2008-11	<u>Change Oil/Oil Life Monitor Reset - Procedure 1</u>
Wrangler	
2008-11	<u>Change Oil/Oil Life Monitor Reset - Procedure 1</u>

CHANGE OIL/OIL LIFE MONITOR RESET - PROCEDURE 1

1. Turn ignition on, with engine off.
2. Fully depress the accelerator pedal, slowly, 3 times within 10 seconds.
3. Turn ignition switch to OFF/LOCK position.

NOTE: If indicator message illuminates when engine is started, repeat the reset procedure.

EMISS MAINT INDICATOR LIGHT

NOTE: To determine the appropriate reset procedure, refer to **EMISS MAINT INDICATOR LIGHT RESET INDEX.**

EMISS MAINT INDICATOR LIGHT RESET INDEX

Model & Year	Reset Procedure
Cherokee	
1988-90	<u>Emiss Maint Indicator Light Reset - Procedure 1</u>

Comanche	
1988-90	<u>Emiss Maint Indicator Light Reset - Procedure 1</u>
Wagoneer	
1988-90	<u>Emiss Maint Indicator Light Reset - Procedure 1</u>
Wrangler	
1988-90	<u>Emiss Maint Indicator Light Reset - Procedure 1</u>

EMISS MAINT INDICATOR LIGHT RESET - PROCEDURE 1

1. Vehicles are equipped with a EMISS MAINT indicator light on the instrument cluster. This light will come on one time at 82,500 miles to alert driver that emission service is required. At this time, oxygen sensor and PCV valve must be replaced and all other emission components should be inspected, and serviced or replaced as necessary.
2. The Service Reminder Indicator (SRI) timer is located under dash, near accelerator pedal or to right of steering column. Timer cannot be reset. To turn off light, timer must be replaced or disconnected. Since timer and sensor are interdependent, if timer should fail prematurely, oxygen sensor should be replaced at same time to preserve correct replacement interval.
3. To replace timer on Cherokee, Comanche and Wagoneer models, remove cruise control module (if equipped). Remove timer mounting screws. Disconnect electrical connector. On Wrangler models, remove timer mounting screws. Disconnect electrical connector. To install, reverse removal procedure.

MAINT REQD INDICATOR LIGHT

NOTE: To determine the appropriate reset procedure, refer to **MAINT REQD INDICATOR LIGHT RESET INDEX**.

MAINT REQD INDICATOR LIGHT RESET INDEX

Model & Year	Reset Procedure
Cherokee	
1991-92	<u>Maint Reqd Indicator Light Reset - Procedure 1</u>
Comanche	
1991-92	<u>Maint Reqd Indicator Light Reset - Procedure 1</u>
Grand Cherokee	
1993	<u>Maint Reqd Indicator Light Reset - Procedure 1</u>
Wrangler	
1991-92	<u>Maint Reqd Indicator Light Reset - Procedure 1</u>

MAINT REQD INDICATOR LIGHT RESET - PROCEDURE 1

Vehicles may be equipped with a MAINT REQD on the instrument cluster. This light will come on one time at 82,500 miles to alert driver that emission service is required. At this time, oxygen sensor must be replaced and all other emission components should be inspected, and serviced or replaced as necessary. Chrysler's Diagnostic Readout Box (DRB-II) tester is required to reset the service reminder indicator system.

Using DRB-II tester, access SELECT SYSTEMS. Select appropriate engine. Select with or without A/C. Select FUEL & IGNITION. Select ADJUSTMENTS. Select RESET SRI LIGHT. Reset SRI light. When DRB-II is finished resetting light, DRB-II display will read SRI LIGHT IS RESET.

PERFORM SERVICE MESSAGE

NOTE: To determine the appropriate reset procedure, refer to PERFORM SERVICE MESSAGE RESET INDEX.

PERFORM SERVICE MESSAGE RESET INDEX

Model & Year	Reset Procedure
Grand Cherokee	
1994-98	<u>Perform Service Message Reset - Procedure 1</u>
1999-07	<u>Perform Service Message Reset - Procedure 2</u>
Liberty	
2003-07	<u>Perform Service Message Reset - Procedure 2</u>

PERFORM SERVICE MESSAGE RESET - PROCEDURE 1

This vehicle may be equipped with an optional Vehicle Information Center (VIC). A PERFORM SERVICE message is displayed when "miles/kms to service" is zero, indicating that regular service and maintenance is due. To reset counter, turn ignition on, then press SELECT button momentarily, then press and hold SET button for at least 2 seconds.

PERFORM SERVICE MESSAGE RESET - PROCEDURE 2

1. The Electronic Vehicle Information Center (EVIC) displays a PERFORM SERVICE message when distance to service interval has been reached, indicating that regular service and maintenance is due. After performing necessary services, reset service distance by selecting a distance to service interval.
2. To program EVIC, turn ignition switch to ON position. Depress and release MENU push button until SERVICE INTV. = is displayed. Press and release STEP button to step through available options. The last selected distance option displayed becomes the service interval at which the PERFORM SERVICE message will be displayed.
3. If a new distance interval is selected, RESET SERVICE DISTANCE? with a yes or no option. When YES is selected, the accumulated distance since the last previous PERFORM SERVICE message will be reset to zero because the service interval has been changed. When NO is selected, the distance until the next PERFORM SERVICE message is reduced by the accumulated distance since the last previous message.
4. EVIC exits programming mode and returns to its normal operation mode when the C/T button is depressed or when the end of the programmable feature menu list is reached, whichever occurs first.

TIRE PRESSURE MONITOR SYSTEM (TPMS)

NOTE: To determine the appropriate reset procedure, refer to TPMS RESET INDEX.

TPMS RESET INDEX

Model & Year	Reset Procedure

2005-11	<u>TPMS Reset - Procedure 1</u>
Patriot	
2007-11	<u>TPMS Reset - Procedure 1</u>
Wrangler	
2007-11	<u>TPMS Reset - Procedure 1</u>

TPMS RESET - PROCEDURE 1

NOTE: Using an RF signal, each sensor transmits tire pressure data approximately once every minute. Each sensor's (transmitter) broadcast is uniquely coded so that the WCM can monitor the state of each of the sensors on the 4 rotating road wheels. The WCM automatically learns and stores the sensor's ID while driving after a sensor has been replaced. There is no formal retraining procedure necessary.

Once the vehicle has remained stationary for more than 20 minutes, drive vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time, the system will learn the new sensor ID.

TPMS RESET - PROCEDURE 2

NOTE: Use the following procedure to retrain all 4 road wheel tire pressure sensors. No attempt should be made to retrain individual sensors.

1. Retrieve Relearn Magnet (8821).
2. Press MENU Button on EVIC until "RETRAIN TIRE SENSORS - NO" is displayed.
3. Press STEP button to select "YES".

NOTE: There is a 60-second timer for training the first sensor, and a 30-second timer between training the remaining sensors. If either of these timers expire, the EVIC will abort the training procedure.

NOTE: If at any time the EVIC display reads "TRAINING ABORTED", move the vehicle ahead at least one foot and repeat the entire retraining procedure.

4. Press MENU button to start retraining. Display will read "TRAIN LEFT FRONT TIRE". The order for retraining all 5 sensors is:
 - Left Front.
 - Right Front.
 - Right Rear.
 - Left Rear.
 - Spare (if so equipped).
5. Starting at left front tire, place relearn magnet over valve stem. See **Fig. 1**. Within approximately 5 seconds, vehicle horn will chirp indicating training complete at that particular sensor. Remove the magnet.
6. Repeat this step on remaining sensors as indicated by EVIC until all TPM sensors positions are trained.
7. Once EVIC displays "TRAINING COMPLETE", pressing either STEP, C/T, RESET or MENU button will exit training routine.

Relearn Magnet

ABS - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

ABS INTERMITTENT CONDITION

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Diagnostic Test

1. PERFORM ABS INTERMITTENT CONDITION TEST

NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Refer to any Technical Service Bulletins (TSBs) that may apply.

Review the scan tool Environmental Data (EV Data). If possible, try to duplicate the conditions under which the DTC set.

Turn the ignition off.

Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.

Wiggle the wires while checking for shorts and open circuits.

Perform a voltage drop test on the related circuits between the suspected inoperative component and the Anti-Lock Brake Module.

Inspect and clean all PCM, ABS, engine, and chassis grounds that are related to the most current DTC.

If numerous trouble codes were set, use a wire schematic and look for any common ground or supply circuits

For any Relay DTCs, actuate the Relay with the scan tool and wiggle the related wire harness to try to interrupt the actuation.

Use the scan tool to perform a System Test if one applies to failing component.

A co-pilot, data recorder, or lab scope should be used to help diagnose intermittent conditions.

Were any problems found during the above inspections?

Yes

Perform the necessary repairs.

Perform **ABS VERIFICATION TEST**.

No

Test Complete.

C1000-BRAKE PEDAL SWITCH 1 CIRCUIT PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Diagnostic Test

1. ENGINE DTCS PRESENT

With the scan tool, read Engine DTCs.

Are there any Engine DTCs present?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

No

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.

Perform **POWERTRAIN VERIFICATION TEST** .

