. 21: Measuring Resistance Of (F201) Fused Run - Start Relay Output Circuit Between 8443-32-R Connector Cavity C2-32 And Cavity 7 Of TIPM C6 Connector
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the TIPM C6 connector.

NOTE: Check connectors - Clean and repair as necessary.

Measure the resistance of the (F201) Fused Run - Start Relay Output Circuit between the 8443-32-R connector cavity C2-32 and cavity 7 of the TIPM C6 connector.

Is the below 5.0 ohms?

Yes

Replace the TIPM in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the open (F201) Fused Run/Start Relay Output circuit.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

8. TEST FOR INTERMITTENT CONDITION

With the scan tool, record and erase all DTCs from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor active codes as you work through the following steps.

WARNING: To avoid serious or fatal injury, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

Does the scan tool display any ACTIVE DTCs?

Yes

Select appropriate symptom from Symptom List.

No

No problem found. Erase all codes before returning the vehicle to the customer.

B212D-IGNITION RUN ONLY INPUT CIRCUIT OPEN

CIRCUIT SCHEMATIC

0190cc02

Fig. 22: Fused Ignition Switch Output (RUN) Circuit Schematic
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

With the ignition in the Run position.

SET CONDITIONS

- **Set Condition:**

If voltage on the (F100) Fused Ignition Switch Output (RUN) circuit drops below 6.0 volts.

POSSIBLE CAUSES

Possible Causes
TIPM FUSE 51 OPEN
TIPM FUSE 51 SUPPLY VOLTAGE LOW
(F100) FUSED RUN RELAY OUTPUT CIRCUIT OPEN
(F100) FUSED RUN RELAY OUTPUT CIRCUIT SHORT TO GROUND
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **VERIFY THAT DTC B212D-IGNITION RUN ONLY INPUT CIRCUIT OPEN IS ACTIVE**

NOTE: **Ensure the battery is fully charged.**

Turn the ignition on.

Wait 10 seconds.

With the scan tool, read Occupant Restraint Controller (ORC) and Occupant Classification Module (OCM) DTCs.

Does the scan tool display active: B212D-IGNITION RUN ONLY INPUT CIRCUIT OPEN?

Yes

Go To 2.

No

Go To 8.

2. **INSPECT AIRBAG RUN CIRCUIT FUSE 51**

Turn the ignition off.

Remove the TIPM Fuse 51 and inspect the fuse.

NOTE: Check connectors - Clean and repair as necessary.

Is the fuse open?

Yes

Go To 3.

No

Go To 5.

3. CHECK (F100) FUSED IGNITION SWITCH OUTPUT CIRCUIT SHORT TO GROUND

81a4084c

Fig. 23: Measuring Resistance Of (F100) Fused Run Relay Output Circuit Between TIPM Fuse 51 (Output Side) Terminal And Ground
Courtesy of CHRYSLER LLC

Measure the resistance of the (F100) Fused Run Relay Output circuit between the TIPM Fuse 51 (output side) terminal and ground.

Is the resistance below 100.0 ohms?

Yes

Go To 4.

No

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Replace TIPM Fuse 51.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

4. **CHECK (F100) FUSED IGNITION SWITCH OUTPUT CIRCUIT RESISTANCE WITH ORC DISCONNECTED**

81a4084c

Fig. 24: Measuring Resistance Of (F100) Fused Run Relay Output Circuit Between TIPM Fuse 51 (Output Side) Terminal And Ground

Courtesy of CHRYSLER LLC

WARNING: If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the Load Tool ORC 8443-32 Adapter to the ORC connectors.

Measure the resistance of the (F100) Fused Run Relay Output circuit between 8443-32-R Adapter cavity C2-31 and ground.

Is the resistance below 100.0 ohms?

Yes

Repair the (F100) Fused Run Relay Output (Run) circuit for a short to ground.

Replace the TIPM Fuse 51.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Replace the ORC in accordance with the Service Information.

Replace the TIPM Fuse 51.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

5. CHECK TIPM FUSE 51 SUPPLY SIDE CIRCUIT VOLTAGE

81a40853

Fig. 25: Measuring Voltage Of TIPM Fuse 51 (Supply Side) Of Fuse To Ground
Courtesy of CHRYSLER LLC

Turn the ignition on.

Measure the voltage of the TIPM Fuse 51 (supply side) of the fuse to ground.

Is the voltage above 6.0 volts?

Yes

Go To 6.

No

Replace the TIPM in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1**.

6. **CHECK (F100) FUSED RUN RELAY OUTPUT CIRCUIT FOR AN OPEN CIRCUIT**

81a40857

Fig. 26: Measuring Voltage Of (F100) Fused Run Relay Output (Run) Circuit Between 8443-32-R Adapter Cavity C2-31 And Ground
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Reinstall the TIPM Fuse 51.

Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

Connect the Airbag Load Tool ORC 8443-32-R Adapter to the ORC harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Measure the voltage of the (F100) Fused Run Relay Output (Run) circuit between the 8443-32-R Adapter cavity C2-31 and ground.

Is the voltage above 6.0 volts?

Yes

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

No

Go To 7.

7. **CHECK FUSE 51 OUTPUT TO CAVITY 38 OF THE TIPM C6 CONNECTOR**

81a4085e

Fig. 27: Measuring Resistance Of (F100) Fused Run Relay Output (Run) Circuit Between 8443-32-R Adapter Cavity C2-31 And TIPM C6 Connector Cavity 38

Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the TIPM C6 connector.

NOTE: Check connectors - Clean and repair as necessary.

Measure the resistance of the (F100) Fused Run Relay Output (Run) circuit between the 8443-32-R Adapter cavity C2-31 and TIPM C6 connector cavity 38.

Is the resistance below 5.0 ohms?

Yes

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Replace the TIPM in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

8. TEST FOR INTERMITTENT CONDITION

With the scan tool, record and erase all DTCs from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor active codes as you work through the following steps.

WARNING: To avoid serious or fatal injury, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

Does the scan tool display any ACTIVE DTCs?

Yes

Select appropriate symptom from Symptom List.

No

No problem found. Erase all codes before returning vehicle to customer.

B2206-CURRENT VIN MISSING / MISMATCH

OCCUPANT CLASSIFICATION SEAT WEIGHTS

Fig. 28: Identifying OCS Seat Weights MRL #9077
Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

During power-up, the Occupant Restraint Controller (ORC) and Occupant Classification Module (OCM) monitors the CAN bus for the VIN message.

SET CONDITIONS

Set Condition:

This DTC will set if the VIN information received from the Powertrain Control Module (PCM) is different from the stored VIN.

POSSIBLE CAUSES

Possible Causes
INCORRECT VIN PROGRAMMED INTO THE PCM OCCUPANT CLASSIFICATION MODULE (OCM)

DIAGNOSTIC TEST

1. CHECK FOR ACTIVE DTC

NOTE: Troubleshoot any Ignition, Battery, Seat Weight Sensor, or OCM Internal DTC BEFORE proceeding

NOTE: Ensure that the battery is fully charged.

NOTE: This DTC cannot be cleared until the *OCM SYSTEM VERIFICATION TEST has been completed successfully.

With the scan tool, read DTC.

Select the module and DTC type.

OCM-Active

Go To 2.

OCM-Stored

Erase code with scan tool, test complete.

2. CHECK THE VIN STORED IN THE PCM

With the scan tool, compare the VIN that is stored in the PCM to the VIN of the vehicle's VIN plate.

Does the VIN stored in the PCM match the vehicle's VIN?

Yes

Go To 3.

No

Replace and Configure the Powertrain Control Module in accordance with the service information.

Perform **POWERTRAIN VERIFICATION TEST**.

3. PERFORM THE OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST

NOTE: Ensure that the battery is fully charged.

NOTE: The Occupant Classification Seat Weights 9077 are required to perform this test.

Verify that the passenger seat is empty.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the ***OCM SYSTEM VERIFICATION TEST** to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTC.

Does the scan tool display any active: B2206-CURRENT VIN MISSING/MISMATCH DTC?

Yes

Go To 4.

No

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

4. PERFORM OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Verify that the passenger seat is empty.

Verify that all of the Seat Weight Sensor mounting screws are tightened to torque specification. Refer to **SEAT WEIGHT SENSOR** for specification.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the ***OCM SYSTEM VERIFICATION TEST** to completion.

To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, proceed as follows.

With the scan tool, read OCM DTC.

Does the scan tool display active: B2206-CURRENT VIN MISSING/MISMATCH?

Yes

To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the OCM in accordance with the Service Information.

Replace the Service Kit if a seat from another vehicle was installed.

Perform ***OCM SYSTEM VERIFICATION TEST** .

No - But Other DTC Present

Diagnose and repair the other DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No - No Active DTC Present

Erase all codes before returning vehicle to customer.

B2207-OCCUPANT RESTRAINT CONTROLLER INTERNAL 1

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

With the ignition on. The module's on board diagnostics continuously performs internal circuit tests.

SET CONDITIONS

- **Set Condition:**

This DTC will set if the module identifies an out of range internal circuit.

POSSIBLE CAUSES

Possible Causes
INTERMITTENT SQUIB SHORT TO GROUND
INTERMITTENT SQUIB SHORT TO VOLTAGE
INTERMITTENT SQUIB OPEN
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. CHECK FOR SQUIB RELATED DTCS

Turn the ignition on.

With the scan tool, read ORC DTCs.

Is there any squib related DTCs present?

Yes

Diagnose specified squib DTCs according to procedure in article before diagnosing this DTC.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go to 2.

2. REPLACE OCCUPANT RESTRAINT CONTROLLER

Turn the ignition on.

With the scan tool, erase and read ORC DTC.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take proper precautions could result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1 .

B2208-OCCUPANT RESTRAINT CONTROLLER INTERNAL 2

MONITOR CONDITIONS

When Monitored:

With the ignition on. The module's on board diagnostics continuously performs internal circuit tests.

SET CONDITIONS

- **Set Condition:**

This DTC will set if the module identifies an out of range internal circuit.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. REPLACE OCCUPANT RESTRAINT CONTROLLER

Turn the ignition on.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take proper precautions could result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

B2209-OCCUPANT RESTRAINT CONTROLLER INTERNAL 3

MONITOR CONDITIONS

When Monitored:

With the ignition on. The module's on board diagnostics continuously performs internal circuit tests.

SET CONDITIONS

- Set Condition:**

This DTC will set if the module identifies an out of range internal circuit.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. REPLACE OCCUPANT RESTRAINT CONTROLLER

Turn the ignition on.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take proper precautions could result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

B220A-OCCUPANT RESTRAINT CONTROLLER INTERNAL 4

MONITOR CONDITIONS

When Monitored:

With the ignition on. The module's on board diagnostics continuously performs internal circuit tests.

SET CONDITIONS

- **Set Condition:**

This DTC will set if the module identifies an out of range internal circuit.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. REPLACE OCCUPANT RESTRAINT CONTROLLER

Turn the ignition on.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take proper precautions could result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

B220B-OCCUPANT RESTRAINT CONTROLLER FIRING STORED ENERGY

MONITOR CONDITIONS

When Monitored:

With the ignition on. The module's on board diagnostics continuously performs internal circuit tests.

SET CONDITIONS

- **Set Condition:**

This DTC will set if the module identifies an out of range internal circuit.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. REPLACE OCCUPANT RESTRAINT CONTROLLER

Turn the ignition on.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

B220C-OCCUPANT RESTRAINT CONTROLLER ACCELEROMETER 1 INTERNAL

MONITOR CONDITIONS

When Monitored:

With the ignition on. The module's on board diagnostics continuously performs internal circuit tests.

SET CONDITIONS

- **Set Condition:**

This DTC will set if the module identifies an out of range internal circuit.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. REPLACE OCCUPANT RESTRAINT CONTROLLER

Turn the ignition on.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take proper precautions can result in accidental airbag deployment and serious or fatal injury.

Repair

Replace the ORC in accordance with the Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

B2212-OCCUPANT CLASSIFICATION MODULE INTERNAL

MONITOR CONDITIONS

When Monitored:

While the IGN status is RUN or signal not available, while the CAN bus system voltage is between 10 and 16 volts, and during the OCS Verification Test.

SET CONDITIONS

- **Set Condition:**

This DTC will set if the module detects an internal failure.

POSSIBLE CAUSES

Possible Causes
OCCUPANT CLASSIFICATION MODULE (OCM)

DIAGNOSTIC TEST

1. **PERFORM THE OCCUPANT CLASSIFICATION MODULE VERIFICATION TEST**

NOTE: **Ensure that the passenger seat is empty.**

Turn the ignition off, wait 10 seconds and turn ignition on.

With the scan tool, read OCM DTC.

Did the DTC: B2212-OCCUPANT CLASSIFICATION MODULE INTERNAL reset?

Yes

Go To 2.

No

Perform ***OCM SYSTEM VERIFICATION TEST** .

2. **PERFORM OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST**

OCCUPANT CLASSIFICATION SEAT WEIGHTS

Fig. 29: OCS Seat Weights MRL #9077
Courtesy of CHRYSLER LLC

Verify that the passenger seat is empty.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all

tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the ***OCM SYSTEM VERIFICATION TEST** to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, proceed as follows.

With the scan tool, read OCM DTC.

Does the scan tool display any active DTC?

Yes -

B2212-OCCUPANT CLASSIFICATION MODULE INTERNAL DTC is ACTIVE
Go To 3.

Yes -

other DTC ACTIVE
Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Perform ***OCM SYSTEM VERIFICATION TEST** .

3. **VERIFY SENSOR TORQUE**

OCCUPANT CLASSIFICATION SEAT WEIGHTS

Fig. 30: OCS Seat Weights MRL #9077
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Verify that the passenger seat is empty.

To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Verify that all of the Seat Weight Sensor mounting screws are tightened to torque specification. Refer to **SEAT WEIGHT SENSOR** for specifications.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the ***OCM SYSTEM VERIFICATION TEST** to completion.

To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, proceed as follows.

With the scan tool, read OCM DTC.

Does the scan tool display any active DTC?

Yes -

B2212-OCCUPANT CLASSIFICATION MODULE INTERNAL DTC is ACTIVE

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Replace the Occupant Classification Module in accordance with the service information.

Perform ***OCM SYSTEM VERIFICATION TEST** .

Yes -

other DTC ACTIVE

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Perform ***OCM SYSTEM VERIFICATION TEST** .

B222A-VEHICLE LINE MISMATCH

ADDITIONAL WIRING

For complete wiring diagrams refer to SYSTEM WIRING DIAGRAMS .

MONITOR CONDITIONS

When Monitored:

With the ignition on.

SET CONDITIONS

- Set Condition:

The Totally Integrated Power Module (TIPM) sends a Bus Message to the Occupant Restraint Controller (ORC) containing the vehicle line but the ORC original VIN does not march the broadcast VIN.

POSSIBLE CAUSES

Possible Causes
TOTALLY INTEGRATED POWER MODULE (TIPM)
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. VERIFY THAT DTC B222A-VEHICLE LINE MISMATCH IS ACTIVE

NOTE: Ensure the battery is fully charged.

Turn the ignition on.

With the scan tool, read ORC DTC.

Does the scan tool display active: B222A-VEHICLE LINE MISMATCH?

Yes

Go To 2.

No

Erase DTC, see if code returns

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1 .

2. COMPARE STORED VIN IN THE TIPM AND ORC

With the scan tool in ORC select More Options select ECU Details, compare Original VIN and current VIN.

With the scan tool, read and record the VIN that is stored in the ORC.

Does the stored VIN match the current VIN?

Yes

Go To 3.

No

Replace or reprogram the TIPM in accordance with the Service Information.

3. REPLACE THE OCCUPANT RESTRAINT CONTROLLER

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

View repair

Repair

Replace the ORC in accordance with the service information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

B223B-VEHICLE CONFIGURATION MISMATCH

MONITOR CONDITIONS

When Monitored:

With the ignition on.

SET CONDITIONS

- **Set Condition:**

The Totally Integrated Power Module (TIPM) sends a message to the Occupant Restraint Controller

(ORC) that the vehicle is not equipped with an Occupant Classification Module (OCM) but the ORC is receiving OCM messages over the Can B bus.

POSSIBLE CAUSES

Possible Causes
TOTALLY INTEGRATED POWER MODULE (TIPM) OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. VERIFY THAT DTC B223B-VEHICLE CONFIGURATION MISMATCH IS ACTIVE

Turn the ignition on.

With the scan tool, read ORC DTC.

NOTE: Ensure the battery is fully charged.

Does the scan tool display active: B223B-VEHICLE CONFIGURATION MISMATCH?

Yes

Go To 2.

No

Erase DTC, see if code returns

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

2. COMPARE STORED VIN IN THE TIPM AND ORC

With the scan tool in ORC select More Options select ECU Details, compare Original VIN and current VIN.

With the scan tool, read and record the VIN that is stored in the ORC.

Does the stored VIN match the current VIN?

Yes

Go To 3.

No

Replace or reprogram the TIPM in accordance with the Service Information.

3. REPLACE THE OCCUPANT RESTRAINT CONTROLLER

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

View repair

Repair

Replace the ORC in accordance with the service information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

B223D-OCCUPANT CLASSIFICATION MODULE DTC PRESENT

MONITOR CONDITIONS

When Monitored:

With the ignition on.

SET CONDITIONS

- Set Condition:

This DTC will set if the ORC receives a bus message with the active OCM DTC Present bit set.

POSSIBLE CAUSES

Possible Causes
ACTIVE DTC IN OCCUPANT CLASSIFICATION MODULE (OCM) OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. VERIFY THAT DTC B223D-OCCUPANT CLASSIFICATION MODULE DTC IS ACTIVE

With the scan tool, read the ORC active DTCs.

Does the scan tool display active: B223D-OCCUPANT CLASSIFICATION MODULE?

Yes

Go To 2.

No

With the scan tool, perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

2. ACTIVE DTC IN OCCUPANT CLASSIFICATION MODULE

With the scan tool, read the OCCUPANT CLASSIFICATION MODULE active DTC.

Are there any active DTC present?

Yes

Refer to the symptom list for problems related to the OCM.

No

Go To 3.

3. REPLACE THE OCCUPANT RESTRAINT CONTROLLER

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

If there are no possible causes remaining, view repair.

Repair

Replace the ORC in accordance with Service Instructions.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

B2255-OCCUPANT RESTRAINT CONTROLLER ROLL OVER FEATURE DISABLE

MONITOR CONDITIONS

When Monitored:

With the ignition on. The module's on board diagnostics continuously performs internal circuit tests.

SET CONDITIONS

- **Set Condition:**

This DTC will set if the ORC Roll Over Feature has been disabled via the scan tool.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. OCCUPANT RESTRAINT CONTROLLER ROLL OVER FEATURE DISABLED

Turn the ignition on.

With the scan tool read the ORC Roll Over Feature status Enabled or Disabled.

Does the scan tool show Roll Over Feature Disabled?

Repair

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

U0002-CAN C BUS OFF PERFORMANCE

CIRCUIT SCHEMATIC

01300245

Fig. 31: CAN C Bus Circuit Schematic
 Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

With the ignition on.

SET CONDITIONS

• Set Condition:

The Occupant Restraint Controller (ORC) or Occupant Classification (OCM) detects a corrupt CAN C Bus messages from the Totally Integrated Power Module (TIPM).

POSSIBLE CAUSES

Possible Causes
(D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE (D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE (D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT ANTILOCK BRAKE MODULE POWERTRAIN CONTROL MODULE (PCM) ENGINE CONTROL MODULE (DIESEL ONLY) (ECM) TRANSMISSION CONTROL MODULE (TCM) STEERING ANGLE SENSOR AUTOMATIC SWAY BAR SYSTEM MODULE WIRELESS CONTROL MODULE (WCM) OCCUPANT RESTRAINT CONTROLLER MODULE (ORC) OCCUPANT CLASSIFICATION MODULE (OCM) TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. ANTILOCK BRAKE MODULE - INTERNAL SHORT

Turn the ignition off.

Disconnect the Antilock Brake Module harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active ORC and OCM DTC's.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes

Go To 3.

No

Inspect the wiring and connectors for damage or shorted circuits in accordance with the service information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

Perform ***OCM SYSTEM VERIFICATION TEST** .

3. POWERTRAIN CONTROL MODULE - INTERNAL SHORT

Turn the ignition off.

Disconnect the Powertrain Control Module C1 harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes

Go To 4.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Powertrain Control Module in accordance with the service information.

Perform **POWERTRAIN VERIFICATION TEST** .

4. ENGINE CONTROL MODULE (DIESEL ONLY) - INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Engine Control Module harness connectors.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes

Go To 5.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the

Engine Control Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

5. TRANSMISSION CONTROL MODULE - INTERNAL SHORT

Turn the ignition off.

NOTE: **If vehicle is not equipped with this module, answer yes to the question.**

Disconnect the Transmission Control Module harness connectors.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes

Go To 6.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Transmission Control Module in accordance with the service information.

Perform **POWERTRAIN VERIFICATION TEST** .

6. STEERING ANGLE SENSOR - INTERNAL SHORT

Turn the ignition off.

NOTE: **If vehicle is not equipped with this module, answer yes to the question.**

Disconnect the Steering Angle Sensor harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes

Go To 7.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Steering Angle Sensor in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

7. AUTOMATIC SWAY BAR SYSTEM MODULE - INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Automatic Sway Bar System Module harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes

Go To 8.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Automatic Sway Bar System Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

8. WIRELESS CONTROL MODULE - INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Wireless Control Module harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes

Go To 9.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Wireless Control Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

9. **OCCUPANT RESTRAINT CONTROLLER MODULE - INTERNAL SHORT**

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Occupant Restraint Controller Module harness connectors.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes

Go To 10.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Occupant Restraint Controller Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

10. OCCUPANT CLASSIFICATION MODULE - INTERNAL SHORT

Turn the ignition off.

NOTE: **If vehicle is not equipped with this module, answer yes to the question.**

Disconnect the Occupant Classification Module harness connectors.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes

Go To 11.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Occupant Classification Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

11. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

Fig. 32: Checking Voltage Between CAN C Bus (+) Circuit & Ground
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Totally Integrated Power Module C1 harness connector.

Turn the ignition on.

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is there any voltage present?

Yes

Repair the (D65) CAN C Bus (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 12.

12. (D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE

Fig. 33: Measuring Voltage Between CAN C Bus (-) Circuit & Ground
 Courtesy of CHRYSLER LLC

Measure the voltage between the (D64) CAN C Bus (-) circuit and ground.

Is there any voltage present?

Yes

Repair the (D64) CAN C Bus (-) circuit for a short to voltage.
 Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 13.

13. **(D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND**

MODULE-
TOTALLY
INTEGRATED
POWER C1

8198930f

Fig. 34: Checking CAN C Bus (+) Circuit For Short To Ground
Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance between ground and the (D65) CAN C Bus (+) circuit.

Is any resistance present?

Yes

Repair the (D65) CAN C Bus (+) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 14.

14. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND

MODULE-
TOTALLY
INTEGRATED
POWER C1

8198931a

Fig. 35: Measuring Resistance Between Ground & CAN C Bus (-) Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is any resistance present?

Yes

Repair the (D64) CAN C Bus (-) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 15.

15. **(D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT**

Fig. 36: Checking Resistance Between CAN C Bus (+) Circuit & CAN C Bus (-) Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between the (D65) CAN C Bus (+) circuit and the (D64) CAN C Bus (-) circuit.

Is any resistance present?

Yes

Repair the (D65) CAN C Bus (+) circuit for a short to the (D64) CAN C Bus (-) circuit.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Totally Integrated Power Module in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (TIPM)

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC)

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0154-LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0170-LOST COMMUNICATION W/UP-FRONT LEFT SATELLITE ACCELERATION SENSOR

CIRCUIT SCHEMATIC

01954000

Fig. 37: Front Left/Right Satellite Acceleration Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

The Occupant Restraint Controller (ORC) continuously communicates with the Front Left Impact Sensor over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITIONS

- **Set Condition:**

This code will set, if the ORC and the Front Left Impact Sensor do not establish and maintain valid data communications.

POSSIBLE CAUSES

Possible Causes
(R79) SIGNAL CIRCUIT SHORTED TO BATTERY
(R79) SIGNAL CIRCUIT SHORTED TO GROUND
(R79, R81) FRONT LEFT IMPACT SENSOR CIRCUITS SHORTED TOGETHER
(R81) FRONT LEFT IMPACT SENSOR GROUND CIRCUIT OPEN
(R79) FRONT LEFT IMPACT SENSOR SIGNAL CIRCUIT OPEN
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **VERIFY THAT DTC U0170-LOST COMMUNICATION W/UP-FRONT LEFT SATELLITE ACCELERATION SENSOR IS ACTIVE**

NOTE: **Ensure the battery is fully charged.**

Turn the ignition on.

With the scan tool, read ORC DTCs.

Does the scan tool display active: U0170-LOST COMMUNICATION W/UP-FRONT LEFT SATELLITE ACCELERATION SENSOR?

Yes

Go To 2.

No

Go To 9.

2. **CHECK THE (R79) and (R81) FRONT LEFT IMPACT SENSOR SIGNAL AND GROUND CIRCUITS FOR A SHORT TO BATTERY**

Fig. 38: Measuring (R79) Front Left Impact Sensor Signal Cavity 1 And (R81) Front Left Impact Sensor Ground Cavity 2 Circuit Voltage Between Front Left Impact Sensor Connector And Ground
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Front Left Impact Sensor connector.

Disconnect the ORC connectors.

Connect the ORC 8443-32-R Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Measure the (R79) Front Left Impact Sensor Signal cavity 1 and (R81) Front Left Impact Sensor Ground cavity 2 circuit voltage between the Front Left Impact Sensor connector and ground.

Is there any voltage present?

Yes

Repair the (R79) and (R81) Front Left Impact Sensor circuits for a short to battery.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK THE (R79) AND (R81) FRONT LEFT IMPACT SENSOR CIRCUITS FOR A SHORT TO GROUND**

819c0f29

Fig. 39: Measuring Resistance Of (R79) Front Left Impact Sensor Signal Circuit Cavity 2 And (R81) Front Left Impact Sensor Ground Circuit Cavity 1 Between Front Left Impact Sensor Connector And Ground

Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Measure the resistance of the (R79) Front Left Impact Sensor Signal circuit cavity 2 and (R81) Front Left Impact Sensor Ground circuit cavity 1 between the Front Left Impact Sensor connector and ground.

Is the resistance below 100K ohms?

Yes

Repair the (R79) and (R81) Front Left Impact Sensor circuits for a short to ground.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 4.

4. **CHECK THE (R79) AND (R81) FRONT LEFT IMPACT SENSOR CIRCUITS FOR A SHORT TOGETHER**

Fig. 40: Measuring Resistance Between (R79) Front Left Impact Sensor Signal And (R81) Front Left Impact Sensor Ground Circuits At Front Left Impact Sensor Connector
Courtesy of CHRYSLER LLC

Measure the resistance between the (R79) Front Left Impact Sensor Signal and (R81) Front Left Impact Sensor Ground circuits at the Front Left Impact Sensor connector.

Is the resistance below 100K ohms?

Yes

Repair the (R79) and (R81) Front Left Impact Sensor circuits shorted together.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 5.

5. **CHECK THE (R81) FRONT LEFT IMPACT SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

819c1062

Fig. 41: Measuring Resistance Of (R81) Front Left Impact Sensor Ground Circuit Cavity 1 Between Front Left Impact Sensor Connector And ORC 8443-32-R Adapter Cavity C1-28
Courtesy of CHRYSLER LLC

Measure the resistance of the (R81) Front Left Impact Sensor Ground circuit cavity 1 between the Front Left Impact Sensor connector and the ORC 8443-32-R Adapter cavity C1-28.

Is the resistance below 1 ohm?

Yes

Go To 6.

No

Repair the (R81) Front Left Impact Sensor 1 Ground circuit for an open or high resistance.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

6. **CHECK THE (R79) FRONT LEFT IMPACT SENSOR CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

819c139a

Fig. 42: Measuring Resistance Of (R79) Front Left Impact Sensor Signal Circuit Cavity 2 Between Front Left Impact Sensor Connector And ORC 8443-32-R Adapter Cavity 29
Courtesy of CHRYSLER LLC

Measure the resistance of the (R79) Front Left Impact Sensor Signal circuit cavity 2 between the Front Left Impact Sensor connector and the ORC 8443-32-R Adapter cavity 29.

Is the resistance below 1 ohm?

Yes

Go To 7.

No

Repair the (R79) Front Left Impact Sensor Signal circuit for an open or high resistance.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

7. CHECK OPERATION OF THE FRONT LEFT IMPACT SENSOR

Replace the Front Left Impact Sensor.

Reconnect the vehicle body harness to the impact sensor.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Connect the scan tool to the Data Link Connector - use the most current software available.

Use the scan tool and erase the stored codes in all airbag system modules.

Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.

Wait one minute, and read active codes and if there are none present read the stored codes.

Did the active Front Left Impact Sensor DTC return?

Yes

Go To 8.

No

Repair is complete.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

8. REPLACE THE OCCUPANT RESTRAINT CONTROLLER

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and serious or fatal injury.

Disconnect the ORC 8443-32-R Adapter.

If there are no possible causes remaining, view repair.

Repair

Replace the Occupant Restraint Controller in accordance with Service Information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

9. TEST FOR AN INTERMITTENT CONDITION

With the scan tool, record and erase all DTC's from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram / schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

WARNING: To avoid serious or fatal injury, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate symptom from Symptom List.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

U0171-LOST COMMUNICATION W/UP-FRONT RIGHT SATELLITE

ACCELERATION SENSOR

CIRCUIT SCHEMATIC

Fig. 43: Front Left/Right Satellite Acceleration Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

The Occupant Restraint Controller (ORC) continuously communicates with the Front Right Impact Sensor over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITIONS

- **Set Condition:**

This code will set, if the ORC and the Front Right Impact Sensor do not establish and maintain valid data communications.

POSSIBLE CAUSES

Possible Causes
(R80) SIGNAL CIRCUIT SHORTED TO BATTERY
(R80) SIGNAL CIRCUIT SHORTED TO GROUND
(R80, R82) FRONT RIGHT IMPACT SENSOR CIRCUITS SHORTED TOGETHER
(R82) FRONT RIGHT IMPACT SENSOR GROUND CIRCUIT OPEN
(R80) FRONT RIGHT IMPACT SENSOR SIGNAL CIRCUIT OPEN
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **VERIFY THAT DTC U0171-LOST COMMUNICATION W/UP-FRONT RIGHT SATELLITE ACCELERATION SENSOR IS ACTIVE**

NOTE: **Ensure the battery is fully charged.**

Turn the ignition on.

With the scan tool, read ORC DTCs.

Does the scan tool display active: U0171-LOST COMMUNICATION W/UP-FRONT RIGHT SATELLITE ACCELERATION SENSOR?

Yes

Go To 2.

No

Go To 9.

2. **CHECK THE (R80) and (R82) FRONT RIGHT IMPACT SENSOR CIRCUITS FOR A SHORT TO BATTERY**

819c3eb1

Fig. 44: Measuring (R80) Front Right Impact Sensor Signal Circuit Cavity 2 And (R82) Sensor Ground Circuit At Front Right Impact Sensor Cavity 1 Circuit Voltage Between Front Right Impact Sensor Connector And Ground
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Front Right Impact Sensor connector.

Disconnect the ORC connectors.

Connect the ORC 8443-32-R Adapter to the ORC connector.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Measure the (R80) Front Right Impact Sensor Signal circuit cavity 2 and (R82) Sensor Ground circuit at the Front Right Impact Sensor cavity 1 circuit voltage between the Front Right Impact Sensor connector

and ground.

Is there any voltage present?

Yes

Repair the (R80) and (R82) Front Right Impact Sensor circuits for a short to battery.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK THE (R80) AND (R82) FRONT RIGHT IMPACT SENSOR CIRCUITS FOR A SHORT TO GROUND

819c3f82

Fig. 45: Measuring Resistance Of (R80) Cavity 2 And (R82) Front Right Impact Sensor Circuit Cavity 1 Between Front Right Impact Sensor Connector And Ground
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn ignition on, then reconnect the battery.

Measure the resistance of the (R80) cavity 2 and (R82) Front Right Impact Sensor circuit cavity 1 between the Front Right Impact Sensor connector and ground.

Is the resistance below 100K ohms?

Yes

Repair the (R80) and (R82) Front Right Impact Sensor circuits for a short to ground.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 4.

4. **CHECK THE (R80) AND (R82) FRONT RIGHT IMPACT SENSOR CIRCUITS FOR A SHORT TOGETHER**

819c3f1a

Fig. 46: Measuring Resistance Between (R80) Front Right Impact Sensor Signal Cavity 2 And (R82) Front Right Impact Sensor Ground Cavity 1 Circuit At Front Right Impact Sensor Connector

Courtesy of CHRYSLER LLC

Measure the resistance between the (R80) Front Right Impact Sensor Signal cavity 2 and (R82) Front Right Impact Sensor Ground cavity 1 circuit at the Front Right Impact Sensor connector.

Is the resistance below 100K ohms?

Yes

Repair the (R80) and (R82) Front Right Impact Sensor circuits shorted together.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

No

Go To 5.

5. **CHECK THE (R82) FRONT RIGHT IMPACT SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

819c3f2f

Fig. 47: Measuring Resistance Of (R82) Front Right Impact Sensor Ground Circuit Cavity 1 Between Front Right Impact Sensor Connector And ORC 8443-32-R Adapter C1-30
Courtesy of CHRYSLER LLC

Measure the resistance of the (R82) Front Right Impact Sensor Ground circuit cavity 1 between the Front Right Impact Sensor connector and the ORC 8443-32-R Adapter C1-30.

Is the resistance below 1 ohm?

Yes

Go To 6.

No

Repair the (R82) Front Right Impact Sensor 2 Ground circuit for an open or high resistance.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

6. **CHECK THE (R80) FRONT RIGHT IMPACT SENSOR SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

819c3f74

Fig. 48: Measuring Resistance Of (R80) Front Right Impact Sensor Signal Circuit Cavity 1 Between Front Right Impact Sensor Connector And ORC 8443-32-R Adapter Cavity 31
Courtesy of CHRYSLER LLC

Measure the resistance of the (R80) Front Right Impact Sensor Signal circuit cavity 1 between the Front Right Impact Sensor connector and the ORC 8443-32-R Adapter cavity 31.

Is the resistance below 1 ohm?

Yes

Go To 7.

No

Repair the (R80) Front Right Impact Sensor Signal circuit for an open or high resistance.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

7. CHECK OPERATION OF THE FRONT RIGHT IMPACT SENSOR

Replace the Front Right Impact Sensor.

Reconnect the vehicle body harness to the impact sensor.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Connect the scan tool to the Data Link Connector - use the most current software available.

Use the scan tool and erase the stored codes in all airbag system modules.

Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.

Wait one minute, and read active codes and if there are none present read the stored codes.

Did the active Front Right Impact Sensor DTC return?

Yes

Go To 8.

No

Repair is complete.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

8. REPLACE THE OCCUPANT RESTRAINT CONTROLLER

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and serious or fatal injury.

If there are no possible causes remaining, view repair.

Repair

Replace the Occupant Restraint Controller in accordance with Service Instructions.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

9. TEST FOR AN INTERMITTENT CONDITION

With the scan tool, record and erase all DTC's from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

WARNING: To avoid serious or fatal injury, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate symptom from Symptom List.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

2008 RESTRAINTS

Electrical Diagnostics - Liberty

U0172-LOST COMMUNICATION W/LEFT SIDE SATELLITE ACCELERATION SENSOR 1

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

The Occupant Restraint Controller (ORC) continuously communicates with the Left Side Impact Sensor 1 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITIONS

- **Set Condition:**

This code will set, if the ORC and the Left Side Impact Sensor 1 do not establish and maintain valid data communications.

POSSIBLE CAUSES

Possible Causes
(R13) SIGNAL CIRCUIT SHORTED TO BATTERY
(R13) SIGNAL CIRCUIT SHORTED TO GROUND
(R13, R15) LEFT SIDE IMPACT SENSOR 1 CIRCUITS SHORTED TOGETHER
(R15) LEFT SIDE IMPACT SENSOR 1 GROUND CIRCUIT OPEN
(R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT OPEN
LEFT SIDE IMPACT SENSOR 1

DIAGNOSTIC TEST

1. **VERIFY THAT DTC U0172-LOST COMMUNICATION W/LEFT SIDE SATELLITE ACCELERATION SENSOR 1 IS ACTIVE**

NOTE: **Ensure the battery is fully charged.**

Turn the ignition on.

With the scan tool, read ORC DTCs.

Does the scan tool display active: U0172-LOST COMMUNICATION W/LEFT SIDE SATELLITE ACCELERATION SENSOR 1?

Yes

Go To 2.

No

Go To 9.

2. **CHECK THE (R13) and (R15) LEFT SIDE IMPACT SENSOR 1 CIRCUITS FOR A SHORT TO BATTERY**

**SENSOR-
SIDE
IMPACT-
LEFT 1**

81618505

Fig. 1: Checking Left Side Impact Sensor 1 Circuits For Short To Battery
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Left Side Impact Sensor 1 connector.

Disconnect the ORC connectors.

Connect the ORC 8443-32-R Adapter to the ORC connectors.

NOTE: The IP Harness is always connected to the right side (C1) of the 8443-32-R Adapter.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R13) Left Side Impact Sensor 1 Signal circuit and (R15) Sensor Ground circuit between the Left Side Impact Sensor 1 connector and ground.

Is there any voltage present?

Yes

Repair the (R13) and (R15) Left Side Impact Sensor 1 circuits for a short to battery.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

No

Go To 3.

3. **CHECK THE (R13) and (R15) LEFT SIDE IMPACT SENSOR 1 CIRCUITS FOR A SHORT TO GROUND**

**SENSOR-
SIDE
IMPACT-
LEFT 1**

81618509

Fig. 2: Checking Left Side Impact Sensor Signal Circuit
Courtesy of CHRYSLER LLC

WARNING: To avoid serious or fatal injury, turn ignition on, then reconnect the battery.

Measure the resistance of the (R13) Left Side Impact Sensor 1 Signal circuit between the Left Side Impact Sensor 1 connector and ground.

Measure the resistance of the (R15) Left Side Impact Sensor 1 Ground circuit between the Left Side Impact Sensor 1 connector and ground.

Is the resistance below 100K ohms on either circuit?

Yes

Repair the (R13) and (R15) Left Side Impact Sensor 1 Signal and Ground circuit for a short to ground.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

No

Go To 4.

4. **CHECK THE (R13) and (R15) LEFT SIDE IMPACT SENSOR CIRCUITS FOR A SHORT TOGETHER**

**SENSOR-
SIDE
IMPACT-
LEFT 1**

8161853b

Fig. 3: Checking Left Side Impact Sensor Circuits For Short Together
Courtesy of CHRYSLER LLC

Measure the resistance between the (R13) Left Side Impact Sensor 1 Signal and (R15) Sensor Ground circuits at the Left Side Impact Sensor 1 connector.

Is the resistance below 100K ohms?

Yes

Repair the (R13) and (R15) Left Side Impact Sensor 1 circuits shorted together.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

No

Go To 5.

5. **CHECK THE (R15) LEFT SIDE IMPACT SENSOR 1 GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

816180db

Fig. 4: Checking Left Side Impact Sensor 1 Signal Circuit For Open Or High Resistance
 Courtesy of CHRYSLER LLC

Measure the resistance of the (R15) Left Side Impact Sensor 1 Ground circuit between the Left Side Impact Sensor 1 connector and the ORC 8443-32-R Adapter.

Is the resistance below 1 ohm?

Yes

Go To 6.

No

Repair the (R15) Left Side Impact Sensor 1 Ground circuit for an open or high resistance.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

6. **CHECK THE (R13) LEFT SIDE IMPACT SENSOR 1 CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

ORC ADAPTER
8443-25

816180d7

Fig. 5: Checking Left Side Impact Sensor 1 Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER LLC

Measure the resistance of the (R13) Left Side Impact Sensor 1 Signal circuit between the Left Side Impact Sensor 1 connector and the ORC 8443-32-R Adapter.

Is the resistance below 1 ohm?

Yes

Go To 7.

No

Repair the (R13) Left Side Impact Sensor 1 Signal circuit for an open or high resistance.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

7. CHECK OPERATION OF THE LEFT SIDE IMPACT SENSOR 1

Replace the Left Side Impact Sensor 1.

Reconnect the vehicle body harness to the impact sensor.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Connect the scan tool to the Data Link Connector - use the most current software available.

Use the scan tool and erase the stored codes in all airbag system modules.

Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.

Wait one minute, and read active codes and if there are none present read the stored codes.

Did the active Left Side Impact Sensor 1 DTC return?

Yes

Go To 8.

No

Repair is complete.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

8. REPLACE THE OCCUPANT RESTRAINT CONTROLLER

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and serious or fatal injury.

If there are no possible causes remaining, view repair.

Repair

Replace the Occupant Restraint Controller in accordance with Service Instructions.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

9. TEST FOR AN INTERMITTENT CONDITION

With the scan tool, record and erase all DTC's from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

WARNING: To avoid serious or fatal injury, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate symptom from Symptom List.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

U0173-LOST COMMUNICATION W/LEFT SIDE SATELLITE ACCELERATION SENSOR 2

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

The Occupant Restraint Controller (ORC) continuously communicates with the Left Side Impact Sensor 2 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITIONS

- **Set Condition:**

This code will set, if the ORC and the Left Side Impact Sensor 2 do not establish and maintain valid data communications.

POSSIBLE CAUSES

Possible Causes
(R17) SIGNAL CIRCUIT SHORTED TO BATTERY
(R17) SIGNAL CIRCUIT SHORTED TO GROUND

Is the resistance below 1 ohm?

Yes

Go To 7.

No

Repair the (R17) Left Side Impact Sensor 2 Signal circuit for an open or high resistance.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

7. CHECK OPERATION OF THE LEFT SIDE IMPACT SENSOR 2

Replace the Left Side Impact Sensor 2.

Reconnect the vehicle body harness to the impact sensor.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Connect the scan tool to the Data Link Connector - use the most current software available.

Use the scan tool and erase the stored codes in all airbag system modules.

Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.

Wait one minute, and read active codes and if there are none present read the stored codes.

Did the active Left Side Impact Sensor 2 DTC return?

Yes

Go To 8.

No

Repair is complete.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

8. REPLACE THE OCCUPANT RESTRAINT CONTROLLER

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and serious or fatal injury.

If there are no possible causes remaining, view repair.

Repair

Replace the Occupant Restraint Controller in accordance with Service Instructions.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

9. TEST FOR AN INTERMITTENT CONDITION

With the scan tool, record and erase all DTC's from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

WARNING: To avoid serious or fatal injury, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate symptom from Symptom List.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

Is the resistance below 1 ohm?

Yes

Go To 7.

No

Repair the (R14) Right Side Impact Sensor 1 Signal circuit for an open or high resistance.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

7. CHECK OPERATION OF THE RIGHT SIDE IMPACT SENSOR 1

Replace the Right Side Impact Sensor 1.

Reconnect the vehicle body harness to the impact sensor.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Connect the scan tool to the Data Link Connector - use the most current software available.

Use the scan tool and erase the stored codes in all airbag system modules.

Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.

Wait one minute, and read active codes and if there are none present read the stored codes.

Did the active Right Side Impact Sensor 1 DTC return?

Yes

Go To 8.

No

Repair is complete.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

8. REPLACE THE OCCUPANT RESTRAINT CONTROLLER

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and serious or fatal injury.

If there are no possible causes remaining, view repair.

Repair

Replace the Occupant Restraint Controller in accordance with Service Instructions.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

9. TEST FOR AN INTERMITTENT CONDITION

With the scan tool, record and erase all DTC's from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

WARNING: To avoid serious or fatal injury, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate symptom from Symptom List.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

7. CHECK OPERATION OF THE RIGHT SIDE IMPACT SENSOR 2

Replace the Right Side Impact Sensor 2.

Reconnect the vehicle body harness to the impact sensor.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Connect the scan tool to the Data Link Connector - use the most current software available.

Use the scan tool and erase the stored codes in all airbag system modules.

Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.

Wait one minute, and read active codes and if there are none present read the stored codes.

Did the active Right Side Impact Sensor 2 DTC return?

Yes

Go To 8.

No

Repair is complete.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

8. REPLACE THE OCCUPANT RESTRAINT CONTROLLER

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and serious or fatal injury.

If there are no possible causes remaining, view repair.

Repair

Replace the Occupant Restraint Controller in accordance with Service Instructions.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

9. TEST FOR AN INTERMITTENT CONDITION

With the scan tool, record and erase all DTC's from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

WARNING: To avoid serious or fatal injury, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

Are any ACTIVE DTCs present?

Yes

Select the appropriate symptom from Symptom List.

No

No problem found at this time. Erase all codes before returning vehicle to customer.

U1414-IMPLAUSIBLE/MISSING ECU NETWORK CONFIGURATION DATA

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

With the ignition on. The Occupant Restraint Controller (ORC) on board diagnostics continuously monitors the CAN Bus message from the TIPM containing the ORC configuration data.

SET CONDITIONS

- **Set Condition:**

This DTC will set if the data is invalid or missing.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **VERIFY TOTALLY INTEGRATED POWER MODULE (TIPM) OPERATION**

Turn the ignition on.

With the scan tool, read TIPM DTC.

Does the scan tool display any TIPM DTC?

Yes

Select appropriate symptom from Symptom List. Repair all TIPM active DTC or reprogram the TIPM before diagnosing the ORC DTC.

No

Go To 2.

2. **CHECK OPERATION OF THE OCCUPANT RESTRAINT CONTROLLER**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the airbag control module is dropped at any time, it must be

replaced. Failure to take the proper precautions could result in accidental airbag deployment and serious or fatal injury.

Replace the Occupant Restraint Controller in accordance with the service information.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Connect the scan tool to the Data Link Connector - use the most current software available.

Wait one minute, and read active codes and if there are none present read the stored codes.

Did the active U1414-IMPLAUSIBLE/MISSING ECU CONFIGURATION DATA DTC return?

Yes

Go To 3.

No

Repair is complete.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

3. REPLACE THE TOTALLY INTEGRATED POWER MODULE (TIPM)

View repair.

Repair

Replace the Totally Integrated Power Module (TIPM) in accordance with Service Information.

U1415-IMPLAUSIBLE/MISSING VEHICLE CONFIGURATION DATA

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

With the ignition on. The Occupant Restraint Controller (ORC) on board diagnostics continuously monitors the CAN Bus message from the TIPM containing the ORC configuration data.

SET CONDITIONS

- **Set Condition:**

This DTC will set if the data is invalid or missing.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. VERIFY TOTALLY INTEGRATED POWER MODULE (TIPM) OPERATION

Turn the ignition on.

With the scan tool, read TIPM DTCs.

Does the scan tool display any TIPM DTCs?

Yes

Select appropriate symptom from Symptom List. Repair all TIPM active DTCs or reprogram the TIPM before diagnosing the ORC DTCs.

No

Go To 2.

2. CHECK OPERATION OF THE OCCUPANT RESTRAINT CONTROLLER

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

WARNING: If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and serious or fatal injury.

Replace the Occupant Restraint Controller in accordance with the service information.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

Connect the scan tool to the Data Link Connector - use the most current software available.

Wait one minute, and read active codes and if there are none present read the stored codes.

Did the active U1415-IMPLAUSIBLE/MISSING VEHICLE CONFIGURATION DATA DTC return?

Yes

Go To 3.

No

Repair is complete.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

3. REPLACE THE TOTALLY INTEGRATED POWER MODULE (TIPM)

View repair.

Repair

Replace the Totally Integrated Power Module (TIPM) in accordance with Service Information.

U1419-IMPLAUSIBLE DATA RECEIVED FROM OCS SENSOR 3 - LEFT FRONT

CIRCUIT SCHEMATIC

**SENSOR-
SEAT
WEIGHT-
LEFT
FRONT**

**MODULE-
OCCUPANT
CLASSIFICATION C2**

0101007

Fig. 23: Left Front Weight Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

MONITOR CONDITIONS

When Monitored:

At ignition on the Occupant Classification Module (OCM) supplies 5 volts to power up the Left Front Passenger Seat Weight Sensor. Every time the sensor is powered up it sends an initialization message containing the sensor serial number to the OCM.

SET CONDITIONS

- **Set Condition:**

If the Left Front Passenger Seat Weight Sensor 5 volt supply is temporarily interrupted resulting in the sensor powering up more than one time in the same ignition cycle the code will be set.

POSSIBLE CAUSES

Possible Causes
PASSENGER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)**

NOTE: **Ensure that the battery is fully charged.**

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

Yes

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 2.

2. **VERIFY THAT DTC U1419-IMPLAUSIBLE DATA RECEIVED FROM OCS SENSOR 3 - LEFT FRONT IS ACTIVE**

With the scan tool, read OCM DTCs.

Does the scan tool display active: U1419-IMPLAUSIBLE DATA RECEIVED FROM OCS SENSOR 3 - LEFT FRONT?

Yes

Go To 3.

No

Go To 6.

3. INSPECT PASSENGER SEAT HARNESS WIRES AND CONNECTORS

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Are any of these conditions present?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if any of these conditions exist.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST**.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

No

Go To 4.

4. PERFORM OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST

NOTE: Failure to follow test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; and Perform The Occupant Classification Module System Verification Test To Completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR DTCs?

Yes

Go To 5.

No - But Other DTCs Present

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No - No Active DTCs Present

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

5. VERIFY SEAT SENSOR TORQUE

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Verify that all of the Seat Weight Sensor mounting screws are torqued to specification. Refer to **SEATS** .

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

NOTE: Failure to follow test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; and Perform The Occupant Classification Module System Verification Test To Completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR DTCs?

Yes

Perform the ***DIAGNOSIS AND CHECKOUT PROCEDURE FOR SEAT WEIGHT SENSORS.**

No - But Other DTCs Present

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No - No Active DTCs Present

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

6. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of airbag system diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question/causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Perform the ***OCM SYSTEM VERIFICATION TEST**. Erase all codes before returning vehicle to customer.

U141A-IMPLAUSIBLE DATA RECEIVED FROM OCS SENSOR 2 - RIGHT FRONT

ADDITIONAL WIRING

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

MONITOR CONDITIONS

When Monitored:

At ignition on the Occupant Classification Module (OCM) supplies 5 volts to power up the Right Front Passenger Seat Weight Sensor. Every time the sensor is powered up it sends an initialization message containing the sensor serial number to the OCM.

SET CONDITIONS

- **Set Condition:**

If the Right Front Passenger Seat Weight Sensor 5 volt supply is temporarily interrupted resulting in the sensor powering up more than one time in the same ignition cycle the code will be set.

POSSIBLE CAUSES

Possible Causes
PASSENGER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)**

NOTE: **Ensure that the battery is fully charged.**

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

Yes

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Go To 2.

2. VERIFY THAT DTC U141A-IMPLAUSIBLE DATA RECEIVED FROM OCS SENSOR 2 - RIGHT FRONT

With the scan tool, read OCM DTCs.

Does the scan tool display active: U141A-IMPLAUSIBLE DATA RECEIVED FROM OCS SENSOR 2 - RIGHT FRONT?

Yes

Go To 3.

No

Go To 6.

3. INSPECT PASSENGER SEAT HARNESS WIRES AND CONNECTORS

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Are any of these conditions present?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if any of these conditions exist.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST.**

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

No

Go To 4.

4. PERFORM OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST

NOTE: Failure to follow test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; and Perform The Occupant Classification Module System Verification Test To Completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR DTCs?

Yes

Go To 5.

No - But Other DTCs Present

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No - No Active DTCs Present

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

5. VERIFY SEAT SENSOR TORQUE

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Verify that all of the Seat Weight Sensor mounting screws are torqued to specification. Refer to **SEATS** .

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect

the battery.

NOTE: Failure to follow test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; and Perform The Occupant Classification Module System Verification Test To Completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR DTCs?

Yes

Perform the ***DIAGNOSIS AND CHECKOUT PROCEDURE FOR SEAT WEIGHT SENSORS.**

No - But Other DTCs Present

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No - No Active DTCs Present

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

6. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of airbag system diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and

contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question/causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Perform the ***OCM SYSTEM VERIFICATION TEST**. Erase all codes before returning vehicle to customer.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Are any of these conditions present?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if any of these conditions exist.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform ***OCM SYSTEM VERIFICATION TEST**.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

No

Go To 4.

4. **PERFORM OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST**

NOTE: Failure to follow test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All

Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; and Perform The Occupant Classification Module System Verification Test To Completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR DTCs?

Yes

Go To 5.

No - But Other DTCs Present

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No - No Active DTCs Present

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

5. VERIFY SEAT SENSOR TORQUE

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Verify that all of the Seat Weight Sensor mounting screws are torqued to specification. Refer to **SEATS**.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

NOTE: Failure to follow test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; and Perform The Occupant Classification Module System Verification Test To Completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR DTCs?

Yes

Perform the ***DIAGNOSIS AND CHECKOUT PROCEDURE FOR SEAT WEIGHT SENSORS**.

No - But Other DTCs Present

Diagnose and repair the DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No - No Active DTCs Present

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

6. CHECKING STORED OR INTERMITTENT CODES

NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of airbag system diagnostic procedures.

With the scan tool, record and erase all Airbag System Module DTCs.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question/causing the intermittent condition.

Are any ACTIVE DTCs present?

Yes

Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX** .

No

No problem found at this time. Perform the ***OCM SYSTEM VERIFICATION TEST**. Erase all codes before returning vehicle to customer.

***DIAGNOSIS AND CHECKOUT PROCEDURE FOR SEAT WEIGHT SENSORS**

OCCUPANT CLASSIFICATION SEAT WEIGHTS

Fig. 24: OCS Seat Weights MRL #9077
Courtesy of CHRYSLER LLC

DIAGNOSTIC TEST

1. VERIFY COMPLAINT

Turn the ignition off.

Move the front passenger seat to the full rear position. Verify that the seat is empty, the seat back is in the normal upright position, and that the seat is not interfering with any interior components.

Verify that all related connectors are properly seated and locked.

Turn the ignition on.

With the scan tool in OCM, select Data Display and note the Passenger Seat Weight Sensor voltage for all four sensors (Left Front, Right Front, Left Rear and Right Rear).

Move the front passenger seat to the mid track position.

Using the scan tool, note the Passenger Seat Weight Sensor voltage for all four sensors.

Move the front passenger seat to the full forward position.

Using the scan tool, note the Passenger Seat Weight Sensor voltage for all four sensors. The voltage should be from 1.4

to 3.6 volts for each sensor in each position (full rear, mid track, and full forward).

Is any sensor's voltage reading out of the acceptable range in any position?

Yes

Go To step 2.

No

Perform test B1BA7-Occupant Classification System Verification Required. If the test passes, the seat weight sensing system is working properly. Return to the procedure that directed you to this procedure.

2. CHECKING FOR BENT FLOOR PAN

Turn the ignition off.

Loosen all of the mounting screws retaining the front passenger seat to the vehicle crossmembers, but do not remove them. Verify that the seat is loose and that no binding exists between the seat and the crossmembers.

Move the front passenger seat to the full rear position and then to the full forward position.

Tighten all of the mounting screws to specification. Refer to **SEAT WEIGHT SENSOR** for specification.

Move the front passenger seat to the full rear position.

Turn the ignition on.

Using the scan tool, note the Passenger Seat Weight Sensor voltage for all four sensors.

Move the front passenger seat to the mid track position.

Using the scan tool, note the Passenger Seat Weight Sensor voltage for all four sensors.

Move the front passenger seat to the full forward position.

Using the scan tool, note the Passenger Seat Weight Sensor voltage for all four sensors. The voltage should be from 1.4 to 3.6 volts for each sensor in each position.

Is any sensor's voltage reading out of the acceptable range in any position?

Yes

Go To step 3.

No

Perform test B1BA7-Occupant Classification System Verification Required. Return to the procedure that directed you to this procedure.

If the test passes, the seat weight sensing system is working properly.

Return to the procedure that directed you to this procedure.

3. CHECKING SEAT TO RISER STRESS

Turn the ignition off.

Loosen all of the mounting screws retaining the front passenger seat track to the riser, but do not remove them. Verify that the seat track is loose and that no binding exists between the seat track and the risers.

Turn the ignition on.

Using the scan tool, note the Passenger Seat Weight Sensor voltage for all four sensors. The voltage should be from 1.5 to 3.5 volts for each sensor.

Is any sensor's voltage reading out of the acceptable range?

Yes

Go To step 4.

No

Visually inspect for damaged or bent risers and crossmembers. Also, verify that the riser holes line

up with the seat mounts in the crossmembers.

If riser damage is apparent, replace the risers in accordance with the Service Information. Then, reinstall the Seat Weight Sensors, and Go To step 6.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the Occupant Classification Module System Verification Test to completion.

If crossmember or floorpan damage is present, repair or replace the components as necessary in accordance with the Service Information. Reinstall the seat in the vehicle in accordance with the Service Information. Turn the ignition on. With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the directions displayed on the scan tool. When the test is complete, Go To step 1.

4. TEST SEAT FRAME

Turn the ignition off.

Remove the front passenger seat from the risers in accordance with the Service Information. Return the risers to their normal mounting position.

Turn the ignition on.

Using the scan tool, note the Passenger Seat Weight Sensor voltage for all four sensors. The voltage should be from 1.4 to 3.6 volts for each sensor.

Is any sensor's voltage reading out of the acceptable range?

Yes

Go To step 5.

No

Visually inspect for damaged or bent risers, a damaged or bent seat and seat structure, and damaged or bent seat tracks. Also, verify that the holes in the center of the sensors line up with the seat track holes and that the seat track position locating tabs are locked in the same parallel slots.

If riser damage is apparent, replace the risers in accordance with the Service Information. Then, reinstall the Seat Weight Sensors, and Go To step 6.

If seat or seat track damage is present, replace the components as necessary in accordance with the

Service Information. Then, Go To step 7.

5. **TEST SENSOR**

Turn the ignition off.

Loosen the mounting screws of all of the Seat Weight Sensors, but do not remove them. Verify that the sensors are loose and that no binding exists between the sensors and the risers.

Turn the ignition on.

Using the scan tool, note the Passenger Seat Weight Sensor voltage for all four sensors. The voltage should be from 1.4 to 3.6 volts for each sensor.

Is any sensor's voltage reading out of the acceptable range?

Yes

Replace any Seat Weight Sensors that have an unacceptable voltage reading in accordance with the Service Information. Then, Go To step 6.

No

Replace the risers in accordance with the Service Information. Then, reinstall the Seat Weight Sensors, and Go To step 6.

6. **CHECKING FOR LOOSE SEAT WEIGHT SENSOR**

Turn the ignition off.

Tighten all of the Seat Weight Sensor mounting screws to specification. Refer to **SEAT WEIGHT SENSOR** for specification.

Turn the ignition on.

Using the scan tool, note the Passenger Seat Weight Sensor voltage for all four sensors. The voltage should be from 1.4 to 3.6 volts for each sensor.

Is any sensor's voltage reading out of the acceptable range?

Yes

Loosen the mounting screws of all Seat Weight Sensors with an unacceptable voltage reading, and repeat Steps 5 and 6.

No

Go To step 7.

7. TEST SEAT TRACKS

Turn the ignition off.

Mount the front passenger seat on the risers in accordance with service information.

Turn the ignition on.

Using the scan tool, note the Passenger Seat Weight Sensor voltage for all four sensors. The voltage should be from 1.4 to 3.6 volts for each sensor.

Is any sensor's voltage reading out of the acceptable range?

Yes

Replace the seat track in accordance with the Service Information. Verify that no binding exists between the seat and risers. Then, repeat Steps 6 and 7.

No

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the Occupant Classification Module System Verification Test to completion.

Reinstall the seat in the vehicle in accordance with the Service Information. Turn the ignition on. With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed by the scan tool. When the test is complete, Go To step 1.

***AIRBAG SYSTEM VERIFICATION TEST - VER 1**

DIAGNOSTIC TEST

1. *AIRBAG SYSTEM VERIFICATION TEST - VER 1

1. Remove all special tools and jumper wires and reconnect all previously disconnected components - except the Battery.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

2. Connect the scan tool to the Data Link Connector - use the most current software available.
3. If sent here from an Occupant Classification System (OCS) related diagnostic procedure or if repairs were made to the OCS, perform the ***OCM SYSTEM VERIFICATION TEST** before proceeding.
4. With the scan tool, erase stored DTCs in all Airbag System Modules.
5. Turn the ignition off, and wait 30 seconds, then turn the ignition on.
6. Wait one minute, and read active DTCs in all Airbag System Modules.
7. Read the stored DTCs in all Airbag System Modules.

Are any DTCs present or if the original condition still present?

Yes

Repair is not complete. Select the appropriate diagnostic procedure from **DIAGNOSTIC CODE INDEX**.

No

Repair is complete.

***OCM SYSTEM VERIFICATION TEST**

DIAGNOSTIC TEST

1. PERFORM THE *OCM SYSTEM VERIFICATION TEST

NOTE: Ensure that the battery is fully charged.

NOTE: The Occupant Classification Seat Weights 9077 are required to perform this test.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the

ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the Occupant Classification Module System Verification Test to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

Does the scan tool display any active: PASSENGER SEAT WEIGHT SENSOR DTCs?

Yes

Go To step 2.

No

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

2. PERFORM THE OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Verify that all of the Seat Weight Sensor mounting screws are tightened to specification. Refer to **SEAT WEIGHT SENSOR** for specification.

WARNING: To avoid serious or fatal injury, turn the ignition on, then reconnect the battery.

NOTE: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed; verify that the ignition is in run; Wait 30 seconds after changing the seat weight before proceeding to allow the system to stabilize; only press scan tool buttons when directed to do so; and perform the Occupant Classification Module System Verification Test to completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

Does the scan tool display any active DTCs?

Yes

Diagnose and repair the DTCs.

Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1.**

2008 TRANSFER CASE

TRANSFER CASE - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

C1403-TRANSFER CASE RANGE POSITION SENSOR PERFORMANCE

Circuit Schematic

Monitor Conditions

When Monitored:

Ignition on. Battery voltage between 9 and 16 volts. No Range Position Sensor low or high voltage conditions present.

Set Conditions

- **Set Condition:**

During a blocked shift attempt, motor current indicates motor movement, but the sensor value change is less than a specified value.

Possible Causes

Possible Causes
(K594) DRIVETRAIN SENSOR RETURN CIRCUIT HIGH RESISTANCE OR OPEN
(K594) DRIVETRAIN SENSOR RETURN CIRCUIT FOR VOLTAGE
(K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT FOR VOLTAGE
TRANSFER CASE MOTOR MODE SENSOR
FINAL DRIVE CONTROL MODULE (FDCM)

Diagnostic Test

1. **DTC IS ACTIVE**

NOTE: If DTCs C1403 and C1407 are both present, refer to the diagnostics for C1407 before continuing with this procedure.

Ignition on, engine not running.

NOTE: Repair any system undervoltage or overvoltage DTCs that are set in this module before proceeding.

With the scan tool, read DTCs in the Final Drive Control Module.

Is the DTC status Active at this time?

Yes

Go to 2.

No

Go to 5.

2. (K594) DRIVETRAIN SENSOR RETURN CIRCUIT HIGH RESISTANCE OR OPEN

Fig. 2: Measuring The Resistance Of The (K594) Drivetrain Sensor Return Circuit Between The Transfer Case Motor Harness Connector And The Final Drive Control Module C1 Harness Connector

Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position

Disconnect the Transfer Case Motor harness connector.

Disconnect the FDCM C1 harness connector.

Measure the resistance of the (K594) Drivetrain Sensor Return circuit between the Transfer Case Motor harness connector and the Final Drive Control Module C1 harness connector.

Is the resistance above 5.0 ohms?

Yes

Repair the high resistance or open in the (K594) Drivetrain Sensor Return circuit.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 3.

3. (K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT FOR VOLTAGE

81dacf97

Fig. 3: Checking Drivetrain 5 Volt Supply Circuit For Voltage
Courtesy of CHRYSLER LLC

Reconnect the FDCM C1 harness connector.

Connect a jumper wire between the (T313) Mode Sensor Signal circuit and the (K504) Drivetrain Sensor Return circuit at the Transfer Case Motor harness connector.

Ignition on, engine not running.

With the scan tool, read the T-Case Position Sensor voltage.

The displayed voltage should be between 4.5 volts and 5.5 volts with the jumper wire in place.

Does the voltage display as described?

Yes

Go to 4.

No

Replace the Final Drive Control Module in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

4. (K594) DRIVETRAIN SENSOR RETURN CIRCUIT FOR VOLTAGE

81dacf9c

Fig. 4: Checking Drivetrain Sensor Return Circuit For Voltage
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position

Connect a jumper wire between the (T313) Mode Sensor Signal circuit and the (K594) Drivetrain Sensor Return circuit at the Transfer Case Motor harness connector.

Ignition on, engine not running.

With the scan tool, read the T-Case Position Sensor voltage.

The displayed voltage should be between 0.0 volts and 0.4 volts with the jumper wire in place.

Does the voltage display as described?

Yes

Replace the Transfer Case Motor Mode Sensor in accordance with the Service Information.
Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Replace the Final Drive Control Module in accordance with the Service Information.
Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.

Look for the data to change other than as expected or for the DTC to reset.

Were any problems found?

Yes

Repair as necessary.
Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test complete.

C1404-TRANSFER CASE RANGE POSITION SENSOR CIRCUIT LOW

Circuit Schematic

01410000

Fig. 5: Transfer Case Sensors Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

With the ignition on and no system undervoltage or overvoltage or supply voltage low conditions present.

Set Conditions

- **Set Condition:**

Sensor input voltage is below a specified value for a calibrated amount of time.

Possible Causes

Possible Causes
INTERMITTENT TRANSFER CASE RANGE POSITION SENSOR CIRCUIT LOW (K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT OPEN (K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE (T313) MODE SENSOR SIGNAL CIRCUIT OPEN (T313) MODE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND TRANSFER CASE MOTOR MODE SENSOR FINAL DRIVE CONTROL MODULE (FDCM)

Diagnostic Test

1. **T-CASE POSITION SENSOR VOLTAGE BELOW 0.4 VOLTS**

NOTE: If DTCs C1404 and C2112 are both present, refer to the diagnostics procedure for C2112 before continuing.

Ignition on, engine not running.

With the scan tool, read the T-Case Position Sensor voltage in the Final Drive Control Module.

Is the voltage below 0.4 volts?

Yes

Go to 2.

No

Go to 8.

2. **(K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT FOR VOLTAGE**

81dad0fe

Fig. 6: Measuring The Voltage Of The (K504) Drivetrain 5-Volt Supply Circuit At The Transfer Case Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position

Disconnect the Transfer Case Motor harness connector.

Ignition on, engine not running.

Measure the voltage of the (K504) Drivetrain 5-volt Supply circuit at the Transfer Case Motor harness connector.

Choose an answer that matches the voltage measured?

Below 4.5 volts

Go to 3.

Above 5.5 volts

Go to 4.

Between 4.5 volts and 5.5 volts

Go to 5.

3. **(K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 7: Measuring The Resistance Of The (K504) Drivetrain 5-Volt Supply Circuit Between The FDCM C1 And The Transfer Case Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position

Disconnect the FDCM C1 harness connector.

Measure the resistance of the (K504) Drivetrain 5-volt Supply circuit between the FDCM C1 and the Transfer Case Motor harness connector.

Is the resistance above 5.0 ohms?

Yes

Repair the (K504) Drivetrain 5-volt Supply circuit for an open or high resistance.

No

Go to 4.

4. **(K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE**

81dad0fe

Fig. 8: Measuring The Voltage Of The (K504) Drivetrain 5-Volt Supply Circuit At The Transfer Case Motor Harness Connector
Courtesy of CHRYSLER LLC

Measure the voltage of the (K504) Drivetrain 5-volt Supply circuit at the Transfer Case Motor harness connector.

Is the voltage above 5.5 volts?

Yes

Repair the (K504) Drivetrain 5-volt Supply circuit for a short to voltage.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 5.

5. (T313) MODE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Fig. 9: Measuring The Resistance Between Ground And The (T313) Mode Sensor Signal Circuit At The Transfer Case Motor Harness Connector

Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position

Disconnect the Final Drive Control Module C1 harness connector.

Measure the resistance between ground and the (T313) Mode Sensor Signal circuit at the Transfer Case Motor harness connector.

Is the resistance below 5.0 ohms?

Yes

Repair the (T313) Mode Sensor Signal circuit for a short to ground.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 6.

6. (T313) MODE SENSOR SIGNAL CIRCUIT OPEN

Fig. 10: Measuring The Resistance Of The (T313) Mode Sensor Signal Circuit Between The Final Drive Control Module C1 Harness Connector And The Transfer Case Motor Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (T313) Mode Sensor Signal circuit between the Final Drive Control Module C1 harness connector and the Transfer Case Motor harness connector.

Is the resistance above 5.0 ohms?

Yes

Repair the (T313) Mode Sensor Signal circuit for an open.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 7.

7. TRANSFER CASE MOTOR MODE SENSOR

81dacf97

Fig. 11: Checking Drivetrain 5 Volt Supply Circuit For Voltage
 Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position

Reconnect the Final Drive Control Module C1 harness connector.

Connect a jumper wire between the (T313) Mode Sensor Signal circuit and the (K504) Drivetrain 5 volt supply circuit at the Transfer Case Motor harness connector.

Ignition on, engine not running.

With the scan tool, read the T-Case Position Sensor voltage in the FDCM.

The displayed voltage should be between 4.5 volts and 5.5 volts with the jumper wire in place.

Does the voltage display as described?

Yes

Replace the Transfer Case Motor Mode Sensor in accordance with the Service Information.
 Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Replace the Final Drive Control Module in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

8. **INTERMITTENT WIRING AND CONNECTORS**

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

Repair as necessary.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test complete.

C1405-TRANSFER CASE RANGE POSITION SENSOR CIRCUIT HIGH

Circuit Schematic

Fig. 12: Transfer Case Sensors Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

With the ignition on and no system undervoltage or overvoltage condition present.

Set Conditions

- **Set Condition:**

The sensor voltage is above a specified value for a calibrated amount of time.

Possible Causes

Possible Causes
(K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(T313) MODE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K594) DRIVETRAIN SENSOR RETURN CIRCUIT OPEN
TRANSFER CASE MOTOR/ENCODER
FINAL DRIVE CONTROL MODULE

Diagnostic Test

1. **T-CASE POSITION SENSOR VOLTAGE ABOVE 4.8 VOLTS**

NOTE: If DTCs C1405 and C2112 are both present, refer to the diagnostics procedure for C2112 before continuing.

Ignition on, engine not running.

With the scan tool, read the T-Case Position Sensor voltage in the Final Drive Control Module.

Is the voltage above 4.8 volts?

Yes

Go To 2.

No

Go to 6.

2. **(K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE**

81dad0fe

Fig. 13: Measuring The Voltage Of The (K504) Drivetrain 5-Volt Supply Circuit At The Transfer Case Motor Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position

Disconnect the Transfer Case Motor harness connector.

Ignition on, engine not running.

Measure the voltage of the (K504) Drivetrain 5 Volt Supply circuit at the Transfer Case Motor harness connector.

Is the voltage above 5.5 volts?

Yes

Repair the (K504) Drivetrain 5 Volt Supply circuit for a short to voltage.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 3.

3. (T313) MODE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

81dad2e2

Fig. 14: Measuring The Voltage Of The (T313) Mode Sensor Signal Circuit At The Transfer Case Motor Harness Connector

Courtesy of CHRYSLER LLC

Measure the voltage of the (T313) Mode Sensor Signal circuit at the Transfer Case Motor harness connector.

Is the voltage above 5.5 volts?

Yes

Repair the (T313) Mode Sensor Signal circuit for a short to voltage.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 4.

4. (K594) DRIVETRAIN SENSOR RETURN CIRCUIT OPEN

Fig. 15: Measuring The Resistance Of The (K594) Drivetrain Sensor Return Circuit Between The Transfer Case Motor Harness Connector And The Final Drive Control Module C1 Harness Connector

Courtesy of CHRYSLER LLC

Measure the resistance of the (K594) Drivetrain Sensor Return circuit between the Transfer Case Motor harness connector and the Final Drive Control Module C2 harness connector.

Is the resistance above 5.0 ohms?

Yes

Repair the (K594) Drivetrain Sensor Return circuit for an open.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to step 5.

5. TRANSFER CASE MOTOR/ENCODER

81dacf9c

Fig. 16: Checking Drivetrain Sensor Return Circuit For Voltage
 Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position

Connect a jumper wire between the (K594) Drivetrain Sensor Return circuit and the (T313) Mode Sensor Signal circuit in the Transfer Case Motor harness connector.

Ignition on, engine not running.

With the scan tool, read the T-Case Position Sensor voltage in the Final Drive Control Module.

NOTE: Remove the jumper wire before continuing.

Is the voltage below 0.2 volts?

Yes

Replace the Transfer Case Motor in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Replace the Transfer Case Motor in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

Repair as necessary.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test complete.

C1406-TRANSFER CASE BRAKE PERFORMANCE

Circuit Schematic

Monitor Conditions

When Monitored:

With the ignition on and no system undervoltage or overvoltage condition present.

Set Conditions

- **Set Condition:**
 1. The Control Module detects an excessive voltage variation on the Mode Sensor Signal circuit.
 2. The Control Module performs an error correction procedure too frequently.

Possible Causes

Possible Causes
(T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT VOLTAGE TRANSFER CASE MOTOR ASSEMBLY FINAL DRIVE CONTROL MODULE

Diagnostic Test

1. **DTC IS ACTIVE**

Start the engine and allow it to idle.

Move the Transfer Case Selector Switch to each position several times.

With the scan tool, read DTCs in the Final Drive Control Module.

Is the status Active for this DTC?

Yes

Go to 2.

No

Go to 3.

2. **(T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT VOLTAGE**

**MOTOR-
TRANSFER
CASE
(MP3022)**

81dad35d

Fig. 18: Checking Switched Battery Solenoid Supply Circuit Voltage
Courtesy of CHRYSLER LLC

Ignition on, engine not running.

Using a 12-volt test light, jumper the (T301) Switched Battery Solenoid Supply circuit to the (T317) Transfer Case Motor Lock Signal in the Transfer Case Motor harness connector.

NOTE: As a fail-safe precaution when the Transfer Case Motor harness connectors are disconnected, the DTCs must be cleared in the FDCM. Failure to follow this will result in the FDCM detecting this condition and turning OFF the Switched Battery Solenoid Supply circuit.

Using the scan tool, clear the DTCs in the FDCM.

With the scan tool, actuate the T-Case Motor Solenoid Lock in the Final Drive Control Module.

NOTE: Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

Replace the Transfer Case Motor in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Replace the Final Drive Control Module in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

3. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

Repair as necessary.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test complete.

C1407-TRANSFER CASE BRAKE CONTROL CIRCUIT LOW

Circuit Schematic

Fig. 19: Transfer Case Sensors Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

With the ignition on and no system undervoltage or overvoltage condition present.

Set Conditions

- **Set Condition:**

The Final Drive Control Module detects that the Transfer Case Motor Lock circuit diagnostic input is low when output is off.

Possible Causes

Possible Causes
(T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT SHORTED TO GROUND (T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT VOLTAGE TRANSFER CASE MOTOR ASSEMBLY FINAL DRIVE CONTROL MODULE

Diagnostic Test

1. **DTC IS ACTIVE**

Start the engine and allow it to idle.

Move the Transfer Case Selector Switch to each position several times.

With the scan tool, read DTCs in the Final Drive Control Module.

Is the status Active for this DTC?

Yes

Go to 2.

No

Go to 4.

2. **(T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT SHORTED TO GROUND**

**MOTOR-
TRANSFER
CASE
(MP3022)**

81dad455

Fig. 20: Measuring The Resistance Between Ground And The (T301) Switched Battery Solenoid Supply Circuit

Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position

Disconnect the Transfer Case Motor harness connector.

Disconnect the Final Drive Control Module C1 harness connector.

Measure the resistance between ground and the (T301) Switched Battery Solenoid Supply circuit.

Is the resistance below 5.0 ohms?

Yes

Repair the (T301) Switched Battery Solenoid Supply circuit for a short to ground.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 3.

3. (T301) SWITCHED BATTERY SOLENOID SUPPLY VOLTAGE

**MOTOR-
TRANSFER
CASE
(MP3022)**

81dad35d

Fig. 21: Checking Switched Battery Solenoid Supply Circuit Voltage
Courtesy of CHRYSLER LLC

Ignition on, engine not running.

Using a 12-volt test light, jumper the (T301) Switched Battery Solenoid Supply circuit to the (T317) Transfer Case Motor Lock Signal in the Transfer Case Motor harness connector.

NOTE: As a fail-safe precaution when either the Transfer Case Motor harness connectors are disconnected, the DTCs must be cleared in the FDCM. Failure to follow this will result in the FDCM detecting this condition and turning OFF the Switched Battery Solenoid Supply circuit.

Using the scan tool, clear the DTCs in the FDCM.

With the scan tool, actuate the T-Case Motor Solenoid Lock in the Final Drive Control Module.

NOTE: Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

Replace the Transfer Case Motor in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Replace the Final Drive Control Module in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

Repair as necessary.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test complete.

C1408-TRANSFER CASE BRAKE CONTROL CIRCUIT HIGH

Circuit Schematic

Fig. 22: Transfer Case Sensors Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

With the ignition on and no undervoltage or overvoltage condition present.

Set Conditions

- **Set Condition:**

The Final Drive Control Module detects that the Transfer Case Motor Lock Circuit diagnostic input is high when the output is on.

Possible Causes

Possible Causes
(T301) TRANSFER CASE MOTOR LOCK SIGNAL CIRCUIT OPEN (T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT SHORT TO VOLTAGE (T317) TRANSFER CASE MOTOR LOCK SIGNAL CIRCUIT OPEN TRANSFER CASE MOTOR ACTUATOR FINAL DRIVE CONTROL MODULE

Diagnostic Test

1. **DTC IS ACTIVE**

Ignition on, engine not running.

With the scan tool, clear DTCs in the Final Drive Control Module.

Move the Shift control to each position.

With the scan tool, read DTCs in the Final Drive Control Module.

Does the DTC reset?

Yes

Go to 2.

No

Go to 7.

2. **(T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT OPEN**

81dad21

Fig. 23: Measuring The Resistance Of The (T301) Switched Battery Solenoid Supply Circuit Between The Transfer Case Motor Harness Connector And The FDCM C1 Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position

Disconnect the Transfer Case Motor harness connector.

Disconnect the Final Drive Control Module C1 harness connector.

Measure the resistance of the (T301) Switched Battery Solenoid Supply circuit between the Transfer Case Motor harness connector and the FDCM C1 harness connector.

Is the resistance above 5.0 ohms?

Yes

Repair the (T301) Switched Battery Solenoid Supply circuit for an open.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 3.

3. (T317) TRANSFER CASE MOTOR LOCK SIGNAL CIRCUIT OPEN

81daddae

Fig. 24: Measuring The Resistance Of The (T317) Transfer Case Motor Lock Signal Circuit Between The Transfer Case Motor Harness Connector And The FDCM C1 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (T317) Transfer Case Motor Lock Signal circuit between the Transfer Case Motor harness connector and the FDCM C1 harness connector.

Is the resistance below 5.0 ohms?

Yes

Repair the (T317) Transfer Case Motor Lock Signal circuit for an open.
Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 4.

4. (T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT SHORTED TO VOLTAGE

**MOTOR-
TRANSFER
CASE
(MP3022)**

81e2525a

Fig. 25: Measuring The Voltage Of The (T301) Switched Battery Solenoid Supply Circuit In The Transfer Case Motor Harness Connector

Ignition on, engine not running.

Measure the voltage of the (T301) Switched Battery Solenoid Supply circuit in the Transfer Case Motor harness connector.

Is any voltage present?

Yes

Repair the (T301) Switched Battery Solenoid Supply circuit for a short to voltage.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 5.

5. TRANSFER CASE MOTOR

MODULE-
FINAL
DRIVE C1

81dc5558

Fig. 26: Measuring The Resistance Of The (T317) Transfer Case Motor Lock Signal Circuit And The (T301) Switched Battery Solenoid Supply In The FDCM C1 Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position

Reconnect the Transfer Case Motor harness connector.

Measure the resistance of the (T317) Transfer Case Motor Lock Signal circuit and the (T301) Switched Battery Solenoid Supply in the FDCM C1 harness connector.

Is the resistance above 10.0 ohms?

Yes

Replace the Transfer Case Motor assembly in accordance with the Service Information.
Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to step 6.

6. FINAL DRIVE CONTROL MODULE (FDCM)

Reconnect the Final Drive Control Module C1 harness connector.

Ignition on, engine not running.

With the scan tool, clear the DTCs.

With the scan tool, read the DTCs in the Final Drive Control Module.

Does the DTC P1408-Transfer Case Brake Control Circuit High set?

Yes

Replace the Final Drive Control Module in accordance with the Service Information.
Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 7.

7. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

Repair as necessary.
Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test complete.

C140A-TRANSFER CASE MOTOR PERFORMANCE

Circuit Schematic

Monitor Conditions

When Monitored:

With the ignition on and no undervoltage or overvoltage condition present.

Set Conditions

- **Set Condition:**

A faulted condition is detected in the H-bridge driver.

Possible Causes

Possible Causes
(T315) SHIFT MOTOR CONTROL A CIRCUIT SHORTED TO GROUND
(T316) SHIFT MOTOR CONTROL B CIRCUIT SHORTED TO GROUND
(T315) SHIFT MOTOR CONTROL A CIRCUIT SHORTED TO (T316) SHIFT MOTOR CONTROL B CIRCUIT
TRANSFER CASE MOTOR
FINAL DRIVE CONTROL MODULE (FDCM)

Diagnostic Test

1. **CHECK DTC CONDITIONS**

Ignition on, engine not running.

With the scan tool, read DTCs in the Final Drive Control Module.

Is C140a active?

Yes

Go to 2.

No

Go to 5.

2. **(T315) SHIFT MOTOR CONTROL A CIRCUIT SHORTED TO GROUND**

81dae9ef

Fig. 28: Measuring The Resistance Between Ground And The (T315) Shift Motor Control A Circuit At The Transfer Case Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position

Disconnect the Transfer Case Motor harness connector.

Ignition on, engine not running.

Measure the resistance between ground and the (T315) Shift Motor Control A circuit at the Transfer Case Motor harness connector.

Is the resistance below 5.0 ohms?

Yes

Repair the (T315) Shift Motor Control A circuit for a short to ground.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 3.

3. (T316) SHIFT MOTOR CONTROL B CIRCUIT SHORTED TO GROUND

81dae9f3

Fig. 29: Measuring The Resistance Between Ground And The (T316) Shift Motor Control B Circuit At The Transfer Case Motor Harness Connector

Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (T316) Shift Motor Control B circuit at the Transfer Case Motor harness connector.

Is the resistance below 5.0 ohms?

Yes

Repair the (T316) Shift Motor Control B circuit for a short to ground.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 4.

4. (T315) SHIFT MOTOR CONTROL A CIRCUIT SHORTED TO (T316) SHIFT MOTOR CONTROL B CIRCUIT

81dae9fb

Fig. 30: Measuring The Resistance Between The (T315) Shift Motor Control A Circuit And The (T316) Shift Motor Control B Circuit At The Transfer Case Motor Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance between the (T315) Shift Motor Control A circuit and the (T316) Shift Motor Control B circuit at the Transfer Case Motor harness connector.

Is the resistance below 5.0 ohms?

Yes

Repair the (T315) Shift Motor Control A circuit for a short to the (T316) Shift Motor Control B circuit.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Replace the Final Drive Control Module in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

Repair as necessary.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test complete.

C140D-TRANSFER CASE MOTOR CONTROL CIRCUIT OPEN

Circuit Schematic

Monitor Conditions

When Monitored:

With the ignition on and no system undervoltage or overvoltage condition present.

Set Conditions

- **Set Condition:**

The Final Drive Control Module detects an open circuit on one of the Transfer Case Shift Motor Control circuits.

Possible Causes

Possible Causes

Diagnostic Test

1. **DTC IS ACTIVE**

Ignition on, engine not running.

With the scan tool, read DTCs in the Final Drive Control Module.

Is the status Active for this DTC?

Yes

Go to 2.

No

Go to 7.

2. **(T315) SHIFT MOTOR CONTROL A CIRCUIT OPEN**

Fig. 32: Measuring The Resistance Of The (T315) Shift Motor Control A Circuit From The Transfer Case Motor Harness Connector To The Final Drive Control Module C2 Harness Connector

Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position

Disconnect the Transfer Case Motor harness connector.

Disconnect the Final Drive Control Module C1 harness connector.

Measure the resistance of the (T315) Shift Motor Control A circuit from the Transfer Case Motor harness connector to the Final Drive Control Module C2 harness connector.

Is the resistance above 5.0 ohms?

Yes

Repair the (T315) Shift Motor Control A circuit for an open.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 3.

3. (T316) SHIFT MOTOR CONTROL B CIRCUIT OPEN

Fig. 33: Measuring The Resistance Of The (T316) Shift Motor Control B Circuit From The Transfer Case Motor Harness Connector To The Final Drive Control Module C2 Harness Connector

Courtesy of CHRYSLER LLC

Measure the resistance of the (T316) Shift Motor Control B circuit from the Transfer Case Motor harness connector to the Final Drive Control Module C2 harness connector.

Is the resistance above 5.0 ohms?

Yes

Repair the (T316) Shift Motor Control B circuit for an open.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 4.

4. (T315) SHIFT MOTOR CONTROL A CIRCUIT VOLTAGE

81daf288

Fig. 34: Measuring The Voltage Of The (T315) Shift Motor Control A Circuit At The Transfer Case Motor Harness Connector
Courtesy of CHRYSLER LLC

Ignition on, engine not running.

Measure the voltage of the (T315) Shift Motor Control A circuit at the Transfer Case Motor harness connector.

Is the voltage above 0.5 volts?

Yes

Repair the (T315) Shift Motor Control A circuit for a short to voltage.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 5.

5. **(T316) SHIFT MOTOR CONTROL B CIRCUIT VOLTAGE**

81daf28f

Fig. 35: Measuring The Voltage Of The (T316) Shift Motor Control B Circuit At The Transfer Case Motor Harness Connector
Courtesy of CHRYSLER LLC

Measure the voltage of the (T316) Shift Motor Control B circuit at the Transfer Case Motor harness connector.

Is the voltage above 0.5 volts?

Yes

Repair the (T316) Shift Motor Control B circuit for a short to voltage.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 6.

6. **TRANSFER CASE MOTOR**

81daea03

Fig. 36: Measuring The Resistance Between The (T315) Shift Motor Control A Circuit And The (T316) Shift Motor Control B Circuit At The Final Drive Control Module C2 Harness Connector
Courtesy of CHRYSLER LLC

Reconnect the Transfer Case Motor harness connector.

Measure the resistance between the (T315) Shift Motor Control A circuit and the (T316) Shift Motor Control B circuit at the Final Drive Control Module C2 harness connector.

Is the resistance below 5.0 ohms?

Yes

Replace the Final Drive Control Module in accordance with the Service Information.
Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Replace the shorted Transfer Case Motor in accordance with the Service Information.
Replace the Final Drive Control Module in accordance with the Service Information.
Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

7. **INTERMITTENT WIRING AND CONNECTORS**

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

Repair as necessary.
Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test complete.

C140E-TRANSFER CASE MOTOR BLOCKED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on and no system undervoltage or overvoltage condition present.

Set Conditions

- **Set Condition:**

The Final Drive Control Module is unable to engage the requested range.

Possible Causes

Possible Causes
TRANSFER CASE INTERNAL CONDITION
TRANSFER CASE MOTOR
FINAL DRIVE CONTROL MODULE

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, read DTCs in the Final Drive Control Module.

Is the status Active for this DTC?

Yes

Go to 2.

No

Go to 4.

2. TRANSFER CASE INTERNAL CONDITION

Turn the ignition off to the lock position

Inspect the Transfer Case in accordance with the Service Information to determine if there are any mechanical conditions that are preventing the Shift Motor from engaging the requested range.

Are any mechanical conditions preventing the Shift Motor from engaging the requested range?

Yes

Repair or replace the Transfer Case in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 3.

3. TRANSFER CASE MOTOR

Turn the ignition off to the lock position

Using the wiring diagram/schematic as a guide, inspect all wiring and connectors that pertain to this circuit.

If any problems are found, repair as necessary and retest.

If no other problems are found, replace the Transfer Case Motor in accordance with the Service Information.

Ignition on, engine not running.

Cycle the Transfer Case Selector Switch to each position several times during a test drive.

With the scan tool, read DTCs in the Final Drive Control Module.

Is the DTC status Active?

Yes

Replace the Final Drive Control Module in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test complete.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

Repair as necessary.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test complete.

C140F-TRANSFER CASE RANGE POSITION SENSOR ERRATIC PERFORMANCE

Circuit Schematic

Monitor Conditions

When Monitored:

With the ignition on and no system undervoltage or overvoltage condition present.

Set Conditions

- **Set Condition:**

The Final Drive Control Module detects excessive voltage fluctuation on the Mode Sensor Signal circuit.

Possible Causes

Possible Causes
(K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT SHORT TO VOLTAGE
(K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT HIGH RESISTANCE
(K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT SHORT TO GROUND
(T313) MODE SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE
(T313) MODE SENSOR SIGNAL CIRCUIT HIGH RESISTANCE
(T313) MODE SENSOR SIGNAL CIRCUIT SHORT TO GROUND
(K594) DRIVETRAIN SENSOR RETURN CIRCUIT SHORT TO VOLTAGE
(K594) DRIVETRAIN SENSOR RETURN CIRCUIT HIGH RESISTANCE
TRANSFER CASE MOTOR/ENCODER
FINAL DRIVE CONTROL MODULE

Diagnostic Test

1. **DTC IS ACTIVE**

NOTE: This DTC sets when the Final Drive Control Module detects excessive voltage fluctuation on the Mode Sensor Signal circuit. Perform a thorough inspection of all wiring and connectors between the sensor and the control module.

Ignition on, engine not running.

With the scan tool, read DTCs in the Final Drive Control Module.

Is the status Active for this DTC?

Yes

Go to 2.

No

Go to 14.

2. (T504) DRIVETRAIN 5 VOLT SUPPLY VOLTAGE ERRATIC

81dafb51

Fig. 38: Measuring The Voltage Of The (T504) Drivetrain 5-Volt Supply Circuit At The Transfer Case Motor Harness Connector
Courtesy of CHRYSLER LLC

NOTE: This DTC sets when the Final Drive Control Module detects excessive voltage fluctuation on the Mode Sensor Signal circuit. Perform a thorough inspection of all wiring and connectors between the sensor and the control module.

Turn the ignition off to the lock position

Disconnect the Transfer Case Motor harness connector.

Ignition on, engine not running.

Measure the voltage of the (T504) Drivetrain 5-volt Supply circuit at the Transfer Case Motor harness connector.

NOTE: Voltage should be approximately 5.0 volts and steady. Compare any slight fluctuations found to a known good circuit in order to verify voltmeter

functionality.

Is the voltage approximately 5.0 volts and steady?

Yes

Go to 6.

No

Go to 3.

3. (T504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT INTERMITTENT SHORT TO VOLTAGE

Fig. 39: Measuring The Voltage Of The (K504) Drivetrain 5-Volt Supply Circuit At The Transfer Case Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position

Disconnect the Final Drive Control Module C1 harness connector.

Ignition on, engine not running.

Measure the voltage of the (T504) Drivetrain 5-volt Supply circuit at the Transfer Case Motor harness connector.

Monitor the voltmeter while performing a wiggle test on the wiring harness and connectors.

Is any voltage detected on the circuit during the wiggle test?

Yes

Repair the (T504) Drivetrain 5-volt Supply circuit for an intermittent short to voltage.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 4.

4. (T504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT HIGH RESISTANCE

Fig. 40: Measuring The Resistance Of The (K504) Drivetrain 5-Volt Supply Circuit Between The FDCM C1 And The Transfer Case Motor Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (T504) Drivetrain 5-volt Supply circuit between the Transfer Case Motor harness connector and the Final Drive Control Module C1 harness connector.

Monitor the ohmmeter while performing a wiggle test on the wiring harness and connectors.

Is the resistance ever above 5.0 ohms during the wiggle test?

Yes

Repair the (T504) Drivetrain 5-volt Supply circuit for an intermittent open circuit or high resistance.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 5.

5. (T504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT INTERMITTENT SHORT TO GROUND

81dafb84

Fig. 41: Measuring The Resistance Between Ground And The (T504) Drivetrain 5-Volt Supply Circuit At The Transfer Case Motor Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (T504) Drivetrain 5-volt Supply circuit at the Transfer

Case Motor harness connector.

Monitor the ohmmeter while performing a wiggle test on the wiring harness and connectors.

Is the resistance ever below 5.0 ohms during the wiggle test?

Yes

Repair the (T504) Drivetrain 5-volt Supply circuit for an intermittent short to ground.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Replace the Final Drive Control Module in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

Turn the ignition off to the lock position

Reconnect the Final Drive Control Module C1 harness connector.

Connect a jumper wire between the (T313) Mode Sensor Signal circuit and the (K594) Drivetrain Sensor Return circuit in the Transfer Case Motor harness connector.

Ignition on, engine not running.

With the scan tool read the T-Case Position Sensor Voltage in the Final Drive Control Module while performing a wiggle test on the wiring and connectors between the sensor and the control module.

NOTE: Voltage should be approximately 0.0 volts and steady.

Is the T-Case Position Sensor Voltage approximately 0.0 volts and steady?

Yes

Go to 12.

No

Go to 7.

7. (T313) MODE SENSOR SIGNAL CIRCUIT INTERMITTENT SHORT TO VOLTAGE

81dad2e2

Fig. 43: Measuring The Voltage Of The (T313) Mode Sensor Signal Circuit At The Transfer Case Motor Harness Connector

Courtesy of CHRYSLER LLC

NOTE: Remove the previously installed jumper wire.

Turn the ignition off to the lock position

Disconnect the Final Drive Control Module C1 harness connector.

Ignition on, engine not running.

Measure the voltage of the (T313) Mode Sensor Signal circuit at the Transfer Case Motor harness connector.

Monitor the voltmeter while performing a wiggle test on the wiring harness and connectors.

Is any voltage detected on the circuit during the wiggle test?

Yes

Repair the (T313) Mode Sensor Signal circuit for an intermittent short to voltage.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 8.

8. (K594) DRIVETRAIN SENSOR RETURN CIRCUIT INTERMITTENT SHORT TO VOLTAGE

81dafc15

Fig. 44: Measuring The Voltage Of The (K594) Drivetrain Sensor Return Circuit At The Transfer Case Motor Harness Connector
Courtesy of CHRYSLER LLC

Measure the voltage of the (K594) Drivetrain Sensor Return circuit at the Transfer Case Motor harness connector.

Monitor the voltmeter while performing a wiggle test on the wiring harness and connectors.

Is any voltage detected on the circuit during the wiggle test?

Yes

Repair the (K594) Drivetrain Sensor Return circuit for an intermittent short to voltage.
 Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 9.

9. (T313) MODE SENSOR SIGNAL CIRCUIT HIGH RESISTANCE

Fig. 45: Measuring The Resistance Of The (T313) Mode Sensor Signal Circuit Between The Final Drive Control Module C1 Harness Connector And The Transfer Case Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position

Measure the resistance of the (T313) Mode Sensor Signal circuit between the Transfer Case Motor harness connector and the Final Drive Control Module C2 harness connector.

Monitor the ohmmeter while performing a wiggle test on the wiring harness and connectors.

Is the resistance ever above 5.0 ohms during the wiggle test?

Yes

Repair the (T313) Mode Sensor Signal circuit for an intermittent open circuit or high resistance.
 Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 10.

10. **(K594) DRIVETRAIN SENSOR RETURN CIRCUIT HIGH RESISTANCE**

Fig. 46: Measuring The Resistance Of The (K594) Drivetrain Sensor Return Circuit Between The Transfer Case Motor Harness Connector And The Final Drive Control Module C1 Harness Connector

Courtesy of CHRYSLER LLC

Measure the resistance of the (K594) Drivetrain Sensor Return circuit between the Transfer Case Motor harness connector and the Final Drive Control Module C1 harness connector.

Monitor the ohmmeter while performing a wiggle test on the wiring harness and connectors.

Is the resistance ever above 5.0 ohms during the wiggle test?

Yes

Repair the (K594) Drivetrain Sensor Return circuit for an intermittent open circuit or high resistance.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 11.

11. **(T313) MODE SENSOR SIGNAL CIRCUIT INTERMITTENT SHORT TO GROUND**

Fig. 47: Measuring The Resistance Between Ground And The (T313) Mode Sensor Signal Circuit At The Transfer Case Motor Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (T313) Mode Sensor Signal circuit at the Transfer Case Motor harness connector.

Monitor the ohmmeter while performing a wiggle test on the wiring harness and connectors.

Is the resistance ever below 5.0 ohms during the wiggle test?

Yes

Repair the (T313) Mode Sensor Signal circuit for an intermittent short to ground.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 12.

12. **TRANSFER CASE MOTOR**

NOTE: This DTC sets when the Final Drive Control Module detects excessive voltage fluctuation on the Mode Sensor Signal circuit. Perform a thorough inspection of all wiring and connectors between the sensor and the control module.

Using the schematic as a guide, inspect the Final Drive Control Module power and ground circuits.

Were any problems found?

Yes

Repair as necessary.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to step 13.

13. **TRANSFER CASE MOTOR/ENCODER**

Replace the Transfer Case Motor/ Encoder in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

Test drive the vehicle.

With the scan tool, read the DTCs in the Final Drive Control Module.

Does this DTC reset?

Yes

Replace the FDCM in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test complete.

14. **INTERMITTENT WIRING AND CONNECTORS**

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

Repair as necessary.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test complete.

C1415-TRANSFER CASE MOTOR "CURRENT" PERFORMANCE

Circuit Schematic

Monitor Conditions

When Monitored:

With the ignition on and no system undervoltage or overvoltage condition present.

Set Conditions

- **Set Condition:**
 1. Current reading greater than 1A for 200 msec with no motor activation.
 2. Current reading never greater than 1A during a completed range or neutral shift.

Possible Causes

Possible Causes
(T315) SHIFT MOTOR CONTROL A CIRCUIT OPEN OR HIGH RESISTANCE
(T316) SHIFT MOTOR CONTROL B CIRCUIT OPEN OR HIGH RESISTANCE
FINAL DRIVE CONTROL MODULE (FDCM)

Diagnostic Test

1. **DTC IS ACTIVE**

NOTE: If both DTCs C1415 and C140A are present, check the FDCM fuse and the B(+) supply to the Integrated Power Module (IPM).

Ignition on, engine not running.

With the scan tool, read DTCs in the Final Drive Control Module.

Pick the answer that best describes the DTC set conditions?

Yes

Go to 2.

No

Go to 4.

2. **(T315) SHIFT MOTOR CONTROL A CIRCUIT OPEN OR HIGH RESISTANCE**

81daf250

Fig. 49: Measuring The Resistance Of The (T315) Shift Motor Control A Circuit From The Transfer Case Motor Harness Connector To The Final Drive Control Module C2 Harness Connector

Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position

Disconnect the Transfer Case Motor harness connector.

Disconnect the Final Drive Control Module C1 harness connector.

Measure the resistance of the (T315) Shift Motor Control A circuit from the Transfer Case Motor harness connector to the Final Drive Control Module C2 harness connector.

Is the resistance above 5.0 ohms?

Yes

Repair the (T315) Shift Motor Control A circuit for an open or high resistance.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 3.

3. (T316) SHIFT MOTOR CONTROL B CIRCUIT OPEN OR HIGH RESISTANCE

Fig. 50: Measuring The Resistance Of The (T316) Shift Motor Control B Circuit From The Transfer Case Motor Harness Connector To The Final Drive Control Module C2 Harness Connector

Courtesy of CHRYSLER LLC

Measure the resistance of the (T316) Shift Motor Control B circuit from the Transfer Case Motor harness connector to the Final Drive Control Module C2 harness connector.

Is the resistance above 5.0 ohms?

Yes

Repair the (T316) Shift Motor Control B circuit for an open or high resistance.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Replace the Final Drive Control Module in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

Repair as necessary.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test complete.

C1438-TRANSFER CASE DIFFERENTIAL CLUTCH WORN

Circuit Schematic

Fig. 51: Transfer Case Sensors Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

The ignition on, engine running. No Under/Overvoltage, and/or encoder error DTCs present. When shifted into 4-Low or in 4-high.

Set Conditions

- **Set Condition:**

The Final Drive Control Module is unable to fully lock the T-Case (in Either High or Low) because the T-Case clutch is worn.

Possible Causes

Possible Causes
(K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(T313) MODE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K594) DRIVETRAIN SENSOR RETURN CIRCUIT OPEN OR HIGH RESISTANCE
TRANSFER CASE CLUTCH WORN
FINAL DRIVE CONTROL MODULE (FDCM)

Diagnostic Test

1. **DTC IS ACTIVE**

NOTE: **Diagnose and repair any system voltage or Transfer Case related DTCs in the FDCM before continuing with this test.**

Ignition on, engine running.

With the scan tool, clear stored DTCs in the Final Drive Control Module.

Test drive the vehicle.

During the test drive, move the Transfer Case Selector Switch to each position several times in accordance with the Service Information.

With the scan tool, read DTCs in the Final Drive Control Module.

Does this DTC reset?

Yes

Go to 2.

No

Go to 6.

2. **(K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT HIGH RESISTANCE**

Fig. 52: Measuring The Resistance Of The (K504) Drivetrain 5 Volt Supply Circuit Between The Transfer Case Motor Harness Connector And The Final Drive Control Module C2 Harness Connector

Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position

Disconnect the Final Drive Control Module C1 harness connector.

Disconnect the Transfer Case Motor harness connector.

Measure the resistance of the (K504) Drivetrain 5 Volt Supply circuit between the Transfer Case Motor harness connector and the Final Drive Control Module C1 harness connector.

Is the resistance above 5.0 ohms?

Yes

Repair the high resistance in the (K504) Drivetrain 5 Volt Supply circuit.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 3.

3. (T313) MODE SENSOR SIGNAL CIRCUIT HIGH RESISTANCE

Fig. 53: Measuring The Resistance Of The (T313) Mode Sensor Signal Circuit Between The Transfer Case Motor Harness Connector And The Final Drive Control Module C2 Harness Connector

Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position

Disconnect the Final Drive Control Module C1 harness connector.

Measure the resistance of the (T313) Mode Sensor Signal circuit between the Transfer Case Motor harness connector and the Final Drive Control Module C1 harness connector.

Is the resistance above 5.0 ohms?

Yes

Repair the high resistance in the (T313) Mode Sensor Signal circuit.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 4.

4. (K594) DRIVETRAIN SENSOR RETURN CIRCUIT HIGH RESISTANCE

Fig. 54: Measuring The Resistance Of The (K594) Drivetrain Sensor Return Circuit Between The Transfer Case Motor Harness Connector And The Final Drive Control Module C1 Harness Connector

Courtesy of CHRYSLER LLC

Measure the resistance of the (K594) Drivetrain Sensor Return circuit between the Transfer Case Motor harness connector and the Final Drive Control Module C1 harness connector.

Is the resistance above 5.0 ohms?

Yes

Repair the high resistance in the (K594) Drivetrain Sensor Return circuit.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 5.

5. TRANSFER CLUTCH WORN

Ignition on, engine not running.

Shift the Transfer case into 4-LOW.

With the scan tool, monitor the encoder voltage in the Final Drive Control Module.

Shift the Transfer case into AWD.

Is the encoder voltage between 4.625 volts and 4.750?

Yes

Replace the worn clutch pack assembly in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Replace the Final Drive Control Module in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

Repair as necessary.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test complete.

Circuit Schematic

Fig. 55: Transfer Case Sensors Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

A calibrated motor abuse temperature limit has been achieved. The Final Drive Control Module monitors the motor use and has determined that excessive motor activations have occurred. This DTC will be stored after Transfer Case Motor has cooled down.