C1008-BRAKE FLUID LEVEL CIRCUIT HIGH

Circuit Schematic

81d044b2

Fig. 1: Brake Fluid Level Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

Continuous monitoring.

Set Conditions

- **Set Condition:**

When the Totally Integrated Power Module indicates that the Brake Fluid Level Circuit is open and greater than 4.9 volts for more then 5 seconds.

Possible Causes

Possible Causes
(B20) BRAKE FLUID LEVEL SWITCH SIGNAL CIRCUIT OPEN BRAKE FLUID LEVEL SWITCH INTERNAL FAILURE (P37)/(K91) SENSOR GROUND CIRCUIT OPEN TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. **BRAKE FLUID LEVEL SWITCH SIGNAL VOLTAGE ABOVE 4.9 VOLTS**

NOTE: **This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, read Brake Fluid Level Switch Signal voltage.

Is the voltage above 4.9 volts?

Yes

Go To 2.

No

Perform the ABS INTERMITTENT CONDITION diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

2. **BRAKE FLUID LEVEL SWITCH INTERNAL FAILURE**

81662855

Fig. 2: Checking Brake Fluid Level Signal Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Connect a jumper wire between the (B20) Brake Fluid Level signal circuit and the (P37)/(K91) Brake Fluid Level ground circuit in the Brake Fluid Level Switch harness connector

Turn the ignition on.

With the scan tool, read the Brake Fluid Level Switch voltage

Is the voltage below 1.0 volt?

Yes

Replace the Brake Fluid Level Switch in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Go To 3.

3. (B20) BRAKE FLUID LEVEL SWITCH CIRCUIT OPEN

819c5e62

Fig. 3: Measuring Resistance Of (B20) Brake Fluid Level Signal Circuit Between Brake Fluid Level Switch Harness Connector And TIPM Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Brake Fluid Level Switch.

Disconnect the TIPM harness connector.

Measure the resistance of the (B20) Brake Fluid Level signal circuit between the Brake Fluid Level Switch harness connector and the TIPM harness connector.

Is the resistance below 5 ohms?

Yes

Go To 4.

No

Repair the open in the (B20) Brake Fluid Level Switch signal circuit.

Perform **ABS VERIFICATION TEST**.

4. **(P37)/(K91) SENSOR GROUND CIRCUIT OPEN**

8166285d

Fig. 4: Measuring Resistance Of (Z905) Brake Fluid Level Switch Ground Circuit Between Brake Fluid Level Switch Harness Connector And Ground
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Brake Fluid Level Switch harness connector.

Reconnect the TIPM harness connector.

Measure the resistance of the (P37)/(K91) Brake Fluid Level Switch ground circuit between the Brake Fluid Level Switch harness connector and ground.

Is the resistance below 5.0 ohms?

Yes

Replace and program the Totally Integrated Power Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Repair the open or high resistance in the (P37)/(K91) Sensor ground circuit.

Perform **ABS VERIFICATION TEST**.

C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT

Circuit Schematic

81d04601

Fig. 5: Wheel Speed Sensors Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

When the Left Front Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes

Possible Causes
CONNECTOR/TERMINAL DAMAGE (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND OR OPEN (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B8) LEFT FRONT WSS SIGNAL CIRCUIT AND (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORTED TOGETHER LEFT FRONT WSS ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR DTC C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT**

NOTE: **This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

Does the scan tool display: C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT?

Yes

Go To 2.

No

Refer to the INTERMITTENT CONDITION diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION.**

2. **CHECK CONNECTOR/TERMINAL FOR DAMAGE**

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Left Front WSS, and Left Front WSS harness connector.

Is the Left Front WSS or any of the connectors/terminals damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST.**

No

Go To 3.

3. **CHECK (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORT TO GROUND**

816acfd

Fig. 6: Checking Left Front Wheel Speed Sensor Supply Circuit Short To Ground
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Left Front WSS harness connector.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B9) Left Front WSS Supply circuit.

Does the test light illuminate brightly?

Yes

Repair the (B9) Left Front WSS Supply circuit for a short to ground.

Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORT TO GROUND

816acfe8

Fig. 7: Checking Left Front Wheel Speed Sensor Signal Circuit Short To Ground
Courtesy of CHRYSLER LLC

Using a 12-volt test light connected to 12-volts, probe the (B8) Left Front WSS Signal circuit.

Does the test light illuminate brightly?

Yes

Repair the (B8) Left Front WSS Signal circuit for a short to ground.

Perform **ABS VERIFICATION TEST**.

No

Go To 5.

5. CHECK (B9) LEFT FRONT WSS SUPPLY CIRCUIT OPEN

**SENSOR-
WHEEL
SPEED-ABS-
LEFT
FRONT**

816acfd

Fig. 8: Checking Left Front Wheel Speed Sensor Supply Circuit Short To Ground
Courtesy of CHRYSLER LLC

Connect a jumper wire between ground and the (B9) Left Front WSS Supply circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B9) Left Front WSS Supply circuit.

Does the test light illuminate brightly

Yes

Go To 6.

No

Repair the (B9) Left Front WSS Supply circuit for an open.

Perform **ABS VERIFICATION TEST**.

6. **CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT OPEN**

816acfe8

Fig. 9: Checking Left Front Wheel Speed Sensor Signal Circuit Short To Ground
Courtesy of CHRYSLER LLC

Connect a jumper wire between ground and the (B8) Left Front WSS Signal circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B8) Left Front WSS Signal circuit.

Does the test light illuminate brightly?

Yes

Go To 7.

No

Repair the (B8) Left Front WSS Signal circuit for an open.

Perform **ABS VERIFICATION TEST**.

7. CHECK (B9) LEFT FRONT WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

**SENSOR-
WHEEL
SPEED-ABS-
LEFT
FRONT**

814eb204

Fig. 10: Checking Left Front WSS Supply Circuit

Courtesy of CHRYSLER LLC

Turn the ignition on.

Remove all jumper wires.

Measure the voltage between the (B9) Left Front WSS Signal circuit and ground.

Is the voltage above one volt?

Yes

Repair the (B9) Left Front WSS Signal circuit for a short to voltage.

Perform **ABS VERIFICATION TEST**.

No

Go To 8.

8. CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

Fig. 11: Checking Left Front Wheel Speed Sensor Signal Circuit
Courtesy of CHRYSLER LLC

Measure the voltage between the (B8) Left Front WSS Signal circuit and ground.

Is the voltage above one volt?

Yes

Repair the (B8) Left Front WSS Signal circuit for a short to voltage.
Perform **ABS VERIFICATION TEST**.

No

Go To 9.

9. **CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT AND (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORT TOGETHER**

**SENSOR-
WHEEL
SPEED-ABS-
LEFT
FRONT**

814eb1de

Fig. 12: Checking Left Front Wheel Speed Sensor Signal Circuit & Supply Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance between the (B8) Left Front WSS Signal circuit and the (B9) Left Front WSS Supply circuit.

Is the resistance above 5.0 ohms?

Yes

Go To step 10.

No

Repair the (B8) Left Front WSS Signal circuit and the (B9) Left Front WSS Supply circuit for a short together.

Perform **ABS VERIFICATION TEST**.

10. **LEFT FRONT WHEEL SPEED SENSOR**

Replace the Left Front Wheel Speed Sensor in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

With the scan tool, read ABS DTCs.

Did DTC C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT reset?

Yes

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Test Complete.

C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

When the Left Front Wheel Speed Sensor (WSS) Signal is intermittently missing while vehicle speed is above 40 km/h (25 mph) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

Possible Causes

Possible Causes
LEFT FRONT WSS LOOSE - B8, B9 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
LEFT FRONT TONE WHEEL DAMAGE
LEFT FRONT WHEEL/ BEARING DAMAGE
IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES
LEFT FRONT WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

NOTE: If DTC C100A Left Front Wheel Speed Sensor Circuit is present it must be repaired before continuing.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs.

Does the scan tool display: C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE active?

Yes

Go To 3.

No

Go To 2.

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Left Front WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

Go To 3.

No

Perform the ABS Intermittent Condition diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

3. CHECK FOR IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Left Front Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Left Front Tire improperly inflated or mismatched tires on vehicle?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. CHECK LEFT FRONT WSS LOOSENESS, INSPECT B8, B9 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

Inspect the Anti-Lock Brake Module harness connector, Left Front WSS, and Left Front WSS harness connector

Inspect the Left Front WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B8) Left Front WSS Signal and (B9) Left Front WSS Supply circuits between the Left Front WSS and Anti-Lock Brake Module for damage.

Is the Left Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 5.

5. CHECK LEFT FRONT WHEEL SPEED SENSOR FOR DAMAGE

Remove the Left Front Wheel Speed Sensor

Inspect the Left Front Wheel Speed Sensor face for damage.

Is the Left Front Wheel Speed Sensor damaged?

Yes

Replace sensor and hub assembly.

Perform **ABS VERIFICATION TEST**.

No

Go To 6.

6. CHECK LEFT FRONT TONE WHEEL/BEARING FOR DAMAGE

Inspect the Left Front Tone Wheel/Bearing for damage, missing teeth, cracks, corrosion or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Left Front Tone Wheel/Bearing damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 7.

7. CHECK LEFT FRONT WHEEL BEARING FOR DAMAGE

Inspect the Left Front wheel bearing for excessive runout or clearance.

NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

Is the Left Front Wheel Bearing Damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 8.

8. LEFT FRONT WHEEL SPEED SENSOR

Replace the Left Front Wheel Speed Sensor in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read ABS DTCs.

Did DTC C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE reset?

Yes

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Test Complete.

C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- Set Condition:**

When the Left Front Wheel Speed Sensor (WSS) Signal reading is different from the readings received from the other WSS's at a vehicle speed above 40 km/h (25 mph). The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

Possible Causes

Possible Causes
LEFT FRONT WSS LOOSE - B8, B9 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES
LEFT FRONT TONE WHEEL/BEARING DAMAGE
LEFT FRONT WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR DTC C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE**

NOTE: **This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, record and erase DTCs.

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

With the scan tool, read DTCs.

Does the scan tool display: C1014-LEFT FRONT WHEEL SPEED COMPARATIVE

PERFORMANCE active?

Yes

Go To 3.

No

Go To 2.

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Left Front WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

Go To 3.

No

The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the **ABS INTERMITTENT CONDITION**.

3. CHECK FOR IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Left Front Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Left Front Tire improperly inflated or mismatched tires on vehicle?

Yes

Repair as necessary

Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. CHECK LEFT FRONT WSS LOOSENESS, INSPECT B8, B9 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

Inspect the Anti-Lock Brake Module harness connector, Left Front WSS, and Left Front WSS harness connector.

Inspect the Left Front WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B8) Left Front WSS Signal and (B9) Left Front WSS Supply circuits between the Left Front WSS and Anti-Lock Brake Module for damage.

Is the Left Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 5.

5. CHECK LEFT FRONT WHEEL SPEED SENSOR FOR DAMAGE

Remove the Left Front Wheel Speed Sensor

Inspect the Left Front Wheel Speed Sensor face for damage.

Is the Left Front Wheel Speed Sensor damaged?

Yes

Replace sensor and hub assembly.

Perform **ABS VERIFICATION TEST**.

No

Go To 6.

6. CHECK LEFT FRONT TONE WHEEL/BEARING FOR DAMAGE

Inspect the Left Front Tone Wheel/Bearing for damage, missing teeth, cracks, corrosion or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Left Front Tone Wheel/Bearing damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 7.

7. LEFT FRONT WHEEL SPEED SENSOR

Replace the Left Front Wheel Speed Sensor in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read ABS DTCs.

Did DTC C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE reset?

Yes

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Test Complete.

C1015-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT

Circuit Schematic

81d04601

Fig. 13: Wheel Speed Sensors Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

When the Right Front Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes

Possible Causes
CONNECTOR/TERMINAL DAMAGE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND OR OPEN (B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B6) RIGHT FRONT WSS SIGNAL CIRCUIT AND (B7) RIGHT FRONT WSS SUPPLY CIRCUIT SHORTED TOGETHER RIGHT FRONT WSS ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR DTC C1015-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT**

NOTE: **This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

Does the scan tool display: C1015-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT?

Yes

Go To 2.

No

Refer to the INTERMITTENT CONDITION diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION.**

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Right Front WSS, and Right Front WSS harness connector.

Is the Right Front WSS or any of the connectors/terminals damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST.**

No

Go To 3.

3. CHECK (B7) RIGHT FRONT WSS SUPPLY CIRCUIT SHORT TO GROUND

**SENSOR-
WHEEL
SPEED-ABS-
RIGHT
FRONT**

816add05

Fig. 14: Checking Right Front Wheel Speed Sensor Supply Circuit For Open Or Short To Ground
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Right Front WSS harness connector.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B7) Right Front WSS Supply circuit.

Does the test light illuminate brightly?

Yes

Repair the (B7) Right Front WSS Supply circuit for a short to ground.
Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. CHECK (B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORT TO GROUND

**SENSOR-
WHEEL
SPEED-ABS-
RIGHT
FRONT**

816add08

Using a 12-volt test light connected to 12-volts, probe the (B6) Right Front WSS Signal circuit.

Does the test light illuminate brightly?

Yes

Repair the (B6) Right Front WSS Signal circuit for a short to ground.

Perform **ABS VERIFICATION TEST**.

No

Go To 5.

5. CHECK (B7) RIGHT FRONT WSS SUPPLY CIRCUIT OPEN

**SENSOR-
WHEEL
SPEED-ABS-
RIGHT
FRONT**

816add05

Fig. 16: Checking Right Front Wheel Speed Sensor Supply Circuit For Open Or Short To Ground
Courtesy of CHRYSLER LLC

Connect a jumper wire between ground and the (B7) Right Front WSS Supply circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B7) Right Front WSS Supply circuit.

Does the test light illuminate brightly

Yes

Go To 6.

No

Repair the (B7) Right Front WSS Supply circuit for an open.

Perform **ABS VERIFICATION TEST**.

6. **CHECK (B6) RIGHT FRONT WSS SIGNAL CIRCUIT OPEN**

816add08

Fig. 17: Checking Right Front Wheel Speed Sensor Signal Circuit Short To ground
Courtesy of CHRYSLER LLC

Connect a jumper wire between ground and the (B6) Right Front WSS Signal circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B6) Right Front WSS Signal circuit.

Does the test light illuminate brightly?

Yes

Go To 7.

No

Repair the (B6) Right Front WSS Signal circuit for an open.

Perform **ABS VERIFICATION TEST**.

7. CHECK (B7) RIGHT FRONT WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

**SENSOR-
WHEEL
SPEED-ABS-
RIGHT
FRONT**

816add04

Fig. 18: Checking Right Front Wheel Speed Sensor Supply Circuit
Courtesy of CHRYSLER LLC

Turn the ignition on.

Remove all jumper wires.

Measure the voltage between the (B7) Right Front WSS Signal circuit and ground.

Is the voltage above one volt?

Yes

Repair the (B7) Right Front WSS Signal circuit for a short to voltage.

Perform **ABS VERIFICATION TEST**.

No

Go To 8.

8. CHECK (B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

**SENSOR-
WHEEL
SPEED-ABS-
RIGHT
FRONT**

816add07

Fig. 19: Measuring Voltage Between Right Front WSS Signal Circuit And Ground
Courtesy of CHRYSLER LLC

Measure the voltage between the (B6) Right Front WSS Signal circuit and ground.

Is the voltage above one volt?

Yes

Repair the (B6) Right Front WSS Signal circuit for a short to voltage.
Perform **ABS VERIFICATION TEST**.

No

Go To 9.

9. **CHECK (B6) RIGHT FRONT WSS SIGNAL CIRCUIT AND (B7) RIGHT FRONT WSS SUPPLY CIRCUIT SHORT TOGETHER**

**SENSOR-
WHEEL
SPEED-ABS-
RIGHT
FRONT**

816add0a

Fig. 20: Measuring Resistance Between Right Front WSS Signal Circuit And Right Front WSS 12 Volt Supply Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance between the (B6) Right Front WSS Signal circuit and the (B7) Right Front WSS Supply circuit.

Is the resistance above 5.0 ohms?

Yes

Go To 10.

No

Repair the (B6) Right Front WSS Signal circuit and the (B7) Right Front WSS Supply circuit for a short together.

Perform **ABS VERIFICATION TEST**.

10. **RIGHT FRONT WHEEL SPEED SENSOR**

Replace the Right Front Wheel Speed Sensor in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

With the scan tool, read ABS DTCs.

Did DTC C1015-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT reset?

Yes

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Test Complete.

C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

When the Right Front Wheel Speed Sensor (WSS) Signal is intermittently missing while vehicle speed is above 40 km/h (25 mph) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

Possible Causes

Possible Causes
RIGHT FRONT WSS LOOSE - B6, B7 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
RIGHT FRONT TONE WHEEL DAMAGE
RIGHT FRONT WHEEL/BEARING DAMAGE
IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES
RIGHT FRONT WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

NOTE: If DTC C1015-Right Front Wheel Speed Sensor Circuit is present it must be repaired before continuing.

Turn the ignition on.

With the scan tool, record and erase DTCs.

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs.

Does the scan tool display: C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE active?

Yes

Go To 3.

No

Go To 2.

2. **CHECK WHEEL SPEED SENSOR SIGNALS**

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Right Front WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

Go To 3.

No

Refer to the **ABS INTERMITTENT CONDITION.**

3. **CHECK FOR IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES**

Turn the ignition off.

Check and adjust the Right Front Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Right Front Tire improperly inflated or mismatched tires on vehicle?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST.**

No

Go To 4.

4. **CHECK RIGHT FRONT WSS LOOSENESS, INSPECT B6, B7 CIRCUITS/TERMINALS FOR DAMAGE**

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

Inspect the Anti-Lock Brake Module harness connector, Right Front WSS, and Right Front WSS harness connector

Inspect the Right Front WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B6) Right Front WSS Signal and (B7) Right Front WSS Supply circuits between the Right Front WSS and Anti-Lock Brake Module for damage.