Possible Causes

Possible Causes
TRANSFER CASE SELECTOR SWITCH AMBIENT TEMPERATURE SENSOR CLUSTER CONTROL NODE (CCN) FINAL DRIVE CONTROL MODULE (FDCM)

Diagnostic Test

1. **DTC IS ACTIVE**

NOTE: **Diagnose and repair any system voltage or Transfer Case related DTCs in the Final Drive Control Module before continuing with this test.**

Ignition on, engine not running.

With the scan tool, clear Stored DTCs in the FDCM and the CCN.

Test drive the vehicle.

During the test drive, move the Transfer Case Selector Switch to each position several times in accordance with the Service Information.

With the scan tool, read DTCs in the FDCM and the CCN.

Does this DTC reset?

Yes

Go to 2.

No

Go to 5.

2. AMBIENT TEMPERATURE SENSOR

With the scan tool, monitor the ambient temperature in the Totally Integrated Power Module (TIPM).

Is the ambient temperature at room temperature?

Yes

Go to 3.

No

Replace the Ambient Temperature Sensor in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

3. TRANSFER CASE SELECTOR SWITCH

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors relative to this circuit.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Were any problems found?

Yes

Repair as necessary.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 4.

4. CLUSTER CONTROL NODE

Turn the ignition off to the lock position

Replace the Transfer Case Selector Switch in accordance with the Service Information.

Ignition on, engine not running.

With the scan tool, clear Stored DTCs in the CCN and the FDCM.

Test drive the vehicle.

During the test drive, move the Transfer Case Selector Switch to each position several times in

accordance with the Service Information.

With the scan tool, read DTCs in the CCN and the FDCM.

Does this DTC reset?

Yes

Replace the Final Drive Control Module in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test complete.

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

Repair as necessary.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test complete.

C1472-TRANSFER CASE CLUTCH CONTROL CIRCUIT PERFORMANCE

Circuit Schematic

Fig. 56: Transfer Case Sensors Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

Ignition on.

Set Conditions

- **Set Condition:**

The FDCM detects an overheat condition due to excessive difference in speed across the Transfer Case from hard driving conditions (Mud, Sand, Snow, 2WD Chassis dynamometer etc.).

Possible Causes

Possible Causes
DRIVING CONDITIONS FINAL DRIVE CONTROL MODULE (FDCM) TRANSFER CASE

Diagnostic Test

1. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE DTCS PRESENT**

Ignition on, engine not running.

With the scan tool, select View DTCs in the ABS Module.

Are there any ABS DTCs present?

Yes

Refer to the symptom list and perform any ABS DTC diagnostic procedures before continuing with this test.

No

Go to 2.

2. **POWER CONTROL MODULE (PCM) DTCS PRESENT**

Ignition on, engine not running.

With the scan tool, select View DTCs in the PCM.

Are there any PCM DTCs present?

Yes

Refer to the symptom list and perform any PCM DTC diagnostic procedures before continuing with this test.

No

Go to 3.

3. **DTC IS ACTIVE**

Ignition on, engine not running.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

Go To 4.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go To 5.

4. **VERIFY SET CONDITION**

NOTE: **Check with customer on driving terrain (e.g. mud, sand, snow) for set condition.**

With the scan tool, erase DTC's.

Test drive vehicle on dry paved road.

With the scan tool, read DTC's.

Is the status Active for this DTC?

Yes

Replace the Transfer Case Clutch Pack in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test Complete.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

5. **INTERMITTENT WIRING AND CONNECTORS**

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

Were there any problems found?

Yes

Repair as necessary.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test Complete.

C1476-TRANSFER CASE CLUTCH POSITION OUT OF RANGE

Circuit Schematic

01410000

Fig. 57: Transfer Case Sensors Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

With the ignition on and no system undervoltage or overvoltage condition present.

Set Conditions

- **Set Condition:**

The Final Drive Control Module is unable to engage the requested range.

Possible Causes

Possible Causes
TRANSFER CASE KISSPOINT NOT LEARNED (T315) MOTOR A CIRCUIT OPEN OR HIGH RESISTANCE (T316) MOTOR B CIRCUIT OPEN OR HIGH RESISTANCE (K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE (T313) MODE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE (K594) DRIVETRAIN SENSOR RETURN CIRCUIT OPEN OR HIGH RESISTANCE TRANSFER CASE INTERNAL CONDITION TRANSFER CASE FINAL DRIVE CONTROL MODULE

Diagnostic Test

1. **DTC IS ACTIVE**

Ignition on, engine not running.

With the scan tool, read DTCs in the Final Drive Control Module.

Is the status Active for this DTC?

Yes

Go to 2.

No

Go to 9.

2. **RELEARN KISS POINT**

Ignition on, engine running.

Place the Transmission in neutral and apply the brakes firmly.

Place the Transfer Case Motor Selector Switch in AWD.

With the scan tool, run the Final Drive Control Module non-volatile reset command.

Place the Transmission in park.

Wait for 10 seconds and turn Ignition switch back to Ignition on, engine not running.

With the scan tool, clear stored DTCs in the Final Drive Control Module.

Switch the Transfer Case Motor Selector Switch to 4-Low and back to AWD.

With the scan tool, read DTCs in the Final Drive Control Module.

Is the DTC status Active?

Yes

Go to 3.

No

Go to 9.

3. (T315) SHIFT MOTOR CONTROL A CIRCUIT OPEN

81daf250

Fig. 58: Measuring The Resistance Of The (T315) Shift Motor Control A Circuit From The Transfer Case Motor Harness Connector To The Final Drive Control Module C2 Harness Connector

Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position

Disconnect the Transfer Case Motor harness connector.

Disconnect the Final Drive Control Module C1 harness connector.

Measure the resistance of the (T315) Shift Motor Control A circuit from the Transfer Case Motor harness connector to the Final Drive Control Module C2 harness connector.

Is the resistance above 5.0 ohms?

Yes

Repair the (T315) Shift Motor Control A circuit for an open.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 4.

4. (T316) SHIFT MOTOR CONTROL B CIRCUIT OPEN

Fig. 59: Measuring The Resistance Of The (T316) Shift Motor Control B Circuit From The Transfer Case Motor Harness Connector To The Final Drive Control Module C2 Harness Connector

Courtesy of CHRYSLER LLC

Measure the resistance of the (T316) Shift Motor Control B circuit from the Transfer Case Motor harness connector to the Final Drive Control Module C2 harness connector.

Is the resistance above 5.0 ohms?

Yes

Repair the (T316) Shift Motor Control B circuit for an open.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 5.

5. **(K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT OPEN**

Fig. 60: Measuring The Resistance Of The (K504) Drivetrain 5 Volt Supply Circuit Between The Transfer Case Motor Harness Connector And The Final Drive Control Module C2 Harness Connector

Courtesy of CHRYSLER LLC

Measure the resistance of the (K504) Drivetrain 5 Volt Supply circuit between the Transfer Case Motor harness connector and the Final Drive Control Module C2 harness connector.

Is the resistance above 5.0 ohms?

Yes

Repair the open in the (K504) Drivetrain 5 Volt Supply circuit.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 6.

6. (T313) MODE SENSOR SIGNAL CIRCUIT HIGH RESISTANCE

Fig. 61: Measuring The Resistance Of The (T313) Mode Sensor Signal Circuit Between The Transfer Case Motor Harness Connector And The Final Drive Control Module C2 Harness Connector

Courtesy of CHRYSLER LLC

Measure the resistance of the (T313) Mode Sensor Signal circuit between the Transfer Case Motor harness connector and the Final Drive Control Module C2 harness connector.

Is the resistance above 5.0 ohms?

Yes

Repair the high resistance in the (T313) Mode Sensor Signal circuit.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 7.

7. (K594) DRIVETRAIN SENSOR RETURN CIRCUIT HIGH RESISTANCE

Fig. 62: Measuring The Resistance Of The (K594) Drivetrain Sensor Return Circuit Between The Transfer Case Motor Harness Connector And The Final Drive Control Module C1 Harness Connector

Courtesy of CHRYSLER LLC

Measure the resistance of the (K594) Drivetrain Sensor Return circuit between the Transfer Case Motor harness connector and the Final Drive Control Module C2 harness connector.

Is the resistance below 5.0 ohms?

Yes

Go to 8.

No

Repair the high resistance in the (K594) Drivetrain Sensor Return circuit.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

8. TRANSFER CASE

Turn the ignition off to the lock position

Inspect the Transfer Case to determine if there are any mechanical conditions preventing the shift motor

from engaging in the position selected.

Are any mechanical conditions preventing the shift motor from engaging in the position selected?

Yes

Replace the Transfer Case in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Replace the Final Drive Control Module in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

9. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

Repair as necessary.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test complete.

- **Set Condition:**

The FDCM detects an overheat condition due to excessive difference in speed across the Transfer Case from hard driving conditions (Mud, Sand, Snow, 2WD Chassis dynamometer etc.).

Possible Causes

Possible Causes
DRIVING CONDITIONS AMBIENT TEMPERATURE SENSOR FINAL DRIVE CONTROL MODULE (FDCM)

Diagnostic Test

1. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE DTCS PRESENT**

Ignition on, engine not running.

With the scan tool, select View DTCs in the ABS Module.

Are there any ABS DTCs present?

Yes

Refer to the symptom list and perform any ABS DTC diagnostic procedures before continuing with this test.

No

Go to 2.

2. **DTC IS ACTIVE**

Ignition on, engine not running.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

Go To 3.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go To 5.

3. **AMBIENT TEMPERATURE SENSOR**

With the scan tool, monitor the ambient temperature in the Totally Integrated Power Module (TIPM).

Is the ambient temperature at room temperature?

Yes

Go To 4.

No

Replace the Ambient Temperature Sensor in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

4. **VERIFY SET CONDITION**

NOTE: Check with customer on driving terrain (e.g. mud, sand, snow) for set condition.

With the scan tool, erase DTC's.

Allow the Transfer Case to cool down.

Test drive vehicle on dry paved road.

With the scan tool, read DTC's.

Is the status Active for this DTC?

Yes

Replace the Final Drive Control Module in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test Complete.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

5. **INTERMITTENT WIRING AND CONNECTORS**

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

Were there any problems found?

Yes

Repair as necessary.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test Complete.

C2100-BATTERY VOLTAGE LOW (FDCM)

Circuit Schematic

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

- **Set Condition:**

The Final Drive Control Module detects that system voltage is below 8.5 volts for 60 seconds with engine RPM greater than 1500.

Possible Causes

Possible Causes
CHARGING SYSTEM DTCS PRESENT FINAL DRIVE CONTROL MODULE (Z910) GROUND CIRCUIT OPEN OR HIGH RESISTANCE FINAL DRIVE CONTROL MODULE POWER CIRCUITS OPEN OR HIGH RESISTANCE FINAL DRIVE CONTROL MODULE (FDCM)

Diagnostic Test

1. **CHARGING SYSTEM DTCS PRESENT**

Ignition on, engine not running.

With the scan tool, read DTCs in the Powertrain Control Module.

Are there any Charging System or related voltage DTCs present?

Yes

Refer to the symptom list and perform any Charging System DTC diagnostic procedures before continuing with this test.

No

Go to 2.

2. **DTC IS ACTIVE**

With the scan tool, read DTCs in the Final Drive Control Module.

Is the status Active for this DTC?

Yes

3. FINAL DRIVE CONTROL MODULE (Z910) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

81db01b8

Fig. 65: Checking Final Drive Control Module (Z910) Ground Circuit Open Or High Resistance
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position

Disconnect the Final Drive Control Module C1 harness connector.

Disconnect the Final Drive Control Module C2 harness connector.

Ignition on, engine not running.

With a 12-volt test light connected to B+, check the (Z910) Ground circuit in the Final Drive Control Module C2 harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a

direct connection to the battery.

Does the test light illuminate brightly for each of the Ground circuits?

Yes

Go to 4.

No

Repair the (Z910) Ground circuit for an open circuit or high resistance.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

4. **FINAL DRIVE CONTROL MODULE POWER CIRCUITS OPEN OR HIGH RESISTANCE**

81db019e

Fig. 66: Checking Final Drive Control Module Power Circuits Open Or High Resistance
Courtesy of CHRYSLER LLC

With a 12-volt test light connected to ground, check the (F943) Fused Ignition Switch Output circuit in the Final Drive Control Module C1 harness connector and the (A115) Fused B+ circuit in the Final Drive Control Module C2 harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly for each of the circuits?

Yes

Replace the Final Drive Control Module in accordance with the Service information.
Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Repair the Fused B+ circuit(s) for an open circuit or high resistance.
Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

Repair as necessary.
Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test complete.

Test complete.

C2111-SENSOR SUPPLY 1 VOLTAGE CIRCUIT LOW (FDCM)

Circuit Schematic

01410000

Fig. 68: Transfer Case Sensors Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

With the ignition on and no system undervoltage or overvoltage condition present.

Set Conditions

- **Set Condition:**

The Final Drive Control Module detects that the Drivetrain Sensor Supply voltage is below 2.5 volts for 300 mS.

Possible Causes

Possible Causes
(K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT SHORT TO GROUND TRANSFER CASE MOTOR/ENCODER FINAL DRIVE CONTROL MODULE (FDCM)

Diagnostic Test

1. **DRIVETRAIN 5 VOLT SUPPLY (REFERENCE) VOLTAGE BELOW 4.8 VOLTS**

Ignition on, engine not running.

With the scan tool, read the Drivetrain 5-volt Supply (Reference) Voltage in the FDCM.

Is the voltage below 4.8 volts?

Yes

Go to 2.

No

Go to 4.

2. **TRANSFER CASE MOTOR/ENCODER**

Turn the ignition off to the lock position

Disconnect the Transfer Case Motor/Encoder harness connector.

Ignition on, engine not running.

With the scan tool, read the 5-volt Supply (Reference) Voltage.

Is the voltage above 4.75 volts with the Transfer Case Motor harness disconnected?

Yes

Replace the Transfer Case Encoder/Sensor in accordance with the Service Information.
Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 3.

3. (K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT SHORT TO GROUND

81dafb84

Fig. 69: Measuring The Resistance Between Ground And The (T504) Drivetrain 5-Volt Supply Circuit At The Transfer Case Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position

Disconnect the Final Drive Control Module harness connector.

Measure the resistance between ground and the (K504) Drivetrain 5- volt Supply circuit at the Transfer Case Motor harness connector.

Is the resistance below 5.0 ohms?

Yes

Repair the (K504) Drivetrain 5 Volt Supply circuit for a short to ground.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Replace the Final Drive Control Module in accordance with the Service information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

Repair as necessary.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test complete.

C2112-SENSOR SUPPLY 1 VOLTAGE CIRCUIT HIGH (FDCM)

Circuit Schematic

Monitor Conditions

When Monitored:

With the ignition on and no system undervoltage or overvoltage condition present.

Set Conditions

- **Set Condition:**

The Final Drive Control Module detects that the Drivetrain Sensor Supply voltage is above 7.5 volts for 300 mS

Possible Causes

Possible Causes
(K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT SHORT TO VOLTAGE FINAL DRIVE CONTROL MODULE (FDCM)

Diagnostic Test

1. **5 VOLT SUPPLY (REFERENCE) VOLTAGE IS ABOVE 5.2 VOLTS**

Ignition on, engine not running.

With the scan tool, read the Drivetrain 5-volt Supply (Reference) Voltage in the FDCM.

Is the voltage above 5.2 volts?

Yes

Go to 2.

No

Go to 3.

2. **(K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE**

81dad0fe

Fig. 71: Measuring The Voltage Of The (K504) Drivetrain 5-Volt Supply Circuit At The Transfer Case Motor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position

Disconnect the Transfer Case Encoder/Sensor harness connector.

Disconnect the Final Drive Control Module C1 harness connector.

Ignition on, engine not running.

Measure the voltage of the (K504) Drivetrain 5 Volt Supply circuit at Transfer Case Encoder/Sensor harness connector.

Is there any voltage present?

Yes

Repair the (K504) Drivetrain 5 Volt Supply circuit for a short to voltage.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Replace the Final Drive Control Module in accordance with the Service information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

3. **INTERMITTENT WIRING AND CONNECTORS**

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

Repair as necessary.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test complete.

C2201-INTERNAL CONTROLLER (FDCM)

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The Final Drive Control Module has detected a failure internal to the controller.

Possible Causes

Possible Causes
FINAL DRIVE CONTROL MODULE (FDCM)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, read DTCs in the Final Drive Control Module.

Is the status Active for this DTC?

Yes

Replace the Final Drive Control Module in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test Complete

C2206-VEHICLE CONFIGURATION MISMATCH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

• Set Condition:

When the Final Drive Control Module (FDCM) detects the signal from the gateway module relevant for vehicle characteristic is missing or does not match for a period greater than the specified fault duration.

Possible Causes

Possible Causes
INCORRECT TRANSFER CASE SWITCH INCORRECT TRANSFER CASE TOTALLY INTEGRATED POWER MODULE (TIPM) NOT CONFIGURED CORRECTLY FINAL DRIVE CONTROL MODULE (FDCM)

Diagnostic Test

1. CHECK FOR A DTC C2206-VEHICLE CONFIGURATION MISMATCH

NOTE: This DTC must be active for the results of this test to be valid and this DTC will be active when a new module is installed until initialization is performed.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, erase DTCs.

Perform ECU initialization with drive test on FDCM.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

Cycle the ignition switch from off to on.

With the scan tool, read and record DTCs.

Does the scan tool display: C2206-VEHICLE CONFIGURATION MISMATCH?

Yes

Go To 2.

No

FDCM is now configured.

2. VERIFY THAT THE CORRECT TRANSFER CASE SWITCH IS INSTALLED

NOTE: Verify the correct Transfer Case Switch part number is installed for the correct for the correct Transfer Case.

Turn the ignition to the lock position.

The correct Transfer Case Switch for the MP 1522 Transfer Case will read 4WD LOCK in the center position.

The correct Transfer Case Switch for the MP 3022 Transfer Case will read 4WD AUTO in the center position.

Is the correct Transfer Case Switch installed for the correct Transfer Case?

Yes

Go To 3.

No

Replace the Transfer Case Switch in accordance with the Service Information.

Perform the **TRANSFER CASE VERIFICATION TEST - VER 1.**

3. VERIFY THAT THE TIPM IS CONFIGURED CORRECTLY

Turn the ignition on.

Check the following data to ensure the TIPM is configured correctly. Engine Displacement (PCM), 2WD 4WD or AWD, Axle ratio N/A, Vehicle Line (BCM), Brake type 1=ESP, Suspension 1, 2 or 3.

NOTE: **The DTC will be active when a new controller is installed until initialization is performed.**

Was the TIPM configured correctly?

Yes

Replace the FDCM in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Reprogram the appropriate module.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

U0001-CAN C BUS

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Theory Of Operation

The FDCM communicates with other controllers over the CAN C bus. The FDCM continuously monitors the bus activity and receives the messages it needs. The CAN C bus is also used to communicate FDCM MIL status to the Engine Controller, therefore if the Engine Controller is unable to communicate with the FDCM, the Engine Controller will light the MIL.

Monitor Conditions

When Monitored:

Ignition run time is greater than 1 second. Battery voltage between 10 and 16 volts. Engine run time greater than 3 seconds.

Set Conditions

- **Set Condition:**

The PCM loses communication over the CAN C Bus circuit. The circuit is continuously monitored. One Trip fault.

Possible Causes

Possible Causes
CAN C BUS OPEN OR SHORTED CONDITION ANTI-LOCK BRAKE SYSTEM (ABS) MODULE FINAL DRIVE CONTROL MODULE (FDCM) POWERTRAIN CONTROL MODULE (PCM) TOTALLY INTEGRATED POWER MODULE (TIPM)

Refer to **DIAGNOSIS AND TESTING** for diagnostic procedures and for further possible causes.

U0100-LOST COMMUNICATION WITH ECM/PCM

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- TIPM is configured correctly

Set Conditions

- **Set Condition:**

Bus messages not received from the ECM/PCM for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
CAN C+ OR CAN C- BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES TIPM NOT CONFIGURED CORRECTLY ECM/PCM POWER AND GROUND ECM/PCM IPM

MODULE THAT SET THIS DTC

Refer to **DIAGNOSIS AND TESTING** for diagnostic procedures and for further possible causes.

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

U0101-LOST COMMUNICATION WITH TCM

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- TIPM is configured correctly

Set Conditions

- Set Condition:**

Bus messages not received from the TCM for approximately 500ms.

Possible Causes

Possible Causes
CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
TCM
TCM POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

NOTE: **Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to the ***STORED LOST COMMUNICATION DTCS** test procedure. Refer to **DIAGNOSTIC CODE INDEX**.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. VERIFY THAT THE TCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the TCM is active on the bus.

Is the TCM active on the bus?

Yes

Go To 4.

No

Refer to **DIAGNOSIS AND TESTING** for No Response diagnostic procedures.

Perform **BODY VERIFICATION TEST - VER 1** .

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS "Logged Against" the TCM?

Yes

Replace/update the TCM in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

U0121-LOST COMMUNICATION WITH ABS

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The ABS communicates with other controllers over the CAN C bus. The FDCM Module continuously monitors the bus activity and receives the messages it needs. If the FDCM does not receive messages from the ABS Module , then this fault will set and the service 4WD is illuminated.

Monitor Conditions

When Monitored:

Every 7 msec. Conditions: Battery voltage greater than 10v but less than 16v.

Set Conditions

- **Set Condition:**

CAN C bus messages not received for 10 seconds.

Refer to **DIAGNOSIS AND TESTING** for diagnostic procedures and for further possible causes.

U0141-LOST COMMUNICATION WITH FCM

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The TIPM communicates with other controllers over the CAN C bus. The FDCM Module continuously monitors the bus activity and receives the messages it needs. If the FDCM does not receive messages from the TIPM Module , then this fault will set and the service 4WD is illuminated.

Monitor Conditions

When Monitored:

Every 7 msec. Conditions: Battery voltage greater than 10v but less than 16v.

Set Conditions

- **Set Condition:**

CAN C bus messages not received for 10 seconds.

Refer to **DIAGNOSIS AND TESTING** for diagnostic procedures and for further possible causes.

U0212-LOST COMMUNICATION WITH SCM (SAS)

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed

Set Conditions

- **Set Condition:**

If the Final Drive Control Module fails to receive bus messages from the Steering Angle Sensor for approximately 500 ms.

Possible Causes

Possible Causes
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CAN C BUS CIRCUITS OPEN OR SHORTED
STEERING ANGLE SENSOR POWER AND GROUND
STEERING ANGLE SENSOR
FINAL DRIVE CONTROL MODULE (FDCM)

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

Turn the ignition on.

With the scan tool, read and record FDCM DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase FDCM DTCs.

Cycle the ignition switch.

With the scan tool, read FDCM DTCs.

Does this DTC reset?

Yes

Go To 2.

No

The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs related to the conditions listed above?

Yes

Diagnose and repair the DTC(s). Refer to the DIAGNOSTIC CODE INDEX in the applicable article.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go To 3.

3. **VERIFY THAT THE STEERING ANGLE SENSOR IS ACTIVE ON THE BUS**

With the scan tool, select ECU View.

Verify that the Steering Angle Sensor is active on the bus.

Is the Steering Angle Sensor active on the bus?

Yes

Refer to the ***STORED LOST COMMUNICATION DTCS** test procedure. Refer to **DIAGNOSTIC CODE INDEX**.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCS "Logged Against" the STEERING ANGLE SENSOR?

Yes

Replace/update the Steering Angle Sensor in accordance with the service information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1**.

No

Replace the Final Drive Control Module in accordance with the service information.

Replace/update the module that set this DTC in accordance with the service information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1**.

U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM (FDCM)

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on for 4 seconds, no CAN BUS circuit error condition present, no lost communication with PCM condition present, and no system undervoltage or overvoltage condition present.

Set Conditions

- **Set Condition:**

The Final Drive Control Module is receiving implausible data for pedal position, engine RPM, torque, or engine coolant temperature from the PCM.

Possible Causes

Possible Causes
POWERTRAIN DTCS PRESENT FINAL DRIVE CONTROL MODULE (FDCM)

Diagnostic Test

1. **POWERTRAIN DTCS PRESENT**

Ignition on.

With the scan tool, read DTCs in the Powertrain Control Module.

Are there any active DTCs present?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and perform the applicable diagnostic procedure.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Replace the Final Drive Control Module in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

U0402-IMPLAUSIBLE DATA RECEIVED FROM TCM (FDCM)

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

With the ignition on for 4 seconds, no CAN BUS circuit error condition present, no lost communication

with TCM condition present, and no system undervoltage or overvoltage condition present.

Set Conditions

- **Set Condition:**

The Final Drive Control Module is receiving implausible data for gear or PRNDL position from the TCM.

Possible Causes

Possible Causes
TRANSMISSION DTCS PRESENT FINAL DRIVE CONTROL MODULE (FDCM)

Diagnostic Test

1. **TRANSMISSION DTCS PRESENT**

Ignition on, engine not running.

With the scan tool, read DTCs in the Transmission Control Module.

Are there any DTCs present?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and perform the applicable diagnostic procedure.
Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Replace the Final Drive Control Module in accordance with the Service Information.
Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

U0415-IMPLAUSIBLE DATA RECEIVED FROM ABS (FDCM)

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on for 4 seconds, no CAN BUS circuit error condition present, no lost communication with ABS condition present, and no system undervoltage or overvoltage condition present.

Set Conditions

- **Set Condition:**

The Final Drive Control Module is receiving implausible data for vehicle speed, wheel speeds, brake switch status, longitudinal acceleration, yaw rate, or lateral acceleration from the ABS controller.

Possible Causes

Possible Causes
ANTILOCK BRAKE SYSTEM DTCS PRESENT FINAL DRIVE CONTROL MODULE (FDCM)

Diagnostic Test

1. **ABS DTCS PRESENT**

Ignition on, engine not running.

With the scan tool, read DTCs in the Antilock Brake Controller.

Are there any DTCs present?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and perform the applicable diagnostic procedure.
Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Replace the Final Drive Control Module in accordance with the Service Information.
Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

U0429-IMPLAUSIBLE DATA RECEIVED FROM SCM (FDCM)

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on for 4 seconds, no CAN BUS circuit error condition present, no lost communication with SCM condition present, and no system undervoltage or overvoltage condition present.

Set Conditions

- **Set Condition:**

The Final Drive Control Module is receiving implausible data for sensor status from the SCM.

Possible Causes

Possible Causes
STEERING COLUMN CONTROL MODULE DTCS PRESENT FINAL DRIVE CONTROL MODULE (FDCM)

Diagnostic Test

1. **STEERING COLUMN CONTROL MODULE DTCS PRESENT**

Ignition on, engine not running.

With the scan tool, read DTCs in the Steering Column Control Module.

Are there any DTCs present?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and perform the applicable diagnostic procedure.
Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Replace the Final Drive Control Module in accordance with the Service Information.
Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

U0431-IMPLAUSIBLE DATA RECEIVED FROM FCM (FDCM)

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on for 4 seconds, no CAN BUS circuit error condition present, no lost communication with FCM condition present, and no system undervoltage or overvoltage condition present.

Set Conditions

- **Set Condition:**

The Final Drive Control Module is receiving no message or implausible data for ambient temperature or the transfer case selector switch.

Possible Causes

Possible Causes
CLUSTER CONTROL NODE (CCN) DTCS PRESENT
TOTALLY INTEGRATED POWER MODULE (TIPM) DTCS PRESENT
TOTALLY INTEGRATED POWER MODULE (TIPM) CONFIGURED INCORRECTLY
TRANSFER CASE SELECTOR SWITCH
AMBIENT TEMPERATURE SENSOR
FINAL DRIVE CONTROL MODULE (FDCM)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

Ignition on, engine not running.

With the scan tool, read DTCs in the Final Drive Control Module.

Is the status Active for this DTC?

Yes

Go to 2.

No

Go to 5.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCS.

With the scan tool, read all active DTCs from the TIPM and CCN.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and perform the applicable diagnostic procedure.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Go to 3.

3. AMBIENT TEMPERATURE SENSOR

With the scan tool, monitor the ambient temperature in the Totally Integrated Power Module (TIPM).

Is the ambient temperature at room temperature?

Yes

Go to 4.

No

Replace the Ambient Temperature Sensor in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

4. TRANSFER CASE SELECTOR SWITCH

With the scan tool, monitor the voltages of the transfer case selector switch positions in the CCN.

Transfer Case Selector Switch Position Voltage	
Transfer Case Selector Switch Position	Voltage Range
Neutral	0.67 volts - 0.95 volts
2WD	1.98 volts - 2.22 volts
4WD AWD (MP3022)	2.62 volts - 2.88 volts
4WD LOCK (MP1522)	3.39 volts - 3.65 volts
4WD LOW	4.05 volts - 4.30 volts

Are the voltages of the transfer case selector switch within the specified ranges?

Yes

Replace the Final Drive Control Module in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Replace the Transfer Case Selector Switch in accordance with the Service Information.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

Repair as necessary.

Perform **TRANSFER CASE VERIFICATION TEST - VER 1.**

No

Test complete.

STANDARD PROCEDURE

TRANSFER CASE VERIFICATION TEST - VER 1

Disconnect all jumper wires and reconnect all previously disconnected components and connectors.

With the scan tool, select clear Stored DTCs.

Make sure that all accessories are turned off and that the battery is fully charged.

Test drive the vehicle in each Transfer Case range and verify proper operation in each range.

To select or deselect 2WD, AWD or 4HI mode, vehicle speed must be below 88 Km/h (55 mph) with all wheels at vehicle speed.

Shifts will not take place with a wheel speed difference of greater than 21 Km/h (13 mph) between the front and rear wheels.

To select or deselect 4LO (if equipped), vehicle speed must be below 5 Km/h (3 mph) with the ignition ON and the transmission in neutral (auto trans) or the clutch pedal pressed (man trans).

To select or deselect Transfer Case Neutral, vehicle speed must be 0 Km/h (0 mph) with the ignition ON, engine OFF, the brake pedal applied, and the transmission in neutral (auto trans) or the clutch pedal pressed (man trans). Press the Neutral button (if equipped) on the Transfer Case Selector Switch until the Neutral Indicator is illuminated.

WARNING: Apply the parking brake. The vehicle may roll with the Transfer Case in neutral.

To verify that the Transfer Case is in Neutral, shift the automatic transmission into reverse and release the

brake pedal for three seconds or shift the manual transmission into gear and slowly release the clutch pedal. There should be no vehicle movement if the Transfer Case is in Neutral.

With the scan tool, select View DTCs in the Totally Integrated Power Module (TIPM) and in the Instrument Cluster (CCN).

Are there any DTCs present in the Totally Integrated Power Module (TIPM) or in the Instrument Cluster (CCN)?

Yes

Return to the symptom list and perform the appropriate diagnostic test.

No

Repair is complete.

ELECTRONIC CONTROL MODULES - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

U0001-CAN C BUS CIRCUIT

Additional Wiring

01d3540c

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- Set Condition:**

The Totally Integrated Power Module (TIPM) detects a corrupt CAN C Bus message.

Possible Causes

Possible Causes
(D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND
(D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE
(D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT
ANTILOCK BRAKE MODULE
POWERTRAIN CONTROL MODULE
ENGINE CONTROL MODULE (DIESEL ONLY)
TRANSMISSION CONTROL MODULE
STEERING ANGLE SENSOR
ELECTRIC GEAR SHIFT MODULE
SENTRY KEY REMOTE ENTRY (SKREEM/WCM) MODULE
OCCUPANT RESTRAINT CONTROLLER MODULE
OCCUPANT CLASSIFICATION MODULE
TOTALLY INTEGRATED POWER MODULE
ANY CAN C BUS MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. ANTILOCK BRAKE MODULE - INTERNAL SHORT

Turn the ignition off.

Disconnect the Antilock Brake Module harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 3.

No

Inspect the wiring and connectors for damage or shorted circuits in accordance with the service information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. POWERTRAIN CONTROL MODULE - INTERNAL SHORT

Turn the ignition off.

Disconnect the Powertrain Control Module C1 harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 4.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Powertrain Control Module in accordance with the service information.

Perform **POWERTRAIN VERIFICATION TEST** .

4. ENGINE CONTROL MODULE (DIESEL ONLY) - INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Engine Control Module harness connectors.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 5.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Engine Control Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

5. TRANSMISSION CONTROL MODULE - INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Transmission Control Module harness connectors.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 6.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Transmission Control Module in accordance with the service information.

Perform **POWERTRAIN VERIFICATION TEST** .

6. STEERING ANGLE SENSOR - INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Steering Angle Sensor harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 7.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Steering Angle Sensor in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

7. ELECTRIC GEAR SHIFT MODULE - INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Electric Gear Shift Module harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 8.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Automatic Sway Bar System Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

8. SENTRY KEY REMOTE ENTRY (SKREEM/WCM) MODULE - INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Sentry Key Remote Entry (SKREEM/WCM) Module harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 9.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Sentry Key Remote Entry (SKREEM/WCM) Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

9. **OCCUPANT RESTRAINT CONTROLLER MODULE - INTERNAL SHORT**

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Occupant Restraint Controller Module harness connectors.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 10.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Occupant Restraint Controller Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

10. OCCUPANT CLASSIFICATION MODULE - INTERNAL SHORT

Turn the ignition off.

NOTE: **If vehicle is not equipped with this module, answer yes to the question.**

Disconnect the Occupant Classification Module harness connectors.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 11.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Occupant Classification Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

11. (D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE

Fig. 2: Measuring Voltage Between CAN C Bus (-) Circuit & Ground
 Courtesy of CHRYSLER LLC

Measure the voltage between the (D64) CAN C Bus (-) circuit and ground.

Is there any voltage present?

Yes

Repair the (D64) CAN C Bus (-) circuit for a short to voltage.
 Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 12.

12. **(D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND**

MODULE-
TOTALLY
INTEGRATED
POWER C1

8198930f

Fig. 3: Checking CAN C Bus (+) Circuit For Short To Ground
Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance between ground and the (D65) CAN C Bus (+) circuit.

Is any resistance present?

Yes

Repair the (D65) CAN C Bus (+) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 13.

13. (D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT

MODULE-
TOTALLY
INTEGRATED
POWER C1

8198932f

Fig. 4: Checking Resistance Between CAN C Bus (+) Circuit & CAN C Bus (-) Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between the (D65) CAN C Bus (+) circuit and the (D64) CAN C Bus (-) circuit.

Is any resistance present?

Yes

Repair the (D65) CAN C Bus (+) circuit for a short to the (D64) CAN C Bus (-) circuit.
Perform **BODY VERIFICATION TEST - VER 1.**

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Totally Integrated Power Module in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1.**

U0010-CAN INTERIOR BUS

Circuit Schematic

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The TIPM detects the CAN Interior Bus (125K) circuits shorted together.

Possible Causes

Possible Causes
(D265) CAN INTERIOR BUS (125K)(+) CIRCUIT SHORTED TO THE (D264) CAN INTERIOR BUS (125K)(-) CIRCUIT ANY CAN INTERIOR BUS MODULE TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. **ANY CAN INTERIOR BUS (125K) MODULE- INTERNAL SHORT**

NOTE: When performing this step, turn the ignition off (wait one minute) before

disconnecting any module. When the module is disconnected turn the ignition on.

NOTE: This step is to determine if the fault is internal within a module.

While monitoring the scan tool, disconnect each CAN Interior Bus (125K) module one at a time.

Check for this DTC to become active after disconnecting each CAN Interior Bus (125K) module the vehicle is equipped with.

NOTE: If the DTC becomes stored when a particular module is disconnected, that module is causing the DTC to set.

With all the CAN Interior Bus modules disconnected does the scan tool display this DTC as active?

Yes

Go To 3.

No

Replace the module that when disconnected caused this DTC to become stored in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

3. **(D265) CAN INTERIOR BUS (125K)(+) CIRCUIT SHORTED TO (D264) CAN INTERIOR BUS (125K)(-) CIRCUIT**

Fig. 6: Measuring Resistance Between (D265) CAN Interior Bus (125K)(+) Circuit And (D264) CAN Interior Bus (125K)(-) Circuit At TIPM C7 Harness Connector

Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance between the (D265) CAN Interior Bus (125K)(+) circuit and the (D264) CAN Interior Bus (125K)(-) circuit at the TIPM C7 harness connector.

Is the resistance below 10K ohms?

Yes

Repair the (D265) CAN Interior Bus (125K)(+) circuit for a short to the (D264) CAN Interior Bus (125K)(-) circuit.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Totally Integrated Power Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

U0011-CAN INTERIOR BUS OFF PERFORMANCE

Circuit Schematic

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

A module detects a short in either CAN Interior Bus circuit.

Perform the CAN Interior Bus Communication Failure diagnostic test procedure. See **DIAGNOSIS AND TESTING** .

U0100-LOST COMMUNICATION WITH ECM/PCM

Circuit Schematic

81d344d1

Fig. 8: Electronic Control Modules Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- IOD fuse installed.
- TIPM is configured correctly.

Set Conditions

- Set Condition:**

Bus messages not received from the ECM/PCM for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
(D65) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE (D64) CAN C BUS(-) CIRCUIT SHORTED TO GROUND DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES TIPM NOT CONFIGURED CORRECTLY ECM/PCM POWER AND GROUND ECM/PCM MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: **Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS.**

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read all active DTCS from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCS.

Does the scan tool display any active DTCS to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

No

Go To 3.

3. **VERIFY THAT THE ECM/PCM IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the ECM/PCM is active on the bus.

Is the ECM/PCM active on the bus?

Yes

Go To 4.

No

Perform the No Response diagnostic procedure. See **DIAGNOSIS AND TESTING.**

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS "Logged Against" the ECM/PCM?

Yes

Replace/update the ECM/PCM in accordance with the service information.
Perform the appropriate VERIFICATION TEST.

No

Go To 5.

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the ECM/PCM.

Clear active DTCs.

Is this DTC still active?

Yes

Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.

No

Go To 6.

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

Go To 7.

No

The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

Perform the appropriate VERIFICATION TEST.

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

Yes

Go To 8.

No

Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.

8. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is the voltage above 5 volts?

Yes

Repair the (D65) CAN C Bus (+) circuit for a short to voltage.
Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 9.

9. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is the resistance below 10K Ohms?

Yes

Repair the (D64) CAN C Bus (-) circuit for a short to ground.
Perform **BODY VERIFICATION TEST - VER 1.**

No

Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.

U0100-LOST COMMUNICATION WITH TCM

Circuit Schematic

81d344d1

Fig. 9: Electronic Control Modules Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- TIPM is configured correctly.

Set Conditions

- Set Condition:**

Bus messages not received from the TCM for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
(D65) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE (D64) CAN C BUS(-) CIRCUIT SHORTED TO GROUND TCM POWER AND GROUND TCM MODULE THAT SET THIS DTC

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

NOTE: **Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS.**

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read all active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

No

Go To 3.

3. VERIFY THAT THE TCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the TCM is active on the bus.

Is the TCM active on the bus?

Yes

Go To 4.

No

Perform the No Response diagnostic procedure. See **DIAGNOSIS AND TESTING**.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the TCM?

Yes

Replace/update the TCM in accordance with the service information.
Perform the appropriate VERIFICATION TEST.

No

Go To 5.

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the TCM.

Clear active DTCs.

Is this DTC still active?

Yes

Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.

No

Go To 6.

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

Go To 7.

No

The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

Perform the appropriate VERIFICATION TEST.

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

Yes

Go To 8.

No

Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.

8. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is the voltage above 5 volts?

Yes

Repair the (D65) CAN C Bus (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 9.

9. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is the resistance below 10K Ohms?

Yes

Repair the (D64) CAN C Bus (-) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Replace/update the module that set this DTC in accordance with the service information.

Perform the appropriate VERIFICATION TEST.

U0103-LOST COMMUNICATION WITH ESM

Circuit Schematic

81d344d1

Fig. 10: Electronic Control Modules Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- IOD fuse installed.
- TIPM is configured correctly.

Set Conditions

- Set Condition:**

Bus messages not received from the ESM for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
(D65) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE (D64) CAN C BUS(-) CIRCUIT SHORTED TO GROUND ESM POWER AND GROUND ESM MODULE THAT SET THIS DTC

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

NOTE: **Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS.**

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read all active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

No

Go To 3.

3. VERIFY THAT THE ESM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the ESM is active on the bus.

Is the ESM active on the bus?

Yes

Go To 4.

No

Perform the No Response diagnostic procedure. See **DIAGNOSIS AND TESTING**.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the ESM?

Yes

Replace/update the ESM in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**

With the scan tool, select the module setting the DTC against the ESM.

Clear active DTCs.

Is this DTC still active?

Yes

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 6.

6. **CYCLE IGNITION**

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

Go To 7.

No

The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

Perform the appropriate VERIFICATION TEST.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

Yes

Go To 8.

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

8. **(D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE**

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is the voltage above 5 volts?

Yes

Repair the (D65) CAN C Bus (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 9.

9. **(D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND**

Turn the ignition off.

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is the resistance below 10K Ohms?

Yes

Repair the (D64) CAN C Bus (-) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

U0114-LOST COMMUNICATION WITH FDCM

Circuit Schematic

81d344d1

Fig. 11: Electronic Control Modules Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- IOD fuse installed.
- TIPM is configured correctly.

Set Conditions

- Set Condition:**

Bus messages not received from the FDCM (ASBS) for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
(D65) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE (D64) CAN C BUS(-) CIRCUIT SHORTED TO GROUND DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES TIPM NOT CONFIGURED CORRECTLY FDCM (ASBS) POWER AND GROUND FDCM (ASBS) MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: **Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS.**

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read all active DTCS from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCS.

Does the scan tool display any active DTCS to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

No

Go To 3.

3. **VERIFY THAT THE FDCM (ASBS) IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the FDCM (ASBS) is active on the bus.

Is the FDCM (ASBS) active on the bus?

Yes

Go To 4.

No

Perform the No Response diagnostic procedure. See **DIAGNOSIS AND TESTING.**

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS "Logged Against" the FDCM (ASBS)?

Yes

Replace/update the FDCM (ASBS) in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 5.

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the FDCM (ASBS).

Clear active DTCs.

Is this DTC still active?

Yes

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 6.

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

Go To 7.

No

The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

Perform the appropriate VERIFICATION TEST.

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

Yes

Go To 8.

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

8. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is the voltage above 5 volts?

Yes

Repair the (D65) CAN C Bus (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 9.

9. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is the resistance below 10K Ohms?

Yes

Repair the (D64) CAN C Bus (-) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

U0121-LOST COMMUNICATION WITH ABS

Circuit Schematic

81d344d1

Fig. 12: Electronic Control Modules Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- IOD fuse installed.
- TIPM is configured correctly.

Set Conditions

- Set Condition:**

Bus messages not received from the ABS for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
(D65) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE (D64) CAN C BUS(-) CIRCUIT SHORTED TO GROUND ABS POWER AND GROUND ABS MODULE THAT SET THIS DTC

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

NOTE: **Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS.**

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read all active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

No

Go To 3.

3. VERIFY THAT THE ABS IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the ABS is active on the bus.

Is the ABS active on the bus?

Yes

Go To 4.

No

Perform the No Response diagnostic procedure. See **DIAGNOSIS AND TESTING**.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the ABS?

Yes

Replace/update the ABS in accordance with the service information.
Perform **ABS VERIFICATION TEST** .

No

Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**

With the scan tool, select the module setting the DTC against the ABS.

Clear active DTCs.

Is this DTC still active?

Yes

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 6.

6. **CYCLE IGNITION**

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

Go To 7.

No

The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

Perform the appropriate VERIFICATION TEST.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

Yes

Go To 8.

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

8. **(D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE**

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is the voltage above 5 volts?

Yes

Repair the (D65) CAN C Bus (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 9.

9. **(D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND**

Turn the ignition off.

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is the resistance below 10K Ohms?

Yes

Repair the (D64) CAN C Bus (-) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

U0126-LOST COMMUNICATION WITH SAS

Circuit Schematic

81d344d1

Fig. 13: Electronic Control Modules Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- IOD fuse installed.
- TIPM is configured correctly.

Set Conditions

- Set Condition:**

Bus messages not received from the SAS for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
(D65) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE (D64) CAN C BUS(-) CIRCUIT SHORTED TO GROUND SAS POWER AND GROUND SAS MODULE THAT SET THIS DTC

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

NOTE: **Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS.**

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read all active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

No

Go To 3.

3. VERIFY THAT THE SAS IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the SAS is active on the bus.

Is the SAS active on the bus?

Yes

Go To 4.

No

Perform the No Response diagnostic procedure. See **DIAGNOSIS AND TESTING**.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the SAS?

Yes

Replace/update the SAS in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**

With the scan tool, select the module setting the DTC against the SAS.

Clear active DTCs.

Is this DTC still active?

Yes

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 6.

6. **CYCLE IGNITION**

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

Go To 7.

No

The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

Perform the appropriate VERIFICATION TEST.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

Yes

Go To 8.

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

8. **(D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE**

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is the voltage above 5 volts?

Yes

Repair the (D65) CAN C Bus (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 9.

9. **(D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND**

Turn the ignition off.

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is the resistance below 10K Ohms?

Yes

Repair the (D64) CAN C Bus (-) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (TIPM)

Circuit Schematic

81d344d1

Fig. 14: Electronic Control Modules Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- IOD fuse installed.
- TIPM is configured correctly.

Set Conditions

- **Set Condition:**

Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
DIAGNOSTIC CAN C BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES TIPM NOT CONFIGURED CORRECTLY TOTALLY INTEGRATED POWER MODULE POWER AND GROUND TOTALLY INTEGRATED POWER MODULE MODULE THAT SET THIS DTC

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

NOTE: **Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS.**

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

No

Go To 3.

3. VERIFY THAT THE TIPM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the TIPM is active on the bus.

Is the TIPM active on the bus?

Yes

Go To 4.

No

Refer to ***NO RESPONSE FROM TIPM (TOTALLY INTEGRATED POWER MODULE)***.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the TIPM?

Yes

Replace/update the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Replace/update the module that set this DTC in accordance with the service information
Perform the appropriate VERIFICATION TEST.

U0151-LOST COMMUNICATION WITH ORC

Circuit Schematic

81d344d1

Fig. 15: Electronic Control Modules Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- Airbag fuse (35) and (51) installed.
- TIPM is configured correctly.

Set Conditions

- Set Condition:**

Bus messages not received from the ORC for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
(D65) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE (D64) CAN C BUS(-) CIRCUIT SHORTED TO GROUND ORC POWER AND GROUND OCCUPANT RESTRAINT CONTROLLER MODULE THAT SET THIS DTC

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

NOTE: **Ensure the Airbag fuses (35) and (51) are installed and battery voltage is between 10 and 16 volts before proceeding.**

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS.**

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read all active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

No

Go To 3.

3. VERIFY THAT THE ORC IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the ORC is active on the bus.

Is the ORC active on the bus?

Yes

Go To 4.

No

Perform the No Response diagnostic procedure. See **DIAGNOSIS AND TESTING**.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the ORC?

Yes

Replace/update the Occupant Restraint Controller in accordance with the service information.
Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

No

Go To 5.

5. **CLEAR DTC IN MODULE SETTING FAULT**

With the scan tool, select the module setting the DTC against the ORC.

Clear active DTCs.

Is this DTC still active?

Yes

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 6.

6. **CYCLE IGNITION**

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

Go To 7.

No

The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

Perform the appropriate VERIFICATION TEST.

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

Yes

Go To 8.

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

8. **(D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE**

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is the voltage above 5 volts?

Yes

Repair the (D65) CAN C Bus (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 9.

9. **(D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND**

Turn the ignition off.

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is the resistance below 10K Ohms?

Yes

Repair the (D64) CAN C Bus (-) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

U0154-LOST COMMUNICATION WITH OCM

Circuit Schematic

81d344d1

Fig. 16: Electronic Control Modules Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- Airbag fuse (48) installed.
- TIPM is configured correctly.

Set Conditions

- Set Condition:**

Bus messages not received from the OCM for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
(D65) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE (D64) CAN C BUS(-) CIRCUIT SHORTED TO GROUND OCM POWER AND GROUND OCCUPANT CLASSIFICATION MODULE MODULE THAT SET THIS DTC

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

NOTE: **Ensure the Airbag fuse (48) is installed and battery voltage is between 10 and 16 volts before proceeding.**

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS.**

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read all active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

No

Go To 3.

3. VERIFY THAT THE OCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the OCM is active on the bus.

Is the OCM active on the bus?

Yes

Go To 4.

No

Perform the No Response diagnostic procedure. See **DIAGNOSIS AND TESTING**.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the OCM?

Yes

Replace/update the Occupant Classification Module in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 5.

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the OCM.

Clear active DTCs.

Is this DTC still active?

Yes

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 6.

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

Go To 7.

No

The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

Perform **BODY VERIFICATION TEST - VER 1.**

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

Yes

Go To 8.

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

8. **(D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE**

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is the voltage above 5 volts?

Yes

Repair the (D65) CAN C Bus (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 9.

9. **(D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND**

Turn the ignition off.

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is the resistance below 10K Ohms?

Yes

Repair the (D64) CAN C Bus (-) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

U0155-LOST COMMUNICATION WITH CLUSTER/CCN

Circuit Schematic

81d344d1

Fig. 17: Electronic Control Modules Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- IOD fuse installed.
- TIPM is configured correctly.

Set Conditions

- Set Condition:**

Bus messages not received from the Cluster/CCN for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT SHORTED TO VOLTAGE (D264) CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO GROUND DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES TIPM NOT CONFIGURED CORRECTLY CLUSTER/CCN POWER AND GROUND CLUSTER/CCN MODULE THAT SET THE DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS.**

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

No

Go To 3.

3. **VERIFY THAT THE CCN IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the CCN is active on the bus.

Is the CCN active on the bus?

Yes

Go To 4.

No

Perform the No Response diagnostic procedure. See **DIAGNOSIS AND TESTING.**

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the CCN?

Yes

Replace/update the Cluster (CCN) in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 5.

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the Cluster/CCN.

Clear active DTCs.

Is this DTC still active?

Yes

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 6.

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

Go To 7.

No

The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

Perform **BODY VERIFICATION TEST - VER 1.**

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN Interior BUS (125K) modules show Lost Communication with the remaining CAN Interior BUS (125K) modules?

Yes

Go To 8.

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

8. (D265) CAN INTERIOR BUS(+) (125K) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D265) CAN Interior Bus(+) (125K) circuit and ground.

Is the voltage above 5 volts?

Yes

Repair the (D265) CAN Interior Bus(+) (125K) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 9.

9. (D264) CAN INTERIOR BUS(-) (125K) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D264) CAN Interior Bus(-) (125K) circuit.

Is the resistance below 10K Ohms?

Yes

Repair the (D264) CAN Interior Bus(-) (125K) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

U0159-LOST COMMUNICATION WITH PARK ASSIST MODULE

Circuit Schematic

81d344d1

Fig. 18: Electronic Control Modules Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- IOD fuse installed.
- TIPM is configured correctly.

Set Conditions

- Set Condition:**

Bus messages not received from the Park Assist (PTS) Module for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT SHORTED TO VOLTAGE (D264) CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO GROUND DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES TIPM NOT CONFIGURED CORRECTLY PARK ASSIST MODULE POWER AND GROUND PARK ASSIST MODULE MODULE THAT SET THE DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS.**

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCS from all modules.

NOTE: Check for TIPM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCS.

Does the scan tool display any active DTCS to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

No

Go To 3.

3. **VERIFY THAT THE PTS IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the PTS is active on the bus.

Is the PTS active on the bus?

Yes

Go To 4.

No

Perform the No Response diagnostic procedure. See **DIAGNOSIS AND TESTING.**

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS "Logged Against" the PTS?

Yes

Replace/update the Park Assist (PTS) Module in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 5.

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the Park Assist (PTS) Module.

Clear active DTCs.

Is this DTC still active?

Yes

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 6.

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

Go To 7.

No

The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

Perform **BODY VERIFICATION TEST - VER 1.**

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN Interior BUS (125K) modules show Lost Communication with the remaining CAN Interior BUS (125K) modules?

Yes

Go To 8.

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

8. (D265) CAN INTERIOR BUS(+) (125K) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D265) CAN Interior Bus(+) (125K) circuit and ground.

Is the voltage above 5 volts?

Yes

Repair the (D265) CAN Interior Bus(+) (125K) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 9.

9. (D264) CAN INTERIOR BUS(-) (125K) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D264) CAN Interior Bus(-) (125K) circuit.

Is the resistance below 10K Ohms?

Yes

Repair the (D264) CAN Interior Bus(-) (125K) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

U0164-LOST COMMUNICATION WITH A/C HEATER CONTROL MODULE (HVAC)

Circuit Schematic

81d344d1

Fig. 19: Electronic Control Modules Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- IOD fuse installed.
- TIPM is configured correctly.

Set Conditions

- Set Condition:**

Bus messages not received from the A/C Heater Control (HVAC) Module for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT SHORTED TO VOLTAGE
(D264) CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
A/C HEATER CONTROL MODULE POWER AND GROUND
A/C HEATER CONTROL MODULE
MODULE THAT SET THE DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS.**

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

No

Go To 3.

3. **VERIFY THAT THE HVAC IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the HVAC is active on the bus.

Is the HVAC active on the bus?

Yes

Go To 4.

No

Perform the No Response diagnostic procedure. See **DIAGNOSIS AND TESTING.**

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the HVAC?

Yes

Replace/update the A/C Heater Control (HVAC) Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 5.

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the A/C Heater Control (HVAC) Module.

Clear active DTCs.

Is this DTC still active?

Yes

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 6.

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

Go To 7.

No

The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

Perform **BODY VERIFICATION TEST - VER 1.**

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN Interior BUS (125K) modules show Lost Communication with the remaining CAN Interior BUS (125K) modules?

Yes

Go To 8.

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

8. (D265) CAN INTERIOR BUS(+) (125K) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D265) CAN Interior Bus(+) (125K) circuit and ground.

Is the voltage above 5 volts?

Yes

Repair the (D265) CAN Interior Bus(+) (125K) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 9.

9. (D264) CAN INTERIOR BUS(-) (125K) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D264) CAN Interior Bus(-) (125K) circuit.

Is the resistance below 10K Ohms?

Yes

Repair the (D264) CAN Interior Bus(-) (125K) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

U0167-LOST COMMUNICATION WITH INTRUSION TRANSCEIVER MODULE (ITM)

Circuit Schematic

81d344d1

Fig. 20: Electronic Control Modules Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- IOD fuse installed.
- TIPM is configured correctly.

Set Conditions

- Set Condition:**

Bus messages not received from the Intrusion Transceiver Module (ITM) for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT SHORTED TO VOLTAGE (D264) CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO GROUND DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES TIPM NOT CONFIGURED CORRECTLY INTRUSION TRANSCIEVER MODULE POWER AND GROUND INTRUSION TRANSCIEVER MODULE MODULE THAT SET THE DTC

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

NOTE: **Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS.**

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

No

Go To 3.

3. **VERIFY THAT THE ITM IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the ITM is active on the bus.

Is the ITM active on the bus?

Yes

Go To 4.

No

Perform the No Response diagnostic procedure. See **DIAGNOSIS AND TESTING.**

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the ITM?

Yes

Replace/update the Intrusion Transceiver Module (ITM) in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 5.

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the Intrusion Transceiver Module (ITM).

Clear active DTCs.

Is this DTC still active?

Yes

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 6.

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

Go To 7.

No

The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

Perform **BODY VERIFICATION TEST - VER 1.**

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN Interior BUS (125K) modules show Lost Communication with the remaining CAN Interior BUS (125K) modules?

Yes

Go To 8.

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

8. (D265) CAN INTERIOR BUS(+) (125K) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D265) CAN Interior Bus(+) (125K) circuit and ground.

Is the voltage above 5 volts?

Yes

Repair the (D265) CAN Interior Bus(+) (125K) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 9.

9. (D264) CAN INTERIOR BUS(-) (125K) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D264) CAN Interior Bus(-) (125K) circuit.

Is the resistance below 10K Ohms?

Yes

Repair the (D264) CAN Interior Bus(-) (125K) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

U0168-LOST COMMUNICATION WITH WCM

Circuit Schematic

81d344d1

Fig. 21: Electronic Control Modules Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- IOD fuse installed.
- TIPM is configured correctly.

Set Conditions

- **Set Condition:**

Bus messages not received from the WCM for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
(D65) CAN C BUS(+) CIRCUIT SHORTED TO VOLTAGE (D64) CAN C BUS(-) CIRCUIT SHORTED TO GROUND DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES TIPM NOT CONFIGURED CORRECTLY WCM POWER AND GROUND VEHICLE SECURITY CONTROL MODULE (WCM/SKREEM) MODULE THAT SET THIS DTC

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

NOTE: **Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS.**

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read all active DTCS from all modules.

NOTE: Check for TIPM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCS.

Does the scan tool display any active DTCS to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

No

Go To 3.

3. **VERIFY THAT THE WCM IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the WCM is active on the bus.

Is the WCM active on the bus?

Yes

Go To 4.

No

Perform the No Response diagnostic procedure. See **DIAGNOSIS AND TESTING.**

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS "Logged Against" the WCM?

Yes

Replace/update the Occupant Classification Module in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 5.

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the WCM.

Clear active DTCs.

Is this DTC still active?

Yes

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 6.

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three time ending with the key in the RUN position.

Does this DTC become active?

Yes

Go To 7.

No

The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

Perform **BODY VERIFICATION TEST - VER 1.**

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

Yes

Go To 8.

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

8. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is the voltage above 5 volts?

Yes

Repair the (D65) CAN C Bus (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 9.

9. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is the resistance below 10K Ohms?

Yes

Repair the (D64) CAN C Bus (-) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

U0169-LOST COMMUNICATION WITH SUNROOF CONTROL MODULE (SUNR)

Circuit Schematic

81d344d1

Fig. 22: Electronic Control Modules Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- IOD fuse installed.
- TIPM is configured correctly.

Set Conditions

- Set Condition:**

Bus messages not received from the Sunroof Control Module (SUNR) for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT SHORTED TO VOLTAGE (D264) CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO GROUND DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES TIPM NOT CONFIGURED CORRECTLY SUNR POWER AND GROUND SUNROOF CONTROL MODULE MODULE THAT SET THE DTC

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

NOTE: **Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS.**

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

No

Go To 3.

3. **VERIFY THAT THE SUNR IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the SUNR is active on the bus.

Is the SUNR active on the bus?

Yes

Go To 4.

No

Perform the No Response diagnostic procedure. See **DIAGNOSIS AND TESTING.**

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the SUNR?

Yes

Replace/update the Sunroof Control Module in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 5.

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the SUNR.

Clear active DTCs.

Is this DTC still active?

Yes

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 6.

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

Go To 7.

No

The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

Perform **BODY VERIFICATION TEST - VER 1.**

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN Interior BUS (125K) modules show Lost Communication with the remaining CAN Interior BUS (125K) modules?

Yes

Go To 8.

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

8. (D265) CAN INTERIOR BUS(+) (125K) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D265) CAN Interior Bus(+) (125K) circuit and ground.

Is the voltage above 5 volts?

Yes

Repair the (D265) CAN Interior Bus(+) (125K) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 9.

9. (D264) CAN INTERIOR BUS(-) (125K) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D264) CAN Interior Bus(-) (125K) circuit.

Is the resistance below 10K Ohms?

Yes

Repair the (D264) CAN Interior Bus(-) (125K) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

U0184-LOST COMMUNICATION WITH RADIO

Circuit Schematic

81d344d1

Fig. 23: Electronic Control Modules Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- IOD fuse installed.
- TIPM is configured correctly.

Set Conditions

- Set Condition:**

Bus messages not received from the Radio for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT SHORTED TO VOLTAGE (D264) CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO GROUND DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES TIPM NOT CONFIGURED CORRECTLY RADIO POWER AND GROUND RADIO MODULE THAT SET THE DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS.**

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

No

Go To 3.

3. **VERIFY THAT THE RADIO IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the RADIO is active on the bus.

Is the RADIO active on the bus?

Yes

Go To 4.

No

Perform the No Response diagnostic procedure. See **DIAGNOSIS AND TESTING.**

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the RADIO?

Yes

Replace/update the Radio in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 5.

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the Radio.

Clear active DTCs.

Is this DTC still active?

Yes

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 6.

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

Go To 7.

No

The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

Perform **BODY VERIFICATION TEST - VER 1.**

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN Interior BUS (125K) modules show Lost Communication with the remaining CAN Interior BUS (125K) modules?

Yes

Go To 8.

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

8. (D265) CAN INTERIOR BUS(+) (125K) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D265) CAN Interior Bus(+) (125K) circuit and ground.

Is the voltage above 5 volts?

Yes

Repair the (D265) CAN Interior Bus(+) (125K) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 9.

9. (D264) CAN INTERIOR BUS(-) (125K) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D264) CAN Interior Bus(-) (125K) circuit.

Is the resistance below 10K Ohms?

Yes

Repair the (D264) CAN Interior Bus(-) (125K) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER

Circuit Schematic

81d344d1

Fig. 24: Electronic Control Modules Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- IOD fuse installed.
- TIPM is configured correctly.

Set Conditions

- Set Condition:**

Bus messages not received from the Amplifier for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT SHORTED TO VOLTAGE (D264) CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO GROUND DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES TIPM NOT CONFIGURED CORRECTLY AMPLIFIER POWER AND GROUND AMPLIFIER MODULE THAT SET THE DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: **Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS.**

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCS.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

No

Go To 3.

3. **VERIFY THAT THE AMP IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the AMP is active on the bus.

Is the AMP active on the bus?

Yes

Go To 4.

No

Perform the No Response diagnostic procedure. See **DIAGNOSIS AND TESTING.**

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the AMP?

Yes

Replace/update the Amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 5.

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the Amp.

Clear active DTCs.

Is this DTC still active?

Yes

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 6.

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

Go To 7.

No

The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

Perform **BODY VERIFICATION TEST - VER 1.**

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN Interior BUS (125K) modules show Lost Communication with the remaining CAN Interior BUS (125K) modules?

Yes

Go To 8.

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

8. (D265) CAN INTERIOR BUS(+) (125K) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D265) CAN Interior Bus(+) (125K) circuit and ground.

Is the voltage above 5 volts?

Yes

Repair the (D265) CAN Interior Bus(+) (125K) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 9.

9. (D264) CAN INTERIOR BUS(-) (125K) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D264) CAN Interior Bus(-) (125K) circuit.

Is the resistance below 10K Ohms?

Yes

Repair the (D264) CAN Interior Bus(-) (125K) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

U0187-LOST COMMUNICATION WITH DVD PLAYER

Circuit Schematic

81d344d1

Fig. 25: Electronic Control Modules Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- IOD fuse installed.
- TIPM is configured correctly.

Set Conditions

- **Set Condition:**

Bus messages not received from the DVD Player (VES) for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT SHORTED TO VOLTAGE (D264) CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO GROUND DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES TIPM NOT CONFIGURED CORRECTLY DVD PLAYER (VES) POWER AND GROUND DVD PLAYER (VES) MODULE THAT SET THE DTC

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

NOTE: **Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS.**

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

No

Go To 3.

3. **VERIFY THAT THE VES IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the VES is active on the bus.

Is the VES active on the bus?

Yes

Go To 4.

No

Perform the No Response diagnostic procedure. See **DIAGNOSIS AND TESTING.**

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the VES?

Yes

Replace/update the DVD Player (VES) in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 5.

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the VES.

Clear active DTCs.

Is this DTC still active?

Yes

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 6.

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

Go To 7.

No

The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

Perform **BODY VERIFICATION TEST - VER 1.**

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN Interior BUS (125K) modules show Lost Communication with the remaining CAN Interior BUS (125K) modules?

Yes

Go To 8.

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

8. (D265) CAN INTERIOR BUS(+) (125K) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D265) CAN Interior Bus(+) (125K) circuit and ground.

Is the voltage above 5 volts?

Yes

Repair the (D265) CAN Interior Bus(+) (125K) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 9.

9. (D264) CAN INTERIOR BUS(-) (125K) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D264) CAN Interior Bus(-) (125K) circuit.

Is the resistance below 10K Ohms?

Yes

Repair the (D264) CAN Interior Bus(-) (125K) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

U0197-LOST COMMUNICATION WITH HANDS FREE MODULE (HFM)

Circuit Schematic

81d344d1

Fig. 26: Electronic Control Modules Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- IOD fuse installed.
- TIPM is configured correctly.

Set Conditions

- Set Condition:**

Bus messages not received from the Hands Free Module (HFM) for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT SHORTED TO VOLTAGE (D264) CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO GROUND DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES TIPM NOT CONFIGURED CORRECTLY HANDS FREE MODULE POWER AND GROUND HANDS FREE MODULE MODULE THAT SET THE DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS.**

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

No

Go To 3.

3. **VERIFY THAT THE HFM IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the HFM is active on the bus.

Is the HFM active on the bus?

Yes

Go To 4.

No

Perform the No Response diagnostic procedure. See **DIAGNOSIS AND TESTING.**

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the HFM?

Yes

Replace/update the Hands Free Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 5.

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the HFM.

Clear active DTCs.

Is this DTC still active?

Yes

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 6.

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

Go To 7.

No

The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

Perform **BODY VERIFICATION TEST - VER 1.**

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN Interior BUS (125K) modules show Lost Communication with the remaining CAN Interior BUS (125K) modules?

Yes

Go To 8.

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

8. (D265) CAN INTERIOR BUS(+) (125K) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D265) CAN Interior Bus(+) (125K) circuit and ground.

Is the voltage above 5 volts?

Yes

Repair the (D265) CAN Interior Bus(+) (125K) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 9.

9. (D264) CAN INTERIOR BUS(-) (125K) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D264) CAN Interior Bus(-) (125K) circuit.

Is the resistance below 10K Ohms?

Yes

Repair the (D264) CAN Interior Bus(-) (125K) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

U0203-LOST COMMUNICATION WITH DRIVER DOOR MODULE (DDM)

Circuit Schematic

81d344d1

Fig. 27: Electronic Control Modules Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- IOD fuse installed.
- TIPM is configured correctly.

Set Conditions

- Set Condition:**

Bus messages not received from the Driver Door Module (DDM) for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT SHORTED TO VOLTAGE (D264) CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO GROUND DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES TIPM NOT CONFIGURED CORRECTLY DRIVER DOOR MODULE POWER AND GROUND DRIVER DOOR MODULE MODULE THAT SET THE DTC

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS.**

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

No

Go To 3.

3. **VERIFY THAT THE DDM IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the DDM is active on the bus.

Is the DDM active on the bus?

Yes

Go To 4.

No

Perform the No Response diagnostic procedure. See **DIAGNOSIS AND TESTING.**

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the DDM?

Yes

Replace/update the Driver Door Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 5.

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the DDM.

Clear active DTCs.

Is this DTC still active?

Yes

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 6.

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

Go To 7.

No

The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

Perform **BODY VERIFICATION TEST - VER 1.**

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN Interior BUS (125K) modules show Lost Communication with the remaining CAN Interior BUS (125K) modules?

Yes

Go To 8.

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

8. (D265) CAN INTERIOR BUS(+) (125K) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D265) CAN Interior Bus(+) (125K) circuit and ground.

Is the voltage above 5 volts?

Yes

Repair the (D265) CAN Interior Bus(+) (125K) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 9.

9. (D264) CAN INTERIOR BUS(-) (125K) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D264) CAN Interior Bus(-) (125K) circuit.

Is the resistance below 10K Ohms?

Yes

Repair the (D264) CAN Interior Bus(-) (125K) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

U0204-LOST COMMUNICATION WITH PASSENGER DOOR MODULE (PDM)

Circuit Schematic

81d344d1

Fig. 28: Electronic Control Modules Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- IOD fuse installed.
- TIPM is configured correctly.

Set Conditions

- Set Condition:**

Bus messages not received from the Passenger Door Module (PDM) for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT SHORTED TO VOLTAGE (D264) CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO GROUND DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES TIPM NOT CONFIGURED CORRECTLY PASSENGER DOOR MODULE POWER AND GROUND PASSENGER DOOR MODULE MODULE THAT SET THE DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS.**

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

No

Go To 3.

3. **VERIFY THAT THE PDM IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the PDM is active on the bus.

Is the PDM active on the bus?

Yes

Go To 4.

No

Perform the No Response diagnostic procedure. See **DIAGNOSIS AND TESTING.**

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the PDM?

Yes

Replace/update the Passenger Door Module in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 5.

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the PDM.

Clear active DTCs.

Is this DTC still active?

Yes

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 6.

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

Go To 7.

No

The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

Perform **BODY VERIFICATION TEST - VER 1.**

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN Interior BUS (125K) modules show Lost Communication with the remaining CAN Interior BUS (125K) modules?

Yes

Go To 8.

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

8. (D265) CAN INTERIOR BUS(+) (125K) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D265) CAN Interior Bus(+) (125K) circuit and ground.

Is the voltage above 5 volts?

Yes

Repair the (D265) CAN Interior Bus(+) (125K) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 9.

9. (D264) CAN INTERIOR BUS(-) (125K) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D264) CAN Interior Bus(-) (125K) circuit.

Is the resistance below 10K Ohms?

Yes

Repair the (D264) CAN Interior Bus(-) (125K) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

U0209-LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE (MSMD)

Circuit Schematic

81d344d1

Fig. 29: Electronic Control Modules Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- IOD fuse installed.
- TIPM is configured correctly.

Set Conditions

- Set Condition:**

Bus messages not received from the Memory Seat Control Module (MSMD) for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
(D265) CAN INTERIOR BUS(+) (125k) CIRCUIT SHORTED TO VOLTAGE (D264) CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO GROUND DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES TIPM NOT CONFIGURED CORRECTLY MSMD POWER AND GROUND MEMORY SEAT CONTROL MODULE MODULE THAT SET THE DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS.**

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

No

Go To 3.

3. **VERIFY THAT THE MSMD IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the MSMD is active on the bus.

Is the MSMD active on the bus?

Yes

Go To 4.

No

Perform the No Response diagnostic procedure. See **DIAGNOSIS AND TESTING.**

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the MSMD?

Yes

Replace/update the Memory Seat Control Module in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 5.

5. CLEAR DTC IN MODULE SETTING FAULT

With the scan tool, select the module setting the DTC against the MSMD.

Clear active DTCs.

Is this DTC still active?

Yes

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 6.

6. CYCLE IGNITION

Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

Go To 7.

No

The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

Perform **BODY VERIFICATION TEST - VER 1.**

7. CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS

With the scan tool, select Network Diagnostics.

Does the TIPM and other CAN Interior BUS (125K) modules show Lost Communication with the remaining CAN Interior BUS (125K) modules?

Yes

Go To 8.

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

8. (D265) CAN INTERIOR BUS(+) (125K) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D265) CAN Interior Bus(+) (125K) circuit and ground.

Is the voltage above 5 volts?

Yes

Repair the (D265) CAN Interior Bus(+) (125K) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To 9.

9. (D264) CAN INTERIOR BUS(-) (125K) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D264) CAN Interior Bus(-) (125K) circuit.

Is the resistance below 10K Ohms?

Yes

Repair the (D264) CAN Interior Bus(-) (125K) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Replace/update the module that set this DTC in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

U1147-ADDITIONAL CAN INTERIOR BUS ECU DETECTED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

- **Set Condition:**

The Totally Integrated Power Module (TIPM) detects an additional CAN Interior Bus module and requires reprogramming.

Possible Causes

Possible Causes
ADDITIONAL MODULE ADDED/REMOVED FROM THE CAN INTERIOR BUS NETWORK

Diagnostic Test

1. **REPROGRAM THE TOTALLY INTEGRATED POWER MODULE (TIPM)**

Turn the ignition on.

With the scan tool, select network view and select the CAN Interior Bus. This will list the CAN Interior Bus modules on the vehicle. Read and record the listed modules.

With the scan tool, select TIPM, miscellaneous functions then add/remove ECUs.

With the scan tool, add or remove the module that was not configured in the TIPM.

With the scan tool, erase DTC's.

Cycle the ignition from on to off 3 times and read the active TIPM DTC's.

Does the scan tool display this DTC as active?

Yes

Retest system and attempt to reprogram the TIPM.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Repair is complete.

Perform **BODY VERIFICATION TEST - VER 1.**

U1148-ADDITIONAL CAN C BUS ECU DETECTED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

- **Set Condition:**

The Totally Integrated Power Module (TIPM) detects an additional CAN C Bus module and requires reprogramming.

Possible Causes

Possible Causes
ADDITIONAL MODULE ADDED/REMOVED FROM THE CAN C BUS NETWORK

Diagnostic Test

1. **REPROGRAM THE TOTALLY INTEGRATED POWER MODULE (TIPM)**

Turn the ignition on.

With the scan tool, select network view and select the CAN C Bus network. This will list the CAN C Bus modules on the vehicle. Read and record the listed modules.

With the scan tool, select TIPM, miscellaneous functions then add/remove ECUs.

With the scan tool, add or remove the module that was not configured in the TIPM.

With the scan tool, erase DTC's.

Cycle the ignition from on to off 3 times and read the active TIPM DTC's.

Does the scan tool display this DTC as active?

Yes

Retest system and attempt to reprogram the TIPM.
Perform **BODY VERIFICATION TEST - VER 1.**

No

Repair is complete.

Perform **BODY VERIFICATION TEST - VER 1.**

***BOTH DIAGNOSTIC CAN C (+) AND DIAGNOSTIC CAN C (-) CIRCUITS OPEN**

Circuit Schematic

MODULE-TOTALLY INTEGRATED POWER C7

DATA LINK CONNECTOR

Fig. 30: Diagnostic CAN C Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

When the scan tool queries the TIPM.

Set Conditions

- **Set Condition:**

The scan tool has detected an open condition on both Diagnostic CAN C circuits.

Possible Causes

Possible Causes
(D72) DIAGNOSTIC CAN C (+) CIRCUIT OPEN
(D71) DIAGNOSTIC CAN C (-) CIRCUIT OPEN
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. **CHECK THE STATUS OF THE ERROR MESSAGE**

NOTE: **Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.**

NOTE: **Ensure the scan tool is updated to the latest software.**

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

Does the scan tool display this same error message?

Yes

Go To step 2.

No

The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. (D72) DIAGNOSTIC CAN C (+) CIRCUIT OPEN

8197bd61

Fig. 31: Measuring Resistance Of (D72) Diagnostic CAN C (+) Circuit Between TIPM C7 Harness Connector And DLC

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Disconnect the scan tool from the DLC.

NOTE: Check the connectors at both the DLC and the TIPM.

Measure the resistance of the (D72) Diagnostic CAN C (+) circuit between the TIPM C7 harness connector and the DLC.

Is the resistance below 5.0 ohms?

Yes

Go To step 3.

No

Repair the (D72) Diagnostic CAN C (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1.**

3. (D71) DIAGNOSTIC CAN C (-) CIRCUIT OPEN

8197bd65

Fig. 32: Measuring Resistance Of (D71) Diagnostic CAN C (-) Circuit Between TIPM C7 Harness Connector And DLC
Courtesy of CHRYSLER LLC

Measure the resistance of the (D71) Diagnostic CAN C (-) circuit between the TIPM C7 harness

connector and the DLC.

Is the resistance below 5.0 ohms?

Yes

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Totally Integrated Power Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Repair the (D71) Diagnostic CAN C (-) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1.**

***DIAGNOSTIC CAN C (+) AND/OR DIAGNOSTIC CAN C (-) CIRCUITS HIGH**

Circuit Schematic

MODULE-TOTALLY INTEGRATED POWER C7

DATA LINK CONNECTOR

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

When the scan tool queries the TIPM.

Set Conditions

- **Set Condition:**

The scan tool has detected a shorted high condition on either or both Diagnostic CAN C circuits.

Possible Causes

Possible Causes
(D72) DIAGNOSTIC CAN C (+) CIRCUIT SHORTED TO VOLTAGE
(D71) DIAGNOSTIC CAN C (-) CIRCUIT SHORTED TO VOLTAGE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. **CHECK THE STATUS OF THE ERROR MESSAGE**

NOTE: **Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.**

NOTE: **Ensure the scan tool is updated to the latest software.**

With the scan tool, record the error message.

Disconnect the scan tool from the Data Link Connector (DLC).

Cycle the ignition from on to off 3 times.

Turn the ignition on.

Does the scan tool display this same error message?

Yes

Go To step 2.

No

The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. DIAGNOSTIC CAN C CIRCUITS SHORTED TO VOLTAGE

Fig. 34: Measuring Voltage Of Diagnostic CAN C Circuits
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Disconnect the scan tool from the DLC.

Turn the ignition on.

Measure the voltage of the Diagnostic CAN C circuits.

Is the voltage above 6.0 volts for either circuit?

Yes

Repair the Diagnostic CAN C circuits for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Totally Integrated Power Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

***DIAGNOSTIC CAN C (+) CIRCUIT LOW**

Fig. 35: Diagnostic CAN C Circuit Schematic
Courtesy of CHRYSLER LLC

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

When the scan tool queries the TIPM.

Set Conditions

- **Set Condition:**

The scan tool has detected a shorted low condition on the (D72) Diagnostic CAN C (+) circuit.

Possible Causes

Possible Causes
(D72) DIAGNOSTIC CAN C (+) CIRCUIT SHORTED TO GROUND TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. **CHECK THE STATUS OF THE ERROR MESSAGE**

NOTE: **Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.**

NOTE: **Ensure the scan tool is updated to the latest software.**

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

Does the scan tool display this same error message?

Yes

Go To step 2.

No

The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. (D72) DIAGNOSTIC CAN C (+) CIRCUIT SHORTED TO GROUND

Fig. 36: Measuring The Resistance Between Ground And The Diagnostic Can C (+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Disconnect the scan tool from the DLC.

Measure the resistance between ground and the (D72) Diagnostic CAN C (+) circuit.

Is the resistance below 100.0 ohms?

Yes

Repair the (D72) Diagnostic CAN C (+) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Totally Integrated Power Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

***DIAGNOSTIC CAN C (+) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Disconnect the scan tool from the DLC.

Measure the resistance of the (D71) Diagnostic CAN C (-) circuit between the TIPM C7 harness connector and the DLC.

Is the resistance below 5.0 ohms?

Yes

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Totally Integrated Power Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Repair the (D71) Diagnostic CAN C (-) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1.**

***NO RESPONSE FROM A/C HEATER CONTROL MODULE (HVAC - ATC)**

Circuit Schematic

Fig. 45: A/C Heater Control Module Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Possible Causes

Possible Causes
(A417) FUSED B+ CIRCUIT OPEN OR SHORTED
(F921) FUSED RUN RELAY OUTPUT CIRCUIT OPEN OR SHORTED
(Z910) GROUND CIRCUIT OPEN
(D264) AND (D265) CAN INTERIOR BUS (125K) CIRCUITS OPEN
A/C HEATER CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes

Go To step 2.

No

The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A417) FUSED B+ CIRCUIT OPEN OR SHORTED

Fig. 46: Checking The Fused B+ Circuit Using A 12-Volt Test Light Connected To Ground
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the A/C Heater Control Module C1 harness connector.

Using a 12-volt test light connected to ground, check the (A417) Fused B+ circuit.

Does the test light illuminate brightly?

Yes

Go To step 3.

No

Repair the (A417) Fused B+ circuit for an open or short.

Perform **BODY VERIFICATION TEST - VER 1.**

3. (F921) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN OR SHORTED

Fig. 47: Checking The Fused Run/Start Relay Output Circuit Using A 12-Volt Test Light Connected To Ground
Courtesy of CHRYSLER LLC

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F921) Fused Run/Start Relay Output circuit.

Does the test light illuminate brightly?

Yes

Go To step 4.

No

Repair the (F921) Fused Run/Start Relay Output circuit for an open or short.

Perform **BODY VERIFICATION TEST - VER 1.**

4. **(Z910) GROUND CIRCUIT OPEN**

Fig. 48: Checking The Ground Circuit Using A 12-Volt Test Light Connected To 12-Volts
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (Z910) ground circuit.

Does the test light illuminate brightly?

Yes

Go To step 5.

No

Repair the (Z910) ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1.**

5. **(D265) OR (D264) CAN INTERIOR BUS (125K) CIRCUIT OPEN**

Fig. 49: Measuring The Resistance Of The Can Interior Bus Circuit Between The TIPM C7 Harness Connector And The A/C Heater Control Module C1 Harness Connector
 Courtesy of CHRYSLER LLC

Measure the resistance of the (D264) CAN Interior Bus (-) (125K) circuit between the TIPM C7 harness connector and the A/C Heater Control Module C1 harness connector.

Measure the resistance of the (D265) CAN Interior Bus (+) (125K) circuit between the TIPM C7 harness connector and the A/C Heater Control Module C1 harness connector.

Is resistance below 5.0 ohms on both circuits?

Yes

Replace the A/C Heater Control Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Repair the (D265) or (D264) CAN Interior Bus (125K) circuit for an open. Inspect the connector

for damage.

Perform **BODY VERIFICATION TEST - VER 1.**

***NO RESPONSE FROM A/C HEATER CONTROL MODULE (HVAC - MTC)**

Circuit Schematic

Fig. 50: A/C Heater Control Module Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Possible Causes

Possible Causes
(F921) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN OR SHORTED
(Z910) GROUND CIRCUIT OPEN
(D264) AND (D265) CAN INTERIOR BUS (125K) CIRCUITS OPEN
A/C HEATER CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: **Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**

With the scan tool, select ECU View.

NOTE: **A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

Does the scan tool display a red X next to the module?

Yes

Go To step 2.

No

The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (F921) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN OR SHORTED

Fig. 51: Using 12-Volt Test Light Connected To Ground To Check (F943) Fused Run/Start Relay Output Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the A/C Heater Control Module C1 harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F921) Fused Run/Start Relay Output circuit.

Does the test light illuminate brightly?

Yes

Go To step 3.

No

Repair the (F921) Fused Run/Start Relay Output circuit for an open or short.

Perform **BODY VERIFICATION TEST - VER 1.**

3. (Z910) GROUND CIRCUIT OPEN

Fig. 52: Using 12-Volt Test Light Connected To 12-Volts To Check (Z910) Ground Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (Z910) ground circuit.

Does the test light illuminate brightly?

Yes

Go To step 4.

No

Repair the (Z910) ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1.**

4. (D265) OR (D264) CAN INTERIOR BUS (125K) CIRCUIT OPEN

Fig. 53: Measuring Resistance Of (D264/5) CAN Interior Bus (-)/(+) (125K) Circuit Between TIPM C7 Harness Connector And A/C Heater Control Module C1 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (D264) CAN Interior Bus (-) (125K) circuit between the TIPM C7 harness connector and the A/C Heater Control Module C1 harness connector.

Measure the resistance of the (D265) CAN Interior Bus (+) (125K) circuit between the TIPM C7 harness connector and the A/C Heater Control Module C1 harness connector.

Is resistance below 5.0 ohms on both circuits?

Yes

Replace the A/C Heater Control Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Repair the (D265) or (D264) CAN Interior Bus (125K) circuit for an open. Inspect the connector

for damage.

Perform **BODY VERIFICATION TEST - VER 1.**

***NO RESPONSE FROM ABS (ANTILOCK BRAKE MODULE)**

Circuit Schematic

BT433680

Fig. 54: Antilock Brake Module Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Possible Causes

Possible Causes
(A107) (A111) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z909) (Z917) GROUND CIRCUIT OPEN
(F941) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN OR SHORTED
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
ANTILOCK BRAKE MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the TIPM for any active CAN C hardware DTCs, perform DTC before proceeding.

Does the scan tool display a red X next to the module?

Yes

Go To step 2.

No

The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A107) (A111) FUSED B(+) CIRCUIT OPEN OR SHORTED

Fig. 55: Checking Each And Fused Circuit Using A 12-Volt Test Light Connected To Ground
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Antilock Brake Module harness connector.

Using a 12-volt test light connected to ground, check each (A107) and (A111) Fused B(+) circuit.

Does the test light illuminate brightly for each circuit?

Yes

Go To step 3.

No

Repair the Fused B(+) circuit for an open or short.

Perform **ABS VERIFICATION TEST** .

3. (Z909) (Z917) GROUND CIRCUITS OPEN

Fig. 56: Checking (Z909) And (Z917) Ground Circuit Using A 12-Volt Test Light Connected To 12-Volts

Courtesy of CHRYSLER LLC

Using a 12-volt test light connected to 12-volts, check each (Z909) and (Z917) ground circuit.

Does the test light illuminate brightly for each circuit?

Yes

Go To step 4.

No

Repair the (Z909) or (Z917) ground circuit for an open.

Perform **ABS VERIFICATION TEST** .

4. (F941) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN OR SHORTED

Fig. 57: Checking The Fused Run/Relay Output Circuit Using A 12-Volt Test Light Connected To Ground

Courtesy of CHRYSLER LLC

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F941) Fused Run/Relay Output circuit.

Does the test light illuminate brightly?

Yes

Go To step 5.

No

Repair the (F941) Fused Run/Relay Output circuit for an open or short.

Perform **ABS VERIFICATION TEST** .

5. (D65) CAN C BUS (+) CIRCUIT OPEN

Fig. 58: Measuring The Resistance Of The CAN C Bus Circuit Between The TIPM C1 Harness Connector And The Antilock Brake Module Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the TIPM C1 harness connector and the Antilock Brake Module connector.

Is resistance below 5.0 ohms?

Yes

Go To step 6.

No

Repair the (D65) CAN C Bus (+) circuit for an open.

Perform **ABS VERIFICATION TEST** .

6. (D64) Can C Bus (-) Circuit Open

Fig. 59: Measuring The Resistance Of The CAN C Bus Circuit Between The TIPM C1 Harness Connector And The Antilock Brake Module Connector
Courtesy of CHRYSLER LLC

Measure The Resistance Of The (D64) Can C Bus (-) Circuit Between The TIPM C1 Harness Connector

And The Antilock Brake Module Connector.

Is Resistance Below 5.0 Ohms?

Yes

Replace The Antilock Brake Module In Accordance With The Service Information.
Perform **ABS Verification Test** .

No

Repair The (D64) Can C Bus (-) Circuit For An Open.
Perform **ABS Verification Test** .

***NO RESPONSE FROM AMP (AMPLIFIER)**

Circuit Schematic

Using a 12-volt test light connected to 12-volts, check the (Z920) ground circuit.

Does the test light illuminate brightly for each circuit?

Yes

Go To step 4.

No

Repair the (Z920) ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1.**

4. **(D265) OR (D264) CAN INTERIOR BUS (125K) CIRCUIT OPEN**

Fig. 63: Measuring Resistance Of (D264/5) CAN Interior Bus (-) (125K) Circuit Between TIPM C7 Harness Connector And Radio Amplifier C1 Harness Connector
 Courtesy of CHRYSLER LLC

Measure the resistance of the (D264) CAN Interior Bus (-) (125K) circuit between the TIPM C7 harness connector and the Radio Amplifier C1 harness connector.

Measure the resistance of the (D265) CAN Interior Bus (+) (125K) circuit between the TIPM C7 harness connector and the Radio Amplifier C1 harness connector.

Is resistance below 5.0 ohms on both circuits?

Yes

Replace the Radio Amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Repair the (D265) or (D264) CAN Interior Bus (125K) circuit for an open. Inspect the connector

for damage.

Perform **BODY VERIFICATION TEST - VER 1.**

***NO RESPONSE FROM CCN (CLUSTER)**

Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Possible Causes

Possible Causes
(A909) (A412) FUSED B(+) CIRCUITS OPEN OR SHORTED
(Z910) GROUND CIRCUITS OPEN
(F943) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN OR SHORTED
(D264) AND (D265) CAN INTERIOR BUS (125K) CIRCUITS OPEN
CLUSTER (CCN)

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes

Go To step 2.

No

The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A909) (A412) FUSED B(+) CIRCUIT OPEN OR SHORTED

CLUSTER C1

81997187

Fig. 65: Checking Each (A909) And (A412) Fused B(+) Circuit Using A 12-Volt Test Light Connected To Ground
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Cluster C1 and C2 harness connectors.

Using a 12-volt test light connected to ground, check each (A909) and (A412) Fused B(+) circuit.

Does the test light illuminate brightly for each circuit?

Yes

Go To step 3.

No

Repair the Fused B(+) circuit for an open or short.

Perform **BODY VERIFICATION TEST - VER 1.**

3. (Z910) GROUND CIRCUIT OPEN

Fig. 66: Using 12-Volt Test Light Connected To 12-Volts To Check Each (Z910) Ground Circuit
 Courtesy of CHRYSLER LLC

Using a 12-volt test light connected to 12-volts, check each (Z910) ground circuit.

Does the test light illuminate brightly for each circuit?

Yes

Go To step 4.

No

Repair the (Z910) ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1.**

4. (F943) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN OR SHORTED

CLUSTER C1

8199718f

Fig. 67: Using 12-Volt Test Light Connected To Ground To Check (F202) Fused Run/Start Relay Output Circuit

Courtesy of CHRYSLER LLC

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F943) Fused Run/Start Relay Output circuit.

Does the test light illuminate brightly?

Yes

Go To step 5.

No

Repair the (F943) Fused Run/Start Relay Output circuit for an open or short.

Perform **BODY VERIFICATION TEST - VER 1.**

5. **(D265) OR (D264) CAN INTERIOR BUS (125K) CIRCUIT OPEN**

81997193

Fig. 68: Measuring Resistance Of (D264/5) CAN Interior Bus (-)/(+) (125K) Circuit Between TIPM C7 Harness Connector And Cluster C2 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (D264) CAN Interior Bus (-) (125K) circuit between the TIPM C7 harness connector and the Cluster C2 harness connector.

Measure the resistance of the (D265) CAN Interior Bus (+) (125K) circuit between the TIPM C7 harness connector and the Cluster C2 harness connector.

Is resistance below 5.0 ohms on both circuits?

Yes

Replace the Cluster in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Repair the (D265) or (D264) CAN C Interior Bus (125K) circuit for an open. Inspect the connector

for damage.

Perform **BODY VERIFICATION TEST - VER 1.**

***NO RESPONSE FROM DRIVER DOOR MODULE (DDM)**

(D264) AND (D265) CAN C INTERIOR BUS (125K) CIRCUITS OPEN
DRIVER DOOR MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes

Go To step 2.

No

The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A215) FUSED B(+) CIRCUIT OPEN OR SHORTED

MODULE-
DOOR-
DRIVER C3

81a2f491

Fig. 70: Using 12-Volt Test Light Connected To Ground To Check (A215) Fused B(+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Driver Door Module C3 harness connector.

Using a 12-volt test light connected to ground, check the (A215) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes

Go To step 3.

No

Repair the (A215) Fused B(+) circuit for an open or short.

Perform **BODY VERIFICATION TEST - VER 1.**

3. (Z913) GROUND CIRCUIT OPEN

MODULE-
DOOR-
DRIVER C3

81a2f495

Fig. 71: Using 12-Volt Test Light Connected To 12-Volts To Check (Z913) Ground Circuit
Courtesy of CHRYSLER LLC

Using a 12-volt test light connected to 12-volts, check the (Z913) ground circuit.

Does the test light illuminate brightly?

Yes

Go To step 4.

No

Repair the (Z913) ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1.**

4. **(D265) OR (D264) CAN C INTERIOR BUS (125K) CIRCUIT OPEN**

Fig. 72: Measuring Resistance Of (D264/5) CAN C Interior Bus (-)/(+) (125K) Circuit Between TIPM C7 Harness Connector And Driver Door Module C3 Harness Connector
 Courtesy of CHRYSLER LLC

Measure the resistance of the (D264) CAN C Interior Bus (-) (125K) circuit between the TIPM C7 harness connector and the Driver Door Module C3 harness connector.

Measure the resistance of the (D265) CAN C Interior Bus (+) (125K) circuit between the TIPM C7 harness connector and the Driver Door Module C3 harness connector.

Is resistance below 5.0 ohms on both circuits?

Yes

Replace the Driver Door Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Repair the (D265) or (D264) CAN C Interior Bus (125K) circuit for an open. Inspect the connector

for damage.

Perform **BODY VERIFICATION TEST - VER 1.**

***NO RESPONSE FROM ECM (ENGINE CONTROL MODULE) - DIESEL**

Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Possible Causes

Possible Causes
ENGINE CONTROL MODULE POWER AND GROUND (D65) CAN C BUS (+) CIRCUIT OPEN (D64) CAN C BUS (-) CIRCUIT OPEN ENGINE CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the TIPM for any active CAN C hardware and any ignition related DTCs, perform DTCs before proceeding.

Does the scan tool display a red X next to the module?

Yes

Go To step 2.

No

The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. CHECK ECM POWER AND GROUND

Check the ECM power and ground circuits. Refer to appropriate Engine ELECTRICAL DIAGNOSTICS article for the diagnostic test procedure.

Were any problems found?

Yes

Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To step 3.

3. (D65) CAN C BUS (+) CIRCUIT OPEN

Fig. 74: Measuring Resistance Of (D65) CAN C Bus (+) Circuit Between TIPM Connector And ECM Connector

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Disconnect the ECM C2 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the TIPM connector and the ECM connector.

Is resistance below 5.0 ohms?

Yes

Go To step 4.

No

Repair the (D65) CAN C Bus (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1.**

4. (D64) CAN C BUS (-) CIRCUIT OPEN

Fig. 75: Measuring Resistance Of (D64) CAN C Bus (-) Circuit Between TIPM Connector And ECM Connector

Courtesy of CHRYSLER LLC

Measure the resistance of the (D64) CAN C Bus (-) circuit between the TIPM connector and the ECM connector.

Is resistance below 5.0 ohms?

Yes

Replace and program the Engine Control Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Repair the (D64) CAN C Bus (-) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1.**

Possible Causes
(Z913) GROUND CIRCUIT OPEN
(A27) FUSED B+ CIRCUIT OPEN OR SHORTED
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
OCCUPANT CLASSIFICATION MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes

Go To step 2.

No

The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (Z913) GROUND CIRCUIT OPEN

Fig. 100: Using 12-Volt Test Light Connected To 12-Volts To Check (Z913) Ground Circuit
Courtesy of CHRYSLER LLC

Disconnect the Occupant Classification Module harness connectors.

Using a 12-volt test light connected to 12-volts, check the (Z913) ground circuit.

Does the test light illuminate brightly?

Yes

Go To step 3.

No

Repair the (Z913) ground circuit for an open.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1** .

3. (A27) FUSED B+ CIRCUIT OPEN OR SHORTED

Fig. 101: Using 12-Volt Test Light Connected To Ground To Check (A27) Fused B+ Circuit
 Courtesy of CHRYSLER LLC

Using a 12-volt test light connected to ground, check the (A27) Fused B+ circuit.

Does the test light illuminate brightly?

Yes

Go To step 4.

No

Repair the (A27) Fused B+ circuit for an open or short.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

4. (D65) CAN C BUS (+) CIRCUIT OPEN

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1 .**

5. (D64) CAN C BUS (-) CIRCUIT OPEN

8199a672

Fig. 103: Measuring Resistance Of (D64) CAN C Bus (-) Circuit Between TIPM C1 Harness Connector And Occupant Classification Module Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (D64) CAN C Bus (-) circuit between the TIPM C1 harness connector and the Occupant Classification Module connector.

Is resistance below 5.0 ohms?

Yes

Replace the Occupant Classification Module in accordance with the service information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1 .**

No

Repair the (D64) CAN C Bus (-) circuit for an open.

***NO RESPONSE FROM ORC (OCCUPANT RESTRAINT CONTROLLER)**

Circuit Schematic

Fig. 104: Occupant Restraint Controller Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Possible Causes

Possible Causes
(Z912) (Z915) GROUND CIRCUITS OPEN
(F100) FUSED RUN RELAY OUTPUT CIRCUIT OPEN OR SHORTED
(F201) FUSED RUN/START RELAY OUTPUT (RUN/START) CIRCUIT OPEN OR SHORTED
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
OCCUPANT RESTRAINT CONTROLLER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

NOTE: **Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.**

Turn the ignition on.

NOTE: **Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**

With the scan tool, select ECU View.

NOTE: **A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

Does the scan tool display a red X next to the module?

Yes

Go To step 2.

No

The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (Z912) (Z915) GROUND CIRCUITS OPEN

Fig. 105: Measuring Resistance Between Ground And (Z912) And (Z915) Ground Circuits
Courtesy of CHRYSLER LLC

WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Occupant Restraint Controller Module harness connectors.

Connect the appropriate Load Tool ACM Adapter to the ORC connectors.

Measure the resistance between ground and the (Z912) and (Z915) ground circuits.

Is the resistance below 10k ohms?

Yes

Go To step 3.

No

Repair the (Z912) or (Z915) ground circuit for an open.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

3. (F100) FUSED RUN RELAY OUTPUT CIRCUIT OPEN OR SHORTED

81998399

Fig. 106: Using 12-Volt Test Light Connected To Ground To Check (F100) Fused Run Relay Output Circuit
 Courtesy of CHRYSLER LLC

NOTE: Check the TIPM for any ignition related DTCs before proceeding. If set. Refer to DIAGNOSIS AND TESTING .

WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Using a 12-volt test light connected to ground, check the (F100) Fused Run Relay Output circuit.

Does the test light illuminate brightly?

Yes

Go To step 4.

No

Repair the (F100) Fused Run Relay Output circuit for an open or short.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1 .

4. (F201) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN OR SHORTED

8199839d

Fig. 107: Using 12-Volt Test Light Connected To Ground To Check (F201) Fused Run/Start Relay Output Circuit
 Courtesy of CHRYSLER LLC

Using a 12-volt test light connected to ground, check the (F201) Fused Run/Start Relay Output circuit.

Does the test light illuminate brightly?

Yes

Go To step 5.

No

Repair the (F201) Fused Run/Start Relay Output circuit for an open or short.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1**.

5. (D65) CAN C BUS (+) CIRCUIT OPEN

819983a2

Fig. 108: Measuring Resistance Of (D65) CAN C Bus (+) Circuit Between TIPM C1 Harness Connector And Occupant Restraint Controller Module Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the TIPM C1 harness connector and the Occupant Restraint Controller Module connector.

Is resistance below 5.0 ohms?

Yes

Go To step 6.

No

Repair the (D65) CAN C Bus (+) circuit for an open.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1 .**

6. (D64) CAN C BUS (-) CIRCUIT OPEN

Fig. 109: Measuring Resistance Of (D64) CAN C Bus (-) Circuit Between TIPM C1 Harness Connector And Occupant Restraint Controller Module Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (D64) CAN C Bus (-) circuit between the TIPM C1 harness connector and the Occupant Restraint Controller Module connector.

Is resistance below 5.0 ohms?

Yes

Replace the Occupant Restraint Controller Module in accordance with the service information.

Perform ***AIRBAG SYSTEM VERIFICATION TEST - VER 1 .**

No

Repair the (D64) CAN C Bus (-) circuit for an open.

Fig. 110: Park Assist (Parktronics) Module Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Possible Causes

Possible Causes
(F921) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR SHORTED
(Z920) GROUND CIRCUIT OPEN
(D265) AND (D264) CAN INTERIOR BUS (125K) CIRCUITS OPEN
PARK ASSIST (PARKTRONICS) (PTS) MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: **Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**

With the scan tool, select ECU View.

NOTE: **A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

Does the scan tool display a red X next to the module?

Yes

Go To step 2.

No

The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (F921) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR SHORTED

Fig. 111: Using 12-Volt Test Light Connected To Ground To Check (F921) Fused Ignition Switch Output (Run) Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the PTS C1 harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F921) Fused Ignition Switch Output (Run) circuit.

Does the test light illuminate brightly?

Yes

Go To step 3.

No

Repair the (F921) Fused Ignition Switch Output (Run) circuit for an open or short.

Perform **BODY VERIFICATION TEST - VER 1.**

3. (Z920) GROUND CIRCUIT OPEN

Fig. 112: Using 12-Volt Test Light Connected To 12-Volts To Check (Z920) Ground Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (Z920) ground circuit.

Does the test light illuminate brightly?

Yes

Go To step 4.

No

Repair the (Z920) ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1.**

4. (D265) OR (D264) CAN INTERIOR BUS (125K) CIRCUIT OPEN

Fig. 113: Measuring Resistance Of (D264/5) CAN Interior Bus (-) (125K) Circuit Between TIPM C7 Harness Connector And PTS C1 Harness Connector
 Courtesy of CHRYSLER LLC

Measure the resistance of the (D264) CAN Interior Bus (-) (125K) circuit between the TIPM C7 harness connector and the PTS C1 harness connector.

Measure the resistance of the (D265) CAN Interior Bus (+) (125K) circuit between the TIPM C7 harness connector and the PTS C1 harness connector.

Is resistance below 5.0 ohms on both circuits?

Yes

Replace the Park Assist (Parktronic) Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Repair the (D265) or (D264) CAN Interior Bus (125K) circuit for an open. Inspect the connector

for damage.

Perform **BODY VERIFICATION TEST - VER 1.**

***NO RESPONSE FROM PASSENGER DOOR MODULE (PDM)**

Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Possible Causes

Possible Causes
(A214) FUSED B (+) CIRCUIT OPEN OR SHORTED
(Z913) GROUND CIRCUIT OPEN
(D264) AND (D265) CAN INTERIOR BUS (125K) CIRCUITS OPEN
PASSENGER DOOR MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes

Go To step 2.

No

The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A214) FUSED B(+) CIRCUIT OPEN OR SHORTED

MODULE-
DOOR-
PASSENGER C3

81a2f6c9

Fig. 115: Using 12-Volt Test Light Connected To Ground To Check (A214) Fused B(+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Passenger Door Module C3 harness connector.

Using a 12-volt test light connected to ground, check the (A214) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes

Go To step 3.

No

Repair the (A214) Fused B(+) circuit for an open or short.

Perform **BODY VERIFICATION TEST - VER 1.**

3. (Z913) GROUND CIRCUIT OPEN

MODULE-
DOOR-
PASSENGER C3

81a2f6cd

Fig. 116: Using 12-Volt Test Light Connected To 12-Volts To Check (Z913) Ground Circuit

Using a 12-volt test light connected to 12-volts, check the (Z913) ground circuit.

Does the test light illuminate brightly?

Yes

Go To step 4.

No

Repair the (Z913) ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1.**

4. **(D265) OR (D264) CAN INTERIOR BUS (125K) CIRCUIT OPEN**

Fig. 117: Measuring Resistance Of (D264/5) CAN Interior Bus (-)/(+) (125K) Circuit Between TIPM C7 Harness Connector And Passenger Door Module C3 Harness Connector
 Courtesy of CHRYSLER LLC

Measure the resistance of the (D264) CAN Interior Bus (-) (125K) circuit between the TIPM C7 harness connector and the Passenger Door Module C3 harness connector.

Measure the resistance of the (D265) CAN Interior Bus (+) (125K) circuit between the TIPM C7 harness connector and the Passenger Door Module C3 harness connector.

Is resistance below 5.0 ohms on both circuits?

Yes

Replace the Passenger Door Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Repair the (D265) or (D264) CAN Interior Bus (125K) circuit for an open. Inspect the connector

for damage.

Perform **BODY VERIFICATION TEST - VER 1.**

***NO RESPONSE FROM PCM (POWERTRAIN CONTROL MODULE) (NGC)**

(F202) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN OR SHORTED
(F1) IGNITION SWITCH OUTPUT (UNLOCK/RUN/START) CIRCUIT OPEN OR SHORTED
(F342) FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR SHORTED
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the TIPM for any active CAN C hardware DTCs, perform DTC before proceeding.

Does the scan tool display a red X next to the module?

Yes

Go To step 2.

No

The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A209) FUSED B(+) CIRCUITS OPEN OR SHORTED

8199840d

Fig. 119: Using 12-Volt Test Light Connected To Ground To Check (A209) Fused B(+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the PCM C1 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Using a 12-volt test light connected to ground, check the (A209) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes

Go To step 3.

No

Repair the (A209) Fused B(+) circuit for an open or short.

Perform **POWERTRAIN VERIFICATION TEST**.

3. (Z933) GROUND CIRCUITS OPEN

PCM PINOUT
BOX 8815

81998415

Fig. 120: Using 12-Volt Test Light Connected To 12-Volts To Check Each (Z933) Ground Circuits
Courtesy of CHRYSLER LLC

Using a 12-volt test light connected to 12-volts, check each (Z933) ground circuits.

Does the test light illuminate brightly for each circuit?

Yes

Go To step 4.

No

Repair the ground circuit for an open.

Perform **POWERTRAIN VERIFICATION TEST** .

4. (F202) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN OR SHORTED

8199841d

Fig. 121: Using 12-Volt Test Light Connected To Ground To Check (F941) Fused Run/Start Relay Output Circuit
Courtesy of CHRYSLER LLC

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F202) Fused Run/Start Relay Output circuit.

Does the test light illuminate brightly?

Yes

Go To step 5.

No

Repair the (F202) Fused Run/Start Relay Output circuit for an open or short.

Perform **POWERTRAIN VERIFICATION TEST** .

5. (F1) IGNITION SWITCH OUTPUT (UNLOCK/RUN/START) CIRCUIT OPEN OR SHORTED

81998428

Fig. 122: Using 12-Volt Test Light Connected To Ground To Check (F1) Ignition Switch Output (Unlock/Run/Start) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F1) Ignition Switch Output (Unlock/Run/Start) circuit.

Does the test light illuminate brightly?

Yes

Go To step 6.

No

Repair the (F1) Ignition Switch Output (Unlock/Run/Start) circuit for an open or short.
Perform **POWERTRAIN VERIFICATION TEST**.

6. (F342) FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR SHORTED

Fig. 123: Using 12-Volt Test Light Connected To Ground To Check (F342) Fused ASD Relay Output Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F342) Fused ASD Relay Output circuit.

Does the test light illuminate brightly?

Yes

Go To step 7.

No

Repair the (F342) Fused ASD Relay Output circuit for an open or short.

Perform **POWERTRAIN VERIFICATION TEST** .

7. **(D65) CAN C BUS (+) CIRCUIT OPEN**

Fig. 124: Measuring Resistance Of (D65) CAN C Bus (+) Circuit Between TIPM Connector And Appropriate Terminal Of Special Tool #8815
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the TIPM connector and the appropriate terminal of the special tool #8815.

Is the resistance below 5.0 ohms?

Yes

Go To step 8.

No

Repair the (D65) CAN C Bus (+) circuit for an open.

Perform **POWERTRAIN VERIFICATION TEST** .

8. (D64) CAN C BUS (-) CIRCUIT OPEN

Fig. 125: Measuring Resistance Of (D64) CAN C Bus (-) Circuit Between TIPM Connector And Appropriate Terminal Of Special Tool #8815
Courtesy of CHRYSLER LLC

Measure the resistance of the (D64) CAN C Bus (-) circuit between the TIPM connector and the appropriate terminal of the special tool #8815.

Is the resistance below 5.0 ohms?

Yes

Replace and program the Powertrain Control Module in accordance with the service information.
Perform **POWERTRAIN VERIFICATION TEST** .

No

Repair the (D64) CAN C Bus (-) circuit for an open.

Perform **POWERTRAIN VERIFICATION TEST** .

***NO RESPONSE FROM RADIO**

Circuit Schematic

Possible Causes

Possible Causes
(A413) FUSED B(+) CIRCUIT OPEN OR SHORTED (Z910) GROUND CIRCUIT OPEN (D265) AND (D264) CAN INTERIOR BUS (125K) CIRCUITS OPEN RADIO

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: **Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**

With the scan tool, select ECU View.

NOTE: **A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

Does the scan tool display a red X next to the module?

Yes

Go To step 2.

No

The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A413) FUSED B(+) CIRCUIT OPEN OR SHORTED

81999260

Fig. 127: Using 12-Volt Test Light Connected To Ground To Check (A413) Fused B(+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Radio harness connector.

Using a 12-volt test light connected to ground, check the (A413) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes

Go To step 3.

No

Repair the (A413) Fused B(+) circuit for an open or short.

Perform **BODY VERIFICATION TEST - VER 1.**

3. (Z910) GROUND CIRCUIT OPEN

8199926b

Fig. 128: Using 12-Volt Test Light Connected To 12-Volts To Check (Z910) Ground Circuit
 Courtesy of CHRYSLER LLC

Using a 12-volt test light connected to 12-volts, check the (Z910) ground circuit.

Does the test light illuminate brightly?

Yes

Go To step 4.

No

Repair the (Z910) ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1.**

4. **(D265) OR (D264) CAN INTERIOR BUS (125K) CIRCUIT OPEN**

8199927e

Fig. 129: Measuring Resistance Of (D264/5) CAN Interior Bus (-) (125K) Circuit Between TIPM C7 Harness Connector And Radio Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (D264) CAN Interior Bus (-) (125K) circuit between the TIPM C7 harness connector and the Radio harness connector.

Measure the resistance of the (D265) CAN Interior Bus (+) (125K) circuit between the TIPM C7 harness connector and the Radio harness connector.

Is resistance below 5.0 ohms on both circuits?

Yes

Replace the Radio in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Repair the (D265) or (D264) CAN Interior Bus (125K) circuit for an open. Inspect the connector

for damage.

Perform **BODY VERIFICATION TEST - VER 1.**

***NO RESPONSE FROM STEERING ANGLE SENSOR (SAS)**

Circuit Schematic

Fig. 130: Steering Angle Sensor Circuit Schematic

(Z910) GROUND CIRCUIT OPEN
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
STEERING ANGLE SENSOR

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the sensor?

Yes

Go To step 2.

No

The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (F202) FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN OR SHORTED

Fig. 131: Using 12-Volt Test Light Connected To Ground To Check (F202) Fused Run/Start Relay Output Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Steering Angle Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F202) Fused Run/Start Relay Output circuit.

Does the test light illuminate brightly?

Yes

Go To step 3.

No

Repair the (F202) Fused Run/Start Relay Output circuit for an open or short.

Perform **BODY VERIFICATION TEST - VER 1.**

3. (Z910) GROUND CIRCUIT OPEN

Fig. 132: Using 12-Volt Test Light Connected To 12-Volts To Check (Z910) Ground Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (Z910) ground circuit.

Does the test light illuminate brightly?

Yes

Go To step 4.

No

Repair the (Z910) ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1.**

4. (D65) CAN C BUS (+) CIRCUIT OPEN

Fig. 133: Measuring Resistance Of (D65) CAN C Bus (+) Circuit Between TIPM C1 Harness Connector And Steering Angle Sensor Connector
 Courtesy of CHRYSLER LLC

Disconnect the TIPM C1 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the TIPM C1 harness connector and the Steering Angle Sensor connector.

Is resistance below 5.0 ohms?

Yes

Go To step 5.

No

Repair the (D65) CAN C Bus (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1.**

5. (D64) CAN C BUS (-) CIRCUIT OPEN

8199ad02

Fig. 134: Measuring Resistance Of (D64) CAN C Bus (-) Circuit Between TIPM C1 Harness Connector And Steering Angle Sensor Connector
 Courtesy of CHRYSLER LLC

Measure the resistance of the (D64) CAN C Bus (-) circuit between the TIPM C1 harness connector and the Steering Angle Sensor connector.

Is resistance below 5.0 ohms?

Yes

Replace the Steering Angle Sensor in accordance with the service information.
 Perform **BODY VERIFICATION TEST - VER 1.**

No

Repair the (D264) CAN C Bus (-) circuit for an open.
 Perform **BODY VERIFICATION TEST - VER 1.**

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: **Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**

With the scan tool, select ECU View.

NOTE: **A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

Does the scan tool display a red X next to the module?

Yes

Go To step 2.

No

The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A906) FUSED B(+) CIRCUIT OPEN OR SHORTED

81d3be4b

Fig. 136: Checking The (A906) Fused B(+) Circuit Using A 12-Volt Test Light Connected To Ground
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Sunroof Module harness connector.

Using a 12-volt test light connected to ground, check the (A906) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes

Go To step 3.

No

Repair the (A906) Fused B(+) circuit for an open or short.

Perform **BODY VERIFICATION TEST - VER 1.**

3. (Z919) GROUND CIRCUIT OPEN

81d3be4f

Fig. 137: Checking The (Z919) Ground Circuit Using A 12-Volt Test Light Connected To 12-Volts
Courtesy of CHRYSLER LLC

Using a 12-volt test light connected to 12-volts, check the (Z919) ground circuit.

Does the test light illuminate brightly?

Yes

Go To step 4.

No

Repair the (Z919) ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1.**

4. **(D265) OR (D264) CAN INTERIOR BUS (125K) CIRCUIT OPEN**

81d3be53

Fig. 138: Measuring The Resistance Of The CAN C Interior Bus (125K) Circuits Between The TIPM C7 Harness Connector And The Sunroof Module Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (D264) CAN C Interior Bus (-) (125K) circuit between the TIPM C7 harness connector and the Sunroof Module harness connector.

Measure the resistance of the (D265) CAN C Interior Bus (+) (125K) circuit between the TIPM C7 harness connector and the Sunroof Module harness connector.

Is resistance below 5.0 ohms on both circuits?

Yes

Replace the Sunroof Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Repair the (D265) or (D264) CAN Interior Bus (125K) circuit for an open. Inspect the connector

for damage.

Perform **BODY VERIFICATION TEST - VER 1.**

***NO RESPONSE FROM TCM (POWERTRAIN CONTROL MODULE) - NGC**

Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Possible Causes

Possible Causes
POWERTRAIN CONTROL MODULE POWERS AND GROUNDS (D65) CAN C BUS (+) CIRCUIT OPEN (D64) CAN C BUS (-) CIRCUIT OPEN POWERTRAIN CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the TIPM for any active CAN C hardware DTCs, perform DTC before proceeding.

Does the scan tool display a red X next to the module?

Yes

Go To step 2.

No

The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. ATTEMPT TO COMMUNICATE WITH THE PCM

With the scan tool in ECU View, observe the status of the PCM.

Does the scan tool display a red X next to the PCM?

Yes

Perform the No Response From PCM diagnostic procedure. See **DIAGNOSIS AND TESTING.**

No

Go To step 3.

3. (D65) CAN C BUS (+) CIRCUIT OPEN

Fig. 140: Measuring Resistance Of (D65) CAN C Bus (+) Circuit Between TIPM Connector And Appropriate Terminal Of Special Tool #8815
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the TIPM connector and the appropriate terminal of the special tool #8815.

Is the resistance below 5.0 ohms?

Yes

Go To step 4.

No

Repair the (D65) CAN C Bus (+) circuit for an open.

Perform **POWERTRAIN VERIFICATION TEST** .

4. (D64) CAN C BUS (-) CIRCUIT OPEN

Fig. 141: Measuring Resistance Of (D64) CAN C Bus (-) Circuit Between TIPM Connector And Appropriate Terminal Of Special Tool #8815
Courtesy of CHRYSLER LLC

Measure the resistance of the (D64) CAN C Bus (-) circuit between the TIPM connector and the appropriate terminal of the special tool #8815.

Is the resistance below 5.0 ohms?

Yes

Replace and program the Powertrain Control Module in accordance with the service information.
Perform **POWERTRAIN VERIFICATION TEST** .

No

Repair the (D64) CAN C Bus (-) circuit for an open.
Perform **POWERTRAIN VERIFICATION TEST** .

***NO RESPONSE FROM TCM - NAG1/DIESEL**

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Possible Causes

Possible Causes
(Z910) GROUND CIRCUIT OPEN (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN OR SHORTED (D65) CAN C BUS (+) CIRCUIT OPEN (D64) CAN C BUS (-) CIRCUIT OPEN TRANSMISSION CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the TIPM for any active CAN C hardware and any ignition related DTCs, perform DTCs before proceeding.

Does the scan tool display a red X next to the module?

Yes

Go To step 2.

No

The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (Z910) GROUND CIRCUIT OPEN

Fig. 142: Using 12-Volt Test Light Connected To 12-Volts To Check (Z910) Ground Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the TCM C1 harness connector.

Using a 12-volt test light connected to 12-volts, check the (Z910) ground circuit.

Does the test light illuminate brightly?

Yes

Go To step 3.

No

Repair the (Z910) ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1.**

3. (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN OR SHORTED

Fig. 143: Using 12-Volt Test Light Connected To Ground To Check (T16) Transmission Control Output Circuit

Courtesy of CHRYSLER LLC

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (T16) Transmission Control Output circuit.

Does the test light illuminate brightly?

Yes

Go To step 4.

No

Repair the (T16) Transmission Control Output circuit for an open or short.

Perform **BODY VERIFICATION TEST - VER 1.**

4. (D65) CAN C BUS (+) CIRCUIT OPEN

81aa07a7

Fig. 144: Measuring Resistance Of (D65) CAN C Bus (+) Circuit Between TIPM Connector And TCM Connector

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Disconnect the TCM C2 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the TIPM connector and the TCM connector.

Is resistance below 5.0 ohms?

Yes

Go To step 5.

No

Repair the (D65) CAN C Bus (+) circuit for an open.

Perform NAG1 TRANSMISSION VERIFICATION TEST.

5. **(D64) CAN C BUS (-) CIRCUIT OPEN**

Fig. 145: Measuring Resistance Of (D64) CAN C Bus (-) Circuit Between TIPM Connector And TCM Connector

Courtesy of CHRYSLER LLC

Measure the resistance of the (D64) CAN C Bus (-) circuit between the TIPM connector and the TCM connector.

Is resistance below 5.0 ohms?

Yes

Replace the Transmission Control Module in accordance with the service information.

Perform NAG1 TRANSMISSION VERIFICATION TEST.

No

Repair the (D64) CAN C Bus (-) circuit for an open.
Perform NAG1 TRANSMISSION VERIFICATION TEST.

***NO RESPONSE FROM TIPM (TOTALLY INTEGRATED POWER MODULE)**

Possible Causes

Possible Causes
FUSED B (+) CIRCUITS OPEN
FUSED IGNITION SWITCH OUTPUT CIRCUITS OPEN
GROUND CIRCUITS OPEN
DIAGNOSTIC CAN C CIRCUITS OPEN
DIAGNOSTIC CAN C CIRCUITS SHORTED TO GROUND
DIAGNOSTIC CAN C CIRCUITS SHORTED TOGETHER
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

NOTE: Ensure the scan tool is updated to the latest software.

NOTE: If the scan tool displays any error messages involving the Diagnostic CAN C circuits, diagnose and repair the error message before proceeding. Refer to **DIAGNOSTIC CODE INDEX** .

NOTE: A loss of communication with the TIPM can cause the ECU View button on the scan tool to be inoperative (not highlighted).

With the scan tool, attempt to select ECU View.

Can the scan tool communicate with the TIPM?

Yes

The no response condition is not present at this time. Using the wiring diagram/schematic as a

guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

No

Go To step 2.

2. **FUSED B (+) CIRCUITS OPEN AT TIPM**

Disconnect the scan tool from the DLC.

Using a 12-volt test light connected to ground, and using the wiring diagram as a guide, check all Fused B (+) circuits at the TIPM.

Does the test light illuminate brightly for each circuit?

Yes

Go To step 3.

No

Repair the Fused B(+) circuit for an open or short.

Perform **BODY VERIFICATION TEST - VER 1.**

3. **FUSED IGNITION SWITCH OUTPUT CIRCUITS OPEN AT TIPM**

Turn the ignition on.

Using a 12-volt test light connected to ground, and using the wiring diagram as a guide, check each Fused Ignition Switch Output circuit at the TIPM.

Does the test light illuminate brightly for each circuit?

Yes

Go To step 4.

No

Repair the Fused Ignition Switch Output circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1.**

4. **GROUND CIRCUITS OPEN AT TIPM**

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, and using the wiring diagram as a guide, check all ground circuits at the TIPM.

Does the test light illuminate brightly on each circuit?

Yes

Go To step 5.

No

Repair the ground circuit that did not light the test light for an open.

Perform **BODY VERIFICATION TEST - VER 1**.

5. **CHECK FOR (D72) DIAGNOSTIC CAN C (+) CIRCUIT OPEN AT DLC**

Fig. 146: Measuring Resistance Of (D72) Diagnostic CAN C (+) Circuit Between TIPM C7 Harness Connector And DLC

Courtesy of CHRYSLER LLC

Disconnect the TIPM C7 harness connector.

Measure the resistance on the (D72) Diagnostic CAN C (+) circuit between the TIPM C7 harness connector and the DLC.

Is the resistance above 10.0 ohms?

Yes

Repair the (D72) Diagnostic CAN C (+) circuit for an open.
Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To step 6.

6. CHECK FOR (D71) DIAGNOSTIC CAN C (-) CIRCUIT OPEN AT DLC

8197bd65

Fig. 147: Measuring Resistance Of (D71) Diagnostic CAN C (-) Circuit Between TIPM C7 Harness Connector And DLC
Courtesy of CHRYSLER LLC

Measure the resistance on the (D71) Diagnostic CAN C (-) circuit between the TIPM C7 harness connector and the DLC.

Is the resistance above 10.0 ohms?

Yes

Repair the (D71) Diagnostic CAN C (-) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To step 7.

7. (D72) DIAGNOSTIC CAN C (+) CIRCUIT SHORTED TO GROUND

Fig. 148: Measuring The Resistance Between Ground And The Diagnostic Can C (+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Disconnect the scan tool from the DLC.

Measure the resistance between ground and the (D72) Diagnostic CAN C (+) circuit.

Is the resistance below 100.0 ohms?

Yes

Repair the (D72) Diagnostic CAN C (+) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To step 8.

8. **(D71) DIAGNOSTIC CAN C (-) CIRCUIT SHORTED TO GROUND**

Fig. 149: Measuring Resistance Between Ground And (D71) Diagnostic CAN C (-) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Disconnect the scan tool from the DLC.

Measure the resistance between ground and the (D71) Diagnostic CAN C (-) circuit.

Is the resistance below 100.0 ohms?

Yes

Repair the (D71) Diagnostic CAN C (-) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Go To step 9.

9. **CHECK FOR DIAGNOSTIC CAN C CIRCUITS SHORTED TOGETHER**

MODULE-
TOTALLY
INTEGRATED
POWER C7

8197bd4c

Fig. 150: Measuring Resistance Between (D72/52) Diagnostic CAN C (+) Circuit And (D71) Diagnostic CAN C (-) Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between the (D52) Diagnostic CAN C (+) circuit and the (D71) Diagnostic CAN C (-) circuit at the TIPM C7 harness connector.

Is the resistance below 100.0 ohms?

Yes

Repair the (D72) Diagnostic CAN C (+) circuit for a short to the (D71) Diagnostic CAN C (-) circuit.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Replace the Totally Integrated Power Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

***NO RESPONSE FROM VEHICLE ENTERTAINMENT SYSTEM (VES)(DVD MONITOR)**

Circuit Schematic

Possible Causes

Possible Causes
(A116) FUSED B (+) (I.O.D.) CIRCUIT OPEN OR SHORTED
(Z919) GROUND CIRCUIT OPEN
(D264) AND (D265) CAN INTERIOR BUS (125K) CIRCUITS OPEN
VEHICLE ENTERTAINMENT SYSTEM (DVD MONITOR)

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes

Go To step 2.

No

The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A116) FUSED B(+) (I.O.D.) CIRCUIT OPEN OR SHORTED

MONITOR-DVD C1

81a2f40a

Fig. 152: Using 12-Volt Test Light Connected To Ground To Check (A116) Fused B(+) (I.O.D.) Circuit

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the DVD Monitor C1 harness connector.

Using a 12-volt test light connected to ground, check the (A116) Fused B(+) (I.O.D.) circuit.

Does the test light illuminate brightly?

Yes

Go To step 3.

No

Repair the (A116) Fused B(+) (I.O.D.) circuit for an open or short.

Perform **BODY VERIFICATION TEST - VER 1.**

3. (Z919) GROUND CIRCUIT OPEN

Fig. 153: Using 12-Volt Test Light Connected To 12-Volts To Check (Z919) Ground Circuit
 Courtesy of CHRYSLER LLC

Using a 12-volt test light connected to 12-volts, check the (Z919) ground circuit.

Does the test light illuminate brightly?

Yes

Go To step 4.

No

Repair the (Z919) ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1.**

4. **(D265) OR (D264) CAN INTERIOR BUS (125K) CIRCUIT OPEN**

Fig. 154: Measuring Resistance Of CAN Interior Bus (125K) Circuits Between TIPM C7 Harness Connector And DVD Monitor C1 Harness Connector
 Courtesy of CHRYSLER LLC

Measure the resistance of the (D264) CAN Interior Bus (-) (125K) circuit between the TIPM C7 harness connector and the DVD Monitor C1 harness connector.

Measure the resistance of the (D265) CAN Interior Bus (+) (125K) circuit between the TIPM C7 harness connector and the DVD Monitor C1 harness connector.

Is resistance below 5.0 ohms on both circuits?

Yes

Replace the DVD Monitor in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1.**

No

Repair the (D265) or (D264) CAN Interior Bus (125K) circuit for an open. Inspect the connector

for damage.

Perform **BODY VERIFICATION TEST - VER 1.**

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the TIPM C1 harness connector and the Sentry Key Remote Entry Module connector.

Is resistance below 5.0 ohms?

Yes

Go To step 6.

No

Repair the (D65) CAN C Bus (+) circuit for an open.

Perform **SKREEM/SKIM VERIFICATION TEST** .

6. (D64) CAN C BUS (-) CIRCUIT OPEN

Fig. 160: Measuring Resistance Of (D64) CAN C Bus (-) Circuit Between TIPM C1 Harness Connector And Sentry Key Remote Entry Module Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (D64) CAN C Bus (-) circuit between the TIPM C1 harness connector and the Sentry Key Remote Entry Module connector.

Is resistance below 5.0 ohms?

Yes

Replace the Sentry Key Remote Entry Module in accordance with the service information.

Perform **SKREEM/SKIM VERIFICATION TEST** .

No

Repair the (D64) CAN C Bus (-) circuit for an open.

Perform SKREEM/SKIM VERIFICATION TEST .

***STORED LOST COMMUNICATION DTCS**

Circuit Schematic

Fig. 161: Electronic Control Modules Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on.
- Battery voltage between 10 and 16 volts.
- IOD fuse installed.

Set Conditions

- Set Condition:**
 - Bus messages not received for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
CAN C BUS CIRCUITS OPEN OR SHORTED
CAN INTERIOR BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
POWER OR GROUND FROM THE REPORTING MODULE
MODULE THAT SET THIS DTC
PREVIOUS SERVICE PERFORMED WITHIN THE LAST 100 KEY CYCLES (FUSE/RELAYS REMOVED, WIRING SERVICE, BATTERY DISCONNECT)
LOW BATTERY/JUMP START CONDITION
IOD FUSE WAS REMOVED DURING SHIPPING
CHECK FOR RELATED TSBS

Diagnostic Test

1. VERIFY DTC IS STORED

- NOTE:** **Stored faults may indicate a customer perceived intermittent condition.**
- NOTE:** **Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

Turn the ignition on.

With the scan tool, read stored DTCs.

Is this DTC stored?

Yes

Go To step 2.

No

Diagnose the active DTC. Refer to **DIAGNOSTIC CODE INDEX** for a list of the symptoms.

2. CHECK THE ENVIRONMENTAL DATA

With the scan tool, read the loss of communication environmental data.

Does the loss of communication environmental odometer data match up to any of the previous service procedures listed in the possible causes or are there any stored CAN C hardware electrical, battery, ignition voltage, VIN missing/mismatch DTCs present which match environmental data?

Yes

These DTCs may have been the result of other service procedures performed. Clear DTCs.
Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To step 3.

3. VERIFY INTERMITTENT LOST COMMUNICATION DTC-WIRING CONCERNS

With the scan tool, select Network View and select Advanced.

Is there more than one ECU with stored DTCs "Logged Against" the module and one or more lost communication DTCs stored in the offending module?

Yes

Verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals. Repair as necessary.

No

Go To step 4.

4. **VERIFY INTERMITTENT LOST COMMUNICATION DTC-OFFENDING MODULE**

With the scan tool, select Network View and select Advanced.

Is there more than one ECU with stored DTCs "Logged Against" the module and NO lost communication DTCs stored in the offending module?

Yes

Check for a TSB related to this offending module.

No

Go To step 5.

5. **VERIFY INTERMITTENT LOST COMMUNICATION DTC-REPORTING MODULE**

With the scan tool, select Network View and select Advanced.

Is there ONLY ONE ECU with stored DTCs "Logged Against" the module?

Yes

Check for a TSB related to the module that set this DTC.

No

Verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals. Repair as necessary.

STANDARD PROCEDURE

BODY VERIFICATION TEST - VER 1

Diagnostic Test

1. Perform Body Verification Test

NOTE: If the SKREEM or PCM/ECM was replaced, refer to the service information for proper programming procedures.

1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
2. Ensure that all accessories are turned off.
3. Ensure that the battery is fully charged.
4. Turn the ignition on.

5. With the scan tool, record and erase DTC's from all modules.
6. If an electronic control module was replaced, select the applicable module from the scan tool menu and press "Misc. Functions". If the module has programmable features, program as necessary.
7. (Export only) If the Intrusion Transceiver Module (ITM) and/or Siren was replaced, select ITM from the scan tool ECU View menu then "Misc. Functions" and perform the applicable replacement procedure.
8. If this vehicle is equipped with Express Up Power Windows and the battery or a door module was disconnected for any reason, the front windows will have to be calibrated. To calibrate, start by moving the window to the middle position. Next, hold the window express up switch one second after fully up. Next, hold the express down switch one second after fully down.
9. Turn the ignition off, wait 10 seconds, and then turn the ignition on.
10. Operate all functions of the system that caused the original concern.
11. With the scan tool, select ECU View and check for DTC's in the modules.

Are DTCs present in any of the modules or is the original condition still present?

Yes

The repair is not complete. Refer to the related article for the DTC or symptom that is still present.

No

The repair is complete.

2008 ACCESSORIES AND EQUIPMENT

Electronic Control Modules - Service Information - Liberty

ELECTRONIC CONTROL MODULES - SERVICE INFORMATION

STANDARD PROCEDURE

SKREEM PROGRAMMING

When a Powertrain Control Module (PCM) for a gasoline engine, or an Engine Control Module (ECM) for a diesel engine and the Sentry Key Remote Entry Module (SKREEM) (also known as the Wireless Control Module/WCM) on vehicles equipped with the Sentry Key Immobilizer System (SKIS) are replaced at the same time, perform the following steps in order:

NOTE: If the PCM and the SKREEM are replaced at the same time, program the PCM VIN into the PCM first.

1. If applicable first replace the PCM/ECM with the original WCM still connected to the vehicle.
2. Using the appropriate service information program the new PCM/ECM. (This will ensure the Secret Key Transfer from the original WCM into the new PCM/ECM).
3. Now replace and program the WCM. This will retain the Secret Key from the PCM/ECM back into the new WCM.
4. With the scan tool, select Miscellaneous Functions, WCM/Wireless Control Module. Then select the desired procedure and follow the display on the scan tool.
5. If the vehicle is equipped with Tire Pressure Monitoring System program the Placard Pressure Values into the WCM/SKREEM.
6. Ensure all the customer's keys have been programmed into the new module if necessary.

NOTE: If the original keys do not successfully program to the new SKREEM after the proper procedures are followed correctly, programming new keys will be necessary.

PROGRAMMING THE SKREEM

The SKIS Secret Key is an ID code that is unique to each SKREEM/WCM. This code is programmed and stored in the SKREEM/WCM, the PCM/ECM, and each ignition key transponder chip. When the PCM/ECM or SKREEM/WCM is replaced, it is necessary to program the Secret Key into the new module using a diagnostic scan tool. Follow the programming steps outlined in the diagnostic scan tool for **PCM REPLACED**, **ECM REPLACED**, **WCM REPLACED**, or **GATEWAY REPLACED** under **MISCELLANEOUS FUNCTIONS** for the **WIRELESS CONTROL MODULE/WCM** menu item as appropriate.

NOTE: Programming the PCM/ECM or SKREEM is done using a diagnostic scan tool and a PIN to enter secure access mode. If three attempts are made to enter secure access mode using an incorrect PIN, secure access mode will be locked

out for one hour. To exit this lockout mode, turn the ignition to the RUN position for one hour then enter the correct PIN. Be certain that all accessories are turned OFF. Also monitor the battery state and connect a battery charger if necessary.

NOTE: Before replacing the ECU for a failed driver, control circuit or ground circuit, be sure to check the related component/circuit integrity for failures not detected due to a double fault in the circuit. Most ECM driver/control circuit failures are caused by internal component failures (i.e. relay and solenoids) and shorted circuits (i.e. pull-ups, drivers and switched circuits). These failures are difficult to detect when a double fault has occurred and only one DTC has set.

ECM/SKIM/WCM PROGRAMMING

When a ECM and the SKIM are replaced at the same time perform the following steps in order:

1. Program the new SKIM
2. Program the new ECM
3. Replace all ignition keys and program them to the new SKIM.

When an ECM (Bosch) and the SKIM are replaced at the same time perform the following steps in order:

1. Program the new SKIM
2. Program the new ECM (Bosch)
3. Replace all ignition keys and program them to the new SKIM.

PROGRAMMING THE SKIM

CAUTION: Read all notes and cautions for programming procedures.

1. Connect a battery charger to the vehicle.
2. Connect the StarSCAN®.

CAUTION: If the ECM/PCM and SKREEM/WCM are replaced at the same time, the ECM/PCM MUST be programmed before the SKREEM/WCM.

3. Select "ECU View".
4. Select "WCM Wireless Control Module".
5. Select "Miscellaneous Functions".
6. Select WCM replaced.
7. Enter the PIN when prompted.
8. Verify the correct information.

NOTE: If the ECM and the SKIM are replaced at the same time, all vehicle keys will need to be replaced and programmed to the new SKIM.

PROGRAMMING IGNITION KEYS TO THE SKREEM

Each ignition key transponder also has a unique ID code that is assigned at the time the key is manufactured. When a key is programmed into the SKREEM/WCM, the transponder ID code is learned by the module and the transponder acquires the unique Secret Key ID code from the SKREEM/WCM. To program ignition keys into the SKREEM/WCM, follow the programming steps outlined in the diagnostic scan tool for **PROGRAM IGNITION KEYS OR KEY FOBS** under **MISCELLANEOUS FUNCTIONS** for the **WIRELESS CONTROL MODULE/WCM** menu item.

NOTE: If the original keys do not successfully program to the new SKREEM after the proper procedures are followed correctly, programming new keys will be necessary.

NOTE: A maximum of eight keys can be learned to each SKREEM. Once a key is learned to a SKREEM, that key has acquired the Secret Key for that SKREEM and cannot be transferred to any other SKREEM or vehicle.

If ignition key programming is unsuccessful, the scan tool will display one of the following error messages:

- **PROGRAMMING NOT ATTEMPTED** - The scan tool attempts to read the programmed key status and there are no keys programmed into SKREEM memory.
- **PROGRAMMING KEY FAILED (POSSIBLE USED KEY FROM WRONG VEHICLE)** - SKREEM is unable to program an ignition key transponder due to one of the following:
 - The ignition key transponder is ineffective.
 - The ignition key transponder is or has been already programmed to another vehicle.
- **8 KEYS ALREADY LEARNED, PROGRAMMING NOT DONE** - The SKREEM transponder ID memory is full.
- **LEARNED KEY IN IGNITION** - The ID for the ignition key transponder currently in the ignition lock cylinder is already programmed into SKREEM memory.

COMMUNICATION

DESCRIPTION

CAN-IHS-LIN BUS

The primary on-board communication network between microprocessor-based electronic control modules in this vehicle is the Controller Area Network (CAN) data bus system. A data bus network minimizes redundant wiring connections; and, at the same time, reduces wire harness complexity, sensor current loads and controller hardware by allowing each sensing device to be connected to only one module (also referred to as a node). Each node reads, then broadcasts its sensor data over the bus for use by all other nodes requiring that data. Each node ignores the messages on the bus that it cannot use.

The CAN bus is a two-wire multiplex system. Multiplexing is any system that enables the transmission of multiple messages over a single channel or circuit. The CAN bus is used for communication between most vehicle nodes. However, in addition to the CAN bus network, certain nodes may also be equipped with a Local Interface Network (LIN) data bus. The LIN data bus is a single wire low-speed (9.6 Kbps) serial link bus used to provide direct communication between a LIN master module and certain switch or sensor inputs.

There are actually three separate CAN bus systems used in the vehicle. They are designated: the CAN-Interior (also known as CAN Interior High Speed/IHS), the CAN-C and the Diagnostic CAN-C. The CAN-Interior and CAN-C systems provide on-board communication between all nodes in the vehicle. The CAN-C is the faster of the two systems providing near real-time communication (500 Kbps). The CAN-C is used typically for communications between more critical nodes, while the slower (125 Kbps) CAN-Interior system is used for communications between less critical nodes.

The added speed of the CAN data bus is many times faster than previous data bus systems. This added speed facilitates the addition of more electronic control modules or nodes and the incorporation of many new electrical and electronic features in the vehicle.

The Diagnostic CAN-C bus is also capable of 500 Kbps communication, and is sometimes informally referred to as the CAN-D system to differentiate it from the other high speed CAN-C bus. The Diagnostic CAN-C is used exclusively for the transmission of diagnostic information between the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) and a diagnostic scan tool connected to the industry-standard 16-way Data Link Connector (DLC) located beneath the instrument panel on the driver side of the vehicle.

The TIPM is located in the engine compartment near the battery. The central CAN gateway or hub module integral to the TIPM is connected to all three CAN buses. This gateway physically and electrically isolates the CAN buses from each other and coordinates the bi-directional transfer of messages between them.

OPERATION

CAN-IHS-LIN BUS

The Controller Area Network (CAN) data bus allows all electronic modules or nodes connected to the bus to share information with each other. Regardless of whether a message originates from a module on the lower speed CAN-Interior (also known as CAN Interior High Speed/IHS) bus or on the higher speed CAN-C or CAN-D bus, the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores a Diagnostic Trouble Code (DTC) for certain bus network faults.

All modules (also referred to as nodes) transmit and receive messages over one of these buses. Data exchange between nodes is achieved by serial transmission of encoded data messages. Each node can both send and receive serial data simultaneously. Each digital bit of a CAN bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each node uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time.

The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) is the Local Interface Network (LIN) master module in this vehicle and it gathers information from the compass module, the instrument panel switch bank, the Steering Control Module (SCM), and the Heated Seat Module

(HSM) through the LIN data bus. There is also LIN bus communication between the individual Tire Pressure Monitor (TPM) transponders and the Sentry Key Remote Entry Module (SKREEM) (also known as the Wireless Control Module/WCM). Both the EMIC and the SKREEM either act directly upon the information received through the LIN data bus, relay the information to other nodes in the vehicle using electronic messages placed on the CAN bus, or both.

The voltage network used to transmit messages requires biasing and termination. Each module on the CAN bus network provides its own biasing and termination. There are two types of nodes used in the CAN bus network. On the CAN-C or the IHS bus, a dominant node has a 120 ohm termination resistance while a non-dominant (or recessive) node has about a 2500 to 3000 ohm (2.5 to 3.0 kilohm) termination resistance. The dominant nodes on the CAN-C bus are the TIPM and the Powertrain Control Module (PCM). The dominant nodes on the IHS bus are the EMIC and the TIPM.

The termination resistance of two dominant nodes is combined in parallel to provide a total of about 60 ohms. This resistance value may vary somewhat by application, depending upon the number of non-dominant nodes on the bus. On the CAN-D bus (or Diagnostic CAN-C) all of the 60 ohm termination resistance is present in the Central GateWay (TIPMCGW).

NOTE: All measurement of termination resistance is done with the vehicle battery disconnected.

The communication protocol being used for the CAN data bus is a non-proprietary, open standard adopted from the Bosch CAN Specification 2.0b. The CAN-C is the faster of the two primary buses in the CAN bus system, providing near real-time communication (500 Kbps).

The CAN bus nodes are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. The twisted pairs have between 33 and 50 twists per meter (yard). While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire. Refer to the CAN BUS VOLTAGES table.

CAN Bus Voltages (Normal Operation)								
CAN-C Bus Circuits	Sleep	Recessive (Bus Idle)	Dominant (Bus Active)	CAN-L Short to Ground	CAN-H Short to Ground	CAN-L Short to Battery	CAN-H Short to Battery	CAN-H Short to CAN-L
CAN-L (-)	0 V	2.4 - 2.5 V	1.3 - 2.3 V	0 V	0.3 - 0.5V	Battery Voltage	Battery Voltage Less 0.75 V	2.45 V
CAN-H (+)	0 V	2.4 - 2.5 V	2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V
CAN-Interior Bus	Key-Off (Bus		Key-On (Bus	CAN-L Short to	CAN-H Short to	CAN-L Short to	CAN-H Short to	CAN-H Short to

Circuits	Asleep)	Active)	Ground	Ground	Battery	Battery	CAN-L
CAN-L (-)	0.0 V	1.3 - 2.3 V	0 V	0.3 - 0.5 V	Battery Voltage	Battery Voltage Less 0.75 V	2.45 V
CAN-H (+)	0.0 V	2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V
Notes							
All measurements taken between node ground and CAN terminal with a standard DVOM. DVOM will display average network voltage. Total resistance of CAN-C network can also be measured (60 ohms). Total resistance of CAN-Interior network varies, depending upon the number of optional non-dominant nodes on the bus. CAN-Interior total resistance should range between about 60 ohms with the minimal number of nodes, to about 42 ohms with the maximum number of nodes.							

In order to minimize the potential effects of Ignition-OFF Draw (IOD), the CAN-Interior network employs a sleep strategy. However, a network sleep strategy should not be confused with the sleep strategy of the individual nodes on that network, as they may differ. For example: The CAN-C bus network is awake only when the ignition switch is in the ON or START positions; however, the TIPM, which is on the CAN-C bus, may still be awake with the ignition switch in the ACCESSORY or UNLOCK positions. The integrated circuitry of an individual node may be capable of processing certain sensor inputs and outputs without the need to utilize network resources.

The CAN-Interior bus network remains active until all nodes on that network are ready for sleep. This is determined by the network using tokens in a manner similar to polling. When the last node that is active on the network is ready for sleep, and it has already received a token indicating that all other nodes on the bus are ready for sleep, it broadcasts a **bus sleep acknowledgment** message that causes the network to sleep. Once the CAN-Interior bus network is asleep, any node on the bus can awaken it by transmitting a message on the network. The TIPM will keep either the CAN-Interior or the CAN-C bus awake for a timed interval after it receives a diagnostic message for that bus over the Diagnostic CAN-C bus.

In the CAN system, available options are configured into the TIPM at the assembly plant, but additional options can be added in the field using the diagnostic scan tool. The configuration settings are stored in non-volatile memory. The TIPM also has two 64-bit registers, which track each of the **as-built** and **currently responding** nodes on the CAN-Interior and CAN-C buses. The TIPM stores a Diagnostic Trouble Code (DTC) in one of two caches for any detected active or stored faults in the order in which they occur. One cache stores powertrain (P-Code), chassis (C-Code) and body (B-Code) DTCs, while the second cache is dedicated to storing network (U-Code) DTCs.

If there are intermittent or active faults in the CAN network, a diagnostic scan tool connected to the Diagnostic CAN-C bus through the 16-way Data Link Connector (DLC) may only be able to communicate with the TIPM. To aid in CAN network diagnosis, the TIPM will provide CAN-Interior and CAN-C network status information to the scan tool using certain diagnostic signals. In addition, the transceiver in each node on the CAN-C bus will identify a **bus off hardware failure**, while the transceiver in each node on the CAN-Interior bus will identify a **general bus hardware failure**. The transceivers for some CAN-Interior nodes will also identify certain

failures for both CAN-Interior bus signal wires.

DATA LINK CONNECTOR

DESCRIPTION

DATA LINK CONNECTOR

Fig. 1: Identifying Data Link Connector (DLC) & Steering Column Opening Cover
Courtesy of CHRYSLER LLC

The Data Link Connector (DLC) (2) is a 16-way molded plastic connector insulator on a dedicated take out of the instrument panel wire harness. This connector is located at the lower edge of the steering column opening cover (1) on the instrument panel, inboard of the steering column. The connector insulator is retained by two screws to an integral mounting tab on the lower instrument panel reinforcement, just below the lower edge of the steering column opening cover.

OPERATION

DATA LINK CONNECTOR

The Data Link Connector (DLC) is an industry-standard 16-way connector that permits the connection of a diagnostic scan tool to the Controller Area Network (CAN) data bus for interfacing with, configuring, and retrieving Diagnostic Trouble Code (DTC) data from the electronic modules that reside on the data bus network of the vehicle.

MODULE-ANTILOCK BRAKE

DESCRIPTION

CONTROLLER ANTILOCK BRAKES

818ba6f7

Fig. 2: ABM MODULE
Courtesy of CHRYSLER LLC

The Antilock Brake Module (ABM) is mounted to the Hydraulic Control Unit (HCU) and operates the ABS system.

OPERATION

CONTROLLER ANTILOCK BRAKES

The ABM voltage source is through the ignition switch in the RUN position. The ABM contains dual microprocessors. A logic block in each microprocessor receives identical sensor signals. These signals are processed and compared simultaneously. The ABM contains a self check program that illuminates the ABS warning light when a system fault is detected. Faults are stored in a diagnostic program memory and are accessible with the scan tool. ABS faults remain in memory until cleared, or until after the vehicle is started approximately 50 times. Stored faults are **not** erased if the battery is disconnected.

REMOVAL

ANTILOCK BRAKE MODULE

1. Disconnect negative (-) battery cable from battery post and isolate.

Fig. 3: ABM CONNECTOR LEVER
 Courtesy of CHRYSLER LLC

NOTE: To disconnect the ABM wiring connector in the following step, depress the tab (1) in the center of the connector and lift the release lever (2), rotating it upward to the top of the connector, or until the connector is fully released from the module socket.

Fig. 4: ABM WIRING CONNECTOR
 Courtesy of CHRYSLER LLC

2. Disconnect the wiring connector from the ABM.

81992b16

Fig. 5: ABM MOUNTING SCREWS (W/ESP)
 Courtesy of CHRYSLER LLC

3. Remove four screws (1) attaching antilock brake module (ABM) (2) to hydraulic control unit (HCU).

81992b7

Fig. 6: REMOVE/INSTALL ABM
 Courtesy of CHRYSLER LLC

CAUTION: When removing ABM from HCU, be sure to completely separate the two components (approximately 38 mm (1.5 inches)) before removing ABM. Otherwise, damage to the pressure sensor will result requiring HCU replacement.

4. Slide ABM (1) off HCU (2).
5. Remove ABM from vehicle.

INSTALLATION

CAUTION: Inspect seal around mating edge of ABM to ensure seal is in good shape.

1. Clean any debris off the mating surfaces of the antilock brake module (ABM) and hydraulic control unit (HCU).

81992bb7

Fig. 7: REMOVE/INSTALL ABM
Courtesy of CHRYSLER LLC

CAUTION: When installing ABM to HCU, care must be taken not to damage the pressure sensor. If damaged, HCU replacement is necessary.

2. Align ABM (1) solenoids and pump/motor wiring with HCU (2) valves and wiring passage. Slide ABM onto HCU.

81992b16

Fig. 8: ABM MOUNTING SCREWS (W/ESP)

Courtesy of CHRYSLER LLC

3. Install four screws (1) attaching ABM to HCU. Tighten mounting screws to 6 N.m (53 in. lbs.).

Fig. 9: ABM CONNECTOR LEVER

Courtesy of CHRYSLER LLC

NOTE: To connect the ABM wiring connector to the ABM in the following step, begin with the release lever in the full upward (released) position. Push the connector onto the ABM socket and rotate the release lever (2) downward until it snaps into place in the locked position below the release tab (1).

Fig. 10: ABM WIRING CONNECTOR

Courtesy of CHRYSLER LLC

4. Install ABM wiring connector (2) into socket of ABM.
5. Connect negative battery cable to battery post.

6. Hook up the scan tool to initialize the ABM and perform the following:
 - Clear any faults.
 - Perform **ABS VERIFICATION TEST** and road test the vehicle.

MODULE-DIESEL ENGINE CONTROL

DESCRIPTION

ENGINE CONTROL MODULE (ECM)

80cc7aa6

Fig. 11: Removing/Installing Engine Control Module (ECM)
Courtesy of CHRYSLER LLC

- 1 - ECM ELECTRICAL CONNECTORS
- 2 - ENGINE CONTROL MODULE (ECM)
- 3 - ECM MOUNTING BRACKET
- 4 - ECM MOUNTING BRACKET MOUNTING STUDS
- 5 - MOUNTING BRACKET RETAINING NUTS

The Engine Control Module (ECM) (2) is located in the left side of engine compartment attached to the left inner fender behind the battery. The ECM also incorporates the barometric pressure sensor in it's housing. See **Fig. 11.**

OPERATION

ENGINE CONTROL MODULE (ECM)

The ECM has been programmed to monitor different circuits of the diesel fuel injection system. This monitoring is called on-board diagnostics. Certain criteria must be met for a diagnostic trouble code to be entered into the ECM memory. The criteria may be a range of engine rpm, engine temperature, time or other input signals to the ECM. If all of the criteria for monitoring a system or circuit are met, and a problem is sensed, then a DTC will be stored in the ECM memory. It is possible that a DTC for a monitored circuit may not be entered into the ECM memory, even though a malfunction has occurred. This may happen when the monitoring criteria have not been met. The ECM compares input signal voltages from each input device with specifications (the established high and low limits of the input range) that are programmed into it for that device. If the input voltage is not within the specifications and other trouble code criteria are met, a DTC will be stored in the ECM memory.

ECM OPERATING MODES

As input signals to the ECM change, the ECM adjusts its response to the output devices. For example, the ECM must calculate a different fuel quantity and fuel timing for engine idle condition than it would for a wide open throttle condition. There are several different modes of operation that determine how the ECM responds to the various input signals.

Ignition Switch On (Engine Off)

When the ignition is turned on, the ECM activates the glow plug relay for a time period that is determined by engine coolant temperature, atmospheric temperature and battery voltage.

Engine Start-Up Mode

The ECM uses the engine temperature sensor and the crankshaft position sensor (engine speed) inputs to determine fuel injection quantity.

Normal Driving Modes

Engine idle, warm-up, acceleration, deceleration and wide open throttle modes are controlled based on all of the sensor inputs to the ECM. The ECM uses these sensor inputs to adjust fuel quantity and fuel injector timing.

Limp-In Mode

If there is a fault detected with the accelerator pedal position sensor, the ECM will set the engine speed at 1100 rpm.

Overspeed Detection Mode

If the ECM detects engine rpm that exceeds 5200 rpm, the ECM will set a DTC in memory and illuminate the MIL until the DTC is cleared.

After-Run Mode

The ECM transfers RAM information to ROM and performs an Input/Output state check.

MONITORED CIRCUITS

The ECM is able to monitor and identify most driveability related trouble conditions. Some circuits are directly monitored through ECM feedback circuitry. In addition, the ECM monitors the voltage state of some circuits and compares those states with expected values. Other systems are monitored indirectly when the ECM conducts a rationality test to identify problems. Although most subsystems of the engine control module are either directly or indirectly monitored, there may be occasions when diagnostic trouble codes are not immediately identified. For a trouble code to set, a specific set of conditions must occur and unless these conditions occur, a DTC will not set.

DIAGNOSTIC TROUBLE CODES

Each Diagnostic Trouble Code (DTC) is diagnosed by following a specific procedure. The diagnostic test procedure contains step-by-step instruction for determining the cause of the DTC as well as no trouble code problems. Refer to the appropriate diagnostic service information.

HARD CODE

A DTC that comes back within one cycle of the ignition key is a hard code. This means that the problem is current every time the ECM/SKIM checks that circuit or function. Procedures in this service information, verify if the DTC is a hard code at the beginning of each test. When the fault is not a hard code, an intermittent test must be performed. **NOTE:** If the scan tool displays faults for multiple components (i.e. ECT, VSS, IAT sensors) identify and check the shared circuits for possible problems before continuing (i.e. sensor grounds or 5-volt supply circuits). Refer to the appropriate schematic to identify shared circuits. Refer to the appropriate diagnostic service information.

INTERMITTENT CODE

A DTC that is not current every time the ECM/SKIM checks the circuit or function is an intermittent code. Most intermittent DTCs are caused by wiring or connector problems. Problems that come and go like this are the most difficult to diagnose; they must be looked for under specific conditions that cause them. **NOTE: Electromagnetic (radio) interference can cause an intermittent system malfunction.** This interference can interrupt communication between the ignition key transponder and the SKIM.

The following checks may assist you in identifying a possible intermittent problem:

- Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, loose fitting or

corroded terminals.

- Visually inspect the related wire harness. Look for chafed, pierced or partially broken wire.
- Refer to hotlines or technical service bulletins that may apply.

Refer to the appropriate diagnostic service information.

ECM DIAGNOSTIC TROUBLE CODES

IMPORTANT NOTE: Before replacing the ECM for a failed driver, control circuit or ground circuit, be sure to check the related component/circuit integrity for failures not detected due to a double fault in the circuit. Most ECM driver/control circuit failures are caused by internal failures to components (i.e. relays and solenoids) and shorted circuits (i.e. sensor pull-ups, drivers and ground circuits). These faults are difficult to detect when a double fault has occurred and only one DTC has set. If the scan tool displays faults for multiple components (i.e. VSS, ECT, Batt Temp, etc.) identify and check the shared circuits for possible problems before continuing (i.e. sensor grounds or 5-volt supply circuits). Refer to the appropriate wiring diagrams to identify shared circuits. Refer to the appropriate diagnostic service information.

STANDARD PROCEDURE

PCM/ECM PROGRAMMING - DIESEL

PCM / TCM FLASH REPROGRAMING

This procedure will need to be done when one or more of the following situations are true:

1. A vehicle's Powertrain control module (PCM) has been replaced.
2. A diagnostic trouble code (DTC) is set P1602 - PCM Not Programmed.
3. An updated calibration or software release is available for either the PCM or TCM ECUs.

This procedure assumes that the StarSCAN® and StarMOBILE® devices are configured to your dealership's network with either a wired or wireless connection. The StarSCAN® and StarMOBILE® must also be running at the latest operating system and software release level. For more help on how to network your StarSCAN® or StarMOBILE® reference the StarSCAN® / StarMOBILE® Quick Start Networking Guide available on 'DealerCONNECT > Service > StarSCAN® and StarMOBILE® Tools > Online Documentation' or at www.dcctools.com, under the Download Center.

TABLE OF CONTENTS

1. **SECTION 1 - PCM / TCM FLASH PROCEDURE.**
2. **REQUIRED TOOLS/EQUIPMENT:.**
3. **TECH TIPS and INFORMATION:.**
4. **PARTS REQUIRED.**

SECTION 1 - PCM / TCM FLASH PROCEDURE

If using StarSCAN® or StarMOBILE® Desktop Client. Go to **REPAIR PROCEDURE - Using StarSCAN® or StarMOBILE® Desktop Client.**

If using StarMOBILE® Standalone Diagnostic Mode. Go To **REPAIR PROCEDURE - Using StarMOBILE® Standalone Diagnostic Mode.**

REPAIR PROCEDURE - Using StarSCAN® or StarMOBILE® Desktop Client

NOTE: If this flash process is interrupted or aborted, the flash should be restarted.

1. Open the hood of the vehicle and install a battery charger. Verify that the charging rate provides a continuous charge of 13.2 - 13.5 volts.
2. Connect the StarSCAN® or StarMOBILE® to the vehicle data link connector located under the steering column and turn the ignition key to the "RUN" position.
3. Power on the StarSCAN® or StarMOBILE®. If the StarMOBILE® is being used, launch the StarMOBILE® Desktop Client and connect to the appropriate StarMOBILE® device.
4. Retrieve the old ECU part number. From the tool's Home screen,
 - a. Select "ECU View"
 - b. Select "PCM"
 - c. Select "More Options"
 - d. Select "ECU Flash"
 - e. Record the part number at the top of the Flash PCM screen for later reference.
5. Program the ECU as follows:
 - Using the StarSCAN® / StarMOBILE® at the Home screen, select "ECU View"
 - Select "PCM"
 - Select "More Options"
 - Select "ECU Flash"
 - Select "Browse for New File" and follow the on screen instructions.
 - Highlight the appropriate calibration based on the part number recorded in Step 4e, or by using Year/Model/Engine and appropriate emissions selection for the vehicle being worked on.

NOTE: If you are not connected to the vehicle, you may also search for flash files by selecting the "Flash Download" button from the Home screen.

- Select "Download to Scantool"
- Once the download is complete, select "Close" and then "Back"
- Highlight the listed calibration, select "Update Controller" and follow the on screen instructions.
- When the PCM update is complete, select "OK"
- Verify that the part number at the top of the Flash PCM screen has updated to the new part number.

NOTE: If this flash process is interrupted or aborted, the flash should be restarted.

6. Continue to **SECTION 2 - ADDITIONAL PCM / TCM REPLACEMENT PROCEDURES** to

complete the process if the ECU has been replaced.

7. Type the necessary information on the "Authorized Modification Label" (p/n 04275086AB) and attach near the VECI label (See **SECTION 3 - AUTHORIZED MODIFICATION LABEL** for details).

REPAIR PROCEDURE - Using StarMOBILE® Standalone Diagnostic Mode

NOTE: StarMOBILE® Standalone Mode is an efficient way to flash ECUs without having direct access to a network connection. It involves first copying the flash file to the StarMOBILE® device which DOES require a network connection. Once the file has been copied to the StarMOBILE® device, it can be used in a Standalone mode to flash the ECU WITHOUT a network connection.

NOTE: StarMOBILE® does not need to be connected to a vehicle when retrieving a flash file for Standalone Mode.

1. Power on the StarMOBILE®, Launch the StarMOBILE® Desktop Client and connect to the tool.
2. At the Home screen, select "ECU View"
 - Select "PCM"
 - Select "More Options"
 - Select "ECU Flash"
 - Select "Browse for New File" and follow the on screen instructions.
 - Highlight the appropriate calibration based on the current ECU part number, or by using Year/Model/Engine and appropriate emissions selection for the vehicle being worked on.

NOTE: If you are not connected to the vehicle, you may also search for flash files by selecting the "Flash Download" button from the Home screen.

3. From the Flash File List, select the appropriate calibration for the PCM and select "Download to Client"
4. Once the download is complete, hit "OK" and then "Manage Files"

6. Exit the StarMOBILE® Desktop Client application.
7. Open the hood of the vehicle and install a battery charger. Verify that the charging rate provides a continuous charge of 13.2 - 13.5 volts.
8. Connect the StarMOBILE® to the vehicle data link connector located under the steering column and turn the ignition key to the "RUN" position.
9. On the StarMOBILE® device, select "Enter Standalone Diagnostic Mode" (use the right function key).

Fig. 14: Identifying StarMOBILE(R) Screen For Enter Standalone Diagnostic Mode
Courtesy of CHRYSLER LLC

NOTE: If a StarMOBILE® Desktop Client is still associated with the device, you will receive the following error: "Your StarMOBILE® device is currently locked by a pc named 'xxxxxxx' on your network. To remove the lock, close its Desktop Client or reboot this device".

10. Program the ECU as follows:

- Select "ECU View"
- Select "PCM"
- Select "Flash ECU"

81eed9a3

Fig. 15: Programming ECU (1 Of 3)
Courtesy of CHRYSLER LLC

- Record the ECU part number at the very top of the screen for later reference.

81eed9a7

Fig. 16: Programming ECU (2 Of 3)
Courtesy of CHRYSLER LLC

- Highlight the flash file that you want to use. Hit "SELECT" and then "OK". Follow the on screen instructions.

Fig. 17: Programming ECU (3 Of 3)
Courtesy of CHRYSLER LLC

- Once the flash is complete, verify that the part number at the top of the Flash PCM screen has updated to the new part number.

NOTE: **If this flash process is interrupted or aborted, the flash should be restarted.**

11. Continue to **SECTION 2 - ADDITIONAL PCM / TCM REPLACEMENT PROCEDURES** to complete the process if the ECU has been replaced.
12. Type the necessary information on the "Authorized Modification Label" (p/n 04275086AB) and attach near the VECI label (See **SECTION 3 - AUTHORIZED MODIFICATION LABEL** for details).

SECTION 2 - ADDITIONAL PCM / TCM REPLACEMENT PROCEDURES

NOTE: **Find the PCM/TCM Type for the vehicle, read and write down the steps, and then go to the step by step instructions for additional information on how to perform these procedures. See STEP-BY-STEP INSTRUCTIONS.**

If an EDC16-U31 PCM was replaced, perform the following additional steps and/or routines:

1. PCM Replaced - if WCM equipped
2. Check PCM VIN - if NOT WCM equipped
3. Program Variant Code

If an EDC16-C2 PCM was replaced, perform the following additional steps and/or routines:

1. PCM Replaced - if WCM equipped
2. Check PCM VIN - if NOT WCM / SKREEM equipped
3. IMA Rapid Calibration Test - Only on 06 PT & up

4. Injector Quantity Adjustment - Only on 06 PT & up

If an EDC16-CP31 was replaced, perform the following additional steps and/or routines:

1. PCM Replaced - if WCM equipped
2. Check PCM VIN - if NOT WCM equipped
3. Diesel Particulate Filter (Used) Learning
4. NOx Catalyst (New) Initialization
5. Injector Quantity Adjustment
6. IMA Rapid Calibration Test
7. Fuel Mean Value Adaptation Initialization
8. Exhaust Throttle Plate Adaptive Learn Position

If an EDC16-CP31-2 was replaced, perform the following additional steps and/or routines:

1. PCM Replaced - if WCM equipped
2. Check PCM VIN - if NOT WCM equipped
3. Injector Quantity Adjustment
4. Program Variant Code
5. ECU Replacement With Value Transfer - if the ECU to be replaced is still responsive
6. ECU Replacement Without Value Transfer - if the ECU to be replaced is NOT responsive
7. Fuel Mean Value Adaptation Initialization
8. IMA Rapid Calibration Test
9. Set Oil Dilution Mass Value

If a CM849 PCM was replaced, perform the following additional steps and/or routines:

1. PCM Replaced - if WCM equipped
2. Check PCM VIN - if NOT WCM equipped

If a CM2100 PCM was replaced, perform the following additional steps and/or routines:

1. PCM Replaced - if WCM equipped
2. Check PCM VIN - if NOT WCM equipped
3. Enable / Disable Vehicle Features - need to enable features
4. Injector Quantity Adjustment
5. Reset Regenerative Filter Timers
6. Mobile DeSoot - NO Minimum Required Soot Load

If an Aisin TCM was replaced, perform the following additional steps and/or routines:

1. Quicklearn

If an EGS TCM was replaced, perform the following additional steps and/or routines:

1. Initialize EGS

If an NGC4 TCM ONLY was replaced, perform the following additional steps and/or routines:

1. Quicklearn

If an NGC3 TCM ONLY was replaced, perform the following additional steps and/or routines:

1. Quicklearn

If an EATX TCM was replaced, perform the following additional steps and/or routines:

1. Quicklearn

STEP-BY-STEP INSTRUCTIONS

Check PCM VIN

From the "Home" screen, select "ECU View"

Select "PCM"

Select "Misc. Functions"

Select "Check PCM VIN" and follow the on screen instructions.

When complete, select "Finish"

Diesel Particulate Filter (Used) Learning

From the "Home" screen, select "ECU View"

Select "PCM"

Select "Misc. Functions"

Select "Diesel Particulate Filter (Used) Learning" and follow the on screen instructions.

When complete, select "Finish"

ECU Replacement with Value Transfer

From the "Home" screen, select "ECU View"

Select "PCM"

Select "Misc. Functions"

Select "ECU Replacement with Value Transfer" and follow the on screen instructions.

When complete, select "Finish"

ECU Replacement without Value Transfer

From the "Home" screen, select "ECU View"

Select "PCM"

Select "Misc. Functions"

Select "ECU Replacement without Value Transfer" and follow the on screen instructions.

When complete, select "Finish"

Enable / Disable Vehicle Features

From the "Home" screen, select "ECU View"

Select "PCM"

Select "Misc. Functions"

Select "Enable / Disable Vehicle Features" and follow the on screen instructions.

When complete, select "Finish"

Exhaust Throttle Plate Adaptive Learn Position

From the "Home" screen, select "ECU View"

Select "PCM"

Select "Misc. Functions"

Select "Exhaust Throttle Plate Adaptive Learn Position" and follow the on screen instructions.

When complete, select "Finish"

Fuel Mean Value Adaptation Initialization

From the "Home" screen, select "ECU View"

Select "PCM"

Select "Misc. Functions"

Select "Fuel Mean Value Adaptation Initialization" and follow the on screen instructions.

When complete, select "Finish"

IMA Rapid Calibration

From the "Home" screen, select "ECU View"

Select "PCM"

Select "Misc. Functions"

Select "IMA Rapid Calibration Test" and follow the on screen instructions.

When complete, select "Finish"

Initialize EGS

From the "Home" screen, select "ECU View"

Select "PCM"

Select "Misc. Functions"

Select "Initialize EGS" and follow the on screen instructions.

When complete, select "Finish"

Injector Quantity Adjustment

From the "Home" screen, select "ECU View"

Select "PCM"

Select "Misc. Functions"

Select "Injector Quantity Adjustment" and follow the on screen instructions.

When complete, select "Finish"

Mobile DeSoot - NO Minimum Required Soot Load

From the "Home" screen, select "ECU View"

Select "PCM"

Select "Misc. Functions"

Select "Mobile DeSoot - NO Minimum Required Soot Load" and follow the on screen instructions.

When complete, select "Finish"

NOx Catalyst (New) Initialization

From the "Home" screen, select "ECU View"

Select "PCM"

Select "Misc. Functions"

Select "NOx Catalyst (New) Initialization" and follow the on screen instructions.

When complete, select "Finish"

PCM Replaced

The vehicle pin (Personal Identification Number) will be required to complete the routine. This information may be obtained in three ways:

1. The original selling invoice

2. DealerCONNECT > Parts > Key Codes
3. Contacting the District Manager.

From the "Home" screen, select "ECU View"

Select "WCM"

Select "Misc. Functions"

Select "PCM Replaced" and follow the on screen instructions.

When complete, select "Finish"

Program Variant Code

From the "Home" screen, select "ECU View"

Select "PCM"

Select "Misc. Functions"

Select "Program Variant Code" and follow the on screen instructions.

When complete, select "Finish"

Quicklearn

From the "Home" screen, select "ECU View"

Select "PCM"

Select "Misc. Functions"

Select "Quicklearn" and follow the on screen instructions.

When complete, select "Finish"

Reset Regenerative Filter Timers

From the "Home" screen, select "ECU View"

Select "PCM"

Select "Misc. Functions"

Select "Reset Regenerative Filter Times" and follow the on screen instructions.

When complete, select "Finish"

Set Oil Dilution Mass Value

From the "Home" screen, select "ECU View"

Select "PCM"

Select "Misc. Functions"

Select "Set Oil Dilution Mass Value" and follow the on screen instructions.
When complete, select "Finish"

SECTION 3 - AUTHORIZED MODIFICATION LABEL

NOTE: The following step is required by law when reprogramming a PCM and/or TCM.

Type the necessary information on the "Authorized Modification Label" and attach near the VECI label.

Fig. 18: Authorized Modification Label
Courtesy of CHRYSLER LLC

1. Powertrain Control / Transmission Control Module Part Numbers (Insert P/Ns) Used
2. Change Authority: TSB XX--XX
3. Dealer Code: XXXXX
4. Date: XX-XX-XX

REQUIRED TOOLS/EQUIPMENT:

PART NUMBER	StarSCAN®	PART NUMBER	StarMOBILE®
NPN	Battery Charger	NPN	Battery Charger
CH9401	StarSCAN® Tool Kit	CH9801	StarMOBILE® Tool Kit
CH9404	StarSCAN® Vehicle Cable	CH9804	StarMOBILE® Vehicle Cable
-	-	-	TechCONNECT PC or equivalent

TECH TIPS and INFORMATION:

1. StarMOBILE® Standalone Diagnostic Mode is an efficient way to flash ECUs without having direct access to a network connection. It involves first copying the flash file to the StarMOBILE® device which DOES require a network connection. Once the file has been copied to the StarMOBILE® device, it can be used in a Standalone mode to flash the ECU WITHOUT a network connection.
2. To use the StarMOBILE® in Pass-Through Mode requires that your StarMOBILE® is connected to the dealerships network via a wired or wireless connection. For more information on how to use the StarMOBILE in Pass-Through Mode see the StarMOBILE® training tutorials available on 'DealerCONNECT > Service > StarSCAN® and StarMOBILE® Tools > Training Aids' link or at www.dcctools.com, under the 'Training Aids' link.

- 3. StarMOBILE® does not need to be connected to a vehicle when retrieving a flash file for Standalone Mode.
- 4. Extreme care must be taken when programming a calibration into a generic PCM. Do not randomly select a calibration. Once a calibration is selected and programmed, the controller cannot be reprogrammed to a different calibration. The ECU can only be reprogrammed to a more recent version of that calibration.
- 5. If the flash process is interrupted or aborted, the flash should be restarted.
- 6. Due to the PCM / TCM programming procedure, a DTC may be set in other ECUs within the vehicle. Some DTCs may cause the MIL to illuminate. From the "Home" screen select "System View". Then select "All DTCs". Press "Clear All Stored DTCs" if there are any DTCs shown on the list.
- 7. Do not allow the battery charger to time out or the charging rate to climb above 13.5 volts during the flash process.
- 8. The StarSCAN® and StarMOBILE® diagnostic tools fully support Internet connectivity and must be configured for your dealership's network. For help on setting up your StarSCAN® / StarMOBILE® for the dealership's network, refer to the StarSCAN® / StarMOBILE® Quick Start Networking Guide available on 'DealerCONNECT > Service > StarSCAN® and StarMOBILE® Tools > Online Documentation' or at www.dcctools.com, under the download center.
- 9. The operating software in the StarSCAN® and StarMOBILE® must be programmed with the latest software release level. The software level is visible in the blue header at the top of the StarSCAN® and StarMOBILE® Desktop Client screens. For instructions on how to update your scan tool, refer to the StarSCAN® / StarMOBILE® Software Update guide available on 'DealerCONNECT > Service > StarSCAN® and StarMOBILE® Tools > Online Documentation' or at www.dcctools.com, under the download center.

PARTS REQUIRED

Qty	Part Number	DESCRIPTION
1	04275086AB	Label, Authorized Modification

REMOVAL

REMOVAL

Fig. 19: ENGINE CONTROL MODULE - DIESEL
Courtesy of CHRYSLER LLC

1. The ECM (Engine Control Module-Diesel) (4) is located in the engine compartment.
2. Disconnect negative battery cable.
3. Disconnect ECM electrical connectors (1).
4. Remove ECM mounting nuts (5).
5. Remove ECM (4) and bracket assembly (3) from vehicle.
6. Separate ECM (4) from bracket (3).

INSTALLATION

INSTALLATION

Fig. 20: ENGINE CONTROL MODULE - DIESEL
Courtesy of CHRYSLER LLC

1. Install ECM (4) to bracket (3).
2. Position ECM and bracket assembly to inner fender.
3. Install ECM mounting nuts (5). Tighten nuts to 20 N.m (177 in. lbs.) torque.
4. Check pin connectors in both the ECM and its electrical connectors for corrosion or damage. Also, the pin heights in connectors should all be same. Repair as necessary before installing connectors.
5. Connect ECM electrical connectors (1).
6. Connect negative battery cable.

CAUTION: Refer to PCM/ECM REPROGRAMMING for reprogramming procedures. If this step is not performed, a Diagnostic Trouble Code (DTC) will be set.

CAUTION: Use the scan tool to reprogram the new ECM with the vehicles original identification number (VIN) and the vehicles original mileage. If this step is not performed, a Diagnostic Trouble Code (DTC) will be set.

MODULE-FINAL DRIVE CONTROL

DESCRIPTION

FINAL DRIVE CONTROL MODULE

Fig. 21: FINAL DRIVE CONTROL MODULE
Courtesy of CHRYSLER LLC

The Final Drive Control Module (FDCM) is a microprocessor-based assembly controlling the Transfer Case. Communication is via the CAN serial bus. Inputs include user selectable 2WD and 4WD modes that include 2WD, 4WD AUTO, 4WD LOW and Neutral.

The FDCM has two electrical connectors and is installed inside the passenger compartment behind the driver side knee bolster and is mounted to the left kick panel. On RHD vehicles the FDCM is located in a mirrored position on the right side.

OPERATION

FINAL DRIVE CONTROL MODULE

During normal operation of an active transfer case the FDCM control module learns and remembers the Clutch Engagement Point (Kiss Point), the position in the motor actuator's travel where torque begins to be transferred to the front wheels. The position is read out using the encoder as a 0 to 5 volt signal. This information is written into the module's EEPROM area at Ignition OFF. Over time the clutch pack wears and the Kiss Point changes in one direction (going from a lower voltage to a higher value).

POWER UP/DOWN

The Final Drive Control Module (FDCM) will power up with an OFF/ON transition of the hard wired ignition switch input.

The FDCM will power down when the vehicle ignition switch transitions from ON to OFF or there are no system requirements that dictate the controller to remain active

START-UP DIAGNOSTICS

When the FDCM is activated, the internal circuitry will undergo a diagnostic procedure. The controller will examine all inputs and outputs for short circuits to ground, short circuits to battery and open circuits and will also verify proper CPU and memory operation. If a fault is detected, a message will be sent out over the CAN C bus to the Cluster indicating that service is recommended.

After passing all diagnostic tests, the controller will receive and process inputs and produce the appropriate outputs. Proper monitoring of the controller inputs and outputs performance will continue.

INPUTS/OUTPUTS

The following are inputs to the FDCM:

- Transfer Case Mode Sensor Signal
- 1 Direct Battery Feeds
- Ignition RUN Sense
- Sensor Ground
- Module Ground
- CAN C Bus

The following are outputs of the FDCM:

- Transfer Case Motor Brake Control (3022 only)
- 5V Sensor Supply
- Transfer Case Bi-directional Motor Control (A & B)
- Switched B+ Solenoid Supply
- Transfer Case Motor Brake Control

TRANSFER CASE RANGE SELECT SWITCH INPUT (NEUTRAL, 2WD, 4WD AUTO and 4WD LOW SELECT SWITCH)

The transfer case range select switch is hardwired directly to the Cluster (CCN). The switch position is read by the CCN and is communicated to the TIPM (Gateway) via the CAN-I bus. The TIPM then rebroadcasts this information onto the CAN-C bus where the FDCM is a receiver.

The Cluster (CCN) will support circuitry which interfaces to the system's Transfer Case Range Select Switch, including a Transfer Case Range Select Switch voltage supply and a Transfer Case Range Select Switch input. The purpose of this circuitry is to determine the mode currently being requested by the operator via the resistance ladder network in the shifter assembly, where the Transfer Case Range Select Switch is packaged.

The NEUTRAL Select Switch Input will provide the operator with the ability to place the Transfer Case in Neutral. The Select Switch Input will provide the operator with the ability to place the transfer case in 2WD, 4WD AUTO and 4WD LOW. The NEUTRAL Select Switch is a momentary pushpin switch and the 2WD, 4WD AUTO and 4WD LOW Select Switch is a 3-position toggle or a contact switch and both these switches are provided through a resistor network for diagnostic purposes. The input will have an internal 1.0K +/- 1% pull-up resistor to 5V.

As the selected position in the switch varies and/or the NEUTRAL Switch is depressed or not, the resistance

between the Cluster (CCN) voltage supply and Transfer Case Range Select Switches input will vary. Hardware, software, and calibrations within the Cluster will be provided that interpret the external resistance between the module's Transfer Case Range Select Switches voltage supply and Transfer Case Range Select Switches inputs as given in the table below:

NOTE: **There is no requirement for the FDCM to distinguish between a neutral request from the 4WD AUTO or the 4WD LOW position. Resistances in these ranges will be represented as a Neutral Switch Activation.**

TRANSFER CASE MODE SENSOR SIGNAL

The Transfer Case Mode Sensor Signal Input will provide the FDCM feedback about the position of the transfer case. The mode sensor will be a linear analog position sensor with a 1.4K +/- 20% potentiometer and a 1 K +/- 20% wiper resistor that converts the motor shaft position into a multiplexed voltage. The mode sensor (on the 3022 transfer case) is an active device where the sensor's current changes as the motor shaft position changes

TRANSFER CASE BI-DIRECTIONAL MOTOR CONTROL (A & B)

This output will control a Bi-directional DC motor that controls a clutch pack in the Transfer Case that varies the torque transfer between the front and rear axles.

MODES OF OPERATION

Normal Operation

This mode is achieved by the ignition being switched in the RUN position, which powers up the 5V regulator and generates the appropriate RESET for the microprocessor. This mode also includes any required power-up system checks.

Shut Down Mode

This mode is activated when the ignition switch turned to the off position. The FDCM will perform any required Shut Down tasks prior to turning off the 5V regulator.

Limp-In Mode

This mode is entered when the FDCM has detected an error condition that prevents the system from performing its' required task. The FDCM operation will vary depending from modified operation to total system shut down based on the failure that has occurred.

REMOVAL

REMOVAL

NOTE: **If the FDCM is being replaced it is necessary to perform the Quick Learn Procedure using the Scan Tool.**

NOTE: **The FDCM has two electrical connectors and is installed inside the passenger**

compartment behind the driver side knee bolster and is mounted to the left kick panel. On RHD vehicles the FDCM is located in a mirrored position on the right side.

81d6110a

2. Install the FDCM being certain the locking tabs (1) are secure.
3. Raise the drivers side knee bolster.

MODULE-HEATED SEAT

DESCRIPTION

MODULE, HEATED SEAT

Fig. 26: Identifying Heated Seat Module, Single Electrical Connector & Seat Pan
Courtesy of CHRYSLER LLC

The heated seat module (1) is located under the left front seat. It has a single electrical connector (2) and a push pin style retainer that secures it to the seat pan (3). The module can be accessed from under the front left seat with the seat in the full back and up position.

The heated seat module is a microprocessor designed to use the Local Interface Network (LIN) data bus messages from the instrument cluster, sometimes referred to as the Cab Compartment Node (CCN). The CCN receives inputs from the heated seat switches and in turn signals the heated seat module to operate the heated seat elements for both front seats.

OPERATION

MODULE-HEATED SEAT

The heated seat module operates on fused battery current received from the ignition switch. The module is grounded to the body at all times through the electrical connector. Inputs to the module include Local Interface Network (LIN) data bus messages and standard hardwired 12 volt power and ground. In response to the LIN inputs the heated seat module will control the battery current to the appropriate heated seat elements.

When a heated seat switch LIN data bus signal is received by the heated seat module, the module energizes the selected heated seat element. The Low heat set point is about 38° C (100.4° F), and the High heat set point is about 42° C (107.6° F).

In addition to operating the heated seat elements, the heated seat module sends LED illumination messages to the instrument cluster, sometimes referred to as the Cab Compartment Node (CCN) via the LIN data bus. The CCN then sends the LED illumination message to the accessory switch bank so that the appropriate LEDs are illuminated for any given heating level. Pressing the switch once will select high-level heating. Pressing the switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

If the heated seat module detects a heated seat element OPEN or SHORT circuit, it will record and store the appropriate Diagnostic Trouble Code (DTC).

DIAGNOSIS AND TESTING

HEATED SEAT MODULE

In order to obtain conclusive testing, the heated seat system and the Local Interface Network (LIN) data bus circuit must be checked. **Any diagnosis of the heated seat system should begin with, the use of a scan tool and the appropriate diagnostic service information.**

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

NOTE: Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.7v or above 15.5v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the heated seat system is attempted, the battery should be fully-charged.

REMOVAL

HEATED SEAT MODULE

Fig. 27: Locating Heated Seat Module
Courtesy of CHRYSLER LLC

CAUTION: The Heated Seat Module mounting tab can be damaged during module removal and installation. Use care to properly align tab to prevent binding that could result in tab breakage.

1. Position the right front seat to the full rearward position.
2. Disconnect and isolate the battery negative cable.
3. Disconnect the wire harness connector (4) from the heated seat module (3).
4. Unsnap the heated seat module retaining tab (2) from the seat pan (1).
5. Remove the heated seat module (3) from the vehicle.

INSTALLATION

HEATED SEAT MODULE

CAUTION: The Heated Seat Module mounting tab can be damaged during module removal and installation. Use care to properly align tab to prevent binding that could result in tab breakage.

Fig. 28: Locating Heated Seat Module
Courtesy of CHRYSLER LLC

1. Install the heated seat module (3) into the vehicle.
2. Position the retaining tab (2) with the mounting hole in the seat pan (1). Firmly apply even pressure to the module (3) until the mounting tab is fully seated.
3. Connect the wire harness connector (4) to the heated seat module (3).
4. Connect the battery negative cable.
5. Check for proper heated seat system operation.

MODULE-POWERTRAIN CONTROL

STANDARD PROCEDURE

PCM/ECM PROGRAMMING - GAS

PCM / TCM FLASH REPROGRAMING

This procedure will need to be done when one or more of the following situations are true:

1. A vehicle's Powertrain control module (PCM) has been replaced.
2. A diagnostic trouble code (DTC) is set "P1602 - PCM Not Programmed."
3. An updated calibration or software release is available for either the PCM or TCM ECUs.

This procedure assumes that the StarSCAN® and StarMOBILE® devices are configured to your dealership's network with either a wired or wireless connection. The StarSCAN® and StarMOBILE® must also be running at the latest operating system and software release level. For more help on how to network your StarSCAN® or StarMOBILE® reference the StarSCAN® / StarMOBILE® Quick Start Networking Guide available on 'DealerCONNECT > Service > StarSCAN® and StarMOBILE® Tools > Online Documentation' or at www.dcctools.com, under the Download Center.

TABLE OF CONTENTS

1. **SECTION 1 - PCM / TCM FLASH PROCEDURE.**
2. **REQUIRED TOOLS/EQUIPMENT:.**
3. **TECH TIPS and INFORMATION:.**
4. **PARTS REQUIRED.**

SECTION 1 - PCM / TCM FLASH PROCEDURE

If using StarSCAN® or StarMOBILE® Desktop Client. Go to **REPAIR PROCEDURE - Using StarSCAN® or StarMOBILE® Desktop Client.**

If using StarMOBILE® Standalone Diagnostic Mode. Go to **REPAIR PROCEDURE - Using StarMOBILE® Standalone Diagnostic Mode.**

REPAIR PROCEDURE - Using StarSCAN® or StarMOBILE® Desktop Client

NOTE: **If this flash process is interrupted or aborted, the flash should be restarted.**

1. Open the hood of the vehicle and install a battery charger. Verify that the charging rate provides a continuous charge of 13.2 - 13.5 volts.
2. Connect the StarSCAN® or StarMOBILE® to the vehicle data link connector located under the steering column and turn the ignition key to the "RUN" position.
3. Power on the StarSCAN® or StarMOBILE®. If the StarMOBILE® is being used, launch the StarMOBILE® Desktop Client and connect to the appropriate StarMOBILE® device.
4. Retrieve the old ECU part number. From the tool's Home screen,
 - a. Select "ECU View"

- b. Select "PCM"
 - c. Select "More Options"
 - d. Select "ECU Flash"
 - e. Record the part number at the top of the Flash PCM screen for later reference.
5. Program the ECU as follows:
- Using the StarSCAN® / StarMOBILE® at the Home screen, select "ECU View"
 - Select "PCM"
 - Select "More Options"
 - Select "ECU Flash"
 - Select "Browse for New File" and follow the on screen instructions.
 - Highlight the appropriate calibration based on the part number recorded in Step 4e, or by using Year/Model/Engine and appropriate emissions selection for the vehicle being worked on.

NOTE: If you are not connected to the vehicle, you may also search for flash files by selecting the "Flash Download" button from the Home screen.

- Select "Download to Scantool"
- Once the download is complete, select "Close" and then "Back"
- Highlight the listed calibration, select "Update Controller" and follow the on screen instructions.
- When the PCM update is complete, select "OK"
- Verify that the part number at the top of the Flash PCM screen has updated to the new part number.

NOTE: If this flash process is interrupted or aborted, the flash should be restarted.

6. Continue to **SECTION 2 - ADDITIONAL PCM / TCM REPLACEMENT PROCEDURES** to complete the process if the ECU has been replaced.
7. Type the necessary information on the "Authorized Modification Label" (p/n 04275086AB) and attach near the VECI label (See **SECTION 3 - AUTHORIZED MODIFICATION LABEL** for details).

REPAIR PROCEDURE - Using StarMOBILE® Standalone Diagnostic Mode

NOTE: StarMOBILE® Standalone Mode is an efficient way to flash ECUs without having direct access to a network connection. It involves first copying the flash file to the StarMOBILE® device which DOES require a network connection. Once the file has been copied to the StarMOBILE® device, it can be used in a Standalone mode to flash the ECU WITHOUT a network connection.

NOTE: StarMOBILE® does not need to be connected to a vehicle when retrieving a flash file for Standalone Mode.

1. Power on the StarMOBILE®. Launch the StarMOBILE® Desktop Client and connect to the tool.
2. At the Home screen, select "ECU View"
 - Select "PCM"
 - Select "More Options"
 - Select "ECU Flash"
 - Select "Browse for New File" and follow the on screen instructions.
 - Highlight the appropriate calibration based on the current ECU part number, or by using Year/Model/Engine and appropriate emissions selection for the vehicle being worked on.

NOTE: If you are not connected to the vehicle, you may also search for flash files by selecting the "Flash Download" button from the Home screen.

3. From the Flash File List, select the appropriate calibration for the PCM and select "Download to Client"
4. Once the download is complete, hit "OK" and then "Manage Files"

Fig. 29: Identifying StarMOBILE(R) Manage Files Screen (1 Of 2)
Courtesy of CHRYSLER LLC

5. In the Manage Files screen, highlight the downloaded flash file and select "Copy to SM Device". A green checkmark should now appear in the On SM Device column.

Courtesy of CHRYSLER LLC

- Exit the StarMOBILE® Desktop Client application.
- Open the hood of the vehicle and install a battery charger. Verify that the charging rate provides a continuous charge of 13.2 - 13.5 volts.
- Connect the StarMOBILE® to the vehicle data link connector located under the steering column and turn the ignition key to the "RUN" position.
- On the StarMOBILE® device, select "Enter Standalone Diagnostic Mode" (use the right function key).

81eed99e

Fig. 31: Identifying StarMOBILE(R) Screen For Enter Standalone Diagnostic Mode
Courtesy of CHRYSLER LLC

NOTE: If a StarMOBILE® Desktop Client is still associated with the device, you will receive the following error: "Your StarMOBILE® device is currently locked by a pc named 'xxxxxxx' on your network. To remove the lock, close its Desktop Client or reboot this device".

10. Program the ECU as follows:

- Select "ECU View"
- Select "PCM"
- Select "Flash ECU"

81eed9a3

Fig. 32: Programming ECU (1 Of 3)
Courtesy of CHRYSLER LLC

- Record the ECU part number at the very top of the screen for later reference.

Fig. 33: Programming ECU (2 Of 3)
Courtesy of CHRYSLER LLC

- Highlight the flash file that you want to use. Hit "SELECT" and then "OK". Follow the on screen instructions.

Fig. 34: Programming ECU (3 Of 3)
Courtesy of CHRYSLER LLC

- Once the flash is complete, verify that the part number at the top of the Flash PCM screen has updated to the new part number.

NOTE: **If this flash process is interrupted or aborted, the flash should be restarted.**

11. Continue to **SECTION 2 - ADDITIONAL PCM / TCM REPLACEMENT PROCEDURES** to complete the process if the ECU has been replaced.
12. Type the necessary information on the "Authorized Modification Label" (p/n 04275086AB) and attach

near the VECI label (See **SECTION 3 - AUTHORIZED MODIFICATION LABEL** for details).

SECTION 2 - ADDITIONAL PCM / TCM REPLACEMENT PROCEDURES

Find the PCM/TCM Type for the vehicle, read and write down the steps, and then go to the step by step instructions for additional information on how to perform these procedures. See **STEP-BY-STEP INSTRUCTIONS**.

If a NGC3 or NGC4 PCM was replaced, perform the following additional steps and/or routines:

1. PCM Replaced - if WCM equipped
2. Learn ETC - if ETC equipped
3. Check PCM Odometer
4. Check PCM VIN - if NOT WCM equipped
5. Quicklearn - if EATX equipped

If a GPEC PCM was replaced, perform the following additional steps and/or routines:

1. If the vehicle is equipped with a CVT, ensure that the TCM has the latest software calibration available (if the vehicle is not equipped with a CVT, skip to Step 3).
2. PCM Replaced - if WCM equipped
3. Learn ETC
4. Check PCM Odometer
5. Check PCM VIN - if NOT WCM equipped
6. TCM Quicklearn - if EATX equipped

If a CVT TCM was replaced, perform the following additional steps and/or routines:

1. Initialize CVT

If an EGS TCM was replaced, perform the following additional steps and/or routines:

1. Initialize EGS

STEP-BY-STEP INSTRUCTIONS

Check PCM Odometer

From the "Home" screen, select "ECU View".

Select "PCM"

Select "Misc. Functions"

Select "Check PCM Odometer" and follow the on screen instructions.

When complete, select "Finish".

Check PCM VIN

From the "Home" screen, select "ECU View"

Select "PCM"

Select "Misc. Functions"

Select "Check PCM VIN" and follow the on screen instructions.

When complete, select "Finish"

Initialize CVT

From the "Home" screen, select "ECU View"

Select "TCM"

Select "Misc. Functions"

Select "Initialize CVT" and follow the on screen instructions.

When complete, select "Finish"

Initialize EGS

From the "Home" screen, select "ECU View"

Select "TCM"

Select "Misc. Functions"

Select "Initialize EGS" and follow the on screen instructions.

When complete, select "Finish"

Learn ETC

From the "Home" screen, select "ECU View"

Select "PCM"

Select "Misc. Functions"

Select "Learn ETC" and follow the on screen instructions.

When complete, select "Finish"

PCM Replaced

The vehicle pin (Personal Identification Number) will be required to complete the routine. This information may be obtained in three ways:

1. The original selling invoice
2. DealerCONNECT > Parts > Key Codes
3. Contacting the District Manager.

From the "Home" screen, select "ECU View"

Select "WCM"

Select "Misc. Functions"

Select "PCM Replaced" and follow the on screen instructions.

When complete, select "Finish"

Quicklearn

From the "Home" screen, select "ECU View"

Select "PCM"

Select "Misc. Functions"

Select "Quicklearn" and follow the on screen instructions.

When complete, select "Finish"

Update CVT TCM

From the "Home" screen:

Select "ECU View"

Select "TCM"

Select "More Options"

Select "ECU Flash"

Select "Browse for New File" and follow the on screen instructions.

Highlight the appropriate calibration.

Select "Download to Scantool"

Once the download is complete, select "Close" and then "Back"

Highlight the listed calibration, select "Update Controller" and follow the on screen instructions.

When the TCM update is complete, select "OK"

Verify that the part number at the top of the "Flash TCM" screen has updated to the latest level.

SECTION 3 - AUTHORIZED MODIFICATION LABEL

NOTE: **The following step is required by law when reprogramming a PCM and/or TCM.**

Type the necessary information on the "Authorized Modification Label" and attach near the VECI label.

Fig. 35: Authorized Modification Label

CH9404	StarSCAN® Vehicle Cable	CH9804	StarMOBILE® Vehicle Cable
-	-	-	TechCONNECT PC or equivalent

TECH TIPS and INFORMATION:

1. StarMOBILE® Standalone Diagnostic Mode is an efficient way to flash ECUs without having direct access to a network connection. It involves first copying the flash file to the StarMOBILE® device which DOES require a network connection. Once the file has been copied to the StarMOBILE® device, it can be used in a Standalone mode to flash the ECU WITHOUT a network connection.
2. To use the StarMOBILE® in Pass-Through Mode requires that your StarMOBILE® is connected to the dealerships network via a wired or wireless connection. For more information on how to use the StarMOBILE in Pass-Through Mode see the StarMOBILE® training tutorials available on 'DealerCONNECT > Service > StarSCAN® and StarMOBILE® Tools > Training Aids' link or at www.dcctools.com, under the 'Training Aids' link.
3. StarMOBILE® does not need to be connected to a vehicle when retrieving a flash file for Standalone Mode.
4. Extreme care must be taken when programming a calibration into a generic PCM. Do not randomly select a calibration. Once a calibration is selected and programmed, the controller cannot be reprogrammed to a different calibration. The ECU can only be reprogrammed to a more recent version of that calibration.
5. If the flash process is interrupted or aborted, the flash should be restarted.
6. Due to the PCM / TCM programming procedure, a DTC may be set in other ECUs within the vehicle. Some DTCs may cause the MIL to illuminate. From the "Home" screen select "System View". Then select "All DTCs". Press "Clear All Stored DTCs" if there are any DTCs shown on the list.

7. When replacing a GPEC PCM for a vehicle that is equipped with a CVT, it is extremely important that the PCM and TCM both have the latest software calibrations.
8. Do not allow the battery charger to time out or the charging rate to climb above 13.5 volts during the flash process.
9. The StarSCAN® and StarMOBILE® diagnostic tools fully support Internet connectivity and must be configured for your dealership's network. For help on setting up your StarSCAN® / StarMOBILE® for the dealership's network, refer to the StarSCAN® / StarMOBILE® Quick Start Networking Guide available on 'DealerCONNECT > Service > StarSCAN® and StarMOBILE® Tools > Online Documentation' or at www.dcctools.com, under the download center.
10. The operating software in the StarSCAN® and StarMOBILE® must be programmed with the latest software release level. The software level is visible in the blue header at the top of the StarSCAN® and StarMOBILE® Desktop Client screens. For instructions on how to update your scan tool, refer to the StarSCAN® / StarMOBILE® Software Update guide available on 'DealerCONNECT > Service > StarSCAN® and StarMOBILE® Tools > Online Documentation' or at www.dcctools.com, under the download center.

REMOVAL

REMOVAL

Fig. 36: PCM LOCATION - LEFT HAND DRIVE
 Courtesy of CHRYSLER LLC

Fig. 37: PCM LOCATION - RIGHT HAND DRIVE
Courtesy of CHRYSLER LLC

1. The PCM (Powertrain Control Module) (3-Right Hand Drive), or (3-Left Hand Drive) is located in the engine compartment.
2. Disconnect negative battery cable.
3. Disconnect PCM electrical connectors (5-Right Hand Drive), or (4-Left Hand Drive).
4. Remove PCM mounting screws (4-Right Hand Drive), or (5-Left Hand Drive).
5. Remove PCM (3-Right Hand Drive), or (3-Left Hand Drive) from vehicle.

INSTALLATION

INSTALLATION

Fig. 38: PCM LOCATION - LEFT HAND DRIVE
 Courtesy of CHRYSLER LLC

Fig. 39: PCM LOCATION - RIGHT HAND DRIVE
 Courtesy of CHRYSLER LLC

1. The PCM (Powertrain Control Module) (3-Right Hand Drive), or (3-Left Hand Drive) is located in the engine compartment.
2. Position PCM (3-Right Hand Drive), or (3-Left Hand Drive) to vehicle.
3. Install PCM mounting screws (4-Right Hand Drive), or (5-Left Hand Drive). Tighten screws to 8 N.m (71 in. lbs.) torque.
4. Connect PCM electrical connectors (5-Right Hand Drive), or (4-Left Hand Drive).
5. Connect negative battery cable.

CAUTION: Refer to PCM/ECM REPROGRAMMING for reprogramming procedures. If this step is not performed, a Diagnostic Trouble Code (DTC) will be set.

CAUTION: Use the scan tool to reprogram the new PCM with the vehicles original identification number (VIN) and the vehicles original mileage. If this step is not performed, a Diagnostic Trouble Code (DTC) will be set.

MODULE-STEERING CONTROL

DESCRIPTION

STEERING CONTROL MODULE

817a5c62

Fig. 40: Steering Control Module
Courtesy of CHRYSLER LLC

This vehicle is equipped with a Steering Control Module (SCM) that is internal to the left multi-function switch housing (2). The left (lighting) multi-function switch is located on the left side of the steering column, just below the steering wheel. This switch is the primary control for the interior and exterior lighting systems. The only visible components of the switch are the control stalk (1), control knob and control sleeve that extend through the steering column shrouds on the left side of the column. The remainder of the switch including its mounting provisions and electrical connections are concealed beneath the shrouds.

The switch housing and controls are constructed of molded black plastic. A single screw (7) through a mounting tab integral to the back of the switch housing, and a slide tab integral to the bottom of the switch housing secure the switch to the mounting bracket integral to the clockspring (3). A connector receptacle containing seven terminal pins is integral to the inboard end of the switch housing and connects the SCM through a jumper wire harness (5) directly to the right (wiper) multi-function switch (6). A second connector receptacle containing four terminal pins is integral to the back of the switch housing and connects the SCM to the vehicle electrical system.

through a dedicated takeout and connector of the instrument panel wire harness.

The SCM cannot be adjusted or repaired. If ineffective or damaged the entire left multi-function switch must be replaced. Refer to **REMOVAL** . The clockspring (with the multi-function switch mounting bracket), the left multi-function switch (with the SCM), the right multi-function switch and the jumper wire harness are each available for separate service replacement.

OPERATION

STEERING CONTROL MODULE

The microprocessor-based Steering Control Module (SCM) utilizes integrated circuitry to monitor hard wired analog and multiplexed inputs from both the right and left multi-function switches. In response to those inputs, the internal circuitry of the SCM allow it to transmit electronic message outputs to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over the Local Interface Network (LIN) data bus.

In response to those inputs the internal circuitry and programming of the EMIC, which is also the LIN master module in the vehicle, allow it to control and integrate many electronic functions and features of the vehicle through both hard wired outputs and the transmission of electronic message outputs to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. See **DESCRIPTION**.

The SCM is connected to both a fused B(+) circuit and a fused ignition switch output (run-start) circuit. It receives a path to ground at all times. These connections allow it to remain functional regardless of the ignition switch position. Any input to the SCM that controls a vehicle system function that does not require that the ignition switch be in the ON position such as turning on the lights, prompts the SCM to wake up and transmit on the LIN data bus.

The hard wired circuits between components related to the SCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SCM or the electronic controls or communication between modules and other devices that provide some features of the SCM. The most reliable, efficient, and accurate means to diagnose the SCM or the electronic controls and communication related to SCM operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

STEERING CONTROL MODULE

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground)

cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired circuits between components related to the Steering Control Module (SCM) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SCM or the electronic controls or communication between modules and other devices that provide some features of the SCM. The most reliable, efficient, and accurate means to diagnose the SCM or the electronic controls and communication related to SCM operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

MODULE-TRANSMISSION CONTROL

DESCRIPTION

TRANSMISSION CONTROL MODULE - DIESEL ENGINE

Fig. 41: NAG1 TCM
Courtesy of CHRYSLER LLC

1 - TCM

If the vehicle is equipped with a NAG1 transmission the TCM (1) is a separate module located behind the drivers knee bolster to the right of the steering column. The TCM uses the Controller Area Network (CAN) C

high-speed intra-vehicle communications network to deliver commands to the transmission and monitor operations. A module on the automatic transmission shifter communicates range selection data to the transmission, also using the CAN-C network. This information is also displayed in the instrument cluster.

TRANSMISSION CONTROL MODULE - GASOLINE ENGINES

81a9792e

Fig. 42: PCM (NGC4)
Courtesy of CHRYSLER LLC

1 - PCM

The Transmission Control Module (TCM) is a sub-module within the Powertrain Control Module (PCM) (1). The PCM is located on the right inner fender. The NGC IV (fourth-generation) Powertrain Control Module (PCM) provides integrated electronic control of all transmission functions.

Fig. 43: NAG1 TCM
Courtesy of CHRYSLER LLC

1 - TCM

If the vehicle is equipped with a NAG1 transmission the TCM (1) is a separate module located behind the drivers knee bolster to the right of the steering column.

OPERATION

OPERATION-TCM- DIESEL ENGINE

The transmission control module (TCM) determines the current operating conditions of the vehicle and controls the shifting process for shift comfort and driving situations. It receives this operating data from sensors and broadcast messages from other modules.

The TCM uses inputs from several sensors that are directly hardwired to the controller and it uses several indirect inputs that are used to control shifts. This information is used to actuate the proper solenoids in the valve body to achieve the desired gear.

The shift lever sensor assembly (SLSA) has sensors that are monitored by the TCM to calculate shift lever position. The reverse light switch, an integral part of the SLSA, controls the reverse light relay control circuit. The Brake/Transmission Shift Interlock (BTSI) solenoid and the park lockout solenoid (also part of the SLSA) are controlled by the TCM.

The ECM and ABS broadcast messages over the controller area network (CAN C) bus for use by the TCM. The TCM uses this information, with other inputs, to determine the transmission operating conditions.

The TCM:

- determines the momentary operating conditions of the vehicle.

controls all shift processes.

considers shift comfort and the driving situation.

The TCM controls the solenoid valves for modulating shift pressures and gear changes. Relative to the torque being transmitted, the required pressures are calculated from load conditions, engine rpm, vehicle speed, and ATF temperature.

The following functions are contained in the TCM:

Shift Program.

Downshift Safety.

Torque Converter Lock-Up Clutch.

Adaptation.

This transmission does not have a TCM relay. Power is supplied to the SLSA and the TCM directly from the ignition.

The TCM continuously checks for electrical problems, mechanical problems, and some hydraulic problems. When a problem is sensed, the TCM stores a diagnostic trouble code (DTC). Some of these codes cause the transmission to go into "Limp-In" or "default" mode. Some DTCs cause permanent Limp-In and others cause temporary Limp-In. The NAG1 defaults in the current gear position if a DTC is detected, then after a key cycle the transmission will go into Limp-in, which is mechanical 2nd gear. Some DTCs may allow the transmission to resume normal operation (recover) if the detected problem goes away. A permanent Limp-In DTC will recover when the key is cycled, but if the same DTC is detected for three key cycles the system will not recover and the DTC must be cleared from the TCM with the scan tool.

TCM SIGNALS

The TCM registers one part of the input signals by direct inputs, the other part by CAN C bus. In addition to the direct control of the actuators, the TCM sends various output signals by CAN C bus to other control modules.

Selector Lever Position

A series of 12 Hall-effect switches in the SLSA inform the TCM of the position of the selector lever.

The TCM monitors the SLSA for all shift lever positions through five position circuits. The SLSA provides a low-current 12-volt signal to the TCM. The TCM compares the on/off signals to programmed combinations to determine the exact position of the shift lever.

ATF Temperature Sensor

The ATF temperature sensor is a positive temperature co-efficient (PTC) thermistor. It measures the temperature of the transmission fluid and is a direct input signal for the TCM. The temperature of the ATF has an influence on the shift time and resulting shift quality. As the temperature rises, resistance rises, and therefore, the probing voltage is decreasing. Because of its registration, the shifting process can be optimized in all temperature ranges.

The ATF temperature sensor is wired in series with the park/neutral contact. The temperature signal is transmitted to the TCM only when the reed contact of the park/neutral contact is closed because the TCM only reads ATF temperature while in any forward gear, or REVERSE. When the transmission is in PARK or NEUTRAL, the TCM will substitute the engine temperature for the ATF temperature.

Starter Interlock

The TCM monitors a contact switch wired in series with the transmission temperature sensor to determine PARK and NEUTRAL positions. The contact switch is open in PARK and NEUTRAL. The TCM senses transmission temperature as high (switch supply voltage), confirming switch status as open. The TCM then broadcasts a message over CAN bus to confirm switch status. The PCM receives this information and allows operation of the starter circuit.

N2 and N3 Speed Sensors

The N2 and N3 Input Speed Sensors are two Hall-effect speed sensors that are mounted internally in the transmission and are used by the TCM to calculate the transmission's input speed. Since the input speed cannot be measured directly, two of the drive elements are measured. Two input speed sensors were required because both drive elements are not active in all gears.

CAN C Bus Indirect Input Signals

A 2.5-volt bias (operating voltage) is present on the CAN C bus any time the ignition switch is in the RUN position. Both the TCM and the ABS apply this bias. On this vehicle, the CAN C bus is used for module data exchange only. The indirect inputs used on the NAG1 electronic control system are:

- Wheel Speed Sensors.

- Transfer Case Switch Status.

- Brake Switch.

- Engine RPM.

- Engine Temperature.

- Cruise Control Status.

- Gear Limit Request.

- Throttle Position - 0% at idle, 100% at WOT. If open, TCM assumes idle (0% throttle opening).

- Odometer Mileage

- Maximum Effective Torque.

- Engine in Limp-In Mode/Mileage Where DTC Was Set.

SHIFT SCHEDULES

The basic shift schedule includes up and downshifts for all five gears. The TCM adapts the shift program according to driving style, accelerator pedal position and deviation of vehicle speed. Influencing factors are:

- Road Conditions.

- Incline, Decline and Altitude.

Trailer Operation, Loading.
Engine Coolant Temperature.
Cruise Control Operation.
Sporty Driving Style.
Low and High ATF Temperature.

Upshift To:	1-2	2-3	3-4	4-5
Activated By Solenoid:	1-2/4-5	2-3	3-4	1-2/4-5
Shift Point (at 35.2% of throttle)	17.8 km/h (11.6 mph)	32.1 km/h (19.95 mph)	67.5 km/h (41.94 mph)	73.8 km/h (45.86 mph)

Downshift From:	5-4	4-3	3-2	2-1
Activated By Solenoid:	1-2/4-5	3-4	2-3	1-2/4-5
Shift Point	55.7 km/h (34.61 mph)	40.5 km/h (25.17 mph)	24.4 km/h (15.16 mph)	15.1 km/h (9.38 mph)

DOWNSHIFT SAFETY

Selector lever downshifts are not performed if inadmissible high engine RPM is sensed.

ADAPTATION

To equalize tolerances and wear, an automatic adaptation takes place for:

Shift Time.
Clutch Filling Time.
Clutch Filling Pressure.
Torque Converter Lock-Up Control.

Adaptation data may be stored permanently and to some extent, can be diagnosed.

Driving Style Adaptation

The shift point is modified in steps based on the information from the inputs. The control module looks at inputs such as:

vehicle acceleration and deceleration (calculated by the TCM).
rate of change as well as the position of the throttle pedal (fuel injection information from the ECM).
lateral acceleration (calculated by the TCM).
gear change frequency (how often the shift occurs).

Based on how aggressive the driver is, the TCM moves up the shift so that the present gear is held a little longer

before the next upshift. If the driving style is still aggressive, the shift point is modified up to ten steps. If the driving returns to normal, then the shift point modification also returns to the base position.

This adaptation has no memory. The adaptation to driving style is nothing more than a shift point modification meant to assist an aggressive driver. The shift points are adjusted for the moment and return to base position as soon as the inputs are controlled in a more rational manner.

Shift Time Adaptation (Shift Overlap Adaptation, Working Pressure)

Shift time adaptation is the ability of the TCM to electronically alter the time it takes to go from one gear to another. Shift time is defined as the time it takes to disengage one shift member while another is being applied. Shift time adaptation is divided into four categories:

Accelerating upshift, which is an upshift under a load. For shift time adaptation for the 1-2 upshift to take place, the transmission must shift from 1st to 2nd in six different engine load ranges vs. transmission output speed ranges.

Decelerating upshift, which is an upshift under no load. This shift is a rolling upshift and is accomplished by letting the vehicle roll into the next gear.

Accelerating downshift, which is a downshift under load. This shift can be initiated by the throttle, with or without kickdown. The shift selector can also be used.

Decelerating downshift, which is accomplished by coasting down. As the speed of the vehicle decreases, the transmission downshifts.

Fill Pressure Adaptation (Apply Pressure Adaptation, Modulating Pressure)

Fill pressure adaptation is the ability of the TCM to modify the pressure used to engage a shift member. The value of this pressure determines how firm the shift will be.

If too much pressure is used, the shift will be hard.

If too little pressure is used, the transmission may slip.

The pressure adjustment is needed to compensate for the tolerances of the shift pressure solenoid valve. The amount the solenoid valve opens as well as how quickly the valve can move, has an effect on the pressure. The return spring for the shift member provides a resistance that must be overcome by the pressure in order for shift member to apply. These return springs have slightly different values. This also affects the application pressure and is compensated for by fill pressure adaptation.