Is the Right Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 5.

5. CHECK RIGHT FRONT WHEEL SPEED SENSOR FOR DAMAGE

Remove the Right Front Wheel Speed Sensor

Inspect the Right Front Wheel Speed Sensor face for damage.

Is the Right Front Wheel Speed Sensor damaged?

Yes

Replace sensor and hub assembly.

Perform **ABS VERIFICATION TEST**.

No

Go To 6.

6. CHECK RIGHT FRONT TONE WHEEL/BEARING FOR DAMAGE

Inspect the Right Front Tone Wheel/Bearing for damage, missing teeth, cracks, corrosion or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Right Front Tone Wheel/Bearing damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 7.

7. CHECK RIGHT FRONT WHEEL BEARING FOR DAMAGE

Inspect the Right Front wheel bearing for excessive runout or clearance.

NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

Is the Right Front Wheel Bearing Damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 8.

8. RIGHT FRONT WHEEL SPEED SENSOR

Replace the Right Front Wheel Speed Sensor in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read ABS DTCs.

Did DTC C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE reset?

Yes

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Test Complete.

C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

When the Right Front Wheel Speed Sensor (WSS) reading is different from the readings received from the other sensors at a vehicle speed above 40 km/h (25 mph). The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

Possible Causes

Possible Causes
RIGHT FRONT WSS LOOSE - B6, B7 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES
RIGHT FRONT TONE WHEEL/BEARING DAMAGE
RIGHT FRONT WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR DTC C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE**

NOTE: **This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, record and erase DTCs.

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

With the scan tool, read DTCs.

Does the scan tool display: C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE active?

Yes

Go To 3.

No

Go To 2.

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: **If graph shows periodic dropouts pay close attention to the tone wheel.**

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Right Front WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

Go To 3.

No

The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the **ABS INTERMITTENT CONDITION.**

3. CHECK FOR IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Right Front Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Right Front Tire improperly inflated or mismatched tires on vehicle?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. CHECK RIGHT FRONT WSS LOOSENESS, INSPECT B6, B7 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

Inspect the Anti-Lock Brake Module harness connector, Right Front WSS, and Right Front WSS harness connector

Inspect the Right Front WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B6) Right Front WSS Signal and (B7) Right Front WSS Supply circuits between the Right Front WSS and Anti-Lock Brake Module for damage.

Is the Right Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 5.

5. CHECK RIGHT FRONT WHEEL SPEED SENSOR FOR DAMAGE

Remove the Right Front Wheel Speed Sensor

Inspect the Right Front Wheel Speed Sensor face for damage.

Is the Right Front Wheel Speed Sensor damaged?

Yes

Replace sensor and hub assembly.

Perform **ABS VERIFICATION TEST**.

No

Go To 6.

6. CHECK RIGHT FRONT TONE WHEEL/BEARING FOR DAMAGE

Inspect the Right Front Tone Wheel/Bearing for damage, missing teeth, cracks, corrosion or looseness.

NOTE: **The Tone Wheel teeth should be perfectly square, not bent, or nicked.**

Is the Right Front Tone Wheel/Bearing damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 7.

7. RIGHT FRONT WHEEL SPEED SENSOR

Replace the Right Front Wheel Speed Sensor in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

Road test the vehicle over 40 km/h (25 mph).

NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

With the scan tool, read ABS DTCs.

Did DTC C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE reset?

Yes

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Test Complete.

C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT

Circuit Schematic

81404601

Fig. 21: Wheel Speed Sensors Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

When the Left Rear Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes

Possible Causes
CONNECTOR/TERMINAL DAMAGE (B4) LEFT REAR WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND OR OPEN (B3) LEFT REAR WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B3) LEFT REAR WSS SIGNAL CIRCUIT AND (B4) LEFT REAR WSS SUPPLY CIRCUIT SHORTED TOGETHER LEFT REAR WSS ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR DTC C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT**

NOTE: **This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

Does the scan tool display: C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT?

Yes

Go To 2.

No

Refer to the INTERMITTENT CONDITION diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, and Left Rear WSS harness connector.

Is the Left Rear WSS or any of the connectors/terminals damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 3.

3. CHECK (B4) LEFT REAR WSS SUPPLY CIRCUIT SHORT TO GROUND

**SENSOR-
WHEEL
SPEED-ABS-
LEFT
REAR**

816add52

Fig. 22: Checking Left Rear Wheel Speed Sensor Supply Circuit For Open Or Short To Ground
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Left Rear WSS harness connector.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B4) Left Rear WSS Supply circuit.

Does the test light illuminate brightly?

Yes

Repair the (B4) Left Rear WSS Supply circuit for a short to ground.

Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT SHORT TO GROUND

**SENSOR-
WHEEL
SPEED-ABS-
LEFT
REAR**

816add54

Using a 12-volt test light connected to 12-volts, probe the (B3) Left Rear WSS Signal circuit.

Does the test light illuminate brightly?

Yes

Repair the (B3) Left Rear WSS Signal circuit for a short to ground.

Perform **ABS VERIFICATION TEST**.

No

Go To 5.

5. CHECK (B4) LEFT REAR WSS SUPPLY CIRCUIT OPEN

**SENSOR-
WHEEL
SPEED-ABS-
LEFT
REAR**

816add52

Fig. 24: Checking Left Rear Wheel Speed Sensor Supply Circuit For Open Or Short To Ground

Connect a jumper wire between ground and the (B3) Left Rear WSS Signal circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B3) Left Rear WSS Signal circuit.

Does the test light illuminate brightly?

Yes

Go To 7.

No

Repair the (B3) Left Rear WSS Signal circuit for an open.

Perform **ABS VERIFICATION TEST**.

7. CHECK (B4) LEFT REAR WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

**SENSOR-
WHEEL
SPEED-ABS-
LEFT
REAR**

816add50

Fig. 26: Checking Left Rear Wheel Speed Sensor Supply Circuit Voltage
Courtesy of CHRYSLER LLC

Turn the ignition on.

Remove all jumper wires.

Measure the voltage between the (B4) Left Rear WSS Signal circuit and ground.

Is the voltage above one volt?

Yes

Repair the (B4) Left Rear WSS Signal circuit for a short to voltage.

Perform **ABS VERIFICATION TEST**.

No

Go To 8.

8. CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

**SENSOR-
WHEEL
SPEED-ABS-
LEFT
REAR**

816add53

Fig. 27: Measuring Voltage Between Left Rear WSS Signal Circuit And Ground

Measure the voltage between the (B3) Left Rear WSS Signal circuit and ground.

Is the voltage above one volt?

Yes

Repair the (B3) Left Rear WSS Signal circuit for a short to voltage.

Perform **ABS VERIFICATION TEST**.

No

Go To 9.

9. **CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT AND (B4) LEFT REAR WSS SUPPLY CIRCUIT SHORT TOGETHER**

**SENSOR-
WHEEL
SPEED-ABS-
LEFT
REAR**

816add56

Fig. 28: Measuring Resistance Between Left Rear WSS Signal Circuit And Left Rear WSS Supply Circuit

Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance between the (B3) Left Rear WSS Signal circuit and the (B4) Left Rear WSS Supply circuit.

Is the resistance above 5.0 ohms?

Yes

Go To step 10.

No

Repair the (B3) Left Rear WSS Signal circuit and the (B4) Left Rear WSS Supply circuit for a short together.

Perform **ABS VERIFICATION TEST**.

10. **LEFT REAR WHEEL SPEED SENSOR**

Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

With the scan tool, read ABS DTCs.

Did DTC C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT reset?

Yes

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Test Complete.

C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

When the Left Rear Wheel Speed Sensor (WSS) Signal is intermittently missing while vehicle speed is above 40 km/h (25 mph) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

Possible Causes

Possible Causes
LEFT REAR WSS LOOSE - B3, B4 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
LEFT REAR TONE WHEEL DAMAGE
LEFT REAR WHEEL BEARING DAMAGE
AXLE SHAFT FASTENER HARDWARE
IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES
LEFT REAR WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR DTC C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs.

Does the scan tool display: C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE active?

Yes

Go To 3.

No

Go To 2.

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Left Rear WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

Go To 3.

No

Refer to the **ABS INTERMITTENT CONDITION.**

3. CHECK FOR IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Left Rear Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Left Rear Tire improperly inflated or mismatched tires on vehicle?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST.**

No

Go To 4.

4. CHECK AXLE SHAFT FASTENER HARDWARE FOR LOOSENESS

Inspect the axle shaft fastener for looseness, and not properly fastened. Tighten fastener to proper

specification as required.

Was the Axle Shaft fastener loose?

Yes

Repair as necessary.

No

Go To 5.

5. CHECK LEFT REAR WSS LOOSENESS, INSPECT B4, B5 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

Inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, and Left Rear WSS harness connector

Inspect the Left Rear WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B3) Left Rear WSS Signal and (B4) Left Rear WSS Supply circuits between the Left Rear WSS and Anti-Lock Brake Module for damage.

Is the Left Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST.**

No

Go To 6.