Fill Time Adaptation (Engagement Time Adaptation)

Fill time is the time it takes to fill the piston cavity and take up any clearances for a friction element (clutch or brake). Fill time adaptation is the ability of the TCM to modify the time it takes to fill the shift member by applying a preload pressure.

CONTROLLER MODES OF OPERATION

Permanent Limp-In Mode

When the TCM determines there is a non-recoverable condition present that does not allow proper transmission operation, it places the transmission in permanent Limp-In Mode. When the condition occurs the TCM turns off all solenoids as well as the solenoid supply output circuit. If this occurs while the vehicle is moving, the transmission remains in the current gear position until the ignition is turned off or the shifter is placed in the "P" position. When the shifter has been placed in "P," the transmission only allows 2nd gear operation. If this occurs while the vehicle is not moving, the transmission only allows operation in 2nd gear.

Temporary Limp-In Mode

This mode is the same as the permanent Limp-In Mode except if the condition is no longer present, the system resumes normal operation.

Under Voltage Limp-In Mode

When the TCM detects that system voltage has dropped below 8.5 volts, it disables voltage-dependant diagnostics and places the transmission in the temporary Limp-In Mode. When the TCM senses that the voltage has risen above 9.0 volts, normal transmission operation is resumed.

Hardware Error Mode

When the TCM detects a major internal error, the transmission is placed in the permanent Limp-In Mode and ceases all communication over the CAN bus. When the TCM has entered this mode normal transmission operation does not resume until all DTCs are cleared from the TCM.

Loss of Drive

If the TCM detects a situation that has resulted or may result in a catastrophic engine or transmission problem, the transmission is placed in the neutral position. Improper Ratio, Input Sensor Overspeed or Engine Overspeed DTCs cause the loss of drive.

Controlled Limp-in Mode

When a failure does not require the TCM to shut down the solenoid supply, but the failure is severe enough that the TCM places the transmission into a predefined gear, there are several shift performance concerns. For instance, if the transmission is slipping, the controller tries to place the transmission into 3rd gear and maintain 3rd gear for all forward drive conditions.

TRANSMISSION CONTROL MODULE - GASOLINE ENGINES

The TCM is the controlling unit for all electronic operations of the transmission. The TCM receives information regarding vehicle operation from both direct and indirect inputs, and selects the operational mode of the transmission. Direct inputs are hard-wired to, and used specifically by the TCM. Indirect inputs originate from other components/modules, and are shared with the TCM via the CAN bus.

Some examples of **direct inputs** to the TCM are:

- Battery (B+) voltage
- Ignition "ON" voltage

Transmission Control Relay (Switched B+)
Throttle Position Sensor
Crankshaft Position sensor (CKP)
Transmission Range Sensor (TRS)
Pressure Switches (L/R, 2/4, OD)
Transmission Temperature Sensor (TTS) (Integral to TRS)
Input Shaft Speed Sensor
Output Shaft Speed Sensor

Some examples of **indirect inputs** to the TCM are:

Engine/Body Identification
Manifold Pressure
Target Idle
Torque Reduction Confirmation
Speed Control ON/OFF Switch
Engine Coolant Temperature
Ambient/Battery Temperature
Brake Switch Status
Scan Tool Communication

Based on the information received from these various inputs, the TCM determines the appropriate shift schedule and shift points, depending on the present operating conditions and driver demand. This is possible through the control of various direct and indirect outputs.

Some examples of TCM **direct outputs** are:

Transmission Control Relay
Solenoids (L/R, 2/4, OD and UD)
Vehicle Speed (to PCM)
Torque Reduction Request (to PCM)

Some examples of TCM **indirect outputs** are:

Transmission Temperature (to PCM)
PRNDL Position (to CCN)

In addition to monitoring inputs and controlling outputs, the TCM has other important responsibilities and functions:

Storing and maintaining Clutch Volume Indices (CVI)
Storing and selecting appropriate Shift Schedules

System self-diagnostics

Diagnostic capabilities (with scan tool)

NOTE: **If the TCM has been replaced, the "Quick Learn Procedure" must be performed. See STANDARD PROCEDURE.**

CLUTCH VOLUME INDEX (CVI)

An important function of the TCM is to monitor Clutch Volume Index (CVI). CVIs represent the volume of fluid needed to compress a clutch pack.

The TCM monitors gear ratio changes by monitoring the Input and Output Speed Sensors. The Input, or Turbine Speed Sensor sends an electrical signal to the TCM that represents input shaft rpm. The Output Speed Sensor provides the TCM with output shaft speed information.

By comparing the two inputs, the TCM can determine transmission gear position. This is important to the CVI calculation because the TCM determines CVIs by monitoring how long it takes for a gear change to occur. See **Fig. 44**.

TCM

THE TCM TIMES HOW LONG
IT TAKES TO COMPRESS
THE CLUTCH PACK TO
CHANGE THE GEAR RATIO

- 1 - OUTPUT SPEED SENSOR
- 2 - OUTPUT SHAFT
- 3 - CLUTCH PACK
- 4 - SEPARATOR PLATE
- 5 - FRICTION DISCS
- 6 - INPUT SHAFT
- 7 - INPUT SPEED SENSOR
- 8 - PISTON AND SEAL

Gear ratios can be determined by using the scan tool and reading the Input/Output Speed Sensor values in the "Monitors" display. Gear ratio can be obtained by dividing the Input Speed Sensor value by the Output Speed Sensor value.

For example, if the input shaft is rotating at 1000 rpm and the output shaft is rotating at 500 rpm, then the TCM can determine that the gear ratio is 2:1. In direct drive (3rd gear), the gear ratio changes to 1:1. The gear ratio changes as clutches are applied and released. By monitoring the length of time it takes for the gear ratio to change following a shift request, the TCM can determine the volume of fluid used to apply or release a friction element.

The volume of transmission fluid needed to apply the friction elements are continuously updated for adaptive controls. As friction material wears, the volume of fluid need to apply the element increases.

Certain mechanical problems within the input clutch assembly (broken return springs, out of position snap rings, excessive clutch pack clearance, improper assembly, etc.) can cause inadequate or out-of-range element volumes. Also, defective Input/Output Speed Sensors and wiring can cause these conditions. The following chart identifies the appropriate clutch volumes and when they are monitored/updated:

CLUTCH VOLUMES				
Clutch	When Updated			Proper Clutch Volume
	Shift Sequence	Oil Temperature	Throttle Angle	
L/R	2-1 or 3-1 coast downshift	> 21° C (70° F)	< 5°	35 to 83
2/4	1-2 shift	> 43° C (110° F)	5 - 54°	20 to 77
OD	2-3 shift			48 to 150
UD	4-3 or 4-2 shift		> 5°	24 to 70

SHIFT SCHEDULES

As mentioned earlier, the TCM has programming that allows it to select a variety of shift schedules. Shift schedule selection is dependent on the following:

- Shift lever position
- Throttle position
- Engine load
- Fluid temperature
- Software level

As driving conditions change, the TCM appropriately adjusts the shift schedule. Refer to the **42RLE SHIFT SCHEDULE** table to determine the appropriate operation expected, depending on driving conditions.

42RLE SHIFT SCHEDULE

Schedule	Condition	Expected Operation
Extreme Cold	Oil temperature at start-up below -27° C (-16° F)	Park, Reverse, Neutral and 2nd gear only (prevents shifting which

		may fail a clutch with frequent shifts)
Cold	Oil temperature at start-up above -25° C (-12° F) and below 2° C (36° F)	- Delayed 2-3 upshift (approximately 22-31 mph) - Delayed 3-4 upshift (45-53 mph) - Early 4-3 coastdown shift (approximately 30 mph) - Early 3-2 coastdown shift (approximately 17 mph) - High speed 4-2, 3-2, 2-1 kickdown shifts are prevented - No EMCC
Warm	Oil temperature at start-up above 2° C (36° F) and below 27° C (80° F)	- Normal operation (upshift, kickdowns, and coastdowns) - No EMCC
Hot	Oil temperature at start-up above 27° C (80° F)	- Normal operation (upshift, kickdowns, and coastdowns) - Full EMCC, no PEMCC except to engage FEMCC (except at closed throttle at speeds above 70-83 mph)
Overheat	Oil temperature above 115° C (240° F) or engine coolant temperature above 118° C (244° F)	- Delayed 2-3 upshift (25-32 mph) - Delayed 3-4 upshift (41-48 mph) - 3rd gear FEMCC from 30-48 mph - 3rd gear PEMCC from 27-31 mph
Super Overheat	Oil temperature above 127° C (260° F)	- All "Overheat" shift schedule features apply - 2nd gear PEMCC above 22 mph - Above 22 mph the torque converter will not unlock unless the throttle is closed or if a wide open throttle 2nd PEMCC to 1 kickdown is made

STANDARD PROCEDURE

DRIVE LEARN - RFE

When a transmission is repaired and a Quick Learn procedure has been performed on the Transmission Control Module (TCM), the following Drive Learn procedure can be performed to fine tune any shifts which are particularly objectionable.

NOTE: It is not necessary to perform the complete Drive Learn procedure every time

the TCM is Quick Learned. Perform only the portions which target the objectionable shift.

LEARN A SMOOTH 1ST NEUTRAL TO DRIVE SHIFT

Perform this procedure only if the complaint is for a delayed or harsh shift the first time the transmission is put into gear after the vehicle is allowed to set with the engine not running for at least 10 minutes. Use the following steps to have the TCM learn the 1st N-D UD CVI.

NOTE: The transmission oil temperature must be between 27-43° C (80-110° F).

1. Start the engine only when the engine and ignition have been off for at least ten (10) minutes.
2. With the vehicle at a stop and the service brake applied, record the 1st N-D UD CVI while performing a Neutral to Drive shift. The 1st N-D UD CVI accounts for air entrapment in the UD clutch that may occur after the engine has been off for a period of time.
3. Repeat step 1 and step 2 until the recorded 1st N-D UD CVI value stabilizes.

NOTE: It is important that this procedure be performed when the transmission temperature is between 27-43° C (80-110° F). If this procedure takes too long to complete fully for the allowed transmission oil temperature, the vehicle may be returned to the customer with an explanation that the shift will improve daily during normal vehicle usage. The TCM also learns at higher oil temperatures, but these values (line pressure correction values) are not available for viewing on the scan tool.

LEARN A SMOOTH NEUTRAL TO DRIVE GARAGE SHIFT

Perform this procedure if the complaint is for a delayed or harsh shift when the transmission is put into gear after the vehicle has had its first shift. Use the following steps to have the TCM learn the Norm N-D UD CVI.

NOTE: The transmission oil temperature must be between 27-43° C (80-110° F) to learn the UD CVI. Additional learning occurs at temperatures as low as -18° C (0° F) and as high as 93° C (200° F). This procedure may be performed at any temperature that experiences poor shift quality. Although the UD CVI may not change, shift quality should improve.

1. Start the vehicle engine and shift to drive.
2. Move the vehicle forward to a speed of at least 16 km/h (10 MPH) and come to a stop. This ensures no air is present in the UD hydraulic circuit.
3. Perform repeated N-D shifts at a stop while pausing in Neutral for at least 2-3 seconds and monitor Norm N-D UD CVI volume until the value stabilizes. The value will change during the N-D shift. This is normal since the UD value is different for the N-D shift then the normal value shown which is used for 4-3 coastdown and kickdowns. Perform repeated shifts in this temperature range until the Norm N-D UD CVI value stabilizes and the N-D shifts become smooth.

LEARN THE 1ST 2-3 SHIFT AFTER A RESTART OR SHIFT TO REVERSE

Use the following steps to have the TCM learn the 1st 2-3 shift OD CVI.

NOTE: The transmission oil temperature must be above 27° C (80° F).

1. With the vehicle engine running, select reverse gear for over 2 seconds.
2. Shift the transmission to Drive and accelerate the vehicle from a stop at a steady 15 degree throttle opening and perform a 2-3 shift while noting the 1st 2-3 OD CVI.
3. Repeat step 1 and step 2 until the 1st 2-3 upshift becomes smooth and the 1st 2-3 OD CVI stabilizes.

LEARN A SMOOTH 2-3 AND 3-4 UPSHIFT

NOTE: The transmission oil temperature must be above 43° C (110° F).

Use the following steps to have the TCM learn the OD and 4C CVI's.

1. Accelerate the vehicle from a stop at a steady 15 degree throttle opening and perform multiple 1-2, 2-3, and 3-4 upshifts. The 2nd 2-3 shift following a restart or shift to reverse will be shown during the shift as a value between the 1st 2-3 OD CVI and the normal OD CVI. Updates to the normal OD CVI will occur after the 2nd shift into 3rd gear, following a restart or shift to reverse.
2. Repeat step 1 until the 2-3 and 3-4 shifts become smooth and the OD and 4C CVI become stable.

LEARN A SMOOTH 4-3 COASTDOWN AND PART THROTTLE 4-3 KICKDOWN

NOTE: The transmission oil temperature must be above 43° C (110° F).

Use the following steps to have the TCM learn the UD shift volume.

1. At a vehicle speed between 64-97 km/h (40-60 mph), perform repeated 4-3 kickdown shifts.
2. Repeat step 1 until the UD volume becomes somewhat stable and the shift becomes smooth.

LEARN A SMOOTH 1-2 UPSHIFT AND 3-2 KICKDOWN

Use the following steps to have the TCM learn the 2C shift volume.

NOTE: The transmission oil temperature must be above 43° C (110° F).

1. With a vehicle speed below 48 km/h (30 mph) and the transmission in 3rd gear, perform multiple 3-2 kickdowns.
2. Repeat step 1 until the 3-2 kickdowns become smooth and the 2C CVI becomes stable.

LEARN A SMOOTH MANUAL 2-1 PULLDOWN SHIFT AS WELL AS A NEUTRAL TO REVERSE SHIFT

NOTE: The transmission oil temperature must be above 43° C (110° F).

Use the following steps to have the TCM learn the LR volume.

1. With the vehicle speed around 40-48 km/h (25-30 mph) in Manual 2nd, perform manual pulldowns to Low or 1st gear at closed throttle.
2. Repeat step 1 until the LR CVI becomes stable and the manual 2-1 becomes smooth.

LEARN A SMOOTH NEUTRAL TO REVERSE SHIFT

NOTE: The transmission oil temperature must be above 43° C (110° F).

1. With the vehicle at a stop, perform Neutral to Reverse shifts until the shift is smooth. An unlearned Neutral to Reverse shift may be harsh or exhibit a double bump.
2. If any of the shifts are still not smooth after the clutch volume stabilizes, an internal transmission problem may be present.

LEARN A SMOOTH 4-5 UPSHIFT

NOTE: The transmission oil temperature must be above 43° C (110° F).

Use the following steps to have the TCM learn the Alt 2C CVI.

1. Accelerate the vehicle through 88 km/h (55 mph) at a steady 10-15 degree throttle opening and perform multiple 4-5 upshifts.
2. Repeat step 1 until the 4-5 shift become smooth and the Alt 2C CVI become stable. There is a separate 2C volume used and learned for 4-5 shifts, 2CA. It is independent of the 2C CVI learned on 3-2 kickdowns.

TCM QUICK LEARN

The quick learn procedure requires the use of the scan tool.

This program allows the electronic transmission system to recalibrate itself. This will provide the proper transmission operation. The quick learn procedure should be performed if any of the following procedures are performed:

Transmission Assembly Replacement
Transmission Control Module Replacement
Solenoid Pack Replacement
Clutch Plate and/or Seal Replacement
Valve Body Replacement or Recondition

To perform the Quick Learn Procedure, the following conditions must be met:

The brakes must be applied
The engine speed must be above 500 rpm
The throttle angle (TPS) must be less than three degrees

The shift lever position must stay in PARK until prompted to shift to overdrive

The shift lever position must stay in overdrive after the Shift to Overdrive prompt until the scan tool indicates the procedure is complete.

The calculated oil temperature must be above 16° C (60° F) and below 93° C (200° F).

4. **The vapor/vacuum lines and hoses must be firmly connected. Also check the vapor/vacuum lines at the ESIM switch and filter for damage or leaks. If a leak is present, a Diagnostic Trouble Code (DTC) may be set.**

CAP-FUEL FILLER

DESCRIPTION

FUEL TANK FILLER TUBE CAP

The plastic fuel tank filler tube cap is threaded onto the end of the fuel fill tube. All models are equipped with a 1/4 turn cap.

OPERATION

FUEL TANK FILLER TUBE CAP

The loss of any fuel or vapor out of fuel filler tube is prevented by the use of a pressure-vacuum fuel fill cap. Relief valves inside the cap will release fuel tank pressure at predetermined pressures. Fuel tank vacuum will also be released at predetermined values. This cap must be replaced by a similar unit if replacement is necessary. This is in order for the system to remain effective.

CAUTION: Remove fill cap before servicing any fuel system component to relieve tank pressure. If equipped with an ORVR system and an ESIM switch, the cap must be tightened securely. If cap is left loose, a Diagnostic Trouble Code (DTC) may be set.

ORVR

DESCRIPTION

ORVR

The ORVR (On-Board Refueling Vapor Recovery) system consists of a unique fuel tank, flow management valve, fluid control valve, one-way check valve and vapor canister.

OPERATION

ORVR

The ORVR (On-Board Refueling Vapor Recovery) system is used to remove excess fuel tank vapors. This is done while the vehicle is being refueled.

Fuel flowing into the fuel filler tube (approx. 1" I.D.) creates an aspiration effect drawing air into the fuel fill tube. During refueling, the fuel tank is vented to the EVAP canister to capture escaping vapors. With air flowing into the filler tube, there are no fuel vapors escaping to the atmosphere. Once the refueling vapors are captured by the EVAP canister, the vehicle's computer controlled purge system draws vapor out of the canister for the engine to burn. The vapor flow is metered by the purge solenoid so that there is no, or minimal impact on driveability or tailpipe emissions.

As fuel starts to flow through the fuel fill tube, it opens the normally closed check valve and enters the fuel tank. Vapor or air is expelled from the tank through the control valve and on to the vapor canister. Vapor is absorbed in the EVAP canister until vapor flow in the lines stops. This stoppage occurs following fuel shut-off, or by having the fuel level in the tank rise high enough to close the control valve. This control valve contains a float that rises to seal the large diameter vent path to the EVAP canister. At this point in the refueling process, fuel tank pressure increases, the check valve closes (preventing liquid fuel from spiting back at the operator), and fuel then rises up the fuel filler tube to shut off the dispensing nozzle.

VALVE-PCV-3.7L

DESCRIPTION

DESCRIPTION

81903415

Fig. 4: Identifying PCV Valve & Rubber Sealing O-Ring

A PCV valve (1) using a rubber sealing O-ring (2) is used.

6190341e

Fig. 5: Identifying PCV Line & Valve
Courtesy of CHRYSLER LLC

The PCV valve is threaded into a metal fitting. The valve (2) is located at the rear of the left cylinder head.

OPERATION

POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM

Fig. 6: Typical Closed Crankcase Ventilation System
 Courtesy of CHRYSLER LLC

A typical enclosed crankcase ventilation system is shown in the graphic.

The PCV system operates by engine intake manifold vacuum. Filtered air is routed into the crankcase through the air cleaner hose. The metered air, along with crankcase vapors, are drawn through the PCV valve (4) and into a passage in the intake manifold. The PCV system manages crankcase pressure and meters blow by gases to the intake system, reducing engine sludge formation.

The PCV valve contains a spring loaded plunger. This plunger meters the amount of crankcase vapors routed into the combustion chamber based on intake manifold vacuum.

Fig. 7: Plunger Position During Engine Off Or Engine Backfire-No Vapor Flow
 Courtesy of CHRYSLER LLC

When the engine is not operating or during an engine pop-back, the spring forces the plunger back against the seat. This will prevent vapors from flowing through the valve.

Fig. 8: Plunger Position During High Intake Manifold Vacuum-Minimal Vapor Flow
 Courtesy of CHRYSLER LLC

During periods of high manifold vacuum, such as idle or cruising speeds, vacuum is sufficient to completely compress spring. It will then pull the plunger to the top of the valve. In this position there is minimal vapor flow

through the valve.

Fig. 9: Plunger Position During Moderate Intake Manifold Vacuum-Maximum Vapor Flow
Courtesy of CHRYSLER LLC

During periods of moderate manifold vacuum, the plunger is only pulled part way back from inlet. This results in maximum vapor flow through the valve.

- 2 - Throttle Body
- 3 - Purge Solenoid
- 4 - Filter
- 5 - ESIM
- 6 - Vapor Canister
- 7 - Control Valve
- 8 - Fuel Tank
- 9 - Gas Cap

The ESIM (Evaporative System Integrity Monitor) is very similar to the NVLD. However, the design of the ESIM has been simplified and unlike the NVLD the ESIM does not require a solenoid. The ESIM mounts

directly to the canister, eliminating the need for a mounting bracket. It is critical that the ESIM is mounted vertically. On vehicles where the canister is mounted on an angle, the ESIM requires an adapter to maintain a vertical position. When the ESIM is installed vertically, the electrical connector is in the 3 o'clock position.

Fig. 16: Identifying ESIM Housing, Diaphragm, Switch, Cover & Small/Large Check Valve
Courtesy of CHRYSLER LLC

- | |
|---|
| <ul style="list-style-type: none">1 - ESIM Housing2 - Diaphragm3 - Switch4 - Cover5 - Small Check Valve6 - Large Check Valve |
|---|

The ESIM assembly consists of a housing, a small weight and a large weight that serve as check valves, a diaphragm, a switch and a cover. There is one large weight and one small weight check valve in the ESIM assembly. A seal is attached at the end of each weighted check valve. The large weight check valve seals for pressure. The small weight check valve seals for vacuum. The weighted check valves are contained within the ESIM housing.

Fig. 17: Identifying Large/Small Check Valve, Fresh Air Inlet, Diaphragm & Vapor Canister
Courtesy of CHRYSLER LLC

- 1 - Large Check Valve
- 2 - Fresh Air Inlet
- 3 - Diaphragm
- 4 - Small Check Valve
- 5 - Vapor Canister

The ESIM (Evaporative System Integrity Monitor), while physically different than the NVLD system, performs the same basic function as the NVLD does - controlling evaporative emissions. The ESIM has been simplified because the solenoid used on the NVLD is not used on the ESIM.

The ESIM consists of housing, two check valves (sometimes referred to as weights), a diaphragm, a switch and a cover. The larger check valve seals for pressure and the smaller one seals for vacuum.

During refueling, pressure is built up in the evaporative system. When pressure reaches approximately .5 inches of water, the large check valve unseats and pressure vents to the fresh air filter.

Conversely, when the system cools, and the resulting vacuum lifts the small check valve from its seat and allows fresh air to enter the system and relieves the vacuum condition. When a calibrated amount of vacuum is achieved in the evaporative system, the diaphragm is pulled inward, pushing on the spring and closing the contacts.

The ESIM conducts test on the evaporative system as follows: An engine off, non-intrusive test for small leaks and an engine running, intrusive test for medium/large leaks.

The ESIM weights seal the EVAP. system during engine off conditions. If the EVAP. system is sealed, it will be pulled into a vacuum, either due to the cool down from operating temperature or diurnal ambient temperature cycling. When the vacuum in the system exceeds about 1" H₂O, the vacuum switch closes. The switch closure sends a signal to the PCM. In order to pass the non-intrusive small leak test, the ESIM switch must close within a calculated amount of time and within a specified amount of key-off events.

If the ESIM switch does not close as specified, the test is considered inconclusive and the intrusive engine running test will be run during the next key-on cycle. This intrusive test will run on the next cold engine running condition.

Conditions for running the intrusive test are:

After the vehicle is started, the engine coolant temperature must be within 50°F (10°C) of ambient to indicate a cold start.

The fuel level must be between 12% and 88%.

The engine must be in closed loop.

Manifold vacuum must be greater than a minimum specified value.

Ambient temperature must be between 39°F and 98°F (4°C and 37°C) and the elevation level must be below 8500 feet (2591 meters).

The test is accomplished by the PCM activating the purge solenoid to create a vacuum in the evaporative system. The PCM then measures the amount of time it takes for the vacuum to dissipate. This is known as the vacuum decay method. If the switch opens quickly a large leak is recorded. If the switch opens after a predetermined amount of time, then the small leak matures. If the switch does not close, then a general evaporative failure is recorded. The purge monitor tests the integrity of the hose attached between the purge valve and throttle body/intake. The purge monitor is a two stage test and it runs only after the evaporative system passes the small leak test.

Even when all of the thresholds are met, a small leak won't be recorded until after the medium/large leak monitor has been run. This is accomplished by the PCM activating the purge solenoid to create a vacuum in the evaporative system. The PCM then measures the amount of time it takes for the vacuum to dissipate. This is known as the vacuum decay method. If the switch opens quickly a large leak is recorded. If the switch opens after a predetermined amount of time, then the small leak matures. If the medium/large leak test runs and the ESIM switch doesn't close, a general evaporative test is run. The purge solenoid is activated for approximately 10 seconds, increasing the amount of vacuum in the system. If the ESIM switch closes after the extended purge activation, a large leak fault is generated. If the switch doesn't close, a general evaporative system fault is generated.

The purge monitor tests the integrity of the hose attached between the purge valve and throttle body/intake. The purge monitor is a two stage test and it runs only after the evaporative system passes the small leak test.

Stage one of the purge monitor is non-intrusive. The PCM monitors the purge vapor ratio. If the ratio is above a calibrated specification, the monitor passes. Stage two is an intrusive test and it runs only if stage one fails. During the stage two test, the PCM commands the purge solenoid to flow at a specified rate to force the purge vapor ratio to update. The vapor ratio is compared to a calibrated specification and if it is less than specified, a one-trip failure is recorded.

The ESIM switch stuck closed monitor checks to see if the switch is stuck closed. This is a power down test that runs at key-off; when the PCM sees 0 rpm's, the purge solenoid is energized for a maximum of 30 seconds, venting any vacuum trapped in the evaporative system. If the switch opens or was open before the test began, the monitor passes. If the switch doesn't open, the monitor fails. This is a two-trip MIL. The star scan tool can be used to force the ESIM switch stick closed monitor to run.

The PCM also uses the ESIM to detect a loose or missing gas cap. The PCM controller looks for a change in the fuel level (25% minimum) and then gas cap is loose or missing. If a medium/large leak is detected, a loose gas cap light illuminates and a pending one-trip fault code is set. On the PCM, this is a three-trip fault before the code matures

REMOVAL

REMOVAL

The ESIM (EVAP System Integrity Monitor) switch is attached to the EVAP canister and is usually not serviceable. Replace the switch by replacing the EVAP canister. Refer to **REMOVAL**.

If servicing separately, refer to the following:

618fa833

Fig. 18: Identifying EVAP Canister, ESIM Switch & Electrical Connector
Courtesy of CHRYSLER LLC

Courtesy of CHRYSLER LLC

1. Remove both plastic lines from switch by folding line tabs (2).

Fig. 20: Identifying ESIM Switch, O-Ring And EVAP Canister Opening
Courtesy of CHRYSLER LLC

2. Disconnect electrical connector at switch.
3. Clean any dirt from ESIM switch and its lines.

Fig. 21: Identifying Locking Tab
Courtesy of CHRYSLER LLC

4. A lock tab (see arrow) is used on the back of the switch. Push lock tab towards switch while rotating switch counterclockwise 1/4 turn for removal.
5. The fresh air lines and hoses from the ESIM must have a clear opening to the atmosphere. Check the fresh air lines, including the fresh air filter, for obstructions or restrictions at the ESIM. Also check the routing to the exit to atmosphere. If a restriction is present, the system will not allow free flow passage of clean air, and an early shut off of the fuel fill nozzle may occur during fuel fill.

INSTALLATION

INSTALLATION

The following pictures display a TYPICAL EVAP Canister and a typical ESIM switch. After installing any ESIM switch, the electrical connector on the switch must be in the 3 O'clock position. This step must be done for proper ESIM switch operation.

1. The fresh air lines and hoses from the ESIM must have a clear opening to the atmosphere. Check the fresh air lines, including the fresh air filter, for obstructions or restrictions at the ESIM. Also check the routing to the exit to atmosphere. If a restriction is present, the system will not allow free flow passage of clean air, and an early shut off of the fuel fill nozzle may occur during fuel fill.

1 - EVAP Canister
2 - ESIM Switch
3 - Electrical Connector

CAUTION: The electrical connector (3) on the ESIM switch must be in 3 O'clock position after installation. This step must be done for proper switch operation.

3. Position ESIM switch (2) into EVAP canister (1) and rotate until electrical connector is in 3 O'clock position (3).
4. Connect electrical connector.
5. Connect plastic lines to ESIM switch.

CANISTER - VAPOR

OPERATION

EVAP CANISTER

A maintenance free, EVAP canister is used on all vehicles. The EVAP canister is filled with granules of an activated carbon mixture. Fuel vapors entering the EVAP canister are absorbed by the charcoal granules.

Fuel tank pressure vents into the EVAP canister. Fuel vapors are temporarily held in the canister until they can be drawn into the intake manifold. The duty cycle EVAP canister purge solenoid allows the EVAP canister to be purged at predetermined times and at certain engine operating conditions.

The EVAP canister is also to be considered as part of the ORVR system.

REMOVAL

REMOVAL

The crankcase heater (2) is located in the hose (1) leading to the crankcase breather (6).

1. Twist heater (2) into hose (3).
2. Twist hose (1) into heater.
3. Connect electrical connector (5).

EXHAUST GAS RECIRCULATION - EXCEPT DIESEL

VALVE - EGR 3.7L

REMOVAL

VALVE - EGR - 3.7L

Fig. 32: EGR Valve Solenoid Location
Courtesy of CHRYSLER LLC

The electronic EGR valve and solenoid assembly (1) is attached to the rear of the left cylinder head.

1. Use a diagnostic scan tool to record any DTC's (Diagnostic Trouble Codes).
2. Disconnect and isolate the negative battery cable.

Fig. 33: Removing/Installing EGR Solenoid/Tube Assembly
 Courtesy of CHRYSLER LLC

An exhaust gas routing tube (1) connects the EGR valve (4) to the intake manifold.

3. Remove two tube mounting bolts (2).
4. Remove tube (1) from solenoid (4). Slip opposite end of tube (6) from intake manifold.
5. Remove gasket (3) located between EGR valve solenoid and tube flange.

Fig. 34: EGR Valve Solenoid Location
 Courtesy of CHRYSLER LLC

6. Disconnect electrical connector (3) at solenoid (1).
7. Remove two EGR valve solenoid mounting bolts (2).
8. Remove solenoid (1) from engine.

Fig. 35: EGR Valve Solenoid Gasket
 Courtesy of CHRYSLER LLC

9. Remove and discard gasket (1) located under EGR solenoid.

INSTALLATION

VALVE - EGR - 3.7L

Fig. 36: EGR Valve Solenoid Gasket
 Courtesy of CHRYSLER LLC

1. Clean gasket area (1) at rear of left cylinder head where it joins base of EGR valve.
2. Clean EGR tube where it joins EGR valve.

3. Position new gasket between EGR valve and cylinder head.

81903c76

Fig. 37: EGR Valve Solenoid Location
Courtesy of CHRYSLER LLC

4. Position EGR valve to cylinder head. Install and tighten two bolts (2). Tighten to 9 N.m (80 in. lbs.).

81903c7e

Fig. 38: Removing/Installing EGR Solenoid/Tube Assembly
Courtesy of CHRYSLER LLC

5. Position new gasket (3) between EGR tube flange and EGR valve assembly.
6. Position EGR tube (1) to side of EGR valve. Position end of tube (6) into intake manifold. Install two bolts (2). Tighten to 11 N.m (97 in. lbs.).

81903c76

Fig. 39: EGR Valve Solenoid Location
Courtesy of CHRYSLER LLC

7. Connect electrical connector (3) to top of EGR valve solenoid (1).
8. Connect negative battery cable.
9. Using a diagnostic scan tool, erase any previously recorded DTC's (Diagnostic Trouble Codes).

TCC	Torque Converter Clutch
TIP	Throttle Inlet Pressure
TIPM	Totally Integrated Power Module
TP	Throttle Position
TPMS	Tire Pressure Monitor System
TRS	Transmission Range Sensor
VSS	Vehicle Speed Sensor/Signal
WCM	Wireless Control Module

OPERATION

OBDII MONITOR RUN PROCESS

The following procedure has been established to assist technicians in the field with enabling and running OBD II Monitors. The order listed in the following procedure is intended to allow the technician to effectively complete each monitor and to set the CARB Readiness Status in the least time possible.

NOTE: Once the monitor run process has begun, do not turn off the ignition. By turning the ignition key off, monitor enabling conditions will be lost. EVAP Monitor runs after key off. By performing a Battery Disconnect, or Selecting Erase DTCs, the CARB Readiness and all additional OBD II information will be cleared.

Monitor Preliminary Checks:

1. Plug a scan tool into the vehicle's Data Link Connector (DLC).
2. Turn the ignition, KEY ON - ENGINE OFF. Watch for MIL lamp illumination during the bulb check.

MIL lamp must have illuminated, if not, repair MIL lamp.

3. Using a scan tool check for Powertrain related DTCs.

Verify that No Emissions Related DTCs are Present. If an Emissions DTC is Present, the OBD II Monitors may not run and the CARB Readiness will not update.

The Emissions related DTC, will need to be repaired, then cleared. By clearing DTCs, the OBD Monitors will need to be run and completed to set the CARB Readiness Status.

Using the scan tool check the CARB Readiness Status.

Do all the CARB Readiness Status Locations read YES?

YES - all monitors have been completed and this vehicle is ready to be I/M or Emission Tested.

NO - then the following procedure needs to be followed to run/complete all available monitors.

NOTE: Only the monitors, which are not YES in the CARB Readiness Status, need to be completed. Specific criteria need to be met for each monitor. The most efficient order to run the monitors has been outlined below, including suggestions to aid the process.

Evaporative Emission System Leak Detection with Purge Monitor

This monitor requires a cool down cycle, usually an overnight soak for at least 8 hours without the engine running. The ambient temperature must decrease overnight - parking the vehicle outside is advised. To run this test the fuel level must be between 15-85% full. Criteria for EVAP monitor:

Engine off time greater than one hour.

Fuel Level between 15% and 85%.

Start Up ECT and IAT within 10°C (18°F).

Vehicle started and run until Purge Monitor reports a result.

NOTE: If the vehicle does not report a result and the conditions where correct. It may take up to two weeks to fail the small leak monitor. DO NOT use this test to attempt to determine a fault. Use the appropriate service information procedure for finding a small leak. If there are no faults and the conditions are correct this test will run and report a pass. Note the Small leak test can find leaks less than 10 thousands of an inch. If a small leak is present it takes approximately one week of normal driving to report a failure.

Catalyst / O2 Monitor

The Catalyst and O2 Monitor information are acquired and processed at the same time. Most vehicles will need to be driven at highway speed (less than 50 mph) (73km/h) for a few minutes. Some vehicles run the monitor at idle in drive. If the vehicle is equipped with a manual transmission, using 4th gear may assist in meeting the monitor running criteria.

Engine RPM between 1200 to 3000.

Engine temperature greater than 70°C (158°F)

Engine run time greater than 92 seconds

MAP between 10 - 20 kPa (7.5 - 15 Hg)

Vehicle speed between 20 - 70 mph (29-103 km/h)

EGR Monitor

After the vehicle has reached the below conditions and during a throttle decel the EGR monitor will run.

Engine RPM between 1375 - 2500

Engine temperature greater than 70°C (158°F)

Engine run time greater than 125 seconds

Vehicle speed between 25 - 70 mph (37-103 km/h)

O2 Sensor Heater Monitor

This monitor is now continuously running once the heaters are energized. Pass information will be processed at power down.

Mis-Fire Monitor

The Misfire Monitor is a continuous two-trip monitor. The monitor uses two different tests/counters:

NOTE: **The Adaptive Numerator must be learned before the PCM will run the Mis-Fire Monitor. The PCM updates the Adaptive Numerator at every key-ON, and is relearned after battery disconnect. The Misfire Monitor will not run until the Adaptive Numerator has updated since the last battery disconnect. If the Adaptive Numerator is equal to the default value then the PCM knows that the Adaptive Numerator has not been learned and does not permit the Misfire Monitor to run. If the Adaptive Numerator exceeds a calibrated percentage, the PCM sets a DTC for CKP NOT LEARNED and illuminates the MIL.**

200 Revolution Counter - Looks for misfire that can cause immediate catalyst damage.

1000 Revolution Counter - Looks for misfire that can cause emissions to increase 1.5 times the Federal Test Procedure (FTP) standards. This test must also identify misfire percentages that might cause a "durability demonstration vehicle" to fail an Inspection and Maintenance Program tailpipe emissions test.

2008 ENGINE

3.7L - Service Information - Liberty

DESCRIPTION

3.7L ENGINE DESCRIPTION

80ccc15e

Fig. 1: 3.7L Engine
Courtesy of CHRYSLER LLC

The 3.7 liter (226 CID) six-cylinder engine is an 90° single overhead camshaft engine. The cast iron cylinder block is made up of two different components; the first component is the cylinder bore and upper block, the second component is the bedplate that comprises the lower portion of the cylinder block and houses the lower

half of the crankshaft main bearings. The cylinders are numbered from front to rear with the left bank being numbered 1,3, and 5 and the right bank being numbered 2,4, and 6. The firing order is 1-6-5-4-3-2. The engine serial number is located at the right front side of the engine block. See **Fig. 1**.

DIAGNOSIS AND TESTING

CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

1. Check the coolant level and fill as required. DO NOT install the radiator cap.
2. Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.
3. Remove the spark plugs.
4. Remove the oil filler cap.
5. Remove the air cleaner.
6. Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.
7. Perform the test procedures on each cylinder according to the tester manufacturer's instructions. Set piston of cylinder to be tested at TDC compression. While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART**.

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.

AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block	Remove cylinder head and inspect. Replace defective part
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders	Remove cylinder head and inspect. Replace gasket, head, or block as necessary
MORE THAN 25% LEAKAGE AND AIR ESCAPES THROUGH OIL FILLER CAP OPENING ONLY	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall	Inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary

CYLINDER COMPRESSION PRESSURE

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

1. Clean the spark plug recesses with compressed air.
2. Remove the spark plugs.
3. Secure the throttle in the wide-open position.
4. Disable the fuel system Refer to **OPERATION** .
5. Remove the ASD relay. Refer to **REMOVAL** .
6. Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.
7. Record the compression pressure on the 3rd revolution. Continue the test for the remaining cylinders.
8. See **SPECIFICATIONS** for the correct engine compression pressures.

ENGINE DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either performance (e.g, engine idles rough and stalls) or mechanical (e.g, a strange noise).

See **ENGINE PERFORMANCE DIAGNOSTIC TABLE** and **ENGINE MECHANICAL DIAGNOSTIC TABLE**. For possible causes and corrections of malfunctions, refer to **DIAGNOSIS AND TESTING** .

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that can not be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following diagnosis:

Cylinder Compression Pressure Test. See **CYLINDER COMPRESSION PRESSURE**.

Cylinder Combustion Pressure Leakage Test. See **CYLINDER COMBUSTION PRESSURE**

LEAKAGE.

Engine Cylinder Head Gasket Failure Diagnosis. See **CYLINDER HEAD GASKET.**

Intake Manifold Leakage Diagnosis. See **INTAKE MANIFOLD LEAKS.**

ENGINE LUBRICATION DIAGNOSTIC TABLE

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS	1. Gaskets and O-Rings. (a) Misaligned or damaged. (b) Loose fasteners, broken or porous metal parts. 2. Crankshaft rear seal 3. Crankshaft seal flange. Scratched, nicked or grooved. 4. Oil pan flange cracked. 5. Timing chain cover seal damaged. 6. Scratched or damaged vibration damper hub.	- (a) Replace as necessary. (b) Tighten fasteners, Repair or replace metal parts. 2. Replace as necessary. See <u>REMOVAL.</u> 3. Polish or replace crankshaft. 4. Replace oil pan. See <u>REMOVAL.</u> 5. Reseal timing cover. 6. Polish or replace damper.
OIL PRESSURE DROP	1. Low oil level. 2. Faulty oil pressure sending unit. 3. Low oil pressure. 4. Clogged oil filter. 5. Worn oil pump. 6. Thin or diluted oil. 7. Excessive bearing clearance. 8. Oil pump relief valve stuck. 9. Oil pick up tube loose, damaged or clogged.	1. Check and correct oil level. 2. Replace sending unit. See <u>REMOVAL.</u> 3. Check oil pump and bearing clearance. 4. Replace oil filter. See <u>REMOVAL.</u> 5. Replace oil pump. See <u>REMOVAL.</u> 6. Change oil and filter. 7. Replace as necessary. 8. Replace oil pump. See <u>REMOVAL.</u> 9. Replace as necessary.
OIL PUMPING AT RINGS; SPARK PLUGS FOULING	1. Worn or damaged rings. 2. Carbon in oil ring slots. 3. Incorrect ring size installed. 4. Worn valve guides.	1. Hone cylinder bores and replace rings. 2. Replace rings. See <u>STANDARD PROCEDURE.</u> 3. Replace rings. See <u>STANDARD PROCEDURE.</u> 4. Ream guides and replace valves. See <u>STANDARD PROCEDURE.</u>

5. Leaking valve guide seals.

5. Replace valve guide seals.

ENGINE MECHANICAL DIAGNOSTIC TABLE

CONDITION	POSSIBLE CAUSES	CORRECTIONS
NOISY VALVES	1. High or low oil level in crankcase. 2. Thin or diluted oil. 3. Low oil pressure. 4. Dirt in lash adjusters. 5. Worn rocker arms. 6. Worn valve guides. 7. Excessive runout of valve seats.	1. Refer to <u>SPECIFICATIONS</u> . 2. Change oil and filter. 3. Check oil pump, if OK, check rod and main bearings for excessive wear. 4. Clean or replace as necessary. 5. Replace as necessary. 6. See <u>STANDARD PROCEDURE</u> . 7. Service valves and valve seats. See <u>STANDARD PROCEDURE</u> .
ENGINE VIBRATION	1. Counter Balance Shaft not timed properly	1. Refer to <u>VALVE TIMING</u>
CONNECTING ROD NOISE	1. Insufficient oil supply. 2. Low oil pressure. 3. Thin or diluted oil. 4. Excessive bearing clearance. 5. Connecting rod journal out-of-round. 6. Misaligned connecting rods.	1. Refer to <u>SPECIFICATIONS</u> . 2. Check oil pump, if OK, check rod and main bearings for excessive wear. 3. Change oil and filter. 4. Replace as necessary. 5. Service or replace crankshaft. 6. Replace bent connecting rods.
MAIN BEARING NOISE	1. Insufficient oil supply. 2. Low oil pressure. 3. Thin or diluted oil. 4. Excessive bearing clearance. 5. Excessive end play. 6. Crankshaft journal out-of-round. 7. Loose flywheel or torque converter.	1. Refer to <u>SPECIFICATIONS</u> . 2. Check oil pump, if OK, check rod and main bearings for excessive wear. 3. Change oil and filter. 4. Replace as necessary. 5. Check thrust washers for wear. 6. Service or replace crankshaft. 7. Tighten to correct torque

ENGINE PERFORMANCE DIAGNOSTIC TABLE

CONDITION	POSSIBLE CAUSE	CORRECTION

ENGINE WILL NOT START	1. Weak battery 2. Corroded or loose battery connections. 3. Faulty starter. 4. Faulty coil or control unit. 5. Incorrect spark plug gap. 6. Incorrect right bank cam timing. 7. Dirt or water in fuel system. 8. Faulty fuel pump, relay or wiring. 9. Faulty cam or crank sensor	1. Charge or replace as necessary. 2. Clean and tighten battery connections. Apply a coat of light mineral grease to the terminals. 3. Refer to <u>DIAGNOSIS AND TESTING</u> . 4. Refer to <u>REMOVAL</u> . 5. (Refer to <u>SPARK PLUG</u> . 6. Refer to <u>VALVE TIMING</u>. 7. Clean system and replace fuel filter. 8. Repair or replace as necessary. 9. Refer to <u>IGNITION CONTROL - SERVICE INFORMATION</u> .
ENGINE STALLS OR ROUGH IDLE	1. Vacuum leak. 2. Faulty crank position sensor 3. Faulty coil. 4. Incorrect cam timing.	1. Inspect intake manifold and vacuum hoses, repair or replace as necessary. 2. Replace crank position sensor. 3. Refer to <u>REMOVAL</u> . 4. See <u>STANDARD PROCEDURE</u>.
ENGINE LOSS OF POWER	1. Dirty or incorrectly gapped spark plugs. 2. Dirt or water in fuel system. 3. Faulty fuel pump. 4. Blown cylinder head gasket. 5. Low	1. Refer to <u>SPARK PLUG</u> . 2. Clean system and replace fuel filter. 3. Refer to <u>PUMP-FUEL</u> . 4. Replace cylinder head gasket. 5. See

	compression. 6. Burned, warped or pitted valves. 7. Plugged or restricted exhaust system. 8. Faulty coil. 9. Incorrect cam timing.	<u>DIAGNOSIS AND TESTING</u>, repair as necessary. 6. Replace as necessary. 7. Inspect and replace as necessary. 8. Refer to <u>REMOVAL</u> . 9. Refer to <u>VALVE TIMING</u>.
ENGINE MISSES ON ACCELERATION	1. Spark plugs dirty or incorrectly gapped. 2. Dirt in fuel system. 3. Burned, warped or pitted valves. 4. Refer to <u>REMOVAL</u> .	1. Refer to <u>SPARK PLUG</u> . 2. Clean fuel system. 3. Replace as necessary.
ENGINE MISSES AT HIGH SPEED	1. Spark plugs dirty or incorrectly gapped. 2. Faulty coil.	1. Refer to <u>SPARK PLUG</u> . 2. Refer to <u>REMOVAL</u> .
3. Dirt or water in fuel system.	3. Clean system and replace fuel filter.	

STANDARD PROCEDURE

ENGINE CORE AND OIL GALLERY PLUGS

9209-41

Fig. 2: Core Hole Plug Removal
Courtesy of CHRYSLER LLC

- 1 - CYLINDER BLOCK
- 2 - REMOVE PLUG WITH PLIERS
- 3 - STRIKE HERE WITH HAMMER
- 4 - DRIFT PUNCH
- 5 - CUP PLUG

Using a blunt tool such as a drift and a hammer, strike the bottom edge of the cup plug (5). With the cup plug rotated, grasp firmly with pliers or other suitable tool and remove plug. See **Fig. 2**.

CAUTION: Do not drive cup plug into the casting as restricted cooling can result and cause serious engine problems.

Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer. Lightly coat inside of cup plug hole with Mopar® Stud and Bearing Mount. Make certain the new plug is cleaned of all oil or grease. Using proper drive plug, drive plug into hole so that the sharp edge of the plug is at least 0.5 mm (0.020 in.) inside the lead-in chamfer.

It is not necessary to wait for curing of the sealant. The cooling system can be refilled and the vehicle placed in service immediately.

ENGINE GASKET SURFACE PREPARATION

Fig. 3: Proper Tool Usage for Surface Preparation
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - ABRASIVE PAD
2 - 3M ROLOC™ BRISTLE DISC
3 - PLASTIC/WOOD SCRAPER |
|--|

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

Metal scraper (3).

Abrasive pad (1) or paper to clean cylinder block and head.

High speed power tool (1) with an abrasive pad or a wire brush.

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Only use the following for cleaning gasket surfaces:

Solvent or a commercially available gasket remover

Plastic or wood scraper.

Drill motor with 3M Roloc™ Bristle Disc (white or yellow).

CAUTION: Excessive pressure or high RPM (beyond the recommended speed), can damage the sealing surfaces. The mild (white, 120 grit) bristle disc is recommended. If necessary, the medium (yellow, 80 grit) bristle disc may be used on cast iron surfaces with care.

REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

Drilling out worn or damaged threads.

Tapping the hole with a special Heli-Coil Tap, or equivalent.

Installing an insert into the tapped hole to bring the hole back to its original thread size.

REMOVAL

REMOVAL

613b6364

Fig. 4: Removal/Installation A/C Compressor
Courtesy of CHRYSLER LLC

1. Disconnect the battery negative cable.
2. Remove hood. Mark hood hinge location for reinstallation.
3. Remove air cleaner assembly.
4. Remove radiator core support bracket.
5. Remove fan shroud with electric fan assembly.
6. Remove mechanical cooling fan.
7. Remove drive belt.

NOTE: **It is NOT necessary to discharge the A/C system to remove the engine.**

8. Remove A/C compressor (2) and secure away from engine with lines attached.

Fig. 5: Removal/Installation Generator - 3.7L/4.7L

|---|
| 1 - LOWER BOLTS
2 - REAR BOLT
3 - GENERATOR |
|---|

NOTE: **Do NOT remove the phenolic pulley from the P/S pump. It is not required for P/S pump removal.**

9. Remove power steering pump with lines attached and secure away from engine.
10. Drain cooling system.
11. Remove coolant bottle.
12. Disconnect the heater hoses from the engine.
13. Disconnect heater hoses from heater core and remove hose assembly.
14. Remove generator (3) and secure away from engine.
15. Disconnect throttle and speed control cables.
16. Remove upper radiator hose from engine.
17. Remove lower radiator hose from engine.

80cad603

Fig. 6: Crankshaft Position Sensor
Courtesy of CHRYSLER LLC

1 - CRANKSHAFT POSITION SENSOR
2 - CYLINDER HEAD COVER
3 - CAMSHAFT POSITION SENSOR
4 - RIGHT

SIDE CYLINDER BLOCK

18. Disconnect the engine wiring harness at the following points:

- Intake air temperature (IAT) sensor
- Fuel Injectors
- Electronic Throttle Control (ETC)
- Idle Air Control (IAC) Motor
- Engine Oil Pressure Switch
- Engine Coolant Temperature (ECT) Sensor
- Manifold Absolute Pressure (MAP) Sensor
- Camshaft Position (CMP) Sensor
- Coil Over Plugs
- Crankshaft Position Sensor (2)

19. Remove coil over plugs.

20. Release fuel rail pressure.

21. Remove fuel rail and secure away from engine.

2 - GROUND STRAP

3 - BRAKE BOOSTER

NOTE: It is not necessary to release the quick connect fitting from the fuel supply line for engine removal.

22. Remove the PCV hose.
23. Remove the breather hoses.
24. Remove the vacuum hose for the power brake booster.
25. Disconnect knock sensors.
26. Disconnect the engine to body ground straps (2) at the cowl.

Fig. 8: 3.7L Intake Torque Sequence
Courtesy of CHRYSLER LLC

27. Remove intake manifold.
28. Remove engine oil dipstick tube.
29. Install Engine Lifting Fixture 8427.

NOTE: Recheck bolt torque for engine lift plate before removing engine.

30. Secure the left and right engine wiring harnesses away from engine.
31. Raise vehicle.

819688ca

Fig. 9: Locating Starter Motor - 3.7L
Courtesy of CHRYSLER LLC

32. Disconnect oxygen sensor wiring.
33. Disconnect the engine block heater power cable, if equipped.
34. Disconnect the front propshaft at the front differential and secure out of way.

NOTE: **It is necessary to disconnect the front propshaft for access to the starter and left side exhaust flange.**

35. Remove the ground straps from the left and right side of the block.
36. Disconnect the right and left exhaust pipes at the manifolds and from the crossover, and remove from the vehicle.

NOTE: **The exhaust clamps at the manifolds cannot be reused. New clamps must be used or leaks may occur.**

NOTE: **For manual transmission vehicles, the transmission must be removed from the vehicle, before the engine can be removed. The manual transmission will contact the floorpan before the engine clears the motor mounts, so it must be removed.**

37. Remove the starter. Refer to **REMOVAL** .

Fig. 10: Structural Cover
 Courtesy of CHRYSLER LLC

1 - BOLT 2 - BOLT 3 - BOLT

38. Remove the structural cover retaining bolts (1), and cover. See **REMOVAL**.
39. Remove torque converter bolts, and mark location for reassembly.
40. Remove transmission bellhousing to engine bolts.
41. Loosen left and right engine mount thru bolts.

NOTE: **It is not necessary to completely remove engine mount thru bolts, for engine removal.**

42. Lower the vehicle.
43. Support the transmission with a suitable jack.
44. Connect a suitable engine hoist to the engine lift plate.
45. Remove engine from vehicle.

INSTALLATION

INSTALLATION

819688cs

Fig. 11: Starter Motor Removal/Installation - 3.7L
 Courtesy of CHRYSLER LLC

1. Position the engine in the vehicle.
2. Install both left and right side engine mounts onto engine.
3. Raise the vehicle.
4. Install the transmission bellhousing to engine mounting bolts. Tighten the bolts to 41 N.m (30 ft. lbs.).
5. Tighten the engine mount thru bolts.
6. Install the torque convertor bolts.
7. Connect the ground straps on the left and right side of the engine.
8. Install the starter (2). Refer to **INSTALLATION** .

Fig. 12: Structural Cover
 Courtesy of CHRYSLER LLC

1 - BOLT

- | |
|----------|
| 2 - BOLT |
| 3 - BOLT |

9. Install the engine block heater power cable, if equipped.

CAUTION: The structural cover requires a specific torque sequence. Failure to follow this sequence may cause severe damage to the cover.

10. Install the structural cover, and torque bolts (1). See INSTALLATION.

NOTE: New clamps must be used on exhaust manifold flanges. Failure to use new clamps may result in exhaust leaks.

11. Install the left and right exhaust pipes.
12. Connect the left and right oxygen sensors.
13. Lower vehicle.

17. Install the intake manifold. See **INSTALLATION**.
18. Install the engine oil dipstick tube.
19. Install the power brake booster vacuum hose.
20. Install the breather hoses.
21. Install the PCV hose.
22. Install the fuel rail.
23. Install the coil over plugs.

80cad603

1 - CRANKSHAFT POSITION SENSOR
2 - CYLINDER HEAD COVER
3 - CAMSHAFT POSITION SENSOR
4 - RIGHT SIDE CYLINDER BLOCK

24. Connect the engine wiring harness at the following points:

- Intake air temperature (IAT) sensor
- Fuel Injectors
- Electronic Throttle Control (ETC)
- Idle Air Control (IAC) Motor
- Engine Oil Pressure Switch
- Engine Coolant Temperature (ECT) Sensor
- Manifold Absolute Pressure (MAP) Sensor
- Camshaft Position (CMP) Sensor
- Coil Over Plugs

- Crankshaft Position Sensor (2)

Courtesy of CHRYSLER LLC

- | |
|-----------------|
| 1 - LOWER BOLTS |
| 2 - REAR BOLT |
| 3 - GENERATOR |

25. Connect lower radiator hose.
26. Connect upper radiator hose.
27. Connect throttle and speed control cables.
28. Install the heater hose assembly.
29. Install coolant recovery bottle.
30. Install the power steering pump.
31. Install the generator (3). Refer to **INSTALLATION**.

Fig. 17: Removing/Installing A/C Compressor
Courtesy of CHRYSLER LLC

32. Install the A/C compressor (2).
33. Install the drive belt. Refer to **INSTALLATION** .
34. Install the fan shroud with the electric fan assembly. Refer to **INSTALLATION** .
35. Install the radiator core support bracket.
36. Install the air cleaner assembly.
37. Refill the engine cooling system.
38. Install the hood.
39. Check and fill engine oil.
40. Connect the battery negative cable.
41. Start the engine and check for leaks.

AIR INTAKE SYSTEM

CLEANER-AIR ELEMENT

REMOVAL

REMOVAL

Fig. 47: Air Cleaner Element - 3.7L
Courtesy of CHRYSLER LLC

- 1 - AIR INTAKE HOSE
- 2 - HOSE CLAMP
- 3 - COVER
- 4 - CLIPS (2)

Housing removal is not necessary for element (filter) replacement.

1. Pry up spring clips (4) from front of housing cover (spring clips retain cover to housing). See **Fig. 47**.
2. Release housing cover from 4 locating tabs located on rear of housing, and remove cover.
3. Remove air cleaner element (filter) from housing.

4. Clean inside of housing before replacing element.

INSTALLATION

INSTALLATION

1. Install element into housing.
2. Position housing cover into housing locating tabs.
3. Pry up spring clips and lock cover to housing.

If any air filter, air resonator, air intake tubes or air filter housing clamps had been loosened or removed, tighten them to 5 N.m (40 in. lbs.)

CYLINDER HEAD - LEFT

DESCRIPTION

VALVE GUIDES

The valve guides are made of powdered metal and are pressed into the cylinder head. The guides are not replaceable or serviceable, and valve guide reaming is not recommended. If the guides are worn beyond acceptable limits, replace the cylinder heads.

DIAGNOSIS AND TESTING

CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in

Cylinder Compression Pressure Test. See **CYLINDER COMPRESSION PRESSURE**. An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50 - 70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

HYDRAULIC LASH ADJUSTER

A tappet-like noise may be produced from several items. Check the following items.

1. Engine oil level too high or too low. This may cause aerated oil to enter the adjusters and cause them to be spongy.
2. Insufficient running time after rebuilding cylinder head. Low speed running up to 1 hour may be required.
3. Turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.
4. Low oil pressure.
5. The oil restrictor in cylinder head gasket or the oil passage to the cylinder head is plugged with debris.
6. Air ingested into oil due to broken or cracked oil pump pick up.
7. Worn valve guides.
8. Rocker arm ears contacting valve spring retainer.

9. Rocker arm loose, adjuster stuck or at maximum extension and still leaves lash in the system.
10. Oil leak or excessive cam bore wear in cylinder head.
11. Faulty lash adjuster.

Check lash adjusters for sponginess while installed in cylinder head and cam on camshaft at base circle. Depress part of rocker arm over adjuster. Normal adjusters should feel firm when pressed quickly. When pressed very slowly, lash adjusters should collapse.

Remove suspected lash adjusters, and replace.

Before installation, make sure adjusters are full of oil. This can be verified by little plunger travel when lash adjuster is depressed quickly.

REMOVAL

REMOVAL

Fig. 48: Engine Top Dead Center (TDC) Indicator Marks

Courtesy of CHRYSLER LLC

- | |
|-----------------------------|
| 1 - TIMING CHAIN COVER |
| 2 - CRANKSHAFT TIMING MARKS |

1. Disconnect the negative cable from the battery.
2. Raise the vehicle on a hoist.
3. Disconnect the exhaust pipe at the left side exhaust manifold.
4. Drain the engine coolant. Refer to **COOLING** .
5. Lower the vehicle.
6. Remove the intake manifold. Refer to appropriate procedure.
7. Remove the cylinder head cover. Refer to appropriate procedure.
8. Remove the fan shroud and fan blade assembly. Refer to **COOLING** .
9. Remove accessory drive belt. Refer to **COOLING** .
10. Remove the power steering pump and set aside.
11. Rotate the crankshaft until the damper timing mark is aligned with TDC indicator mark (2). See **Fig. 48**.

Fig. 49: Camshaft Sprocket V6 Marks (#1 TDC, Exhaust Stroke)

Courtesy of CHRYSLER LLC

- | |
|-------------------------|
| 1 - LEFT CYLINDER HEAD |
| 2 - RIGHT CYLINDER HEAD |

12. Verify the V6 mark on the camshaft sprocket is at the 12 o'clock position. See **Fig. 49**. Rotate the crankshaft one turn if necessary.
13. Remove the crankshaft damper. See **REMOVAL**.

14. Remove the timing chain cover. See **REMOVAL**.

Courtesy of CHRYSLER LLC

- | |
|----------------------------|
| 1 - SPECIAL TOOL 8429 |
| 2 - CAMSHAFT CHAIN |
| 3 - CRANKSHAFT TIMING GEAR |

15. Lock the secondary timing chains to the idler sprocket using Secondary Camshaft Chain Holder 8429 (1). See **Fig. 50**.

NOTE: Mark the secondary timing chain prior to removal to aid in installation.

16. Mark the secondary timing chain, one link on each side of the V6 mark on the camshaft drive gear.
17. Remove the left side secondary chain tensioner.

Fig. 51: Cylinder Head Access Plug Location
Courtesy of CHRYSLER LLC

1 - RIGHT CYLINDER HEAD ACCESS PLUG 2 - LEFT CYLINDER HEAD ACCESS PLUG

18. Remove the cylinder head access plug (1) (2). See **Fig. 51**.
19. Remove the left side secondary chain guide.
20. Remove the retaining bolt and the camshaft drive gear.

CAUTION: Do not allow the engine to rotate. Severe damage to the valve train can occur.

CAUTION: Do not overlook the four smaller bolts at the front of the cylinder head. Do not attempt to remove the cylinder head without removing these four bolts.

NOTE: The cylinder head is attached to the cylinder block with twelve bolts.

21. Remove the cylinder head retaining bolts.
22. Remove the cylinder head and gasket. Discard the gasket.

CAUTION: Do not lay the cylinder head on its gasket sealing surface, due to the design of the cylinder head gasket any distortion to the cylinder head sealing surface may prevent the gasket from properly sealing resulting in leaks.

Fig. 52: Proper Tool Usage for Surface Preparation

1 - PLASTIC/WOOD SCRAPER

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components. See **Fig. 52**. See **STANDARD PROCEDURE**.

INSTALLATION

INSTALLATION

Fig. 53: Checking Cylinder Head Bolts for Stretching (Necking)
Courtesy of CHRYSLER LLC

- 1 - STRETCHED BOLT
- 2 - THREADS ARE NOT STRAIGHT ON LINE
- 3 - THREADS ARE STRAIGHT ON LINE
- 4 - UNSTRETCHED BOLT

NOTE: The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down the bolts should be replaced.

Necking can be checked by holding a straight edge against the threads. If all the threads do not contact the scale

(1), the bolt should be replaced. See **Fig. 53**.

80b76eba

Fig. 54: Proper Tool Usage for Surface Preparation
Courtesy of CHRYSLER LLC

1 - PLASTIC/WOOD SCRAPER

CAUTION: When cleaning cylinder head and cylinder block surfaces, DO NOT use a metal scraper because the surfaces could be cut or ground. Use only a wooden or plastic scraper.

1. Clean the cylinder head and cylinder block mating surfaces. See **Fig. 54**.
2. Position the new cylinder head gasket on the locating dowels.

CAUTION: When installing cylinder head, use care not damage the tensioner

arm or the guide arm.

3. Position the cylinder head onto the cylinder block. Make sure the cylinder head seats fully over the locating dowels.

80cb8871

Fig. 55: Cylinder Head Bolt Tightening Sequence
Courtesy of CHRYSLER LLC

* - INDICATES SEALANT ON THREADS

NOTE: The four smaller cylinder head mounting bolts require sealant to be added to them before installing. Failure to do so may cause leaks.

4. Lubricate the cylinder head bolt threads with clean engine oil and install the eight M11 bolts.
5. Coat the four M8 cylinder head bolts with **Mopar® Lock and Seal Adhesive** then install the bolts.

NOTE: The cylinder head bolts are tightened using an angle torque procedure, however, the bolts are not a torque-to-yield design.

6. Tighten the bolts in sequence using the following steps and torque values:
 - Step 1: Tighten bolts 1-8, 27 N.m (20 ft. lbs.).
 - Step 2: Verify that bolts 1-8, all reached 27 N.m (20 ft. lbs.), by repeating step-1 without loosening the bolts. Tighten bolts 9 through 12 to 14 N.m (10 ft. lbs.).
 - Step 3: Tighten bolts 1-8, 90 degrees. See **Fig. 55**.
 - Step 4: Tighten bolts 1-8, 90 degrees, again. Tighten bolts 9-12, 26 N.m (19 ft. lbs.)
7. Position the secondary chain onto the camshaft drive gear, making sure one marked chain link is on either side of the V6 mark on the gear then using Camshaft Holder 8428, position the gear onto the camshaft.

CAUTION: Remove excess oil from camshaft sprocket retaining bolt before reinstalling bolt. Failure to do so may cause over-torquing of bolt resulting in bolt failure.

8. Install the camshaft drive gear retaining bolt.
9. Install the left side secondary chain guide.
10. Install the cylinder head access plug.
11. Reset and Install the left side secondary chain tensioner.
12. Remove Secondary Camshaft Chain Holder 8429.
13. Install the timing chain cover.
14. Install the crankshaft damper. Tighten damper bolt 175 N.m (130 Ft. Lbs.)
15. Install the power steering pump.
16. Install the fan blade assembly and fan shroud.
17. Install the cylinder head cover.
18. Install the intake manifold.
19. Refill the cooling system
20. Raise the vehicle.
21. Install the exhaust pipe onto the left exhaust manifold.
22. Lower the vehicle.
23. Connect the negative cable to the battery.
24. Start the engine and check for leaks.

CAMSHAFT

DESCRIPTION

CAMSHAFT - LEFT

The camshafts consist of powdered metal steel lobes which are sinter-bonded to a steel tube. Four bearing journals are machined into the camshaft. Camshaft end play is controlled by two thrust walls that border the

nose piece journal.

REMOVAL

CAMSHAFT - LEFT

CAUTION: When the timing chain is removed and the cylinder heads are still installed, DO NOT forcefully rotate the camshafts or crankshaft independently of each other. Severe valve and/or piston damage can occur.

CAUTION: When removing the cam sprocket, timing chains or camshaft, Failure to use the Wedge Locking Tool 8379 will result in hydraulic tensioner ratchet over extension, requiring timing chain cover removal to reset the tensioner ratchet.

1. Remove cylinder head cover. See REMOVAL.

80c41ef3

Fig. 56: Securing Timing Chain Tensioners Using Timing Chain Wedge - Typical

1 - SPECIAL TOOL 8379 2 - CAMSHAFT SPROCKET 3 - CAMSHAFT SPROCKET BOLT 4 - CYLINDER HEAD

2. Set engine to TDC cylinder #1, camshaft sprocket V6 marks at the 12 o'clock position.
3. Mark one link on the secondary timing chain on both sides of the V6 mark on the camshaft sprocket to aid in installation.

CAUTION: Do not hold or pry on the camshaft target wheel (Located on the right side camshaft sprocket) for any reason, Severe damage will occur to the target wheel resulting in a vehicle no start condition.

4. Loosen but **DO NOT** remove the camshaft sprocket retaining bolt. Leave the bolt snug against the sprocket.

NOTE: The timing chain tensioners must be secured prior to removing the camshaft sprockets. Failure to secure tensioners will allow the tensioners to extend, requiring timing chain cover removal in order to reset tensioners.

CAUTION: Do not force wedge past the narrowest point between the chain strands. Damage to the tensioners may occur.

5. Position the Wedge Locking Tool 8379. See **Fig. 56** between the timing chain strands, tap the tool to securely wedge the timing chain against the tensioner arm and guide.

80ccc0a4

Fig. 57: Special Tool 8428
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - Camshaft hole
2 - Special Tool 8428 |
|--|

6. Hold the camshaft with Camshaft Holder 8428 while removing the camshaft sprocket bolt and sprocket. See **Fig. 57**.
7. Using the Camshaft Holder 8428, gently allow the camshaft to rotate 5° clockwise until the camshaft is in the neutral position (no valve load).
8. Starting at the outside working inward, loosen the camshaft bearing cap retaining bolts 1/2 turn at a time. Repeat until all load is off the bearing caps.

CAUTION: DO NOT STAMP OR STRIKE THE CAMSHAFT BEARING CAPS.

SEVERE DAMAGE WILL OCCUR TO THE BEARING CAPS.

NOTE: When the camshaft is removed the rocker arms may slide downward, mark the rocker arms before removing camshaft.

9. Remove the camshaft bearing caps and the camshaft.

INSTALLATION

CAMSHAFT - LEFT

808a1e9b

Fig. 58: Camshaft Bearing Cap Bolt Tightening Sequence
Courtesy of CHRYSLER LLC

1. Lubricate camshaft journals with clean engine oil.

NOTE: Position the left side camshaft so that the camshaft sprocket dowel is near

the 1 o'clock position, This will place the camshaft at the neutral position easing the installation of the camshaft bearing caps.

2. Position the camshaft into the cylinder head.
3. Install the camshaft bearing caps, hand tighten the retaining bolts.

NOTE: Caps should be installed so that the stamped numbers on the caps are in numerical order, (1 through 4) from the front to the rear of the engine. All caps should be installed so that the stamped arrows on the caps point toward the front of the engine.

4. Working in 1/2 turn increments, tighten the bearing cap retaining bolts starting with the middle cap working outward.
5. Tighten the camshaft bearing cap retaining bolts to 11 N.m (100 in. lbs.). See **Fig. 58**.
6. Position the camshaft drive gear into the timing chain aligning the V6 mark between the two marked chain links (Two links marked during removal).
7. Using the Camshaft Holder 8428, rotate the camshaft until the camshaft sprocket dowel is aligned with the slot in the camshaft sprocket. Install the sprocket onto the camshaft.

CAUTION: Remove excess oil from camshaft sprocket bolt. Failure to do so can cause bolt over-torque resulting in bolt failure.

8. Remove excess oil from bolt, then install the camshaft sprocket retaining bolt and hand tighten.
9. Remove Wedge Locking Tool 8379.
10. Using the Spanner Wrench 6958 with adapter pins 8346, tighten the camshaft sprocket retaining bolt to 122 N.m (90 ft. lbs.).
11. Install the cylinder head cover. See **INSTALLATION**.

COVER-CYLINDER HEAD

DESCRIPTION

CYLINDER HEAD COVER

80ca556d

Fig. 59: Identifying Cylinder Head Covers
Courtesy of CHRYSLER LLC

- 1 - LEFT SIDE CYLINDER HEAD COVER
- 2 - RIGHT SIDE CYLINDER HEAD COVER

The cylinder head covers (1,2) are made of glass re-enforced thermoset plastic, and are not interchangeable from side-to-side. See **Fig. 59**.

REMOVAL

CYLINDER HEAD COVER

80cb41a5

Fig. 60: Cylinder Head Cover - Typical
Courtesy of CHRYSLER LLC

- | |
|---------------------------------------|
| 1 - SCREWS
2 - CYLINDER HEAD COVER |
|---------------------------------------|

1. Disconnect negative cable from battery.
2. Remove the resonator assemble and air inlet hose.
3. Disconnect injector connectors and unclip the injector harness.

4. Route injector harness in front of cylinder head cover.
5. Disconnect the left side breather tube and remove the breather tube.
6. Remove the cylinder head cover mounting bolts (1).
7. Remove cylinder head cover (1) and gasket. See **Fig. 60**.

NOTE: The gasket may be used again, providing no cuts, tears, or deformation has occurred.

INSTALLATION

CYLINDER HEAD COVER

- | |
|---------------------------------------|
| 1 - SCREWS
2 - CYLINDER HEAD COVER |
|---------------------------------------|

CAUTION: Do not use harsh cleaners to clean the cylinder head covers. Severe damage to covers may occur.

NOTE: The gasket may be used again, provided no cuts, tears, or deformation has occurred.

1. Clean cylinder head cover and both sealing surfaces. Inspect and replace gasket as necessary.
2. Install cylinder head cover (2). See **Fig. 61**.
3. Tighten cylinder head cover bolts (1) and double ended studs to 12 N.m (105 in. lbs.).
4. Install left side breather and connect breather tube.
5. Connect injector electrical connectors and injector harness retaining clips.
6. Install the resonator and air inlet hose.
7. Connect negative cable to battery.

VALVES & SEATS - INTAKE/EXHAUST

DESCRIPTION

VALVES

The valves are made of heat resistant steel and have chrome plated stems to prevent scuffing. Each valve is actuated by a roller rocker arm which pivots on a stationary lash adjuster. All valves use three bead lock keepers to retain the springs and promote valve rotation.

STANDARD PROCEDURE

REFACING

80b8983f

Fig. 62: Valve Assembly Configuration
 Courtesy of CHRYSLER LLC

- 1 - VALVE LOCKS (3-BEAD)
- 2 - RETAINER
- 3 - VALVE STEM OIL SEAL
- 4 - INTAKE VALVE
- 5 - EXHAUST VALVE

NOTE: Valve seats that are worn or burned can be reworked, provided that correct angle and seat width are maintained. Otherwise the cylinder head must be replaced.

NOTE: When refacing valves (4) and valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

1. Using a suitable dial indicator measure the center of the valve seat. Total run out must not exceed 0.051 mm (0.002 in).
2. Apply a small amount of Prussian blue to the valve seat, insert the valve into the cylinder head, while applying light pressure on the valve rotate the valve. Remove the valve and examine the valve face. If the blue is transferred below the top edge of the valve face, lower the valve seat using a 15 degree stone. If the blue is transferred to the bottom edge of the valve face, raise the valve seat using a 65 degree stone.
3. When the seat is properly positioned the width of the intake seat must be 1.75 - 2.36 mm (0.0689 - 0.0928 in.) and the exhaust seat must be 1.71 - 2.32 mm (0.0673 - 0.0911 in.).
4. Check the valve spring (6) installed height after refacing the valve and seat. The installed height for both intake and exhaust valve springs must not exceed 40.74 mm (1.6039 in.)
5. The valve seat and valve face must maintain a face angle of 44.5 - 45° angle.

REMOVAL

VALVES AND VALVE SPRINGS

Fig. 63: Removing/Installing Rocker Arm
Courtesy of CHRYSLER LLC

- | |
|-----------------------------------|
| 1 - CAMSHAFT |
| 2 - VALVE SPRING COMPRESSOR 10102 |

NOTE: The cylinder heads must be removed in order to perform this procedure.

1. Remove rocker arms and lash adjusters. See **REMOVAL**.
2. Remove the camshaft bearing caps and the camshaft.

NOTE: All valve springs and valves are removed in the same manner; this procedure only covers one valve and valve spring.

3. Using Valve Spring Compressor C-3422-B or C-3422-C and Adapter 8519, compress the valve spring.

NOTE: It may be necessary to tap the top of the valve spring to loosen the spring retainers locks enough to be removed.

4. Remove the two spring retainer lock halves.

NOTE: the valve spring is under tension use care when releasing the valve spring compressor.

5. Remove the valve spring compressor.

6. Remove the spring retainer, and the spring.

NOTE: Check for sharp edges on the keeper grooves. Remove any burrs from the valve stem before removing the valve from the cylinder head.

7. Remove the valve from the cylinder head.

NOTE: The valve stem seals are common between intake and exhaust.

8. Remove the valve stem seal. Mark the valve for proper installation.

TESTING VALVE SPRINGS

Fig. 64: Testing Valve Spring
Courtesy of CHRYSLER LLC

1 - SPECIAL TOOL C-647

NOTE: Whenever the valves are removed from the cylinder head it is recommended that the valve springs be inspected and tested for reuse.

Inspect the valve springs for physical signs of wear or damage. Turn table of tool C-647 (1) until surface is in line with the 40.12 mm (1.579 in.) mark on the threaded stud and the zero mark on the front. Place spring over the stud on the table and lift compressing lever to set tone device. Pull on torque wrench until a Ping is heard. Take reading on torque wrench at this instant. Multiply this reading by two. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to **SPECIFICATIONS** to obtain specified height and allowable tensions. Replace any springs that do not meet specifications.

INSTALLATION

VALVES AND VALVE SPRINGS

80b8983f

Fig. 65: Valve Assembly Configuration
Courtesy of CHRYSLER LLC

- 1 - VALVE LOCKS (3-BEAD)
- 2 - RETAINER
- 3 - VALVE STEM OIL SEAL

- 4 - INTAKE VALVE
- 5 - EXHAUST VALVE
- 6 - VALVE SPRING

1. coat the valve stem with clean engine oil and insert it into the cylinder head.
2. Install the valve stem seal. make sure the seal is fully seated and that the garter spring at the top of the seal is intact.
3. Install the spring and the spring retainer.
4. Using the valve spring compressor, compress the spring and install the two valve spring retainer halves.
5. Release the valve spring compressor and make sure the two spring retainer halves and the spring retainer are fully seated. See **Fig. 65**.

808a1e9b

Fig. 66: Camshaft Bearing Caps Tightening Sequence
Courtesy of CHRYSLER LLC

6. Lubricate the camshaft journal with clean engine oil then Position the camshaft (with the sprocket dowel on the left camshaft at 11 o'clock and the right camshaft at 12 o'clock), then position the camshaft bearing

caps.

7. Install the camshaft bearing cap retaining bolts. Tighten the bolts 9-13 N.m (100 in. lbs.) in 1/2 turn increments in the sequence shown in illustration. See **Fig. 66**.
8. Position the hydraulic lash adjusters and rocker arms. See **INSTALLATION**.

ARM-VALVE ROCKER

DESCRIPTION

VALVE ROCKER ARM

The rocker arms are steel stampings with an integral roller bearing. The rocker arms incorporate a 2.8 mm (0.5 inch) oil jet hole in the lash adjuster socket for roller and camshaft lubrication.

REMOVAL

VALVE ROCKER ARM

Fig. 67: Removing/Installing Rocker Arm
Courtesy of CHRYSLER LLC

- | |
|---------------------------------------|
| 1 - CAMSHAFT
2 - SPECIAL TOOL 8516 |
|---------------------------------------|

NOTE: **Disconnect the battery negative cable to prevent accidental starter engagement.**

1. Remove the cylinder head cover. See **REMOVAL**.
2. For rocker arm removal on cylinder No. 4, Rotate the crankshaft until cylinder No. 1 is at BDC intake stroke.
3. For rocker arm removal on cylinder No. 1, Rotate the crankshaft until cylinder No. 1 is at BDC combustion stroke.

4. For rocker arm removal on cylinders No. 3 and No. 5, Rotate the crankshaft until cylinder No. 1 is at TDC exhaust stroke.
5. For rocker arm removal on cylinders No. 2 and No. 6, Rotate the crankshaft until cylinder No. 1 is at TDC ignition stroke.
6. Using the Rocker Arm Remover/Installer 8516A (2) , press downward on the valve spring, remove rocker arm. See **Fig. 67**.

SEALS-VALVE GUIDE

DESCRIPTION

VALVE GUIDE SEAL

The valve guide seals are made of rubber and incorporate an integral steel valve spring seat. The integral garter spring maintains consistent lubrication control to the valve stems.

SPRINGS-VALVE

DESCRIPTION

VALVE SPRINGS

The valve springs are made from high strength chrome silicon steel. The springs are NOT common for intake and exhaust applications. The exhaust spring has an external damper. The valve spring seat is integral with the valve stem seal, which is a positive type seal to control lubrication.

REMOVAL

VALVE SPRINGS

1. Remove the cylinder head cover. See **REMOVAL**.
2. Using the Valve Spring Remover/Installer 8516A, remove the rocker arms and the hydraulic lash adjusters.
3. Remove the spark plug for the cylinder the valve spring and seal are to be removed from.
4. Apply shop air to the cylinder to hold the valves in place when the spring is removed.

NOTE: **All six valve springs and seals are removed in the same manner; this procedure only covers one valve seal and valve spring.**

5. Using the Valve Spring Compressor 8387, compress the valve spring.

NOTE: **It may be necessary to tap the top of the valve spring to loosen the spring retainers locks enough to be removed.**

6. Remove the two spring retainer lock halves.

NOTE: **the valve spring is under tension use care when releasing the valve spring compressor.**

7. Remove the valve spring compressor.

NOTE: **The valve springs are NOT common between intake and exhaust.**

8. Remove the spring retainer, and the spring.
9. Remove the valve stem seal.

NOTE: **The valve stem seals are common between intake and exhaust.**

INSTALLATION

VALVE SPRINGS

NOTE: **All six valve springs and seals are removed in the same manner; this procedure only covers one valve seal and valve spring.**

1. Apply shop air to the cylinder to hold the valves in place while the spring is installed.

NOTE: **The valve stem seals are common between intake and exhaust.**

2. Install the valve stem seal.

NOTE: **The valve springs are NOT common between intake and exhaust.**

3. Install the spring retainer, and the spring.
4. Using the Valve Spring Compressor 8387, compress the valve spring.
5. Install the two spring retainer lock halves.

NOTE: **the valve spring is under tension use care when releasing the valve spring compressor.**

6. Remove the valve spring compressor.
7. Disconnect the shop air to the cylinder.
8. Install the spark plug for the cylinder the valve spring and seal was installed on.
9. Using Valve Spring Remover/Installer 8516, install the rocker arms and the hydraulic lash adjusters.
10. Install the cylinder head cover. See **INSTALLATION**.

CYLINDER HEAD - RIGHT

DESCRIPTION

CYLINDER HEAD

The cylinder heads are made of an aluminum alloy. The cylinder head features two valves per cylinder with pressed in powdered metal valve guides. The cylinder heads also provide enclosures for the timing chain drain, necessitating unique left and right cylinder heads.

VALVE GUIDES

The valve guides are made of powdered metal and are pressed into the cylinder head. The guides are not replaceable or serviceable, and valve guide reaming is not recommended. If the guides are worn beyond acceptable limits, replace the cylinder heads.

VALVES

The valves are made of heat resistant steel and have chrome plated stems to prevent scuffing. Each valve is actuated by a roller rocker arm which pivots on a stationary lash adjuster. All valves use three bead lock keepers to retain the springs and promote valve rotation.

DIAGNOSIS AND TESTING

CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test. See **CYLINDER COMPRESSION PRESSURE**. An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50 - 70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

HYDRAULIC LASH ADJUSTER

A tappet-like noise may be produced from several items. Check the following items.

1. Engine oil level too high or too low. This may cause aerated oil to enter the adjusters and cause them to be spongy.
2. Insufficient running time after rebuilding cylinder head. Low speed running up to 1 hour may be required.
3. Turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.
4. Low oil pressure.
5. The oil restrictor in cylinder head gasket or the oil passage to the cylinder head is plugged with debris.
6. Air ingested into oil due to broken or cracked oil pump pick up.
7. Worn valve guides.
8. Rocker arm ears contacting valve spring retainer.
9. Rocker arm loose, adjuster stuck or at maximum extension and still leaves lash in the system.
10. Oil leak or excessive cam bore wear in cylinder head.
11. Faulty lash adjuster.

Check lash adjusters for sponginess while installed in cylinder head and cam on camshaft at base circle. Depress part of rocker arm over adjuster. Normal adjusters should feel very firm. Spongy

adjusters can be bottomed out easily.

Remove suspected lash adjusters, and replace.

Before installation, make sure adjusters are at least partially full of oil. This can be verified by little or no plunger travel when lash adjuster is depressed.

REMOVAL

CYLINDER HEAD - RIGHT

Fig. 68: Engine Top Dead Center (TDC) Indicator Mark
Courtesy of CHRYSLER LLC

1 - TIMING CHAIN COVER

2 - CRANKSHAFT TIMING MARKS

1. Disconnect battery negative cable.
2. Raise the vehicle on a hoist.
3. Disconnect the exhaust pipe at the right side exhaust manifold.
4. Drain the engine coolant. Refer to **STANDARD PROCEDURE** .
5. Lower the vehicle.
6. Remove the intake manifold. See **REMOVAL**.
7. Remove the cylinder head cover. See **REMOVAL**.
8. Remove the fan shroud. Refer to **REMOVAL** .
9. Remove oil fill housing from cylinder head.
10. Remove accessory drive belt. Refer to **REMOVAL** .
11. Rotate the crankshaft until the damper timing mark is aligned with TDC indicator mark (2). See **Fig. 68**.

Fig. 69: Camshaft Sprocket V6 Marks
Courtesy of CHRYSLER LLC

12. Verify the V6 mark on the camshaft sprocket is at the 12 o'clock position. See **Fig. 69**. Rotate the crankshaft one turn if necessary.
13. Remove the crankshaft damper. See **REMOVAL**.
14. Remove the timing chain cover. See **REMOVAL**.

80cb5655

Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - SPECIAL TOOL 8429
2 - CAMSHAFT CHAIN
3 - CRANKSHAFT TIMING GEAR |
|---|

15. Lock the secondary timing chains to the idler sprocket using the Secondary Camshaft Chain Holder 8429 (1). See **Fig. 70**.

NOTE: Mark the secondary timing chain prior to removal to aid in installation.

16. Mark the secondary timing chain, one link on each side of the V6 mark on the camshaft drive gear.

17. Remove the right side secondary chain tensioner. See **REMOVAL**.

Fig. 71: Locating Cylinder Head Access Plugs

Courtesy of CHRYSLER LLC

1 - RIGHT CYLINDER HEAD ACCESS PLUG

2 - LEFT CYLINDER HEAD ACCESS PLUG

18. Remove the cylinder head access plug (1,2). See **Fig. 71**.
19. Remove the right side secondary chain guide. See **REMOVAL**.

CAUTION: The nut on the right side camshaft sprocket should not be removed for any reason, as the sprocket and camshaft sensor target wheel is serviced as an assembly. If the nut was removed, tighten nut to 5 N.m (44 in. lbs.).

20. Remove the retaining bolt and the camshaft drive gear.

CAUTION: Do not allow the engine to rotate. severe damage to the valve train can occur.

CAUTION: Do not overlook the four smaller bolts at the front of the cylinder head. Do not attempt to remove the cylinder head without removing these four bolts.

CAUTION: Do not hold or pry on the camshaft target wheel for any reason. A damaged target wheel can result in a vehicle no start condition.

80cb8871

Fig. 72: Cylinder Head Bolt Tightening Sequence
Courtesy of CHRYSLER LLC

* - INDICATES SEALANT ON THREADS

NOTE: The cylinder head is attached to the cylinder block with twelve bolts.

21. Remove the cylinder head retaining bolts. See **Fig. 72**.

22. Remove the cylinder head and gasket. Discard the gasket.

CAUTION: Do not lay the cylinder head on its gasket sealing surface, do to the design of the cylinder head gasket any distortion to the cylinder head sealing surface may prevent the gasket from properly sealing resulting in leaks.

CLEANING

CYLINDER HEADS

80b76eba

Fig. 73: Proper Tool Usage for Surface Preparation
Courtesy of CHRYSLER LLC

1 - PLASTIC/WOOD SCRAPER

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components. See **Fig. 73**. See **STANDARD PROCEDURE**.

INSPECTION

CYLINDER HEADS

1. Inspect the cylinder head for out-of-flatness, using a straightedge and a feeler gauge. If measurements exceed 0.0508 mm (0.002 in.) replace the cylinder head.
2. Inspect the valve seats for damage. Service the valve seats as necessary.
3. Inspect the valve guides for wear, cracks or looseness. If either condition exist, replace the cylinder head.

INSTALLATION

CYLINDER HEAD - RIGHT

80865280

Fig. 74: Checking Cylinder Head Bolts for Stretching (Necking)

Courtesy of CHRYSLER LLC

NOTE: The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down (2) the bolts should be replaced.

Necking can be checked by holding a straight edge against the threads. If all the threads do not contact the scale, the bolt should be replaced. See **Fig. 74**.

80b76eba

Fig. 75: Proper Tool Usage for Surface Preparation
Courtesy of CHRYSLER LLC

1 - PLASTIC/WOOD SCRAPER

CAUTION: When cleaning cylinder head and cylinder block surfaces, DO NOT use a metal scraper because the surfaces could be cut or ground. Use only a wooden or plastic scraper (1).

1. Clean the cylinder head and cylinder block mating surfaces. See **Fig. 75**.

80cb8871

Fig. 76: Cylinder Head Bolt Tightening Sequence
 Courtesy of CHRYSLER LLC

* - INDICATES SEALANT ON THREADS

2. Position the new cylinder head gasket on the locating dowels.

CAUTION: When installing cylinder head, use care not damage the tensioner arm or the guide arm.

3. Position the cylinder head onto the cylinder block. Make sure the cylinder head seats fully over the locating dowels.

NOTE: The four M8 cylinder head mounting bolts (1) require sealant to be added to them before installing. Failure to do so may cause leaks.

4. Lubricate the cylinder head bolt threads with clean engine oil and install the eight M10 bolts.
5. Coat the four M8 cylinder head bolts with **Mopar Lock and Seal Adhesive** then install the bolts.

NOTE: The cylinder head bolts are tightened using an angle torque procedure, however, the bolts are not a torque-to-yeild design.

6. Tighten the bolts in sequence using the following steps and torque values. See **Fig. 76**:

Step 1: Tighten bolts 1-8, 27 N.m (20 ft. lbs.).

Step 2: Verify that bolts 1-8, all reached 27 N.m (20 ft. lbs.), by repeating step 1 without loosening the bolts. Tighten bolts 9 thru 12 to 14 N.m (10 ft. lbs.).

Step 3: Tighten bolts 1-8, 90 °.

Step 4: Tighten bolts 1-8, 90 °, again. Tighten bolts 9-12, 26 N.m (19 ft. lbs.)

Fig. 77: Locking Secondary Timing Chains

7. Position the secondary chain (2) onto the camshaft drive gear, making sure one marked chain link is on either side of the V6 mark (1) on the gear, then using the Camshaft Holder 8428, position the gear onto the camshaft. See **Fig. 77** and **Fig. 78**.

CAUTION: Remove excess oil from camshaft sprocket retaining bolt before reinstalling bolt. Failure to do so may cause over-torquing of bolt resulting in bolt failure.

8. Install the camshaft drive gear retaining bolt.
9. Install the right side secondary chain guide. See **INSTALLATION**.

Fig. 79: Locating Cylinder Head Access Plugs
Courtesy of CHRYSLER LLC

1 - RIGHT CYLINDER HEAD ACCESS PLUG
2 - LEFT CYLINDER HEAD ACCESS PLUG

10. Install the cylinder head access plug (1,2). See **Fig. 79**.
11. Reset and install the right side secondary chain tensioner. See **INSTALLATION**.

80cb5655

3 - CRANKSHAFT TIMING GEAR |
|---|

12. Remove the Camshaft Holder 8429 (1). See **Fig. 80**.
13. Install the timing chain cover. See **REMOVAL**.
14. Install the crankshaft damper. See **INSTALLATION**. Tighten damper bolt 175 N.m (130 ft. lbs.).
15. Install accessory drive belt. Refer to **INSTALLATION**.
16. Install the fan shroud. Refer to **INSTALLATION**.

17. Install the cylinder head cover. See **INSTALLATION**.
18. Install the intake manifold. See **INSTALLATION**.
19. Install oil fill housing onto cylinder head.
20. Refill the cooling system. Refer to **STANDARD PROCEDURE**.
21. Raise the vehicle.
22. Install the exhaust pipe onto the right exhaust manifold.
23. Lower the vehicle.
24. Reconnect battery negative cable.
25. Start the engine and check for leaks.

CAMSHAFT

DESCRIPTION

CAMSHAFT - RIGHT

The camshafts consist of powdered metal steel lobes which are sinter-bonded to a steel tube. Four bearing journals are machined into the camshaft. Camshaft end play is controlled by two thrust walls that border the nose piece journal.

REMOVAL

CAMSHAFT - RIGHT

Fig. 81: Camshaft Sprocket V6 Marks
 Courtesy of CHRYSLER LLC

CAUTION: When the timing chain is removed and the cylinder heads are still installed, **DO NOT** forcefully rotate the camshafts or crankshaft independently of each other. Severe valve and/or piston damage can

occur.

CAUTION: When removing the cam sprocket, timing chains or camshaft, Failure to use Wedge Locking Tool 8379 will result in hydraulic tensioner ratchet over extension, Requiring timing chain cover removal to reset the tensioner ratchet.

1. Remove the cylinder head cover. See **REMOVAL**.
2. Set engine to TDC cylinder No. 1, camshaft sprocket V6 marks at the 12 o'clock position (1). See **Fig. 81**.
3. Mark one link on the secondary timing chain on both sides of the V6 mark on the camshaft sprocket to aid in installation.

80ccc0a4

Fig. 82: Special Tool 8428
Courtesy of CHRYSLER LLC

- 1 - Camshaft hole
- 2 - Special Tool 8428

CAUTION: Do not hold or pry on the camshaft target wheel for any reason, Severe damage will occur to the target wheel. A damaged target wheel could cause a vehicle no start condition.

4. Loosen but **DO NOT** remove the camshaft sprocket retaining bolt. See **Fig. 83**. Leave bolt snug against sprocket.

Fig. 83: Securing Timing Chain Tensioners Using Timing Chain Wedge - Typical
Courtesy of CHRYSLER LLC

- 1 - SPECIAL TOOL 8379
- 2 - CAMSHAFT SPROCKET
- 3 - CAMSHAFT SPROCKET BOLT
- 4 - CYLINDER HEAD

NOTE: The timing chain tensioners must be secured prior to removing the camshaft sprockets. Failure to secure tensioners will allow the tensioners to extend, requiring timing chain cover removal in order to reset tensioners.

CAUTION: Do not force wedge past the narrowest point between the chain strands. Damage to the tensioners may occur.

5. Position the Wedge Locking Tool 8379 (1) between the timing chain strands. Tap the tool to securely wedge the timing chain against the tensioner arm and guide. See **Fig. 83**.

80ccc0a4

Fig. 84: Special Tool 8428
Courtesy of CHRYSLER LLC

- 1 - Camshaft hole
- 2 - Special Tool 8428

6. Remove the camshaft position sensor.
7. Hold the camshaft with Camshaft Holder 8428 (2), while removing the camshaft sprocket bolt and sprocket. See **Fig. 84**.

808a1e9b

Fig. 85: Camshaft Bearing Cap Bolt Tightening Sequence
Courtesy of CHRYSLER LLC

8. Starting at the outside working inward, loosen the camshaft bearing cap retaining bolts 1/2 turn at a time. Repeat until all load is off the bearing caps. See **Fig. 85**.

**CAUTION: DO NOT STAMP OR STRIKE THE CAMSHAFT BEARING CAPS.
SEVERE DAMAGE WILL OCCUR TO THE BEARING CAPS.**

NOTE: When the camshaft is removed the rocker arms may slide downward, mark the rocker arms before removing camshaft.

9. Remove the camshaft bearing caps and the camshaft.

INSTALLATION

CAMSHAFT - RIGHT

808a1e9b

Fig. 86: Camshaft Bearing Cap Bolt Tightening Sequence
Courtesy of CHRYSLER LLC

1. Lubricate camshaft journals with clean engine oil.

NOTE: Position the right side camshaft so that the camshaft sprocket dowel is near the 10 o'clock position, This will place the camshaft at the neutral position easing the installation of the camshaft bearing caps.

2. Position the camshaft into the cylinder head.
3. Install the camshaft bearing caps, hand tighten the retaining bolts.

NOTE: Caps should be installed so that the stamped numbers on the caps are in numerical order, (1 through 4) from the front to the rear of the engine. All caps should be installed so that the stamped arrows on the caps point toward the front of the engine.

4. Working in 1/2 turn increments, tighten the bearing cap retaining bolts starting with the middle cap working outward.
5. Tighten the camshaft bearing cap retaining bolts to 11 N.m (100 in. lbs.). See **Fig. 86**.

Fig. 87: Camshaft Sprocket V6 Marks
Courtesy of CHRYSLER LLC

6. Position the camshaft drive gear into the timing chain aligning the V6 mark between the two marked chain links (Two links marked during removal). See **Fig. 87**.

80ccc0a4

Fig. 88: Special Tool 8428
Courtesy of CHRYSLER LLC

1 - Camshaft hole 2 - Special Tool 8428
--

7. Using the Camshaft Holder 8428 (2), rotate the camshaft until the camshaft sprocket dowel is aligned with the slot in the camshaft sprocket . Install the sprocket onto the camshaft. See **Fig. 88**.

CAUTION: Remove excess oil from camshaft sprocket bolt. Failure to do so can cause bolt over-torque resulting in bolt failure.

8. Remove excess oil from camshaft sprocket bolt, then install the camshaft sprocket retaining bolt and hand tighten.

80c41ef3

9. Remove timing chain wedge special tool 8379 (1). See **Fig. 89**.
10. Using Spanner Wrench 6958 with adapter pins 8346, tighten the camshaft sprocket retaining bolt to 122 N.m (90 ft. lbs.)
11. Install the camshaft position sensor.
12. Install the cylinder head cover. See **INSTALLATION**.

COVER-CYLINDER HEAD

REMOVAL

CYLINDER HEAD COVER

1. Disconnect battery negative cable.
2. Remove air cleaner assembly, resonator assembly and air inlet hose.
3. Drain cooling system, below the level of the heater hoses. Refer to **STANDARD PROCEDURE** .
4. Remove accessory drive belt. Refer to **REMOVAL** .
5. Remove air conditioning compressor retaining bolts and move compressor to the left.
6. Remove heater hoses.
7. Disconnect injector and ignition coil connectors.
8. Disconnect and remove positive crankcase ventilation (PCV) hose.
9. Remove oil fill tube.
10. Unclip injector and ignition coil harness and move away from cylinder head cover.
11. Remove right rear breather tube and filter assembly.
12. Remove cylinder head cover retaining bolts.
13. Remove cylinder head cover.

INSTALLATION

CYLINDER HEAD COVER

CAUTION: Do not use harsh cleaners to clean the cylinder head covers. Severe damage to covers may occur.

NOTE: The gasket may be used again, provided no cuts, tears, or deformation has occurred.

1. Clean cylinder head cover and both sealing surfaces. Inspect and replace gasket as necessary.
2. Tighten cylinder head cover bolts and double ended studs to 12 N.m (105 in. lbs).
3. Install right rear breather tube and filter assembly.
4. Connect injector, ignition coil electrical connectors and harness retaining clips.
5. Install the oil fill tube.
6. Install PCV hose.
7. Install heater hoses.
8. Install air conditioning compressor retaining bolts.
9. Install accessory drive belt. Refer to **INSTALLATION** .
10. Fill Cooling system. Refer to **STANDARD PROCEDURE** .
11. Install air cleaner assembly, resonator assembly and air inlet hose.
12. Connect battery negative cable.

VALVES AND SEATS - INTAKE/EXHAUST

DESCRIPTION

VALVES

The valves are made of heat resistant steel and have chrome plated stems to prevent scuffing. Each valve is actuated by a roller rocker arm which pivots on a stationary lash adjuster. All valves use three bead lock keepers to retain the springs and promote valve rotation.

STANDARD PROCEDURE

REFACING

80b8983f

Fig. 90: Valve Assembly Configuration
Courtesy of CHRYSLER LLC

- 1 - VALVE LOCKS (3-BEAD)
- 2 - RETAINER
- 3 - VALVE STEM OIL SEAL
- 4 - INTAKE VALVE
- 5 - EXHAUST VALVE

NOTE: Valve seats that are worn or burned can be reworked, provided that correct angle and seat width are maintained. Otherwise the cylinder head must be replaced.

NOTE: When refacing valves (4) and valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

1. Using a suitable dial indicator measure the center of the valve seat. Total run out must not exceed 0.051 mm (0.002 in).
2. Apply a small amount of Prussian blue to the valve seat, insert the valve into the cylinder head, while applying light pressure on the valve rotate the valve. Remove the valve and examine the valve face. If the blue is transferred below the top edge of the valve face, lower the valve seat using a 15 degree stone. If the blue is transferred to the bottom edge of the valve face, raise the valve seat using a 65 degree stone.
3. When the seat is properly positioned the width of the intake seat must be 1.75 - 2.36 mm (0.0689 - 0.0928 in.) and the exhaust seat must be 1.71 - 2.32 mm (0.0673 - 0.0911 in.).
4. Check the valve spring (6) installed height after refacing the valve and seat. The installed height for both intake and exhaust valve springs must not exceed 40.74 mm (1.6039 in.)
5. The valve seat and valve face must maintain a face angle of 44.5 - 45 ° angle.

REMOVAL

VALVES AND VALVE SPRINGS

Fig. 91: Removing/Installing Rocker Arm
Courtesy of CHRYSLER LLC

1 - CAMSHAFT

2 - VALVE SPRING COMPRESSOR 10102

NOTE: The cylinder heads must be removed in order to perform this procedure.

1. Remove rocker arms and lash adjusters. See **REMOVAL**.
2. Remove the camshaft bearing caps and the camshaft.

NOTE: All valve springs and valves are removed in the same manner; this procedure only covers one valve and valve spring.

3. Using Valve Spring Compressor C-3422-B or C-3422-C and Adapter 8519, compress the valve spring.

NOTE: **It may be necessary to tap the top of the valve spring to loosen the spring retainers locks enough to be removed.**

4. Remove the two spring retainer lock halves.

NOTE: **the valve spring is under tension use care when releasing the valve spring compressor.**

5. Remove the valve spring compressor.

6. Remove the spring retainer, and the spring.

NOTE: **Check for sharp edges on the keeper grooves. Remove any burrs from the valve stem before removing the valve from the cylinder head.**

7. Remove the valve from the cylinder head.

NOTE: **The valve stem seals are common between intake and exhaust.**

8. Remove the valve stem seal. Mark the valve for proper installation.

TESTING VALVE SPRINGS

Fig. 92: Testing Valve Spring
Courtesy of CHRYSLER LLC

1 - SPECIAL TOOL C-647

NOTE: Whenever the valves are removed from the cylinder head it is recommended that the valve springs be inspected and tested for reuse.

Inspect the valve springs for physical signs of wear or damage. Turn table of tool C-647 (1) until surface is in line with the 40.12 mm (1.579 in.) mark on the threaded stud and the zero mark on the front. Place spring over the stud on the table and lift compressing lever to set tone device. Pull on torque wrench until a Ping is heard. Take reading on torque wrench at this instant. Multiply this reading by two. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to **SPECIFICATIONS** to obtain specified height and allowable tensions. Replace any springs that do not meet specifications.

INSTALLATION

VALVES AND VALVE SPRINGS

80b8983f

Fig. 93: Valve Assembly Configuration
Courtesy of CHRYSLER LLC

- 1 - VALVE LOCKS (3-BEAD)
- 2 - RETAINER
- 3 - VALVE STEM OIL SEAL

- 4 - INTAKE VALVE
- 5 - EXHAUST VALVE
- 6 - VALVE SPRING

1. coat the valve stem with clean engine oil and insert it into the cylinder head.
2. Install the valve stem seal. make sure the seal is fully seated and that the garter spring at the top of the seal is intact.
3. Install the spring and the spring retainer.
4. Using the valve spring compressor, compress the spring and install the two valve spring retainer halves.
5. Release the valve spring compressor and make sure the two spring retainer halves and the spring retainer are fully seated. See **Fig. 65**.

808a1e9b

Fig. 94: Camshaft Bearing Caps Tightening Sequence
Courtesy of CHRYSLER LLC

6. Lubricate the camshaft journal with clean engine oil then Position the camshaft (with the sprocket dowel on the left camshaft at 11 o'clock and the right camshaft at 12 o'clock), then position the camshaft bearing

caps.

7. Install the camshaft bearing cap retaining bolts. Tighten the bolts 9-13 N.m (100 in. lbs.) in 1/2 turn increments in the sequence shown in illustration. See **Fig. 66**.
8. Position the hydraulic lash adjusters and rocker arms. See **INSTALLATION**.

ROCKER ARM - VALVE

DESCRIPTION

VALVE ROCKER ARM

The rocker arms are steel stampings with an integral roller bearing. The rocker arms incorporate a 0.5 mm oil jet hole in the lash adjuster socket for roller and camshaft lubrication.

REMOVAL

VALVE ROCKER ARM

Fig. 95: Removing/Installing Rocker Arm
Courtesy of CHRYSLER LLC

- | |
|---------------------------------------|
| 1 - CAMSHAFT
2 - SPECIAL TOOL 8516 |
|---------------------------------------|

NOTE: **Disconnect the battery negative cable to prevent accidental starter engagement.**

1. Remove the cylinder head cover. See **REMOVAL**.
2. For rocker arm removal on cylinder No. 4, Rotate the crankshaft until cylinder No. 1 is at BDC intake stroke.
3. For rocker arm removal on cylinder No. 1, Rotate the crankshaft until cylinder No. 1 is at BDC combustion stroke.

4. For rocker arm removal on cylinders No. 3 and No. 5, Rotate the crankshaft until cylinder No. 1 is at TDC exhaust stroke.
5. For rocker arm removal on cylinders No. 2 and No. 6, Rotate the crankshaft until cylinder No. 1 is at TDC ignition stroke.
6. Using the Rocker Arm Remover/Installer 8516A (2), press downward on the valve spring, remove rocker arm. See **Fig. 67**.

INSTALLATION

VALVE ROCKER ARM

80b76fa5

Fig. 96: Removing/Installing Rocker Arm
Courtesy of CHRYSLER LLC

- | |
|---------------------------------------|
| 1 - CAMSHAFT
2 - SPECIAL TOOL 8516 |
|---------------------------------------|

CAUTION: Make sure the rocker arms are installed with the concave pocket over the lash adjusters. Failure to do so may cause severe damage to the rocker arms and/or lash adjusters.

NOTE: Coat the rocker arms with clean engine oil prior to installation.

1. For rocker arm installation on cylinders No. 4, Rotate the crankshaft until cylinder No. 1 is at BDC intake stroke.
2. For rocker arm installation on cylinder No. 1, Rotate the crankshaft until cylinder No. 1 is at BDC combustion stroke.
3. For rocker arm installation on cylinders No. 3 and No. 5, Rotate the crankshaft until cylinder No. 1 is at TDC exhaust stroke.
4. For rocker arm installation on cylinders No. 2 and No. 6, Rotate the crankshaft until cylinder No. 1 is at TDC ignition stroke.
5. Using the Rocker Arm Remover/Installer 8516A (2), press downward on the valve spring, install rocker arm. See **Fig. 96**.
6. Install the cylinder head cover. See **INSTALLATION**.

SEALS-VALVE GUIDE

DESCRIPTION

VALVE GUIDE SEALS

The valve guide seals are made of rubber and incorporate an integral steel valve spring seat. The integral garter spring maintains consistent lubrication control to the valve stems.

SPRINGS-VALVE

DESCRIPTION

VALVE SPRINGS

The valve springs are made from high strength chrome silicon steel. There are different springs for intake and exhaust applications. The exhaust spring has an external damper. The valve spring seat is integral with the valve stem seal, which is a positive type seal to control lubrication.

REMOVAL

VALVE SPRINGS

1. Remove the cylinder head cover. See **REMOVAL**.
2. Using the Valve Spring Remover/Installer 8516A, remove the rocker arms and the hydraulic lash

adjusters.

3. Remove the spark plug for the cylinder the valve spring and seal are to be removed from.
4. Apply shop air to the cylinder to hold the valves in place when the spring is removed.

NOTE: All six valve springs and seals are removed in the same manner; this procedure only covers one valve seal and valve spring.

5. Using the Valve Spring Compressor 8387, compress the valve spring.

NOTE: It may be necessary to tap the top of the valve spring to loosen the spring retainers locks enough to be removed.

6. Remove the two spring retainer lock halves.

NOTE: the valve spring is under tension use care when releasing the valve spring compressor.

7. Remove the valve spring compressor.

NOTE: The valve springs are NOT common between intake and exhaust.

8. Remove the spring retainer, and the spring.

9. Remove the valve stem seal.

NOTE: The valve stem seals are common between intake and exhaust.

INSTALLATION

VALVE SPRINGS

NOTE: All six valve springs and seals are removed in the same manner; this procedure only covers one valve seal and valve spring.

1. Apply shop air to the cylinder to hold the valves in place while the spring is installed.

NOTE: The valve stem seals are common between intake and exhaust.

2. Install the valve stem seal.

NOTE: The valve springs are NOT common between intake and exhaust.

3. Install the spring retainer, and the spring.
4. Using Valve Spring Compressor 8387, compress the valve spring.

5. Install the two spring retainer lock halves.

NOTE: **the valve spring is under tension use care when releasing the valve spring compressor.**

6. Remove the valve spring compressor.
7. Disconnect the shop air to the cylinder.
8. Install the spark plug for the cylinder the valve spring and seal was installed on.
9. Using the Valve Spring Remover/Installer Special Tool 8516A, install the rocker arms and the hydraulic lash adjusters.
10. Install the cylinder head cover. See **INSTALLATION**.

ENGINE BLOCK

DESCRIPTION

ENGINE BLOCK

The cylinder block is made of cast iron. The block is a closed deck design with the left bank forward. To provide high rigidity and improved NVH an enhanced compacted graphite bedplate is bolted to the block. The block design allows coolant flow between the cylinders bores, and an internal coolant bypass to a single poppet inlet thermostat is included in the cast aluminum front cover.

STANDARD PROCEDURE

CYLINDER BORE HONING

8086fd41

Fig. 97: Cylinder Bore Crosshatch Pattern
Courtesy of CHRYSLER LLC

1 - CROSSHATCH PATTERN 2 - INTERSECT ANGLE

Before honing, stuff plenty of clean shop towels under the bores and over the crankshaft to keep abrasive materials from entering the crankshaft area.

1. Used carefully, the Cylinder Bore Sizing Hone C-823, equipped with 220 grit stones, is the best tool for this job. In addition to deglazing, it will reduce taper and out-of-round, as well as removing light scuffing, scoring and scratches. Usually, a few strokes will clean up a bore and maintain the required limits.

CAUTION: DO NOT use rigid type hones to remove cylinder wall glaze.

2. Deglazing of the cylinder walls may be done if the cylinder bore is straight and round. Use a cylinder surfacing hone, Honing Tool C-3501, equipped with 280 grit stones (C-3501-3810). about 20-60 strokes, depending on the bore condition, will be sufficient to provide a satisfactory surface. Using honing oil C-3501-3880, or a light honing oil, available from major oil distributors.

CAUTION: DO NOT use engine or transmission oil, mineral spirits, or kerosene.

3. Honing should be done by moving the hone up and down fast enough to get a crosshatch pattern (1). The hone marks should INTERSECT at 50° to 60° for proper seating of rings (2).
4. A controlled hone motor speed between 200 and 300 RPM is necessary to obtain the proper crosshatch angle. The number of up and down strokes per minute can be regulated to get the desired 50° to 60° angle. Faster up and down strokes increase the crosshatch angle.
5. After honing, it is necessary that the block be cleaned to remove all traces of abrasive. Use a brush to wash parts with a solution of hot water and detergent. Dry parts thoroughly. Use a clean, white, lint-free cloth to check that the bore is clean. Oil the bores after cleaning to prevent rusting.

CLEANING

CYLINDER BLOCK

Thoroughly clean the oil pan and engine block gasket surfaces.

Use compressed air to clean out:

The galley at the oil filter Adapter hole.

The front and rear oil galley holes.

The feed holes for the crankshaft main bearings.

Once the block has been completely cleaned, apply Loctite PST pipe sealant with Teflon 592 to the threads of the front and rear oil galley plugs. Tighten the plugs to 34 N.m (25 ft. lbs.)

INSPECTION

ENGINE BLOCK

805dd884

Fig. 98: Measuring Cylinder Bore With Gauge - Typical
 Courtesy of CHRYSLER LLC

- 1 - FRONT
- 2 - BORE GAUGE
- 3 - CYLINDER BORE
- 4 - 38 MM (1.5 in)

1. It is mandatory to use a dial bore gauge to measure each cylinder bore diameter. To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.
2. Measure the inside diameter of the cylinder bore at three levels below top of bore. Start perpendicular

(across or at 90 degrees) to the axis of the crankshaft and then take two additional reading.

3. Measure the cylinder bore diameter crosswise to the cylinder block near the top of the bore. Repeat the measurement near the middle of the bore, then repeat the measurement near the bottom of the bore.
4. Determine taper by subtracting the smaller diameter from the larger diameter.
5. Rotate measuring device 90° and repeat steps above.
6. Determine out-of-roundness by comparing the difference between each measurement.
7. If cylinder bore taper does not exceed 0.025 mm (0.001 inch) and out-of-roundness does not exceed 0.015 mm (0.0006 inch), the cylinder bore can be honed. If the cylinder bore taper or out- of-round condition exceeds these maximum limits, the cylinder block must be replaced. A slight amount of taper always exists in the cylinder bore after the engine has been in use for a period of time.

CRANKSHAFT

DESCRIPTION

CRANKSHAFT

The crankshaft is constructed of nodular cast iron. The crankshaft is a three throw split pin design with six counterweights for balancing purposes. The crankshaft is supported by four select fit main bearings with the number two serving as the thrust washer location. The main journals of the crankshaft are cross drilled to improve rod bearing lubrication. The number six counterweight has provisions for crankshaft position sensor target wheel mounting. The select fit main bearing markings are located on the rear side of the target wheel. The crankshaft oil seals are one piece design. The front oil seal is retained in the timing chain cover, and the rear seal is pressed in to a bore formed by the cylinder block and the bedplate assembly. See **Fig. 99**.

80bbb3ce

Fig. 99: Crankshaft & Target Ring

REMOVAL

CRANKSHAFT

Fig. 100: Bedplate Pry Point Location
Courtesy of CHRYSLER LLC

NOTE: To remove the crankshaft from the engine, the engine must be removed from the vehicle.

1. Remove the engine. See REMOVAL.
2. Remove the engine oil pump. See REMOVAL.

CAUTION: DO NOT pry on the oil pan gasket when removing the oil pan, The oil pan gasket is mounted to the cylinder block in three locations and will remain attached to block when removing oil pan. Gasket can not be removed with oil pan.

3. Remove the bedplate mounting bolts. Note the location of the two stud bolts for installation.
4. Remove the connecting rods from the crankshaft.

CAUTION: The bedplate to cylinder block mating surface is a critical sealing surface. Do not pry on or damage this surface in anyway.

NOTE: The bedplate contains the lower main bearing halves. Use care when

handling bedplate as not to drop or damage bearing halves. Installing main bearing halves in the wrong position will cause severe damage to the crankshaft.

NOTE: The bedplate has pry points cast into it. Use these points only. The pry points are shown in illustration.

5. Carefully pry on the pry points to loosen the bedplate then remove the bedplate. See **Fig. 100**.

CAUTION: When removing the crankshaft, use care not to damage bearing surfaces on the crankshaft.

6. Remove the crankshaft.
7. Remove the crankshaft tone wheel.

INSPECTION

CRANKSHAFT

NOTE: Thoroughly inspect the connecting rod bearing bores and main bearing bores for scoring, blueing or severe scratches. Further disassembly may be required.

If connecting rod bearing bores show damage, the cylinder heads must be removed to service the piston and rod assemblies. If the bedplate or the cylinder block main bearing bores show damage the engine must be replaced.

1. If required, remove the main bearing halves from the cylinder block and bedplate.
2. Thoroughly clean the bedplate to cylinder block sealing surfaces and main bearing bores. Remove all oil and sealant residue.
3. Inspect the bedplate main bearing bores for cracks, scoring or severe blueing. If either condition exists the engine must be replaced.
4. Inspect the crankshaft thrust washers for scoring, scratches, wear or blueing. If either condition exist replace the thrust washers.
5. Inspect the oil pan gasket/windage tray for splits, tears or cracks in the gasket sealing surfaces. Replace gasket as necessary.

INSTALLATION

CRANKSHAFT

80b77054

Fig. 101: Identifying Crankshaft Thrust Washer
Courtesy of CHRYSLER LLC

1 - CRANKSHAFT THRUST WASHER

CAUTION: Main bearings are select fit. Refer to CRANKSHAFT MAIN BEARINGS for proper bearing selections.

CAUTION: When installing crankshaft, use care not to damage bearing surfaces on the crankshaft.

NOTE: Apply sealant to the tone wheel retaining screws prior to installation.

1. Lubricate upper main bearing halves with clean engine oil.
2. Install the crankshaft tone wheel. Tighten the mounting screws to 15 N.m (11 ft. lbs.)
3. Position crankshaft in cylinder block.

4. Install the thrust washers (1).

80e534f6

Fig. 102: Bedplate Sealant
Courtesy of CHRYSLER LLC

- | |
|--------------------|
| 1 - CYLINDER BLOCK |
| 2 - SEALANT |
| 3 - SEALANT |

CAUTION: The bedplate to cylinder block mating surface must be coated with Mopar® Engine RTV sealant prior to installation. Failure to do so will cause severe oil leaks.

NOTE: Make sure that the bedplate and cylinder block sealing surfaces are clean and free of oil or other contaminants. Contaminants on the sealing surfaces may cause main bearing distortion and/or oil leaks.

5. Apply a 2.5 mm (0.100 inch) bead of Mopar® Engine RTV sealant to the cylinder block-to-bedplate mating surface (2,3) as shown in illustration.

★ = STUDS

■ = DOWEL LOCATIONS

Fig. 103: Bedplate Tightening Sequence
Courtesy of CHRYSLER LLC

6. Coat the crankshaft main bearing journals with clean engine oil and position the bedplate onto the cylinder block.

NOTE: Lubricate the bedplate retaining bolts with clean engine oil prior to installation.

7. Install the bedplate retaining bolts, making sure to place the stud bolts in the correct location, Tighten the bolts in the sequence shown in illustration.

Hand tighten bolts **1D, 1G and 1F** until the bedplate contacts the block.

Tighten bolts **1A - 1J** to 54 N.m (40 ft. lbs.)

Tighten bolts **1 - 8** to 7 N.m (5 ft. lbs.)

Turn bolts **1 - 8** an additional 90°.

Tighten bolts **A - E** 27 N.m (20 ft. lbs.).

8. Measure crankshaft end play.
9. Install the connecting rods and measure side clearance. See **STANDARD PROCEDURE**.
10. Install oil pump. See **INSTALLATION**.
11. Install the engine. See **INSTALLATION**.

BEARINGS-CRANKSHAFT MAIN

STANDARD PROCEDURE

CRANKSHAFT MAIN BEARINGS

SELECT FIT IDENTIFICATION

Fig. 104: Markings on Target Wheel
Courtesy of CHRYSLER LLC

1 - REARMOST CRANKSHAFT COUNTER WEIGHT
2 - TARGET WHEEL

3 - MAIN BEARING SELECT FIT MARKINGS

The main bearings are "select fit" to achieve proper oil clearances. For main bearing selection, the crankshaft position sensor target wheel (2) has grade identification marks stamped into it. These marks are read from left to right, corresponding with journal number 1, 2, 3, 4. The crankshaft position sensor target wheel is mounted to the number 6 counter weight (1) on the crankshaft. See **Fig. 104**.

INSPECTION

Wipe the inserts clean and inspect for abnormal wear patterns and for metal or other foreign material imbedded in the lining. Normal main bearing insert wear patterns are illustrated.

Inspect the back of the inserts for fractures, scrapings or irregular wear patterns.

Inspect the upper insert locking tabs for damage.

Replace all damaged or worn bearing inserts.

MAIN BEARING JOURNAL DIAMETER (CRANKSHAFT REMOVED)

Remove the crankshaft from the cylinder block. See **REMOVAL**.

Clean the oil off the main bearing journal.

Determine the maximum diameter of the journal with a micrometer. Measure at two locations 90° apart at each end of the journal.

The maximum allowable taper is 0.008 mm (0.0004 inch.) and maximum out of round is 0.005mm (0.002 inch). Compare the measured diameter with the journal diameter specification (MAIN BEARING FITTING CHART). Select inserts required to obtain the specified bearing-to-journal clearance.

Install the crankshaft into the cylinder block. See **INSPECTION**.

Check crankshaft end play.

CRANKSHAFT MAIN BEARING SELECTION

Crankshaft Marking	JOURNAL SIZE SIZE mm (in.)	
"R" Size	63.488 - 63.496 mm (2.4995 - 2.4998 in.)	
"S" Size	63.496 - 63.500 mm (2.4998 - 2.4999 in.)	
"T" Size	63.500 - 63.504 mm (2.4999 - 2.501 in.)	
"U" Size	63.504 - 63.512 mm (2.5001 - 2.5004 in.)	
Bearing size		
Bearing Code	Size	Application

Upper Bearing		
A	2.443 - 2.447 mm (.0961 -.0963 in.)	Use with crankshaft size "R" -
B	2.439 - 2.443 mm (0.960 -.0961 in.)	Use with crankshaft "S, T" -
C	2.435 - 2.439 mm (.0958 -.0960 in.)	Use with crankshaft "U" -
Lower Bearing Main "1" and "4"		
"1" -	2.441 - 2.447 mm (.0961 -.0963 in.)	Use with crankshaft "R, S" Use with crankshaft "T, U"
"2" -	2.435 - 2.441 mm (.0958 -.0962 in.)	
Lower Main Bearing "2" and "3"		
"3" -	2.429 - 2.435 mm (.0956 -.0958 in.)	Use with crankshaft "R, S" Use with crankshaft "T, U"
"4" -	2.423 - 2.429 mm (.0953 -.0956 in.)	
Bearing Clearances		
Main "1, 4"		
Crankshaft "R"	.004 -.034 mm (.00015 - .0013 in.)	
Crankshaft "S"	.004 -.030 mm (.00015 - .0011 in.)	
Crankshaft "T"	.006 -.032 mm (.0002 - .0012 in.)	
Crankshaft "U"	.002 -.032 mm (.00007 - .0012 in.)	
Main "2, 3"		
Crankshaft "R"	.016 -.046 mm (.0006 - .0018 in.)	
Crankshaft "S"	.016 -.042 mm (.00062 - .016 in.)	
Crankshaft "T"	.018 -.044 mm (.0007 - .0017 in.)	
Crankshaft "U"	.014 -.044 mm (.0005 - .0017 in.)	

1. Service main bearings are available in four grades. The chart identifies the four service grades available.

SEAL-CRANKSHAFT OIL-FRONT

REMOVAL

CRANKSHAFT OIL SEAL - FRONT

80b6b292

Fig. 105: Crankshaft Damper - Removal
Courtesy of CHRYSLER LLC

- | |
|--|
| <p>1 - SPECIAL TOOL 8513 I INSERT</p> <p>2 - SPECIAL TOOL 1026</p> |
|--|

1. Disconnect negative cable from battery.
2. Remove accessory drive belt. Refer to **REMOVAL** .
3. Remove A/C compressor mounting fasteners and set aside.
4. Drain cooling system. Refer to **STANDARD PROCEDURE** .
5. Remove upper radiator hose.
6. Disconnect electrical connector for fan mounted inside radiator shroud.
7. Remove radiator shroud attaching fasteners.

8. Remove radiator cooling fan and shroud. Refer to **REMOVAL** .
9. Remove crankshaft damper bolt.
10. Remove damper using the Crankshaft Insert 8513A (1) and the Three Jaw Puller 1026 (2). See **Fig. 105**.

80b6b290

Fig. 106: Crankshaft Front Seal Removal
Courtesy of CHRYSLER LLC

1 - SPECIAL TOOL 8511

11. Using Seal Remover 8511, remove crankshaft front seal (1). See **Fig. 106**.

INSTALLATION

CRANKSHAFT OIL SEAL - FRONT

Fig. 107: Crankshaft Front Seal Installation
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - TIMING CHAIN COVER
2 - SPECIAL TOOL 8348
3 - SPECIAL TOOL 8512 |
|--|

CAUTION: To prevent severe damage to the Crankshaft, Damper or Special Tool 8512, thoroughly clean the damper bore and the crankshaft nose before installing Damper.

1. Using the Seal Installer 8348 (2) and Damper Installer 8512 (3), install crankshaft front seal. See **Fig. 107.**
2. Install vibration damper. See **INSTALLATION.**
3. Install radiator cooling fan and shroud. Refer to **INSTALLATION** .
4. Install upper radiator hose.
5. Install A/C compressor and tighten fasteners to 54 N.m (40 ft. lbs.).
6. Install accessory drive belt refer. Refer to **INSTALLATION** .
7. Refill cooling system. Refer to **STANDARD PROCEDURE** .
8. Connect negative cable to battery.

SEAL-CRANKSHAFT OIL-REAR

DIAGNOSIS AND TESTING

REAR CRANKSHAFT OIL SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect the battery.
2. Raise the vehicle.
3. Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:
 - Circular spray pattern generally indicates seal leakage or crankshaft damage.
 - Where leakage tends to run straight down, possible causes are a porous block, oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces.
4. If no leaks are detected, pressurize the crankcase as outlined in **AIR LEAK DETECTION TEST METHOD**

CAUTION: Do not exceed 20.6 kPa (3 psi).

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks or scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.

6. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled. See OIL LEAKS row under **ENGINE LUBRICATION DIAGNOSTIC TABLE** for components inspections on possible causes and corrections.
7. After the oil leak root cause and appropriate corrective action have been identified, see **REMOVAL**.

REMOVAL

CRANKSHAFT OIL SEAL - REAR

Fig. 108: Crankshaft Rear Oil Seal Removal
Courtesy of CHRYSLER LLC

NOTE: This procedure can be performed in vehicle.

1. If being performed in vehicle, remove the transmission.
2. Remove the flexplate. See **REMOVAL**.

NOTE: The crankshaft oil seal CAN NOT be reused after removal.

NOTE: The crankshaft rear oil seal remover 8506 must be installed deeply into the seal. Continue to tighten the removal tool into the seal until the tool can not be turned farther. Failure to install tool correctly the first time will cause tool to pull free of seal without removing seal from engine.

3. Using Seal Remover 8506 (2), remove the crankshaft rear oil seal (1).

INSTALLATION

CRANKSHAFT OIL SEAL - REAR

Fig. 109: Positioning Seal Guide Special Tool 8349-2 Onto Crankshaft Rear Face
Courtesy of CHRYSLER LLC

- | |
|-------------------------------|
| 1 - REAR CRANKSHAFT SEAL |
| 2 - SPECIAL TOOL 8349-2 GUIDE |

1. Lubricate the crankshaft flange with engine oil.

2. Position the magnetic seal guide 8349-2 onto the crankshaft rear face. Then position the crankshaft rear oil seal (1) onto the guide (2).

Fig. 110: Crankshaft Rear Oil Seal Installation
Courtesy of CHRYSLER LLC

1 - REAR CRANKSHAFT SEAL
2 - SPECIAL TOOL 8349-1 INSTALLER
3 - SPECIAL TOOL C-4171 HANDLE

3. Using Crankshaft Rear Oil Seal Installer 8349 (2) and Driver Handle C-4171 (3), with a hammer, tap the seal (1) into place. Continue to tap on the driver handle until the seal installer seats against the cylinder block crankshaft bore.
4. Install the flexplate.
5. Install the transmission.

REMOVAL

FLEXPLATE

1. Remove the transmission.
2. Remove the bolts and flexplate.

INSTALLATION

FLEXPLATE

Fig. 111: Flexplate Loosening/Tightening Sequence
Courtesy of CHRYSLER LLC

1. Position the flexplate (1) onto the crankshaft and install the bolts hand tight.
2. Tighten the flexplate retaining bolts to 95 N.m (70 ft. lbs.) in the sequence shown in illustration. See **Fig. 111**.
3. Install the transmission.

ROD-PISTON AND CONNECTING

DESCRIPTION

DESCRIPTION PISTON AND CONNECTING ROD

Fig. 112: Piston & Rod Assembly
Courtesy of CHRYSLER LLC

- | |
|----------------------|
| 1 - CONNECTING ROD |
| 2 - PISTON |
| 3 - PISTON PIN |
| 4 - OIL SLINGER SLOT |

CAUTION: Do not use a metal stamp to mark connecting rods as damage may result,

instead use ink or a scratch awl.

The pistons (2) are made of a high strength aluminum alloy. The connecting rods (1) are made of forged powdered metal, with a "fractured cap" design. A full floating piston pin is used to attach the piston to the connecting rod. See **Fig. 112**.

STANDARD PROCEDURE

CONNECTING ROD BEARING FITTING

80f77803

Fig. 113: Scoring Caused By Insufficient Lubrication or Damaged Crankshaft Journal
Courtesy of CHRYSLER LLC

Inspect the connecting rod bearings for scoring. Check the bearings for normal wear patterns, scoring, grooving, fatigue and pitting. See **Fig. 113**. Replace any bearing that shows abnormal wear.

Inspect the connecting rod journals for signs of scoring, nicks and burrs.

Misaligned or bent connecting rods can cause abnormal wear on pistons, piston rings, cylinder walls, connecting rod bearings and crankshaft connecting rod journals. If wear patterns or damage to any of these components indicate the probability of a misaligned connecting rod, inspect it for correct rod alignment. Replace misaligned, bent or twisted connecting rods.

80f11849

Fig. 114: Bearing Insert Location
Courtesy of CHRYSLER LLC

1 - Connecting Rod
2 - Bearing Insert
- A, B less then .50 mm (.0196 in.)

1. Wipe the oil from the connecting rod journal.
2. Lubricate the upper bearing insert and position in connecting rod. **Center bearing insert (2) in connecting rod (1).** See **Fig. 114**.

80b77088

Fig. 115: Piston & Connecting Rod - Installation - Typical

Courtesy of CHRYSLER LLC

- | |
|--------------------------------|
| 1 - "F" TOWARD FRONT OF ENGINE |
| 2 - OIL SLINGER SLOT |
| 3 - RING COMPRESSOR |
| 4 - SPECIAL TOOL 8507 |

3. Use piston ring compressor (3) and Connecting Rod Guides 8507 to install the rod and piston assemblies. The oil slinger slots in the rods must face front of the engine. The "F"'s near the piston wrist pin bore (1) should point to the front of the engine. See **Fig. 115**.

80f777cc

Fig. 116: Measuring Bearing Clearance With Plastigage
Courtesy of CHRYSLER LLC

- | |
|---------------------------|
| 1 - PLASTIGAGE SCALE |
| 2 - COMPRESSED PLASTIGAGE |

4. Install the lower bearing insert in the bearing cap. **Center bearing insert in connecting rod.** . The lower

insert must be dry. Place strip of Plastigage across full width of the lower insert at the center of bearing cap. See **Fig. 116**. Plastigage must not crumble in use. If brittle, obtain fresh stock.

5. Install bearing cap and connecting rod on the journal and tighten bolts to 27 N.m (20 ft. lbs.) plus a 90° turn. DO NOT rotate crankshaft. Plastigage will smear, resulting in inaccurate indication.
6. Remove the bearing cap and determine amount of bearing-to-journal clearance by measuring the width of compressed Plastigage (2). Refer to **SPECIFICATIONS** for the proper clearance. **Plastigage should indicate the same clearance across the entire width of the insert. If the clearance varies, it may be caused by either a tapered journal, bent connecting rod or foreign material trapped between the insert and cap or rod.**
7. If the correct clearance is indicated, replacement of the bearing inserts is not necessary. Remove the Plastigage from crankshaft journal and bearing insert. Proceed with installation.

Bearing Mark	SIZE	USED WITH JOURNAL SIZE
.025 US	.025 mm (.001 in.)	57.883 - 57.867 mm (2.2788 - 2.2783 in.)
Std.	STANDARD	57.908 - 57.892 mm (2.2798 - 2.2792 in.)
.250 US -	.250 mm (.010 in.)	57.658 - 57.646 mm (2.2700 - 2.2695 in.)

8. If bearing-to-journal clearance exceeds the specification, determine which services bearing set to use the bearing sizes are as follows:

CAUTION: Connecting Rod Bolts are Torque to Yield Bolts and Must Not Be Reused. Always replace the Rod Bolts whenever they are loosened or removed.

9. Repeat the Plastigage measurement to verify your bearing selection prior to final assembly.
10. Once you have selected the proper insert, install the insert and cap. Tighten the connecting rod bolts to 27 N.m (20 ft. lbs.) plus a 90° turn.

Fig. 117: Checking Connecting Rod Side Clearance - Typical
Courtesy of CHRYSLER LLC

Slide snug-fitting feeler gauge between the connecting rod and crankshaft journal flange. See **Fig. 117**. Refer to **SPECIFICATIONS** for the proper clearance. Replace the connecting rod if the side clearance is not within specification.

PISTON FITTING

805dd884

Fig. 118: Measuring Cylinder Diameter With Bore Gauge - Typical
 Courtesy of CHRYSLER LLC

- 1 - FRONT
- 2 - BORE GAUGE
- 3 - CYLINDER BORE
- 4 - 38 MM
(1.5 in)

1. To correctly select the proper size piston, a cylinder bore gauge (2), capable of reading in 0.003 mm (.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer. See **Fig. 118**.

2. Measure the inside diameter of the cylinder bore (3) at a point 38.0 mm (1.5 inches) below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft at point A and then take an additional bore reading 90 degrees to that at point B.

80aac2ao

Fig. 119: Typical Moly Coated Piston
Courtesy of CHRYSLER LLC

1 - MOLY COATED
2 - MOLY COATED

3. The coated pistons (1,2) will be serviced with the piston pin and connecting rod pre-assembled. See **Fig. 119**.
4. The coating material is applied to the piston after the final piston machining process. Measuring the outside diameter of a coated piston (1,2) will not provide accurate results. Therefore measuring the inside diameter of the cylinder bore with a dial Bore Gauge is **MANDATORY**. To correctly select the proper size piston, a cylinder bore gauge capable of reading in 0.003 mm (.0001 in.) increments is required.
5. Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

REMOVAL

REMOVAL PISTON AND CONNECTING ROD

1. Disconnect negative cable from battery.
2. Remove the following components:
 - Oil pan and gasket/windage tray. See **REMOVAL**.
 - Cylinder head covers. See **REMOVAL**.
 - Timing chain cover. See **REMOVAL**.
 - Cylinder head(s). See **REMOVAL**.
3. If necessary, remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation.** Pistons and connecting rods must be removed from top of cylinder block. When removing piston and connecting rod assemblies from the engine, rotate crankshaft so the each connecting rod is centered in cylinder bore.

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

4. Mark connecting rod and bearing cap positions using a permanent ink marker or scribe tool.

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

5. Remove connecting rod cap. Install the Connecting Rod Guides 8507 into the connecting rod being removed. Remove piston from cylinder bore. Repeat this procedure for each piston being removed.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur

6. Immediately after piston and connecting rod removal, install bearing cap on the mating connecting rod to prevent damage to the fractured cap and rod surfaces.

CLEANING

PISTON AND CONNECTING ROD

CAUTION: DO NOT use a wire wheel or other abrasive cleaning devise to clean the pistons or connecting rods. The pistons have a Moly coating, this coating must not be damaged.

1. Using a suitable cleaning solvent clean the pistons in warm water and towel dry.
2. Use a wood or plastic scraper to clean the ring land grooves.

CAUTION: DO NOT remove the piston pin from the piston and connecting rod assembly.

INSPECTION

PISTON AND CONNECTING ROD

Check the connecting rod journal for excessive wear, taper and scoring.

Check the connecting rod for signs of twist or bending.

Check the piston for taper and elliptical shape before it is fitted into the cylinder bore.

Check the piston for scoring, or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.

INSTALLATION

PISTON AND CONNECTING ROD

80b77088

Fig. 120: Installing Piston & Connecting Rod

1 - "F" TOWARD FRONT OF ENGINE 2 - OIL SLINGER SLOT 3 - RING COMPRESSOR 4 - SPECIAL TOOL 8507
--

1. Before installing piston and connecting rod assemblies into the bore, install the piston rings.
2. Immerse the piston head and rings in clean engine oil. Position a ring compressor over the piston and rings. Tighten ring compressor. **Ensure position of rings do not change during this operation.**
3. Position bearing onto connecting rod. Ensure that tabs in bearing shell aligns with slots in connecting rod. Verify that parting line of bearing is aligned with parting line of connecting rod.
4. Lubricate bearing surface with clean engine oil.
5. Install Connecting Rod Guides 8507 (4) onto connecting rod bolt threads. See **Fig. 120**.

808a1f06

Fig. 121: Identifying Proper Connecting Rod Installation
Courtesy of CHRYSLER LLC

1 - MAJOR THRUST SIDE OF PISTON 2 - OIL SLINGER SLOT

6. The pistons are marked on the piston pin bore surface with an raised "F" indicating installation position. This mark must be pointing toward the front of engine on both cylinder banks. The connecting rod oil slinger slot (2) faces the front of the engine. See **Fig. 121**.
7. Wipe cylinder bore clean and lubricate with engine oil.
8. Rotate crankshaft until connecting rod journal is on the center of cylinder bore. Insert rod and piston into cylinder bore and carefully position connecting rod guides over crankshaft journal.
9. Tap piston down in cylinder bore using a hammer handle. While at the same time, guide connecting rod into position on rod journal.

CAUTION: Connecting Rod Bolts are Torque to Yield Bolts and Must Not Be Reused. Always replace the Rod Bolts whenever they are loosened or removed.

10. Lubricate rod bolts and bearing surfaces with engine oil. Install connecting rod cap and bearing. Tighten bolts to 27 N.m (20 ft. lbs.) plus 90°.
11. Install the following components:
 - Cylinder head(s). See **INSTALLATION**.
 - Timing chain and cover. See **INSTALLATION**.
 - Cylinder head covers. See **INSTALLATION**.
 - Oil pan and gasket/windage tray. See **INSTALLATION**.
12. Fill crankcase with proper engine oil to correct level.
13. Connect negative cable to battery.

RINGS-PISTON

STANDARD PROCEDURE

PISTON RING FITTING

Fig. 122: Ring End Gap Measurement - Typical
Courtesy of CHRYSLER LLC

1 - FEELER GAUGE

Before reinstalling used rings or installing new rings, the ring clearances must be checked.

1. Wipe the cylinder bore clean.
2. Insert the ring in the cylinder bore.

NOTE: The ring gap measurement must be made with the ring positioned at least 12 mm (0.50 inch.) from bottom of cylinder bore.

3. Using a piston, to ensure that the ring is squared in the cylinder bore, slide the ring downward into the cylinder.
4. Using a feeler gauge (1) check the ring end gap. Replace any rings not within specification.

805dd887

Fig. 123: Measuring Piston Ring Side Clearance
Courtesy of CHRYSLER LLC

1 - FEELER GAUGE

PISTON RING SIDE CLEARANCE

NOTE: Make sure the piston ring grooves are clean and free of nicks and burrs.

5. Measure the ring side clearance as shown in illustration make sure the feeler gauge (1) fits snugly between the ring land and the ring. Replace any ring not within specification.
6. Rotate the ring around the piston, the ring must rotate in the groove with out binding.

PISTON RING SPECIFICATION CHART

Ring Position	Groove Clearance	Maximum Clearance
Upper Ring	0.051 - 0.094 mm (0.0020 - 0.0037 in.)	0.11 mm (0.004 in.)
Intermediate Ring	0.04 - 0.08 mm (0.0016 - 0.0031 in.)	0.10 mm (0.004 in.)
Oil Control Ring (Steel Rails)	0.019 - 0.229 mm (0.0007 - 0.0090 in.)	0.25 mm (0.010 in.)
Ring Position	Ring Gap	Wear Limit
Upper Ring -	0.20 - 0.36 mm (0.0079 - 0.0142 in.)	0.43 mm (0.0017 in.)
Intermediate Ring -	0.37 - 0.63 mm (0.0146 - 0.0249 in.)	0.74 mm (0.029 in.)
Oil Control Ring (Steel Rail)	0.025 - 0.76 mm (0.0099 - 0.03 in.)	1.55 mm (0.061 in.)

80ae8450

Fig. 124: Side Rail - Installation

1 - SIDE RAIL END

7. The No. 1 and No. 2 piston rings have a different cross section. Ensure No. 2 ring is installed with manufacturers I.D. mark (Dot) facing up, towards top of the piston.

NOTE: Piston rings are installed in the following order:

Oil ring expander.

Upper oil ring side rail.

Lower oil ring side rail.

No. 2 Intermediate piston ring.

No. 1 Upper piston ring.

8. Install the oil ring expander.
9. Install upper side rail (1) by placing one end between the piston ring groove and the expander ring. Hold end firmly and press down the portion to be installed until side rail is in position. Repeat this step for the lower side rail.

9309-47

Fig. 125: Piston Ring Remover/Installer
Courtesy of CHRYSLER LLC

10. Install No. 2 intermediate piston ring using a piston ring installer.
11. Install No. 1 upper piston ring using a piston ring installer.

- | |
|---|
| 1 - SPECIAL TOOL 8513 I INSERT
2 - SPECIAL TOOL 1026 |
|---|

1. Disconnect negative cable from battery.
2. Remove accessory drive belt. Refer to **REMOVAL** .

NOTE: **Transmission cooler line snaps into shroud lower right hand corner.**

3. Remove crankshaft damper bolt.
4. Remove damper using Crankshaft Insert 8513A (1) and Three Jaw Puller 1026(2).

INSTALLATION

CRANKSHAFT DAMPER

Fig. 128: Proper Assembly Method for Special Tool 8512-A
Courtesy of CHRYSLER LLC

- 1 - BEARING
- 2 - NUT
- 3 - THREADED ROD
- 4 - BEARING HARDENED SURFACE (FACING NUT)
- 5 - HARDENED WASHER

CAUTION: To prevent severe damage to the Crankshaft, Damper or Special Tool 8512, thoroughly clean the damper bore and the crankshaft nose before installing Damper.

1. Align crankshaft damper slot with key in crankshaft. Slide damper onto crankshaft slightly.

CAUTION: Damper Installer 8512A, is assembled in a specific sequence. Failure to assemble this tool in this sequence can result in tool failure and severe damage to either the tool or the crankshaft.

2. Assemble the Damper Installer 8512A as follows, The nut is threaded onto the shaft first. Then the roller bearing (1) is placed onto the threaded rod (3) (The hardened bearing surface of the bearing **MUST** face the nut). Then the hardened washer slides onto the threaded rod. See **Fig. 128**. Once assembled coat the threaded rod's threads with Mopar® Nickel Anti-Seize or (Loctite No. 771).

Fig. 129: Crankshaft Damper Installation
Courtesy of CHRYSLER LLC

1 - SPECIAL TOOL 8512A

3. Using the Damper Installer 8512A (1), press damper onto the crankshaft. See **Fig. 129**.
4. Install then tighten crankshaft damper bolt to 175 N.m (130 ft. lbs.).
5. Install accessory drive belt. Refer to **INSTALLATION** .
6. Connect negative cable to battery.

COVER-STRUCTURAL

DESCRIPTION

STRUCTURAL DUST COVER

The structural dust cover is made of die cast aluminum and joins the lower half of the transmission bell housing to the engine bedplate.

OPERATION

STRUCTURAL DUST COVER

The structural cover provides additional powertrain stiffness and reduces noise and vibration.

REMOVAL

STRUCTURAL COVER

Fig. 130: Removing/Installing Structural Cover
Courtesy of CHRYSLER LLC

1 - BOLT
2 - BOLT
3 - BOLT

1. Raise vehicle on hoist.
2. Remove the bolts (1) retaining structural cover. See **Fig. 130**.
3. Remove the structural cover.

INSTALLATION

STRUCTURAL COVER

Fig. 131: Removing/Installing Structural Cover
Courtesy of CHRYSLER LLC

1 - BOLT
2 - BOLT
3 - BOLT

CAUTION: The structural cover must be installed as described in the following steps. Failure to do so will cause severe damage to the cover.

1. Position the structural cover in the vehicle.
2. Install all bolts (1) retaining the cover-to-engine. DO NOT tighten the bolts at this time.
3. Install the cover-to-transmission bolts. Do NOT tighten at this time.

CAUTION: The structural cover must be held tightly against both the engine and the transmission bell housing during tightening sequence. Failure to do so may cause damage to the cover.

4. Starting with the two rear cover-to-engine bolts, tighten bolts (1) to 54 N.m (40 ft. lbs.), then tighten bolts (2) and (3) to 54 N.m (40 ft. lbs.) in the sequence shown in illustration. See **Fig. 131**.

ENGINE MOUNTING

MOUNT - ENGINE FRONT

REMOVAL

REMOVAL FRONT ENGINE MOUNT

808c2c9d

Fig. 132: Engine Insulator Mount 3.7 Left

|---------------|
| 1 - MOUNT |
| 2 - THRU BOLT |
| 3 - BOLT |
| 4 - NUT |

6. Using the jack, raise the engine high enough to remove the engine insulator mount thru bolt (2) and the insulator mount and. See **Fig. 132**. See **Fig. 133**.

INSTALLATION

INSTALLATION FRONT ENGINE MOUNT

1. Position the insulator mount and install the insulator mount through bolt.
2. Lower the engine until the cylinder block-to-insulator mount bolts can be installed.
3. Remove the jack and block of wood.
4. Tighten the cylinder block-to-insulator mount bolts to 61 N.m (45 ft. lbs.).
5. Install and tighten the through bolt retaining nut to 61 N.m (45 ft. lbs.).
6. Install the fan blade, fan clutch and fan shroud.

MOUNT - ENGINE REAR

REMOVAL

ENGINE MOUNT - REAR

NOTE: **A resilient rubber cushion supports the transmission at the rear between the transmission extension housing and the rear support crossmember or skid plate.**

1. Disconnect negative cable from battery.
2. Raise the vehicle and support the transmission.
3. Remove the nuts holding the support cushion to the crossmember. Remove the crossmember.

MANUAL TRANSMISSION

Remove the support cushion nuts and remove the cushion.

Remove the transmission support bracket bolts and remove the bracket from the transmission.

AUTOMATIC TRANSMISSION

Remove the support cushion bolts and remove the cushion and the support bracket from the transmission (4WD) or from the Adapter bracket (2WD).

On 2WD vehicles, remove the bolts holding the transmission support Adapter bracket to the transmission. Remove the Adapter bracket.

INSTALLATION

ENGINE MOUNT - REAR

MANUAL TRANSMISSION:

- | |
|-----------------|
| 1 - NUT |
| 2 - BOLT |
| 3 - TRANS MOUNT |

1. Install the transmission mount (1) to the transmission. Install the bolts (2) and tighten.
2. Position the crossmember in the vehicle. Install the crossmember to mount through bolt and nut.
3. Install crossmember-to-sill bolts and tighten to 41 N.m (30 ft. lbs.)

4. Remove the transmission support.
5. Lower the vehicle.
6. Connect negative cable to battery.

AUTOMATIC TRANSMISSION:

Courtesy of CHRYSLER LLC

1 - BOLT
2 - MOUNT

Fig. 137: Transmission Mount - 3.7L 4WD Auto Trans
Courtesy of CHRYSLER LLC

1 - MOUNT
2 - BOLT

1. Install the transmission mount to transmission. See **Fig. 136** and **Fig. 137**. Install the bolts.
2. Position the crossmember in the vehicle. Install the crossmember to mount through bolt and nut.
3. Remove the transmission support.
4. Lower the vehicle.
5. Connect negative cable to battery.

LUBRICATION

DESCRIPTION

LUBRICATION

The lubrication system is a full flow filtration pressure feed type.

OPERATION

LUBRICATION

ENGINE LUBRICATION FLOW CHART - BLOCK: TABLE 1

FROM	TO
Oil Pickup Tube	Oil Pump
Oil Pump	Oil Filter
Oil Filter	Block Main Oil Gallery
Block Main Oil Gallery	1. Crankshaft Main Journal
-	2. Left Cylinder Head*
-	3. Right Cylinder Head*
-	4. Counterbalance Shaft Rear Journal
Crankshaft Main Journals	Crankshaft Rod Journals
Crankshaft Number One Main Journal	1. Front Timing Chain Idler Shaft
-	2. Counterbalance Shaft - Front Journal
-	3. Both Secondary Chain Tensioners
Left Cylinder Head	Refer to ENGINE LUBRICATION FLOW CHART - CYLINDER HEADS: TABLE 2
Right Cylinder Head	Refer to ENGINE LUBRICATION FLOW CHART - CYLINDER HEADS: TABLE 2
* The cylinder head gaskets have an oil restricter to control oil flow to the cylinder heads

-	2. Lash Adjuster Towers
Base of Camshaft Towers	Vertical Drilling Through Tower to Camshaft Bearings**
Lash Adjuster Towers	Diagonal Drillings to Hydraulic Lash Adjuster Pockets
** The number three camshaft bearing journal feeds oil into the hollow camshaft tubes. Oil is routed to the intake lobes, which have oil passages drilled into them to lubricate the rocker arms.	

80bbb21e

Fig. 138: Lubrication Oil Flow
 Courtesy of CHRYSLER LLC

- 1 - OIL FLOW TO RIGHT CYLINDER HEAD
- 2 - CYLINDER BLOCK MAIN OIL GALLERY
- 3 - LEFT CYLINDER HEAD OIL GALLERY
- 4 - OIL FLOW TO BOTH SECONDARY TENSIONERS
- 5 - OIL FLOW TO LEFT CYLINDER HEAD
- 6 - OIL PRESSURE SENSOR LOCATION
- 7 - OIL FLOW TO COUNTER BALANCE SHAFT
- 8 - OIL PUMP OUTLET TO CYLINDER BLOCK
- 9 - OIL PUMP

- 10 - OIL FLOW TO CRANKSHAFT MAIN JOURNALS
- 11 - CRANKSHAFT MAIN BEARING JOURNALS
- 12 - RIGHT CYLINDER HEAD OIL GALLERY

Oil from the oil pan is pumped by a gerotor type oil pump (9) directly mounted to the crankshaft nose. Oil pressure is controlled by a relief valve mounted inside the oil pump housing.

The camshaft exhaust valve lobes and rocker arms are lubricated through a small hole in the rocker arm; oil flows through the lash adjuster then through the rocker arm and onto the camshaft lobe. Due to the orientation of the rocker arm, the camshaft intake lobes are not lubed in the same manner as the exhaust lobes. The intake lobes are lubed through internal passages in the camshaft. Oil flows through a bore in the No. 3 camshaft bearing bore, and as the camshaft turns, a hole in the camshaft aligns with the hole in the camshaft bore allowing engine oil to enter the camshaft tube. See **Fig. 138**. The oil then exits through 1.6 mm (0.063 in.) holes drilled into the intake lobes, lubricating the lobes and the rocker arms.

DIAGNOSIS AND TESTING

CHECKING ENGINE OIL PRESSURE

Fig. 139: Locating Oil Pressure Sending Unit, Connector & Oil Filter
Courtesy of CHRYSLER LLC

- 1 - BELT
- 2 - OIL PRESSURE SENSOR
- 3 - OIL FILTER
- 4 - ELEC. CONNECTOR

1. Remove oil pressure sending unit (2) and install gauge assembly C-3292. See **Fig. 139**.
2. Run engine until thermostat opens.
3. Oil Pressure:
 - Curb Idle - 25 kPa (4 psi) minimum

3000 RPM - 170 - 758 kPa (25 - 110 psi)

4. If oil pressure is 0 at idle, shut off engine. Check for a clogged oil pick-up screen or a pressure relief valve stuck open.

ENGINE OIL LEAK

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.
2. Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.
3. Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair per service information instructions.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.

If the oil leak source is not positively identified at this time, proceed with the AIR LEAK DETECTION TEST METHOD.

AIR LEAK DETECTION TEST METHOD

1. Disconnect the breather cap to air cleaner hose at the breather cap end. Cap or plug breather cap nipple.
2. Remove the PCV valve from the cylinder head cover. Cap or plug the PCV valve grommet.
3. Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.

4. Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service information procedures.
5. If the leakage occurs at the rear oil seal area, refer to INSPECTION FOR REAR SEAL AREA LEAK.
6. If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve and breather cap hose.
7. Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect the battery.
2. Raise the vehicle.
3. Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:
 - Circular spray pattern generally indicates seal leakage or crankshaft damage.
 - Where leakage tends to run straight down, possible causes are a porous block, camshaft bore cup plugs oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces.
4. If no leaks are detected, pressurize the crankcase as outlined in **AIR LEAK DETECTION TEST METHOD**

CAUTION: Do not exceed 20.6 kPa (3 psi).

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

6. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

REAR CRANKSHAFT OIL SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect the battery.
2. Raise the vehicle.
3. Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:
 - Circular spray pattern generally indicates seal leakage or crankshaft damage.
 - Where leakage tends to run straight down, possible causes are a porous block, oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces.
4. If no leaks are detected, pressurize the crankcase as outlined in **AIR LEAK DETECTION TEST METHOD**

CAUTION: Do not exceed 20.6 kPa (3 psi).

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks or scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.

6. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled. See OIL LEAKS row under **ENGINE LUBRICATION DIAGNOSTIC TABLE** for components inspections on possible causes and corrections.
7. After the oil leak root cause and appropriate corrective action have been identified, see **REMOVAL**.

OIL

STANDARD PROCEDURE

ENGINE OIL SERVICE

808a1b92

Fig. 140: Identifying Engine Oil & Transmission Dipsticks & Engine Oil Fill Cap
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - TRANSMISSION DIPSTICK
2 - ENGINE OIL DIPSTICK
3 - ENGINE OIL FILL CAP |
|---|

The engine oil level indicator (1) is located at the right rear of the engine on the 3.7L/4.7L engines. See **Fig. 140**.

CRANKCASE OIL LEVEL INSPECTION

CAUTION: Do not overfill crankcase with engine oil, pressure loss or oil foaming can result.

Inspect engine oil level approximately every 800 kilometers (500 miles). Unless the engine has exhibited loss of oil pressure, run the engine for about five minutes before checking oil level. Checking engine oil level on a cold engine is not accurate.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable levels are indicated between the ADD and SAFE marks on the engine oil dipstick.

1. Position vehicle on level surface.
2. With engine OFF, allow approximately ten minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.
3. Wipe dipstick clean.
4. Install dipstick and verify it is seated in the tube.
5. Remove dipstick, with handle held above the tip, take oil level reading.
6. Add oil only if level is below the ADD mark on dipstick.

ENGINE OIL CHANGE

Change engine oil at mileage and time intervals described in Maintenance Schedules.

Run engine until achieving normal operating temperature.

1. Position the vehicle on a level surface and turn engine off.
2. Hoist and support vehicle on safety stands.
3. Remove oil fill cap.
4. Place a suitable drain pan under crankcase drain.
5. Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug if damaged.
6. Install drain plug in crankcase.
7. Lower vehicle and fill crankcase with specified type and amount of engine oil.
8. Install oil fill cap.
9. Start engine and inspect for leaks.
10. Stop engine and inspect oil level.

NOTE: Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine.

FILTER-ENGINE OIL

REMOVAL

ENGINE OIL FILTER

80b76f81

Fig. 141: Oil Filter - 4.7L Engine
Courtesy of CHRYSLER LLC

1 - ENGINE OIL FILTER

All engines are equipped with a high quality full-flow, disposable type oil filter. DaimlerChrysler Corporation recommends a Mopar® or equivalent oil filter be used.

1. Position a drain pan under the oil filter (1).
2. Using a suitable oil filter wrench loosen filter.
3. Rotate the oil filter counterclockwise to remove it from the cylinder block oil filter boss. See **Fig. 141**.
4. When filter separates from cylinder block oil filter boss, tip gasket end upward to minimize oil spill. Remove filter from vehicle.

NOTE: **Make sure filter gasket was removed with filter.**

5. With a wiping cloth, clean the gasket sealing surface of oil and grime.

INSTALLATION

ENGINE OIL FILTER

Fig. 142: Oil Filter Sealing Surface - Typical
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - SEALING SURFACE
2 - RUBBER GASKET
3 - OIL FILTER |
|--|

1. Lightly lubricate oil filter gasket (2) with engine oil. See **Fig. 142**.
2. Thread filter (3) onto adapter nipple. When gasket makes contact with sealing surface, hand tighten filter one full turn, do not over tighten.
3. Add oil, verify crankcase oil level and start engine. Inspect for oil leaks.

PAN-ENGINE OIL

DESCRIPTION

OIL PAN

80ca56ed

Fig. 143: Oil Pan & Gasket
Courtesy of CHRYSLER LLC

2 - WINDAGE TRAY AND INTEGRATED OIL PAN GASKET

The engine oil pan (1) is made of laminated steel and has a single plane sealing surface. The sandwich style oil pan gasket has an integrated windage tray (2) and steel carrier. The sealing area of the gasket is molded with rubber and is designed to be reused as long as the gasket is not cut, torn or ripped. See **Fig. 143**.

REMOVAL

REMOVAL OIL PAN - 4X2

80ca56ed

Fig. 144: Oil Pan & Gasket
Courtesy of CHRYSLER LLC

2 - WINDAGE TRAY AND INTEGRATED OIL PAN GASKET

1. Disconnect and isolate negative battery cable.
2. Install engine support fixture.
3. Raise and support vehicle.
4. Remove front wheel assemblies.
5. Remove skid plate (if equipped). Refer to **REMOVAL** .
6. Drain engine oil.
7. Mark adjustment cam position of front lower control arm bolts.
8. Remove front lower control arm bolts. Refer to **REMOVAL** .
9. Disconnect LH tie rod. Refer to **REMOVAL** .
10. Disconnect LH lower ball joint. Refer to **REMOVAL** .
11. Disconnect LH strut clevis. Refer to **REMOVAL** .
12. Remove LH front axle. Refer to **REMOVAL** .
13. Remove front axle brace bolts.
14. Remove front prop shaft. Refer to **REMOVAL** .
15. Drain front axle.
16. Using a transmission jack, support front axle.
17. Remove axle bracket bolts.
18. With RH axle still in place, remove front differential.
19. Remove transmission oil cooler line bracket.
20. Remove engine to transmission stiffening bracket.
21. Position Engine Support 8534 on the fender lip and align the slots in the brackets with the fender mounting holes.
22. Secure brackets to the fender using four M6 X 1.0 X 25 MM flanged cap screws.
23. Tighten the thumbscrews to secure the sleeves to the support tube.
24. Secure the support tube in an upright position.
25. Assemble the flat washer, thrust bearing, hook and T handle.
26. Using the M10 X 1.75 mm flanged nut supplied with the support fixture, secure the chain to the front engine lifting stud.
27. Loosen engine mounts.
28. Remove oil pan bolts.
29. Separate oil pan (1) from engine.
30. Move oil pan to one side, remove oils sump bolt and windage tray bolts,

NOTE: **Do not pry on oil pan or oil pan gasket. Gasket is integral to engine windage tray and does not come out with oil pan. See Fig. 144.**

31. Move the oil pan and windage tray (2) toward front of vehicle and remove from vehicle.

REMOVAL - 4X4

1. Disconnect Battery.
2. Install Engine Support Fixture 8534.
3. Raise and support vehicle.
4. Remove front wheel and tire assemblies.
5. Remove skid plate (if equipped).
6. Drain engine oil.
7. Remove engine to transmission structural cover, (if equipped).
8. Remove transmission oil cooler line bracket.
9. Remove the front axle assembly from the vehicle.
10. Loosen both engine mount through bolts.
11. Lower the vehicle.

NOTE: It is not necessary to remove the viscous fan , or fan shroud, for oil pan removal.

12. Raise the engine using Engine Support Fixture 8534, until the viscous fan almost touches the fan shroud.
13. Raise the vehicle.
14. Remove the oil pan bolts.
15. Separate the oil pan from the engine.
16. Remove the (2) nuts and (1) bolt holding the oil pump pick-up tube, and windage tray in place.

NOTE: It will be necessary to move the oil pan from side to side to gain access to these fasteners.

17. Drop the oil pump pick-up tube into the oil pan, and remove the oil pan, pick-up tube, and the windage tray, as an assembly, from the front of the vehicle.

CLEANING

OIL PAN

1. Clean oil pan in solvent and wipe dry with a clean cloth.
2. Clean the oil pan gasket surface. **DO NOT** use a grinder wheel or other abrasive tool to clean sealing surface.
3. Clean oil screen and tube thoroughly in clean solvent.

INSPECTION

OIL PAN

1. Inspect oil drain plug and plug hole for stripped or damaged threads. Repair as necessary.

2. Inspect the oil pan mounting flange for bends or distortion. Straighten flange, if necessary.

INSTALLATION

INSTALLATION - 4X4

1. Inspect oil pan gasket for defects, and replace if necessary.
2. Clean the oil pan and block gasket mating surfaces.
3. Drop the oil pump pick-up tube into the oil pan, and install the oil pan, pick-up tube, and the windage tray, as an assembly, from the front of the vehicle.
4. Install the windage tray, then the oil pump pick-up tube, and the (2) nuts and (1) bolt holding the oil pump pick-up tube, in place.

NOTE: **It will be necessary to move the oil pan from side to side to gain access to these fasteners.**

5. Torque the pick-up tube fasteners.
6. Install the oil pan.
7. Install and torque the oil pan bolts.
8. Install the engine to transmission structural cover, (if equipped).
9. Lower the vehicle.
10. Lower the engine using Engine Support Fixture 8534.
11. Remove the Engine Support Fixture 8534.
12. Raise the vehicle.
13. Tighten both engine mount through bolts.
14. Install the transmission oil cooler line bracket.
15. Install the front axle assembly to the vehicle.
16. Install the skid plate (if equipped).
17. Install the front wheel and tire assemblies.
18. Lower the vehicle.
19. Refill engine oil.
20. Reconnect battery.
21. Start engine, and check for leaks.

INSTALLATION OIL PAN - 4X2

80cc65e7

Fig. 145: Oil Pan Bolt Torque Sequence - 3.7L

Courtesy of CHRYSLER LLC

1. Clean the oil pan gasket mating surface of the bedplate and oil pan.
2. Clean the oil pan and block gasket mating surfaces.
3. Inspect integrated oil pan gasket, and replace as necessary.
4. Drop the oil pump pick-up tube into the oil pan, and install the oil pan, pick-up tube, and the windage tray, as an assembly, from the front of the vehicle.
5. Install the windage tray, then the oil pump pick-up tube, and the (2) nuts and (1) bolt holding the oil pump pick-up tube, in place.

NOTE: It will be necessary to move the oil pan from side to side to gain access to these fasteners.

6. Tighten the pick-up tube fasteners.
7. Install the oil pan.
8. Install and tighten the oil pan bolts. See **Fig. 145**.
9. Install the engine to transmission structural cover, (if equipped).
10. Lower engine, and remove Engine Support 8534.
11. Lower the vehicle.
12. Lower the engine using Engine Support Fixture 8534.
13. Remove the Engine Support Fixture 8534.
14. Raise the vehicle.
15. Tighten both engine mount through bolts.
16. Install the transmission oil cooler line bracket.
17. Lower the vehicle.
18. Refill engine oil.
19. Reconnect battery.
20. Start engine and check for leaks.

SWITCH-OIL PRESSURE

DESCRIPTION

OIL PRESSURE SENSOR

The oil pressure switch is a pressure sensitive switch that is activated by the engine's oil pressure (in the main oil gallery). The switch is a two terminal device (one terminal is provided to the wiring harness and the other terminal is the switch's metal housing that screws into the engine block).

OPERATION

OIL PRESSURE SWITCH

The oil pressure switch is normally "Closed." The switch changes from a "Closed" circuit to an "Open" circuit, on increasing pressure of 7 psig. The oil pressure switch changes from an "Open" circuit to a "Closed" circuit, on decreasing pressure, between 2 psig and 4 psig.

REMOVAL

OIL PRESSURE SWITCH

Fig. 146: Locating Oil Pressure Sending Unit, Connector & Oil Filter
Courtesy of CHRYSLER LLC

- | |
|---|
| <ul style="list-style-type: none">1 - BELT2 - OIL PRESSURE SENSOR3 - OIL FILTER4 - ELEC. CONNECTOR |
|---|

1. Disconnect the negative cable from the battery.
2. Raise vehicle on hoist.
3. Remove front splash shield.
4. Disconnect oil pressure sender wire (4).

5. Remove the pressure sender (2). See **Fig. 146**.

INSTALLATION

OIL PRESSURE SWITCH

1. Install oil pressure sender.
2. Connect oil pressure sender wire.
3. Install front splash shield.
4. Lower vehicle.
5. Connect the negative battery cable.

PUMP-ENGINE OIL

REMOVAL

OIL PUMP

1. Remove the oil pan and pick-up tube. See **REMOVAL**.
2. Remove the timing chain cover. See **REMOVAL**.
3. Remove the timing chains and tensioners. See **REMOVAL**.
4. Remove the four bolts, primary timing chain tensioner and the oil pump.

DISASSEMBLY

OIL PUMP

1. Remove oil pump cover screws and lift off cover plate.
2. Remove pump inner and outer rotors.

NOTE: **Once the oil pressure relief valve, cup plug, and pin are removed, the pump assembly must be replaced.**

3. If it is necessary to remove the pressure relief valve, drive the roll pin from pump housing and remove cup plug, spring and valve.

INSPECTION

OIL PUMP

9309-184

Fig. 147: Checking Oil Pump Cover Flatness
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - STRAIGHT EDGE
2 - FEELER GAUGE
3 - OIL PUMP COVER |
|---|

CAUTION: Oil pump pressure relief valve and spring should not be removed from the oil pump. If these components are disassembled and or removed from the pump the entire oil pump assembly must be replaced.

1. Clean all parts thoroughly. Mating surface of the oil pump housing should be smooth. If the pump cover is scratched or grooved the oil pump assembly should be replaced.
2. Lay a straight edge across the pump cover surface (3). If a 0.025 mm (0.001 in.) feeler gauge (2) can be inserted between the cover and the straight edge the oil pump assembly should be replaced.

Fig. 148: Measuring Outer Rotor Thickness
Courtesy of CHRYSLER LLC

3. Measure the thickness of the outer rotor. If the outer rotor thickness measures at 12.005 mm (0.472 in.) or less the oil pump assembly must be replaced.
4. Measure the diameter of the outer rotor. If the outer rotor diameter measures at 85.925 mm (3.382 in.) or less the oil pump assembly must be replaced.

9309-70

Fig. 149: Measuring Inner Rotor Thickness
Courtesy of CHRYSLER LLC

5. Measure the thickness of the inner rotor. If the inner rotor thickness measures at 12.005 mm (0.472 in.) or less then the oil pump assembly must be replaced.

80b6b3b1

Fig. 150: Measuring Outer Rotor Clearance
Courtesy of CHRYSLER LLC

1 - FEELER GAUGE
2 - OUTER ROTOR

6. Slide outer rotor (2) into the body of the oil pump. Press the outer rotor to one side of the oil pump body and measure clearance between the outer rotor and the body. If the measurement is 0.235 mm (0.009 in.) or more the oil pump assembly must be replaced.

Fig. 151: Measuring Clearance Between Rotors
Courtesy of CHRYSLER LLC

1 -
OUTER
ROTOR
2 -
FEELER
GAUGE
3 -
INNER
ROTOR

7. Install the inner rotor into the oil pump body. Measure the clearance between the inner (3) and outer (1) rotors. If the clearance between the rotors is .150 mm (0.006 in.) or more the oil pump assembly must be replaced.

80b6b3b2

Fig. 152: Measuring Flatness Of Rotors
Courtesy of CHRYSLER LLC

1 - STRAIGHT EDGE
2 - FEELER GAUGE

8. Place a straight edge (1) across the body of the oil pump (between the bolt holes), if a feeler gauge (2) of .095 mm (0.0038 in.) or greater can be inserted between the straightedge and the rotors, the pump must be replaced.

NOTE: The 3.7L/4.7L Oil pump is released as an assembly. There are no DaimlerChrysler part numbers for Sub-Assembly components. In the event the oil pump is not functioning or out of specification it must be replaced as an assembly.

ASSEMBLY

OIL PUMP

1. Wash all parts in a suitable solvent and inspect carefully for damage or wear.
2. Install inner and outer rotors
3. Install oil pump cover plate and install cover bolts and tighten them to 12 N.m (105 in. lbs.).
4. Prime oil pump before installation by filling rotor cavity with engine oil.
5. If oil pressure is low and pump is within specifications, inspect for worn engine bearings or other causes for oil pressure loss.

INSTALLATION

OIL PUMP

Fig. 153: Primary Timing Chain Tensioner Bolt Tightening Sequence
Courtesy of CHRYSLER LLC

1. Position the oil pump onto the crankshaft and install two oil pump retaining bolts.
2. Position the primary timing chain tensioner and install the two retaining bolts.
3. Tighten the oil pump and primary timing chain tensioner retaining bolts to 28 N.m (250 in. lbs.) in the sequence shown in illustration. See **Fig. 153**.
4. Install the secondary timing chain tensioners and timing chains. See **INSTALLATION**.
5. Install the timing chain cover. See **INSTALLATION**.
6. Install the pick-up tube and oil pan. See **INSTALLATION**.

MANIFOLDS

MANIFOLD-INTAKE

DESCRIPTION

INTAKE MANIFOLD

Fig. 154: 3.7L Intake Torque Sequence
Courtesy of CHRYSLER LLC

The intake manifold is made of a composite material and features 300 mm (11.811 in.) long runners which maximizes low end torque. See **Fig. 154**.

81b05c49

Fig. 155: Intake Manifold Seals
Courtesy of CHRYSLER LLC

The intake manifold uses single plane sealing which consist of six individual press in place port gaskets (2) to prevent leaks. The throttle body attaches directly to the intake manifold.

DIAGNOSIS AND TESTING

INTAKE MANIFOLD LEAKS

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

1. Start the engine.
2. Spray a small stream of water (spray bottle) at the suspected leak area.
3. If engine RPM'S change, the area of the suspected leak has been found.
4. Repair as required.

REMOVAL

INTAKE MANIFOLD

- 4 - LEFT SIDE EXHAUST MANIFOLD FLANGE

The exhaust manifolds (1,2) are log style with a patented flow enhancing design to maximize performance. The exhaust manifolds are made of high silicon molybdenum cast iron. A perforated core graphite exhaust manifold gasket is used to improve sealing to the cylinder head. The exhaust manifolds are covered by a three layer laminated heat shield (3) for thermal protection and noise reduction. The heat shields are fastened with a torque prevailing nut that is backed off slightly to allow for the thermal expansion of the exhaust manifold. See **Fig. 166**.

REMOVAL

- 3 - MANIFOLD FLANGE

1. Disconnect the negative cable from the battery.

2. Raise and support the vehicle.
3. Remove the bolts and nuts attaching the exhaust pipe to the engine exhaust manifold.
4. Lower the vehicle.
5. Remove the exhaust heat shields (1).
6. Remove bolts, nuts and washers attaching manifold to cylinder head.
7. Remove manifold and gasket from the cylinder head. See **Fig. 168**.

INSTALLATION

EXHAUST MANIFOLD

RIGHT EXHAUST MANIFOLD

CAUTION: If the studs came out with the nuts when removing the engine exhaust manifold, install new studs. Apply sealer on the coarse thread ends. Water leaks may develop at the studs if this precaution is not taken.

1. Position the engine exhaust manifold and gasket on the two studs located on the cylinder head. Install conical washers and nuts on these studs.
2. Install remaining conical washers. Starting at the center arm and working outward, tighten the bolts and nuts to 25 N.m (18 ft. lbs.)
3. Install the exhaust heat shields.
4. Raise and support the vehicle.

CAUTION: Over tightening heat shield fasteners, may cause shield to distort and/or crack.

5. Assemble exhaust pipe to manifold and secure with bolts, nuts and retainers. Tighten the bolts and nuts to 34 N.m (25 ft. lbs.)

LEFT EXHAUST MANIFOLD

CAUTION: If the studs came out with the nuts when removing the engine exhaust manifold, install new studs. Apply sealer on the coarse thread ends. Water leaks may develop at the studs if this precaution is not taken.

1. Position the engine exhaust manifold and gasket on the two studs located on the cylinder head. Install conical washers and nuts on these studs.
2. Install remaining conical washers. Starting at the center arm and working outward, tighten the bolts and nuts to 25 N.m (18 ft. lbs.)
3. Install the exhaust heat shields.
4. Raise and support the vehicle.

CAUTION: Over tightening heat shield fasteners, may cause shield to distort and/or crack.

5. Assemble exhaust pipe to manifold and secure with bolts, nuts and retainers. Tighten the bolts and nuts to 34 N.m (25 ft. lbs.)

VALVE TIMING

DESCRIPTION

TIMING DRIVE

80d72b71

Fig. 169: Timing Drive System
Courtesy of CHRYSLER LLC

- 1 - RIGHT CAMSHAFT SPROCKET AND SECONDARY CHAIN
- 2 - SECONDARY TIMING CHAIN TENSIONER (LEFT AND RIGHT SIDE NOT INTERCHANGEABLE)
- 3 - SECONDARY TENSIONER ARM
- 4 - LEFT CAMSHAFT SPROCKET AND SECONDARY CHAIN
- 5 - CHAIN GUIDE (LEFT AND RIGHT SIDE ARE NOT INTERCHANGEABLE)
- 6 - PRIMARY CHAIN
- 7 - IDLER SPROCKET

The timing drive system has been designed to provide quiet performance and reliability to support a **non-free wheeling** engine. Specifically the intake valves are non-free wheeling and can be easily damaged with forceful engine rotation if camshaft-to-crankshaft timing is incorrect. The timing drive system consists of a primary chain (6), two secondary timing chain drives (1,4) and a counterbalance shaft drive. See **Fig. 169**.

OPERATION

TIMING DRIVE

The primary timing chain is a single inverted tooth chain type. The primary chain drives the large 50 tooth idler sprocket directly from a 25 tooth crankshaft sprocket. Primary chain motion is controlled by a pivoting leaf spring tensioner arm and a fixed guide. The arm and the guide both use nylon plastic wear faces for low friction and long wear. The primary chain receives oil splash lubrication from the secondary chain drive and designed oil pump leakage. The idler sprocket assembly connects the primary chain drive, secondary chain drives, and the counterbalance shaft. The idler sprocket assembly consists of two integral 26 tooth sprockets a 50 tooth sprocket and a helical gear that is press-fit to the assembly. The spline joint for the 50 tooth sprocket is a non serviceable press fit anti rattle type. The idler sprocket assembly spins on a stationary idler shaft. The idler shaft is a light press-fit into the cylinder block. A large washer on the idler shaft bolt and the rear flange of the idler shaft are used to control sprocket thrust movement. Pressurized oil is routed through the center of the idler shaft to provide lubrication for the two bushings used in the idler sprocket assembly.

There are two secondary drive chains, both are roller type, one to drive the camshaft in each SOHC cylinder head. There are no shaft speed changes in the secondary chain drive system. Each secondary chain drives a 26 tooth cam sprocket directly from the 26 tooth sprocket on the idler sprocket assembly. A fixed chain guide and a hydraulic oil damped tensioner are used to maintain tension in each secondary chain system. The hydraulic tensioners for the secondary chain systems are fed pressurized oil from oil reservoir pockets in the block. Each tensioner incorporates a controlled leak path through a device known as a vent disc located in the nose of the piston to manage chain loads. Each tensioner also has a mechanical ratchet system that limits chain slack if the tensioner piston bleeds down after engine shut down. The tensioner arms and guides also utilize nylon wear faces for low friction and long wear. The secondary timing chains receive lubrication from a small orifice in the tensioners. This orifice is protected from clogging by a fine mesh screen which is located on the back of the hydraulic tensioners.

STANDARD PROCEDURE

MEASURING TIMING CHAIN WEAR

80b77058

Fig. 170: Checking Secondary Timing Chains for Wear
 Courtesy of CHRYSLER LLC

- | |
|--------------------------------------|
| 1 - SECONDARY TENSIONER ARM |
| 2 - SECONDARY CHAIN TENSIONER PISTON |

NOTE: This procedure must be performed with the timing chain cover removed.

1. Remove the timing chain cover. See **REMOVAL**.
2. To determine if the secondary timing chains are worn, rotate the engine clockwise until maximum tensioner piston (2) extension is obtained. Measure the distance between the secondary timing chain tensioner housing and the step ledge on the piston. The measurement at point (A) must be less than 15 mm (.5906 inches). See **Fig. 170**.
3. If the measurement exceeds the specification the secondary timing chains are worn and require

replacement. See **REMOVAL**.

TIMING VERIFICATION

Fig. 171: Engine Top Dead Center (TDC) Indicator Marks
Courtesy of CHRYSLER LLC

- | |
|-----------------------------|
| 1 - TIMING CHAIN COVER |
| 2 - CRANKSHAFT TIMING MARKS |

CAUTION: The 3.7L is a non free-wheeling design engine. Therefore, correct engine timing is critical.

NOTE: Components referred to as left hand or right hand are as viewed from the drivers position inside the vehicle.

NOTE: The blue link plates on the chains and the dots on the camshaft drive sprockets may not line up during the timing verification procedure. The blue link plates are lined up with the sprocket dots only when re-timing the complete timing drive. Once the timing drive is rotated blue link-to-dot alignment is no longer valid.

Engine base timing can be verified by the following procedure:

1. Remove the cylinder head covers.
2. Using a mirror, locate the TDC arrow on the front cover. Rotate the crankshaft until the mark on the crankshaft damper (2) is aligned with the TDC arrow on the front cover (2). The engine is now at TDC. See **Fig. 171**.

80ce8813

Fig. 172: Camshaft Sprocket V6 Marks (#1 TDC, Exhaust Stroke)
Courtesy of CHRYSLER LLC

1 - LEFT CYLINDER HEAD 2 - RIGHT CYLINDER HEAD

3. Note the location of the V6 mark stamped into the camshaft drive gears (1,2). If the V6 mark on each camshaft drive gear is at the twelve o'clock position, the engine is at TDC on the exhaust stroke. If the V6 mark on each gear is at the six o'clock position, the engine is at TDC on the compression stroke. See **Fig. 172**.
4. If both of the camshaft drive gears are off in the same or opposite directions, the primary chain or both secondary chains are at fault. Refer to **CHAIN AND SPROCKETS-TIMING**.
5. If only one of the camshaft drive gears is off and the other is correct, the problem is confined to one

secondary chain.

6. If both camshaft drive gear V6 marks are at the twelve o'clock or the six o'clock position the engine base timing is correct. Reinstall the cylinder head covers.

COUNTER BALANCE SHAFT TIMING

Fig. 173: Counterbalance Shaft Alignment Marks
Courtesy of CHRYSLER LLC

- | |
|-------------------------------|
| 1 - COUNTERBALANCE SHAFT GEAR |
| 2 - TIMING MARK |
| 3 - IDLER SPROCKET GEAR |

1. Ensure that the engine is at TDC with both camshaft sprocket V6 marks in the 12 o'clock position.

2. Look down the left cylinder head chain cavity. The timing dot (2) on the counter balance shaft drive gear should be in the 6 o'clock position. See **Fig. 173**.

TIMING - SINGLE CAMSHAFT

| 2 - CAMSHAFT DRIVE GEAR |
| 3 - RETAINING BOLT |
| 4 - CYLINDER HEAD |

2. Remove the camshaft drive gear retaining bolt (3). See **Fig. 175**.
3. Carefully remove the camshaft drive gear from the camshaft.

80cae8813

Fig. 176: Camshaft Sprocket V6 Marks (#1 TDC, Exhaust Stroke)
Courtesy of CHRYSLER LLC

1 - LEFT CYLINDER HEAD 2 - RIGHT CYLINDER HEAD

4. Re-index the camshaft drive gear in the chain until the V6 mark is at the same position as the V6 mark on the opposite camshaft drive gear (1,2). See **Fig. 176**.
5. Using the Camshaft Holder 8428, rotate the camshaft until the alignment dowel on the camshaft is aligned with the slot in the camshaft drive gear.

CAUTION: Remove excess oil from camshaft sprocket retaining bolt before reinstalling bolt. Failure to do so may cause over-torqueing of bolt resulting in bolt failure.

6. Position the camshaft drive gear onto the camshaft, remove oil from bolt then install the retaining bolt. Using Special Tools, Spanner Wrench 6958 with Adapter Pins 8346 and a suitable torque wrench, Tighten the retaining bolt to 122 N.m (90 ft. lbs.)
7. Remove the Wedge Locking Tool 8379.
8. Rotate the crankshaft two full revolutions, then verify that the camshaft drive gear V6 marks are in fact aligned.
9. Install the cylinder head covers.

SHAFT-BALANCE

REMOVAL

BALANCE SHAFT

Fig. 177: Counterbalance Shaft Retaining Plate
Courtesy of CHRYSLER LLC

- | |
|---|
| <p>1 - IDLER SHAFT
2 - COUNTERBALANCE SHAFT THRUST PLATE
3 - COUNTERBALANCE SHAFT DRIVE GEAR
4 - RETAINING BOLT</p> |
|---|

1. Remove the primary and secondary timing chains.

NOTE: The balance shaft and gear are serviced as an assembly. Do not attempt to remove the gear from the balance shaft.

Remove the retaining bolt (4) from the counterbalance shaft thrust plate (2). See **Fig. 177**.

Fig. 178: Counterbalance Shaft Removal/Installation Tool
Courtesy of CHRYSLER LLC

1 - COUNTERBALANCE SHAFT REMOVAL AND INSTALLATION TOOL 2 - COUNTERBALANCE SHAFT THRUST PLATE
--

2. Using the Counterbalance Shaft Remover/Installer tool 8641 (1), remove the counterbalance shaft from the engine. See **Fig. 178**.

INSTALLATION

BALANCE SHAFT

Fig. 179: Counterbalance Shaft Removal/Installation Tool

Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - COUNTERBALANCE SHAFT REMOVAL AND INSTALLATION TOOL |
| 2 - COUNTERBALANCE SHAFT THRUST PLATE |

NOTE: The balance shaft and gear are serviced as an assembly. Do not attempt to remove the gear from the balance shaft.

1. Coat counterbalance shaft bearing journals with clean engine oil.

NOTE: The balance shaft is heavy, and care should be used when installing shaft, so bearings are not damaged.

2. Using the Counterbalance Shaft Remover/Installer 8641 (1), carefully install counterbalance shaft into engine. See **Fig. 179**.

80c41ef1

- | |
|--|
| 1 - IDLER SHAFT |
| 2 - COUNTERBALANCE
SHAFT THRUST PLATE |
| 3 - COUNTERBALANCE
SHAFT DRIVE GEAR |
| 4 - RETAINING BOLT |

3. Install Counterbalance shaft thrust plate retaining bolt (4) finger tight. Do not tighten bolt at this time.

4. Position the right side of the thrust plate with the right chain guide bolt, install bolt finger tight.
5. Tighten the thrust plate retaining bolt (4) to 28 N.m (250 in. lbs.) See **Fig. 180**.
6. Remove the chain guide bolt so that guide can be installed.

COVER-TIMING

REMOVAL

TIMING CHAIN COVER

Fig. 181: Accessory Drive Belt Tensioner
Courtesy of CHRYSLER LLC

2 - FASTENER TENSIONER TO FRONT COVER

1. Disconnect the battery negative cable.
2. Drain cooling system. Refer to **STANDARD PROCEDURE** .
3. Remove electric cooling fan and fan shroud assembly.
4. Remove fan and fan drive assembly.
5. Disconnect both heater hoses at timing cover.
6. Disconnect lower radiator hose at engine.
7. Remove accessory drive belt tensioner assembly (1). See **Fig. 181**.

Fig. 182: Timing Chain Cover Fastener Tightening Sequence
Courtesy of CHRYSLER LLC

8. Remove crankshaft damper. See **REMOVAL**.
9. Remove the generator. Refer to **REMOVAL** .
10. Remove the A/C compressor. Refer to **REMOVAL** .

CAUTION: The 3.7L engine uses an anaerobic sealer instead of a gasket to seal the front cover to the engine block, from the factory. For service, Mopar® Grey Engine RTV sealant must be substituted.

NOTE: It is not necessary to remove the water pump for timing cover removal.

11. Remove the bolts holding the timing cover to engine block. See **Fig. 182**.
12. Remove the timing cover.

INSTALLATION

TIMING CHAIN COVER

80cca006

Fig. 183: Installing Timing Cover
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - TIMING CHAIN COVER
2 - WATER PASSAGE O-RING
3 - MOPAR® ENGINE RTV SEALER |
|--|

CAUTION: Do not use oil based liquids to clean timing cover or block surfaces. Use only rubbing alcohol, along with plastic or wooden scrapers. Use no wire brushes or abrasive wheels or metal scrapers, or damage to surfaces could result.

1. Clean timing chain cover and block surface using rubbing alcohol.

CAUTION: The 3.7L uses a special anaerobic sealer instead of a gasket to seal the timing cover to the engine block, from the factory. For service repairs, Mopar® Grey Engine RTV must be used as a substitute.

2. Inspect the water passage o-rings for any damage, and replace as necessary.
3. Apply Mopar® Grey Engine RTV sealer (3) to the front cover following the path below, using a 3 to 4 mm thick bead. See **Fig. 183**.

★ INDICATES STUD LOCATIONS

80b6b298

Fig. 184: Timing Chain Cover Fastener Tightening Sequence
 Courtesy of CHRYSLER LLC

4. Install cover. Tighten flange head fasteners in sequence shown in illustration to 58 N.m (43 ft. lbs.). See **Fig. 184**.
5. Install crankshaft damper. See **INSTALLATION**.
6. Install the A/C compressor. Refer to **INSTALLATION**.
7. Install the generator. Refer to **INSTALLATION**.
8. Install accessory drive belt tensioner assembly. Refer to **INSTALLATION**.
9. Install radiator upper and lower hoses.
10. Install both heater hoses.
11. Install electric fan shroud and viscous fan drive assembly.
12. Fill cooling system. Refer to **STANDARD PROCEDURE**.
13. Connect the battery negative cable.

SHAFT-IDLER

REMOVAL

IDLER SHAFT

1. Remove the primary and secondary timing chains and sprockets. Refer to **CHAIN AND SPROCKETS-TIMING**.

NOTE: To remove the idler shaft, it is necessary to tap threads into the shaft, to install the removal tool.

2. Using a 12 mm X 1.75 tap, cut threads in the idler shaft center bore.
3. Cover the radiator core with a suitable cover.

CAUTION: Use care when removing the idler shaft, Do not strike the radiator cooling fins with the slide hammer.

4. Using Slide Hammer 8517 remove the idler shaft.

INSTALLATION

IDLER SHAFT

1. Thoroughly clean the idler shaft bore.
2. Position the idler shaft in the bore.

NOTE: The two lubrication holes in the idler shaft do not require any special alignment.

NOTE: Before using the retaining bolt to install the idler shaft, coat the threads and the pilot on the idler shaft, with clean engine oil.

3. Using the primary idler sprocket retaining bolt and washer, carefully draw the idler shaft into the bore until fully seated.
4. Coat the idler shaft with clean engine oil.
5. Install the timing chains and sprockets. Refer to CHAIN AND SPROCKETS-TIMING.

CHAIN AND SPROCKETS-TIMING

REMOVAL

10. Collapse and pin primary chain tensioner.

CAUTION: Plate behind left secondary chain tensioner could fall into oil pan.
Therefore, cover pan opening.

11. Remove secondary chain tensioners.

12. Remove camshaft position sensor (2). See **Fig. 188**.

80ccc0a4

Fig. 189: Special Tool 8428
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - Camshaft hole
2 - Special Tool 8428 |
|--|

CAUTION: Care should be taken not to damage camshaft target wheel. Do not hold target wheel while loosening or tightening camshaft sprocket. Do not place the target wheel near a magnetic source of any kind. A damaged or magnetized target wheel could cause a vehicle no start condition.

CAUTION: Do not forcefully rotate the camshafts or crankshaft independently of each other. Damaging intake valve to piston contact will occur.

Ensure negative battery cable is disconnected to guard against accidental starter engagement.

13. Remove left and right camshaft sprocket bolts.
14. While holding the left camshaft steel tube with Camshaft Holder 8428 (2), remove the left camshaft sprocket. Slowly rotate the camshaft approximately 5 degrees clockwise to a neutral position. See **Fig. 189**.
15. While holding the right camshaft steel tube with Camshaft Holder 8428 (2), remove the right camshaft sprocket.
16. Remove idler sprocket assembly bolt.
17. Slide the idler sprocket assembly and crank sprocket forward simultaneously to remove the primary and secondary chains.
18. Remove both pivoting tensioner arms and chain guides.
19. Remove primary chain tensioner.

INSPECTION

TIMING CHAIN AND SPROCKETS

Inspect the following components:

Sprockets for excessive tooth wear. Some tooth markings are normal and not a cause for sprocket replacement.

Idler sprocket assembly bushing and shaft for excessive wear.

Idler sprocket assembly spline joint. The joint should be tight with no backlash or axial movement.

Chain guides and tensioner arms. Replace these parts if grooving in plastic face is more than 1 mm (0.039 in.) deep. If plastic face is severely grooved or melted, the tensioner lube jet may be clogged. The tensioner should be replaced.

Secondary chain tensioner piston and ratcheting device. Inspect for evidence of heavy contact between tensioner piston and tensioner arm. If this condition exist, the tensioner arm and chain should be replaced.

Primary chain tensioner plastic faces. Replace as required.

INSTALLATION

TIMING CHAIN AND SPROCKETS

80b77052

Fig. 190: Resetting Secondary Chain Tensioners
Courtesy of CHRYSLER LLC

- 1 - VISE
- 2 - TENSIONER BODY
- 3 - INSERT LOCK PIN
- 4 - RATCHET
- 5 - PISTON

1. Using a vise, lightly compress the secondary chain tensioner piston (5) until the piston step is flush with the tensioner body. Using a pin or suitable tool, release ratchet pawl by pulling pawl back against spring force through access hole on side of tensioner. While continuing to hold pawl back, Push ratchet device to approximately 2 mm from the tensioner body. Install Tensioner pin 8514 (3) into hole on front of

tensioner. Slowly open vise (1) to transfer piston spring force to lock pin. See **Fig. 190**.

2. Position primary chain tensioner over oil pump and insert bolts into lower two holes on tensioner bracket. Tighten bolts to 28 N.m (250 in. lbs.).

Fig. 191: Identifying Crankshaft Gear, Primary Chain Idler Sprocket & Special Tool
Courtesy of CHRYSLER LLC

- | |
|----------------------------------|
| 1 - SPECIAL TOOL 8429 |
| 2 - PRIMARY CHAIN IDLER SPROCKET |
| 3 - CRANKSHAFT SPROCKET |

3. Install right side chain tensioner arm. Install Torx® bolt. Tighten Torx® bolt to 28 N.m (250 in. lbs.).

CAUTION: The silver bolts retain the guides to the cylinder heads and the black bolts retain the guides to the engine block.

4. Install the left side chain guide. Tighten the bolts to 28 N.m (250 in. lbs.).

5. Install left side chain tensioner arm, and Torx® bolt. Tighten Torx® bolt to 28 N.m (250 in. lbs.).
6. Install the right side chain guide. Tighten the bolts to 28 N.m (250 in. lbs.).
7. Install both secondary chains onto the idler sprocket. Align two plated links on the secondary chains to be visible through the two lower openings on the idler sprocket (4 o'clock and 8 o'clock). Once the secondary timing chains are installed, position the Secondary Camshaft Chain Holder 8429 (1) to hold chains in place for installation. See **Fig. 191**.
8. Align primary chain double plated links with the timing mark at 12 o'clock on the idler sprocket. Align the primary chain single plated link with the timing mark at 6 o'clock on the crankshaft sprocket.
9. Lubricate idler shaft and bushings with clean engine oil.

Fig. 192: Counterbalance Shaft Alignment Marks
Courtesy of CHRYSLER LLC

- | |
|-------------------------------|
| 1 - COUNTERBALANCE SHAFT GEAR |
| 2 - TIMING MARK |
| 3 - IDLER SPROCKET GEAR |

NOTE: **The idler sprocket must be timed to the counterbalance shaft drive gear before the idler sprocket is fully seated.**

10. Install all chains, crankshaft sprocket, and idler sprocket as an assembly. After guiding both secondary chains through the block and cylinder head openings, affix chains with a elastic strap or equivalent. This will maintain tension on chains to aid in installation. Align the timing mark (2) on the idler sprocket gear (3) to the timing mark on the counterbalance shaft drive gear (1), then seat idler sprocket fully. Before installing idler sprocket bolt, lubricate washer with oil, and tighten idler sprocket assembly retaining bolt to 34 N.m (25 ft. lbs.). See **Fig. 192**.

Fig. 193: Camshaft Sprocket V6 Marks
Courtesy of CHRYSLER LLC

NOTE: **It will be necessary to slightly rotate camshafts for sprocket installation.**

11. Align left camshaft sprocket "L" dot to plated link on chain.
12. Align right camshaft sprocket "R" dot to plated link on chain. See **Fig. 193**.

CAUTION: Remove excess oil from the camshaft sprocket bolt. Failure to do so can result in over-torque of bolt resulting in bolt failure.

13. Remove Secondary Camshaft Chain Holder 8429, then attach both sprockets to camshafts. Remove excess oil from bolts, then Install sprocket bolts, but do not tighten at this time.
14. Verify that all plated links are aligned with the marks on all sprockets and the "V6" marks on camshaft sprockets are at the 12 o'clock position.

| 1 - TORQUE WRENCH |
| 2 - SPECIAL TOOL 6958 WITH ADAPTER PINS 8346 |
| 3 - LEFT CAMSHAFT SPROCKET |
| 4 - RIGHT CAMSHAFT SPROCKET |

CAUTION: Ensure the plate between the left secondary chain tensioner and block is correctly installed.

15. Install both secondary chain tensioners. Tighten bolts to 28 N.m (250 in. lbs.).

NOTE: Left and right secondary chain tensioners are not common.

16. Remove all 3 locking pins from tensioners.

CAUTION: After pulling locking pins out of each tensioner, DO NOT manually extend the tensioner(s) ratchet. Doing so will over tension the chains, resulting in noise and/or high timing chain loads.

17. Using Spanner Wrench 6958 with Adapter Pins 8346, (4) tighten left and right camshaft sprocket bolts to 122 N.m (90 ft. lbs.). See **Fig. 194** and **Fig. 195**.
18. Rotate engine two full revolutions. Verify timing marks are at the follow locations:
 - primary chain idler sprocket dot is at 12 o'clock
 - primary chain crankshaft sprocket dot is at 6 o'clock
 - secondary chain camshaft sprockets "V6" marks are at 12 o'clock
 - counterbalancer shaft drive gear dot is aligned to the idler sprocket gear dot
19. Lubricate all three chains with engine oil.

80b897e1

Fig. 196: Measuring Idler Gear End Play
Courtesy of CHRYSLER LLC

1 - IDLER SPROCKET ASSEMBLY 2 - DIAL INDICATOR

20. After installing all chains, it is recommended that the idler gear end play be checked. The end play must be within 0.10 - 0.25 mm (0.004 - 0.010 in.). If not within specification, the idler gear must be replaced. See **Fig. 196**.
21. Install timing chain cover and crankshaft damper.
22. Install cylinder head covers. See **INSTALLATION**.

80b897e2

Fig. 197: Locating Cylinder Head Access Plugs
Courtesy of CHRYSLER LLC

1 - RIGHT CYLINDER HEAD ACCESS PLUG
2 - LEFT CYLINDER HEAD ACCESS PLUG

NOTE: Before installing threaded plug in right cylinder head, the plug must be coated with sealant to prevent leaks.

23. Coat the large threaded access plug with **Mopar® Thread Sealant with Teflon** , then install into the right cylinder head (1) and tighten to 81 N.m (60 ft. lbs.). See **Fig. 197**.
24. Install the oil fill housing.
25. Install access plug in left cylinder head (2).
26. Install power steering pump. Refer to **INSTALLATION** .
27. Fill cooling system. Refer to **STANDARD PROCEDURE** .
28. Connect negative cable to battery.

2008 ENGINE

Exhaust System And Turbocharger - Liberty

DESCRIPTION

DESCRIPTION-2.8L DIESEL

81a592e0

Fig. 1: Exhaust System - 2.8L Diesel - w/out DPF

Courtesy of CHRYSLER LLC

1 - OXYGEN SENSOR
2 - MANIVERTER
3 - MANIVERTER TO EXHAUST PIPE FLANGE
4 - FLEXIBLE BELLOWS
5 - ISOLATORS
6 - MUFFLER/TAILPIPE ASSEMBLY
7 - EXHAUST PIPE TO MUFFLER FLANGE

CAUTION: Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan exhaust heat shields. Light overspray near the edges is permitted. Application of coating will result in excessive floor pan temperatures and objectionable fumes.

The diesel engine exhaust system consists of an engine exhaust manifold, turbocharger, EGR valve with intercooler, front exhaust pipe with catalytic converter, muffler and tailpipe assembly.

81a592db

Fig. 2: Exhaust System - 2.8L Diesel - w/DPF

2 - MANIVERTER TO DFP FLANGE
3 - PRESSURE SENSOR TUBING
4 - STEADY MOUNT
5 - FLEXIBLE BELLOWS
6 - ISOLATOR
7 - MUFFLER/TAIL PIPE ASSEMBLY
8 - DPF TO MUFFLER FLANGE

The exhaust system must be properly aligned to prevent stress, leakage and body contact. The exhaust components should be kept a minimum of 25.4 mm (1.0 in.) away from the body and frame. If the system contacts any body panel, it may amplify objectionable noises from the engine or body.

DESCRIPTION-GAS ENGINE

81471506

Fig. 3: Exhaust System - Typical - Gas Engines

| 1 - EXHAUST FLANGE
2 - CATALYTIC CONVERTER
3 - FRONT EXHAUST PIPE ASSEMBLY-TO-MUFFLER CLAMP
4 - MUFFLER
5 - INSULATOR
6 - RESONATOR |
|--|

The basic exhaust system consists of an exhaust pipe assembly with catalytic converters (2), muffler (4) and tailpipe assembly and heat shields

The exhaust system must be properly aligned to prevent stress, leakage and body contact. Minimum clearance between any exhaust component and the body or frame is 25 mm (1.0 in.). If the system contacts any body panel, it may amplify objectionable noises from the engine or body.

When inspecting an exhaust system, critically inspect for cracked or loose joints, stripped screw or bolt threads, corrosion damage and worn, cracked or broken hangers. Replace all components that are badly corroded or damaged. DO NOT attempt to repair.

When replacement is required, use original equipment parts (or equivalent). This will assure proper engine function and system alignment.

CAUTION: Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan exhaust heat shields. Light overspray near the edges is permitted. Application of coating will result in excessive floor pan temperatures and objectionable fumes.

DIAGNOSIS AND TESTING

EXHAUST SYSTEM-DIESEL ENGINE

CAUTION: On high mileage vehicles it is normal to see some exhaust staining around the turbocharger control rod area. This is not a sign of turbocharger failure.

EXHAUST SYSTEM DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
EXCESSIVE EXHAUST NOISE OR LEAKING EXHAUST GASES	1. Leaks at pipe joints. 2. Rusted or blown out muffler. 3. Broken or rusted out exhaust pipe. 4. Exhaust pipe leaking at manifold flange. 5. Exhaust manifold cracked or broken. 6. Leak between exhaust manifold and cylinder head. 7. Turbocharger mounting flange cracked. 8. Restriction in exhaust system. 9. EGR pipe(s) leak. 10. EGR assembly leak.	1. Tighten clamps/bolts at leaking joints. 2. Replace muffler. Inspect exhaust system. 3. Replace exhaust pipe. 4. Tighten/replace flange attaching nuts/bolts. 5. Replace exhaust manifold. 6. Tighten exhaust manifold to cylinder head bolts. Replace gasket if necessary. 7. Remove turbocharger and inspect. (Refer to REMOVAL . 8. Remove restriction, if possible. Replace restricted part if necessary. 9. Tighten bolts. Replace gasket. 10. Tighten bolts. Replace gaskets.
Driveability Concern - Turbo	1. Vacuum hose disconnected. 2. Vacuum system leaks. 3. Boost pressure solenoid filter clogged.	1. Check connections, replace as necessary. 2. Inspect for damage. Check for leaks, replace as necessary. 3. Replace the filter.

EXHAUST SYSTEM-GAS ENGINES

CONDITION	POSSIBLE CAUSE	CORRECTION
EXCESSIVE EXHAUST NOISE OR LEAKING EXHAUST GASES	1. Leaks at pipe joints. 2. Rusted or blown out muffler. 3. Broken or rusted out exhaust pipe. 4. Exhaust pipe leaking at	1. Tighten clamps/bolts to specified torque at leaking joints. 2. Replace muffler. Inspect exhaust system. 3. Replace exhaust pipe. 4. Tighten/replace flange attaching

	manifold flange. 5. Exhaust manifold cracked or broken. 6. Leak between exhaust manifold and cylinder head. 7. Catalytic converter rusted or blown out. 8. Restriction in exhaust system.	nuts/bolts. 5. Replace exhaust manifold. 6. Tighten exhaust manifold to cylinder head bolts. 7. Replace catalytic converter assy. 8. Remove restriction, if possible. Replace restricted part if necessary.
CAUTION: When servicing and replacing exhaust system components, disconnect the oxygen sensor connector(s). Allowing the exhaust to hang by the oxygen sensor wires will damage the harness and/or sensor.

CONVERTER-CATALYTIC

DESCRIPTION

DESCRIPTION

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never work around or attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

CAUTION: DO NOT remove spark plug wires from plugs or by any other means short out cylinders. Failure of the catalytic converter can occur due to a temperature increase caused by unburned fuel passing through the

converter.

The stainless steel catalytic converter body is designed to last the life of the vehicle. Excessive heat can result in bulging or other distortion, but excessive heat will not be the fault of the converter. If unburned fuel enters the converter, overheating may occur. If a converter is heat-damaged, correct the cause of the damage at the same time the converter is replaced. Also, inspect all other components of the exhaust system for heat damage.

Unleaded gasoline must be used to avoid contaminating the catalyst core.

50 State emission vehicles incorporate two catalytic converters located after the exhaust manifolds and before the muffler.

REMOVAL

REMOVAL-2.8L DIESEL

Fig. 6: CATALYTIC CONVERTER - 2.8L DIESEL
Courtesy of CHRYSLER LLC

1 - NUT
2 - MOUNTING BOLT
3 - CATALYTIC CONVERTER

WARNING: If torches are used when working on the exhaust system, do not allow the flame near the fuel lines.

1. Raise and support the vehicle.
2. Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
3. Remove diesel particulate filter (DPF), if equipped.
4. Remove two bracket bolts (2).

5. Remove the nuts (1) from the front catalytic converter to turbocharger flange.
6. Lower the catalyst assembly (2) and slide out of the mount at the transmission (if equipped).
7. Remove the front exhaust pipe/catalytic converter assembly from the vehicle.

REMOVAL-3.7L ENGINE

Fig. 7: 3.7L Catalytic Converter - Typical
Courtesy of CHRYSLER LLC

WARNING: If torches are used when working on the exhaust system, do not allow the flame near the fuel lines.

1. Raise and support the vehicle.

2. Saturate the bolts (1) and nuts with heat valve lubricant. Allow 5 minutes for penetration.
3. Disconnect oxygen sensor electrical connectors.
4. Remove the nuts from the front exhaust pipe and catalytic converter assembly to muffler flange.
5. Remove bolts (1) and flanged nuts at the manifold.
6. Lower the front exhaust pipe/catalytic converter assembly (3) and slide out of the mount at the transmission (if equipped).
7. Remove the front exhaust pipe/catalytic converter assembly from the vehicle.

INSPECTION

INSPECTION

Look at the stainless steel body of the converter, inspect for bulging or other distortion that could be a result of overheating. If the converter has a heat shield attached make sure it is not bent or loose.

If you suspect internal damage to the catalyst, tapping the bottom of the catalyst with a rubber mallet may indicate a damaged core.

INSTALLATION

INSTALLATION-2.8L DIESEL

Fig. 8: CATALYTIC CONVERTER - 2.8L DIESEL
Courtesy of CHRYSLER LLC

- | |
|-------------------------|
| 1 - NUT |
| 2 - MOUNTING BOLT |
| 3 - CATALYTIC CONVERTER |

1. Position the front catalytic converter assembly (3) onto the turbocharger.
2. Install two catalytic converter mounting bolts. Tighten bolts to 27 N.m (19 ft. lbs.) torque.

3. Install DPF, if equipped. See **REMOVAL**.
4. Position the exhaust pipe for proper clearance with the frame and underbody parts. A minimum clearance of 25.4 mm (1.0 in.) is required.
5. Lower the vehicle.
6. Start the vehicle and inspect for exhaust leaks. Repair exhaust leaks as necessary.
7. Check the exhaust system for contact with the body panels. Make adjustments, if necessary.

INSTALLATION-3.7L ENGINE

Fig. 9: 3.7L Catalytic Converter - Typical
Courtesy of CHRYSLER LLC

1. Position the front exhaust pipe and catalytic converter assembly (3) into the mount at the transmission (if

equipped) and onto the exhaust manifold flange connection.

2. Install the nuts at the front exhaust pipe and catalytic converter assembly to muffler flange. Do not tighten.
3. Position the exhaust pipe for proper clearance with the frame and underbody parts. A minimum clearance of 25.4 mm (1.0 in.) is required.
4. Tighten the bolt (1) at exhaust manifold to 27 N.m (19 in. lbs.) torque.
5. Tighten the front exhaust pipe and catalytic converter assembly to muffler flange nuts to 27 N.m (19 ft. lbs.) torque.
6. Position the front pipe onto the exhaust manifold flange connection. Tighten the clamp to 10 N.m (95 in. lbs.) torque.
7. Connect oxygen sensor electrical connectors.
8. Lower the vehicle.
9. Start the vehicle and inspect for exhaust leaks. Repair exhaust leaks as necessary.
10. Check the exhaust system for contact with the body panels. Make adjustments, if necessary.

MUFFLER

3. Install clamp. Tighten nut to 32 N.m (24 ft. lbs.).
4. Lower vehicle from hoist.

SHIELDS-HEAT

DESCRIPTION

DESCRIPTION

80b89850

Fig. 12: Front & Rear Floor Pan Heat Shields Typical
 Courtesy of CHRYSLER LLC

1 - REAR FLOOR PAN HEAT SHIELD
2 - HEAT SHIELD RETAINING NUTS
3 - FRONT FLOOR PAN HEAT SHIELD

Heat shields (1) (3) are needed to protect both the vehicle and the environment from the high temperatures developed by the catalytic converter. The catalytic converter releases additional heat into the exhaust system. Under severe operating conditions, the temperature increases in the area of the converter. Such conditions can exist when the engine misfires or otherwise does not operate at peak efficiency. See **Fig. 12**.

FILTER-DIESEL PARTICULATE

DESCRIPTION

DESCRIPTION

A diesel particulate filter DPF is installed for exhaust gas after-treatment. The DPF is located downstream of the main oxidation catalyst. The DPF filters, stores and burns particulate matter (soot) that is generated during the combustion process. The soot is oxidized to carbon dioxide CO₂ at exhaust temperatures over 600° C (1,112° F).

OPERATION

OPERATION

The oxidation catalysts raise the exhaust gas temperatures to regenerate the DPF , which is passive regeneration. If the passive regeneration cannot keep up with the build up of soot in the DPF, the ECM will actively regenerate the DPF to burn off the soot. Residue remains inside the DPF in the form of non burnable ash. Ash comes from the oils and other materials that are trapped in the oils and are present in the soot. Ash is not eliminated by the regeneration cycle. Excessive ash accumulation requires the replacement of the DPF. The DPF uses a silicon carbide wall-flow monolith with a platinum coating to trap particulates. The monolith contains a large number of square parallel channels, which run in the axial direction and are separated by thin porous walls. The channels are alternatively open at one end, but plugged at the other. The exhaust gases flow through the walls and escape through the pores in the wall material. Particulates, however, are too large to escape and are trapped in the monolith walls. The ECM starts the regeneration of the DPF if the soot load exceeds a performance map value. The ECM determines the load condition of the DPF based upon the exhaust gas pressure upstream and downstream of the DPF. A pressure differential sensor provides the pressure input to the ECM. During the regeneration process, the ECM raises the temperature in the DPF to burn off the soot accumulated. Under normal operation, the engine does not produce enough heat to oxidize the soot inside the DPF. This process requires temperatures above 550 °C (1,022 °F). After regeneration, the ECM reads the actual pressure difference at the DPF and compares it with a reference value. From this comparison, the ECM determines the ash quantity inside the DPF.

TURBOCHARGER

TURBOCHARGER

DESCRIPTION

TURBOCHARGER-DESCRIPTION

80b5cc50

Fig. 15: Identifying Turbocharger Components

Courtesy of CHRYSLER LLC

- 1 - TURBINE SECTION
- 2 - EXHAUST GAS
- 3 - BEARING HOUSING
- 4 - COMPRESSOR SECTION
- 5 - INLET AIR
- 6 - COMPRESSED AIR TO ENGINE
- 7 - EXHAUST GAS
- 8 - EXHAUST GAS TO EXHAUST PIPE

CAUTION: The turbocharger is a performance part and must not be tampered with. The wastegate bracket is an integral part of the turbocharger. Tampering with the wastegate components can reduce durability by increasing cylinder pressure and thermal loading due to incorrect inlet and exhaust manifold pressure. Poor fuel economy and failure to meet regulatory

emissions laws may result. Increasing the turbocharger boost WILL NOT increase engine power.

The turbocharger is an exhaust-driven supercharger which increases the pressure and density of the air entering the engine through the charge air cooler. With the increase of air entering the engine, more fuel can be injected into the cylinders, which creates more power during combustion.