6. CHECK LEFT REAR WHEEL SPEED SENSOR FOR DAMAGE

Remove the Left Rear Wheel Speed Sensor

Inspect the Left Rear Wheel Speed Sensor face for damage.

Is the Left Rear Wheel Speed Sensor damaged?

Yes

Replace sensor and hub assembly.

Perform **ABS VERIFICATION TEST.**

No

Go To 7.

7. CHECK LEFT REAR TONE WHEEL FOR DAMAGE

Inspect the Left Rear Tone Wheel for damage, missing teeth, cracks, corrosion or looseness.

NOTE: **The Tone Wheel teeth should be perfectly square, not bent, or nicked.**

Is the Left Rear Tone Wheel damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST.**

No

Go To 8.

8. CHECK LEFT REAR WHEEL BEARING FOR DAMAGE

Inspect the Left Rear wheel bearing for excessive runout or clearance.

NOTE: **Refer to the appropriate service information, if necessary, for procedures or specifications.**

Is the Left Rear Wheel Bearing Damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST.**

No

Go To 9.

9. LEFT REAR WHEEL SPEED SENSOR

Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information.

Perform **ABS VERIFICATION TEST.**

Road test the vehicle over 40 km/h (25 mph).

NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be**

met.

With the scan tool, read ABS DTCs.

Did DTC C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE reset?

Yes

Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform **ABS VERIFICATION TEST**.

No

Test Complete.

C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

• **Set Condition:**

When the Left Rear Wheel Speed Sensor (WSS) reading is different from the readings received from the other sensors at a vehicle speed above 40 km/h (25 mph). The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

Possible Causes

Possible Causes
LEFT REAR WSS LOOSE - B3, B4 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES
LEFT REAR TONE WHEEL DAMAGE
AXLE SHAFT FASTENER HARDWARE
LEFT REAR WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs.

Does the scan tool display: C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE active?

Yes

Go To 3.

No

Go To 2.

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Left Rear WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

Go To 3.

No

The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires. Refer to the **ABS INTERMITTENT CONDITION**.

3. CHECK FOR IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Left Rear Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Left Rear Tire improperly inflated or mismatched tires on vehicle?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. CHECK AXLE SHAFT FASTENER HARDWARE FOR LOOSENESS

Inspect the axle shaft fastener for looseness, and not properly fastened. Tighten fastener to proper specification as required.

Was the Axle Shaft fastener loose?

Yes

Repair as necessary.

No

Go To 5.

5. CHECK LEFT REAR WSS LOOSENESS, INSPECT B3, B4 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

Inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, and Left Rear WSS harness connector.

Inspect the Left Rear WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B3) Left Rear WSS Signal and (B4) Left Rear WSS Supply circuits between the Left Rear WSS and Anti-Lock Brake Module for damage.

Is the Left Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 6.

6. CHECK LEFT REAR WHEEL SPEED SENSOR FOR DAMAGE

Remove the Left Rear Wheel Speed Sensor

Inspect the Left Rear Wheel Speed Sensor face for damage.

Is the Left Rear Wheel Speed Sensor damaged?

Yes

Replace sensor and hub assembly.

Perform **ABS VERIFICATION TEST**.

No

Go To 7.

7. CHECK LEFT REAR TONE WHEEL FOR DAMAGE

Inspect the Left Rear Tone Wheel for damage, missing teeth, cracks, corrosion or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Left Rear Tone Wheel damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 8.

8. LEFT REAR WHEEL SPEED SENSOR

Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

Road test the vehicle over 40 km/h (25 mph).

NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

With the scan tool, read ABS DTCs.

Did DTC C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE reset?

Yes

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Test Complete.

C102B-RIGHT REAR WHEEL SPEED SENSOR CIRCUIT

Circuit Schematic

81d04601

Fig. 29: Wheel Speed Sensors Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

When the Right Rear Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes

Possible Causes
CONNECTOR/TERMINAL DAMAGE (B2) RIGHT REAR WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND OR OPEN (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B1) RIGHT REAR WSS SIGNAL CIRCUIT AND (B2) RIGHT REAR WSS SUPPLY CIRCUIT SHORTED TOGETHER RIGHT REAR WSS ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR DTC C102B-RIGHT REAR WHEEL SPEED SENSOR CIRCUIT**

NOTE: **This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs

Does the scan tool display: C102B-RIGHT REAR WHEEL SPEED SENSOR CIRCUIT?

Yes

Go To 2.

No

Refer to the INTERMITTENT CONDITION diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION.**

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, and Right Rear WSS harness connector.

Is the Left Rear WSS or any of the connectors/terminals damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST.**

No

Go To 3.

3. CHECK (B2) RIGHT REAR WSS SUPPLY CIRCUIT SHORT TO GROUND

**SENSOR-
WHEEL
SPEED-ABS-
RIGHT
REAR**

816add70

Fig. 30: Checking Right Rear Wheel Speed Sensor Supply Circuit For An Open Or Short To Ground

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Right Rear WSS harness connector.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B2) Right Rear WSS Supply circuit.

Does the test light illuminate brightly?

Yes

Repair the (B2) Right Rear WSS Supply circuit for a short to ground.

Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORT TO GROUND

**SENSOR-
WHEEL
SPEED-ABS-
RIGHT
REAR**

816add72

Fig. 31: Checking Right Rear Wheel Speed Sensor Signal Circuit For An Open Or Short To Ground

Courtesy of CHRYSLER LLC

Using a 12-volt test light connected to 12-volts, probe the (B1) Right Rear WSS Signal circuit.

Does the test light illuminate brightly?

Yes

Repair the (B1) Right Rear WSS Signal circuit for a short to ground.

Perform **ABS VERIFICATION TEST**.

No

Go To 5.

5. **CHECK (B2) RIGHT REAR WSS SUPPLY CIRCUIT OPEN**

**SENSOR-
WHEEL
SPEED-ABS-
RIGHT
REAR**

816add70

Fig. 32: Checking Right Rear Wheel Speed Sensor Supply Circuit For An Open Or Short To Ground

Courtesy of CHRYSLER LLC

Connect a jumper wire between ground and the (B2) Right Rear WSS Supply circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B2) Right Rear WSS Supply circuit.

Does the test light illuminate brightly

Yes

Go To 6.

No

Repair the (B2) Right Rear WSS Supply circuit for an open.

Perform **ABS VERIFICATION TEST**.

6. **CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT OPEN**

**SENSOR-
WHEEL
SPEED-ABS-
RIGHT
REAR**

816add72

Fig. 33: Checking Right Rear Wheel Speed Sensor Signal Circuit For An Open Or Short To Ground

Courtesy of CHRYSLER LLC

Connect a jumper wire between ground and the (B1) Right Rear WSS Signal circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B1) Right Rear WSS Signal circuit.

Does the test light illuminate brightly?

Yes

Go To 7.

No

Repair the (B1) Right Rear WSS Signal circuit for an open.

Perform **ABS VERIFICATION TEST**.

7. CHECK (B2) RIGHT REAR WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

**SENSOR-
WHEEL
SPEED-ABS-
RIGHT
REAR**

816add6e

Fig. 34: Measuring Voltage Of Right Rear WSS 12 Volt Supply Circuit
Courtesy of CHRYSLER LLC

Turn the ignition on.

Remove all jumper wires.

Measure the voltage between the (B2) Right Rear WSS Signal circuit and ground.

Is the voltage above one volt?

Yes

Repair the (B2) Right Rear WSS Signal circuit for a short to voltage.

Perform **ABS VERIFICATION TEST**.

No

Go To 8.

8. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

**SENSOR-
WHEEL
SPEED-ABS-
RIGHT
REAR**

816add71

Fig. 35: Measuring Voltage Between Right Rear WSS Signal Circuit And Ground
Courtesy of CHRYSLER LLC

Measure the voltage between the (B1) Right Rear WSS Signal circuit and ground.

Is the voltage above one volt?

Yes

Repair the (B1) Right Rear WSS Signal circuit for a short to voltage.

Perform **ABS VERIFICATION TEST**.

No

Go To 9.

9. **CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT AND (B2) RIGHT REAR WSS SUPPLY CIRCUIT SHORT TOGETHER**

**SENSOR-
WHEEL
SPEED-ABS-
RIGHT
REAR**

816add74

Fig. 36: Measuring Resistance Between Right Rear WSS Signal Circuit And Right Rear WSS Supply Circuit

Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance between the (B1) Right Rear WSS Signal circuit and the (B2) Right Rear WSS Supply circuit.

Is the resistance above 5.0 ohms?

Yes

Go To step 10.

No

Repair the (B1) Right Rear WSS Signal circuit and the (B2) Right Rear WSS Supply circuit for a short together.

Perform **ABS VERIFICATION TEST**.

10. RIGHT REAR WHEEL SPEED SENSOR

Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

With the scan tool, read ABS DTCs.

Did DTC C102B-RIGHT REAR WHEEL SPEED SENSOR CIRCUIT reset?

Yes

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Test Complete.

C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

When the Right Rear Wheel Speed Sensor (WSS) Signal is intermittently missing while vehicle speed is above 40 km/h (25 mph) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

Possible Causes

Possible Causes
RIGHT REAR WSS LOOSE - B1, B2 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
RIGHT REAR TONE WHEEL DAMAGE
RIGHT REAR WHEEL BEARING DAMAGE
AXLE SHAFT FASTENER HARDWARE
IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES
RIGHT REAR WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR DTC C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs.

Does the scan tool display: C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE active?

Yes

Go To 3.

No

Go To 2.

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Right Rear WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

Go To 3.

No

Refer to the INTERMITTENT CONDITION diagnostic procedure. See **DIAGNOSIS AND TESTING**.

3. CHECK FOR IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Right Rear Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Right Rear Tire improperly inflated or mismatched tires on vehicle?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. CHECK AXLE SHAFT FASTENER HARDWARE FOR LOOSENESS

Inspect the axle shaft fastener for looseness, and not properly fastened. Tighten fastener to proper specification as required.

Was the Axle Shaft fastener loose?

Yes

Repair as necessary.

No

Go To 5.

5. CHECK RIGHT REAR WSS LOOSENESS, INSPECT B1, B2 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, and Right Rear WSS harness connector.

Inspect the Right Rear WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B1) Right Rear WSS Signal and (B2) Right Rear WSS Supply circuits between the Right Rear WSS and Anti-Lock Brake Module for damage.

Is the Right Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 6.

6. CHECK RIGHT REAR WHEEL SPEED SENSOR FOR DAMAGE

Remove the Right Rear Wheel Speed Sensor.

Inspect the Right Rear Wheel Speed Sensor face for damage.

Is the Right Rear Wheel Speed Sensor damaged?

Yes

Replace sensor and hub assembly.

Perform **ABS VERIFICATION TEST**.

No

Go To 7.

7. CHECK RIGHT REAR TONE WHEEL FOR DAMAGE

Inspect the Right Rear Tone Wheel for damage, missing teeth, cracks, corrosion or looseness.

NOTE: **The Tone Wheel teeth should be perfectly square, not bent, or nicked.**

Is the Right Rear Tone Wheel damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 8.

8. CHECK RIGHT REAR WHEEL BEARING FOR DAMAGE

Inspect the Right Rear wheel bearing for excessive runout or clearance.

NOTE: **Refer to the appropriate service information, if necessary, for procedures or specifications.**

Is the Right Rear Wheel Bearing Damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 9.

9. RIGHT REAR WHEEL SPEED SENSOR

Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

Road test the vehicle over 40 km/h (25 mph).

NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

With the scan tool, read ABS DTCs.

Did DTC C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE reset?

Yes

Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform **ABS VERIFICATION TEST**.

No

Test Complete.

C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

• **Set Condition:**

When the Right Rear Wheel Speed Sensor (WSS) reading is different from the readings received from the other sensors at a vehicle speed above 40 km/h (25 mph). The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

Possible Causes

Possible Causes
RIGHT REAR WSS LOOSE - B1, B2 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES
RIGHT REAR TONE WHEEL/BEARING DAMAGE
AXLE SHAFT FASTENER HARDWARE
RIGHT REAR WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs.

Does the scan tool display: C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE active?

Yes

Go To 3.

No

Go To 2.

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Right Rear WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

Go To 3.

No

The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the **ABS INTERMITTENT CONDITION.**

3. CHECK FOR IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Right Rear Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Right Rear Tire improperly inflated or mismatched tires on vehicle?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST.**

No

Go To 4.

4. CHECK AXLE SHAFT FASTENER HARDWARE FOR LOOSENESS

Inspect the axle shaft fastener for looseness, and not properly fastened. Tighten fastener to proper specification as required.

Was the Axle Shaft fastener loose?

Yes

Repair as necessary.

No

Go To 5.

5. CHECK RIGHT REAR WSS LOOSENESS, INSPECT B1, B2 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

Inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, and Right Rear WSS harness connector

Inspect the Right Rear WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B1) Right Rear WSS Signal and (B2) Right Rear WSS Supply circuits between the Right Rear WSS and Anti-Lock Brake Module for damage.

Is the Right Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 6.

6. CHECK RIGHT REAR WHEEL SPEED SENSOR FOR DAMAGE

Remove the Right Rear Wheel Speed Sensor.

Inspect the Right Rear Wheel Speed Sensor face for damage.

Is the Right Rear Wheel Speed Sensor damaged?

Yes

Replace sensor and hub assembly.

Perform **ABS VERIFICATION TEST**.

No

Go To 7.

7. CHECK RIGHT REAR TONE WHEEL/BEARING FOR DAMAGE

Inspect the Right Rear Tone Wheel/Bearing for damage, missing teeth, cracks, corrosion or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Right Rear Tone Wheel/Bearing damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 8.

8. RIGHT REAR WHEEL SPEED SENSOR

Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

Road test the vehicle over 40 km/h (25 mph).

NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

With the scan tool, read ABS DTCs.

Did DTC C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE reset?

Yes

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Test Complete.

C1041-LEFT FRONT TONE WHEEL PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

When the Anti-Lock Brake Module detects periodic drops of a WSS signal.

Possible Causes

Possible Causes
LEFT FRONT TONE WHEEL/BEARING DAMAGE
IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES
DIRT, METAL, DAMAGED TONE WHEEL/SENSOR

Diagnostic Test

1. CHECK FOR A DTC C1041-LEFT FRONT TONE WHEEL PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

Test drive the vehicle in a straight line to 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs.

Does the scan tool display: C1041-LEFT FRONT TONE WHEEL PERFORMANCE active?

Yes

Go To 3.

No

Go To 2.

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Left Front WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

Go To 3.

No

Refer to the INTERMITTENT CONDITION diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

3. CHECK FOR IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Left Front Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Left Front Tire improperly inflated or mismatched tires on vehicle?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. CHECK THE LEFT FRONT TONE WHEEL/BEARING FOR DAMAGE

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Check the Left Front Tone Wheel/Bearing for damage.

Check the Left Front Tone Wheel for dirt.

Was the tone wheel dirty?

Yes

Clean tone wheel and sensor. Clear codes and retest.

Perform **ABS VERIFICATION TEST**.

No

Replace the Left Front Tone Wheel/Bearing in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

C1042-RIGHT FRONT TONE WHEEL PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

• **Set Condition:**

When the Anti-Lock Brake Module detects periodic drops of a Wheel Speed Sensor (WSS) signal.

Possible Causes

Possible Causes
DIRTY TONE WHEEL/SENSOR
IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES
RIGHT FRONT TONE WHEEL/BEARING DAMAGE

Diagnostic Test

1. CHECK FOR A DTC C1042-RIGHT FRONT TONE WHEEL PERFORMANCE

NOTE: **This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

Test drive the vehicle in a straight line to 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs.

Does the scan tool display: C1042-RIGHT FRONT TONE WHEEL PERFORMANCE?

Yes

Go To 3.

No

Go To 2.

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Right Front WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

Go To 3.

No

Perform the ABS Intermittent Condition diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

3. CHECK FOR IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Right Front Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Right Front Tire improperly inflated or mismatched tires on vehicle?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. CHECK THE RIGHT FRONT TONE WHEEL/BEARING FOR DAMAGE

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Check the Right Front Tone Wheel/Bearing for damage.

Check the Right Front Tone Wheel for dirt.

Was the tone wheel dirty?

Yes

Clean tone wheel and sensor. Clear codes and retest.

Perform **ABS VERIFICATION TEST**.

No

Replace the Right Front Tone Wheel/Bearing in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

C1043-LEFT REAR TONE WHEEL PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to SYSTEM WIRING DIAGRAMS .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- Set Condition:

When the Anti-Lock Brake Module detects periodic drops of a Wheel Speed Sensor (WSS) signal.

Possible Causes

Possible Causes
DIRTY TONE WHEEL/SENSOR IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES AXLE SHAFT FASTENER HARDWARE LEFT REAR TONE WHEEL/BEARING DAMAGE

Diagnostic Test

1. CHECK FOR A DTC C1043-LEFT REAR TONE WHEEL PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

Test drive the vehicle in a straight line to 40 km/h (25 mph).

NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

With the scan tool, read DTCs.

Does the scan tool display: C1043-LEFT REAR TONE WHEEL PERFORMANCE?

Yes

Go To 3.

No

Go To 2.

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: **If graph shows periodic dropouts pay close attention to the tone wheel.**

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Left Rear WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

Go To 3.

No

Perform the ABS Intermittent Condition diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

3. CHECK FOR IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Left Rear Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Left Rear Tire improperly inflated or mismatched tires on vehicle?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. CHECK AXLE SHAFT FASTENER HARDWARE FOR LOOSENESS

Inspect the axle shaft fastener for looseness, and not properly fastened. Tighten fastener to proper specification as required.

Was the Axle Shaft fastener loose?

Yes

Repair as necessary.

No

Go To 5.

5. CHECK THE LEFT REAR TONE WHEEL/BEARING FOR DAMAGE

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Check the Left Rear Tone Wheel/Bearing for damage.

Check the Left Rear Tone Wheel for dirt.

Was the tone wheel dirty?

Yes

Clean tone wheel and sensor. Clear codes and retest.