The turbocharger assembly consists of four (5) major component systems. See **Fig. 15**.

Turbine section

Compressor section

Bearing housing

Variable veins

Actuator

OPERATION

OPERATION

Fig. 16: Turbocharger Oil Supply & Drain
Courtesy of CHRYSLER LLC

- | |
|---|
| <ul style="list-style-type: none">1 - BEARINGS2 - OIL SUPPLY (FROM ENGINE BLOCK)3 - OIL RETURN (TO OIL PAN) |
|---|

Exhaust gas pressure and energy drive the turbine, which in turn drives a centrifugal compressor that compresses the inlet air, and forces the air into the engine through the charge air cooler and plumbing. Since heat is a by-product of this compression, the air must pass through a charge air cooler to cool the incoming air and maintain power and efficiency.

Increasing air flow to the engine provides:

Improved engine performance

- Lower exhaust smoke density
- Improved operating economy
- Altitude compensation
- Noise reduction.

The turbocharger is lubricated by engine oil that is pressurized, cooled, and filtered. The oil is delivered to the turbocharger by a supply line (2) that is tapped into the engine block. The oil travels into the bearing housing, where it lubricates the shaft (1) and bearings. See **Fig. 16**. A return pipe (3) at the bottom of the bearing housing, routes the engine oil back to the crankcase.

The most common turbocharger failure is bearing failure related to repeated hot shutdowns with inadequate "cool-down" periods. A sudden engine shut down after prolonged operation will result in the transfer of heat from the turbine section of the turbocharger to the bearing housing. This causes the oil to overheat and break down, which causes bearing and shaft damage the next time the vehicle is started.

Letting the engine idle after extended operation allows the turbine housing to cool to normal operating temperature. The following chart should be used as a guide in determining the amount of engine idle time required to sufficiently cool down the turbocharger before shut down, depending upon the type of driving and the amount of cargo.

TURBOCHARGER "COOL DOWN" CHART			
Driving Condition	Load -	Turbocharger Temperature	Idle Time (in minutes) Before Shut Down
Stop & Go	Empty	Cool	Less than 1
Stop & Go	Medium	Warm	1
Highway Speeds	Medium	Warm	2
City Traffic	Max. GCWR	Warm	3
Highway Speeds	Max. GCWR	Warm	4
Uphill Grade	Max. GCWR	Hot	5

DIAGNOSIS AND TESTING

TURBOCHARGER-BOOST PRESSURE

Low turbocharger boost pressure can cause poor engine performance and driveability concerns. The following procedure will test the turbocharger boost pressure.

Causes of low boost pressure include the following:

- Restricted air inlet system
- Leak in charge air cooler system
- Restricted/high pressure drop across charge air cooler
- Damaged turbocharger compressor wheel housing
- Turbocharger wastegate stuck open

Excessive exhaust restriction

Causes of excessively high boost pressure include:

Turbocharger wastegate stuck closed

Turbocharger wastegate signal line leaking or damaged

Damaged wastegate command valve O-rings

Wastegate command valve mechanically stuck in actuated position

Several Diagnostic Trouble Codes (DTCs) can be set that will indicate high or low system boost levels. There is a DTC for circuit faults relating to the electronically controlled wastegate command valve.

See **DIAGNOSIS AND TESTING** for diagnosing of low or high boost pressure due to leaks.

REMOVAL

REMOVAL

80cb4415

- 9 - TURBOCHARGER TO EXHAUST MANIFOLD GASKET

1. Disconnect negative battery cable.
2. Disconnect the MAF and Inlet air pressure sensors wiring harness connectors, disconnect the air outlet duct from the turbocharger, and remove air cleaner assembly.
3. Remove charge air cooler inlet hose from turbocharger. See **REMOVAL**.
4. Drain cooling system.
5. Remove coolant recovery pressure container. Refer to **REMOVAL**.
6. Disconnect the turbocharger actuator vacuum hose and position aside.
7. Remove turbocharger upper heat shield.
8. Raise and support the vehicle.
9. Remove the lower splash shield.
10. Disconnect the front exhaust pipe from the turbocharger.
11. Remove the turbocharger support bracket.
12. Disconnect turbocharger oil return line at turbocharger.
13. Lower the vehicle.
14. Remove the turbocharger oil supply line.
15. Remove turbocharger to exhaust manifold retaining nuts and separate turbocharger from exhaust manifold.

CLEANING

CLEANING

All old gaskets should be inspected for any tears or signs of prior leakage. If any gaskets show such indications, they should be replaced with new gaskets. All gasket mating surfaces must be cleaned of old gasket material to produce a smooth and dirt free sealing surface for the new gasket.

INSTALLATION

INSTALLATION

1. Connect turbocharger to exhaust manifold with new gasket. Torque retaining nuts to 32 N.m.

NOTE: After tightening the exhaust manifold to specification using a diagonal-cross pattern, retrace the pattern checking the correct torque value again.

2. Install exhaust manifold and turbocharger assembly with new gasket in position on studs in cylinder head. Install retaining nuts and tighten to 36 N.m.
3. Install thermostat housing. Refer to **INSTALLATION** .
4. Install accessory drive belt. Refer to **INSTALLATION** .
5. Raise vehicle on hoist.
6. Connect turbocharger oil return line at turbocharger.
7. Connect exhaust pipe at turbocharger downpipe.
8. Lower vehicle from hoist.
9. Connect oil supply line at turbocharger. Tighten banjo fitting to 24 N.m (18 ft. lbs.).
10. Install exhaust manifold heat shield. Tighten retaining bolts to 24 N.m (18 ft. lbs.).
11. Reposition EGR cooler and or EGR valve assembly on exhaust manifold. Tighten retaining nuts and bolt to 32.4 N.m.
12. Connect EGR pipe to EGR valve. Torque bolts to 32 N.m (24 ft. lbs.).
13. Connect EGR cooler coolant hoses at cooler.
14. Install coolant recovery pressure container. Refer to **INSTALLATION** .
15. Refill cooling system. Refer to **STANDARD PROCEDURE** .
16. Connect charge air cooler inlet hose at turbocharger.
17. Install air cleaner assembly.
18. Connect air inlet hose to turbocharger.
19. Connect negative battery cable.

CHARGE AIR COOLER AND PLUMBING

DIAGNOSIS AND TESTING

LEAKS

Fig. 18: AIR INLET DUCT RUBBER SLEEVE
Courtesy of CHRYSLER LLC

- | |
|----------------------------|
| 1 - CLAMP |
| 2 - TURBOCHARGER |
| 3 - AIR DUCT RUBBER SLEEVE |
| 4 - AIR INLET DUCT |

Low turbocharger boost pressure and low engine performance can be caused by leaks in the charge air cooler or plumbing. Fuel staining on the exhaust manifold can also be an indication that there are leaks in the air system. The following procedure outlines how to check for leaks in the charge air cooler system.

This procedure can also be used to check for leaks in the wastegate signal line or the wastegate canister.

1. Loosen clamp (1) and remove air inlet hose (3) from turbocharger.
2. Insert Special Tool 9022 Adapter into the turbocharger inlet. Tighten tool clamp to 8 N.m (72 in. lbs.).

CAUTION: Do not apply more than 138 kPa (20 psi) air pressure to the charge air cooler system; severe damage to the charge air cooler system may occur.

3. Connect a regulated air supply to air fitting on Tool 9022 Adapter. Set air pressure to a maximum of 138 kPa (20 psi).
4. Using soapy water check the rubber sleeves, charge air cooler and intake manifold for leaks.
5. Using soapy water check for leaks at the wastegate signal line, wastegate canister and wastegate command valve.

REMOVAL

- 4. Install the rear bumper fascia foam. See **INSTALLATION**.

FRAME

WARNING

WARNING - USE OF HEAT DURING REPAIR

WARNING: Chrysler Group engineering's position on the use of heat during collision repair is as follows:

Any body panel or frame component damaged which is to be repaired and reused, must be repaired using the "cold straightening" method. No heat may be used during the straightening process.

During rough straightening prior to panel replacement, damaged panels or frame components may be heated to assist in body/frame realignment. The application of heat must be constrained to the parts which will be replaced and not allowed to affect any other components.

This "no heat" recommendation is due to the extensive use of high strength and advanced high strength steels in Chrysler Group products. High-strength materials can be substantially and negatively affected from heat input which will not be obviously known to the repairer or consumer.

Ignoring these recommendations may lead to serious compromises in the ability to protect occupants in a future collision event, reduce the engineered qualities and attributes, or decrease the durability and reliability of the vehicle.

Failure to follow these instructions may result in serious or fatal injury.

This statement supersedes any previously released information by the Chrysler Group.

STANDARD PROCEDURE

FRONT FRAME TIP REPLACEMENT

CAUTION: Damage to the frame rail, rearward of the area covered by this procedure, which is not eliminated during preliminary structural corrections and pulls, necessitates complete rail replacement to restore the vehicle to pre-loss condition.

81de8b1e

2 - REPLACEMENT FRAME TIP
3 - ACCESS PANEL
4 - ACCESS WINDOW |
|---|

16. Weld inner frame rail in the following sequence.
 - Upper half from the access window.
 - Lower half from exterior of rail.
 - Clean backside of above two welds in preparation for welding.
 - Upper half from exterior.
 - Lower half from access window.
17. Weld Z-reinforcement from top and from bottom, from inner side rail to outer side rail.
18. Prepare access panel for reinstallation.
19. Clamp the access panel back to rail assembly.
20. Weld the butt-joints completely using a skip/stitch method to reduce the heat affected zone and distortion.
21. Weld the access window at the top and bottom to the inner frame rail using ring file or Squeeze Type Resistance Spot Welding (STRSW) (puddle) welds.
22. Install clamp to snug gap between outer rail and inner Z-reinforcements and MIG weld the outer rail back to the Z-reinforcement through the slots in the outer rail.

 - Apply rust protection into the repaired frame rail.

SPECIFICATIONS

SPECIFICATION - FRAME DIMENSIONS

Frame dimensions are listed in metric scale. All dimensions are from center to center of Principal Locating Point (PLP), or from center to center of PLP and fastener location.

VEHICLE PREPARATION

Position the vehicle on a level work surface. Using screw or bottle jacks, adjust the vehicle PLP heights to the specified dimension above a level work surface. Vertical dimensions can be taken from the work surface to the locations indicated were applicable.

FUEL DELIVERY - GAS

OPERATION

FUEL DELIVERY SYSTEM

Fuel is picked up in the fuel tank by the fuel pump module. This module is located on the bottom of the fuel tank.

A fuel return system is provided within the fuel pump module using check valves. A separate fuel return line from the engine to the tank is not used.

The fuel pressure regulator and the main fuel filter are combined within the fuel pump module.

The fuel tank assembly consists of: the fuel tank, fuel pump module assembly, fuel pump module lock ring/gasket, ORVR components. Refer to **DESCRIPTION** .

A fuel filler/vent tube assembly using a pressure/vacuum, 1/4 turn fuel filler cap is used. A one-way check valve is installed into the tanks fuel fill fitting.

Also to be considered part of the fuel system is the evaporation control system and ORVR system. This is designed to reduce the emission of fuel vapors into the atmosphere.

Both fuel filters are designed for extended service. They do not require normal scheduled maintenance.

STANDARD PROCEDURE

DRAINING FUEL TANK - GAS

Fig. 1: FUEL TANK REAR
Courtesy of CHRYSLER LLC

1. Disconnect negative battery cable.
2. Remove fuel fill cap.
3. Raise and support vehicle.
4. Remove fuel fill hose clamp (2) at rear of tank (6).
5. Remove fuel fill hose (1) from fuel tank fitting (4).
6. Position a drain hose into the fuel fill hose opening. Note that a small flapper valve is installed into the opening.
7. Drain fuel tank using an approved gasoline, or diesel fuel draining station.

FUEL SYSTEM PRESSURE RELEASE

1. Remove fuel fill cap.
2. Remove fuel pump fuse from Totally Integrated Power Module (TIPM). For location of fuse, refer to label on underside of TIPM cover.

3. Start and run engine until it stalls.
4. Attempt restarting engine until it will no longer run.
5. Turn ignition key to OFF position.
6. Place a rag or towel below fuel line quick-connect fitting at fuel rail.
7. Disconnect quick-connect fitting at fuel rail. See **STANDARD PROCEDURE**.
8. When the repair is complete, return fuel pump fuse to TIPM.
9. One or more Diagnostic Trouble Codes (DTC's) may have been stored in PCM memory due to fuel pump fuse removal. A diagnostic scan tool must be used to erase a DTC.

SPECIFICATIONS

FILTER-FUEL

DESCRIPTION

DESCRIPTION

The fuel filter and fuel pressure regulator are combined within the fuel pump module assembly. They are not serviceable.

SENSOR-FUEL LEVEL SENDING UNIT

DESCRIPTION

FUEL LEVEL SENDING UNIT SENSOR

The fuel gauge sending unit (fuel level sensor) is attached to the fuel pump module. The sending unit consists of a float, an arm, and a variable resistor track (card).

The sensor is serviceable.

REMOVAL

SENSOR-FUEL LEVEL SENDING UNIT

81971740

Fig. 6: FUEL TANK MOUNTING

Courtesy of CHRYSLER LLC

1. Drain and remove fuel tank (4). (Refer to **REMOVAL**).
2. Remove the fuel pump module. See **REMOVAL**.
3. Remove the fuel level sending unit.

INSTALLATION

SENSOR-FUEL LEVEL SENDING UNIT

1. Install the fuel level sending unit to the module.
2. Install the fuel pump module in the tank. See **INSTALLATION**.

81971740

Fig. 7: FUEL TANK MOUNTING
Courtesy of CHRYSLER LLC

3. Install fuel tank (4). See **INSTALLATION**.

LINES-FUEL

DESCRIPTION

FUEL LINES

See **STANDARD PROCEDURE**.

WARNING: The fuel system may be under a constant pressure (even with the engine off). Before servicing any fuel system hoses, fittings, lines, or most components, fuel system pressure must be released. Refer to the **FUEL SYSTEM PRESSURE RELEASE** procedure.

The lines/tubes/hoses used on fuel injected vehicles are of a special construction. This is due to the higher fuel pressures and the possibility of contaminated fuel in this system. If it is necessary to replace these lines/tubes/hoses, only those marked EFM/EFI may be used.

If equipped: The hose clamps used to secure rubber hoses on fuel injected vehicles are of a special rolled edge construction. This construction is used to prevent the edge of the clamp from cutting into the hose. Only these rolled edge type clamps may be used in this system. All other types of clamps may cut into the hoses and cause high-pressure fuel leaks.

Use new original equipment type hose clamps.

FITTING-QUICK CONNECT

DESCRIPTION

FITTING-QUICK CONNECT

Different types of quick-connect fittings are used to attach the various fuel system components, lines and tubes. These are: a single-button type, a two-button type, a pinch type, a single-tab type, a two-tab type or a plastic retainer ring type. Some are equipped with safety latch clips. Some may require the use of a special tool for disconnection and removal. See **STANDARD PROCEDURE**.

CAUTION: Before separating a quick-connect fitting, pay attention to what type of fitting is being used by referring to Quick-Connect Fitting Removal. This will prevent unnecessary fitting or fitting latch breakage.

CAUTION: The interior components (O-rings, clips) of quick-connect fittings are not serviced separately, but new plastic spacers and latches are available for some types. If service parts are not available, do not attempt to repair the damaged fitting or fuel line (tube). If repair is necessary, replace the complete fuel line (tube) assembly.

STANDARD PROCEDURE

FITTING-QUICK CONNECT

Different types of quick-connect fittings are used to attach the various fuel system components, lines and tubes. These are: a single-button type, a two-button type, a pinch type, a single-tab type, a two-tab type or a plastic retainer ring type. Some are equipped with safety latch clips. Some may require the use of a special tool for disconnection and removal.

DISCONNECTING

WARNING: The fuel system is under a constant pressure (even with engine off). Before servicing any fuel system hose, fitting or line, fuel system pressure must be released. Refer to **FUEL SYSTEM PRESSURE RELEASE** procedure .

CAUTION: Before separating a quick-connect fitting, pay attention to what type of fitting is being used by referring to Quick-Connect Fitting Removal. This will prevent unnecessary fitting or fitting latch breakage.

CAUTION: The interior components (O-rings, clips) of quick-connect fittings are not serviced separately, but new plastic spacers and latches are available for some types. If service parts are not available, do not attempt to repair the damaged fitting or fuel line (tube). If repair is necessary, replace the

complete fuel line (tube) assembly.

1. Perform fuel pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** Procedure.
2. Disconnect negative battery cable from battery.
3. Clean fitting of any foreign material before disassembly.

812bc64f

Fig. 8: Single Button Fitting
Courtesy of CHRYSLER LLC

4. **Single-Button Type Fitting:** This type of fitting is equipped with a single push-button (2) located on the quick-connect fitting.

812bc655

Fig. 9: Fitting Latches

Courtesy of CHRYSLER LLC

5. The push-button is attached to two internal latches (1). To disconnect, press on push-button with your thumb and unlatch fitting from fuel line. Special tools are not required for disconnection. **DO NOT ATTEMPT TO PRY OR PULL UP ON PUSH-BUTTON. LATCHES WILL BE BROKEN.**

80cc704d

Fig. 10: 2-Button Type Fitting
Courtesy of CHRYSLER LLC

6. Perform fuel pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE** Procedure.
7. Disconnect negative battery cable from battery.
8. Clean fitting of any foreign material before disassembly.
9. **2-Button Type Fitting:** This type of fitting (1) is equipped with a push-button located on each side of quick-connect fitting (2). Press on both buttons simultaneously for removal. Special tools are not required for disconnection.

80d85327

Fig. 11: Pinch Type Quick-Connect Fitting
Courtesy of CHRYSLER LLC

10. **Pinch-Type Fitting:** This fitting (1) is equipped with two finger tabs (2). Pinch both tabs together while removing fitting. Special tools are not required for disconnection.

8087037c

Fig. 12: Single-Tab Type Fitting
Courtesy of CHRYSLER LLC

11. **Single-Tab Type Fitting:** This type of fitting (3) is equipped with a single pull tab (1). The tab is removable. After tab is removed, quick-connect fitting can be separated from fuel system component. Special tools are not required for disconnection.

8087037e

Fig. 13: Disconnecting Single-Tab Type Fitting
Courtesy of CHRYSLER LLC

12. Press release tab on side of fitting to release pull tab (1). **If release tab is not pressed prior to releasing pull tab, pull tab will be damaged.**
13. While pressing release tab on side of fitting, use screwdriver (2) to pry up pull tab.
14. Raise pull tab until it separates from quick-connect fitting.

Fig. 14: Typical Two-Tab Type Quick-Connect Fitting
Courtesy of CHRYSLER LLC

15. **Two-Tab Type Fitting:** This type of fitting (2) is equipped with tabs located on both sides of fitting (1). The tabs are supplied for disconnecting quick-connect fitting from component being serviced.
- To disconnect quick-connect fitting, squeeze plastic retainer tabs (1) against sides of quick-connect fitting with your fingers. Tool use is not required for removal and may damage plastic retainer.
 - Pull fitting from fuel system component being serviced.
 - The plastic retainer will remain on component being serviced after fitting is disconnected. The O-rings and spacer will remain in quick-connect fitting connector body.

808a2606

Fig. 15: Plastic Retainer Ring Type Fitting
 Courtesy of CHRYSLER LLC

16. **Plastic Retainer Ring Type Fitting:** This type of fitting can be identified by the use of a full-round plastic retainer ring (4) usually black in color.
 - To release fuel system component from quick-connect fitting, firmly push fitting towards component being serviced while firmly pushing plastic retainer ring into fitting (6). With plastic ring depressed, pull fitting from component. **The plastic retainer ring must be pressed squarely into fitting body. If this retainer is cocked during removal, it may be difficult to disconnect fitting. Use an open-end wrench on shoulder of plastic retainer ring to aid in disconnection.**
 - After disconnection, plastic retainer ring will remain with quick-connect fitting connector body.
 - Inspect fitting connector body, plastic retainer ring and fuel system component for damage. Replace as necessary.

80870383

Fig. 16: Latch Clip-Type 1
Courtesy of CHRYSLER LLC

17. **Latch Clips - Type 1:** Depending on vehicle model and engine, 2 different types of safety latch clips are used. Type-1 (4) is tethered to fuel line and type-2 is not. A special tool will be necessary to disconnect fuel line after latch clip is removed. The latch clip may be used on certain fuel line/fuel rail connection, or to join fuel lines together.
18. Pry up on latch clip with a screwdriver (3).
19. Slide latch clip toward fuel rail while lifting with screwdriver.

80870387

Fig. 17: Fuel Line Disconnection Using Special Tool
Courtesy of CHRYSLER LLC

20. Insert special fuel line removal tool (Snap-On number FIH 9055-1 or equivalent) into fuel line (1). Use tool to release locking fingers in end of line.
21. With special tool still inserted, pull fuel line from fuel rail.
22. After disconnection, locking fingers will remain within quick-connect fitting at end of fuel line.
23. Disconnect quick-connect fitting from fuel system component being serviced.

Fig. 18: Latch Clip-Type 2
Courtesy of CHRYSLER LLC

24. **Latch Clips - Type 2:** Depending on vehicle model and engine, 2 different types of safety latch clips are used. Type-1 is tethered to fuel line and type-2 is not. A special tool will be necessary to disconnect fuel line after latch clip is removed. The latch clip may be used on certain fuel line/fuel rail connection, or to join fuel lines together.
25. Type 2: Separate and unlatch small arms on end of clip and swing away from fuel line.
26. Slide latch clip toward fuel rail while lifting with screwdriver.

80870387

Fig. 19: Fuel Line Disconnection Using Special Tool
Courtesy of CHRYSLER LLC

27. Insert special fuel line removal tool (Snap-On number FIH 9055-1 or equivalent) into fuel line (1). Use tool to release locking fingers in end of line.
28. With special tool still inserted, pull fuel line from fuel rail.
29. After disconnection, locking fingers will remain within quick-connect fitting at end of fuel line.
30. Disconnect quick-connect fitting from fuel system component being serviced.

814a90e5

Fig. 20: EVAP Can. Vapor Hose
Courtesy of CHRYSLER LLC

31. **Wing Type:** A special tool will not be necessary to disconnect this type of fitting (2). This line is used on different fuel and emission components. The graphic shows the fitting used on an EVAP canister.
32. Use two fingers to push on fitting wings (2)
33. Pull and disconnect fitting while holding wings.
34. After disconnection, locking fingers will remain within quick-connect fitting.

CONNECTING

1. Inspect quick-connect fitting body and fuel system component for damage. Replace as necessary.
2. Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.
3. Insert quick-connect fitting into fuel tube or fuel system component until built-on stop on fuel tube or component rests against back of fitting.

4. Continue pushing until a click is felt.
5. Single-tab type fitting: Push new tab down until it locks into place in quick-connect fitting.
6. Verify a locked condition by firmly pulling on fuel tube and fitting (15-30 lbs.).
7. Latch Clip Equipped: Install latch clip (snaps into position). **If latch clip will not fit, this indicates fuel line is not properly installed to fuel rail (or other fuel line). Recheck fuel line connection.**
8. Connect negative cable to battery.
9. Start engine and check for leaks.

REGULATOR-FUEL PRESSURE

DESCRIPTION

FUEL PRESSURE REGULATOR

The fuel pressure regulator is located within the fuel pump module. It is serviced by replacing the fuel pump module assembly.

PUMP-FUEL

DESCRIPTION

FUEL PUMP

The electric fuel pump is located inside of the fuel pump module. A 12 volt, permanent magnet, electric motor powers the fuel pump. The electric fuel pump is not a separate, serviceable component.

OPERATION

FUEL PUMP

Voltage to operate the electric pump is supplied through the fuel pump relay.

Fuel is drawn in through a filter at the bottom of the module and pushed through the electric motor gearset to the pump outlet.

Check Valve Operation: The fuel pump module contains a one-way check valve to prevent fuel flow back into the tank and to maintain fuel supply line pressure (engine warm) when pump is not operational. It is also used to keep the fuel supply line full of gasoline when pump is not operational. After the vehicle has cooled down, fuel pressure may drop to 0 psi (cold fluid contracts), but liquid gasoline will remain in fuel supply line between the check valve and fuel injectors. **Fuel pressure that has dropped to 0 psi on a cooled down vehicle (engine off) is a normal condition.**

The electric fuel pump is not a separate, serviceable component.

MODULE-FUEL PUMP

REMOVAL

FUEL PUMP MODULE

WARNING: The fuel system is under a constant pressure (even with the engine off). Before servicing the fuel pump module, the fuel system pressure must be released. (Refer to FUEL SYSTEM PRESSURE RELEASE procedure)

Fig. 21: FUEL PUMP MODULE LOCATION
Courtesy of CHRYSLER LLC

1. Drain and remove fuel tank. (Refer to REMOVAL).
2. Note rotational position of module before attempting removal. An indexing arrow is located on top of module for this purpose.
3. Position special Lockring Remover/Installer tool 9340 (3) into notches on outside edge of lock ring (5).
4. Install 1/2 inch drive breaker bar (1) to special Lockring Remover/Installer tool 9340 (3).
5. Rotate breaker bar counterclockwise to remove lockring.
6. Remove lockring. The module will spring up slightly when lockring is removed.
7. Remove module from fuel tank. Be careful not to bend float arm while removing.

INSTALLATION

FUEL PUMP MODULE

CAUTION: Whenever the fuel pump module is serviced, the rubber seal (gasket) must be replaced.

Fig. 22: FUEL PUMP MODULE LOCATION
Courtesy of CHRYSLER LLC

1. Using a new seal (gasket), position fuel pump module into opening in fuel tank.
2. Position lockring (5) over top of fuel pump module.
3. Rotate module until embossed alignment arrow points to center alignment mark. This step must be performed to prevent float from contacting side of fuel tank.
4. Install Lockring Remover/Installer 9340 (3) to lockring.
5. Install 1/2 inch drive breaker (1) into Lockring Remover/Installer 9340 (3).
6. Tighten lockring (clockwise) until all seven notches have engaged.
7. Install fuel tank.

- 10 - CONNECTOR TUBE

CAUTION: The left and right fuel rails are replaced as an assembly. Do not attempt to

separate rail halves at connector tube (10). Due to design of tube, it does not use any clamps. Never attempt to install a clamping device of any kind to tube. When removing fuel rail assembly for any reason, be careful not to bend or kink tube.

1. Remove fuel tank filler tube cap.
2. Perform Fuel System Pressure Release Procedure. See **FUEL SYSTEM PRESSURE RELEASE**.
3. Remove negative battery cable at battery.
4. Remove air duct at throttle body air box.
5. Remove air box at throttle body.
6. Disconnect fuel line latch clip and fuel line at fuel rail. A special tool will be necessary for fuel line disconnection. See **STANDARD PROCEDURE**.
7. Remove necessary vacuum/vapor lines at throttle body.

REMOVE

INSTALL

80b6f033

Fig. 24: Remove/Install Injector Connector
Courtesy of CHRYSLER LLC

8. Disconnect electrical connectors at all 6 fuel injectors. Push red colored slider away from injector (1). While pushing slider, depress tab (2) and remove connector (3) from injector. The factory fuel injection wiring harness is numerically tagged (INJ 1, INJ 2, etc.) for injector position identification. If harness is not tagged, note wiring location before removal.

9. Disconnect electrical connectors at throttle body sensors.
10. Remove 6 ignition coils. Refer to **REMOVAL** .

80c8e706

| 9 - INJ. #6 |

11. Remove four fuel rail mounting bolts (1).
12. Gently rock and pull **left** side of fuel rail until fuel injectors just start to clear machined holes in cylinder head. Gently rock and pull **right** side of rail until injectors just start to clear cylinder head holes. Repeat this procedure (left/right) until all injectors have cleared cylinder head holes.
13. Remove fuel rail (with injectors attached) from engine.
14. If fuel injectors are to be removed, see **REMOVAL**.

INSTALLATION

FUEL RAIL

1. If fuel injectors are to be installed, refer to **INSTALLATION** .
2. Clean out fuel injector machined bores in intake manifold.
3. Apply a small amount of engine oil to each fuel injector O-ring. This will help in fuel rail installation.
4. Position fuel rail/fuel injector assembly to machined injector openings in cylinder head.
5. Guide each injector into cylinder head. Be careful not to tear injector O-rings.
6. Push **right** side of fuel rail down until fuel injectors have bottomed on cylinder head shoulder. Push **left** fuel rail down until injectors have bottomed on cylinder head shoulder.
7. Install four fuel rail mounting bolts and tighten to 11 N.m (100 in. lbs.).
8. Install six ignition coils. Refer to **INSTALLATION** .
9. Connect electrical connectors to throttle body.

REMOVE

INSTALL

80b6f033

Fig. 26: Remove/Install Injector Connector
Courtesy of CHRYSLER LLC

10. Connect electrical connectors at all fuel injectors. Push connector onto injector (1) and then push and lock red colored slider (2). Verify connector is locked to injector by lightly tugging on connector.
11. Connect necessary vacuum/vapor lines to throttle body.

12. Connect fuel line latch clip and fuel line to fuel rail.
13. Install air box to throttle body.
14. Install air duct to air box.
15. Connect battery cable to battery.
16. Start engine and check for leaks.

TANK - FUEL

REMOVAL

REMOVAL

WARNING: The fuel system is under constant pressure even with engine off. Before servicing fuel rail, fuel system pressure must be released.

1. Remove fuel tank filler tube cap.
2. Perform **FUEL SYSTEM PRESSURE RELEASE** Procedure.
3. Raise and support vehicle.

81971744

Fig. 27: FUEL LINES FRONT OF TANK
Courtesy of CHRYSLER LLC

4. Disconnect fuel line quick connect fittings (1) and (2) at front of fuel tank (5).

Fig. 28: FUEL TANK LINES - REAR
Courtesy of CHRYSLER LLC

5. Remove fuel fill hose and clamp (6) at rear of tank.
6. Position a drain hose into the fuel fill hose opening. Note that a small flapper valve is installed into the opening.
7. Disconnect vapor lines (4) and (5) at rear of tank.
8. Remove rear propshaft.
9. Support tank with a hydraulic jack.

Fig. 29: FUEL TANK SIDE BRACKET

Courtesy of CHRYSLER LLC

10. Loosen two nuts (3) at tank support bracket (1).
11. Remove bolt (2) from tank support bracket (1).

81971740

Fig. 30: FUEL TANK MOUNTING
Courtesy of CHRYSLER LLC

12. Remove tank mounting bolts (3) at both sides of tank.
13. Partially lower tank to gain access to pump module electrical connector.
14. Disconnect electrical connector at fuel pump module.
15. Continue lowering tank for removal.
16. If fuel tank is to be replaced, remove fuel pump module from tank.

INSTALLATION

INSTALLATION

1. If fuel pump module is to be installed, install module to tank.
2. Place tank to a hydraulic jack and raise just enough to connect fuel pump module electrical connector.
3. Continue raising tank until snug to body.

81971740

Fig. 31: FUEL TANK MOUNTING
 Courtesy of CHRYSLER LLC

4. Install tank mounting bolts (3) at both sides of tank. Tighten to 61 N.m (45 ft. lbs.).

81971749

Fig. 32: FUEL TANK SIDE BRACKET

Courtesy of CHRYSLER LLC

5. Tighten two nuts (3) at tank support bracket (1) to 61 N.m (45 ft. lbs.).
6. Install bolt (2). Tighten to 61 N.m (45 ft. lbs.).
7. Install rear propshaft.

Fig. 33: FUEL TANK LINES - REAR

Courtesy of CHRYSLER LLC

8. Connect vapor lines (4) and (5) at rear of tank.
9. Connect fuel fill hose and clamp (6) at rear of tank.

81971744

Fig. 34: FUEL LINES FRONT OF TANK
Courtesy of CHRYSLER LLC

10. Connect fuel line quick connect fittings (1) and (2) at front of fuel tank (5).
11. Lower vehicle, fill tank with fuel and install fuel fill cap.
12. Check for fuel leaks.

FUEL DELIVERY - 2.8L DIESEL

WARNING

HIGH FUEL SYSTEM PRESSURE

WARNING: High-pressure fuel lines deliver fuel under extreme pressure from the injection pump to the injectors. This may be as high as 1600 bar (23,200 psi). Use extreme caution when inspecting for high-pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect high-pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.

DIAGNOSIS AND TESTING

D & T HIGH PRESSURE LEAKS

Fig. 35: TYPICAL TEST FOR FUEL LEAK
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - HIGH-PRESSURE LINE
2 - CARDBOARD
3 - FITTING |
|--|

WARNING: High-pressure lines deliver diesel fuel under extreme pressure from the injection pump to the fuel injectors. This may be as high as 160,000 kPa (23,206 psi). Use extreme caution when inspecting for high-pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high-pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.

High-pressure fuel leaks can cause starting problems and poor engine performance.

Carefully place a piece of cardboard (2) over the high-pressure fuel lines or suspected area. Move your body and hands away from the area. Start the engine and run till warm. **TURN THE ENGINE OFF** . Inspect the piece of cardboard for witness marks. If a high-pressure line connection is leaking, replace damaged, restricted or leaking high-pressure fuel lines with the correct replacement line.

CAUTION: The high-pressure fuel lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. Only use the recommended lines when replacement of high-pressure fuel line is necessary.

FUEL SUPPLY RESTRICTIONS

LOW-PRESSURE LINES

Fuel supply line restrictions or a restricted fuel filter can cause starting problems and prevent engine from accelerating. The starting problems include; no start, longer cranking times, low power and/or white fog like exhaust.

Inspect all fuel supply lines for restrictions or blockage, including the fuel filter. Flush or replace as necessary.

HIGH-PRESSURE LINES

CAUTION: High-pressure lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. High-pressure lines can be reused only after close inspection for cracks or deformation around the sealing cone. Corroded pipes must be replaced. Use only recommended lines when replacement of high-pressure fuel line is necessary.

NOTE: High-pressure fuel lines must be replaced at each disassembly.

Restricted (kinked or bent) high-pressure lines can cause starting problems, poor engine performance, engine misfire and white smoke from exhaust.

STANDARD PROCEDURE

CLEANING FUEL SYSTEM COMPONENTS

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines, fuel rail, and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. DO NOT wire brush injector nozzles when cleaning. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

STANDARD PROCEDURE - DRAINING FUEL TANK

618d3t33

Fig. 36: FUEL TANK REAR
Courtesy of CHRYSLER LLC

1. Disconnect negative battery cable.
2. Remove fuel fill cap.
3. Raise and support vehicle.
4. Remove fuel fill hose clamp (2) at rear of tank (3).
5. Remove fuel fill hose (1) from fuel tank.
6. Position a drain hose into the fuel fill hose opening. Note that a small flapper valve is installed into the opening.
7. Drain fuel tank using an approved gasoline, or diesel fuel draining station.

SEPARATOR-FUEL FILTER/WATER

DESCRIPTION

FUEL FILTER/WATER SEPARATOR

The fuel filter/water separator assembly (8) is located on the left-rear side of the engine compartment. The assembly includes the fuel filter (7), fuel heater (1), fuel temperature sensor (5), combination water drain valve/Water-In-Fuel (WIF) sensor (6), and a quick-connect fittings attached at the side of the fuel filter canister.

81b8dodd

Fig. 37: FUEL FILTER/WATER SEPARATOR
Courtesy of CHRYSLER LLC

OPERATION

FUEL FILTER/WATER SEPARATOR

The fuel filter/water separator protects the fuel injection pump by removing water and contaminants from the fuel. The construction of the filter/separator allows fuel to pass through it, but helps prevent moisture (water) from doing so. Moisture collects at the bottom of the filter.

Refer to the maintenance schedules in the owners manual for the recommended fuel filter replacement intervals.

For draining of water from canister, refer to **REMOVAL** .

A Water-In-Fuel (WIF) sensor is attached to the bottom of fuel filter element.

The fuel heater and fuel temperature sensor are installed into the side of the filter/separator housing.

REMOVAL

FUEL FILTER/WATER SEPARATOR

Refer to maintenance schedules, or the Owner's Manual for recommended fuel filter replacement intervals.

81b8dodd

Fig. 38: FUEL FILTER/WATER SEPARATOR
Courtesy of CHRYSLER LLC

DRAINING WATER FROM FUEL FILTER CANISTER:

The combination housing drain valve/WIF sensor (6) serves two purposes. One is to **partially** drain the filter housing of excess water. The other is to **partially** drain the housing for fuel temperature sensor, fuel filter or fuel heater element replacement.

The filter housing should be partially drained whenever the water-in-fuel warning lamp remains illuminated. (Note that lamp will be illuminated for approximately two seconds when ignition key is initially placed in ON position for a bulb check).

1. A nipple is located at the bottom of drain valve (6). Attach a drain hose to this nipple. Place drain pan under drain hose.
2. **With engine not running**, Disconnect WIF sensor electrical connector (4) then rotate drain valve (6) approximately two revolutions to open it. Leave open until all water and contaminants have been removed and clean fuel exits. Hand tighten drain valve after tightening.
3. If fuel heater element is being replaced, drain housing completely. Dispose of mixture in drain pan according to applicable regulations.
4. After draining operation, close and tighten drain valve (6).

81b8dodd

Fig. 39: FUEL FILTER/WATER SEPARATOR

Courtesy of CHRYSLER LLC

5. FUEL FILTER REPLACEMENT:

6. Clean all debris from around filter canister (7) and canister head.
7. Open drain valve (6) two complete revolutions. Drain approximately 1 cup of fuel into a waste canister. Dispose of fuel according to environmental regulations.
8. Remove drain hose from drain valve (6).
9. Use an oil filter type wrench to loosen filter (7). Continue removing filter by hand.

81b8dadd

Fig. 40: FUEL FILTER/WATER SEPARATOR

Courtesy of CHRYSLER LLC

10. **WATER-IN-FUEL (WIF) SENSOR REPLACEMENT:** The combination fuel drain valve/WIF sensor (6) is located on the bottom of the fuel filter housing.

The WIF sensor is not a separately serviceable item. If diagnostics have led you to replace this sensor, then the whole fuel filter assembly needs to be changed.

81b8dodd

Fig. 41: FUEL FILTER/WATER SEPARATOR
Courtesy of CHRYSLER LLC

11. **FUEL HEATER ELEMENT REPLACEMENT:** The fuel heater element (1) is located in the fuel filter housing (8). To replace heater, the entire housing assembly must be replaced.
12. Drain fuel filter. See previous steps.

81b8dadd

Fig. 42: FUEL FILTER/WATER SEPARATOR
Courtesy of CHRYSLER LLC

13. Disconnect electrical connectors (2), (3) and (4).

81b8be5b

Fig. 43: FITTINGS/NUTS FUEL FILTER
Courtesy of CHRYSLER LLC

14. Disconnect quick-connect fittings (1), (2) and (4) at housing.
15. Remove housing mounting nuts (3).
16. Remove housing assembly.

81b8d0dd

Fig. 44: FUEL FILTER/WATER SEPARATOR
Courtesy of CHRYSLER LLC

17. **FUEL TEMPERATURE SENSOR REPLACEMENT:** The fuel temperature sensor (5) is located in the fuel filter housing (8). To replace sensor, the entire housing assembly must be replaced.
18. Drain fuel filter. See previous steps.
19. Disconnect electrical connectors (2), (3) and (4).

81b80e6b

Fig. 45: FITTINGS/NUTS FUEL FILTER

Courtesy of CHRYSLER LLC

20. Disconnect quick-connect fittings (1), (2) and (4) at housing.
21. Remove housing mounting nuts (3).
22. Remove housing assembly.
23. **DRAIN VALVE REPLACEMENT:** The Drain Valve is located on the bottom of the fuel filter. This is not a separately serviceable item. If replacement is necessary, replace the entire filter/filter canister assembly.

INSTALLATION

FUEL FILTER/WATER SEPARATOR

Refer to maintenance schedules for recommended fuel filter replacement intervals.

81b8dadd

Fig. 46: FUEL FILTER/WATER SEPARATOR
Courtesy of CHRYSLER LLC

1. FUEL FILTER:

2. Lubricate new fuel filter O-ring with clean engine oil.
3. Position new fuel filter/canister assembly (7) to housing.
4. Rotate fuel filter/canister assembly until it comes to a hard stop.
5. Tighten the filter element an additional half-inch of rotation.
6. Connect WIF sensor electrical connector (4).
7. Be sure drain valve (6) is tight.

8. FUEL HEATER ELEMENT OR FUEL TEMPERATURE SENSOR:

Both the fuel heater element and fuel temperature sensor are attached to the fuel filter housing. To replace either of these components, the entire housing assembly must be replaced.

9. Position housing/canister assembly to body.

81b88e6b

Fig. 47: FITTINGS/NUTS FUEL FILTER

Courtesy of CHRYSLER LLC

10. Install housing mounting nuts (3).
11. Connect quick-connect fittings (1), (2) and (4) to housing fittings.

81b8dadd

Fig. 48: FUEL FILTER/WATER SEPARATOR

Courtesy of CHRYSLER LLC

12. Connect electrical connectors (2), (3) and (4).
13. **WATER-IN-FUEL (WIF) SENSOR REPLACEMENT:** The combination fuel drain valve/WIF sensor is located on the bottom of the fuel filter housing.

The WIF sensor is not a separately serviceable item. If diagnostics have led you to replace this sensor, then the whole fuel filter assembly needs to be changed.

SENSOR-WATER IN FUEL

DESCRIPTION

WATER-IN-FUEL (WIF) SENSOR - ECM INPUT

Fig. 49: FUEL FILTER/WATER SEPARATOR
Courtesy of CHRYSLER LLC

The combination drain valve/Water-In-Fuel (WIF) sensor (6) is located on the bottom of the fuel filter/water separator filter canister.

OPERATION

WATER-IN-FUEL (WIF) SENSOR - ECM INPUT

The sensor sends an input to the Engine Control Module (ECM) when it senses water in the fuel filter/water separator. As the water level in the filter/separator increases, the resistance across the WIF sensor decreases. This decrease in resistance is sent as a signal to the ECM and compared to a high water standard value. Once the value reaches 30 to 40 kilohms, the ECM will activate the water-in-fuel warning lamp through CAN bus circuits. This all takes place when the ignition key is initially put in the ON position. The ECM continues to monitor the input while the engine is running.

REMOVAL

WATER-IN-FUEL (WIF) SENSOR

The Water-In-Fuel (WIF) sensor is located at the bottom of fuel filter/water separator canister. Refer to **SEPARATOR-FUEL FILTER/WATER** for removal and installation procedures.

HEATER - FUEL

REMOVAL

WATER-IN-FUEL (WIF) SENSOR

The fuel heater is located in the fuel filter/water separator canister housing. Refer to **SEPARATOR-FUEL FILTER/WATER** for removal and installation procedures.

RELAY - FUEL HEATER

REMOVAL

REMOVAL

Fig. 50: FUEL HEATER RELAY

Courtesy of CHRYSLER LLC

The fuel heater relay (1) is located in the left/rear of the engine compartment.

1. Disconnect negative battery cable.
2. Disconnect electrical connector (2) from relay.
3. Remove relay mounting bolt and remove relay.
4. Check condition of relay connector pins for corrosion, etc.

INSTALLATION

INSTALLATION

Fig. 51: FUEL HEATER RELAY
 Courtesy of CHRYSLER LLC

The fuel heater relay (1) is located in the left/rear of the engine compartment.

1. Check condition of relay connector pins for corrosion, etc.
2. Position relay and install mounting bolt.
3. Connect electrical connector (2) to relay.
4. Connect negative battery cable to battery.

SENSOR - FUEL TEMPERATURE

REMOVAL

WATER-IN-FUEL (WIF) SENSOR

The fuel temperature sensor is located in the fuel filter/water separator canister housing. Refer to **SEPARATOR-FUEL FILTER/WATER** for removal and installation procedures.

RAIL - FUEL

REMOVAL

REMOVAL

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead

to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

81b2ac70

Fig. 52: FUEL RAIL - 2.8L DIESEL
Courtesy of CHRYSLER LLC

1. Disconnect negative battery cable at battery. Isolate end of cable.
2. Remove dress-up cover from top of engine.
3. Disconnect electrical connector at fuel pressure sensor (1).
4. Disconnect electrical connector at fuel pressure solenoid (3).

Fig. 53: FUEL INJECTORS - 2.8L DIESEL
 Courtesy of CHRYSLER LLC

CAUTION: WHEN LOOSENING OR TIGHTENING HIGH-PRESSURE LINE FITTINGS ATTACHED TO A SEPARATE FITTING, USE A BACK-UP WRENCH ON FITTING. DO NOT ALLOW FITTING TO ROTATE. DAMAGE TO BOTH FUEL LINE AND FITTING WILL RESULT.

5. Disconnect fuel line fittings (2) and (4) and remove four fuel lines (3). Note and mark position of each fuel line while removing.
6. Remove fuel line clamp bolt (10).
7. Disconnect rail-to-injection pump high-pressure fuel line fittings (9) and (11) and remove fuel line (12). Note and mark position of fuel line while removing.

81b2ac70

Fig. 54: FUEL RAIL - 2.8L DIESEL
Courtesy of CHRYSLER LLC

8. Remove three fuel rail mounting nuts (4).
9. Remove rail (2) from cylinder head.

INSTALLATION

INSTALLATION

NOTE: New High Pressure Fuel Line must be used any time the High Pressure Fuel Lines have been removed.

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

81b2ac70

Fig. 55: FUEL RAIL - 2.8L DIESEL

Courtesy of CHRYSLER LLC

1. Position fuel rail (2) to cylinder head.
2. Install three fuel rail mounting nuts (4). Tighten nuts (alternately) to 24 N.m (18 ft. lbs.) torque.

Fig. 56: FUEL INJECTORS - 2.8L DIESEL
 Courtesy of CHRYSLER LLC

CAUTION: WHEN LOOSENING OR TIGHTENING HIGH-PRESSURE LINE FITTINGS ATTACHED TO A SEPARATE FITTING, USE A BACK-UP WRENCH ON FITTING. DO NOT ALLOW FITTING TO ROTATE. DAMAGE TO BOTH FUEL LINE AND FITTING WILL RESULT.

3. Install the injectors (8), the injector clamps (7) and washers (6).
4. Install the injector bolts (5). Do not tighten at this time.
5. Position and connect the high pressure line (12) between the high pressure injection pump and the fuel rail. Do not tighten at this time.
6. Torque injector clamp bolts to 32.4 Nm (23 ft. lbs.).
7. Torque the rail side (4) of the high pressure lines between the injectors and the fuel rail to 5 Nm (44 in. lbs.) plus an additional 75°.
8. Torque the injector side (2) of the high pressure lines between the injectors and the fuel rail to 28 Nm (20 ft. lbs.).
9. Torque the rail side (9) of the high pressure fuel line between the high pressure injection pump and the fuel rail to 5 Nm (44 in. lbs.) plus an additional 75°.
10. Torque the high pressure pump side (11) of the high pressure fuel line between the high pressure injection pump and the fuel rail to 28 Nm (20 ft. lbs.).
11. Install fuel line clamp bolt (10). Tighten bolt to 15 N.m (11 ft. lbs.) torque.

81b2ac70

Fig. 57: FUEL RAIL - 2.8L DIESEL
Courtesy of CHRYSLER LLC

12. Connect electrical connectors to fuel injectors.
13. Connect electrical connector to fuel pressure solenoid (3).
14. Connect electrical connector to fuel pressure sensor (1).
15. Install the engine cover.
16. Connect negative battery cable to battery.

LINES-FUEL

DESCRIPTION

DESCRIPTION

Low-Pressure Lines Are:

- the fuel supply line from fuel tank to fuel filter housing.
- the fuel return line back to fuel tank.
- the fuel drain line from each fuel injector.
- the fuel supply line from fuel filter to fuel injection pump.
- the fuel injection pump return line.

High-Pressure Lines Are:

the fuel line from fuel injection pump to fuel rail.

the four fuel lines from fuel rail up to the fuel injectors

WARNING: High-pressure fuel lines deliver diesel fuel under extreme pressure from the injection pump to the fuel injectors. This may be as high as 160,000 kPa (23,206 psi). Use extreme caution when inspecting for high-pressure fuel leaks. Inspect for high-pressure fuel leaks with a sheet of cardboard. High fuel injection pressure can cause personal injury if contact is made with the skin.

OPERATION

HIGH-PRESSURE FUEL LINES

High-Pressure Lines

CAUTION: The high-pressure fuel lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. If lines are ever kinked or bent, they must be replaced. Use only the recommended lines when replacement of high-pressure fuel line is necessary.

High-pressure fuel lines deliver fuel (under pressure) of up to approximately 160,000 kPa (23,206 psi) from the injection pump to the fuel injectors. The lines expand and contract from the high-pressure fuel pulses generated during the injection process. All high-pressure fuel lines are of the same length and inside diameter. Correct high-pressure fuel line usage and installation is critical to smooth engine operation.

WARNING: Use extreme caution when inspecting for high-pressure fuel leaks. Inspect for high-pressure fuel leaks with a sheet of cardboard. High fuel injection pressure can cause personal injury if contact is made with the skin.

DIAGNOSIS AND TESTING

HIGH-PRESSURE FUEL LINE LEAK TEST

J9414-130

Fig. 58: TYPICAL TEST FOR LEAKS USING CARDBOARD

Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - HIGH-PRESSURE LINE
2 - CARDBOARD
3 - TYPICAL HIGH-PRESSURE FITTING |
|--|

High-pressure fuel line leaks can cause starting problems and poor engine performance.

WARNING: Due to extreme fuel pressures of up to 160,000 kPa (23,207 psi), use extreme caution when inspecting for high-pressure fuel leaks. Do not get your hand or a finger near a suspected leak. Inspect for high-pressure fuel leaks with a sheet of cardboard (2) (typical picture). High fuel injection pressure can cause personal injury if contact is made with the skin.

Start the engine. Move the cardboard (2) over the suspected high-pressure fuel line leak, and check for fuel spray onto the cardboard. If line is leaking, retorque line while engine is shutdown. Replace damaged, restricted or leaking high-pressure fuel lines with the correct replacement line.

CAUTION: The high-pressure fuel lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. Only use the recommended lines when replacement of high-pressure fuel line is necessary.

REMOVAL

HIGH-PRESSURE FUEL LINES

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel

fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

1. Disconnect negative battery cable at battery. Isolate end of cable.
2. Remove dress-up cover from top of engine.

INSTALLATION

HIGH-PRESSURE FUEL LINES

All high-pressure fuel lines are of the same length and inside diameter. Correct high-pressure fuel line usage and installation is critical to smooth engine operation.

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

Fig. 60: FUEL INJECTORS - 2.8L DIESEL
Courtesy of CHRYSLER LLC

CAUTION: WHEN LOOSENING OR TIGHTENING HIGH-PRESSURE LINE FITTINGS

ATTACHED TO A SEPARATE FITTING, USE A BACK-UP WRENCH ON FITTING. DO NOT ALLOW FITTING TO ROTATE. DAMAGE TO BOTH FUEL LINE AND FITTING WILL RESULT.

1. Position the injectors with the clamp and washer into the cylinder head seat.
2. Hand tighten the injector clamp bolts.
3. Install the high pressure fuel line.
4. Hand tighten the high pressure fuel line.
5. Torque the fuel injector clamp bolts to 32 Nm (23 ft. lbs.).
6. Torque the high pressure fuel rail nuts to 25 Nm (221 in. lbs.).
7. Torque the high pressure fuel line on the fuel injector to 28 Nm (247 in. lbs.).
8. Torque the high pressure fuel line on the fuel rail to 5 Nm (44 in. lbs) +75 degrees.

MOTOR - FUEL PUMP

DESCRIPTION

DESCRIPTION

An engine mounted, low-pressure mechanical fuel pump is **not used** with the 2.8L diesel engine.

An electric fuel pump is mounted to the fuel pump module. The pump supplies a low-pressure fuel supply to the engine.

Fuel is drawn in through a filter at the bottom of the module and pushed through the electric motor gearset to the pump outlet.

The electric fuel pump is not a separate, serviceable component. The entire fuel pump module must be replaced.

MODULE - FUEL PUMP

REMOVAL

REMOVAL

81b222d5

Fig. 61: FUEL TANK TOP

1. The 2.8L diesel fuel pump module (2) is located on the top of fuel tank.

81281857

Fig. 62: FUEL PUMP MODULE LOCATION
 Courtesy of CHRYSLER LLC

2. Drain and remove fuel tank.
3. Note rotational position of module before attempting removal. An indexing arrow is located on top of module for this purpose.
4. Position special Lockring Remover/Installer tool 9340 (3) into notches on outside edge of lockring (5).
5. Install 1/2 inch drive breaker bar (1) to special Lockring Remover/Installer tool 9340 (3).
6. Rotate breaker bar counterclockwise to remove lockring.
7. Remove lockring. The module will spring up slightly when lockring is removed.

8. Remove module from fuel tank. Be careful not to bend float arm while removing.

INSTALLATION

INSTALLATION

CAUTION: Whenever the fuel pump module is serviced, the rubber seal (gasket) must be replaced.

Fig. 63:
Courtesy of CHRYSLER LLC

1. Using a new seal (gasket), position fuel pump module into opening in fuel tank.
2. Position lockring (5) over top of fuel pump module.
3. Rotate module until embossed alignment arrow points to center alignment mark. This step must be performed to prevent float from contacting side of fuel tank.
4. Install Lockring Remover/Installer 9340 (3) to lockring.
5. Install 1/2 inch drive breaker (1) into Lockring Remover/Installer 9340 (3).
6. Tighten lockring (clockwise) until all seven notches have engaged.
7. Install fuel tank.

PUMP-FUEL INJECTION

DESCRIPTION

FUEL INJECTION PUMP

Fig. 64: Fuel Injection Pump
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - FUEL INJECTION PUMP
2 - FUEL QUANTITY SOLENOID |
|---|

A radial, 3 piston pump (1) mounted to the timing belt cover, is used to deliver fuel under high pressure to the fuel rail. See **WARNING**.

The pump is driven by the timing belt. Pressure is generated independently of the injection process. The pump is lubricated with diesel fuel and is not responsible for fuel injection timing. However, there is a mark on the high pressure fuel pump sprocket that must be aligned with a mark on the timing belt cover whenever the high pressure pump, sprocket, or timing belt have been removed.

OPERATION

FUEL INJECTION PUMP

High Pressure Pumping Plungers

The fuel quantity solenoid supplies three high pressure pumping chambers. The pumping chambers have one way inlet valves that allow fuel to flow into the chambers. The valves then close during compression of the fuel and cause the high pressure fuel to overcome a ball and angled seat outlet valve.

All three pumping chambers are tied together in one circuit internal to the pump and provide high pressure fuel up to 1600 bar (23,000 psi) through a steel line, to the fuel rail.

The pump is driven at 1:1 engine speed and is not responsible for injection timing. The pump is only responsible for providing high pressure fuel while the ECM controls the injection timing.

REMOVAL

FUEL INJECTION PUMP

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

WARNING: High-pressure lines deliver diesel fuel under extreme pressure from the injection pump to the fuel injectors. Use extreme caution when inspecting for high-pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high-pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.

1. Disconnect negative battery cable.
2. Drain engine coolant.
3. Raise and support vehicle.
4. Disconnect and reposition engine coolant hose near rear of injection pump.
5. Remove timing belt.

7. Tighten injection pump sprocket nut (4) to 88 N.m (65 ft. lbs.) torque.
8. **PUMP ALIGNMENT MARKS:** Rotate pump gear (1) until marks (2) and (3) are aligned.
9. Install timing belt.
10. Connect engine coolant hose near rear of injection pump.
11. Fill engine cooling system.
12. Lower vehicle.
13. Connect negative battery cable.
14. Start engine and check for fuel leaks.

PUMP-FUEL TRANSFER

DESCRIPTION

FUEL TRANSFER (LIFT) PUMP

The fuel transfer pump (fuel lift pump) is part of the fuel pump module. The fuel pump module is located in the fuel tank. The 12-volt electric pump is operated and controlled by the Engine Control Module (ECM).

REMOVAL

FUEL TRANSFER PUMP

The fuel transfer pump (fuel lift pump) is a part of the fuel tank module. It is not serviced separately.

SENSOR-FUEL PRESSURE

DESCRIPTION

FUEL PRESSURE SENSOR

WARNING: High - pressure fuel line deliver diesel fuel under extreme pressure from the injection pump to the fuel injectors. This may be as high as 1600 bar (23,200 psi). Use extreme caution when inspecting for high - pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high - pressure leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.

81b2ac70

Fig. 72: SENSOR LOCATIONS
Courtesy of CHRYSLER LLC

The fuel rail pressure sensor (1) screws into the fuel rail (2) at the top of the engine. The ECM uses this sensor to monitor the fuel rail pressure.

OPERATION

FUEL PRESSURE SENSOR

Review the high pressure fuel system warning. See **WARNING**.

The fuel flows to the fuel pressure sensor through an opening in the rail, the end of which is sealed off by the sensor diaphragm. Pressurized fuel reaches the sensor's diaphragm through a blind hole. The sensor element

(semiconductor device) converts the pressure to an electric signal is mounted on this diaphragm. The signal generated by the sensor is monitored by the ECM.

REMOVAL

FUEL PRESSURE SENSOR

1. Disconnect negative battery cable.
2. Remove engine cover.

WARNING: High pressure fuel spray can cause severe cuts, and is extremely flammable. Before opening any part of the high pressure fuel system, wait for a minimum of 30 seconds after turning off the engine to allow pressure to bleed down from the high pressure side of the fuel system. Otherwise severe personal injury can result when the high pressure fuel system is opened.

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Risk of injury to eyes and skin from contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing.

NOTE: Do allow cleaning solvent or debris to enter the fuel pressure sensor harness connector.

3. Clean the area around the fuel pressure sensor with Mopar® Throttle Body Cleaner P/N 04897156AA or equivalent degreasing solvent and compressed air.
4. Disconnect fuel pressure sensor electrical connector.

WARNING: When working with parts on the high side of the fuel injection system such as the fuel rail and high pressure injector lines, slowly loosen the part to allow any residual pressure to bleed down from the high pressure side of the system.

81b2ac70

Fig. 73: FUEL RAIL - 2.8L DIESEL
 Courtesy of CHRYSLER LLC

NOTE: Do not touch the connector terminals of the fuel rail pressure sensor. The internal electronic components of the sensor can be damaged.

5. Remove fuel pressure sensor (1) from fuel rail.
6. If the sensor is to be reused, remove the fuel rail pressure sensor sealing ring. Do not damage or gouge the fuel rail pressure sensor threads. If any gouges or cuts are present in the fuel rail pressure sensor threads, the sensor must be replaced. Otherwise, fuel leaks can occur.

NOTE: Do not allow dirt or debris to enter the fuel rail and fuel rail solenoid threads after the fuel pressure solenoid has been removed from the fuel rail.

7. Clean the thread and fuel pressure sensor sealing surface of the fuel rail.
8. Use a clean plug to close off the fuel rail pressure sensor opening if the fuel pressure solenoid will not be immediately reinstalled.

INSTALLATION

FUEL PRESSURE SENSOR

WARNING: Diesel fuel is under extreme pressure in the high pressure side of the fuel

This exploded view diagram illustrates the assembly of a 1.6L engine. The main engine block is shown on the left, with various components numbered for identification. The components include:

- 1: Intake manifold
- 2: Intake manifold gasket
- 3: Intake manifold bolt
- 4: Intake manifold nut
- 5: Water pump
- 6: Water pump gasket
- 7: Water pump housing
- 8: Water pump pulley
- 9: Water pump bracket
- 10: Water pump bracket gasket
- 11: Water pump bracket bolt
- 12: Water pump housing gasket
- 13: Water pump pulley bolt
- 14: Water pump pulley nut
- 15: Water pump pulley

1. If reusing an existing fuel pressure sensor, install a new fuel pressure sensor sealing ring.
2. Lubricate the fuel pressure sensor threads and sealing ring with clean diesel fuel.
3. Install fuel pressure sensor (1) in fuel rail (2). Position the fuel rail pressure sensor so the harness connector is not stretched or under tension. Tighten sensor to 100 N.m (73 ft. lbs.).
4. Connect fuel pressure sensor electrical connector.
5. Install engine cover.
6. Connect negative battery cable.

FUEL PRESSURE SOLENOID

81b2ac70

Fig. 75: FUEL RAIL PRESSURE SOLENOID

Courtesy of CHRYSLER LLC

The fuel pressure solenoid (3) is attached to the rear of the fuel rail (2). The tip of the fuel pressure solenoid (3) uses a knife edge, for metal to metal sealing. The knife edge actually deforms the metal in the fuel rail in order to seal the surfaces. The solenoid must be replaced when ever it is removed from the rail. The solenoid controls and maintains constant rail pressure with a control current transmitted by the engine control module (ECM).

OPERATION

FUEL PRESSURE SOLENOID

80a1a220

Fig. 76: FUEL PRESSURE SOLENOID OPERATION
Courtesy of CHRYSLER LLC

- 1 - BALL SEAT
 - 2 - SPRING FORCE
 - 3 - MAGNETIC FORCE
 - 4 - COIL
 - 5 - FUEL PRESSURE SOLENOID
 - 6 - HIGH PRESSURE SUPPLY

High pressure which is present in the fuel rail flows to the ball seat (1) of the pressure solenoid. The specified pressure required by the system is built up in the rail by the fuel pressure solenoid building up a magnetic force which corresponds to this specific pressure by means of a control current from the Electronic Control Module (ECM). This magnetic force equals a certain outlet cross section at the ball seat of the valve. The rail pressure is altered as a result of the quantity of fuel which flows off. The current fuel pressure is signaled by the fuel rail pressure sensor to the engine control module (ECM). The controlled fuel flows back along the return fuel line, into the tank.

In a de-energized state, the fuel pressure solenoid is closed as the spring force (2) presses the ball into the ball seat. When driving, the fuel pressure solenoid is constantly open. When engine is started, the fuel pressure solenoid is held closed by magnetic force. When driving, the pressure of the fluid counteracts the magnetic force of the coil and the slight spring force.

REMOVAL

FUEL PRESSURE SOLENOID

Review the high pressure fuel system warning before beginning repair. See **WARNING**.

81b2ac70

Fig. 77: FUEL RAIL PRESSURE SOLENOID

Courtesy of CHRYSLER LLC

WARNING: High pressure fuel spray can cause severe cuts, and is extremely flammable. Before opening any part of the high pressure fuel system, wait for a minimum of 30 seconds after turning off the engine to allow pressure to bleed down from the high pressure side of the fuel system. Otherwise severe personal injury can result when the high pressure fuel system is opened.

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Risk of injury to eyes and skin from contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing.

1. Disconnect negative battery cable.

NOTE: Do allow cleaning solvent or debris to enter the fuel pressure solenoid harness connector.

2. Clean the area around the fuel pressure solenoid with Mopar® Throttle Body Cleaner P/N 04897156AA or equivalent degreasing solvent and compressed air.
3. Disconnect the fuel pressure solenoid harness connector.

WARNING: When working with parts on the high side of the fuel injection system such as the fuel rail and high pressure injector lines, slowly loosen the part to allow any residual pressure to bleed down from the high pressure side of the system.

4. Remove fuel rail. See **REMOVAL**.
5. Clamp fuel rail (2) securely in vise with protective jaws.

CAUTION: Once removed, the solenoid must always be replaced. Do not reuse a fuel pressure solenoid that has been installed in the fuel rail.

6. Counterhold the fuel rail and unscrew the fuel pressure solenoid (3).

NOTE: Do not allow dirt or debris to enter the fuel rail and fuel rail solenoid threads after the fuel pressure solenoid has been removed from the fuel rail.

7. Use a clean plug to close off the fuel rail pressure solenoid opening if the fuel pressure solenoid will not be immediately reinstalled.

INSTALLATION

FUEL PRESSURE SOLENOID

Review the high pressure fuel system warning before beginning repair. See **WARNING**.

81b2ac70

Fig. 78: FUEL RAIL PRESSURE SOLENOID

Courtesy of CHRYSLER LLC

WARNING: Before working on an open fuel system, eliminate any source of sparks or open flames near the work area, and do not smoke. Wash diesel fuel off skin as soon as possible to avoid the risk of poisoning from inhaling and swallowing fuel. Do not allow diesel fuel to come in contact with eyes, otherwise, severe injury can result from contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing whenever possible to avoid injury.

CAUTION: There is a special tightening procedure for the fuel rail solenoid that must be followed along with the proper use of a torque wrench. Therefore the fuel rail must be removed before installing the fuel pressure solenoid.

CAUTION: Do not reuse an existing fuel pressure solenoid. A new fuel pressure solenoid must be installed any time the existing solenoid has been removed from the fuel rail.

1. Position the fuel rail (2) into a soft jawed vise.
2. Inspect the sealing surfaces of the fuel pressure solenoid opening in the fuel rail. If any cuts or gouges are present in the fuel rail pressure solenoid opening, replace the fuel rail.
3. Lubricate the fuel pressure solenoid sealing rings with clean diesel fuel. Do not allow dirt or debris to come in contact with the fuel rail solenoid or the threads in the fuel rail.

4. Manually thread the fuel pressure solenoid (3) into the fuel rail until hand tight.
5. Position the fuel pressure solenoid electrical socket so the fuel pressure solenoid harness connector is not under stress. Otherwise, the connector or harness can be damaged.
6. Counterhold the fuel rail, and tighten the fuel rail solenoid (3) as follows:
 - Tighten the fuel pressure solenoid to 60 N.m (44 ft. lbs.)
 - Loosen the fuel pressure solenoid 90 degrees.
 - Retighten the fuel pressure solenoid to 85 N.m (62 ft. lbs.).
7. Install fuel rail. See **INSTALLATION**.
8. Connect negative battery cable.
9. Start engine, allow to warm, turn engine off and inspect for leaks. See **DIAGNOSIS AND TESTING**.

SOLENOID - FUEL QUANTITY

DESCRIPTION

FUEL QUANTITY SOLENOID

Fig. 79: Fuel Quantity Solenoid
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - FUEL SUPPLY TO FUEL RAIL
2 - HIGH PRESSURE FUEL PUMP
3 - FUEL QUANTITY SOLENOID |
|---|

The fuel quantity solenoid is located in the back of the high pressure pump. The solenoid is pulse width modulated by the ECM and meters the amount of fuel that flows into the high pressure elements inside of the high pressure pump. The solenoid is also inactive during the first 30 seconds to allow maximum fuel pressure to the fuel rail during start up. See **Fig. 79**.

OPERATION

FUEL QUANTITY SOLENOID

The fuel quantity solenoid is a pulse width modulated valve that controls the amount of fuel sent or delayed to the high pressure pump elements inside of the high pressure pump. The ECM determines the fuel pressure set point based on engine sensor inputs. If the actual fuel rail pressure is too low, the ECM commands the solenoid to allow more fuel to flow to the high pressure pump. This minimizes the difference between the actual fuel rail pressure reading and the set point. The ECM will also operate the solenoid, delaying fuel if the fuel rail pressure becomes too high.

The fuel quantity solenoid is commanded open by the ECM to allow the high pressure pump to build maximum pressure (1600 BAR, 23,200 PSI). See **WARNING**. The solenoid also has fuel tank heat protection function that meters the exact amount of fuel to prevent excess heated fuel from returning to the fuel tank

REMOVAL

2. Apply a small amount of engine oil to sensor o-ring (3).
3. Install sensor (2) into engine block with a slight rocking and twisting action.

CAUTION: Before tightening sensor mounting bolt (1), be sure sensor is completely flush to cylinder block. If sensor is not flush, damage to sensor mounting tang may result.

4. Install mounting bolt (1).
5. Connect electrical connector to sensor.
6. Lower vehicle.

INJECTOR-FUEL

DESCRIPTION

FUEL INJECTORS

80b6f035

Fig. 87: Fuel Injector - Typical
Courtesy of CHRYSLER LLC

- | |
|---|
| 2 - FUEL OUTLET NOZZLE
3 - FUEL INLET NOZZLE |
|---|

An individual fuel injector (1) is used for each individual cylinder. See **Fig. 87**.

OPERATION

FUEL INJECTORS

The top (fuel entry) end of the injector is attached into an opening on the fuel rail. See **Fig. 87**.

The fuel injectors are electrical solenoids. The injector contains a pintle that closes off an orifice at the nozzle end. When electric current is supplied to the injector, the armature and needle move a short distance against a spring, allowing fuel to flow out the orifice. Because the fuel is under high pressure, a fine spray is developed in the shape of a pencil stream. The spraying action atomizes the fuel, adding it to the air entering the combustion chamber.

The nozzle (outlet) ends of the injectors are positioned into openings in the intake manifold just above the intake valve ports of the cylinder head. The engine wiring harness connector for each fuel injector is equipped with an attached numerical tag (INJ 1, INJ 2 etc.). This is used to identify each fuel injector.

The injectors are energized individually in a sequential order by the Powertrain Control Module (PCM). The PCM will adjust injector pulse width by switching the ground path to each individual injector on and off. Injector pulse width is the period of time that the injector is energized. The PCM will adjust injector pulse width based on various inputs it receives.

Battery voltage is supplied to the injectors through the ASD relay.

The PCM determines injector pulse width based on various inputs.

FUEL INJECTORS - PCM OUTPUT

The nozzle ends of the injectors are positioned into openings in the intake manifold just above the intake valve ports of the cylinder head. The engine wiring harness connector for each fuel injector is equipped with an attached numerical tag (INJ 1, INJ 2 etc.). This is used to identify each fuel injector with its respective cylinder number.

The injectors are energized individually in a sequential order by the Powertrain Control Module (PCM). The PCM will adjust injector pulse width by switching the ground path to each individual injector on and off. Injector pulse width is the period of time that the injector is energized. The PCM will adjust injector pulse width based on various inputs it receives.

Battery voltage (12 volts +) is supplied to the injectors through the ASD relay. The ASD relay will shut-down the 12 volt power source to the fuel injectors if the PCM senses the ignition is on, but the engine is not running. This occurs after the engine has not been running for approximately 1.8 seconds.

The PCM determines injector on-time (pulse width) based on various inputs.

REMOVAL

FUEL INJECTORS

Courtesy of CHRYSLER LLC

- 1 - PLIERS
- 2 - INJECTOR CLIP
- 3 - FUEL INJECTOR
- 4 - FUEL RAIL - TYPICAL

1. Install fuel injector(s) (3) into fuel rail assembly (4) and install retaining clip(s) (2).
2. If same injector(s) is being reinstalled, install new O-ring(s). Two different O-rings are being used. These can be easily identified by color. Install black O-ring at intake manifold end of injector. Install red/rust colored O-ring at fuel rail end of injector.
3. Apply a small amount of clean engine oil to each injector O-ring. This will aid in installation.
4. Install fuel rail. See **INSTALLATION**.
5. Start engine and check for fuel leaks.

RELAY-FUEL PUMP

DESCRIPTION

FUEL PUMP RELAY

This vehicle is not equipped with a fuel pump relay. The fuel pump control is done through the TIPM. The TIPM receives an input signal from the PCM. Once the TIPM receives the signal, it will output a 12 volt supply to the fuel pump module turning the pump on.

SENSOR-INTAKE AIR TEMPERATURE

REMOVAL

REMOVAL - 3.7L

Fig. 90: IAT SENSOR - 3.7L

The intake manifold air temperature (IAT) sensor (1) is installed into the rubber air intake tube near the throttle body.

1. Clean mounting hole.
2. Check condition of sensor O-ring.
3. Push IAT sensor (1) into rubber intake tube while rotating for installation.
4. Connect electrical connector (2) to IAT sensor.

SENSOR-MANIFOLD AIR PRESSURE

OPERATION

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR - PCM INPUT

The MAP sensor is used as an input to the Powertrain Control Module (PCM). It contains a silicon based sensing unit to provide data on the manifold vacuum that draws the air/fuel mixture into the combustion chamber. The PCM requires this information to determine injector pulse width and spark advance. When

manifold absolute pressure (MAP) equals Barometric pressure, the pulse width will be at maximum.

A 5 volt reference is supplied from the PCM and returns a voltage signal to the PCM that reflects manifold pressure. The zero pressure reading is 0.5V and full scale is 4.5V. For a pressure swing of 0-15 psi, the voltage changes 4.0V. To operate the sensor, it is supplied a regulated 4.8 to 5.1 volts. Ground is provided through the low-noise, sensor return circuit at the PCM.

The MAP sensor input is the number one contributor to fuel injector pulse width. The most important function of the MAP sensor is to determine barometric pressure. The PCM needs to know if the vehicle is at sea level or at a higher altitude, because the air density changes with altitude. It will also help to correct for varying barometric pressure. Barometric pressure and altitude have a direct inverse correlation; as altitude goes up, barometric goes down. At key-on, the PCM powers up and looks at MAP voltage, and based upon the voltage it sees, it knows the current barometric pressure (relative to altitude). Once the engine starts, the PCM looks at the voltage again, continuously every 12 milliseconds, and compares the current voltage to what it was at key-on. The difference between current voltage and what it was at key-on, is manifold vacuum.

During key-on (engine not running) the sensor reads (updates) barometric pressure. A normal range can be obtained by monitoring a known good sensor.

As the altitude increases, the air becomes thinner (less oxygen). If a vehicle is started and driven to a very different altitude than where it was at key-on, the barometric pressure needs to be updated. Any time the PCM sees Wide Open Throttle (WOT), and RPM, it will update barometric pressure in the MAP memory cell. With periodic updates, the PCM can make its calculations more effectively.

The PCM uses the MAP sensor input to aid in calculating the following:

- Manifold pressure
- Barometric pressure
- Engine load
- Injector pulse-width
- Spark-advance programs
- Shift-point strategies (certain automatic transmissions only)
- Idle speed
- Decel fuel shutoff

The MAP sensor signal is provided from a single piezoresistive element located in the center of a diaphragm. The element and diaphragm are both made of silicone. As manifold pressure changes, the diaphragm moves causing the element to deflect, which stresses the silicone. When silicone is exposed to stress, its resistance changes. As manifold vacuum increases, the MAP sensor input voltage decreases proportionally. The sensor also contains electronics that condition the signal and provide temperature compensation.

The PCM recognizes a decrease in manifold pressure by monitoring a decrease in voltage from the reading stored in the barometric pressure memory cell. The MAP sensor is a linear sensor; meaning as pressure changes, voltage changes proportionately. The range of voltage output from the sensor is usually between 4.6 volts at sea level to as low as 0.3 volts at 26 in. of Hg. Barometric pressure is the pressure exerted by the atmosphere upon an object. At sea level on a standard day, no storm, barometric pressure is approximately 29.92 in Hg. For every

100 feet of altitude, barometric pressure drops 0.10 in. Hg. If a storm goes through, it can change barometric pressure from what should be present for that altitude. You should know what the average pressure and corresponding barometric pressure is for your area.

REMOVAL

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR

Fig. 92: MAP SENSOR LOCATION 3.7L
Courtesy of CHRYSLER LLC

The Manifold Absolute Pressure (MAP) sensor (7) is mounted into the front of the intake manifold (1).

1. Disconnect electrical connector (2) at sensor.
2. Clean area around MAP sensor.
3. Remove one sensor mounting screw (8).
4. Remove MAP sensor from intake manifold by slipping it from locating pin (6).

80c91461

Fig. 93: Locating MAP Sensor O-Ring - 3.7L/4.7L

1 - MAP SENSOR 2 - O-RING

5. Check condition of sensor o-ring (2)

INSTALLATION

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR

80c91461

Fig. 94: Locating MAP Sensor O-Ring - 3.7L/4.7L
Courtesy of CHRYSLER LLC

1 - MAP SENSOR
2 - O-RING

1. Clean MAP sensor mounting hole at intake manifold.
2. Check MAP sensor o-ring seal (2) for cuts or tears.

Fig. 95: MAP SENSOR LOCATION 3.7L/4.7L
Courtesy of CHRYSLER LLC

3. Position MAP sensor into manifold by sliding sensor over locating pin (6).
4. Install mounting bolt (8). Tighten to 3 N.m (25 in. lbs.) torque.
5. Connect electrical connector (2).

SENSOR - OXYGEN

REMOVAL

REMOVAL - 3.7L

819736fe

Fig. 96: OXYGEN SENSORS - 3.7L
Courtesy of CHRYSLER LLC

CAUTION: Never apply any type of grease to the oxygen sensor electrical connector, or attempt any soldering of the sensor wiring harness.

WARNING: The exhaust manifold, exhaust pipes and catalytic converter become very hot during engine operation. Allow engine to cool before removing oxygen sensor.

1. Raise and support vehicle.
2. Disconnect wire connector from O2S sensor.

CAUTION: When disconnecting sensor electrical connector, do not pull directly on wire going into sensor.

3. Remove O2S sensor (3) or (4) with an oxygen sensor removal and installation tool.
4. Clean threads in exhaust pipe using appropriate tap.

INSTALLATION

INSTALLATION - 3.7L

819736fe

Fig. 97: OXYGEN SENSORS - 3.7L
Courtesy of CHRYSLER LLC

Threads of new oxygen sensors are factory coated with anti-seize compound to aid in removal. **DO NOT add any additional anti-seize compound to threads of a new oxygen sensor.**

1. Install O2S sensor (3) or (4). Tighten to 41 N.m (30 ft. lbs.).
2. Connect O2S sensor wire connector.
3. Lower vehicle.

BODY-THROTTLE

REMOVAL

THROTTLE BODY - 3.7L

CAUTION: Using a diagnostic scan tool, record any previous DTC's (Diagnostic Trouble Codes).

CAUTION: Never have the ignition key in the ON position when/if checking the throttle body shaft for a binding condition. This may set DTC's.

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the Powertrain Control Module (PCM).

Fig. 98: Throttle Body 3.7L
Courtesy of CHRYSLER LLC

1. Disconnect and isolate negative battery cable at battery.
2. Remove air intake tube at throttle body flange (1).
3. Disconnect throttle body electrical connector (3).
4. Disconnect necessary vacuum lines at throttle body.
5. Remove four throttle body mounting bolts (2).
6. Remove throttle body from intake manifold.
7. Check condition of old throttle body-to-intake manifold o-ring.

INSTALLATION

THROTTLE BODY - 3.7L

Fig. 99: Throttle Body 3.7L
Courtesy of CHRYSLER LLC

1. Check condition of throttle body-to-intake manifold O-ring. Replace as necessary.
2. Clean mating surfaces of throttle body and intake manifold.
3. Install O-ring between throttle body and intake manifold.
4. Position throttle body (1) to intake manifold.
5. Install all throttle body mounting bolts (2) finger tight.

Fig. 100: Throttle Body Mandatory Torque
Courtesy of CHRYSLER LLC

CAUTION: The throttle body mounting bolts **MUST** be torqued to specifications. **DO NOT OVER TIGHTEN MOUNTING BOLTS.** Over tightening can cause damage to the throttle body, throttle plate, gaskets, bolts and/or the intake manifold. Proper torque of the mounting bolts is critical to normal operation.

6. Obtain a torque wrench. Tighten mounting bolts (as shown in graphic) in a mandatory torque crisscross pattern sequence to 7.5 N.m (65 in. lbs.).

Fig. 101: Throttle Body 3.7L
Courtesy of CHRYSLER LLC

7. Install electrical connector (3).
8. Install necessary vacuum lines.
9. Install air cleaner duct at throttle body.
10. Connect negative battery cable.
11. Using the diagnostic scan tool, erase all previous DTC's and perform the ETC Relearn function.

FUEL INJECTION - 2.8L DIESEL

OPERATION

SYSTEM DIAGNOSIS

OPERATION

A leaking fuel injector can cause excessive preignition knock, poor engine performance, excessive black smoke in the exhaust, poor fuel economy and rough engine idle. If the fuel injector needle valve does not operate properly, the engine may misfire and produce low power.

The Fuel Injection System is controlled by the Engine Control Module (ECM). If the ECM senses a fault in a monitored fuel system circuit, the ECM will store a Diagnostic Trouble Code (DTC), which can be retrieved with a Scan Tool. The On-Board Diagnostic functions of the ECM must be used to test the system when diagnosing mechanical or electrical problems with the Fuel Injection System. In addition to diagnosing electrical faults, the Scan Tool has the following functions to test the mechanical operation of the injectors:

- Compression Test
- Fuel Correction Test
- Balance Test
- Kill Test

SENSOR-ACCELERATOR PEDAL POSITION

REMOVAL

ACCELERATOR PEDAL - WITHOUT ACCELERATOR PEDAL POSITION SENSOR

Fig. 102: ACCELERATOR PEDAL/APPS

Courtesy of CHRYSLER LLC

The accelerator pedal and APPS (Accelerator Pedal Position Sensor) are serviced as a complete assembly including the bracket.

1. Disconnect electrical connector (3) at APPS.
2. Remove two accelerator pedal mounting bracket nuts (2).
3. Remove accelerator pedal/APPS assembly (1) from vehicle.

INSTALLATION

ACCELERATOR PEDAL - WITHOUT ACCELERATOR PEDAL POSITION SENSOR

Fig. 103: ACCELERATOR PEDAL/APPS

Courtesy of CHRYSLER LLC

The accelerator pedal and APPS (Accelerator Pedal Position Sensor) are serviced as a complete assembly including the bracket.

1. Position accelerator pedal/APPS assembly over two mounting studs.
2. Install two accelerator pedal mounting bracket nuts (2).
3. Connect electrical connector (3) at APPS.
4. Before starting engine, operate accelerator pedal to check for any binding.

INJECTOR-FUEL

DESCRIPTION

FUEL INJECTOR

To control the injection valves, the new Common-Rail injectors use a rapid-action actuator made of piezo crystals, which opens and closes the injection valve. The piezo crystals expand when electrical current is applied to them, and contract when electrical current is turned off. The piezo actuator can switch up to five times faster than a standard solenoid, because the movement of the piezo crystals does not rely on mechanical components to transmit motion to the injection valve. This doubles the piezo injector's switching speed, and enables fuel to be delivered with greater precision, which leads to lower emissions and better engine performance.

STANDARD PROCEDURE

INJECTOR CLASSIFICATION

Fig. 104: FUEL INJECTOR ID NUMBER
Courtesy of CHRYSLER LLC

Each fuel injector has a alphanumeric correction code number. This correction code is printed on the upper part of the fuel injector (3) and is used to identify injector calibration. When replacing any fuel injectors, this code must be entered into the vehicles Engine Control Module (ECM) using a diagnostic scan tool. In addition, if a new ECM is installed, use a diagnostic scan tool to program all of the injector codes from the original fuel injectors into the new ECM.

The classification of injectors describes the fuel flow quantity characteristic of the injector. This will make it possible in the future to match the engine software to the tolerances of the injector within a more narrowly graduated range. Classification can be clearly recognized, and assigned only by means of a scan tool.

These general conditions equally apply if, as a result of replacing an engine, carrying out repairs to the cylinder head etc, the cylinder selective assignment of the injectors or the engine control module assignment may have changed. If proper attention is not paid to the classification on these vehicles, driveability and smoking concerns could result.

If an injector is replaced, it is then necessary to assign the classification code to the corresponding cylinder in the ECM (Engine Control Module) with the appropriate scan tool.

INJECTOR CLASSIFICATION PROCEDURE

1. Turn ignition switch "ON".
2. Using the diagnostic scan tool, select ENGINE then MISCELLANEOUS.
3. Select LEARN INJECTORS.
4. Using the up and down arrows, scroll to the appropriate injector.
5. Using the right and left arrows, set injector to proper classification code.
6. Once injectors are classified, cycle ignition key to complete.

REMOVAL

REMOVAL

CAUTION: Due to the complexity of the fuel injection system used on this engine, service any fuel system DTCs prior to replacing any fuel injectors. If no DTCs are present, refer to the appropriate Diesel Engine Diagnostic Test for Lack of Engine Power, and perform all steps as directed prior to replacing any fuel injectors.

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

1. Disconnect negative battery cable at battery. Isolate end of cable.
2. Remove dress-up cover from top of engine.
3. Remove the high-pressure fuel lines from fuel rail to fuel injectors. Refer to **REMOVAL** .

Fig. 105: FUEL INJECTORS - 2.8L DIESEL
Courtesy of CHRYSLER LLC

4. Locate common fuel return line (1).

Fig. 106: RETURN LINE LOCK BUTTON UP
Courtesy of CHRYSLER LLC

5. Disconnect electrical connector at top of injector(s).

NOTE: The injector common fuel return line is connected to the low pressure fuel circuit (5 bar/72 psi).

6. A lock button (1) is used to secure the common fuel return line to each fuel injector. Use your fingers to lift all four lock buttons (1) up. After unlocking all four buttons, lift fuel return line assembly up for removal.

81b2f15a

Fig. 107: TOP OF FUEL INJECTOR
Courtesy of CHRYSLER LLC

7. Remove injector mounting bolt (2) and washer (3).
8. Remove injector mounting clamp (1).
9. Using compressed air, thoroughly clean surface area in and around injector bore to prevent foreign material from falling into the injector bore after injector removal.
10. Using your hand, pull fuel injector straight up from cylinder head for removal.

81b2f15e

Fig. 108: SPECIAL TOOL #9552
Courtesy of CHRYSLER LLC

11. If injector can't be removed by hand, install special fuel injector removal tool #9552 (2) to top of fuel

injector.

Fig. 109: SPECIAL SLIDE HAMMER TOOL #8941
Courtesy of CHRYSLER LLC

12. Install special slide hammer tool #8941 (1) onto special tool #9552 (4). Tighten lock nut (2). Remove injector from cylinder head.

NOTE: **DO NOT** use a wire brush to clean the fuel injector or nozzle. Possible restriction of the injector needle may result.

INSTALLATION

INSTALLATION

CAUTION: Due to the complexity of the fuel injection system used on this engine, service any fuel system DTCs prior to replacing any fuel injectors. If no DTCs are present, refer to the appropriate Diesel Engine Diagnostic Test for Lack of Engine Power, and perform all steps as directed prior to replacing any fuel injectors.

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new

parts, lubricate them with clean engine oil or clean diesel fuel only.

81b2f16a

Fig. 110: FUEL INJECTOR GASKET

Courtesy of CHRYSLER LLC

NOTE: DO NOT use a brush to clean around the injector nozzle (2). DO NOT lubricate area around injector nozzle. The injector may become restricted with debris.

NOTE: Be sure a new copper washer/seal (3) is installed on end of injector and the old seal is removed, before installing in cylinder head.

1. Install fuel injector into cylinder head with new seal.

81b2f15a

Fig. 111: TOP OF FUEL INJECTOR

Courtesy of CHRYSLER LLC

2. Install fuel injector retainer clamp (1), washer (3) and bolt (2). Tighten clamp bolt (2) to 33 N.m (24 ft. lbs.) torque.
3. Connect electrical connector to fuel injector.
4. Install fuel injector high-pressure lines. Refer to **INSTALLATION** .

Fig. 112: RETURN LINE LOCK BUTTON UP

Courtesy of CHRYSLER LLC

5. Position female fittings on fuel return line to male fittings at each fuel injector. **Be sure lock buttons (1) are in up position before positioning.**

Fig. 113: RETURN LINE LOCK BUTTON DOWN
Courtesy of CHRYSLER LLC

6. After positioning, push each lock button (1) down to secure fuel return line to each fuel injector.
7. Connect each fuel injector electrical connector.
8. Connect negative battery cable.
9. Perform the injector classification procedure with a diagnostic scan tool.
10. Start the engine and allow to warm. **Turn off the ignition switch** and inspect for fuel leaks.
11. Install engine dress-up cover.

SENSOR-CRANKSHAFT POSITION

REMOVAL

REMOVAL

81b31297

Fig. 114: CRANKSHAFT POSITION SENSOR
Courtesy of CHRYSLER LLC

The Crankshaft Position Sensor (CKP) (4) is located between the transmission and the rear of the engine block. It is bolted to the engine block below the crankshaft hub (1).

1. Raise and support vehicle.
2. Remove access cover.
3. Disconnect CKP electrical connector (2).
4. Remove CKP mounting bolt (3).
5. Remove CKP sensor (4).

INSTALLATION

INSTALLATION

81b31297

Fig. 115: CRANKSHAFT POSITION SENSOR
Courtesy of CHRYSLER LLC

The Crankshaft Position Sensor (CKP) (4) is located between the transmission and the rear of the engine block. It is bolted to the engine block below the crankshaft hub (1).

1. Position CKP sensor (4) into mounting hole.

CAUTION: Before tightening sensor mounting bolt, be sure sensor is completely flush to cylinder block. If sensor is not flush, damage to sensor mounting tang may result.

2. Install CKP mounting bolt (3). Tighten bolt to 11 N.m (8 ft. lbs.) torque.
3. Connect CKP electrical connector (2).
4. Position CKP access cover. Install bolts and tighten to 15 N.m (11 ft. lbs.) torque.
5. Lower vehicle.

SENSOR-INTAKE AIR PRESSURE

REMOVAL

REMOVAL

Fig. 116: MAF AND INLET PRESSURE SENSORS
Courtesy of CHRYSLER LLC

The Inlet Pressure Sensor (3) is located on the air cleaner cover (1).

1. Disconnect electrical connector at sensor.
2. Remove mounting screws.
3. Remove sensor from air cleaner cover.

INSTALLATION

INSTALLATION

Fig. 117: MAF AND INLET PRESSURE SENSORS

Courtesy of CHRYSLER LLC

1. Check condition of sensor O-ring.
2. Position Inlet Pressure Sensor (3) into top of air cleaner cover (1) with a slight twisting action.
3. Install mounting screws.
4. Install Inlet Pressure Sensor electrical connector.

SENSOR-MASS AIR FLOW

REMOVAL

REMOVAL

Fig. 118: MAF AND INLET PRESSURE SENSORS

Courtesy of CHRYSLER LLC

The Mass Airflow Sensor (2) is located on the air cleaner cover (1).

1. Disconnect electrical connector at sensor.
2. Remove mounting screws.
3. Remove sensor from air cleaner cover.

INSTALLATION

INSTALLATION

Fig. 119: MAF AND INLET PRESSURE SENSORS
Courtesy of CHRYSLER LLC

1. Check condition of sensor O-ring.
2. Position MAF sensor (2) into top of air cleaner cover (1) with a slight twisting action.
3. Install mounting screws.
4. Install MAF electrical connector.

SENSOR-TEMPERATURE/PRESSURE-MAP

OPERATION

INTAKE MANIFOLD AIR TEMPERATURE (IAT) SENSOR - ECM INPUT

The combination, dual function Intake Manifold Air Temperature Sensor/MAP Sensor is installed into the top of the intake manifold with the sensor element extending into the air stream.

The IAT portion of the sensor provides an input voltage to the Engine Control Module (ECM) indicating intake manifold air temperature. The MAP portion of the sensor provides an input voltage to the ECM indicating turbocharger boost pressure.

REMOVAL

INTAKE MANIFOLD AIR TEMPERATURE (IAT) SENSOR

81ab858c

Fig. 120: INTAKE MANIFOLD AIR TEMPERATURE SENSOR/MAP SENSOR
Courtesy of CHRYSLER LLC

The combination, dual function Intake Manifold Air Temperature Sensor/MAP (IAT/MAP) sensor (1) is installed into the top of the intake manifold near the fuel rail.

1. Clean area around sensor.
2. Disconnect electrical connector from IAT/MAP sensor.
3. Remove mounting screw.
4. Remove sensor from intake manifold by twisting.
5. Check condition of sensor O-ring.

INSTALLATION

INTAKE MANIFOLD AIR TEMPERATURE (IAT) SENSOR

81ab858c

Fig. 121: INTAKE MANIFOLD AIR TEMPERATURE SENSOR/MAP SENSOR
Courtesy of CHRYSLER LLC

1. Check condition of sensor O-ring.
2. Clean sensor mounting area at intake manifold.
3. Lubricate sensor O-ring and sensor mounting hole in intake manifold cover with clean engine or diesel oil.
4. Position sensor (1) into intake manifold.
5. Install and tighten sensor mounting screw to 1 N.m (9 in. lbs.) torque.
6. Connect electrical connector to sensor.

2008 ACCESSORIES AND EQUIPMENT

Full Open Retractable Roof - Service Information - Liberty

SERVICE INFORMATION

DESCRIPTION

FULL OPEN RETRACTABLE ROOF

This vehicle is available with the Full Open Retractable Roof (FORR) option. Marketed as Sky Slider™, the unit is made of reinforced acrylic cloth, similar to a convertible top. The material can be collected to the rear of the vehicle or over the front occupant.

Features

Sky Slider™ offers a convenient express one-touch switch for opening and closing, allowing for operator interruption for infinite positioning

The fabric roof can be gathered fully forward, or fully rearward, or partially opened to any position in-between

The top panel nests into the weather-strip seal to minimize wind noise. Factory installation ensures optimum fit, finish and function

A color-keyed, decorative molding joins the FORR assembly to the headliner

The FORR assembly is equipped with a matching headliner

The full-length open roof assembly is attached to the vehicle through a unique roof structure to facilitate similar performance in noise, wind and crash safety as the standard vehicle. This structure is then bonded to the body side reinforcement system.

OPERATION

FULL OPEN RETRACTABLE ROOF

Automatic Roof Operation (Auto Mode)

Automatic Operation is movement of the roof to either the full open or full closed position without the vehicle operator continually pressing one of the three roof switch buttons. Anti-pinch detection is active in auto mode.

Pressing one of the three roof switch buttons for less than 500 milliseconds will result in the roof moving automatically. The roof will continue movement until either the full open or full closed position is reached or the vehicle operator interrupts movement by pressing any roof switch button.

Manual Roof Operation (Manual Mode)

Manual Operation is movement of the roof while the vehicle operator is continually pressing one of the three roof switch buttons. Roof movement is stopped as soon as the button is released. Anti-pinch detection is not active in manual mode.

Pressing one of the three roof switch buttons for more than 500 milliseconds will result in the roof moving manually. While in manual mode, the roof will move in the desired direction until either the full open or full closed position is reached or the roof switch button is released.

Front Open

To open the Front of the roof from the closed position press the vehicle **most rearward** roof switch button. Once the roof is in the **front open mode** , only the front of the roof can be controlled by the vehicle operator. Use the vehicle **most rearward** roof switch button to further open the roof, or the vehicle **most forward** roof switch button to close the roof. Once the roof is fully closed the roof will exit the **front open mode** .

Rear Open

To open the Rear of the roof from the closed position press the vehicle **most forward** roof switch button. Once the roof is in the **rear open mode** , only the rear of the roof can be controlled by the vehicle operator. Use the vehicle **most forward** roof switch button to further open the roof, or the vehicle **most rearward** roof switch button to close the roof. Once the roof is fully closed the roof will exit the **rear open mode** .

Global Close

Pressing the roof switch center button with the roof in any position other than closed position, will result in the roof closing. A short press for less than 500 milliseconds will result in automatic mode closing, and a long press for more than 500 milliseconds will result in manual mode closing.

Power Modes Of Operation

The Electronic Control Unit (ECU) (sometimes referred to as the Power Top Control Module) will function as follows in respect to Country Code Configuration:

- Key out door open - (No Function all Markets)

- Remote Start active - (No Function all Markets)

- Accessory Delay, Front Doors closed, key out - (Manual & Automatic Function for North American Markets) (Manual Function Only for Non-North American Markets)

- Key in Accessory Mode - (Manual & Automatic Function for North American Markets) (Manual Function Only for Non-North American Markets)

- Ignition On (Engine Off) - (Manual & Automatic Function all Markets)

- Ignition On (Engine Running) - (Manual & Automatic Function all Markets)

DIAGNOSIS AND TESTING

FULL OPEN RETRACTABLE ROOF

Any diagnosis of the FULL OPEN RETRACTABLE ROOF (FORR) system should begin with a scan tool and proper Diagnostic Procedures. The scan tool can provide confirmation that the FORR Electronic Control Unit (ECU), (sometimes referred to as the Power Top Control Module) is functional, that all of the electronic modules are sending and receiving the proper messages on the Controller Area Network (CAN) Data Bus, and that the power to the FORR is being sent the proper hard wired output by the FORR switch.

Check the condition of the circuit protection and inspect all wiring connector pins for proper engagement and continuity. For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views wire harness connectors, splices and grounds.

NOTE: Roof limits:

Motor Thermal Protection: The ECU Calculates the internal motor temperature. When the calculated temperature exceeds 365F (185C), the ECU allows the roof to only close. At 392F (200C) The ECU prevents motor movement.

System Low Temperature Operation: (Via the Vehicle Ambient Temp Sensor) At 14F (-10C) the ECU does not allow the system to vent without stopping the other motor. At -4F (-20C) the motors are allowed to close only.

Speed Thresholds: At 86 m.p.h. (138 km/h) we stop operation and at 81 m.p.h. (129 km/h) we resume operation.

NOTE: For the FORR initialization procedure, see STANDARD PROCEDURE.

SYMPTOM	POSSIBLE CAUSES	CORRECTION
Roof Completely Inoperative	Inoperative control switch	Perform sunroof switch diagnostics
	Inoperative circuit between FORR motor/ECU, control switch, and body harness.	Check the condition of the circuit protection and inspect all wiring. Repair as necessary.
	Inoperative FORR motor/ECU	Replace as necessary Motor/ECU
Audible Whine When Switch Is Depressed, Roof Does Not Operate	Inoperative drive motor gear	Replace drive motor Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
	Broken or worn drive cable	Replace cables left & right hand Refer to <u>REMOVAL</u> . Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
Audible Clicking Or Ratcheting When Switch Is Pressed, FORR Does Not Operate.	Cables out of calibration	Left & right hand cables need to be timed Refer to <u>REMOVAL</u> . Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
	Cable retainer clip worn or broken	Replace cable retainer clip Refer to <u>REMOVAL</u> . Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
	Broken or worn drive cable	Replace cables left & right hand Refer to <u>REMOVAL</u> .

		Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
	Inoperative drive motor gear	Replace drive motor Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
Front Header Bow Misaligned To Frame	Debris in drive track	Remove debris from track, check cables for wear replace if necessary and reset timing. Refer to <u>REMOVAL</u> . Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
	Broken or worn drive cable	Replace Drive Cables Refer to <u>REMOVAL</u> . Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
	Cables out of time	Left & right hand cables need to be timed Refer to <u>REMOVAL</u> . Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
	Broken cap extension	Replace the front drive assembly. Refer to <u>REMOVAL</u> . Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
Rear Header Bow Misaligned To Frame	Debris in drive track	Remove Debris from Track, check cables for wear replace if necessary and reset Timing. Refer to <u>REMOVAL</u> . Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
	Broken or worn drive cable	Replace cables left & right hand Refer to <u>REMOVAL</u> . Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
	Cables out of time	Left & right hand cables need to be timed Refer to <u>REMOVAL</u> . Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
	Broken cap extension	Replace the rear drive assembly. Refer to <u>REMOVAL</u> . Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
Front Lift Arm Not Lifting	Spring disengaged from lift arm	Repair or replace spring if necessary Refer to <u>REMOVAL</u> .

		Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
	Pin disengaged or broken	Repair or replace nylon pin if necessary Refer to <u>REMOVAL</u> . Re-initialize ECU: See <u>STANDARD PROCEDURE</u>
	Lift arm disengaged from cap extension or broken	Repair or replace front lift arm assembly if necessary Refer to <u>REMOVAL</u> . Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
Floating Bows Not Lifting	Spring disengaged	Repair or replace spring if necessary Refer to <u>REMOVAL</u> . Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
	Broken lift arm assembly	Replace lift arm assembly if necessary Refer to <u>REMOVAL</u> . Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
Top Cover Loose In Side View To Seal	Tension cable not attach at front header	Attach tension cable to front header Refer to <u>REMOVAL</u> . Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
	Tension cable not attach at rear header	Attach tension cable to rear header Refer to <u>REMOVAL</u> . Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
	Tension cable broken	Replace tension cable Refer to <u>REMOVAL</u> . Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
Top Stops Moving Prior To Full Close, Or Full Open	Debris in track	Clean track Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
	ECU lost normed "home" position	Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .
Slider Chatter	Debris in track	Clean track Re-initialize ECU: See <u>STANDARD PROCEDURE</u> .

STANDARD PROCEDURE

FULL OPEN RETRACTABLE ROOF INITIALIZATION

Limits

Temperature

The temperature must be between 5°C (41°F) to 45°C (113°F) for initialization to be performed, Outside of this temperature range an initialization will not start and if requested by a diagnostics scan tool, the Electronic Control Unit (ECU), (sometimes referred to as the Power Top Control Module) will send the proper reject code.

Voltage

Vehicle voltage must be maintained between 11V - 15V.

Roof Initialization Procedure

1. Ensure the Vehicle is in the RUN power mode with the engine running.
2. If roof is in a position other than fully closed; press roof switch center button for less than 1 second and wait for the roof to close.
3. With roof fully closed: Push and hold the roof switch center button for more than 20 seconds and do not release until the following roof cycle is complete:
 - Front of Roof will Close (Then Stall)
 - Rear of Roof will Close (Then Stall)
 - Rear of Roof will Open
 - Rear of Roof will Close
 - Rear of Roof Vents (approx two inches)
 - Front of Roof will Open
 - Front of Roof will Close
 - Rear of Roof Closes from Vent
4. Once all movement has stopped, release the roof switch center button. Roof system initialization is now complete.

MANUAL ROOF OPERATION

Fig. 1: MOTOR MANUAL OPEN

- 1 - REAR DRIVE MOTOR
 - 2 - FRONT DRIVE MOTOR
 - 3 - DRIVE AXLE LOCATION
 - 4 - 6 mm HEX SOCKET

- 1. Remove the rear dome light. Refer to **REMOVAL** .
- 2. Disconnect the green Electronic Control Unit (ECU) (sometimes referred to as the Power Top Control Module) electrical connector.
- 3. Locate the motor drive axle hole (3) and using a 6 mm hex socket or equivalent (4), open or close the desired drive assembly as required.

POWER FULL OPEN RETRACTABLE ROOF MODULE

DESCRIPTION

POWER FULL OPEN RETRACTABLE ROOF MODULE

The Electronic Control Unit (ECU) (sometimes referred to as the Power Top Control Module) is located at the rear of the vehicle roof next to the Full Open Retractable Roof (FORR) motors. The ECU is mounted to the FORR frame assembly with two screws. Three wire harness connectors are used to supply inputs to the ECU and send outputs to the FORR motors.

The ECU communicates via the Controller Area Network (CAN) data bus circuit and can be diagnosed and receive software updates with the use of a diagnostic scan tool.

OPERATION

POWER FULL OPEN RETRACTABLE ROOF MODULE

This vehicle is available with the Full Open Retractable Roof (FORR) option. Marketed as Sky Slider™, the unit is made of reinforced acrylic cloth, similar to a convertible top. The FORR system receives battery feed through the "sunroof" relay and a 25 amp mini fuse located in the Totally Integrated Power Module (TIPM). The FORR system power is supplied when the ignition switch is in the RUN and ACCESSORY positions. The sunroof will operate normally with the key in any position while the Accessory Delay system is active.

The FORR utilizes a single Electronic Control Unit (ECU) (sometimes referred to as the Power Top Control Module) to control the movement of the power top. The ECU sends a reference voltage to and receives inputs back from the power top switch via a hardwired connection. The ECU responds to the switch input by controlling one or both of the power top motors via a hardwired connection.

The ECU communicates via the Controller Area Network (CAN) data bus circuit and can be diagnosed and receive software updates with the use of a diagnostic scan tool. The ECU continually monitors ambient temperature and vehicle speed inputs from the instrument cluster, sometimes referred to as the Cab Compartment Node (CCN). The ECU also receives vehicle configuration data from the Totally Integrated Power Module (TIPM) to ensure proper operation related to geographical location (i.e. North American markets

versus Export markets).

REMOVAL

POWER FULL OPEN RETRACTABLE ROOF MODULE

Fig. 2: Electrical Connectors
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Drop rear of headliner down as needed to gain access to the module. Refer to **REMOVAL** .
3. Disconnect the electrical connectors (3) from the module.
4. Remove the two screws (1) and separate the module (2) from the roof system.

INSTALLATION

POWER FULL OPEN RETRACTABLE ROOF MODULE

Fig. 3: Electrical Connectors
Courtesy of CHRYSLER LLC

1. Position the module (2) onto the power full open retractable roof assembly.
2. Install the two mounting screws (1).
3. Connect the electrical connectors (3).
4. Install the headliner. Refer to **INSTALLATION**.
5. Connect the battery negative cable.
6. Re-initialize roof assembly. See **STANDARD PROCEDURE**.

POWER FULL OPEN RETRACTABLE ROOF MOTOR

REMOVAL

POWER FULL OPEN RETRACTABLE ROOF MOTOR

Fig. 4: MOTOR
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Drop rear of headliner down as needed to gain access to the motor. Refer to **REMOVAL**.
3. Remove the three screws (2) and separate the motor (3) from the roof system.
4. Disconnect the electrical connector (1) and remove the motor.

INSTALLATION

POWER FULL OPEN RETRACTABLE ROOF MOTOR

CAUTION: When moving the drive assemblies without the motors attached make sure that the assemblies are moved straight forward or rearward.

Fig. 5: FRONT DRIVE CABLE TIMING
 Courtesy of CHRYSLER LLC

1. Manually move drive assembly to the fully closed position.
 - For front motor installation, manually push the front drive assembly (1) fully forward.
 - Using a small screwdriver or equivalent, make sure the cable ends (3) are in contact with the frame (2).

Fig. 6: REAR DRIVE CABLE TIMING
 Courtesy of CHRYSLER LLC

2. Manually move drive assembly to the fully closed position.
 - For rear motor installation, manually push the rear drive assembly (1) fully rearward.
 - Using a small screwdriver or equivalent, make sure the cable ends (2) are in contact with the frame (3).

Fig. 7: MOTOR INSTALL
Courtesy of CHRYSLER LLC

3. Position the drive motor (1) up onto the motor mounting plate.

CAUTION: Do not install the motor using any twisting motion. Always install the motor straight and use the screws to draw the drive gear into the drive cables.

4. Install the motor screws (2) and draw the motor up evenly using the motor screws.
5. Connect the electrical connector.
6. Install the headliner. Refer to **INSTALLATION** .
7. Connect battery negative cable.
8. Re-initialize roof assembly. See **STANDARD PROCEDURE**.

POWER FULL OPEN RETRACTABLE ROOF SWITCH

DESCRIPTION

POWER FULL OPEN RETRACTABLE ROOF SWITCH

81a28142

Fig. 8: Identifying Overhead Console, Sunroof Switch, Courtesy Lamps & Infrared Temperature Sensor
Courtesy of CHRYSLER LLC

The full open retractable roof switch (2) is a combination push-button and rocker switch module mounted in the overhead console assembly (1). The power roof switch is a direct contact unit that is directly wired to the roof Electronic Control Unit (ECU) (sometimes referred to as the Power Top Control Module).

The power roof switch is part of the overhead console assembly and cannot be serviced separately. If the switch is damaged or inoperative the overhead console assembly must be replaced. Refer to **REMOVAL** .

OPERATION

POWER FULL OPEN RETRACTABLE ROOF SWITCH

The full open retractable roof switch is grounded at one terminal and receives a 5 volt signal from the Electronic Control Unit (ECU), (sometimes referred to as the Power Top Control Module) on the remaining three terminals. The switch pulls down the 5 volt reference voltage from the module signaling it to perform the desired function.

For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

Front Open

To open the Front of the roof from the closed position press the vehicle **most rearward** roof switch button. Once the roof is in the **front open mode** , only the front of the roof can be controlled by the vehicle operator. Use the vehicle **most rearward** roof switch button to further open the roof, or the vehicle **most forward** roof switch button to close the roof. Once the roof is fully closed the roof will exit the **front open mode** .

Rear Open

To open the Rear of the roof from the closed position press the vehicle **most forward** roof switch button. Once

the roof is in the **rear open mode** , only the rear of the roof can be controlled by the vehicle operator. Use the vehicle **most forward** roof switch button to further open the roof, or the vehicle **most rearward** roof switch button to close the roof. Once the roof is fully closed the roof will exit the **rear open mode** .

Global Close

Pressing the roof switch center button with the roof in any position other than closed position, will result in the roof closing. A short press for less than 500 milliseconds will result in automatic mode closing, and a long press for more than 500 milliseconds will result in manual mode closing.

DIAGNOSIS AND TESTING

POWER FULL OPEN RETRACTABLE ROOF SWITCH

For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

1. Remove the overhead console. Refer to **REMOVAL** .
2. Disconnect the full open retractable roof switch wire harness connector.
3. With the ignition key in the "RUN" position check for 5 volts on the "FRONT OPEN", "REAR OPEN" and "CLOSE" circuits of the switch harness connector. If OK, go to step 4. If not OK, inspect the wiring harness and connectors for damage and repair as necessary.
4. With the ignition key in the "OFF" position check for continuity between the ground circuit of the switch harness connector and a known good ground. Continuity should be present. If OK, go to step 5. If not OK, inspect the wiring harness and connector and repair the ground circuit as necessary.

813794bc

Fig. 9: Identifying Power Sunroof Switch Terminal Connectors

Courtesy of CHRYSLER LLC

5. Using an ohmmeter, test the continuity of the full open retractable roof switch in each switch position. Refer to **FULL OPEN RETRACTABLE ROOF SWITCH CONTINUITY TABLE**. If OK, inspect the wiring harness and connectors for damage and repair as necessary. If not OK, replace the overhead console assembly. Refer to **REMOVAL** .

FULL OPEN RETRACTABLE ROOF SWITCH CONTINUITY TABLE

SWITCH POSITION	CONTINUITY BETWEEN PINS
OFF	NO CONTINUITY

Heated Glass - Service Information - Liberty

HEATED GLASS - SERVICE INFORMATION

DESCRIPTION

REAR WINDOW DEFOGGER (EBL) SYSTEM

CAUTION: Grid lines can be damaged or scraped off with sharp instruments. Care should be taken in cleaning glass or removing foreign materials, decals or stickers. Normal glass cleaning solvents or hot water used with rags or toweling is recommended.

Fig. 1: Identifying Vertical Bus Bars, Grid Lines & Rear Window
Courtesy of CHRYSLER LLC

The rear window defogger system, also known as electric backlight (EBL), consists of two vertical bus bars (1) and a series of grid lines (2) fired onto the inside surface of the rear window (3).

The EBL system is turned on or off by a push-button switch located in the A/C-heater control. Refer to **DESCRIPTION**.

OPERATION

REAR WINDOW DEFOGGER (EBL) SYSTEM

81d5f1be

Fig. 2: A/C-Heater Control Assembly
Courtesy of CHRYSLER LLC

NOTE: ATC control shown. MTC control similar.

The electric backlight (EBL) system is controlled by a momentary push-button switch inside the mode control knob (4) on the A/C-heater control (1) located in the instrument panel center bezel. When the rear window defogger switch is pressed to the On position with the ignition switch in RUN, the switch sends a request signal over the CAN-IHS bus to the totally integrated power module (TIPM), which provides a ground path to energize the coil in the EBL relay. When energized, the EBL relay provides battery current through a fuse to the rear window defogger grid lines and to the heated side view mirrors, when equipped. The grid lines heat the glass to help clear the rear window and side mirror surfaces of fog or frost.

An amber indicator in the mode control knob will illuminate to indicate when the EBL system is operating.

NOTE: The EBL system turns off automatically after 10 minutes of initial operation. Each following activation cycle of the EBL system will last 5 minutes.

The EBL system will be automatically turned off after an initial programmed time interval of about 10 minutes as long as the ignition switch is in RUN. After the initial time interval has expired, if the rear window defogger switch is pressed to the On position again during the same ignition cycle, the EBL system will automatically turn off after about 5 minutes. The EBL system will also turn off if the ignition switch is turned to any position other than RUN or by manually pressing the rear window defogger switch a second time.

Repair of the rear window defogger grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar® Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent. See **STANDARD PROCEDURE**.

Circuit protection for the EBL system is provided by fuse 13 located in the TIPM.

DIAGNOSIS AND TESTING

REAR WINDOW DEFOGGER (EBL) SYSTEM

NOTE: Illumination of the defogger switch indicator lamp does not necessarily mean that electrical current is reaching the rear window glass and/or the outside rear view mirror heating grids (when equipped).

NOTE: For circuit descriptions and diagrams of the rear window defogger (EBL) and heated mirror systems, refer to SYSTEM WIRING DIAGRAMS article.

Operation of the electric backlight (EBL) system can be confirmed by the following:

Fig. 3: Rear Window Glass Defogger Grid Test
Courtesy of CHRYSLER LLC

NOTE: Typical heated rear window glass shown.

1. Use a scan tool and check for diagnostic trouble codes (DTCs) related to the A/C-heater control and the totally integrated power module (TIPM). If no DTCs are found, go to step 2. If any DTCs are found, repair as required, then proceed to step 2.
2. Turn the ignition switch to RUN. Press the rear window defogger switch to the On position. Rear window defogger operation can be checked by feeling the surfaces of the rear window glass, or the heated outside rear view mirror glass when equipped with heated mirrors. A distinct difference in temperature between the grid lines (5) and the adjacent clear glass or the heated mirror glass should be detected within three to

four minutes of operation.

3. If a temperature difference is not detected, use a 12-volt DC voltmeter and contact the rear glass heating grid terminal A (1) with the negative lead, and terminal B (2) with the positive lead. The voltmeter should read battery voltage. If the voltmeter does not read battery voltage, check the following:
 - Confirm the ignition switch is in RUN.
 - Confirm the rear window defogger switch is pressed to the On position.
 - Confirm the EBL feed wire (3) is connected to the heating grid positive terminal and that there is continuity between the EBL relay terminal and the heating grid.
 - Confirm the EBL ground wire (6) is connected to the heating grid negative terminal and that there is continuity to ground.
 - Check fuse 13 and fuse 34 located in the TIPM. The fuses must be tight in the receptacles and the electrical connections must be secure.
 - Check the EBL relay located in the TIPM. The relay must be tight in the receptacle and the electrical connections must be secure.
 - When diagnosing a heater mirror concern, check fuse 54 located in the TIPM. The fuse must be tight in the receptacle and the electrical connections must be secure.
4. If broken defogger grid lines or bus bars are suspected, use a 12-volt DC voltmeter and contact terminal A with the negative lead and each rear glass heating grid line at its mid-point C (4) with the positive lead. The voltmeter should read approximately 6 volts at each grid line mid-point. If the voltmeter does not read approximately 6 volts, repair the open grid line(s) or bus bar(s). See **STANDARD PROCEDURE**.
5. If the EBL system operation has been verified but the rear window defogger indicator does not illuminate, replace the A/C-heater control. Refer to **REMOVAL**.

GRID-REAR WINDOW DEFOGGER

STANDARD PROCEDURE

GRID LINE AND TERMINAL REPAIR

WARNING: Materials contained in the Repair Kit (Part Number 04549275) may cause skin or eye irritation. The kit contains epoxy resin and amine type hardener, which are harmful if swallowed. Avoid contact with the skin and eyes. For skin contact, wash the affected areas with soap and water. For contact with the eyes, flush with plenty of water. Do not take internally. If taken internally, induce vomiting and call a physician immediately. Use with adequate ventilation. Do not use near fire or flame. Contains flammable solvents. Keep out of the reach of children. Failure to follow the warnings may result in serious or fatal injury.

Repair of the rear glass heating grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar® Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent.

Fig. 4: Grid Line Repair - Typical
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - BREAK
2 - GRID LINE
3 - MASKING TAPE |
|--|

1. Mask the repair area with masking tape (3) so that the conductive epoxy can be applied neatly. Extend the epoxy application onto the grid line (2) or the bus bar on each side of the break (1).
2. Follow the instructions in the repair kit for preparing the damaged area.
3. Remove the package separator clamp and mix the two conductive epoxy components thoroughly within the packaging. Fold the package in half and cut the center corner to dispense the epoxy.
4. Apply the epoxy through the slit in the masking tape or template. Overlap both ends of the break by at least 19 millimeters (0.75 inch).
5. For a terminal or pigtail wire replacement, mask the adjacent areas so the epoxy can be extended onto the adjacent grid line as well as the bus bar. Apply a thin layer of epoxy to the area where the terminal or pigtail wire was fastened and onto the adjacent grid line.
6. Apply a thin layer of conductive epoxy to the terminal or bare wire end of the pigtail and place it in the proper location on the bus bar. To prevent the terminal or pigtail wire from moving while the epoxy is curing, it must be wedged or clamped.
7. Carefully remove the masking tape or template.

CAUTION: Do not allow the glass surface to exceed 204° C (400° F) when using a heat gun, or the glass may fracture.

8. Allow the epoxy to cure 24 hours at room temperature, or carefully use a heat gun for 15 minutes. When using a heat gun, hold it approximately 25.4 centimeters (10 inches) from the repair and do not allow the glass surface to exceed 204° C (400° F).
9. After the conductive epoxy is properly cured, remove the wedge or clamp from the terminal or pigtail wire.
10. Connect the wire harness leads to the grid terminals or pigtail wires and verify EBL operation.

RELAY-REAR WINDOW DEFOGGER

DESCRIPTION

RELAY-REAR WINDOW DEFOGGER

Fig. 5: Identifying Relay Terminals
Courtesy of CHRYSLER LLC

The rear window defogger (EBL) relay (1) is an International Standards Organization (ISO)-type relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal functions and patterns (2). The EBL relay is a electromechanical device that switches fused battery current to the rear window defogger grid and to the outside rear view mirror heating grids, when equipped. The EBL relay is energized when the relay coil is provided a ground path by the control circuitry within the totally integrated power module (TIPM).

The EBL relay is located in the TIPM inside the engine compartment.

OPERATION

RELAY-REAR WINDOW DEFOGGER

The rear window defogger (EBL) relay is an electromechanical switch that uses a low current input controlled by the totally integrated power module (TIPM) to control the high current output to the rear window defogger grid lines and to the heated outside mirrors, when equipped. The movable, common feed relay contact is held against the fixed, normally closed relay contact by spring pressure. When the electromagnetic relay coil is energized, it draws the movable common feed relay contact away from the fixed, normally closed relay contact and, holds it against the fixed, normally open relay contact. This action allows high current to flow to the rear window defogger grid lines.

When the relay coil is de-energized, spring pressure returns the movable relay contact back against the fixed, normally closed contact point. The resistor or diode is connected in parallel with the relay coil, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The EBL relay terminals are connected to the vehicle electrical system through a receptacle in the TIPM located in the engine compartment. The inputs and outputs of the EBL relay include:

Terminal (30) receives battery current at all times.

Terminal (85) receives a ground through the EBL control circuit of the TIPM only when the module electronically pulls the circuit to ground.

Terminal (86) receives battery current at all times.

Terminal (87) provides battery current to the rear window defogger grid and to the heated outside mirrors, only when the EBL relay coil is energized.

Terminal (87A) is not connected to any circuit in this application, but provides a battery current output only when the EBL relay coil is de-energized.

The EBL relay cannot be repaired and must be replaced if inoperative or damaged. Refer to the appropriate wiring information for diagnosis and testing of the ISO relay and for complete rear window defogger (EBL) wiring diagrams.

REMOVAL

RELAY-REAR WINDOW DEFOGGER

Fig. 6: Identifying Power Module (TIPM) & EBL Relay
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Open the cover on the totally integrated power module (TIPM) (1) located in the engine compartment.

NOTE: Refer to the fuse and relay map on the inside of the TIPM cover for EBL relay location.

3. Remove the EBL relay (2) from the TIPM.

INSTALLATION

RELAY-REAR WINDOW DEFOGGER

Fig. 7: Identifying Power Module (TIPM) & EBL Relay
Courtesy of CHRYSLER LLC

NOTE: Refer to the fuse and relay map on the inside of the totally integrated power module (TIPM) cover for EBL relay location.

1. Position the EBL relay (2) to the TIPM (1).
2. Align the EBL relay terminals with the terminal cavities in the TIPM receptacle and push down firmly on the relay until the terminals are fully seated.
3. Close the TIPM cover.
4. Reconnect the negative battery cable.

SWITCH-REAR WINDOW DEFOGGER

DESCRIPTION

SWITCH-REAR WINDOW DEFOGGER

Fig. 8: A/C-Heater Control Assembly
 Courtesy of CHRYSLER LLC

NOTE: ATC control shown in illustration. MTC control similar.

The switch for the rear window defogger (EBL) system is integral to the mode control knob (4) located on the A/C-heater control (1) in the instrument panel. When the rear window defogger switch is pressed to the On position, a request signal is sent over the CAN-IHS bus to the totally integrated power module (TIPM) to operate the EBL system and the amber indicator illuminates within the mode control knob.

When the EBL relay is energized, current is directed to the rear defogger grid lines and to the heated side view mirrors, when equipped. The grid lines heat the glass to help clear the rear window and side mirror surfaces of fog or frost.

OPERATION

SWITCH-REAR WINDOW DEFOGGER

The amber indicator located in the mode control knob in the A/C-heater control will illuminate when the EBL system is operating. When the rear window defogger switch is pressed to the On position with the ignition switch in RUN, the switch sends a request signal to the totally integrated power module (TIPM), which then provides a ground path to energize the coil in the EBL relay. When energized, the EBL relay provides fused battery current to the rear window defogger grid lines and to the heated side view mirrors, when equipped.

NOTE: The EBL system turns off automatically after 10 minutes of initial operation. Each following activation cycle of the EBL system will last 5 minutes.

The EBL system will be automatically turned off after an initial programmed time interval of about 10 minutes as long as the ignition switch is in RUN. After the initial time interval has expired, if the rear window defogger switch is pressed to the On position again during the same ignition cycle, the EBL system will automatically turn off after about 5 minutes. The EBL system will automatically shut off if the ignition switch is turned to any position other than RUN, or it can be turned off manually by pressing the rear window defogger switch a second time.

The rear window defogger switch is diagnosed using a scan tool (refer to **HEATED MIRRORS - ELECTRICAL DIAGNOSTICS** for more information).

The rear window defogger switch and indicator cannot be adjusted or repaired and the A/C-heater control must be replaced if inoperative or damaged. Refer to **REMOVAL** .

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

NOTE: This test covers both the Driver and Passenger code depending on the side the code appeared in.

- Set Condition:

When the Door Module senses a low value on the mirror heater driver for over 10ms, this code will set.

Possible Causes

Possible Causes
(C16) OR (C17) MIRROR HEATER DRIVER CIRCUIT SHORT TO GROUND
MIRROR SHORTED
DOOR MODULE

Diagnostic Test

1) TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Turn the rear defogger ON.

Operate the Mirror Switch in all directions several times.

With the scan tool, read DTC's.

Does the scan tool display B1D33, B1D37-MIRROR HEATER CONTROL CIRCUIT LOW?

Yes

Go To 2) TEST FOR A SHORTED MIRROR.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2) TEST FOR A SHORTED MIRROR

81a77bd4

Fig. 2: Driver/Passenger Door Module C2 Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the appropriate door module C2 connector.

Turn the ignition on.

With the scan tool, erase DTC's

Turn the rear defogger ON.

Operate the Mirror Switch in all directions several times.

With the scan tool, read DTC's.

Does the scan tool display B1D33,B1D37-MIRROR HEATER CONTROL CIRCUIT LOW?

Yes

Replace the appropriate Door Module.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Inspect the mirror harness wires for shorted condition and repair as necessary. If the mirror wiring is OK, replace the Mirror.

Perform **BODY VERIFICATION TEST - VER 1** .

- Set Condition:

When the Door Module senses a high value on the mirror heater driver for over 10ms, this code will set.

NOTE: This test covers both the Driver and Passenger code depending on the side the code appeared in.

Possible Causes

Possible Causes
(C16) OR (C17) MIRROR HEATER DRIVER CIRCUIT SHORT TO VOLTAGE
MIRROR SHORTED
DOOR MODULE

Diagnostic Test

1) TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Turn the rear defogger ON.

Operate the Mirror Switch in all directions several times.

With the scan tool, read DTC's.

Does the scan tool display B1D34, B1D38-MIRROR HEATER CONTROL CIRCUIT HIGH?

Yes

Go To 2).

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2) TEST FOR A SHORTED MIRROR

81a77bd4

Fig. 4: Driver/Passenger Door Module C2 Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the appropriate door module C2 connector.

Turn the ignition on.

With the scan tool, erase DTC's

Turn the rear defogger ON.

Operate the Mirror Switch in all directions several times.

With the scan tool, read DTC's.

Does the scan tool display B1D34,B1D38-MIRROR HEATER CONTROL CIRCUIT HIGH?

Yes

Replace the appropriate Door Module.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Inspect the mirror harness wires for shorted condition and repair as necessary. If the mirror wiring is OK, replace the Mirror.

Perform **BODY VERIFICATION TEST - VER 1** .

2008 ACCESSORIES AND EQUIPMENT

Heated Mirrors - Service Information - Liberty

HEATED MIRRORS - SERVICE INFORMATION

DESCRIPTION

HEATED MIRROR SYSTEM

81d5f1be

Fig. 1: A/C-Heater Control Assembly
Courtesy of CHRYSLER LLC

When equipped, the heated mirror system operates in concert with the rear window defogger (EBL) system. The EBL system is controlled by a momentary push-button switch integral to the mode control knob located on the A/C-heater control (1) in the instrument panel. When the rear window defogger switch is pressed to the On position with the ignition switch in RUN, the switch sends a request signal over the CAN-IHS bus to the totally integrated power module (TIPM) to energize the EBL relay. When energized, the EBL relay provides battery current to the rear window defogger grid lines and to the heated side view mirrors. The heated side view mirrors help clear the mirror surfaces of fog or frost.

An amber indicator in the mode control knob will illuminate to indicate when the heated mirror system is turned on.

NOTE: **The heated mirror system turns off automatically after 10 minutes of initial operation. Each following activation cycle of the heated mirror system will last 5 minutes.**

The heated mirror system will be automatically turned off after an initial programmed time interval of about 10 minutes as long as the ignition switch is in RUN. After the initial time interval has expired, if the rear window defogger switch is pressed to the on position again during the same ignition cycle, the heated mirror system will automatically turn off after about 5 minutes. The heated mirror system will also turn off if the ignition switch is turned to any position other than RUN or by manually pressing the rear window defogger switch a second time.

Circuit protection for the heated mirror system is provided by fuse 54 located in the TIPM.

OPERATION

HEATED MIRRORS

When equipped, the heated mirror system is activated when the rear window defogger (EBL) system is turned on. Refer to **OPERATION** . When the heated mirror system is activated, an electric heater grid located behind the glass of each of the outside rear view mirror becomes energized and produces heat to help clear the mirror of ice, snow, or fog.

If the outside mirror heating grids are both inoperative, refer to **DIAGNOSIS AND TESTING** . If only one of the outside mirror heating grid is inoperative, refer to **DIAGNOSIS AND TESTING** .

The heating grid behind each outside mirror glass cannot be repaired and the mirror glass must be replaced if the heating grid is found inoperative or damaged. Refer to **REMOVAL** .

HEATED SEATS - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B1092-FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW

Circuit Schematic

Fig. 1: Front Left Seat Heater Control Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Ignition on, during the heated seat operation.

Set Conditions

- **Set Condition:**

This code is set immediately after the Heated Seat Module detects the control circuit shorted to ground.

Possible Causes

Possible Causes
(P187) LEFT SEAT HEATER B(+) DRIVER SHORTED TO GROUND SEAT CUSHION HEATER ELEMENT SHORTED SEAT BACK HEATER ELEMENT SHORTED HEATED SEAT MODULE

Diagnostic Test

1. **VERIFY THAT DTC B1092-FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW IS ACTIVE**

With the scan tool, record and erase CCN DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

Does the DTC B1092 - FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW reset?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **DISCONNECT LEFT CUSHION HEATER 2-WAY CONNECTOR AND READ DTC'S**

819f506e

Fig. 2: Left Seat Cushion Heater 2- Way Connector
Courtesy of CHRYSLER LLC

Disconnect the Left Seat Cushion Heater 2- way connector.

NOTE: Check connectors - Clean and repair as necessary.

With the scan tool, erase DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

Does the scan tool display the same DTC?

Yes

Go To 5.

No

Go To 3.

3. **CHECK THE (P187) LEFT SEAT HEATER B(+) DRIVER FOR A SHORT TO GROUND AT THE SEAT**

Fig. 3: Measuring Between (P187) Left Seat Heater B(+) Driver Circuit At Left Seat Heater Connector (Component Side) And Seat Frame For Short To Ground
Courtesy of CHRYSLER LLC

Measure between the (P187) Left Seat Heater B(+) Driver circuit at the Left Seat Heater connector (component side) and the seat frame for a short to ground.

Is the resistance below 1000 ohms?

No

Go To 4.

Yes

Repair/replace the pigtail/heating element as necessary for a short to ground condition.

Perform **BODY VERIFICATION TEST - VER 1**.

4. CHECK THE LEFT HEATER ELEMENT SEAT CUSHION AND SEAT BACK RESISTANCE

819f50e7

Fig. 4: Measuring Between (P187) Left Seat Heater B(+) Driver And Ground Circuit At Seat Cushion And Seat Back Heater Connectors
 Courtesy of CHRYSLER LLC

Gain access to the seat cushion and seat back heater connectors.

Check the resistance of each of the heater elements by measuring between the (P187) Left Seat Heater B (+) Driver and the Ground circuit at the seat cushion and seat back heater connectors.

For the seat cushion element the resistance value is 3 to 5.5 ohms.

For the seat back element the resistance value is 4 to 6 ohms.

Is the resistance correct for each heater element?

Yes

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent short to ground.

No

Replace the heater element as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

5. Check the (P187) Left Seat Heater B(+) Driver circuit for a short to ground

Fig. 5: Checking The Seat Heater B(+) Driver Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

Ensure the Left Seat Cushion Heater 2- way connector is still disconnected.

Disconnect the Heated Seat Module connector.

NOTE: Check connectors - Clean and repair as necessary.

Measure the (P187) Left Seat Heater B(+) Driver circuit cavity D at the HSM connector to ground.

Is the resistance below 5.0 ohms?

Yes

Repair the (P187) Left Seat Heater B(+) Driver circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Heated Seat Module.

Perform **BODY VERIFICATION TEST - VER 1** .

B1094-FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN

Circuit Schematic

Fig. 6: Front Left Seat Heater Control Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Ignition on, during the heated seat operation.

Set Conditions

- **Set Condition:**

This code is set immediately after the Heated Seat Module detects an open in the seat heater B(+) driver circuit.

Possible Causes

Possible Causes
(P187) LEFT SEAT HEATER B(+) DRIVER WIRE OPEN (Z914) GROUND WIRE OPEN SEAT CUSHION HEATER ELEMENT OPEN SEAT BACK HEATER ELEMENT OPEN HEATED SEAT MODULE

Diagnostic Test

1. **VERIFY THAT DTC B1094-FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN IS ACTIVE**

With the scan tool, record and erase CCN DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

Does the DTC B1094 FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN reset?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK FOR AN OPEN SEAT HEATER ELEMENT CIRCUIT**

Fig. 7: Measuring Total Resistance Of Cushion And Seat Back Heater Elements At Left Seat Cushion 2- Way Connector (Component Side)
Courtesy of CHRYSLER LLC

Disconnect the Left Seat Cushion Heater 2- way connector.

NOTE: Check connectors - Clean and repair as necessary.

Measure the total resistance of the cushion and seat back heater elements at the Left Seat Cushion 2- way connector (component side).

Is the total resistance 2.5 to 3.5 ohms + or -.5 ohms?

Yes

Go To 4.

No

Go To 3.

3. CHECK THE LEFT SEAT HEATER ELEMENT RESISTANCE

819f50e7

Fig. 8: Measuring Between (P187) Left Seat Heater B(+) Driver And Ground Circuit At Seat Cushion And Seat Back Heater Connectors

Courtesy of CHRYSLER LLC

Gain access to and disconnect the seat cushion and seat back heater connectors.

NOTE: Check connectors - Clean and repair as necessary.

Measure each of the heater elements by measuring between the (P187) Left Seat Heater B(+) Driver and the Ground circuit at the seat cushion and seat back heater connectors.

For the seat cushion element the resistance value is 3 to 5.5 ohms.

For the seat back element the resistance value is 4 to 6 ohms.

Is the resistance correct for each heater element?

Yes

Check for an open in the pigtail harness and repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the heater element as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

4. **CHECK THE LEFT SEAT HEATER GROUND CIRCUIT**

Fig. 9: Using 12-Volt Test Light Connected To 12-Volts To Check (Z914) Ground Circuit At Left Seat Cushion Heater 2- Way Connector (Harness Side)

Courtesy of CHRYSLER LLC

Using a 12-volt test light connected to 12-volts, check the (Z914) Ground circuit at the Left Seat Cushion Heater 2- way connector (harness side).

Does the test light illuminate brightly?

Yes

Go To 5.

No

Repair the (Z914) Ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

5. **CHECK THE (P187) LEFT SEAT HEATER B(+) DRIVER CIRCUIT FOR AN OPEN**

HEATER-
SEAT
CUSHION-
LEFT

81a68d9c

Fig. 10: Measuring (P187) Left Seat Heater B(+) Driver Circuit Cavity D From HSM Connector To Left Seat Cushion Heater 2- Way Connector (Harness Side)
Courtesy of CHRYSLER LLC

Disconnect the Heated Seat Module connector.

NOTE: Check connectors - Clean and repair as necessary.

Measure the (P187) Left Seat Heater B(+) Driver circuit cavity D from the HSM connector to the Left Seat Cushion Heater 2- way connector (harness side).

Is the resistance below 5.0 ohms?

Yes

Replace the Heated Seat Module.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (P187) Left Seat Heater B(+) Driver circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

B1096-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW

Circuit Schematic

014-02005

Fig. 11: Front Right Seat Heater Control Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

Ignition on, during the heated seat operation.

Set Conditions

- **Set Condition:**

This code is set immediately after the Heated Seat Module detects the control circuit shorted to ground.

Possible Causes

Possible Causes
(P188) RIGHT SEAT HEATER B(+) DRIVER SHORTED TO GROUND SEAT CUSHION HEATER ELEMENT SHORTED SEAT BACK HEATER ELEMENT SHORTED HEATED SEAT MODULE

Diagnostic Test

1. **VERIFY THAT DTC B1096-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW IS ACTIVE**

With the scan tool, record and erase CCN DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

Does the DTC B1096 - FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW reset?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **DISCONNECT RIGHT CUSHION HEATER 2-WAY CONNECTOR AND READ DTC'S**

Fig. 12: Left Seat Cushion Heater 2- Way Connector
Courtesy of CHRYSLER LLC

Disconnect the Left Seat Cushion Heater 2- way connector.

NOTE: Check connectors - Clean and repair as necessary.

With the scan tool, erase DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

Does the scan tool display the same DTC?

Yes

Go To 5.

No

Go To 3.

3. **CHECK THE (P188) RIGHT SEAT HEATER B(+) DRIVER FOR A SHORT TO GROUND AT THE SEAT**

Fig. 13: Measuring Between (P188) Right Seat Heater B(+) Driver Circuit At Right Seat Heater Connector (Component Side) And Seat Frame For Short To Ground
Courtesy of CHRYSLER LLC

Measure between the (P188) Right Seat Heater B(+) Driver circuit at the Right Seat Heater connector (component side) and the seat frame for a short to ground.

Is the resistance below 1000 ohms?

No

Go To 4.

Yes

Repair/replace the pigtail/heating element as necessary for a short to ground condition.

Perform **BODY VERIFICATION TEST - VER 1** .

4. CHECK THE RIGHT HEATER ELEMENT SEAT CUSHION AND SEAT BACK RESISTANCE

Fig. 14: Measuring Between (P188) Right Seat Heater B(+) Driver And Ground Circuit At Seat Cushion And Seat Back Heater Connectors
 Courtesy of CHRYSLER LLC

Gain access to the seat cushion and seat back heater connectors.

Check the resistance of each of the heater elements by measuring between the (P188) Right Seat Heater B (+) Driver and the Ground circuit at the seat cushion and seat back heater connectors.

For the seat cushion element the resistance value is 3 to 5.5 ohms.

For the seat back element the resistance value is 4 to 6 ohms.

Is the resistance correct for each heater element?

Yes

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent short to ground.

No

Replace the heater element as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

5. **CHECK THE (P188) RIGHT SEAT HEATER B(+) DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 15: Checking The Seat Heater B(+) Driver Circuit For A Short To Ground
Courtesy of CHRYSLER LLC

Ensure the Right Seat Cushion Heater 2 - way connector is still disconnected.

Disconnect the Heated Seat Module connector.

NOTE: Check connectors - Clean and repair as necessary.

Measure the (P188) Right Seat Heater B(+) Driver circuit cavity K at the HSM connector to ground.

Is the resistance below 5.0 ohms?

Yes

Repair the (P188) Right Seat Heater B(+) Driver circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Heated Seat Module.

Perform **BODY VERIFICATION TEST - VER 1** .

B1098-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN

Circuit Schematic

014-02005

Fig. 16: Front Right Seat Heater Control Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Ignition on, during the heated seat operation.

Set Conditions

- **Set Condition:**

This code is set immediately after the Heated Seat Module detects an open in the seat heater B(+) driver circuit.

Possible Causes

Possible Causes
(P188) RIGHT SEAT HEATER B(+) DRIVER WIRE OPEN (Z914) GROUND WIRE OPEN SEAT CUSHION HEATER ELEMENT OPEN SEAT BACK HEATER ELEMENT OPEN HEATED SEAT MODULE

Diagnostic Test

1. **VERIFY THAT DTC B1098-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN IS ACTIVE**

With the scan tool, record and erase CCN DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

Does the DTC B1098 FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN reset?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK FOR AN OPEN SEAT HEATER ELEMENT**

Fig. 17: Measuring Total Resistance Of Cushion And Seat Back Heater Elements At Right Seat Cushion 2 - Way Connector (Component Side)
Courtesy of CHRYSLER LLC

Disconnect the Right Seat Cushion Heater 2 - way connector.

NOTE: Check connectors - Clean and repair as necessary.

Measure the total resistance of the cushion and seat back heater elements at the Right Seat Cushion 2 - way connector (component side).

Is the total resistance 2.5 to 3.5 ohms + or -.5 ohms?

Yes

Go To 4.

No

Go To 3.

3. CHECK THE RIGHT SEAT HEATER ELEMENT RESISTANCE

Fig. 18: Measuring Between (P188) Right Seat Heater B(+) Driver And Ground Circuit At Seat Cushion And Seat Back Heater Connectors
 Courtesy of CHRYSLER LLC

Gain access to and disconnect the seat cushion and seat back heater connectors.

NOTE: Check connectors - Clean and repair as necessary.

Measure each of the heater elements by measuring between the (P188) Right Seat Heater B(+) Driver and the Ground circuit at the seat cushion and seat back heater connectors.

For the seat cushion element the resistance value is 3 to 5.5 ohms.

For the seat back element the resistance value is 4 to 6 ohms.

Is the resistance correct for each heater element?

Yes

Check for an open in the pigtail harness and repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the heater element as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

4. **CHECK THE SEAT HEATER GROUND CIRCUIT**

Fig. 19: Using 12-Volt Test Light Connected To 12-Volts To Check (Z914) Ground Circuit At Right Seat Cushion Heater 2 - Way Connector (Harness Side)
Courtesy of CHRYSLER LLC

Using a 12-volt test light connected to 12-volts, check the (Z914) Ground circuit at the Right Seat Cushion Heater 2 - way connector (harness side).

Does the test light illuminate brightly?

Yes

Go To 5.

No

Repair the (Z914) Ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

5. **CHECK THE (P188) RIGHT SEAT HEATER B(+) DRIVER CIRCUIT FOR AN OPEN.**

Fig. 20: Measuring (P188) Right Seat Heater B(+) Driver Circuit Cavity K From HSM Connector To Right Seat Cushion Heater 2 - Way Connector (Harness Side)
Courtesy of CHRYSLER LLC

Disconnect the Heated Seat Module connector.

NOTE: Check connectors - Clean and repair as necessary.

Measure the (P188) Right Seat Heater B(+) Driver circuit cavity K from the HSM connector to the Right Seat Cushion Heater 2 - way connector (harness side).

Is the resistance below 5.0 ohms?

Yes

Replace the Heated Seat Module.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (P188) Right Seat Heater B(+) Driver circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

B10BB-LEFT HEATED SEAT SWITCH INPUT CIRCUIT STUCK - CLUSTER

Circuit Schematic

01a063a5

Fig. 21: Left Heated Seat Switch Input Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously

Set Conditions

- Set Condition:**

When the Heated Seat Switch in the Switch Bank is held in the on position for over 10 seconds, this code will set.

Possible Causes

Possible Causes
(D506) LIN BUS CIRCUIT PARTIAL SHORT TO GROUND SWITCH BANK STUCK INSTRUMENT CLUSTER

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase CCN DTC's

Operate the Heated Seat Switch several times.

Cycle the ignition from on to off.

Turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display B10BB LEFT HEATED SEAT SWITCH INPUT CIRCUIT STUCK?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. SWITCH SHORTED

Fig. 22: Identifying Switch Bank Connector
Courtesy of CHRYSLER LLC

With the scan tool, erase DTC's.

Disconnect the Switch Bank connector.

With the scan tool, read DTC's.

Does the scan tool display B10BB - LEFT HEATED SEAT SWITCH INPUT CIRCUIT STUCK?

No

Replace the Switch Bank.

Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Go To 3.

3. (D506) LIN BUS CIRCUIT PARTIAL SHORT TO GROUND

81aa127d

Fig. 23: Measuring Resistance Between Ground And (D506) LIN Bus Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Cluster C2 connector.

Measure the resistance between ground and the (D506) LIN Bus circuit.

Is the resistance below 10000.0 ohms?

Yes

Repair the (D506) LIN Bus circuit for a partial short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Instrument Cluster in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B10BC-RIGHT HEATED SEAT SWITCH INPUT CIRCUIT STUCK - CLUSTER

Circuit Schematic

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase CCN DTC's

Operate the Heated Seat Switch several times.

Cycle the ignition from on to off.

Turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display B10BC RIGHT HEATED SEAT SWITCH INPUT CIRCUIT STUCK?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. SWITCH SHORTED

Fig. 25: Identifying Switch Bank Connector
Courtesy of CHRYSLER LLC

With the scan tool, erase DTC's.

Disconnect the Switch Bank connector.

With the scan tool, read DTC's.

Does the scan tool display B10BC - RIGHT HEATED SEAT SWITCH INPUT CIRCUIT STUCK?

No

Replace the Switch Bank.

Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Go To 3.

3. (D506) LIN BUS CIRCUIT PARTIAL SHORT TO GROUND

81aa127d

Fig. 26: Measuring Resistance Between Ground And (D506) LIN Bus Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Cluster C2 connector.

Measure the resistance between ground and the (D506) LIN Bus circuit.

Is the resistance below 10000.0 ohms?

Yes

Repair the (D506) LIN Bus circuit for a partial short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Instrument Cluster in accordance with service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B2181-HEATED SEAT MODULE POWER SUPPLY LOW

Circuit Schematic

MODULE-HEATED SEATS

01a77965

Fig. 27: Heated Seat Module Supply Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

During heated seat operation.

Set Conditions

- **Set Condition:**

This code is set immediately if the Heated Seat Module detects voltage under 10 volts on the (P693) Heated Seat Module Supply circuit.

Possible Causes

Possible Causes
(P693) HEATED SEAT MODULE SUPPLY CIRCUIT HIGH RESISTANCE HEATED SEAT MODULE

Diagnostic Test

1. **CHECK PCM FOR CHARGING SYSTEM DTC**

With the scan tool, read Powertrain Control Module DTC's.

Are there any Charging System DTC's set in the Powertrain Control Module?

Yes

(Refer to **DIAGNOSIS AND TESTING**) for Charging System diagnostic procedures.

No

Go To 2.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **VERIFY THAT DTC B2181 - HEATED SEAT MODULE POWER SUPPLY LOW IS ACTIVE**

With the scan tool, record and erase DTC's

Turn the ignition switch to the Off position then start the engine and operate the heated seats for one minute.

With the scan tool, read DTC's.

Does the DTC B2181 - HEATED SEAT MODULE POWER SUPPLY LOW reset?

Yes

Go To 3.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

3. **(P693) HEATED SEAT MODULE SUPPLY CIRCUIT HIGH RESISTANCE**

Fig. 28: Using 12-Volt Test Light Connected To Ground To Check (P693) Heated Seat Module Supply Circuit At HSM Connector
Courtesy of CHRYSLER LLC

Disconnect the Heated Seat Module connector.

NOTE: Check connectors - Clean and repair as necessary.

Start the engine and let idle.

Using a 12-volt test light connected to ground, check the (P693) Heated Seat Module Supply circuit at the HSM connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

Replace the Heated Seat Module in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (P693) Heated Seat Module Supply circuit as necessary.
Perform **BODY VERIFICATION TEST - VER 1** .

B2182-HEATED SEAT MODULE POWER SUPPLY HIGH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

During heated seat operation.

Set Conditions

• **Set Condition:**

This code is set immediately if the Heated Seat Module detects voltage over 16.0 volts on the (F937) Fused Ignition Switch Output (Run) circuit.

Possible Causes

Possible Causes
TROUBLE CODE PRESENT CHARGING SYSTEM HIGH

Diagnostic Test

1. **CHECK PCM FOR CHARGING SYSTEM DTC**

With the scan tool, record and erase DTC's.

Cycle the ignition switch from On to Off.

Start the engine.

Run the engine at approximately 1500 RPM for 1 minute.

With the scan tool, read DTCs.

With the scan tool, read Powertrain Control Module DTC's.

Are there any Charging System DTC's set in the Powertrain Control Module?

Yes

(Refer to **DIAGNOSIS AND TESTING**) for Charging System diagnostic procedures.

Perform **BODY VERIFICATION TEST - VER 1** .

No

The conditions that caused this code to set are not present at this time. Using Service Information, check the charging system.

Perform **BODY VERIFICATION TEST - VER 1** .

2008 ACCESSORIES AND EQUIPMENT

Heated Seats - Service Information - Liberty

HEATED SEATS - SERVICE INFORMATION

DESCRIPTION

HEATED SEATS

WARNING: The front passenger seat assembly contains critical components that affect the front passenger airbag deployment. Correctly functioning front passenger seat components are critical for the Occupant Classification System (OCS) to properly classify the front passenger and calculate the proper airbag deployment. Unapproved modifications or service procedures to the front passenger seat assembly, its related components, or trim cover may inadvertently change the airbag deployment in case of a frontal crash. This could result in death or serious injury to the front seat passenger if the vehicle is involved in an accident. The following requirements must be strictly adhered to:

- Do not modify the front passenger seat assembly or components in any way.
- Do not modify the front seat center console or center position seat in any way.
- Do not use prior or future model year seat trim covers not designated for the specific model being repaired. Always use the correct seat trim cover specified for the vehicle.
- Do not replace the seat trim cover with an aftermarket trim cover.
- Do not add a secondary trim cover other than those approved by DaimlerChrysler/Mopar.
- At no time should any Supplemental Restraint System (SRS) component or SRS related component or fastener be modified or replaced with any part except those which are approved by DaimlerChrysler/Mopar.

81a28090

Fig. 1: Heated Seat System Components
Courtesy of CHRYSLER LLC

Vehicles with the heated seat option can be visually identified by the two heated seat switches (2) located in the center stack (1) of the instrument panel. The switches are located on the outer edges of the accessory switch bank. The heated seat system allows the driver and front seat passenger to select from two different levels of electrical seat heating (HI/LO). The heated seat system includes the following major components:

- **Heated Seat Elements** - Four heated seat elements are used per vehicle. Two heated seat elements are integral to each seat, one in the seat back and the other in the seat cushion.
- **Heated Seat Module** - One heated seat module is used per vehicle. The Heated Seat Module is mounted under the left front seat. This module contains the control logic and software for the front heated seat system. The module communicates on the Local Interface Network (LIN) data bus.
- **Heated Seat Switches** - Two heated seat switches are used per vehicle, one for each heated seat. Both switches are mounted in the instrument panel center stack.
- **Instrument Cluster (CCN)** - The instrument cluster, sometimes referred to as the Cab Compartment Node (CCN) utilizes integrated software and information carried on the LIN data bus. The CCN serves as the link between the heated seat switches and the heated seat module.

OPERATION

HEATED SEATS

The heated seat system operates on battery current received through a fuse in the Totally Integrated Power Module (TIPM). Fused ignition switch output (Run) circuits are used, so that the heated seat system will only operate when the ignition switch is in the ON position. The heated seat system will turn Off automatically whenever the ignition switch is turned to any position except ON.

A Heated Seat Module is used to control the heated seat system. The module responds to heated seat switch messages and ignition switch status inputs by controlling the 12v output to the front seat heating elements through integral solid-state relays.

When either of the heated seat switches are depressed a switch status message is sent to the Cab Compartment Node (CCN) or instrument cluster via the Local Interface Network (LIN) data bus. The CCN then sends a message via the LIN data bus to the heated seat module, signaling the module to energize the heating element for the selected seat. Amber Light Emitting Diodes (LEDs) in the top portion of each switch indicate the level of heat in use: Two LEDs are illuminated for high, one for low, and none for off. The heated seat module sends the LED illumination message to the CNN via the LIN data bus. The CNN then sends the LED illumination message to the accessory switch bank so that the appropriate LEDs are illuminated for any given heating level. Pressing the switch once will select high-level heating. Pressing the switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

The heated seat module energizes an integral solid-state relay, which supplies battery current to the heating elements. When high-temperature heating is selected, the heaters provide a boosted heat level during the first four minutes of operation after heating is activated. The heat output then drops to the normal high-temperature level. If high-level heating is selected, the control system will automatically switch to the low level after two hours of continuous operation. At that time, the number of illuminated LEDs changes from two to one, indicating the change. Operation on the low setting also turns off automatically after two hours.

The module will automatically turn off the heating elements if it detects an OPEN or LOW short in the heating element circuit.

DIAGNOSIS AND TESTING

HEATED SEATS

In order to obtain conclusive testing, the heated seat system and the Local Interface Network (LIN) data bus circuit must be checked. **Any diagnosis of the heated seat system should begin with, the use of a scan tool and the appropriate diagnostic service information.**

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

NOTE: Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.7v or above 15.5v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the heated seat system is attempted, the battery should be fully-charged.

HEATER-CUSHION PAD

DESCRIPTION

HEATED SEAT ELEMENT

Vehicles equipped with the optional heated seat system have two carbon fiber heated seat elements located in each front seat. One heating element is used for each seat cushion and another for each seat back.

Each of the heated seat elements consist of multiple heating circuits operating in parallel throughout the carbon

fiber element. The heated seat elements are captured between the leather trim cover and the seat cushion assembly. If a malfunction occurs in one or more of the individual carbon fiber circuits, the others will continue to provide heat.

The heated seat elements cannot be repaired. If found to be damaged or inoperative, a new heating element assembly must be installed.

OPERATION

HEATED SEAT ELEMENT

One end of the heated seat element is connected to ground at all times through a splice under the seat. Battery current is directed to the other end of the heated seat element by the heated seat module. The heated seat module will energize the heated seat element when the heated seat switch is depressed in the LOW or HIGH position.

As electrical current passes through the heated seat element, the resistance of the wire used in the element disperses some of the electrical current in the form of heat. The heat produced by the heated seat element then radiates through the underside of the seat cushion and seat back trim covers, warming the seat cover and its occupant.

DIAGNOSIS AND TESTING

HEATER-CUSHION PAD

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

The wire harness connectors for the heating elements are located under the seat.

NOTE: When checking heated seat elements for continuity, be certain to move the heating element being checked. Moving the element, such as sitting in the seat will eliminate the possibility of an intermittent open in the element which would only be evident if the element was in a certain position. Failure to check the element in various positions could result in an incomplete test.

1. Locate and disconnect the seat element electrical connector.
2. Check the resistance between the circuit leading in and out of the suspect heated seat element. The resistance should be between 3.0 - 5.5 ohms for a seat cushion element and 4.0 - 6.0 ohms for a seat back element. If OK, see [DIAGNOSIS AND TESTING](#). If not OK, replace the inoperative heated seat element.

REMOVAL

HEATED SEAT ELEMENT

80c91d10

Fig. 2: Identifying Seat & Back Cushion Element Connectors
Courtesy of CHRYSLER LLC

NOTE: Do not remove the factory installed heating elements from the seat cushion (3) or seat back foam. The original element is permanently attached and cannot be removed without permanent damage. The replacement heating element is designed to be applied directly on top of the inoperative factory installed heating element.

NOTE: Heated seat cushion shown in illustration, heated seat back similar.

1. Disconnect and isolate the battery negative cable.
2. Remove the appropriate seat cushion trim cover or seat back trim cover. Refer to **DISASSEMBLY** for seat cushion or refer to **DISASSEMBLY** for trim cover.
3. Disconnect the inoperative heated seat cushion or seat back element electrical connectors (2).
4. Locate the wires leading from the inoperative heating element and cut them off flush with the edge of the original heating element.

INSTALLATION

HEATED SEAT ELEMENT

80c91cf2

Fig. 3: Identifying Replacement Heating Element
Courtesy of CHRYSLER LLC

CAUTION: During the installation of the replacement heating element, be careful not to fold or crease the element assembly. Folds or creases will cause premature failure.

NOTE: Heated seat cushion shown in illustration, heated seat back similar.

1. Peel off the adhesive backing on the back of the replacement heating element (2) and stick directly on top of the factory installed heating element (1).

80c91d46

Fig. 4: Identifying Heating Element Electrical Connectors
Courtesy of CHRYSLER LLC

2. Connect the new heating element electrical connectors (3 & 4).

3. Connect the battery negative cable.
4. Verify heated seat system operation.
5. Install the appropriate seat cushion trim cover or seat back trim cover. Refer to **ASSEMBLY** for seat cushion or refer to **ASSEMBLY** for trim cover.

NOTE: Make certain the seat wire harness is correctly routed through the seat and seat back. The excess wire between the cushion and back elements should be securely tucked between the rear of the cushion foam and the rear carpet flap of the trim cover.

MODULE-HEATED SEATS

DESCRIPTION

MODULE, HEATED SEAT

Fig. 5: Identifying Heated Seat Module, Single Electrical Connector & Seat Pan
Courtesy of CHRYSLER LLC

The heated seat module (1) is located under the left front seat. It has a single electrical connector (2) and a push pin style retainer that secures it to the seat pan (3). The module can be accessed from under the front left seat with the seat in the full back and up position.

The heated seat module is a microprocessor designed to use the Local Interface Network (LIN) data bus messages from the instrument cluster, sometimes referred to as the Cab Compartment Node (CCN). The CCN receives inputs from the heated seat switches and in turn signals the heated seat module to operate the heated seat elements for both front seats.

OPERATION

MODULE-HEATED SEAT

The heated seat module operates on fused battery current received from the ignition switch. The module is grounded to the body at all times through the electrical connector. Inputs to the module include Local Interface Network (LIN) data bus messages and standard hardwired 12 volt power and ground. In response to the LIN inputs the heated seat module will control the battery current to the appropriate heated seat elements.

When a heated seat switch LIN data bus signal is received by the heated seat module, the module energizes the selected heated seat element. The Low heat set point is about 38° C (100.4° F), and the High heat set point is about 42° C (107.6° F).

In addition to operating the heated seat elements, the heated seat module sends LED illumination messages to the instrument cluster, sometimes referred to as the Cab Compartment Node (CCN) via the LIN data bus. The CCN then sends the LED illumination message to the accessory switch bank so that the appropriate LEDs are illuminated for any given heating level. Pressing the switch once will select high-level heating. Pressing the switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

If the heated seat module detects a heated seat element OPEN or SHORT circuit, it will record and store the appropriate Diagnostic Trouble Code (DTC).

DIAGNOSIS AND TESTING

HEATED SEAT MODULE

In order to obtain conclusive testing, the heated seat system and the Local Interface Network (LIN) data bus circuit must be checked. **Any diagnosis of the heated seat system should begin with, the use of a scan tool and the appropriate diagnostic service information.**

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

NOTE: Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.7v or above 15.5v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the heated seat system is attempted, the battery should be fully-charged.

REMOVAL

HEATED SEAT MODULE

Fig. 6: Locating Heated Seat Module
Courtesy of CHRYSLER LLC

CAUTION: The Heated Seat Module mounting tab can be damaged during module removal and installation. Use care to properly align tab to prevent binding that could result in tab breakage.

1. Position the right front seat to the full rearward position.
2. Disconnect and isolate the battery negative cable.
3. Disconnect the wire harness connector (4) from the heated seat module (3).
4. Unsnap the heated seat module retaining tab (2) from the seat pan (1).
5. Remove the heated seat module (3) from the vehicle.

INSTALLATION

HEATED SEAT MODULE

CAUTION: The Heated Seat Module mounting tab can be damaged during module removal and installation. Use care to properly align tab to prevent binding that could result in tab breakage.

Fig. 7: Locating Heated Seat Module
Courtesy of CHRYSLER LLC

1. Install the heated seat module (3) into the vehicle.
2. Position the retaining tab (2) with the mounting hole in the seat pan (1). Firmly apply even pressure to the module (3) until the mounting tab is fully seated.
3. Connect the wire harness connector (4) to the heated seat module (3).
4. Connect the battery negative cable.
5. Check for proper heated seat system operation.

SWITCH-HEATED SEAT

DESCRIPTION

SEAT SWITCH

Fig. 8: Heated Seat System Components
Courtesy of CHRYSLER LLC

The heated seat switches (2) are located in the center stack (1) of the instrument panel. The switches are located on the outer edges of the accessory switch bank. If either of the switches is damaged or inoperative the complete accessory switch bank assembly must be replaced.

Each heated seat switch provides a resistor-multiplexed signal to the instrument cluster, sometimes referred to as the Cab Compartment Node (CCN). Amber Light Emitting Diodes (LEDs) in the top portion of each switch indicate the level of heat in use: Two LEDs are illuminated for high, one for low, and none for off. Pressing the switch once will select high-level heating. Pressing the switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

The LED indicator lamps in each heated seat switch cannot be repaired. If the LED lamps are inoperative or damaged, or the switch is inoperative or damaged, the complete switch pod assembly must be replaced. See **REMOVAL**.

OPERATION

SEAT SWITCH

The heated seat switches are active any time the Local Interface Network (LIN) data bus is active. Depressing the heated seat switch provides a switch status message to the instrument cluster, sometimes referred to as the Cab Compartment Node (CCN), via the LIN data bus. The CCN is responsible for supplying the LIN data bus message to the heated seat module, signaling the module to power the heated seat element of the selected seat and maintain the temperature setting. If the heated seat switch is depressed to a different position (Low or High) than the currently selected state, the CCN will go through the process again to change the temperature setting.

DIAGNOSIS AND TESTING

SEAT SWITCH

In order to obtain conclusive testing, the heated seat system and the Local Interface Network (LIN) data bus circuit must be checked. **Any diagnosis of the heated seat system should begin with, the use of a scan tool and the appropriate diagnostic service information.**

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

NOTE: Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.7v or above 15.5v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the heated seat system is attempted, the battery should be fully-charged.

REMOVAL

SEAT SWITCH

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: The heated seat switches are integral to the accessory switch bank and cannot be serviced separately. The complete accessory switch bank assembly must be replaced.

Fig. 9: Identifying Center Bezel, Screws & Accessory Switch Bank
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the center bezel from the instrument panel. Refer to **REMOVAL** .
3. Remove the four screws (2) that secure the accessory switch bank (3) to the back of the center bezel (1) and remove the switch bank.

INSTALLATION

SEAT SWITCH

Fig. 10: Identifying Center Bezel, Screws & Accessory Switch Bank
Courtesy of CHRYSLER LLC

NOTE: There are different accessory switch banks available based on the option content of the vehicle. Ensure the switch pod being installed matches the vehicle options.

1. Position the accessory switch bank (3) onto the back of the instrument panel center bezel (1).
2. Install the four screws (2) that secure the accessory switch bank to the center bezel. Tighten the screws to 2 N.m (17 in. lbs.).
3. Install the center bezel onto the instrument panel. Refer to **INSTALLATION** .
4. Connect the battery negative cable.
5. Verify heated seat system operation.

HVAC - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

HEATING AND AIR CONDITIONING SYSTEM

ON-BOARD DIAGNOSTICS

CAUTION: Do not exchange A/C Heater Controls from vehicle to vehicle. Software versions differ between models and model years. Installing an A/C Heater Control with software that is incompatible for a given vehicle can result in

either improper or failed HVAC system operation.

NOTE: Always inspect the IOD fuse prior to diagnosing any heating-A/C system concerns. Make sure the fuse is functional and fully seated into the terminals of the totally integrated power module (TIPM) located in the engine compartment.

The A/C-heater control communicates on the controller area network (CAN) IHS bus and is fully addressable with a scan tool.

The A/C-heater control's primary means of fault detection is through active and stored diagnostic trouble codes (DTCs). Active DTCs are those which currently exist in the system. The condition causing the fault must be repaired in order to clear this type of DTC. Stored DTCs are those which occurred in the system since the A/C-heater control received the last clear diagnostic info message. All DTCs must be read with a scan tool.

The A/C-heater control's secondary means of fault detection is through system tests. These tests include the HVAC System Test, the A/C Cool down Test, the Actuator Calibration Function, and for MTC Systems, the Actuator DTC Detection Test. Refer to **SYSTEM TESTS** for a detailed description of each test.

SYSTEM TESTS

HVAC System Test

The HVAC System Test provides a starting point in the diagnostic process by identifying the appropriate system test to perform when diagnosing a given condition or DTC. It also provides a means for testing the entire HVAC system by utilizing the A/C-heater control's On-Board System Tests. The On-Board System Tests can also assist in diagnosing stored DTCs.

A/C Cool down Test

The A/C Cool down Test:

- is actuated with a scan tool.

- tests A/C system performance based on evaporator temperature sensor input.

- will fail if evaporator starting temperature is below 18° C (65° F) when initiating the test.

- will pass if the evaporator temperature drops 11° C (20° F).

- indicates test outcome by displaying one or more test status messages on the scan tool. These messages will clear after paging back out of this test function. Therefore, is it important to note all of the messages before doing so.

- will cause the A/C status indicator to flash while the test is running.

Actuator Calibration Function

The Actuator Calibration function:

- is actuated with a scan tool.

- homes and repositions door actuators.

monitors for door span faults. Door span faults (XXX Door Travel Range Too Large or XXX Door Travel Range Too Small) will only display after calibration.

will cause the electric backlight (EBL) status indicator to flash while the test is running.

Actuator DTC Detection Test

The Actuator DTC Detection Test:

is actuated with a scan tool.

supplements the continuous diagnostics on the actuator drive system.

monitors for shorted actuator circuits allowing service to easily diagnose and troubleshoot up to three simultaneous shorts. Shorted actuator circuit faults (XXX Control Circuit High or XXX Control Circuit Low) will only display after running the Actuator DTC Detection Test.

After repairing each DTC, cycle the ignition switch, and then rerun the Actuator DTC Detection test to ensure that no new DTCs exist. If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high faults and then short low faults. When the test returns passed, proceed with troubleshooting by clearing faults and running the Actuator Calibration function as a final check of proper system operation.

1006-BI-LEVEL SWITCH REQUEST INPUT CIRCUIT PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Theory Of Operation

The Bi-Level mode switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the Bi-Level mode switch is stuck in a pushed position for more than two minutes. This DTC has a maturing time of two minutes and a de-maturing time of two seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION A/C HEATER CONTROL

Diagnostic Test

1. VERIFY THE DTC IS STILL ACTIVE

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on. Wait 2 minutes before proceeding.

With the scan tool, read HVAC DTCs.

Does the scan tool display this DTC?

Yes

Replace the A/C Heater Control in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

B1000-A/C SWITCH REQUEST INPUT CIRCUIT/PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The switch input changes when the switch is pushed down. A stored DTC indicates that the A/C request switch was stuck in a pushed position for more than 10 minutes, but has since returned to its normal state. An active DTC indicates that the A/C request switch is stuck in a pushed position. When active, this DTC will prevent proper A/C request switch and status indicator function.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C request switch is detected in a pushed position for more than 10 minutes.

Possible Causes

Possible Causes
OBJECT HOLDING A/C MODE SWITCH IN A PUSHED POSITION
SUBSTANCE CAUSING A/C MODE SWITCH TO GET STUCK IN A PUSHED POSITION
A/C HEATER CONTROL

Diagnostic Test

1. VERIFY THE DTC IS STILL ACTIVE

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on. Wait 10 minutes before proceeding.

With the scan tool, read HVAC DTCs.

Does the scan tool display this DTC?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK FOR NORMAL A/C REQUEST SWITCH & STATUS INDICATOR FUNCTION

Set the Blower control to any position except Off.

Set the Mode control to any position except Auto.

Press the A/C request switch on and off several times while observing the A/C status indicator.

Does the A/C status indicator turn on and off?

Yes

Go To 4.

No

Go To 3.

3. INSPECT FOR OBJECT OR SUBSTANCE CAUSING THE A/C REQUEST SWITCH TO STAY OR STICK IN A PUSHED POSITION

Inspect the A/C Heater Control for anything that would cause the A/C request switch to stay or stick in a pushed position.

Is anything present that would cause the A/C request switch to stay or stick in a pushed position?

Yes

Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. INSPECT THE A/C HEATER CONTROL FOR DAMAGE

Inspect the A/C Heater Control for damage.

Is the A/C Heater Control damaged?

Yes

Replace the A/C Heater Control in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Perform **BODY VERIFICATION TEST - VER 1** .

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The switch input changes when the switch is pushed down. A stored DTC indicates that the panel mode switch was stuck in a pushed position for more than 10 minutes, but has since returned to its normal state. An active DTC indicates that the panel mode switch is stuck in a pushed position. An active DTC will prevent proper A/C mode switch and status indicator function.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- Set Condition:**

If the panel mode switch is detected in a pushed position for more than 10 minutes.

Possible Causes

Possible Causes
OBJECT HOLDING PANEL MODE SWITCH IN A PUSHED POSITION
SUBSTANCE CAUSING PANEL MODE SWITCH TO GET STUCK IN A PUSHED POSITION
A/C HEATER CONTROL

Diagnostic Test

1. **VERIFY THE DTC IS STILL ACTIVE**

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on. Wait 10 minutes before proceeding.

With the scan tool, read HVAC DTCs.

Does the scan tool display this DTC?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK FOR NORMAL PANEL MODE SWITCH & STATUS INDICATOR FUNCTION

Set the Blower control to any position except Off.

Set the Mode control to any position except Auto.

Press the Panel mode switch on and off several times while observing the Panel mode status indicator.

Does the Panel mode status indicator turn on and off?

Yes

Go To 4.

No

Go To 3.

3. INSPECT FOR OBJECT OR SUBSTANCE CAUSING THE PANEL MODE SWITCH TO STAY OR STICK IN A PUSHED POSITION

Inspect the A/C Heater Control for anything that would cause the Panel mode switch to stay or stick in a pushed position.

Is anything present that would cause the Panel mode switch to stay or stick in a pushed position?

Yes

Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. INSPECT THE A/C HEATER CONTROL FOR DAMAGE

Inspect the A/C Heater Control for damage.

Is the A/C Heater Control damaged?

Yes

Replace the A/C Heater Control in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Perform **BODY VERIFICATION TEST - VER 1** .

B1009-RECIRCULATION SWITCH REQUEST INPUT CIRCUIT/PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The switch input changes when the switch is pushed down. A stored DTC indicates that the recirculation switch was stuck in a pushed position for more than 10 minutes, but has since returned to its normal state. An active DTC indicates that the recirculation switch is stuck in a pushed position.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the recirculation switch is detected in a pushed position for more than 10 minutes.

Possible Causes

Possible Causes
OBJECT HOLDING RECIRCULATION SWITCH IN A PUSHED POSITION
SUBSTANCE CAUSING RECIRCULATION SWITCH TO GET STUCK IN A PUSHED POSITION
A/C HEATER CONTROL

Diagnostic Test

1. VERIFY THE DTC IS STILL ACTIVE

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on. Wait 10 minutes before proceeding.

With the scan tool, read HVAC DTCs.

Does the scan tool display this DTC?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK FOR NORMAL RECIRCULATION SWITCH & STATUS INDICATOR FUNCTION

Set the Blower control to any position except Off.

Set the Mode control to any position except Auto.

Press the Recirculation switch on and off several times while observing the Recirculation status indicator.

Does the Recirculation status indicator turn on and off?

Yes

Go To 4.

No

Go To 3.

3. INSPECT FOR OBJECT OR SUBSTANCE CAUSING THE RECIRCULATION SWITCH TO STAY OR STICK IN A PUSHED POSITION

Inspect the A/C Heater Control for anything that would cause the Recirculation switch to stay or stick in a pushed position.

Is anything present that would cause the Recirculation switch to stay or stick in a pushed position?

Yes

Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. **INSPECT THE A/C HEATER CONTROL FOR DAMAGE**

Inspect the A/C Heater Control for damage.

Is the A/C Heater Control damaged?

Yes

Replace the A/C Heater Control in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Perform **BODY VERIFICATION TEST - VER 1** .

B100C-FLOOR MODE SWITCH REQUEST INPUT CIRCUIT PER

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The Floor mode switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the Floor mode switch is stuck in a pushed position for more than two minutes. This DTC has a maturing time of two minutes and a de-maturing time of two seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

Diagnostic Test

1. VERIFY THE DTC IS STILL ACTIVE

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on. Wait 2 minutes before proceeding.

With the scan tool, read HVAC DTCs.

Does the scan tool display this DTC?

Yes

Replace the A/C Heater Control in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

B100F-MIX SWITCH REQUEST INPUT CIRCUIT PER

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The mix switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the mix switch is stuck in a pushed position for more than two minutes. This DTC has a maturing time of two minutes and a de-maturing time of two seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION A/C HEATER CONTROL

Diagnostic Test

1. VERIFY THE DTC IS STILL ACTIVE

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on. Wait 2 minutes before proceeding.

With the scan tool, read HVAC DTCs.

Does the scan tool display this DTC?

Yes

Replace the A/C Heater Control in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

B1012-DEFROST SWITCH REQUEST INPUT CIRCUIT/PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The switch input changes when the switch is pushed down. A stored DTC indicates that the defrost switch was

stuck in a pushed position for more than 10 minutes, but has since returned to its normal state. An active DTC indicates that the defrost switch is stuck in a pushed position.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the defrost switch is detected in a pushed position for more than 10 minutes.

Possible Causes

Possible Causes
OBJECT HOLDING DEFROST SWITCH IN A PUSHED POSITION SUBSTANCE CAUSING DEFROST SWITCH TO GET STUCK IN A PUSHED POSITION A/C HEATER CONTROL

Diagnostic Test

1. **VERIFY THE DTC IS STILL ACTIVE**

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on. Wait 10 minutes before proceeding.

With the scan tool, read HVAC DTCs.

Does the scan tool display this DTC?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK FOR NORMAL DEFROST SWITCH & STATUS INDICATOR FUNCTION

Set the Blower control to any position except Off.

Set the Mode control to any position except Auto.

Press the Defrost switch on and off several times while observing the Defrost status indicator.

Does the Defrost status indicator turn on and off?

Yes

Go To 4.

No

Go To 3.

3. INSPECT FOR OBJECT OR SUBSTANCE CAUSING THE DEFROST SWITCH TO STAY OR STICK IN A PUSHED POSITION

Inspect the A/C Heater Control for anything that would cause the Defrost switch to stay or stick in a pushed position.

Is anything present that would cause the Defrost switch to stay or stick in a pushed position?

Yes

Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 4.

4. INSPECT THE A/C HEATER CONTROL FOR DAMAGE

Inspect the A/C Heater Control for damage.

Is the A/C Heater Control damaged?

Yes

Replace the A/C Heater Control in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Perform **BODY VERIFICATION TEST - VER 1** .

B1015-REAR DEFROST SWITCH REQUEST INPUT CIRCUIT/PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The switch input changes when the switch is pushed down. A stored DTC indicates that the rear defrost switch was stuck in a pushed position for more than 10 minutes, but has since returned to its normal state. An active DTC indicates that the rear defrost switch is stuck in a pushed position.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the rear defrost switch is detected in a pushed position for more than 10 minutes.

Possible Causes

Possible Causes
OBJECT HOLDING REAR DEFROST SWITCH IN A PUSHED POSITION SUBSTANCE CAUSING REAR DEFROST SWITCH TO GET STUCK IN A PUSHED POSITION A/C HEATER CONTROL

Diagnostic Test

1. **VERIFY THE DTC IS STILL ACTIVE**

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on. Wait 10 minutes before proceeding.

With the scan tool, read HVAC DTCs.

Does the scan tool display this DTC?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK FOR NORMAL REAR DEFROST SWITCH & STATUS INDICATOR FUNCTION

Set the Blower control to any position except Off.

Set the Mode control to any position except Auto.

Press the Rear Defrost switch on and off several times while observing the Rear Defrost status indicator.

Does the Rear Defrost status indicator turn on and off?

Yes

Go To 4.

No

Go To 3.

3. INSPECT FOR OBJECT OR SUBSTANCE CAUSING THE REAR DEFROST SWITCH TO STAY OR STICK IN A PUSHED POSITION

Inspect the A/C Heater Control for anything that would cause the Rear Defrost switch to stay or stick in a pushed position.

Is anything present that would cause the Rear Defrost switch to stay or stick in a pushed position?

Yes

Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. INSPECT THE A/C HEATER CONTROL FOR DAMAGE

Inspect the A/C Heater Control for damage.

Is the A/C Heater Control damaged?

Yes

Replace the A/C Heater Control in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Perform **BODY VERIFICATION TEST - VER 1** .

B1031-EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW

Circuit Schematic

01000010

Fig. 1: Evaporator Fin Temperature Sensor Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the Evaporator Temperature Sensor input is out of range toward the low voltage threshold.

Possible Causes

Possible Causes
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND EVAPORATOR TEMPERATURE SENSOR A/C HEATER CONTROL

Diagnostic Test

1. **ACTIVE DTC(S) PRESENT**

Turn the ignition on.

Using the A/C Heater Control, turn the heater on.

With the scan tool, check for DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK FOR DTC WITH THE EVAPORATOR TEMPERATURE SENSOR HARNESS CONNECTOR DISCONNECTED**

Turn the ignition off.

Disconnect the Evaporator Temperature Sensor Harness Connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, read HVAC DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 3.

No

Replace the Evaporator Temperature Sensor in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. **CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 2: Measuring Resistance Between Ground And (C21) Evaporator Temperature Sensor Signal Circuit In A/C Heater Control C1 Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance between ground and the (C21) Evaporator Temperature Sensor Signal circuit in the A/C Heater Control C1 harness connector.

Does the ohm meter read open circuit?

Yes

Replace the A/C Heater Control in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

B1032-EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT HIGH

Circuit Schematic

01000010

Fig. 3: Evaporator Fin Temperature Sensor Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the Evaporator Temperature Sensor input is out of range toward the high voltage threshold.

Possible Causes

Possible Causes
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN
(C121) SENSOR GROUND CIRCUIT OPEN
EVAPORATOR TEMPERATURE SENSOR
A/C HEATER CONTROL

Diagnostic Test

1. **ACTIVE DTC(S) PRESENT**

Turn the ignition on.

Using the A/C Heater Control, turn the heater on.

With the scan tool, check for DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 4: Measuring Voltage Of (C21) Evaporator Temperature Sensor Signal Circuit In A/C Heater Control C1 Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

Measure the voltage of the (C21) Evaporator Temperature Sensor Signal circuit in the A/C Heater Control C1 harness connector.

Is there any voltage present?

Yes

Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to voltage.
 Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT, (C121) SENSOR GROUND CIRCUIT, & EVAPORATOR TEMPERATURE SENSOR**

Fig. 5: Measuring Resistance Between (C21) Evaporator Temperature Sensor Signal Circuit And (C121) Sensor Ground Circuit In A/C Heater Control C1 Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance between the (C21) Evaporator Temperature Sensor Signal circuit and the (C121) Sensor Ground circuit in the A/C Heater Control C1 harness connector. The approximate circuit resistance should be as follows:

- 1468 ohms @ 40°C (104°F)
- 1800 ohms @ 35°C (95°F)
- 2221 ohms @ 30°C (86°F)
- 2757 ohms @ 25°C (77°F)
- 3443 ohms @ 20°C (68°F)
- 4330 ohms @ 15°C (59°F)
- 5485 ohms @ 10°C (50°F)
- 6998 ohms @ 5°C (41°F)
- 7354 ohms @ 4°C (39°F)
- 7731 ohms @ 3°C (37°F)
- 8130 ohms @ 2°C (36°F)
- 8553 ohms @ 1°C (34°F)
- 9000 ohms @ 0°C (32°F)

Is the resistance within the specifications?

Yes

Replace the A/C Heater Control in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

Fig. 6: Measuring Resistance Of (C21) Evaporator Temperature Sensor Signal Circuit Between A/C Heater Control C1 Harness Connector And Evaporator Temperature Sensor Harness Connector

Courtesy of CHRYSLER LLC

Disconnect the Evaporator Temperature Sensor harness connector.

Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between the A/C Heater Control C1 harness connector and the Evaporator Temperature Sensor harness connector.

Does the ohm meter read open circuit?

Yes

Repair the (C21) Evaporator Temperature Sensor Signal circuit for an open.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 5.

5. **CHECK (C121) SENSOR GROUND CIRCUIT FOR AN OPEN**

Fig. 7: Measuring Resistance Of (C121) Sensor Ground Circuit Between A/C Heater Control C1 Harness Connector And Evaporator Temperature Sensor Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (C121) Sensor Ground circuit between the A/C Heater Control C1 harness connector and the Evaporator Temperature Sensor harness connector.

Does the ohm meter read open circuit?

Yes

Repair the (C121) Sensor Ground circuit for an open.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Evaporator Temperature Sensor in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

B1034-INFRARED TEMPERATURE SENSOR INPUT CIRCUIT LOW

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the IR Sensor fails the internal self test.

Possible Causes

Possible Causes
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to ***HVAC SYSTEM TEST** for stored DTC test procedures.

Diagnostic Test

1. **REPLACE THE A/C HEATER CONTROL**

Repair

Replace the A/C Heater Control in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

B1034-INFRARED TEMPERATURE SENSOR THERMISTOR CIRCUIT LOW

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the IR Sensor fails the internal self test.

Possible Causes

Possible Causes
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to ***HVAC SYSTEM TEST** for stored DTC test procedures.

Diagnostic Test

1. **REPLACE THE A/C HEATER CONTROL**

Repair

Replace the A/C Heater Control in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

B1035-INFRARED TEMPERATURE SENSOR INPUT CIRCUIT HIGH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the IR Sensor fails the internal self test.

Possible Causes

Possible Causes
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to *HVAC SYSTEM TEST for stored DTC test procedures.

Diagnostic Test

- 1. REPLACE THE A/C HEATER CONTROL

Repair

Replace the A/C Heater Control in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1 .

B1040-PANEL MODE DOOR 1 CONTROL CIRCUIT/PERFORMANCE

Circuit Schematic

01a20602

Fig. 8: Panel Mode Door Control , Recirculation Door Control And Left Blend Door Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The A/C Heater Control drives the Mode Door Actuator via the (C35) Mode Door Driver circuit and the (C154) Common Door Driver circuit. The Mode Door Actuator shares the (C154) Common Door Driver circuit with the blend door and Recirculation Door Actuators.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C Heater Control detects a short to ground or to voltage on the (C32) Recirculation Door Driver, the (C54) Blend Door Driver, or the (C154) Common Door Driver circuits while attempting to drive the (C35) Mode Door Driver.

Possible Causes

Possible Causes
(C32) RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
(C54) BLEND DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
(C35) MODE DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
(C154) COMMON DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
(C32) RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C54) BLEND DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C35) MODE DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C154) COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND
RECIRCULATION DOOR ACTUATOR
MODE DOOR ACTUATOR
BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Diagnostic Test

1. **ACTIVE DTC(S) PRESENT**

Turn the ignition on.

Using the A/C Heater Control, actuate the Mode Door.

With the scan tool, check for DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1**.

2. CHECK (C32) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Fig. 9: Measuring Voltage Of (C32) Recirculation Door Driver Circuit In A/C Heater Control C1 Harness Connector

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

Measure the voltage of the (C32) Recirculation Door Driver circuit in the A/C Heater Control C1 harness connector.

Is there any voltage present?

Yes

Repair the (C32) Recirculation Door Driver circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK (C35) MODE DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Fig. 10: Measuring Voltage Of (C35) Mode Door Driver Circuit In A/C Heater Control C1 Harness Connector

Courtesy of CHRYSLER LLC

Measure the voltage of the (C35) Mode Door Driver circuit in the A/C Heater Control C1 harness connector.

Is there any voltage present?

Yes

Repair the (C35) Mode Door Driver circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. CHECK (C54) BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Fig. 11: Measuring Voltage Of (C54) Blend Door Driver Circuit In A/C Heater Control C1 Harness Connector
 Courtesy of CHRYSLER LLC

Measure the voltage of the (C54) Blend Door Driver circuit in the A/C Heater Control C1 harness connector.

Is there any voltage present?

Yes

Repair the (C54) Blend Door Driver circuit for a short to voltage.
 Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 5.

5. CHECK (C154) COMMON DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Fig. 12: Measuring Voltage Of (C154) Common Door Driver Circuit In A/C Heater Control C1 Harness Connector
 Courtesy of CHRYSLER LLC

Measure the voltage of the (C154) Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is there any voltage present?

Yes

Repair the (C154) Common Door Driver circuit for a short to voltage.
 Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 6.

6. CHECK (C32) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND

81a29db9

Fig. 13: Measuring Resistance Between Ground And (C32) Recirculation Door Driver Circuit In A/C Heater Control C1 Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance between ground and the (C32) Recirculation Door Driver circuit in the A/C Heater Control C1 harness connector.

Does the ohm meter read open circuit?

Yes

Go To 7.

No

Repair the (C32) Recirculation Door Driver circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1**.

7. CHECK (C54) DRIVER BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND

Fig. 14: Measuring Resistance Between Ground And (C54) Driver Blend Door Driver Circuit In A/C Heater Control C1 Harness Connector
 Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (C54) Driver Blend Door Driver circuit in the A/C Heater Control C1 harness connector.

Does the ohm meter read open circuit?

Yes

Go To 8.

No

Repair the (C54) Driver Blend Door Driver circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

8. CHECK (C35) MODE DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND

Fig. 15: Measuring Resistance Between Ground And (C35) Mode Door Driver Circuit In A/C Heater Control C1 Harness Connector
 Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (C35) Mode Door Driver circuit in the A/C Heater Control C1 harness connector.

Does the ohm meter read open circuit?

Yes

Go To 9.

No

Repair the (C35) Mode Door Driver circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

9. CHECK (C154) COMMON DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND

81a29dcf

Fig. 16: Measuring Resistance Between Ground And (C154) Common Door Driver Circuit In A/C Heater Control C1 Harness Connector
 Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (C154) Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Does the ohm meter read open circuit?

Yes

Go To 10.

No

Repair the (C154) Common Door Driver circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

10. **CHECK RECIRCULATION DOOR ACTUATOR CIRCUIT RESISTANCE**

81a29de1

Fig. 17: Measuring Resistance Between (C32) Recirculation Door Driver Circuit And (C154) Common Door Driver Circuit In A/C Heater Control C1 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance between the (C32) Recirculation Door Driver circuit and the (C154) Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is the resistance between 30 and 40 ohms?

Yes

Go To 11.

No

Replace the Recirculation Door Actuator in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

11. CHECK MODE DOOR ACTUATOR CIRCUIT RESISTANCE

81a29e28

Fig. 18: Measuring Resistance Between (C35) Mode Door Driver Circuit And (C154) Common Door Driver Circuit In A/C Heater Control C1 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance between the (C35) Mode Door Driver circuit and the (C154) Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is the resistance between 30 and 40 ohms?

Yes

Go To 12.

No

Replace the Mode Door Actuator in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

12. CHECK BLEND DOOR ACTUATOR CIRCUIT RESISTANCE

81a29e6b

Fig. 19: Measuring Resistance Between (C54) Blend Door Driver Circuit And (C154) Common Door Driver Circuit In A/C Heater Control C1 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance between the (C54) Blend Door Driver circuit and the (C154) Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is the resistance between 30 and 40 ohms?

Yes

Go To 13.

No

Replace the Blend Door Actuator in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

13. RUN THE ACTUATOR CALIBRATION TEST

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool only display: B1040-PANEL MODE DOOR 1 CONTROL CIRCUIT/PERFORMANCE?

Yes

Replace the A/C Heater Control in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No, Other DTC(s) Displayed

Diagnose and repair the other DTC(s). Refer to **DIAGNOSTIC CODE INDEX** for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed

Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

B1043-PANEL MODE DOOR 1 CONTROL CIRCUIT OPEN

Circuit Schematic

9100a001

Fig. 20: Panel Mode Door 1 Control Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The A/C Heater Control drives the Mode Door Actuator via the (C35) Mode Door Driver circuit and the (C154) Common Door Driver circuit.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- Set Condition:**

If Mode Door Actuator's electrical circuit is open.

Possible Causes

Possible Causes
(C35) MODE DOOR DRIVER CIRCUIT OPEN (C154) COMMON DOOR DRIVER CIRCUIT OPEN MODE DOOR ACTUATOR A/C HEATER CONTROL

Diagnostic Test

1. **ACTIVE DTC(S) PRESENT**

Turn the ignition on.

Using the A/C Heater Control, actuate the Panel Mode Door.

With the scan tool, check for DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK (C154) COMMON DOOR DRIVER CIRCUIT FOR AN OPEN**

819faa45

Fig. 21: Measuring Resistance Of (C154) Common Door Driver Circuit Between A/C Heater Control C1 Harness Connector And Mode Door Actuator Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Disconnect the Mode Door Actuator harness connector.

Measure the resistance of the (C154) Common Door Driver circuit between the A/C Heater Control C1 harness connector and the Mode Door Actuator harness connector.

Does the ohm meter read open circuit?

Yes

Repair the (C154) Common Door Driver circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK (C35) MODE DOOR DRIVER CIRCUIT FOR AN OPEN**

Fig. 22: Measuring Resistance Of (C35) Mode Door Driver Circuit Between A/C Heater Control C1 Harness Connector And Mode Door Actuator Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (C35) Mode Door Driver circuit between the A/C Heater Control C1 harness connector and the Mode Door Actuator harness connector.

Does the ohm meter read open circuit?

Yes

Repair the (C35) Mode Door Driver circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. CHECK MODE DOOR ACTUATOR CIRCUIT RESISTANCE

Fig. 23: Measuring Resistance Between (C35) Mode Door Driver Circuit And (C154) Common Door Driver Circuit In A/C Heater Control C1 Harness Connector
Courtesy of CHRYSLER LLC

Reconnect the Mode Door Actuator harness connector.

Measure the resistance between the (C35) Mode Door Driver circuit and the (C154) Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is the resistance between 30 and 40 ohms?

Yes

Replace the A/C Heater Control in accordance with the service information.

No

Replace the Mode Door Actuator in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1044-PANEL MODE DOOR 1 TRAVEL RANGE TOO SMALL

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after

installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is less than the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

Monitor Conditions

When Monitored:

During actuator calibration.

Set Conditions

- Set Condition:**

If the total span of the Mode Door is less than the low range limit.

Possible Causes

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S) MODE DOOR SEIZED, BINDING, OBSTRUCTED MODE DOOR ACTUATOR A/C HEATER CONTROL

Diagnostic Test

1. **CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs**

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active CONTROL CIRCUIT/PERFORMANCE or CONTROL CIRCUIT OPEN DTCs?

Yes

Diagnose and repair the DTC(s). If present, diagnose and repair all Rear Blend and Rear Mode Door Control Circuit/Performance DTCs first, all other Control Circuit/Performance DTCs second, and all Control Circuit Open DTCs last. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of all HVAC related symptoms.

No

Go To 2.

2. **INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE DOOR TO SEIZE OR BIND**

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the door to seize or bind.

Are there any physical or mechanical problems with the door, housing, linkage, or actuator?

Yes

Repair as necessary in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK MODE DOOR TRAVEL**

Remove the Mode Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over approximately 90 degrees of travel.

Does the door operate smoothly in both directions over approximately 90 degrees of travel?

Yes

Replace the Mode Door Actuator in accordance with the service information. Then, Go To 4.

No

Repair as necessary in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

4. **RUN THE ACTUATOR CALIBRATION TEST**

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display this DTC as active?

Yes

Replace the A/C Heater Control in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Perform **BODY VERIFICATION TEST - VER 1** .

B1045-PANEL MODE DOOR 1 TRAVEL RANGE TOO LARGE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value exceeds the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

Monitor Conditions

When Monitored:

During actuator calibration.

Set Conditions

- **Set Condition:**

If the total span of the Mode 1 (Floor to Panel) Door exceeds the high range limit.

Possible Causes

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S) MODE DOOR OR A/C HEATER HOUSING COMPONENTS WARPED, WORN, DAMAGED, MISSING, BROKEN MODE DOOR 1 (FLOOR TO PANEL) ACTUATOR A/C HEATER CONTROL

Diagnostic Test

1. **CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs**

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active CONTROL CIRCUIT/PERFORMANCE or CONTROL CIRCUIT OPEN DTCs?

Yes

Diagnose and repair the DTC(s). If present, diagnose and repair all Rear Blend and Rear Mode Door Control Circuit/Performance DTCs first, all other Control Circuit/Performance DTCs second, and all Control Circuit Open DTCs last. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of all HVAC related symptoms.

No

Go To 2.

2. CHECK FOR A BROKEN MODE DOOR 1 (FLOOR TO PANEL) ACTUATOR

Turn the ignition off.

Remove the Mode Door 1 (Floor to Panel) Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

Does the actuator turn in either direction?

Yes

Replace the Mode Door 1 (Floor to Panel) Actuator in accordance with the service information. Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 3.

3. CHECK MODE 1 (FLOOR TO PANEL) DOOR & A/C HEATER HOUSING FOR WARPED, WORN, DAMAGED, MISSING, & BROKEN COMPONENTS

Inspect for excessively worn, disconnected, missing, or broken door linkage. Inspect for a damaged or broken A/C Heater Housing Assembly. Inspect for a warped or broken door, and missing door seals. Rotate the door from stop to stop. The door should rotate approximately 90 degrees.

Are there any physical or mechanical problems with the door or housing?

Yes

Repair as necessary in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Mode Door 1 (Floor to Panel) Actuator in accordance with the service information.
Then, Go To 4.

4. RUN THE ACTUATOR CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display this DTC as active?

Yes

Replace the A/C Heater Control in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Perform **BODY VERIFICATION TEST - VER 1** .

B1058-RECIRCULATION DOOR CONTROL CIRCUIT/PERFORMANCE

Circuit Schematic

01a20602

Fig. 24: Panel Mode Door Control , Recirculation Door Control And Left Blend Door Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The A/C Heater Control drives the Recirculation Door Actuator via the (C32) Recirculation Door Driver and the (C154) Common Door Driver.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- Set Condition:**

If the A/C Heater Control detects a short to ground or to voltage on the (C32) Recirculation Door Driver, the (C54) Blend Door Driver, the (C35) Mode Door Driver, or the (C154) Common Door Driver circuits while attempting to drive the (C32) Recirculation Door Driver.

Possible Causes

Possible Causes
(C32) RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
(C54) BLEND DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
(C35) MODE DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
(C154) COMMON DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
(C32) RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C54) BLEND DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C35) MODE DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C154) COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND
RECIRCULATION DOOR ACTUATOR
MODE DOOR ACTUATOR
BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Diagnostic Test

1. **ACTIVE DTC(S) PRESENT**

Turn the ignition on.

Using the A/C Heater Control, actuate the Recirculation Door.

With the scan tool, check for DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1**.

2. CHECK (C32) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Fig. 25: Measuring Voltage Of (C32) Recirculation Door Driver Circuit In A/C Heater Control C1 Harness Connector

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

Measure the voltage of the (C32) Recirculation Door Driver circuit in the A/C Heater Control C1 harness connector.

Is there any voltage present?

Yes

Repair the (C32) Recirculation Door Driver circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK (C35) MODE DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Fig. 26: Measuring Voltage Of (C35) Mode Door Driver Circuit In A/C Heater Control C1 Harness Connector

Courtesy of CHRYSLER LLC

Measure the voltage of the (C35) Mode Door Driver circuit in the A/C Heater Control C1 harness connector.

Is there any voltage present?

Yes

Repair the (C35) Mode Door Driver circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. CHECK (C54) BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Fig. 27: Measuring Voltage Of (C54) Blend Door Driver Circuit In A/C Heater Control C1 Harness Connector
 Courtesy of CHRYSLER LLC

Measure the voltage of the (C54) Blend Door Driver circuit in the A/C Heater Control C1 harness connector.

Is there any voltage present?

Yes

Repair the (C54) Blend Door Driver circuit for a short to voltage.
 Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 5.

5. CHECK (C154) COMMON DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Fig. 28: Measuring Voltage Of (C154) Common Door Driver Circuit In A/C Heater Control C1 Harness Connector
 Courtesy of CHRYSLER LLC

Measure the voltage of the (C154) Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is there any voltage present?

Yes

Repair the (C154) Common Door Driver circuit for a short to voltage.
 Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 6.

6. CHECK (C32) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND

Fig. 29: Measuring Resistance Between Ground And (C32) Recirculation Door Driver Circuit In A/C Heater Control C1 Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance between ground and the (C32) Recirculation Door Driver circuit in the A/C Heater Control C1 harness connector.

Does the ohm meter read open circuit?

Yes

Go To 7.

No

Repair the (C32) Recirculation Door Driver circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1**.

7. CHECK (C54) DRIVER BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND

Fig. 30: Measuring Resistance Between Ground And (C54) Driver Blend Door Driver Circuit In A/C Heater Control C1 Harness Connector
 Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (C54) Driver Blend Door Driver circuit in the A/C Heater Control C1 harness connector.

Does the ohm meter read open circuit?

Yes

Go To 8.

No

Repair the (C54) Driver Blend Door Driver circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

8. CHECK (C35) MODE DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND

81a29dc5

Fig. 31: Measuring Resistance Between Ground And (C35) Mode Door Driver Circuit In A/C Heater Control C1 Harness Connector
 Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (C35) Mode Door Driver circuit in the A/C Heater Control C1 harness connector.

Does the ohm meter read open circuit?

Yes

Go To 9.

No

Repair the (C35) Mode Door Driver circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

9. CHECK (C154) COMMON DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND

81a29dcf

Fig. 32: Measuring Resistance Between Ground And (C154) Common Door Driver Circuit In A/C Heater Control C1 Harness Connector
 Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (C154) Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Does the ohm meter read open circuit?

Yes

Go To 10.

No

Repair the (C154) Common Door Driver circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

10. **CHECK RECIRCULATION DOOR ACTUATOR CIRCUIT RESISTANCE**

81a29de1

Fig. 33: Measuring Resistance Between (C32) Recirculation Door Driver Circuit And (C154) Common Door Driver Circuit In A/C Heater Control C1 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance between the (C32) Recirculation Door Driver circuit and the (C154) Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is the resistance between 30 and 40 ohms?

Yes

Go To 11.

No

Replace the Recirculation Door Actuator in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

11. CHECK MODE DOOR ACTUATOR CIRCUIT RESISTANCE

81a29e28

Fig. 34: Measuring Resistance Between (C35) Mode Door Driver Circuit And (C154) Common Door Driver Circuit In A/C Heater Control C1 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance between the (C35) Mode Door Driver circuit and the (C154) Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is the resistance between 30 and 40 ohms?

Yes

Go To 12.

No

Replace the Mode Door Actuator in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

12. CHECK BLEND DOOR ACTUATOR CIRCUIT RESISTANCE

81a29e6b

Fig. 35: Measuring Resistance Between (C54) Blend Door Driver Circuit And (C154) Common Door Driver Circuit In A/C Heater Control C1 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance between the (C54) Blend Door Driver circuit and the (C154) Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is the resistance between 30 and 40 ohms?

Yes

Go To 13.

No

Replace the Blend Door Actuator in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

13. **RUN THE ACTUATOR CALIBRATION TEST**

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool only display: B1058-RECIRCULATION DOOR CONTROL CIRCUIT/PERFORMANCE?

Yes

Replace the A/C Heater Control in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No, Other DTC(s) Displayed

Diagnose and repair the other DTC(s). Refer to **DIAGNOSTIC CODE INDEX** for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed

Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

B105B-RECIRCULATION DOOR CONTROL CIRCUIT OPEN

Circuit Schematic

0100a000

Fig. 36: Recirculation Door Control Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The A/C Heater Control drives the Recirculation Door Actuator via the (C32) Recirculation Door Driver circuit and the (C154) Common Door Driver 2 circuit.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- Set Condition:**

If the Recirculation Door Actuator's electrical circuit is open.

Possible Causes

Possible Causes
(C32) RECIRCULATION DOOR DRIVER CIRCUIT OPEN (C154) COMMON DOOR DRIVER 2 CIRCUIT OPEN RECIRCULATION DOOR ACTUATOR A/C HEATER CONTROL

Diagnostic Test

1. **ACTIVE DTC(S) PRESENT**

Turn the ignition on.

Using the A/C Heater Control, actuate the Recirculation Door.

With the scan tool, check for DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK (C32) RECIRCULATION DOOR DRIVER CIRCUIT FOR AN OPEN**

Fig. 37: Measuring Resistance Of (C32) Recirculation Door Driver Circuit Between A/C Heater Control C1 Harness Connector And Recirculation Door Actuator Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Disconnect the Recirculation Door Actuator harness connector.

Measure the resistance of the (C32) Recirculation Door Driver circuit between the A/C Heater Control C1 harness connector and the Recirculation Door Actuator harness connector.

Does the ohm meter read open circuit?

Yes

Repair the (C32) Recirculation Door Driver circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK (C154) COMMON DOOR DRIVER 2 CIRCUIT FOR AN OPEN**

Fig. 38: Measuring Resistance Of (C154) Common Door Driver 2 Circuit Between A/C Heater Control C1 Harness Connector And Recirculation Door Actuator Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (C154) Common Door Driver 2 circuit between the A/C Heater Control C1 harness connector and the Recirculation Door Actuator harness connector.

Does the ohm meter read open circuit?

Yes

Repair the (C154) Common Door Driver 2 circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. CHECK RECIRCULATION DOOR ACTUATOR CIRCUIT RESISTANCE

Fig. 39: Measuring Resistance Between (C32) Recirculation Door Driver Circuit And (C154) Common Door Driver 2 Circuit In A/C Heater Control C1 Harness Connector
Courtesy of CHRYSLER LLC

Reconnect the Recirculation Door Actuator harness connector.

Measure the resistance between the (C32) Recirculation Door Driver circuit and the (C154) Common Door Driver 2 circuit in the A/C Heater Control C1 harness connector.

Is the resistance between 30 and 40 ohms?

Yes

Replace the Recirculation Door Actuator in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the A/C Heater Control in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

B105B-RECIRCULATION DOOR CONTROL CIRCUIT OPEN (TIPM)

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

When actuator movement is requested.

Set Conditions

- **Set Condition:**

If the (C268) Recirculation Door Driver circuit or the (C68) Recirculation Door Common Driver circuit is open.

Possible Causes

Possible Causes
(C268) RECIRCULATION DOOR DRIVER CIRCUIT OPEN (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT OPEN RECIRCULATION DOOR ACTUATOR A/C HEATER CONTROL

Diagnostic Test

1. **CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE DTCs**

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE DTCs?

Yes

Diagnose and repair the DTC(s). Refer to **DIAGNOSTIC CODE INDEX** for a complete list of all HVAC related symptoms.

No

Go To 2.

2. **CHECK THE RECIRCULATION DOOR ACTUATOR CIRCUIT RESISTANCE**

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Measure the resistance between the (C268) Recirculation Door Driver circuit and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance above 70.0 ohms?

Yes

Go To 3.

No

Replace the A/C Heater Control in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. CHECK THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT FOR AN OPEN

Disconnect the Recirculation Door Actuator harness connector.

Measure the resistance of the (C268) Recirculation Door Driver circuit between the Recirculation Door Actuator harness connector and the A/C Heater Control C2 harness connector.

Is the resistance below 5.0 ohms?

Yes

Go To 4.

No

Repair the (C268) Recirculation Door Driver circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. CHECK THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT FOR AN OPEN

Measure the resistance of the (C68) Recirculation Door Common Driver circuit between the Recirculation Door Actuator harness connector and the A/C Heater Control C2 harness connector.

Is the resistance below 5.0 ohms?

Yes

Replace the Recirculation Door Actuator in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (C68) Recirculation Door Common Driver circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is less than the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

Monitor Conditions

When Monitored:

During actuator calibration.

Set Conditions

- **Set Condition:**

If the total span of the Recirculation Door is less than the low range limit.

Possible Causes

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S) RECIRCULATION DOOR SEIZED, BINDING, OBSTRUCTED RECIRCULATION DOOR ACTUATOR A/C HEATER CONTROL

Diagnostic Test

1. **CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs**

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active CONTROL CIRCUIT/PERFORMANCE or CONTROL CIRCUIT OPEN DTCs?

Yes

Diagnose and repair the DTC(s). If present, diagnose and repair all Rear Blend and Rear Mode

Door Control Circuit/Performance DTCs first, all other Control Circuit/Performance DTCs second, and all Control Circuit Open DTCs last. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of all HVAC related symptoms.

No

Go To 2.

2. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE DOOR TO SEIZE OR BIND

Turn the ignition off.

Inspect the actuator and the housing assembly for a condition causing the door to seize or bind.

Are there any physical or mechanical problems with the door, housing, or actuator?

Yes

Repair as necessary in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK RECIRCULATION DOOR TRAVEL

Remove the Recirculation Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over approximately 70 degrees of travel.

Does the door operate smoothly in both directions over approximately 70 degrees of travel?

Yes

Replace the Recirculation Door Actuator in accordance with the service information. Then, Go To 4.

No

Repair as necessary in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

4. RUN THE ACTUATOR CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display this DTC as active?

Yes

Replace the A/C Heater Control in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Perform **BODY VERIFICATION TEST - VER 1** .

B105D-RECIRCULATION DOOR TRAVEL RANGE TOO LARGE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value exceeds the expected range for this actuator, this DTC will set. BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Diagnostic Test

1. **ACTIVE DTC(S) PRESENT**

Turn the ignition on.

Using the A/C Heater Control, actuate the Blend Door.

With the scan tool, check for DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1**.

2. CHECK (C32) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Fig. 41: Measuring Voltage Of (C32) Recirculation Door Driver Circuit In A/C Heater Control C1 Harness Connector

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

Measure the voltage of the (C32) Recirculation Door Driver circuit in the A/C Heater Control C1 harness connector.

Is there any voltage present?

Yes

Repair the (C32) Recirculation Door Driver circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK (C35) MODE DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Fig. 42: Measuring Voltage Of (C35) Mode Door Driver Circuit In A/C Heater Control C1 Harness Connector

Courtesy of CHRYSLER LLC

Measure the voltage of the (C35) Mode Door Driver circuit in the A/C Heater Control C1 harness connector.

Is there any voltage present?

Yes

Repair the (C35) Mode Door Driver circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. CHECK (C54) BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Fig. 43: Measuring Voltage Of (C54) Blend Door Driver Circuit In A/C Heater Control C1 Harness Connector
 Courtesy of CHRYSLER LLC

Measure the voltage of the (C54) Blend Door Driver circuit in the A/C Heater Control C1 harness connector.

Is there any voltage present?

Yes

Repair the (C54) Blend Door Driver circuit for a short to voltage.
 Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 5.

5. CHECK (C154) COMMON DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

81a29dac

Fig. 44: Measuring Voltage Of (C154) Common Door Driver Circuit In A/C Heater Control C1 Harness Connector

Courtesy of CHRYSLER LLC

Measure the voltage of the (C154) Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is there any voltage present?

Yes

Repair the (C154) Common Door Driver circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 6.

6. CHECK (C32) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND

81a29db9

Fig. 45: Measuring Resistance Between Ground And (C32) Recirculation Door Driver Circuit In A/C Heater Control C1 Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance between ground and the (C32) Recirculation Door Driver circuit in the A/C Heater Control C1 harness connector.

Does the ohm meter read open circuit?

Yes

Go To 7.

No

Repair the (C32) Recirculation Door Driver circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1**.

7. CHECK (C54) DRIVER BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND

81a29dbd

Fig. 46: Measuring Resistance Between Ground And (C54) Driver Blend Door Driver Circuit In A/C Heater Control C1 Harness Connector
 Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (C54) Driver Blend Door Driver circuit in the A/C Heater Control C1 harness connector.

Does the ohm meter read open circuit?

Yes

Go To 8.

No

Repair the (C54) Driver Blend Door Driver circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

8. CHECK (C35) MODE DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND

Fig. 47: Measuring Resistance Between Ground And (C35) Mode Door Driver Circuit In A/C Heater Control C1 Harness Connector
 Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (C35) Mode Door Driver circuit in the A/C Heater Control C1 harness connector.

Does the ohm meter read open circuit?

Yes

Go To 9.

No

Repair the (C35) Mode Door Driver circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

9. CHECK (C154) COMMON DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND

81a29dcf

Fig. 48: Measuring Resistance Between Ground And (C154) Common Door Driver Circuit In A/C Heater Control C1 Harness Connector
 Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (C154) Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Does the ohm meter read open circuit?

Yes

Go To 10.

No

Repair the (C154) Common Door Driver circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

10. **CHECK RECIRCULATION DOOR ACTUATOR CIRCUIT RESISTANCE**

81a29de1

Fig. 49: Measuring Resistance Between (C32) Recirculation Door Driver Circuit And (C154) Common Door Driver Circuit In A/C Heater Control C1 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance between the (C32) Recirculation Door Driver circuit and the (C154) Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is the resistance between 30 and 40 ohms?

Yes

Go To 11.

No

Replace the Recirculation Door Actuator in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

11. CHECK MODE DOOR ACTUATOR CIRCUIT RESISTANCE

81a29e28

Fig. 50: Measuring Resistance Between (C35) Mode Door Driver Circuit And (C154) Common Door Driver Circuit In A/C Heater Control C1 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance between the (C35) Mode Door Driver circuit and the (C154) Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is the resistance between 30 and 40 ohms?

Yes

Go To 12.

No

Replace the Mode Door Actuator in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

12. CHECK BLEND DOOR ACTUATOR CIRCUIT RESISTANCE

81a29e6b

Fig. 51: Measuring Resistance Between (C54) Blend Door Driver Circuit And (C154) Common Door Driver Circuit In A/C Heater Control C1 Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance between the (C54) Blend Door Driver circuit and the (C154) Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is the resistance between 30 and 40 ohms?

Yes

Go To 13.

No

Replace the Blend Door Actuator in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

13. **RUN THE ACTUATOR CALIBRATION TEST**

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool only display: B10A2-LEFT BLEND DOOR CONTROL CIRCUIT/PERFORMANCE?

Yes

Replace the A/C Heater Control in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No, Other DTC(s) Displayed

Diagnose and repair the other DTC(s). Refer to **DIAGNOSTIC CODE INDEX** for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed

Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

B10A5-LEFT BLEND DOOR CONTROL CIRCUIT OPEN

Circuit Schematic

0101010101

Fig. 52: Blend Door Control Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The A/C Heater Control drives the Left Blend Door Actuator via the (C54) Left Blend Door Driver circuit and the (C154) Common Door Driver circuit.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- Set Condition:**

If the Left Blend Door Actuator's electrical circuit is open.

Possible Causes

Possible Causes
(C54) DRIVER BLEND DOOR DRIVER CIRCUIT OPEN
(C154) COMMON DOOR DRIVER CIRCUIT OPEN
LEFT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Diagnostic Test

1. **ACTIVE DTC(S) PRESENT**

Turn the ignition on.

Using the A/C Heater Control, actuate the Left Blend Door.