Perform **ABS VERIFICATION TEST**.

No

Replace the Left Rear Tone Wheel/Bearing in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

DIRTY TONE WHEEL/SENSOR IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES AXLE SHAFT FASTENER HARDWARE RIGHT REAR TONE WHEEL/BEARING DAMAGE

Diagnostic Test

1. **CHECK FOR A DTC C1044-RIGHT REAR TONE WHEEL PERFORMANCE**

NOTE: **This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

Test drive the vehicle in a straight line to 40 km/h (25 mph).

NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be**

met.

With the scan tool, read DTCs.

Does the scan tool display: C1044-RIGHT REAR TONE WHEEL PERFORMANCE?

Yes

Go To 3.

No

Go To 2.

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Right Rear WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

Go To 3.

No

Refer to the INTERMITTENT CONDITION diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

3. CHECK FOR IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Right Rear Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Right Rear Tire improperly inflated or mismatched tires on vehicle?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. CHECK AXLE SHAFT FASTENER HARDWARE FOR LOOSENESS

Inspect the axle shaft fastener for looseness, and not properly fastened. Tighten fastener to proper specification as required.

Was the Axle Shaft fastener loose?

Yes

Repair as necessary.

No

Go To 5.

5. CHECK THE RIGHT REAR TONE WHEEL FOR DAMAGE

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Check the Right Rear Tone Wheel for damage.

Check the Right Rear Tone Wheel for dirt.

Was the tone wheel dirty?

Yes

Clean tone wheel and sensor. Clear codes and retest.

Perform **ABS VERIFICATION TEST**.

No

Replace the Right Rear Tone Wheel in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

C1073-ABS PUMP MOTOR CONTROL CIRCUIT

Circuit Schematic

81d0b12

Fig. 37: ABS Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

When the ABS Pump Motor is activated.

Set Conditions

- **Set Condition:**

The ABM detects low pump motor feedback voltage with actuation of the pump motor relay.

Possible Causes

Possible Causes
BLOWN PUMP FUSE WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE HIGH RESISTANCE IN B+ CIRCUITS HIGH RESISTANCE IN GROUND CIRCUITS INTEGRATED CONTROL UNIT

Diagnostic Test

1. **CHECK FOR A DTC C1073-ABS PUMP MOTOR CONTROL CIRCUIT**

NOTE: This DTC must be active for the results of this test to be valid. If present, diagnose and repair DTC C2116-ABS PUMP MOTOR SUPPLY LOW VOLTAGE before diagnosing this DTC.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

With the scan tool, read DTCs

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Does the scan tool display: C1073-ABS PUMP MOTOR CONTROL CIRCUIT?

Yes

Go To 2.

No

Refer to the INTERMITTENT CONDITION diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Turn the ignition off.

Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

Were any problems found?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 3.

3. CHECK THE ABS PUMP MOTOR FUSED B+ FOR AN OPEN

Turn the ignition off.

Remove and visually inspect the ABS Pump Motor B+ fuse.

Is the ABS Pump Motor B+ fuse open?

Yes

Go To 4.

No

Go To 6.

4. CHECK THE (A107) FUSED B(+) FOR A SHORT TO GROUND

Fig. 38: Checking Fused B(+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (A107) Fused B+ circuit.

Does the test light illuminate brightly?

Yes

Repair the (A107) Fused B(+) circuit for a short to ground.

Perform **ABS VERIFICATION TEST**.

No

Go To 5.

5. CHECK THE (A107) FUSED B(+) CIRCUIT

Turn the ignition off.

Visually inspect the (A107) Fused B(+) circuit in the wiring harness.

Look for any signs of intermittent short to ground.

Is the wiring harness OK?

Yes

Go To 6.

No

Repair the (A107) Fused B(+) circuit for a short to ground.

Perform **ABS VERIFICATION TEST**.

6. CHECK THE VOLTAGE ON THE (A107) FUSED B(+) CIRCUIT

**MODULE-
ANTI-
LOCK
BRAKES
(ESP)**

Fig. 39: Measuring The Voltage Of The Fused Circuit In The Anti-Lock Brake Module Harness Connector

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the voltage of the (A107) Fused B(+) circuit in the Anti-Lock Brake Module harness connector.

Is the voltage above 10 volts?

Yes

Go To 7.

No

Repair the (A107) Fused B(+) circuit for an open.

Perform **ABS VERIFICATION TEST**.

7. CHECK THE (Z903) GROUND CIRCUIT FOR AN OPEN

81d0fbc0

Fig. 40: Measuring The Resistance Of The Ground Circuit Between The Anti-Lock Brake Module Harness Connector And Ground

Courtesy of CHRYSLER LLC

Measure the resistance of the (Z903) Ground circuit between the Anti-Lock Brake Module harness

connector and ground

Is the resistance below 5.0 ohms?

Yes

Replace the ICU per service information.

Perform **ABS VERIFICATION TEST**.

No

Repair the high resistance in the (Z903) Ground circuit.

Perform **ABS VERIFICATION TEST**.

C1074-ABS PUMP MOTOR CONTROL CIRCUIT PERFORMANCE

Circuit Schematic

81d0b12

Fig. 41: ABS Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuous

Set Conditions

- **Set Condition:**

The ABM detects low pump motor feedback voltage with actuation of the pump motor relay.

Possible Causes

Possible Causes
BLOWN PUMP FUSE HIGH RESISTANCE IN B+ CIRCUITS HIGH RESISTANCE IN GROUND CIRCUITS INTEGRATED CONTROL UNIT

Diagnostic Test

1. **CHECK FOR A DTC C1074-ABS PUMP MOTOR CONTROL CIRCUIT PERFORMANCE**

NOTE: **This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

Road test the vehicle over 10 km/h (7 mph).

NOTE: **Vehicle must be driven above 10 km/h (7 mph) for set conditions to be meet.**

With the scan tool, read DTCs.

Does the scan tool display: C1074-ABS PUMP MOTOR CONTROL CIRCUIT PERFORMANCE?

Yes

Go To 2.

No

Refer to the INTERMITTENT CONDITION diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

2. CHECK THE ABS PUMP MOTOR FUSED B+ FOR AN OPEN

Turn the ignition off.

Remove and visually inspect the ABS Pump Motor B+ fuse.

Is the ABS Pump Motor B+ fuse open?

Yes

Go To 3.

No

Go To 5.

3. CHECK THE (A107) FUSED B(+) FOR A SHORT TO GROUND

Fig. 42: Checking Fused B(+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (A107) Fused B+ circuit.

Does the test light illuminate brightly?

Yes

Repair the (A921) Fused B(+) circuit for a short to ground.

Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. CHECK THE (A107) FUSED B(+) CIRCUIT

Turn the ignition off.

Visually inspect the (A107) Fused B(+) circuit in the wiring harness.

Look for any signs of intermittent short to ground.

Is the wiring harness OK?

Yes

Go To 5.

No

Repair the (A107) Fused B(+) circuit for a short to ground.

Perform **ABS VERIFICATION TEST**.

5. CHECK THE VOLTAGE ON THE (A107) FUSED B(+) CIRCUIT

**MODULE-
ANTI-
LOCK
BRAKES
(ESP)**

Fig. 43: Measuring The Voltage Of The Fused Circuit In The Anti-Lock Brake Module Harness Connector

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the voltage of the (A107) Fused B(+) circuit in the Anti-Lock Brake Module harness connector.

Is the voltage above 10 volts?

Yes

Go To 6.

No

Repair the (A107) Fused B(+) circuit for an open.

Perform **ABS VERIFICATION TEST**.

6. CHECK THE (Z903) GROUND CIRCUITS FOR AN OPEN

81d0fbc0

Fig. 44: Measuring The Resistance Of The Ground Circuit Between The Anti-Lock Brake Module Harness Connector And Ground

Courtesy of CHRYSLER LLC

Measure the resistance of the (Z903) Ground circuits between the Anti-Lock Brake Module harness

connector and ground

Is the resistance below 5.0 ohms?

Yes

Replace the ICU per service information.

Perform **ABS VERIFICATION TEST**.

No

Repair the high resistance in the affected circuit.

Perform **ABS VERIFICATION TEST**.

C1078-TIRE REVOLUTIONS RANGE PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

On key up.

Set Conditions

• **Set Condition:**

A comparison between the tire circumference value contained in the EEPROM and the tire circumference value received on the CAN bus. Programmed value for tire size is not within acceptable range.

Possible Causes

Possible Causes
INCORRECT VALUE PROGRAMMED INTO TIPM ENGINE CONTROL MODULE

Diagnostic Test

1. INCORRECT VALUE PROGRAMMED INTO TIPM

TIRE SIZE	BODY STYLE	ENGINE SIZE	SALES CODE	TIRE CIRCUMFERENCE (MM)
P225/75R 16 BSW				

GOODYEAR ALL SEASON	KK	ALL	TRY	2251
P235/65R 17 VSB GOODYEAR AS PERF	KK	ALL	TUP	2226
P235/70R 16 BSW GOODYEAR ALL SEASON	KK	ALL	TSE	2208
P235/60R 18 BSW GOODYEAR PERF	KK	ALL	TU2	2229
P235/60R 18 BSW GOODYEAR PERF	KK	ALL	TVA	2223
P235/70R 16 BSW GOODYEAR ALL TERRAIN	KK	ALL	TSN	2214
P235/65R 17 BSW BFG ALL SEASON	KK	ALL	TCC	2214
T175/90D 17 MINI SPARE	KK	ALL	TBC	2270

Verify the correct Tire/wheel information is programmed in the TIPM.