With the scan tool, check for DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK (C154) COMMON DOOR DRIVER CIRCUIT FOR AN OPEN**

819fafa0

Fig. 53: Measuring Resistance Of (C154) Common Door Driver Circuit Between A/C Heater Control C1 Harness Connector And Left Blend Door Actuator Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Disconnect the Left Blend Door Actuator harness connector.

Measure the resistance of the (C154) Common Door Driver circuit between the A/C Heater Control C1 harness connector and the Left Blend Door Actuator harness connector.

Does the ohm meter read open circuit?

Yes

Repair the (C154) Common Door Driver circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK (C54) LEFT BLEND DOOR DRIVER CIRCUIT FOR AN OPEN**

Fig. 54: Measuring Resistance Of (C54) Driver Blend Door Driver Circuit Between A/C Heater Control C1 Way Harness Connector And Left Blend Door Actuator Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (C54) Driver Blend Door Driver circuit between the A/C Heater Control C1 way harness connector and the Left Blend Door Actuator harness connector.

Does the ohm meter read open circuit?

Yes

Repair the (C54) Driver Blend Door Driver circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. CHECK LEFT BLEND DOOR ACTUATOR CIRCUIT RESISTANCE

Fig. 55: Measuring Resistance Between (C54) Driver Blend Door Driver Circuit And (C154) Common Door Driver Circuit In A/C Heater Control C1 Harness Connector
Courtesy of CHRYSLER LLC

Reconnect the Left Blend Door Actuator harness connector.

Measure the resistance between the (C54) Driver Blend Door Driver circuit and the (C154) Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is the resistance between 30 and 40 ohms?

Yes

Replace the A/C Heater Control in accordance with the service information.

No

Replace the Mode Door Actuator in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B10B1-INFRA-RED SENSOR THERMISTOR CIRCUIT HIGH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the IR Sensor fails the internal self test.

Possible Causes

Possible Causes
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to *HVAC SYSTEM TEST for stored DTC test procedures.

Diagnostic Test

1. **REPLACE THE A/C HEATER CONTROL**

Repair

Replace the A/C Heater Control in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B10B4-CABIN HEATER 1 CONTROL CIRCUIT LOW (TIPM)

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on, the Cabin Heater Relay energized.

Set Conditions

- **Set Condition:**

If the Totally Integrated Power Module (TIPM) detects that the (K360) Cabin Heater 1 Relay Control circuit is shorted to ground.

Possible Causes

Possible Causes
(K360) CABIN HEATER 1 RELAY CONTROL CIRCUIT SHORTED TO GROUND
(K360) CABIN HEATER 1 RELAY CONTROL CIRCUIT OPEN
CABIN HEATER RELAY
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. VERIFY THAT THE DTC IS ACTIVE

WARNING: When the engine is operating, do not stand in direct line with the fan, do not put your hands near the pulleys, belts or fan. Do not wear loose clothing.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase DTCs.

With the scan tool, actuate the Cabin Heater Relay.

Monitor the scan tool for at least two minutes.

With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

2. CHECK (K360) CABIN HEATER 1 RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Remove the Cabin Heater Relay.

Measure the resistance between ground and the (K360) Cabin Heater 1 Relay Control circuit in the TIPM C1 harness connector.

Does the ohm meter read open circuit?

Yes

Repair the (K360) Cabin Heater 1 Relay Control circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK (K360) CABIN HEATER 1 RELAY CONTROL CIRCUIT FOR AN OPEN

Measure the resistance of the (K360) Cabin Heater 1 Relay Control circuit between the Cabin Heater Relay connector and the TIPM C1 harness connector.

Does the ohm meter read open circuit?

Yes

Repair the (K360) Cabin Heater 1 Relay Control circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. CHECK PTC NO. 1 RELAY

Install the TIPM.

Install a substitute PTC No. 1 Relay in place of the vehicle's PTC No. 1 Relay.

Turn the ignition on.

With the scan tool, erase TIPM DTCs.

With the scan tool, actuate the PTC No. 1 Relay.

Monitor the scan tool for at least two minutes.

With the scan tool, read TIPM DTCs.

Is the status Active for this DTC?

Yes

Go To 5.

No

Replace the PTC No. 1 Relay in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

5. INSPECT RELATED WIRING & CHECK FOR TSBs

Turn the ignition off.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the PTC No. 1 Relay and the FCM.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the TIPM in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

B10B8-CABIN HEATER 2 CONTROL CIRCUIT LOW (TIPM)

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on, the ASD Relay energized, and the PTC No. 2 Relay command on.

Set Conditions

- **Set Condition:**

If the Totally Integrated Power Module (TIPM) detects that the (K361) PTC No. 2 Relay Control circuit is shorted to ground.

Possible Causes

Possible Causes
(K342) FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
(K361) PTC NO. 2 RELAY CONTROL CIRCUIT SHORTED TO GROUND
(K361) PTC NO. 2 RELAY CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
PTC NO. 2 RELAY
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. **VERIFY THAT THE DTC IS ACTIVE**

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing.

NOTE: If the TIPM detects and stores a DTC, the TIPM also stores the environmental conditions under which the DTC was set.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase TIPM DTCs.

With the scan tool, actuate the PTC No. 2 Relay.

Monitor the scan tool for at least two minutes.

With the scan tool, read TIPM DTCs.

Is the status Active for this DTC?

Yes

Go To 2.

No

Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

2. **CHECK (K342) FUSED ASD RELAY OUTPUT CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Turn the ignition off.

Remove the PTC No. 2 Relay.

Turn the ignition on.

Using a 12 volt test light connected to ground, check the (K342) Fused ASD Relay Output circuit in the PTC No. 2 Relay harness connector.

NOTE: **The test light should illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly?

Yes

Go To 3.

No

Repair the (K342) Fused ASD Relay Output circuit for an open or high resistance.

Perform **BODY VERIFICATION TEST - VER 1** .

3. **CHECK (K361) PTC NO. 2 RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Measure the resistance between ground and the (K361) PTC No. 2 Relay Control circuit in the PTC No. 2 Relay connector.

Is the resistance above 10.0 ohms?

Yes

Go To 4.

No

Repair the (K361) PTC No. 2 Relay Control circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

4. **CHECK (K361) PTC NO. 2 RELAY CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Measure the resistance of the (K361) PTC No. 2 Relay Control circuit between the PTC No. 2 Relay connector and the TIPM connector.

Is the resistance below 10.0 ohms?

Yes

Go To 5.

No

Repair the (K361) PTC No. 2 Relay Control circuit for an open or high resistance.

Perform **BODY VERIFICATION TEST - VER 1** .

5. **CHECK PTC NO. 2 RELAY**

Install a substitute PTC No. 2 Relay in place of the vehicle's PTC No. 2 Relay.

Turn the ignition on.

With the scan tool, erase TIPM DTCs.

With the scan tool, actuate the PTC No. 2 Relay.

Monitor the scan tool for at least two minutes.

With the scan tool, read TIPM DTCs.

Is the status Active for this DTC?

Yes

Go To 6.

No

Replace the PTC No. 2 Relay in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

6. **INSPECT RELATED WIRING & CHECK FOR TSBs**

Turn the ignition off.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the PTC No. 2 Relay and the FCM.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Front Control Module (FCM) in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

B10B9-CABIN HEATER 2 CONTROL CIRCUIT HIGH (TIPM)

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on, the ASD Relay energized, and the PTC No. 2 Relay command on.

Set Conditions

- **Set Condition:**

If the Totally Integrated Power Module (TIPM) detects that the (K361) PTC No. 2 Relay Control circuit voltage is shorted to voltage.

Possible Causes

Possible Causes
(K361) PTC NO. 2 RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
(K361) PTC NO. 2 RELAY CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
PTC NO. 2 RELAY
TOTALLY INTEGRATED POWER MODULE (TIPM)

1. VERIFY THAT THE DTC IS ACTIVE

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing.

NOTE: If the TIPM detects and stores a DTC, the TIPM also stores the environmental conditions under which the DTC was set.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase TIPM DTCs.

With the scan tool, actuate the PTC No. 2 Relay.

Monitor the scan tool for at least two minutes.

With the scan tool, read TIPM DTCs.

Is the status Active for this DTC?

Yes

Go To 2.

No

Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

2. CHECK PTC NO. 2 RELAY

With the scan tool, erase TIPM DTCs.

Turn the ignition off.

Remove the PTC No. 2 Relay.

Turn the ignition on.

With the scan tool, actuate the PTC No. 2 Relay.

With the scan tool, read TIPM DTCs.

NOTE: The scan tool should display an open circuit DTC with the PTC No. 2 Relay removed.

Does the scan tool display: B10B9-CABIN HEATER 2 CONTROL CIRCUIT HIGH?

Yes

Go To 3.

No

Replace the PTC No. 2 Relay in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. CHECK (K361) PTC NO. 2 RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the TIPM from the Power Module.

Remove the ASD Relay from the TIPM.

Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.

Turn the ignition on.

Measure the voltage of the (K361) PTC No. 2 Relay Control circuit in the PTC No. 2 Relay connector.

Is there any voltage present?

Yes

Repair the (K361) PTC No. 2 Relay Control circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. CHECK (K361) PTC NO. 2 RELAY CONTROL FOR AN OPEN OR HIGH RESISTANCE

Turn the ignition off.

Measure the resistance of the (K361) PTC No. 2 Relay Control circuit between the PTC No. 2 Relay connector and the TIPM connector.

Is the resistance below 10.0 ohms?

Yes

Go To 5.

No

Repair the (K361) PTC No. 2 Relay Control circuit for an open or high resistance.

Perform **BODY VERIFICATION TEST - VER 1** .

5. INSPECT RELATED WIRING & CHECK FOR TSBs

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the PTC No. 2 Relay and the TIPM.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the TIPM in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

Perform **BODY VERIFICATION TEST - VER 1** .

B10EA-BLOWER MOTOR CONTROL CIRCUIT HIGH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on. Battery voltage greater than 10.4 volts. TIPM requesting Blower Motor operation.

Set Conditions

- **Set Condition:**

If the Totally Integrated Power Module (TIPM) detects a short to voltage condition on the (C7) Blower Motor Control circuit.

Possible Causes

Possible Causes
(C7) BLOWER MOTOR CONTROL CIRCUIT SHORTED TO VOLTAGE
(C7) BLOWER MOTOR CONTROL CIRCUIT OPEN
BLOWER MOTOR
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

Turn the ignition on.

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the a/c control, turn on the Blower Motor.

With the scan tool, read DTCs.

Does the scan tool display active: B10EA-BLOWER MOTOR CONTROL CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK (C7) BLOWER MOTOR CONTROL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the TIPM C8 harness connector.

Disconnect the Blower Motor harness connector.

Measure the resistance of the (C7) Blower Motor Control circuit between the TIPM C8 harness connector and the Blower Motor harness connector.

Does the ohm meter read open circuit?

Yes

Repair the (C7) Blower Motor Control circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK (C7) BLOWER MOTOR CONTROL CIRCUIT FOR SHORT TO VOLTAGE

Turn the ignition on.

With a volt meter measure the voltage on the (C7) Blower Motor Control circuit.

Does the volt meter read above 10.0 volts?

Yes

Repair the (C7) Blower Motor Control circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. TOTALLY INTEGRATED POWER MODULE

Turn the ignition on.

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the a/c control, turn on the Blower Motor.

With the scan tool, read DTCs.

Does the scan tool display active: B10EA-BLOWER MOTOR CONTROL CIRCUIT HIGH?

Yes

Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Blower Motor in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

B10EC-BLOWER MOTOR CONTROL CIRCUIT OVERCURRENT (TIPM)

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The Totally Integrated Power Module (TIPM) will set this DTC if it detects an overcurrent condition on the (C7) Blower Motor Control circuit for more than 500 ms when blower motor operation is requested.

Possible Causes

Possible Causes
BLOCKAGE STALLING BLOWER MOTOR BLOWER MOTOR TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. VERIFY DTC B10EC-BLOWER MOTOR CONTROL CIRCUIT OVERCURRENT IS ACTIVE

Turn the ignition on.

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display active: B10EC-BLOWER MOTOR CONTROL CIRCUIT OVERCURRENT?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK FOR PROPER BLOWER MOTOR OPERATION

Turn the ignition on.

Turn the Blower Motor on.

Does the Blower Motor operate normally?

Yes

Go To 5.

No

Go To 3.

3. CHECK FOR 12 VOLTS TO THE BLOWER MOTOR

Turn the ignition off.

Disconnect the Blower Motor harness connector.

Turn the ignition on.

Turn the Blower Motor control on.

Using a volt meter measure the voltage on the (C7) Blower Motor Control circuit in the Blower Motor harness connector.

Does the volt meter read 12 volts?

Yes

Go To 4.

No

Go To 5.

4. **CHECK FOR A BLOCKAGE STALLING THE BLOWER MOTOR**

Turn the ignition off.

Remove the Blower Motor from the HVAC housing assembly.

Look for anything on the Blower Motor and in the HVAC housing that is physically preventing Blower Motor operation.

Is anything physically preventing Blower Motor operation?

Yes

Repair as necessary. Also, check Blower Motor for proper operation. Reinstall, or replace the Blower Motor as necessary in accordance with the service information.

No

Replace the Blower Motor in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

5. **CHECK FOR CHAFING IN THE (C7) BLOWER MOTOR CONTROL CIRCUIT**

Turn the ignition off.

Check the (C7) Blower Motor Control circuit for wire chafing.

Is any wire chafing present?

Yes

Repair the wire chafing on the (C7) Blower Motor Control circuit.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1138-CABIN HEATER 3 CONTROL CIRCUIT LOW (TIPM)

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on, the Cabin Heater Relay 2 commanded on.

Set Conditions

- **Set Condition:**

If the Totally Integrated Power Module detects the (K232) Cabin Heater Relay 2 Control circuit is shorted to ground.

Possible Causes

Possible Causes
(K232) CABIN HEATER RELAY 2 CONTROL CIRCUIT SHORTED TO GROUND
CABIN HEATER 2 RELAY
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. **VERIFY THAT THE DTC IS ACTIVE**

Turn the ignition on.

With the scan tool, erase DTCs.

With the scan tool, actuate the Cabin Heater 2 Relay.

Monitor the scan tool, for at least two minutes.

With the scan tool, read DTCs.

Does the scan tool, display active: B10B8-CABIN HEATER 2 CONTROL CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or

contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK (K232) CABIN HEATER RELAY 2 OUTPUT CIRCUIT FOR SHORT TO GROUND**

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Remove the Cabin Heater Relay 2.

Using an ohm meter measure the resistance between the (K232) Cabin Heater Relay 2 Output circuit and ground.

Does the ohm meter read open circuit?

Yes

Go To 3.

No

Repair the (K232) Cabin Heater Relay 2 Output circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

3. **TOTALLY INTEGRATED POWER MODULE (TIPM)**

Turn the ignition on.

With the scan tool, erase DTCs.

With the scan tool, actuate the Cabin Heater 2 Relay.

Monitor the scan tool for at least two minutes.

With the scan tool, read DTCs.

Does the scan tool display active: B10B8-CABIN HEATER 2 CONTROL CIRCUIT LOW?

Yes

Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Cabin Heater Relay 2 in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1139-CABIN HEATER 3 CONTROL CIRCUIT HIGH (TIPM)

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on, the Cabin Heater Relay 2 is commanded on.

Set Conditions

- Set Condition:**

If the Totally Integrated Power Module detects a short to voltage on the (K232) Cabin Heater Relay 2 Control circuit.

Possible Causes

Possible Causes
(K232) CABIN HEATER RELAY 2 CONTROL CIRCUIT SHORTED TO VOLTAGE CABIN HEATER RELAY 2 TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

With the scan tool, erase DTCs.

With the scan tool, actuate the Cabin Heater 2 Relay.

Monitor the scan tool for at least two minutes.

With the scan tool, read DTCs.

Does the scan tool, display active: B10B9-CABIN HEATER 2 CONTROL CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK THE (K232) CABIN HEATER RELAY 2 CONTROL CIRCUIT FOR SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Remove the Cabin Heater Relay 2.

Turn the ignition on.

With a volt meter, measure the voltage on the (K232) Cabin Heater Relay 2 Control circuit.

Does the volt meter read 1.0 volt or above?

Yes

Repair short to voltage on the (K232) Cabin Heater Relay 2 Control circuit.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **TOTALLY INTEGRATED POWER MODULE**

Turn the ignition on.

With the scan tool, erase DTCs.

With the scan tool, actuate the Cabin Heater 2 Relay.

Monitor the scan tool for at least two minutes.

With the scan tool, read DTCs.

Does the scan tool display active: B10B9-CABIN HEATER 2 CONTROL CIRCUIT HIGH?

Yes

Replace the Totally Integrated Power Module (TIPM in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Cabin Heater Relay 2 in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

B1610-AMBIENT LIGHT SENSOR INPUT CIRCUIT LOW

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the Ambient Light Sensor input is out of range toward the low voltage threshold.

Possible Causes

Possible Causes
(L24) AUTO HEADLAMPS SIGNAL CIRCUIT SHORTED TO GROUND SUNLOAD SENSOR A/C HEATER CONTROL

Diagnostic Test

1. VERIFY THE DTC IS ACTIVE

Turn the ignition switch on.

With a scan tool, read and record DTCs.

With the scan tool, clear DTCs.

Turn the ignition switch off, and then on.

Using the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK FOR ACTIVE DTC WITH SUNLOAD SENSOR HARNESS CONNECTOR DISCONNECTED**

Turn the ignition off.

Disconnect the Sunload Sensor harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, read HVAC DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 3.

No

Replace the Sunload Sensor in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. **CHECK (L24) AUTO HEADLAMPS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (L24) Auto Headlamps Signal circuit between ground and the A/C Heater Control C1 harness connector.

Does the ohm meter read open circuit?

Yes

Replace the A/C Heater Control in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (L24) Auto Headlamps Signal circuit for a short to ground.
Perform **BODY VERIFICATION TEST - VER 1** .

B1610-AMBIENT LIGHT SENSOR INPUT CIRCUIT PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

• **Set Condition:**

If the Ambient Light Sensor input is out of range.

Possible Causes

Possible Causes
(L24) AUTO HEADLAMPS SIGNAL CIRCUIT OPEN
(L24) AUTO HEADLAMPS SIGNAL CIRCUIT SHORTED TO GROUND
(C121) SENSOR GROUND OPEN
SUNLOAD SENSOR
A/C HEATER CONTROL

Diagnostic Test

1. **ACTIVE DTC(S) PRESENT**

Turn the ignition on.

With the scan tool, check for DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK (L24) AUTO HEADLAMPS SIGNAL CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Disconnect the Sunload Sensor harness connector.

Measure the resistance of the (L24) Auto Headlamps Signal circuit between the Sunload Sensor harness connector and the A/C Heater Control C1 harness connector.

Does the ohm meter read open circuit?

Yes

Repair the (L24) Auto Headlamps Signal circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK (L24) AUTO HEADLAMPS SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (L24) Auto Headlamps Signal circuit in the A/C Heater Control C1 harness connector.

Does the ohm meter read open circuit?

Yes

Go To 4.

No

Repair the (L24) Auto Headlamps Signal circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

4. **CHECK (C121) SENSOR GROUND CIRCUIT FOR AN OPEN**

Measure the resistance of the (C121) Sensor Ground circuit between the Sunload Sensor harness connector and the A/C Heater Control C1 harness connector.

Does the ohm meter read open circuit?

Yes

Repair the (C121) Sensor Ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 5.

5. **CHECK THE SUNLOAD SENSOR**

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

Using the scan tool, observe the Auto Headlamp signal while connecting a jumper wire between the (L24) Auto Headlamps Signal circuit and the (C121) Sensor Ground circuit in the Sunload Sensor harness connector.

Does the Auto Headlamp signal change from approximately 5 volts to 0 volts?

Yes

Replace the Sunload Sensor in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the A/C Heater Control in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1611-AMBIENT LIGHT SENSOR INPUT CIRCUIT HIGH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the Ambient Light Sensor input is out of range toward the high voltage threshold.

Possible Causes

Possible Causes
(L24) AUTO HEADLAMPS SIGNAL CIRCUIT SHORTED TO VOLTAGE SUNLOAD SENSOR A/C HEATER CONTROL

Diagnostic Test

1. **CHECK FOR ACTIVE DTC WITH THE SUNLOAD SENSOR HARNESS CONNECTOR DISCONNECTED**

Turn the ignition off.

Disconnect the Sunload Sensor harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, read HVAC DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

Replace the Sunload Sensor in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK (L24) AUTO HEADLAMPS SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the voltage of the (L24) Auto Headlamps Signal circuit between ground and the A/C Heater Control C1 harness connector.

Is there any voltage present?

Yes

Repair the (L24) Auto Headlamps Signal circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the A/C Heater Control in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B210A-SYSTEM VOLTAGE LOW

Circuit Schematic

0100200

Fig. 56: Fused Run-Start Relay Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition switch on.

Set Conditions

- **Set Condition:**

The A/C Heater Control has detected the system voltage is low.

Possible Causes

Possible Causes
(F943) FUSED RUN-START RELAY OUTPUT CIRCUIT OPEN A/C HEATER CONTROL

Diagnostic Test

1. **VERIFY THE DTC IS ACTIVE**

NOTE: **Diagnose any related Powertrain DTCs before continuing.**

Turn the ignition switch on.

With a scan tool, read and record DTCs.

With the scan tool, clear DTCs.

Turn the ignition switch off, and then on.

Using the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. (F943) FUSED RUN-START RELAY OUTPUT CIRCUIT OPEN

Fig. 57: Using 12 Volt Test Light Connected To Ground To Probe (F943) Fused Run-Start Relay Output Circuit In A/C Heater Control C1 Harness Connector
Courtesy of CHRYSLER LLC

NOTE: Check the related fuses to the Fused Ignition Switch Output (Run-Start) circuit. If the fuse is found to be open repair the circuit for a shorted condition.

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, probe the (F943) Fused Run-Start Relay Output circuit in the A/C Heater Control C1 harness connector.

Does the test light illuminate brightly?

Yes

Go to 3.

No

Repair the (F943) Fused Run-Start Relay Output circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1**.

3. CHECK THE A/C HEATER CONTROL

NOTE: A dirty (partial) ground can cause abnormal conditions within a system. Make sure the module has a good ground before continuing.

Turn the ignition off.

Reconnect the A/C Heater Control C1 harness connector.

While back probing, measure the voltage of the (F943) Fused Run-Start Relay Output circuit in the A/C Heater Control C1 harness connector.

Start the engine.

Using the scan tool, view battery voltage under Data Display in the Engine category.

Compare the voltage on the scan tool to the voltage reading on the voltmeter.

Is the voltage on the scan tool equal to the voltmeter reading within +/- 0.5 volt?

Yes

Replace the A/C Heater Control in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the circuit(s) that indicated the incorrect voltage.
Perform **SKREEM/SKIM VERIFICATION TEST** .

B210B-SYSTEM VOLTAGE HIGH

Circuit Schematic

0100200

Fig. 58: Fused Run-Start Relay Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition switch on.

Set Conditions

- Set Condition:

The A/C Heater Control has detected the system voltage is high.

Possible Causes

Possible Causes
(F943) FUSED RUN-START RELAY OUTPUT CIRCUIT SHORTED TO VOLTAGE A/C HEATER CONTROL

Diagnostic Test

1. ACTIVE DTC(S) PRESENT

Turn the ignition on.

With the scan tool, check for DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK (F943) FUSED RUN-START RELAY OUTPUT CIRCUIT FOR A SHORT TO BATTERY VOLTAGE

Fig. 59: Using Volt Meter Measure Voltage On (F943) Fused Run-Start Relay Output Circuit In A/C Heater Control C1 Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Using a volt meter measure the voltage on the (F943) Fused Run-Start Relay Output circuit in the A/C Heater Control C1 harness connector.

Is there any voltage present?

Yes

Repair the (F943) Fused Run-Start Relay Output circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the A/C Heater Control in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B2214-(HVAC) CLIMATE CONTROL INTERNAL

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C Heater Control has an internal fault. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes

Possible Causes
A/C HEATER CONTROL

Diagnostic Test

1. ACTIVE DTC(S) PRESENT

Turn the ignition on.

With the scan tool, check for DTCs.

Does the scan tool display this DTC as active?

Yes

Replace the A/C Heater Control in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

B222A-VEHICLE LINE MISMATCH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

The A/C Heater Control will receive and monitor the vehicle line message from the PCM and record the vehicle line if different from the last vehicle line.

Possible Causes

Possible Causes
PCM A/C HEATER CONTROL

Diagnostic Test

1. ACTIVE DTC(S) PRESENT

Turn the ignition on.

With the scan tool, check for DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK VEHICLE LINE IN PCM

With the scan tool compare the vehicle line that is programmed into the PCM to the vehicle line of the vehicle.

Does the vehicle line programmed into the PCM match the vehicle?

Yes

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the A/C Heater Control in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace and program the Powertrain Control Module in accordance with the service information. Ensure the PCM is replaced with the correct vehicle line PCM.

Perform **POWERTRAIN VERIFICATION TEST** .

U0010-CAN INTERIOR BUS

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously

Set Conditions

• **Set Condition:**

If the CAN Interior Bus (+) or CAN Interior Bus (-) circuit is open, shorted to voltage, or shorted to ground.

Possible Causes

Possible Causes
ACTIVE CAN BUS DTC IN THE TOTALLY INTEGRATED POWER CONTROL MODULE (D265) CAN C INTERIOR BUS (125K) (+) CIRCUIT OPEN (D264) CAN C INTERIOR BUS (125K) (-) CIRCUIT OPEN A/C HEATER CONTROL

Diagnostic Test

1. **VERIFY THE DTC IS ACTIVE**

Turn the ignition on.

With the scan tool, read HVAC DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

If the DTC is stored, check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK FOR ACTIVE CAN BUS RELATED DTCS IN THE TOTALLY INTEGRATE POWER MODULE (TIPM)

With the scan tool, read the Totally Integrated Power Module (TIPM) DTCs

Does the scan tool display any active CAN BUS related DTCs?

Yes

Diagnose and repair the DTC(s).

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK (D265) CAN INTERIOR BUS (+) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the negative battery cable.

Disconnect the A/C Heater Control C1 harness connector.

Disconnect the Totally Integrated Power Module (TIPM) C7 harness connector.

Measure the resistance of the (D265) CAN Interior Bus (+) circuit between the Totally Integrated Power Module (TIPM) C7 harness connector and the A/C Heater Control C1 harness connector.

Is the resistance below 2.0 ohms?

Yes

Go To 4.

No

Repair the (D265) CAN Interior Bus (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. CHECK (D264) CAN INTERIOR BUS (-) CIRCUIT FOR AN OPEN

Measure the resistance of the (D264) CAN Interior Bus (-) circuit between the Totally Integrated Power Module (TIPM) C7 connector and the A/C Heater Control C1 harness connector.

Is the resistance below 2.0 ohms?

Yes

Go To 5.

No

Repair the (D264) CAN Interior Bus (-) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

5. CHECK (D265) CAN C INTERIOR BUS (+) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (D265) CAN C Interior Bus (125K) (+) circuit in the A/C Heater Control C1 harness connector.

Is the resistance above 1000.0 ohms?

Yes

Go To 6.

No

Repair the (D265) CAN C Interior Bus (+) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

6. CHECK (D264) CAN C INTERIOR BUS (-) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (D264) CAN C Interior Bus (125K) (-) circuit in the A/C Heater Control C1 harness connector.

Is the resistance above 1000.0 ohms?

Yes

Go To 7.

No

Repair the (D264) CAN C Interior Bus (-) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

7. **CHECK (D265) CAN C INTERIOR BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition on.

Measure the voltage of the (D265) CAN C Interior Bus (125K) (+) circuit in the A/C Heater Control C1 harness connector.

Is the voltage below 0.2 volts?

Yes

Go To 8.

No

Repair the (D265) CAN C Interior Bus (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

8. **CHECK (D264) CAN C INTERIOR BUS (-) CIRCUIT FOR A SHORT TO VOLTAGE**

Measure the voltage of the (D264) CAN C Interior Bus (125K) (-) circuit in the A/C Heater Control C1 harness connector.

Is the voltage below 0.2 volts?

Yes

Replace the A/C Heater Control in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (D264) CAN C Interior Bus (-) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

U0141-LOST COMM W/INTEGRATED POWER MODULE/FRONT CONTROL MODULE/TIPM

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C Heater Control loses communication with the Totally Integrated Power Module (TIPM).

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC)

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C Heater Control loses communication with the Occupant Restraint Controller (ORC).

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0154-LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C Heater Control loses communication with the Occupant Classification Module (OCM).

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0155-LOST COMMUNICATION WITH CLUSTER/CCN

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C Heater Control loses communication with the Cluster (CCN).

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0159-LOST COMMUNICATION WITH PARKING ASSIST CONTROL MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C Heater Control loses communication with the Parktronics (PTS).

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0167-LOST COMMUNICATION WITH INTRUSION TRANSCEIVER CONTROL MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C Heater Control loses communication with the Intrusion Transceiver Control Module (ITM).

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0168-LOST COM WITH VEHICLE SECURITY CONTROL MODULE (SKREEM/WCM)

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C Heater Control loses communication with the Vehicle Security Control Module (SKREEM/WCM).

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0169-LOST COMMUNICATION WITH SUNROOF CONTROL MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C Heater Control loses communication with the Sunroof Control Module (SCM).

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0181-LOST COMMUNICATION WITH HEADLAMP LEVELING TRANSLATOR

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C Heater Control loses communication with the Headlamp Leveling Translator.

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0184-LOST COMMUNICATION WITH RADIO

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C Heater Control loses communication with the Radio.

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C Heater Control loses communication with the Amplifier (AMP).

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0187-LOST COMMUNICATION WITH DVD PLAYER

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C Heater Control loses communication with the DVD Player.

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0196-LOST COMMUNICATION WITH VEHICLE ENTERTAINMENT CONTROL MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C Heater Control loses communication with the Vehicle Entertainment System (VES).

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0197-LOST COMMUNICATION WITH HANDS FREE PHONE MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C Heater Control loses communication with the Hands Free Phone Module (HFM).

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0200-LOST COMMUNICATION WITH PASSENGER DOOR MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C Heater Control loses communication with the Passenger Door Module (PDM).

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0201-LOST COMMUNICATION WITH LEFT REAR DOOR MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C Heater Control loses communication with the Left Rear Door Module (LRDM).

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0202-LOST COMMUNICATION WITH RIGHT REAR DOOR MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C Heater Control loses communication with the Right Rear Door Module (LRDM).

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0203-LOST COMMUNICATION WITH DOOR MODULE FRONT LEFT

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C Heater Control loses communication with the Left Front Door Module (LRDM).

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0203-LOST COMMUNICATION WITH DOOR MODULE FRONT RIGHT

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C Heater Control loses communication with the Right Front Door Module (LRDM).

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0209-LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

If the A/C Heater Control loses communication with the Memory Seat Module (MSM).

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

***HVAC SYSTEM TEST**

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

1. HVAC SYSTEM TEST

NOTE: The HVAC System Test consists of four tests. Test 2 tests A/C system performance, Test 3 tests for mode switch, door actuator circuit, and auxiliary coolant pump circuit faults, Test 4 tests for shorted door actuator circuits, and Test 5 tests for door actuator calibration faults. Either perform all four tests for a complete system test or perform an individual test if diagnosing a specific symptom.

NOTE: Active DTCs must be resolved before diagnosing stored DTCs.

Start the engine.

With the scan tool, erase HVAC DTCs.

Choose a diagnostic test to perform

Complete HVAC System Test

Go To step 2.

A/C System Performance Test

Go To step 2.

Mode Switch, Door Actuator Ckt, & Auxiliary Coolant Pump Ckt Test

Go To step 3.

Actuator DTC Detection Test

Go To step 4.

Actuator Calibration Test

Go To step 5.

2. A/C SYSTEM PERFORMANCE TEST

NOTE: The work area ambient temperature must be above 15.6°C (60°F) and the evaporator temperature must be above 18.3°C (65°F) in order to test A/C system performance.

NOTE: Before actuating the Cool down Test, verify that the mode setting is not in a defrost position and that the A/C compressor is not running. If the

compressor is running, turn the A/C off and allow the evaporator to warm up before proceeding with the test.

NOTE: Running the Cool down test will cause the A/C status indicator to flash.

NOTE: One or more status messages will display on the scan tool after running the Cool down Test. These messages will clear after paging back out of this test function. Therefore, it is important to note all messages before doing so.

Set the mode to the Panel position.

Verify that the front blower motor operates correctly in all speeds. Diagnose and repair all blower related faults before proceeding with this test.

Set the front blower speed to high.

With the scan tool in HVAC, select System Tests and then select Cool down test. Allow the test to run to completion.

Does the scan tool display a status message that indicates a fault has occurred?

Yes, Conditions Too Cold - Test Not Run

If running, turn the A/C compressor off. Verify that the work area ambient temperature is above 15.6°C (60°F). If not, move the vehicle to a warmer work area. Verify that the evaporator temperature is above 18.3°C (65°F). If not, set the front blower to high speed and allow the blower to run for five minutes. Then, rerun the Cool down Test.

Yes, Blowers Not On High - Test Not Run

Set the front blower speed to high speed and then rerun the Cool down Test.

Yes, No Results Stored/Test Not Complete

Verify that power is not interrupted while rerunning the Cool down Test.

No

Perform **BODY VERIFICATION TEST - VER 1**.

3. **MODE SWITCH, DOOR ACTUATOR CIRCUIT, & AUXILIARY COOLANT PUMP CIRCUIT TEST**

NOTE: If at anytime a DTC becomes active during this test, proceed to the conclusion question.

NOTE: **If multiple DTCs become active, diagnose those that relate to a short circuit first.**

Set the front blower speed to low.

Set the Blend control to full cold.

Set the Mode control to Bi-Level/Recirc.

If equipped, set the Rear Fan switch on the Rear A/C Heater Control to off.

If equipped, set the Rear Blend switch on the Rear A/C Heater Control to full cold.

Monitor the scan tool for active HVAC DTCs while performing the following test steps.

Press the A/C mode switch on, wait 30 seconds, press it off, and then proceed to the next step.

Press the Rear Defrost mode switch on, wait 30 seconds, press it off, and then proceed to the next step.

Press and hold the Rear Washer mode switch for several seconds, release it, and then proceed to the next step.

Set the Blend control to full hot, wait 30 seconds and then set it to full cold.

Turn the Mode control to every door position. Leave it in each position for 30 seconds.

If equipped, set the Rear Blower control to Rear Control.

If equipped, set the Rear Fan switch on the Rear A/C Heater Control to high speed.

If equipped, slowly turn the Rear Blend switch on the Rear A/C Heater Control to full hot, wait 30 seconds and then turn it back to full cold.

If equipped, turn the Rear Fan switch on the Rear A/C Heater Control to off.

If equipped with rear HVAC, with the scan tool, select the following: Actuators, Auxiliary Coolant Pump, Start, and Constant On. Allow the pump to run for approximately one minute.

Does the scan tool display any active DTCs?

Yes

Diagnose and repair the DTC(s). Refer to **DIAGNOSTIC CODE INDEX** for a complete list of HVAC related symptoms.

No

As necessary, either Go To step 4 or step 5, or perform BODY VERIFICATION TEST - VER 1. Refer to **STANDARD PROCEDURE** (ELECTRICAL DIAGNOSTICS). Refer to **STANDARD PROCEDURE** (SERVICE INFORMATION).

4. ACTUATOR DTC DETECTION TEST

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes

Diagnose and repair the DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of all HVAC related symptoms.

No

Perform **BODY VERIFICATION TEST - VER 1** .

5. ACTUATOR CALIBRATION TEST

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes

Diagnose and repair the DTC(s). Refer to **DIAGNOSTIC CODE INDEX** for a complete list of all HVAC related symptoms.

No

No problem found.

Perform **BODY VERIFICATION TEST - VER 1** .

2008 HVAC

Heating & Air Conditioning - Service Information - Liberty

DESCRIPTION

HEATER AND AIR CONDITIONER SYSTEM

A manual temperature control (MTC) single zone type heating-A/C system or an automatic temperature controlled (ATC) single zone type heating-A/C system is available on this model.

To maintain the performance level of the heating, ventilation and air conditioning (HVAC) system, the engine cooling system must be properly maintained. The use of a bug screen is not recommended. Any obstructions in front of the radiator or A/C condenser will reduce the performance of the A/C and engine cooling systems.

The engine cooling system includes the radiator, thermostat, radiator hoses and the engine coolant pump. Refer to **COOLING** article for more information before opening or attempting any service to the engine cooling system.

Fig. 1: HVAC Housing Assembly
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

All vehicles are equipped with a common heater, ventilation and air conditioning (HVAC) housing assembly (1). The heating-A/C system combines A/C, heating, and ventilating capabilities in a single HVAC housing assembly mounted within the passenger compartment behind the instrument panel. The HVAC housing assembly includes:

- Mode-air doors (2)
- A/C evaporator (3)
- Recirculation door actuator (4)

Air inlet housing (5)
Recirculation-air door (6)
Blower motor (7)
Blower motor resistor (8)
Heater core (9)
Air distribution housing (10)
Blend-air door (11)
Blend door actuator (12)
Floor distribution ducts (13)
Mode door actuator (14)

NOTE: An electric positive temperature coefficient (PTC) heater is used on vehicles when equipped with the 2.8L diesel engine. The PTC heater unit compensates for the lower engine coolant temperatures produced by the diesel engine. The PTC heater unit is mounted in the HVAC air distribution housing, downstream of the heater core. See DESCRIPTION.

Based upon the mode selected, conditioned air can exit the HVAC housing through one or a combination of the three main housing outlets: defrost, panel or floor. The defrost and panel outlets are located on the top of the housing and the floor outlets are located on each side of the housing. Once the conditioned air exits the HVAC housing, it is further directed through molded plastic ducts to the outlets within the vehicle interior. These outlets and their locations are as follows:

Defroster Outlet - Dual defroster outlets are located in the center of the instrument panel top cover, near the base of the windshield.

Side Window Demister Outlets - There are two side window demister outlets, one is located at each outboard end of the instrument panel and are integral to the instrument panel air outlets.

Panel Outlets - There are four panel outlets in the instrument panel, one located near each outboard end of the instrument panel facing the rear of the vehicle and two located near the top of the instrument panel center bezel.

Front Floor Outlets - There are two front floor outlets, one located above each side of the center of the floor panel near the dash panel.

Rear Floor Outlets - There are two rear floor outlets, one located on each side of the floor console near the rear of each front seat.

OPERATION

HEATER AND AIR CONDITIONER SYSTEM

Both the manual temperature control (MTC) and the automatic temperature controlled (ATC) heating-A/C systems are blend-air type systems. In a blend-air system, a blend-air door controls the amount of conditioned air that is allowed to flow through, or around the heater core. This design allows almost immediate control of output air temperature.

Fig. 2: Blend Air System Schematic
Courtesy of CHRYSLER LLC

NOTE: **Typical blend-air type HVAC system shown in graphic.**

The heating-A/C system pulls outside (ambient) air through the fresh air intake (4) located at the cowl panel at the base of the windshield and into the air inlet housing above the heating, ventilation and air conditioning (HVAC) housing and passes through the A/C evaporator (7). Air flow is then directed either through or around the heater core (2). This is done by adjusting the position of the blend-air door (3) with the temperature control located on the A/C-heater control in the instrument panel. Air flow is then directed out the floor outlet (8), instrument panel outlet (10) or the defroster outlet (1) in various combinations by adjusting the position of the mode-air doors (9 and 11) using the mode control located on the A/C-heater control. The temperature and mode control uses electrical actuators to operate the air doors.

The velocity of the air flow out of the outlets can be adjusted with the blower speed control located on the A/C-heater control.

The fresh air intake can be shut off by pressing the Recirculation button on the A/C-heater control. This will operate the electrically actuated recirculation-air door (5), which closes off the fresh air intake. With the fresh air intake closed, the conditioned air within the vehicle is pulled back into the HVAC housing through the recirculation air intake (6).

The A/C compressor can be engaged by pressing the A/C (snowflake) button on the A/C-heater control when the mode control is set in any floor to instrument panel position. The A/C compressor will automatically engage when the mode control is set in any Mix to Defrost position. This is done to help reduce fogging of the front windows by removing humidity from the conditioned air prior to it coming into contact with the windows.

The defroster outlet receives airflow from the HVAC housing through the molded plastic defroster duct. The airflow from the defroster outlet is directed by fixed vanes in the defroster outlet grille and cannot be adjusted.

The side window demister outlets receive airflow from the HVAC housing through the defroster duct and molded plastic demister ducts which are integral to the instrument panel. The airflow from the side window demister outlets is directed by fixed vanes in the demister outlet grilles and cannot be adjusted. The demisters

direct air from the HVAC housing through the outlets located on the top corners of the instrument panel. The demisters operate when the mode control is positioned in the floor-defrost and defrost-only settings. Some air may be noticeable from the demister outlets when the mode control is in the bi-level to floor positions.

The panel outlets receive airflow from the HVAC housing through the center panel duct and the two molded plastic panel ducts, which are integral to the instrument panel. The two end ducts direct airflow to the left and right instrument panel outlets, while the center panel duct directs airflow to the two center panel outlets. Each of these outlets can be individually adjusted to direct the flow of air.

The floor outlets receive airflow from the HVAC housing through the floor distribution ducts. The front floor outlets are integral to the molded plastic floor ducts, which are secured to the sides of the HVAC housing. The floor outlets cannot be adjusted.

NOTE: It is important to keep the air intake opening clear of debris. Leaf particles and other debris that is small enough to pass through the cowl opening screen can accumulate within the HVAC housing. The closed, warm, damp and dark environment created within the housing is ideal for the growth of certain molds, mildews and other fungi. Any accumulation of decaying plant matter provides an additional food source for fungal spores, which enter the housing with the fresh intake-air. Excess debris, as well as objectionable odors created by decaying plant matter and growing fungi can be discharged into the passenger compartment during heater-A/C operation if the air intake opening is not kept clear of debris.

This A/C system uses an A/C expansion valve to meter the flow of refrigerant to the A/C evaporator. The A/C evaporator cools and dehumidifies the incoming air prior to blending it with the heated air. To maintain minimum evaporator temperatures and prevent evaporator freezing, an evaporator temperature sensor is used. The sensor is located downstream of the evaporator and supplies an evaporator temperature signal to the A/C-heater control.

DIAGNOSIS AND TESTING

A/C PERFORMANCE

The A/C system is designed to provide the passenger compartment with low temperature and low humidity air. The A/C evaporator, located in the HVAC housing is cooled to temperatures near the freezing point. As warm damp air passes over the fins of the A/C evaporator, the air transfers its heat to the refrigerant in the evaporator coils and the moisture in the air condenses on the evaporator fins. During periods of high heat and humidity, an A/C system will be more effective in the Recirculation mode (max-A/C). With the system in the Recirculation mode, only air from the passenger compartment passes through the A/C evaporator. As the passenger compartment air dehumidifies, the A/C system performance levels rise.

Humidity has an important bearing on the temperature of the air delivered to the interior of the vehicle. It is important to understand the effect that humidity has on the performance of the A/C system. When humidity is high, the A/C evaporator has to perform a double duty. It must lower the air temperature, and it must lower the temperature of the moisture in the air that condenses on the evaporator fins. Condensing the moisture in the air transfers heat energy into the evaporator fins and coils. This reduces the amount of heat the A/C evaporator can

absorb from the air. High humidity greatly reduces the ability of the A/C evaporator to lower the temperature of the air.

However, evaporator capacity used to reduce the amount of moisture in the air is not wasted. Wringing some of the moisture out of the air entering the vehicle adds to the comfort of the passengers. Although, an owner may expect too much from their A/C system on humid days. A performance test is the best way to determine whether the system is performing up to design standards. This test also provides valuable clues as to the possible cause of trouble with the A/C system. The ambient air temperature in the location where the vehicle will be tested must be a minimum of 21° C (70° F) for this test.

A/C PERFORMANCE TEST

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **WARNING** and **CAUTION**. Failure to follow the warnings and cautions could result in possible serious or fatal injury.

CAUTION: The use of an A/C recycling/charging station for purposes of determining the actual charge level of an A/C system is not recommend. Service recycling/charging stations do not reflect the correct amount of refrigerant charge in the A/C system after a single "reclaim" cycle. Tests have shown that it takes up to 3 or 4 "reclaim" cycles to remove all of the refrigerant charge. Use only the following procedure for determining the proper charge level.

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

1. Check for diagnostic trouble codes using a scan tool. If no DTCs are found in the powertrain control module (PCM) or engine control module (ECM), depending on engine application, go to step 2.
2. Connect a tachometer and a manifold gauge set or an A/C recycling/charging station.
3. Operate the heating-A/C system under the following conditions.
 - Engine at 1,000 rpm at operating temperature
 - Door or windows open
 - Transmission in Park or Neutral with parking brake set (depending on transmission application)
 - A/C-heater controls set to Recirculation mode (max-A/C), full cool, panel mode, high blower and with A/C compressor engaged. If the A/C compressor does not engage, see the A/C SYSTEM DIAGNOSIS chart.
4. Insert a thermometer in the driver side center panel air outlet and operate the vehicle a minimum of ten minutes to allow the thermometer temperature to stabilize.
5. With the A/C compressor clutch engaged, compare the air temperature at the center panel outlet and the A/C compressor discharge pressure (high side) to the A/C PERFORMANCE TEMPERATURE AND PRESSURE chart. The compressor clutch may cycle, depending upon the ambient temperature and humidity. If the clutch cycles, use the readings obtained before the clutch disengaged.

A/C PERFORMANCE TEMPERATURE AND PRESSURE

Ambient Air Temperature	21° C (70° F)	27° C (80° F)	32° C (90° F)	38° C (100° F)	43° C (110° F)
Air Temperature at Center Panel Outlet	7° C (45° F)	7° C (45° F)	13° C (55° F)	13° C (55° F)	18° C (64° F)
Compressor Inlet Pressure at Service Port (Low Side)	138 to 207 kPa (20 to 30 psi)	172 to 241 kPa (25 to 35 psi)	207 to 276 kPa (30 to 40 psi)	241 to 310 kPa (35 to 45 psi)	276 to 345 kPa (40 to 50 psi)
Condenser Outlet Pressure at Service Port (High Side)	1034 to 1724 kPa (150 to 250 psi)	1379 to 2068 kPa (200 to 300 psi)	1724 to 2413 kPa (250 to 350 psi)	1999 to 2689 kPa (290 to 390 psi)	2413 to 2965 kPa (350 to 430 psi)

6. If the air outlet temperature fails to meet the specifications in the A/C Performance Temperature and Pressure chart, or if the A/C compressor discharge pressure is high, refer to the A/C SYSTEM DIAGNOSIS chart.

A/C SYSTEM DIAGNOSIS

Condition	Possible Causes	Correction
Rapid A/C clutch cycling (ten or more cycles per minute).	1. Low refrigerant system charge.	1. See Refrigerant System Leaks in this service information. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system as required.
Equal pressures, but the A/C clutch does not engage.	1. No refrigerant in the refrigerant system.	1. See Refrigerant System Leaks in this service information. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system as required.
	2. Open fuse.	2. Check the fuses in the power distribution center and the junction block. Repair the shorted circuit or component and replace the fuses as required.
	3. Inoperative A/C clutch field coil.	3. See A/C Compressor Clutch in this service information. Test the A/C clutch field coil and replace as required.
	4. Inoperative A/C clutch relay.	4. See A/C Clutch Relay in this service information. Test the A/C clutch relay and relay circuits. Repair the circuits or replace the relay as required.
	5. Improperly installed or inoperative A/C pressure transducer.	5. See A/C Pressure Transducer in this service information. Test the A/C pressure transducer and tighten or replace as required.

-	6. Inoperative evaporator temperature sensor.	6. See Evaporator Temperature Sensor in this service information. Test the evaporator temperature sensor and replace as required.
-	7. Inoperative powertrain control module (PCM) or engine control module (ECM), depending on engine application.	7. Refer to the proper Diagnostic article for testing of the PCM or ECM. Test the PCM or ECM and replace as required.
Normal pressures, but A/C Performance Test air temperatures at center panel outlet are too high.	1. Excessive refrigerant oil in system.	1. See Refrigerant Oil Level in this service information. Recover the refrigerant from the refrigerant system and inspect the refrigerant oil content. Restore the refrigerant oil to the proper level as required.
-	2. Blend door actuator improperly installed or inoperative.	2. See Blend Door Actuator in this service information. Inspect the actuator for proper operation and replace as required.
-	3. Blend-air door inoperative or sealing improperly.	3. See HVAC Housing in this service information. Inspect the blend-air door for proper operation and sealing and correct as required.
The low side pressure is normal or slightly low, and the high side pressure is too low.	1. Low refrigerant system charge.	1. See Refrigerant System Leaks in this service information. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system as required.
-	2. Refrigerant flow through the A/C accumulator is restricted.	2. See A/C Accumulator in this service information. Replace the restricted accumulator as required.
-	3. Refrigerant flow through the A/C evaporator is restricted.	3. See A/C Evaporator in this service information. Replace the restricted A/C evaporator as required.
-	4. Inoperative A/C compressor.	4. See A/C Compressor in this service information. Replace the A/C compressor as required.
The low side pressure is normal or slightly high, and the high side pressure is too high.	1. A/C Condenser air flow restricted.	1. Check the A/C condenser for damaged fins, foreign objects obstructing air flow through the condenser fins, and missing or improperly installed air seals. Clean, repair, or replace components as required.
-	2. Inoperative radiator cooling fan.	2. Test the radiator cooling fan and replace as required.
-	3. Refrigerant system overcharged.	3. See Refrigerant System Charge Level in this service information. Recover the refrigerant from the refrigerant system. Charge the refrigerant system to the proper level as required.
-	4. Air in the refrigerant	4. See Refrigerant System Leaks in this

-	system.	service information. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system as required.
	5. Engine overheating.	5. Test the engine cooling system and repair, if required.
The low side pressure is too high, and the high side pressure is too low. - - -	1. Accessory drive belt slipping.	1. Inspect the accessory drive belt condition and tension. Replace the accessory drive belt and/or tensioner as required.
	2. Inoperative A/C expansion valve.	2. See A/C Expansion Valve in this service information. Test the expansion valve and replace as required.
	3. Inoperative A/C compressor.	3. See A/C Compressor in this service information. Replace the A/C compressor as required.
The low side pressure is too low, and the high side pressure is too high. - -	1. Restricted refrigerant flow through the refrigerant lines.	1. See Liquid Line, Suction Line and A/C Discharge Line in this service information. Inspect the refrigerant lines for kinks, tight bends or improper routing. Correct the routing or replace the refrigerant line as required.
	2. Restricted refrigerant flow through the A/C expansion valve.	2. See A/C Expansion Valve in this service information. Test the expansion valve and replace as required.
	3. Restricted refrigerant flow through the A/C condenser.	3. See A/C Condenser in this service information. Replace the restricted condenser as required.

HEATER PERFORMANCE

Before performing the following tests, refer to **COOLING** article for the procedures to check the engine coolant level and flow, engine coolant reserve/recovery system operation, accessory drive belt condition and tension, radiator air flow and the fan drive operation.

WARNING: Do not remove radiator cap when engine is hot, personal injury can result.

If vehicle has been run recently, wait 15 minutes before removing the radiator cap. Place a rag over the cap and turn it to the first safety stop. Allow pressure to escape through the overflow tube. When the system pressure stabilizes, remove the cap completely.

MAXIMUM HEATER OUTPUT

Engine coolant is delivered to the heater core through two heater hoses. With the engine idling at normal operating temperature, set the temperature control to the full hot position, the mode control to the floor position, and the blower motor control to the highest speed position. Using a test thermometer, check the temperature of the air being discharged at the front floor outlets. Compare the test thermometer reading to the HEATER TEMPERATURE REFERENCE chart.

HEATER TEMPERATURE REFERENCE

Ambient Air Temperature	16° C (60° F)	21° C (70° F)	26° C (80° F)	32° C (90° F)
Minimum Air Temperature at Floor Outlet	52° C (125° F)	56° C (133° F)	59° C (139° F)	62° C (144° F)

If the heater outlet air temperature is below the minimum specification, refer to **COOLING** article . Both of the heater hoses should be hot to the touch. The coolant return heater hose should be slightly cooler than the coolant supply heater hose. If the return hose is much cooler than the supply hose, locate and repair the engine coolant flow obstruction in the cooling system (refer to **COOLING** article for more information).

OBSTRUCTED COOLANT FLOW

Possible locations or causes of obstructed coolant flow are as follows:

- Inoperative water pump.
- Inoperative thermostat.
- Pinched or kinked heater hoses.
- Improper heater hose routing.
- Plugged heater hoses or supply and return ports at the cooling system connections.
- Plugged heater core.

If proper coolant flow through the cooling system is verified, and heater outlet air temperature is low, a mechanical problem may exist.

MECHANICAL PROBLEMS

Possible causes of insufficient heat due to mechanical problems are as follows:

- Obstructed cowl air intake.
- Obstructed heater system outlets.
- Inoperative engine thermostat.
- Inoperative blower motor system.
- Inoperative A/C-heater control.
- Inoperative blend door actuator.
- Inoperative, obstructed or improperly installed blend-air door.

TEMPERATURE CONTROL

If the heater outlet air temperature cannot be adjusted with the temperature control on the A/C-heater control, the following could require service:

- Inoperative A/C-heater control.
- Inoperative blend door actuator.

Inoperative, obstructed or improperly installed blend-air door.

Inoperative related wiring harness or connectors.

Improper engine coolant temperature.

SPECIFICATIONS

A/C SYSTEM

Item	Description	Notes
A/C Compressor	Zexel DKS-17DS (2.8L/4.0L engines)	VC-46 PAG oil
	Visteon HS-18 (3.7L engine)	VC-46 PAG oil
Freeze-up Control	Evaporator temperature sensor	Input to A/C-heater control. HVAC housing mounted.
Pressure Control	A/C pressure transducer	Input to PCM/ECM. A/C liquid line mounted. Cycles clutch off if refrigerant pressure falls below 206 kPa (30 psi) or rises above 2971 kPa (431 psi)
R-134a Refrigerant Charge Capacity	0.510 kg (1.12 lbs.)	Also see A/C Underhood Specification Label located in the engine compartment.
A/C Clutch Coil Draw	3.3 amps @ 12V $\pm$ 0.5V @ 25° C (77° F)	2.8L and 4.0L engines. A/C clutch field coil resistance when measured across coil lead connector is 4.02 ± 0.2 ohms @ 25° C (77° F).
	3.1 - 4 amps @ 12V $\pm$ 0.5V @ 21° C (70° F)	3.7L engine.
A/C Clutch Air Gap	0.30 - 0.60 mm (0.012 - 0.024 in.)	2.8L and 4.0L engines.
	0.35 - 0.65 mm (0.014 - 0.025 in.)	3.7L engine.

CONTROLS

ACTUATOR-BLEND DOOR

DESCRIPTION

ACTUATOR-BLEND DOOR

Fig. 10: Identifying Blend Door Actuator, Integral Wire Connector Receptacle, Integral Mounting Tabs & Output Shaft
Courtesy of CHRYSLER LLC

The heating-A/C system uses a reversible, 12-volt direct current (DC) servo motor which mechanically positions the blend-air door. The blend door actuator (1) is located on the driver side of the HVAC housing.

The blend door actuator is interchangeable with the actuators for the mode-air doors and the recirculation-air door. Each actuator is contained within a black molded plastic housing with an integral wire connector receptacle (2) and integral mounting tabs (3) that allow the actuator to be secured to the HVAC housing. The blend door actuator output shaft (4) is connected to the linkage that drives the blend-air door. The blend door actuator does not require mechanical indexing to the blend-air door, as it is electronically calibrated by the A/C-heater control.

OPERATION

ACTUATOR-BLEND DOOR

The blend door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the HVAC wire harness. The blend door actuator can move the blend-air door in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the blend-air door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the blend-air door moves in the opposite direction. When the A/C-heater control makes the voltage to both connections high or both connections low, the blend-air door stops and will not move.

The A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the blend door actuator and the blend-air door. The A/C-heater control learns the blend-air door stop positions during the actuator calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the blend door actuator circuits (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

The blend door actuator cannot be adjusted or repaired and must be replaced if found inoperative or damaged.

REMOVAL

ACTUATOR-BLEND DOOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: LHD model shown in illustration. RHD model similar.

1. Position the blend door actuator (4) to the actuator mounting bracket (1) located on the driver side of the air distribution housing (4). Make sure the actuator output shaft is properly aligned to the door linkage. If necessary, rotate the actuator slightly to align the splines on the output shaft with those in the door linkage.
2. Install the two screws (5) that secure the blend door actuator to the actuator mounting bracket. Tighten the screws to 1.2 N.m (10 in lbs.).
3. Connect the wire harness connector (3) to the blend door actuator.
4. If equipped, install the silencer below the driver side of the instrument panel. Refer to **INSTALLATION**.
5. Reconnect the negative battery cable.
6. Initiate the Actuator Calibration function using a scan tool. See **DIAGNOSIS AND TESTING**.

ACTUATOR-MODE DOOR

DESCRIPTION

ACTUATOR-MODE DOOR

Fig. 13: Identifying Blend Door Actuator, Integral Wire Connector Receptacle, Integral Mounting Tabs & Output Shaft

Courtesy of CHRYSLER LLC

The heating-A/C system uses a reversible, 12-volt direct current (DC) servo motor which mechanically positions the mode-air door. The mode door actuator (1) is located on the driver side of the HVAC housing.

The mode door actuator is interchangeable with the actuators for the blend-air door and the recirculation-air

door. Each actuator is contained within a black molded plastic housing with an integral wire connector receptacle (2) and integral mounting tabs (3) that allow the actuator to be secured to the HVAC housing. The mode door actuator output shaft (4) is connected to the linkage that drives the mode-air door. The mode door actuator does not require mechanical indexing to the mode-air doors, as it is electronically calibrated by the A/C-heater control.

OPERATION

ACTUATOR-MODE DOOR

The mode door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the HVAC wire harness. The mode door actuator can move the floor, defrost/demist and the panel-air doors in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the mode-air doors will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the mode-air doors moves in the opposite direction. When the A/C-heater control makes the voltage to both connections high or both connections low, the mode-air doors stop and will not move.

The A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the mode door actuator and the mode-air doors. The A/C-heater control learns the mode-air doors stop position during the actuator calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the mode door actuator circuits (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

The mode door actuator cannot be adjusted or repaired and must be replaced if found inoperative or damaged.

REMOVAL

ACTUATOR-MODE DOOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: LHD model shown in illustration. RHD model similar.

1. Position the mode door actuator (2) to the actuator mounting bracket (4) located on the driver side of the air distribution housing (5). Make sure the actuator output shaft is properly aligned to the door linkage. If necessary, rotate the actuator slightly to align the splines on the output shaft with those in the mode door linkage
2. Install the two screws (1) that secure the mode door actuator to the actuator mounting bracket. Tighten the screws to 1.2 N.m (10 in lbs.).
3. Connect the wire harness connector (3) to the mode door actuator.
4. If equipped, install the silencer below the driver side of the instrument panel. Refer to **INSTALLATION**.
5. Reconnect the negative battery cable.
6. Initiate the Actuator Calibration function using a scan tool. See **DIAGNOSIS AND TESTING**.

ACTUATOR-RECIRCULATION DOOR

DESCRIPTION

ACTUATOR-RECIRCULATION DOOR

Fig. 16: Identifying Blend Door Actuator, Integral Wire Connector Receptacle, Integral Mounting Tabs & Output Shaft

Courtesy of CHRYSLER LLC

The heating-A/C system uses a reversible, 12-volt direct current (DC) servo motor which mechanically positions the recirculation-air door. The recirculation door actuator (1) is located on the side of the HVAC air inlet housing.

The recirculation door actuator is interchangeable with the actuators for the blend-air door and the mode-air door. Each actuator is contained within a black molded plastic housing with an integral wire connector receptacle (2) and integral mounting tabs (3) that allow the actuator to be secured to the HVAC housing. The recirculation door actuator output shaft (4) is directly connected to the pivot shaft lever of the recirculation-air door. The recirculation door actuator does not require mechanical indexing to the recirculation-air door, as it is electronically calibrated by the A/C-heater control.

OPERATION

ACTUATOR-RECIRCULATION DOOR

The recirculation door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the HVAC wire harness. The recirculation door actuator can move the recirculation-air door in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the recirculation-air door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the recirculation-air door moves in the opposite direction. When the A/C-heater control makes the voltage to both connections high or both connections low, the recirculation-air door stops and will not move.

The A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the recirculation door actuator and the recirculation-air door. The A/C-heater control learns the recirculation-air door stop positions during the actuator calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the recirculation door actuator circuits (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

The recirculation door actuator cannot be adjusted or repaired and must be replaced if found inoperative or damaged.

REMOVAL

ACTUATOR-RECIRCULATION DOOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

Fig. 17: Recirculation Door Actuator, Screws & Air Inlet Housing

NOTE: LHD model shown in illustration. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. On LHD models, remove the glove box bin. Refer to **REMOVAL** .
3. On RHD models, remove the instrument panel. Refer to **REMOVAL** .
4. Remove the two screws (2) that secure the recirculation door actuator (1) to the air inlet housing (3).
5. Disconnect the wire harness connector from the recirculation door actuator and remove the actuator from the vehicle.

INSTALLATION

ACTUATOR-RECIRCULATION DOOR

Fig. 18: Recirculation Door Actuator, Screws & Air Inlet Housing
 Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Connect the wire harness connector to the recirculation door actuator (1).
2. Position the recirculation door actuator to the side of the air inlet housing (3). Make sure the actuator output shaft is properly aligned to the recirculation door pivot shaft. If necessary, rotate the actuator slightly to engage the splines on the output shaft with those in the pivot shaft.
3. Install the two screws (2) that secure the recirculation door actuator to the air inlet housing. Tighten the screws to 1.2 N.m (10 in lbs.).
4. On RHD models, install the instrument panel. Refer to **INSTALLATION** .
5. On LHD models, install the glove box bin. Refer to **INSTALLATION** .
6. Reconnect the negative battery cable.
7. Initiate the Actuator Calibration function using a scan tool. See **DIAGNOSIS AND TESTING**.

CLUTCH-A/C COMPRESSOR

DESCRIPTION

CLUTCH-A/C COMPRESSOR

Fig. 19: Bolt, Clutch Plate, Pulley Assembly, Stationary Electromagnetic Field Coil, Snap Ring & Shims
Courtesy of CHRYSLER LLC

The A/C system on models equipped with the 2.8L and 4.0L engine use a Zexel DKS-17DS A/C compressor. The clutch assembly for this A/C compressor consists of a stationary electromagnetic field coil (4), bearing and pulley assembly (3), shims (6), and a clutch plate (2) that is splined to the compressor shaft and secured by a bolt (1). These components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt.

The A/C clutch field coil is pressed onto the front of this A/C compressor and cannot be serviced separately from the compressor. The A/C clutch bearing and pulley assembly is retained to the front of the compressor by a snap ring (5) and can be serviced separately.

CLUTCH-A/C COMPRESSOR

812295b1

Fig. 20: A/C Compressor Clutch Components
Courtesy of CHRYSLER LLC

The A/C system on models equipped with the 3.7L engine use the Visteon HS-18 A/C compressor. The clutch assembly for this A/C compressor consists of a stationary electromagnetic field coil (4), bearing and pulley assembly (3), shims (7), and a clutch plate (2) that is splined to the compressor shaft and secured by a bolt (1). These components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt.

The A/C clutch field coil is pressed onto the front of this A/C compressor and retained with a snap ring (6). The A/C clutch bearing and pulley assembly is also retained to the front of this compressor by a snap ring (5). Both the A/C clutch bearing and pulley assembly and the field coil can be serviced separately.

OPERATION

CLUTCH-A/C COMPRESSOR

The A/C compressor clutch components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt. When the electromagnetic A/C clutch field coil is energized, it magnetically draws the clutch plate into contact with the clutch pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub bearing, which is part of the pulley assembly.

A/C compressor clutch engagement is controlled by the powertrain control module (PCM) or the engine control module (ECM), depending on engine application. When the A/C-heater control is set to any A/C position, it sends a request signal on the CAN-B bus to the totally integrated power module (TIPM), which then transfers the request on the CAN-C Bus to the PCM/ECM, which determines if operating conditions are correct for A/C clutch engagement. When all operating conditions have been met, the PCM/ECM sends a signal on a dedicated hard-wired circuit back to the totally integrated power module (TIPM) to energize the internal A/C clutch high side driver. When energized, the A/C clutch high side driver provides battery current to the A/C clutch field coil.

The A/C clutch control system is diagnosed using a scan tool (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article or appropriate Engine ELECTRICAL DIAGNOSTICS article for more information).

The A/C compressor clutch components cannot be adjusted or repaired and must be replaced if found inoperative or damaged.

DIAGNOSIS AND TESTING

CLUTCH-A/C COMPRESSOR

The A/C compressor clutch coil electrical circuit is controlled by the powertrain control module (PCM) or the engine control module (ECM) (depending on engine application) through the totally integrated power module (TIPM). See **OPERATION**. Begin testing of a suspected compressor clutch coil problem by performing the preliminary checks.

PRELIMINARY CHECKS

1. Using a scan tool, check for diagnostic trouble codes (DTCs) in the A/C-heater control, TIPM and the PCM/ECM. If no DTCs are found, go to step 2. If any DTCs are found, repair as required.
2. If the A/C compressor clutch still will not engage, verify the refrigerant charge level. See **DIAGNOSIS AND TESTING**. If the refrigerant charge level is OK, go to step 3. If the refrigerant charge level is not OK, adjust the refrigerant charge as required.
3. If the A/C compressor clutch still will not engage, disconnect the wire harness connector from the A/C pressure transducer and check for battery current at the connector with the engine running and the A/C-heater control set to the A/C mode. If OK, go to **COIL CURRENT DRAW TEST**, and/or **COIL RESISTANCE TEST - 2.8L AND 4.0L ENGINES ONLY**.

COIL CURRENT DRAW TEST

1. Verify the battery state of charge. Refer to **DIAGNOSIS AND TESTING**.
2. Connect an ammeter (0 to 10 ampere scale selected) in series with the clutch field coil feed terminal.

- Connect a voltmeter (0 to 20 volt scale selected) to measure voltage across the battery and the clutch coil.
3. With the A/C-heater control in the A/C mode and the blower motor at low speed, start the engine and allow it to run at a normal idle speed.
 4. The A/C clutch should engage immediately, and the clutch field coil supply voltage should be within two volts of the battery voltage. If the field coil supply voltage is OK, go to step 5. If the field coil supply voltage is not within two volts of battery voltage, test the clutch field coil feed circuit for excessive voltage drop and repair as necessary.
 5. Refer to the following A/C CLUTCH FIELD COIL SPECIFICATIONS chart for the acceptable A/C clutch field coil current draw. If voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until voltage reads below 12.5 volts.
 - If the A/C clutch field coil current reading is zero, the coil is open and must be replaced.
 - If the A/C clutch field coil current reading is above specifications, the coil is shorted and must be replaced.

COIL RESISTANCE TEST - 2.8L AND 4.0L ENGINES ONLY

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the A/C clutch field coil connector.
3. Use an ohmmeter and measure the resistance of the clutch field coil at the field coil connector terminals.
4. Refer to the following A/C CLUTCH FIELD COIL SPECIFICATIONS chart for the acceptable A/C clutch coil resistance.
 - If the A/C clutch coil resistance reading is above specifications, the coil is shorted and must be replaced.
 - If the A/C clutch coil resistance reading is below specifications, the coil is open and must be replaced.

A/C CLUTCH FIELD COIL SPECIFICATIONS

A/C Compressor	Current Draw	Coil Resistance
Zexel DKS-17DS (2.8L/4.0L engines)	3.3 amps @ 12V ± 0.5V @ 25° C (77° F)	4.02 ± 0.2 ohms @ 25° C (77° F)
Visteon HS-18 (3.7L engine)	3.1 - 4 amps @ 12V ± 0.5V @ 21° C (70° F)	Not applicable

STANDARD PROCEDURE

CLUTCH-A/C COMPRESSOR

NOTE: The A/C clutch can be serviced in the vehicle. The refrigerant system can remain fully-charged during compressor clutch, pulley and bearing assembly, or coil replacement.

81229afa

Fig. 21: Identifying Compressor Shaft, Clutch Plate & Shim
Courtesy of CHRYSLER LLC

Examine the friction surfaces of the pulley and the clutch plate (2) for wear. The pulley and clutch plate should be replaced if there is excessive wear or scoring.

If the friction surfaces are oily, inspect the shaft and nose area of the A/C compressor (1) for refrigerant oil. If refrigerant oil is found, the compressor shaft seal is leaking and the A/C compressor must be replaced.

Check the pulley bearing for roughness or excessive leakage of grease. Replace the pulley and bearing assembly, if required.

CLUTCH-A/C COMPRESSOR

After a new A/C compressor clutch has been installed, cycle the compressor clutch approximately 20 times (5 seconds on, then 5 seconds off). During this procedure, set the A/C-heater controls to the A/C Recirculation Mode, the blower motor in the highest speed position, and the engine speed at 1500 to 2000 rpm. This procedure (burnishing) will seat the opposing friction surfaces and provide a higher compressor clutch torque capability.

REMOVAL

CLUTCH-A/C COMPRESSOR

NOTE: The compressor clutch assembly can be serviced with the refrigerant system fully-charged.

Fig. 22: Strap Wrench, Bolt, Clutch Plate, A/C Compressor & Clutch Field Coil Connector
Courtesy of CHRYSLER LLC

1. Disconnect and isolate negative battery cable.
2. Remove the accessory drive belt. Refer to **REMOVAL** .
3. Disconnect the engine wire harness from the clutch field coil connector (4).
4. Remove the bolts that secure the A/C compressor (4) to the mounting bracket. See **REMOVAL**.
5. Remove the A/C compressor from the mounting bracket and support the compressor while servicing the clutch.
6. Using a strap wrench (1), remove the bolt (2) that secures the clutch plate (3) to the compressor shaft.

NOTE: The clutch plate can be removed from the compressor shaft by hand or, if required, pressed off with an 8 x 1.25 mm bolt.

NOTE: Clutch plate shim(s) may remain inside the hub of the clutch plate. Be sure to remove all of the shims from inside the hub or from the end of the compressor shaft.

7. Remove the clutch plate and shim(s) from the A/C compressor. If required, install a 8 x 1.25 mm bolt into the center of the clutch plate and turn the bolt clockwise until the clutch plate is completely removed from the A/C compressor.

Fig. 23: Using Snap Ring Pliers To Remove/Install Snap Ring That Secures Pulley And Bearing Assembly To Front Of A/C Compressor
Courtesy of CHRYSLER LLC

8. Using snap ring pliers (Special Tool 9764 or equivalent) (1), remove the snap ring (2) that secures the pulley and bearing assembly (3) to the front of the A/C compressor (4).

81715a57

Fig. 24: Pulley & Bearing - KJ Visteon Compressor
Courtesy of CHRYSLER LLC

NOTE: The pulley and bearing assembly can be removed from the compressor by hand or, if required, with a two jaw puller.

9. Remove the pulley and bearing assembly (1) from the front of the A/C compressor (2). If required, install a two jaw puller (3) and turn the puller center-bolt clockwise until the pulley and bearing assembly is completely removed.

81715a56

Fig. 25: Locating Field Coil Wire Lead - KJ Visteon Compressor
Courtesy of CHRYSLER LLC

10. Remove the screw (1) that secures the clutch field coil wire lead bracket (2) to the A/C compressor (3).

Fig. 26: Using Compressor Field Coil Remover And Two Jaw Puller To Remove Clutch Field Coil From Front Of A/C Compressor
Courtesy of CHRYSLER LLC

11. Using compressor field coil remover (Special Tool 9354 in Kit 9349) (1) and a two jaw puller (2), remove the clutch field coil (3) from the front of the A/C compressor (4).

CLUTCH-A/C COMPRESSOR

NOTE: The compressor clutch plate and pulley and bearing assembly and can be serviced with the refrigerant system fully-charged and with the A/C compressor installed on the engine.

NOTE: Typical A/C compressor and clutch assembly shown in illustrations.

81229afc

Fig. 27: Locating A/C Compressor Shaft Bolt

Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the coolant recovery container from the front of the engine compartment. Refer to **REMOVAL** .
3. Remove the radiator fan and shroud assembly. Refer to **REMOVAL** .
4. Remove the accessory drive belt. Refer to **REMOVAL** .
5. Disconnect the engine wire harness from the compressor clutch field coil connector (1) located on the top of the A/C compressor (5).
6. Remove the screw that secures the connector bracket (2) to the A/C compressor and position the bracket

and wire lead out of the way.

NOTE: A band-type oil filter wrench or a strap wrench may be used to hold the clutch plate from turning during compressor shaft bolt removal.

7. Hold the clutch plate (4) from turning and remove the compressor shaft bolt (3).

81229afa

Fig. 28: Identifying Compressor Shaft, Clutch Plate & Shim
Courtesy of CHRYSLER LLC

CAUTION: Do not pry between the clutch plate and the pulley and bearing assembly to remove the clutch plate from the compressor shaft as

this may damage the clutch plate.

NOTE: Use care not to lose any clutch shim(s) during removal of the clutch plate, as they may be reused during the clutch plate installation process.

8. Tap the clutch plate (2) lightly with a plastic mallet to release it from the splines on the compressor shaft (1) and remove the clutch plate and shim(s) (3).

Fig. 29: PULLEY AND SNAP RING
Courtesy of CHRYSLER LLC

NOTE: The pulley and bearing assembly can be removed from the compressor by hand or, if required, with a two jaw puller.

9. Using Snap Ring Pliers 9764 or equivalent (1), remove the snap ring (2) that secures the pulley and bearing assembly (3) to the front of the A/C compressor (4).
10. Remove the pulley and bearing assembly from the front of the A/C compressor. If required, install a two jaw puller and turn the puller center-bolt clockwise until the pulley and bearing assembly is completely removed.

INSTALLATION

CLUTCH-A/C COMPRESSOR

NOTE: Typical A/C compressor and clutch assembly shown in illustrations.

81229b4a

Fig. 30: Installing Pulley & Bearing Assembly
Courtesy of CHRYSLER LLC

CAUTION: Be certain to position the compressor clutch field coil wire lead so that it is not damaged during A/C compressor pulley and bearing installation.

CAUTION: When installing the pulley and bearing assembly, DO NOT mar the friction surfaces of the pulley or premature failure of the clutch will result.

1. Install the pulley and bearing assembly (1) onto the front of the A/C compressor. If necessary, tap the pulley gently with a block of wood (2) placed on the pulley friction surface.

Fig. 31: PULLEY AND SNAP RING
Courtesy of CHRYSLER LLC

CAUTION: The snap ring must be fully and properly seated in the groove or it will vibrate out, resulting in a clutch failure and severe damage to the A/C compressor.

NOTE: A new snap ring must be used to secure the pulley and bearing assembly to the A/C compressor. The bevel side of the snap ring must face outward.

2. Using Snap Ring Pliers 9764 or equivalent (1), install the snap ring (2) that secures the pulley and bearing assembly (3) to the front of the A/C compressor (4). Be certain that the snap ring is fully and properly seated in the groove.

81229afa

Fig. 32: Identifying Compressor Shaft, Clutch Plate & Shim
Courtesy of CHRYSLER LLC

3. If the original clutch plate (2) and pulley and bearing assembly are to be reused, reinstall the original shim (s) (3) onto the compressor shaft (1). If a new clutch plate and pulley and bearing assembly are being used, install a trial stack of shims 1.50 mm (0.059 in.) thick onto the compressor shaft.

Fig. 33: Locating A/C Compressor Shaft Bolt
Courtesy of CHRYSLER LLC

4. Install the clutch plate (4) onto the front of the A/C compressor (5).
5. Install the compressor shaft bolt (3). Tighten the bolt to 20 N.m (177 in. lbs.).

NOTE: The shims may compress after tightening the shaft bolt. Check the air gap in four or more places to verify the air gap is correct. Spin the pulley before performing a final check of the air gap.

NOTE: On models with the clutch plate recessed into the pulley, use a 90° wire gap gauge to measure the clutch air gap. On other models, use a blade type feeler gauge to measure the air gap.

6. With the clutch plate assembled tight against the shim(s), measure the air gap between the clutch plate and the pulley and bearing assembly. The air gap should be between 0.30 - 0.60 mm (0.012 - 0.024 in.). If the air gap is not between specifications, add or subtract shims as needed until the correct air gap is obtained.

CAUTION: Be certain that the compressor clutch field coil wire lead is routed so that it is not pinched between the A/C compressor and the field coil connector bracket.

7. Carefully route the compressor clutch field coil wire lead and install the connector bracket (2) and retaining screw onto the A/C compressor. Tighten the screw to 4.3 N.m (38 in. lbs.).
8. Connect the engine wire harness to the compressor clutch field coil connector (1).
9. Install the accessory drive belt. Refer to **INSTALLATION** .
10. Install the radiator and fan shroud assembly. Refer to **INSTALLATION** .
11. Install the coolant recovery container. Refer to **REMOVAL** .
12. Reconnect the negative battery cable.

CLUTCH-A/C COMPRESSOR

81716552

Fig. 34: Field Coil Installation - KJ Visteon Compressor
Courtesy of CHRYSLER LLC

1. Position the A/C clutch field coil (1) squarely onto the front of the A/C compressor (2).

CAUTION: Position the A/C clutch field coil so that the coil positioning tabs and the wire harness lead are oriented in the correct direction. Failure to correctly position the field coil on the A/C compressor will result in field coil damage.

2. Align the field coil positioning tabs to the recessed area at the front of the A/C compressor and install the clutch field coil onto the compressor using a two jaw puller (3), compressor field coil installer (Special Tool 9352 in Kit 9349) (4) and the compressor field coil installer spacer (Special Tool 9353 in Kit 9349) (5).

81715a56

Fig. 35: Locating Field Coil Wire Lead - KJ Visteon Compressor
Courtesy of CHRYSLER LLC

3. Position the clutch field coil wire lead and bracket (2) to the A/C compressor (3) and install the screw (1) that secures the bracket to the compressor. Tighten the screw to 4 N.m (35 in. lbs.).

81716551

Fig. 36: Installing Pulley & Bearing - KJ Visteon Compressor
Courtesy of CHRYSLER LLC

4. Align the pulley and bearing assembly (1) squarely onto the front of the A/C compressor (2).

NOTE: A distinct change of sound during the clutch pulley tapping process indicates that the pulley and bearing assembly has bottomed out against the compressor housing.

5. Using clutch pulley installer (Special Tool 9355 in Kit 9349) (3) and a hammer (4), install the pulley and bearing assembly onto the front of the A/C compressor. Tap the installer with a hammer until the pulley and bearing assembly has bottomed against the compressor housing.

Fig. 37: Using Snap Ring Pliers To Remove/Install Snap Ring That Secures Pulley And Bearing Assembly To Front Of A/C Compressor
Courtesy of CHRYSLER LLC

CAUTION: If the snap ring is not fully seated in the groove it will vibrate out, resulting in clutch failure and severe damage to the A/C compressor.

NOTE: Install the snap ring with the beveled side of the snap ring facing outward.

6. Using snap ring pliers (Special Tool 9764 or equivalent) (1), install the snap ring (2) that secures the pulley and bearing assembly (3) to the front of the A/C compressor (4). Make sure the snap ring is properly seated in the groove.

Fig. 38: Installing Clutch Bolt - KJ Visteon Compressor
Courtesy of CHRYSLER LLC

7. Verify that there is adequate clearance for the clutch field coil wire lead (1) between the housing of the A/C compressor (2) and the pulley and bearing assembly (3).

NOTE: When installing an original or a new clutch assembly, try the original shims first. When installing a clutch onto a compressor that previously did not have a clutch, use the 1.0, 0.50 and 0.13 millimeter (0.040, 0.020 and 0.005 inch) shims from the clutch hardware package which is provided with the new clutch.

8. Install the clutch shims onto the compressor shaft.
9. Using a strap wrench (4), install the bolt (5) that secures the clutch plate (6) to the A/C compressor. Hold the clutch plate stationary with the strap wrench and tighten the bolt to 15 N.m (133 in. lbs.).

8171654f

Fig. 39: Locating Clutch Air Gap - KJ Visteon Compressor
Courtesy of CHRYSLER LLC

10. Using 90° wire gauges (1), check the air gap between the clutch plate (2) and the pulley and bearing assembly (3). If the air gap is not between 0.35 to 0.65 millimeter (0.014 to 0.025 inch), add or subtract shims as required.
11. Position the A/C compressor onto the mounting bracket.
12. Install the bolts that secure the A/C compressor to the mounting bracket. See **INSTALLATION**.
13. Connect the engine wire harness to the compressor clutch field coil connector.
14. Install the accessory drive belt (Refer to **BELT-ACCESSORY DRIVE**).
15. Reconnect the negative battery cable.
16. Perform the Clutch Break-in Procedure. See **STANDARD PROCEDURE**.

CONTROL-A/C HEATER

DESCRIPTION

AUTOMATIC SINGLE ZONE

Fig. 40: A/C-Heater Control Assembly
Courtesy of CHRYSLER LLC

The A/C-heater control for the automatic temperature control (ATC) single zone system maintains the interior comfort level desired by the vehicle operator. This is accomplished by use of an infrared sensor located in the front overhead console that measures the surface temperature of the driver and front seat passengers. Based on the sensors input, the system automatically adjusts the air temperature, airflow volume, airflow distribution and amount of inside air recirculation to maintain occupant comfort, even under changing outside weather conditions. All controls are identified by ISO graphic symbols.

This ATC system offers several manual override features such as fan speed, airflow distribution and when the outside air contains smoke, odors, high humidity, or if rapid cooling is desired, the interior conditioned air can be recirculated within the vehicle.

The heating-A/C system uses electrically operated controls. These controls provide the vehicle operator with a number of setting options to help control the climate and comfort within the vehicle.

The A/C-heater control and integral computer (1) is located in the instrument panel and contains:

- a rotary control for manual and automatic blower motor speed selection and for turning the heating-A/C system on and off (2). This control also contains a push button function for recirculating the conditioned air. The control contains an indicator lamp that illuminates when the heating-A/C system is in recirculation mode.

- a rotary control for temperature control of the discharged air (3). This control also contains a push button function for manually turning the A/C system on and off. The control contains an indicator lamp that illuminates when the A/C system is in operation.

- a rotary control for manual and automatic mode control of the discharged air (4). This control also contains a push button function for turning the rear window defogger system on and off. The control contains an indicator lamp that illuminates when the rear window defogger system is in operation.

The A/C-heater control for the ATC heating and A/C system obtains vehicle speed, engine speed, engine coolant temperature, ambient temperature and refrigerant system head pressure data from the CAN-IHS bus and is diagnosed using a scan tool (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

Prior to replacing an A/C-heater control, check for any diagnostic trouble codes (DTCs) related to the heating-A/C system and run the Actuator Calibration function using a scan tool to verify that the concern is not a system issue. See **DIAGNOSIS AND TESTING**.

The A/C-heater control cannot be adjusted or repaired and must be replaced if inoperative or damaged.

CONTROL-A/C HEATER

81d5f14a

Fig. 41: AC Heater Control Components
Courtesy of CHRYSLER LLC

The A/C-heater control (1) for the manual temperature control (MTC) single zone heating-A/C system allows one temperature setting for the entire vehicle. All controls are identified by ISO graphic symbols.

The A/C-heater control and integral computer is located in the instrument panel and contains:

- a rotary control for fan speed selection and for turning the heating-A/C system on and off (2). This control also contains a push button function for recirculating the conditioned air. The control contains an indicator lamp that illuminates when the heating-A/C system is in recirculation mode.

- a rotary control for temperature control of the discharged air (3). This control also contains a push button function for turning the A/C system on and off. The control contains an indicator lamp that illuminates when the A/C system is in operation.

- a rotary control for mode control of the discharged air (4). This control also contains a push button function for turning the rear window defogger system on and off. The control contains an indicator lamp that illuminates when the rear window defogger system is in operation.

The A/C-heater control for this heating and A/C system is diagnosed using a scan tool (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

Prior to replacing an A/C-heater control, check for any diagnostic trouble codes (DTCs) related to the heating-A/C system and run the Actuator Calibration function using a scan tool to verify that the concern is not a system issue. See **DIAGNOSIS AND TESTING**.

The A/C-heater control cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

CONTROL-A/C HEATER

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

Fig. 42: A/C Heater Control - R and I
Courtesy of CHRYSLER LLC

NOTE: MTC A/C-heater control shown in illustration. ATC control similar.

1. Disconnect and isolate the negative battery cable.
2. Remove the center bezel from the instrument panel and place it on a workbench. Refer to **REMOVAL**.
3. Remove the four screws (1) that secure the A/C-heater control (2) to the instrument panel center bezel (3) and remove the control.

INSTALLATION

CONTROL-A/C HEATER

Fig. 43: A/C Heater Control - R and I
 Courtesy of CHRYSLER LLC

NOTE: MTC A/C-heater control shown in illustration. ATC control similar.

1. Install the A/C-heater control (2) onto the back of the instrument panel center bezel (3).
2. Install the four screws (1) that secure the A/C-heater control to the center bezel. Tighten the screws to 1.2 N.m (10 in. lbs.).
3. Position the center bezel to the instrument panel and connect the wire harness connectors to the back of the A/C-heater control.
4. Connect the wire harness connectors to the accessory switches and install the center bezel. Refer to **INSTALLATION** .
5. Reconnect the negative battery cable.

NOTE: The A/C-heater control will automatically perform the Actuator Calibration function when the ignition is initially turned on when installing a new control or when reinstalling the original control. However, the Actuator Calibration function must be manually initiated using a scan tool if the A/C-heater control has been previously installed in another vehicle (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

6. If required, initiate the Actuator Calibration function using a scan tool. See **DIAGNOSIS AND TESTING**.

MODULE-POWER-BLOWER MOTOR

DESCRIPTION

DESCRIPTION

81b872ad

Fig. 44: Power-Blower Motor Module
Courtesy of CHRYSLER LLC

A blower motor power module is used on this model when equipped with the automatic temperature control (ATC) heating-A/C system. Models equipped with the manual temperature control (MTC) heating-A/C system use a blower motor resistor, instead of the blower motor power module. See **DESCRIPTION**.

The blower motor power module is mounted to the rear of the HVAC housing, directly behind the glove box. The blower motor power module consists of a molded plastic mounting plate (1) with an integral connector receptacle (2). Concealed behind the mounting plate is the power module electronic circuitry and a finned aluminum heat sink (3). The blower motor power module is accessed for service from under the instrument panel.

The blower motor power module is accessed for service through the glove box opening.

OPERATION

MODULE-POWER-BLOWER MOTOR

The blower motor power module is connected to the vehicle electrical system through a dedicated lead and connector. A second lead and connector is connected to the blower motor. The blower motor power module allows the microprocessor-based automatic temperature control (ATC) A/C-heater control to calculate and provide infinitely variable blower motor speeds based upon either manual blower switch input or the ATC programming using a pulse width modulated (PWM) circuit strategy.

The PWM voltage is applied to a comparator circuit which compares the PWM signal voltage to the blower motor feedback voltage. The resulting output drives the power module circuitry, which provides a linear output voltage to change or maintain the desired blower speed.

The blower motor power module is diagnosed using a scan tool (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

The blower motor power module cannot be adjusted or repaired must be replaced if inoperative or damaged.

REMOVAL

MODULE-POWER-BLOWER MOTOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

WARNING: The heat sink for the blower motor power module may get very hot during normal operation. If the blower motor was turned on prior to servicing the blower motor power module, wait five minutes to allow the heat sink to cool before performing diagnosis or service. Failure to take this precaution can result in possible personal injury.

Fig. 45: HVAC Housing, Screws, Blower Motor Power Module & Wire Harness Connectors

NOTE: LHD model shown in illustration. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Lower the glove box door.
3. Disconnect the two wire harness connectors (4) from the blower motor power module (3).
4. Remove the two screws (2) that secure the blower motor power module to the HVAC housing (1) and remove the power module.

INSTALLATION

MODULE-POWER-BLOWER MOTOR

81b872a2

Fig. 46: HVAC Housing, Screws, Blower Motor Power Module & Wire Harness Connectors
 Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Position the blower motor power module (3) into the HVAC housing (1).
2. Install the two screws (2) that secure the blower motor power module to the HVAC housing. Tighten the screws to 1.2 N.m (10 in. lbs.).
3. Connect the wire harness connectors (4) to the blower motor power module.
4. Close the glove box door.
5. Reconnect the negative battery cable.

RESISTOR-BLOWER MOTOR

DESCRIPTION

RESISTOR-BLOWER MOTOR

81b84158

Fig. 47: Mounting Plate, Integral Wire Connector Receptacle & Metal Housing
Courtesy of CHRYSLER LLC

A blower motor resistor is used on vehicles equipped with the manual temperature control (MTC) heating-A/C system. Vehicles equipped with the automatic temperature control (ATC) heating-A/C system use a blower motor power module, instead of the blower motor resistor. See **DESCRIPTION**.

The blower motor resistor is mounted to the rear of the HVAC housing, directly behind the glove box. The blower motor resistor consists of a molded plastic mounting plate (1) with an integral wire connector receptacle (2). Concealed behind the mounting plate is the resistor circuit board located within a metal housing (3).

The blower motor resistor is accessed for service through the glove box opening.

OPERATION

RESISTOR-BLOWER MOTOR

The blower motor resistor is connected to the vehicle electrical system through a dedicated wire lead and connector of the HVAC wire harness. The blower motor resistor has multiple resistor circuits, each of which will reduce the current flow through the blower motor to change the blower motor speed.

The blower motor control in the MTC heating-A/C system directs the ground path for the blower motor through the correct resistor circuit to obtain the selected speed. With the blower motor control in the lowest speed position, the ground path for the blower motor is applied through all of the resistor circuits. Each higher speed selected with the blower motor control applies the blower motor ground path through fewer of the resistor circuits, increasing the blower motor speed. When the blower motor control is in the highest speed position, the blower motor resistor is bypassed and the blower motor receives a direct path to ground.

The blower motor resistor cannot be adjusted or repaired and it must be replaced if found inoperative or damaged.

DIAGNOSIS AND TESTING

RESISTOR-BLOWER MOTOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: For circuit descriptions and diagrams, refer to **SYSTEM WIRING DIAGRAMS** article and **WIRING DIAGRAM INFORMATION** article . The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location

views for the various wire harness connectors, splices and grounds.

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the blower motor resistor. See **REMOVAL**.
3. Using an ohmmeter, check for continuity between all of the blower motor resistor terminals. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor speed control and the blower motor resistor or blower motor as required. If not OK, replace the inoperative blower motor resistor.

REMOVAL

RESISTOR-BLOWER MOTOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

WARNING: The blower motor resistor may get very hot during normal operation. If the blower motor was turned on prior to servicing the blower motor resistor, wait five minutes to allow the blower motor resistors to cool before performing diagnosis or service. Failure to take this precaution can result in possible personal injury.

Fig. 48: Blower Motor Resistor, Wire Harness Connector, Screws & HVAC Housing
Courtesy of CHRYSLER LLC

NOTE: Typical resistor shown in illustration. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Lower the glove box door.
3. Disconnect the wire harness connector (2) from the blower motor resistor (1).
4. Remove the two screws (3) that secure the blower motor resistor to the HVAC housing (4) and remove the resistor.

INSTALLATION

RESISTOR-BLOWER MOTOR

Fig. 49: Blower Motor Resistor, Wire Harness Connector, Screws & HVAC Housing
Courtesy of CHRYSLER LLC

NOTE: Typical resistor shown in illustration. RHD model similar.

1. Position the blower motor resistor (1) into the HVAC housing (4).
2. Install the two screws (3) that secure the blower motor resistor to the HVAC housing. Tighten the screws to 1.2 N.m (10 in. lbs.).
3. Connect the wire harness connector (2) to the blower motor resistor.
4. Close the glove box door.
5. Reconnect the negative battery cable.

SENSOR-EVAPORATOR TEMPERATURE

DESCRIPTION

SENSOR-EVAPORATOR TEMPERATURE

812b0cc6

Fig. 50: Sensor-Evaporator Temperature
Courtesy of CHRYSLER LLC

NOTE: Typical evaporator temperature sensor shown in graphic.

The evaporator temperature sensor (1) measures the temperature of the conditioned air downstream of the A/C evaporator (2). The evaporator temperature sensor is an electrical thermistor within a molded plastic case that is inserted into rear the HVAC housing (3) near the coldest point of the A/C evaporator. Two terminals within the connector receptacle (4) connect the sensor to the vehicle electrical system through a wire lead and connector of the instrument panel wire harness.

The external location of the evaporator temperature sensor allows the sensor to be removed or installed without disturbing the refrigerant in the A/C system.

OPERATION

SENSOR-EVAPORATOR TEMPERATURE

The evaporator temperature sensor monitors the temperature of the conditioned air downstream of the A/C evaporator and supplies an input signal to the A/C-heater control. The A/C-heater control uses the evaporator temperature sensor input signal to optimize A/C system performance and to protect the A/C system from evaporator freezing. The evaporator temperature sensor will change its internal resistance in response to the temperatures it monitors and is connected to the A/C-heater control through sensor ground circuit and a 5-volt reference signal circuit. As the temperature of the A/C evaporator decreases, the internal resistance of the evaporator temperature sensor decreases.

The A/C-heater control uses the monitored voltage reading as an indication of evaporator temperature. The A/C-heater control is programmed to respond to this input by requesting the powertrain control module (PCM) or the engine control module (ECM) (depending on engine application) to cycle the A/C compressor clutch as necessary to optimize A/C system performance and to protect the A/C system from evaporator freezing.

The evaporator temperature sensor is diagnosed using a scan tool. See **DIAGNOSIS AND TESTING**.

The evaporator temperature sensor cannot be adjusted or repaired and must be replaced if found inoperative or damaged.

REMOVAL

SENSOR-EVAPORATOR TEMPERATURE

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: Illustration shown with instrument panel removed for clarity.

NOTE: LHD model shown in illustration. RHD model similar.

1. Install the evaporator temperature sensor (1) into rear of the HVAC housing (2) and connect the instrument panel wire harness connector.
2. Install the instrument panel. Refer to **INSTALLATION**.
3. Reconnect the negative battery cable.

SENSOR-INFRARED

DESCRIPTION

SENSOR-INFRARED

Fig. 53: Infrared Temperature Sensor, Integral Wire Connector Receptacle, Alignment Tabs & Clear Lens

Courtesy of CHRYSLER LLC

The infrared temperature sensor (1) consists of an infrared transducer concealed behind a clear lens (4) located in a molded plastic housing with an integral wire connector receptacle (2) and mounting and alignment tabs (3 and 5).

The infrared sensor is used only on models equipped with the automatic temperature control (ATC) heating-A/C system.

OPERATION

SENSOR-INFRARED

The infrared sensor detects thermal radiation emitted by the driver and front seat occupants and surroundings and converts its data into a linear pulse width modulated (PWM) output signal which is read by the automatic

temperature control (ATC) A/C-heater control. The ATC A/C-heater control uses the infrared sensor data as one of the inputs necessary to automatically control the interior cabin temperature level. By using thermal radiation (surface temperature) measurement, rather than an air temperature measurement, the ATC heating-A/C system is able to adjust itself to the comfort level as perceived by the front seat occupants. This allows the ATC system to compensate for other ambient conditions affecting comfort levels, such as solar heat gain or evaporative heat loss.

The ATC system logic responds to the infrared sensor message by calculating and adjusting the air flow temperature and air flow rate needed to properly obtain and maintain the selected comfort level temperature of the occupants. The A/C-heater control continually monitors the infrared sensor circuit, and will store diagnostic trouble codes (DTCs) for any problem it detects.

The infrared sensor is diagnosed using a scan tool (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

The infrared sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

SENSOR-INFRARED

NOTE: Take the proper precautions to protect the front face of the overhead console from cosmetic damage while performing this procedure.

Courtesy of CHRYSLER LLC

NOTE: Typical overhead console shown in graphic.

1. Disconnect and isolate the negative battery cable.
2. Remove the overhead console (1) from the headliner and place it on a workbench.
3. Remove the screw (2) that secures the infrared sensor (3) to the back of the overhead console and remove

the sensor.

INSTALLATION

SENSOR-INFRARED

NOTE: Take the proper precautions to protect the front face of the overhead console from cosmetic damage while performing this procedure.

Fig. 55: Overhead Console, Screw, Infrared Sensor & Tab
Courtesy of CHRYSLER LLC

NOTE: Typical overhead console shown in graphic.

1. Position the infrared sensor (3) onto the back of the overhead console (1). Align the tab (4) on the sensor with the slot in the console.
2. Install the screw (2) that secures the infrared sensor(s) to the overhead console. Tighten the screw to 1.2 N.m (10 in. lbs).
3. Install the overhead console.
4. Reconnect the negative battery cable.

TRANSDUCER-A/C PRESSURE

DESCRIPTION

TRANSDUCER-A/C PRESSURE

81254c0f

Fig. 56: A/C Pressure Transducer
Courtesy of CHRYSLER LLC

The A/C pressure transducer (1) sends a signal to the powertrain control module (PCM) which controls both A/C compressor clutch engagement/disengagement and electric cooling fan operation. The A/C pressure transducer is mounted on a fitting located on the A/C liquid line near the dash panel. The PCM will disengage the A/C compressor clutch when high side pressure rises above 2971 kPa (431 psi) or fall below 206 kPa (30 psi).

The fitting for the A/C pressure transducer on the A/C liquid line is equipped with an O-ring seal and contains a Schrader-type valve to allow the transducer to be serviced without discharging the refrigerant system.

OPERATION

TRANSDUCER-A/C PRESSURE

The A/C pressure transducer monitors the pressures in the high side of the refrigerant system through its

connection to a fitting on the A/C liquid line. The A/C pressure transducer will change its internal resistance in response to the pressures it monitors. The powertrain control module (PCM) or the engine control module (ECM) (depending on engine application) provides a five volt reference signal and a sensor ground to the A/C pressure transducer, then monitors the output voltage of the A/C pressure transducer on a sensor return circuit to determine refrigerant pressure. The PCM/ECM is programmed to respond to the A/C pressure transducer and other sensor inputs by controlling the operation of the A/C compressor clutch and the radiator cooling fan to help optimize A/C system performance and to protect the system components from damage. The PCM/ECM will disengage the A/C compressor clutch when high side pressure rises above 2971 kPa (431 psi) or fall below 206 kPa (30 psi). The A/C pressure transducer input to the PCM/ECM also prevents the A/C compressor clutch from engaging when ambient temperatures are below about 10° C (50° F) due to the pressure/temperature relationship of the refrigerant.

A Schrader-type valve in the A/C discharge line fitting permits the A/C pressure transducer to be removed or installed without disturbing the refrigerant in the A/C system.

The A/C pressure transducer is diagnosed using a scan tool (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article for more information).

The A/C pressure transducer cannot be adjusted or repaired and it must be replaced if found inoperative or damaged.

DIAGNOSIS AND TESTING

TRANSDUCER-A/C PRESSURE

The A/C pressure transducer is tested using a scan tool (refer to **HEATING & AIR CONDITIONING - ELECTRICAL DIAGNOSTICS** article or appropriate Engine ELECTRICAL DIAGNOSTICS article for more information). Before testing the A/C pressure transducer, be certain that the transducer wire harness connection is clean of corrosion and properly connected. For the A/C to operate, an A/C pressure transducer voltage reading between 0.451 and 4.519 volts is required. Voltages outside this range indicate a low or high refrigerant system pressure condition to the powertrain control module (PCM). The PCM is programmed to respond to a low or high refrigerant system pressure by suppressing operation of the A/C compressor. Refer to the A/C PRESSURE TRANSDUCER VOLTAGE chart for the possible conditions indicated by the transducer voltage reading.

A/C PRESSURE TRANSDUCER VOLTAGE

Voltage	Possible Indication
0.0	1. No sensor supply voltage from PCM.
-	2. Shorted sensor circuit.
-	3. Inoperative transducer.
0.150 TO 0.450	1. Ambient temperature below 10° C (50° F).
-	2. Low refrigerant system pressure.
0.451 TO 4.519	1. Normal refrigerant system pressure.
4.520 TO 4.850	1. High refrigerant system pressure.
5.0	1. Open sensor circuit.
-	2. Inoperative transducer.

REMOVAL

TRANSDUCER-A/C PRESSURE

NOTE: It is not necessary to discharge the refrigerant system to replace the A/C pressure transducer.

Fig. 57: Wire Harness Connector, A/C Pressure Transducer, A/C Liquid Line & Dash Panel
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector (1) from the A/C pressure transducer (2) located on the A/C liquid line (3) near the dash panel (4) in the engine compartment.
3. Remove the A/C pressure transducer from the A/C liquid line and remove and discard the O-ring seal.

INSTALLATION

TRANSDUCER-A/C PRESSURE

NOTE: Use only the specified O-ring as it is made of special material for R-134a. Use only refrigerant oil of the type required for the A/C compressor.

Fig. 58: Wire Harness Connector, A/C Pressure Transducer, A/C Liquid Line & Dash Panel
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it onto the A/C pressure transducer fitting.
2. Install the A/C pressure transducer (2) onto the A/C liquid line (3) near the dash panel (4). Hand-tightened the transducer securely.
3. Connect the wire harness connector (1) to the A/C pressure transducer.
4. Reconnect the negative battery cable.

DISTRIBUTION

DUCT-CENTER INSTRUMENT PANEL

REMOVAL

DUCT-CENTER INSTRUMENT PANEL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.

NOTE: Typical rear floor heat duct shown in graphic.

1. Remove the floor console. Refer to **REMOVAL** .
2. Remove the push-pin retainer (2) that secures the rear floor heat duct (1) to the floor console bracket (3) located behind the gear shift lever assembly (4).

3. Disconnect the rear floor heat duct from the floor distribution duct (5).
4. Remove the rear floor heat duct from the vehicle.

INSTALLATION

DUCT-REAR FLOOR HEAT

80cb41cb

Fig. 70: Rear Floor Heat Duct

NOTE: Typical rear floor heat duct shown in graphic.

1. Position the rear floor heat duct (1) into the vehicle.

2. Connect the rear floor heat duct to the floor distribution duct (5) located in front of the gear shift lever assembly (4).
3. Install the push-pin retainer (2) that secures the rear floor heat duct to the floor console bracket (3).
4. Install the floor console. Refer to **INSTALLATION** .

FILTER-PARTICULATE AIR

DESCRIPTION

FILTER-PARTICULATE AIR

812d31e6

Fig. 71: Filter-Particulate Air Description
Courtesy of CHRYSLER LLC

Some models are equipped with a particulate air filter (1) that helps purify the outside air entering the HVAC

housing. The filter is mounted in the passenger compartment, behind the glove box bin.

The filter should be replaced at least once a year or every 24,000 km (15,000 miles) and checked if heating-A/C system performance seems lower than expected. The particulate air filter is labeled with an arrow (2) to indicate the direction of air flow through the filter.

REMOVAL

FILTER-PARTICULATE AIR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.

WARNING: Always make sure the A/C-heater system is turned off and that the ignition switch is in the OFF position prior to servicing the particulate air filter. Never place fingers or other objects into the filter opening of the HVAC housing. Failure to follow this warning may result in serious injury.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 72: Removing/Installing Particulate Filter Cover
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with instrument panel removed for clarity.

1. Remove the glove box bin. Refer to **REMOVAL** .
2. Disengage the two retaining tabs (1) that secure the particulate air filter cover (2) to the passenger side of

the HVAC housing (3) and remove the cover.

3. Remove the particulate air filter (1) from the HVAC housing (2) by pulling the filter element straight out of the housing.

INSTALLATION

FILTER-PARTICULATE AIR

NOTE: The particulate air filter is labeled with an arrow to indicate air flow direction through the filter. Make sure to properly install the particulate air filter. Failure to properly install the filter will result in the need to replace the filter sooner than required by design.

NOTE: LHD model shown in illustrations. RHD model similar.