Is the correct value programmed in the TIPM according to the chart?

Yes

Test complete.

Perform **ABS VERIFICATION TEST**.

No

Program the correct Tire/Wheel information in the TIPM.

Perform **ABS VERIFICATION TEST**.

C107B-WHEEL SPEED COMPARATIVE PERFORMANCE

Circuit Schematic

81d04601

Fig. 45: Wheel Speed Sensors Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

Continuous monitoring.

Set Conditions

- **Set Condition:**

When one or more WSS reading is different from the readings received from the other WSS's. The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear above 40 km/h (25 mph).

Possible Causes

Possible Causes
WSS LOOSE - SIGNAL SUPPLY CIRCUITS/CONNECTOR/TERMINAL DAMAGE
TONE WHEEL DAMAGE
WSS - INTERNAL FAULT
IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES
ANTI-LOCK BRAKE MODULE - INTERNAL FAULT

Diagnostic Test

1. **CHECK FOR DTC C107B-WHEEL SPEED COMPARATIVE PERFORMANCE**

NOTE: **This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, record and erase DTCs.

CAUTION: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.**

With the scan tool, read DTCs.

NOTE: **The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

Does the scan tool display: C107B-WHEEL SPEED COMPARATIVE PERFORMANCE?

Yes

Go To 3.

No

Go To 2.

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is one or more WSS speeds showing 0 km/h (0 mph) or not matching other wheel speeds?

Yes

Go To 3.

No

Perform the ABS Intermittent Condition diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION.**

3. CHECK FOR IMPROPER TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Tire improperly inflated or mismatched tires on vehicle?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST.**

No

Go To 4.

4. **CHECK REAR AXLE SHAFT FASTENER HARDWARE FOR LOOSENESS**

Inspect the rear axle shaft fastener for looseness, and not properly fastened. Tighten fastener to proper specification as required.

Was the Axle Shaft fastener loose?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 5.

5. **CHECK WSS LOOSENESS, INSPECT SIGNAL SUPPLY CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE**

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector and each WSS harness connector that didn't match other wheel speeds for looseness and not properly fastened.

Inspect each WSS Signal and WSS Supply circuits between each WSS and Anti-Lock Brake Module for damage.

Is any WSS loose or any of the wiring/connectors/terminals damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 6.

6. **CHECK EACH TONE WHEEL FOR DAMAGE**

Turn the ignition off.

Inspect each Tone Wheel for damage, missing teeth, cracks, or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Tone Wheels damaged?

Yes

Repair as necessary.
Perform **ABS VERIFICATION TEST**.

No

Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform **ABS VERIFICATION TEST**.

C107C-BRAKE PEDAL SWITCH 1/2 STUCK

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuous monitoring.

Set Conditions

• **Set Condition:**

When monitoring for brake stuck condition detected or a mismatch between brake switch signal received and internal pressure sensor.

Possible Causes

Possible Causes
BRAKE SWITCH POWERTRAIN CONTROL MODULE (ECM/PCM) CAN BUS ANTI-LOCK BRAKE MODULE (ABM)

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: If present, diagnose and repair any Engine or CAN bus related DTCs

before diagnosing this DTC.

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

WARNING: Ensure brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 mph).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

Go To 2.

No

The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the **ABS INTERMITTENT CONDITION**.

2. BRAKE SWITCH STATUS

Turn the ignition on, vehicle in park and the brake pedal not depressed.

With the scan tool, read Brake Switch status.

Does Brake Switch display not pressed?

Yes

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Go To 3.

3. STOP LAMP SWITCH

NOTE: Inspect the related Fuse and Relay.

Turn the ignition off.

Disconnect the Stop Lamp Switch harness connector.

Measure the resistance between the (Z910) Ground circuit terminal and the (B15) Brake Signal 1 circuit terminal in the Stop Lamp Switch.

Apply and release the Stop Lamp Switch while monitoring the ohmmeter.

Does the resistance change from below 5.0 ohms to an open circuit?

Yes

Go To 4.

No

Verify that there is good pin to terminal contact in the Switch and Control Module connectors. If OK, replace the Stop Lamp Switch.

Perform **POWERTRAIN VERIFICATION TEST** .

4. (B15) BRAKE SIGNAL 1 CIRCUIT OPEN

Turn the ignition off.

Disconnect the C3 ECM/ECM/PCM harness connector.

CAUTION: Do not probe the ECM/PCM harness connectors. Probing the ECM/PCM harness connectors will damage the ECM/PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Measure the resistance of the (B15) Brake Signal 1 circuit from the Stop Lamp Switch harness connector to the appropriate terminal of special tool #8815.

Is the resistance below 5.0 ohms?

Yes

Go To 5.

No

Repair the open in the (B15) Brake Signal 1 circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

5. (B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (B16) Brake Signal 2 circuit in the Stop Lamp Switch harness connector.

Is the resistance below 100 ohms?

Yes

Repair the short to ground in the (B16) Brake Signal 2 circuit.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 6.

6. POWERTRAIN CONTROL MODULE (ECM/PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (ECM/PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Switch and Powertrain Control Module connectors.

Refer to any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace and program the Powertrain Control Module per Service Information.

Perform **POWERTRAIN VERIFICATION TEST** .

C1086-ABS SYSTEM CONTROL TOO LONG

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

During an ABS event.

Set Conditions

- **Set Condition:**

If the Anti-Lock Brakes Module detects a lack of response from a wheel speed sensor.

Possible Causes

Possible Causes
WHEEL SPEED SENSOR AND/OR IMPLAUSIBLE RELATED DTCs PRESENT
HYDRAULIC / BRAKE SYSTEM COMPONENT INSTALLATION
INTEGRATED CONTROL UNIT

Diagnostic Test

1. **CHECK IF WHEEL SPEED SENSOR AND/OR IMPLAUSIBLE RELATED DTCs ARE PRESENT**

Turn the ignition on.

With the scan tool, read ABS DTCs.

Are any other WHEEL SPEED SENSOR AND/OR IMPLAUSIBLE RELATED DTCs present?

Yes

Diagnose and repair the DTC(s). Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

Perform **ABS VERIFICATION TEST**.

No

Go To 2.

2. **CHECK HYDRAULIC SYSTEM & BRAKE SYSTEM COMPONENT INSTALLATION & FUNCTION**

Verify that the Anti-Lock Brakes Module and Hydraulic Control Unit are properly installed.

Verify that the hydraulic system is properly filled and bled.

Verify that the brake system components are installed and functioning properly.

Were any problems found?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Replace the Integrated Control Unit in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

C1090-ABS BRAKE LAMP CONTROL CIRCUIT LOW

Circuit Schematic

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Fig. 46: ABS Brake Lamp Control Circuit Schematic
 Courtesy of CHRYSLER LLC

Monitor Conditions

When Monitored:

Continuous monitoring.

Set Conditions

- **Set Condition:**

When monitoring the Brake Lamp Activation Relay Control circuit the module detects a short to ground.

Possible Causes

Possible Causes
(B401) BRAKE LAMP ACTIVATION RELAY CONTROL OPEN OR SHORTED TO GROUND BLOWN FUSE (F941) FUSED RUN/START RELAY OUTPUT OPEN OR SHORTED TO GROUND BRAKE LAMP ACTIVATION RELAY ANTI-LOCK BRAKE MODULE (ABM)

Diagnostic Test

1. CHECK FOR DTC C1090-ABS BRAKE LAMP CONTROL CIRCUIT LOW

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Start Engine.

Apply brake pedal firmly with at least 80 bar (1160 psi.).

With the scan tool, read DTCs.

Does the scan tool display: C1090-ABS BRAKE LAMP CONTROL CIRCUIT LOW?

Yes

Go To 2.

No

Refer to the INTERMITTENT CONDITION diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION.**

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector and the Brake Lamp Activation Relay harness connector.

Is the Anti-Lock Brake Module or any of the connectors/terminals damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST.**

No

Go To 3.

3. CHECK (B401) BRAKE LAMP ACTIVATION RELAY CONTROL SHORTED TO GROUND

81d958cd

Fig. 47: Probing The Brake Lamp Activation Relay Control Circuit At The Anti-Lock Brake Module Harness Connector Using A 12-Volt Test Light Connected To Ground
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Anti-Lock Brake Module

Start the engine.

Using a 12-volt test light connected to ground, probe the (B401) Brake Lamp Activation Relay Control Circuit at the Anti-Lock Brake Module harness connector.

Does the test light illuminate brightly?

Yes

Replace the Anti-Lock Brake Module in accordance with the service information.
Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. CHECK (F941) FUSED RUN/START RELAY OUTPUT

81d63b79

Fig. 48: Using 12-Volt Test Light Connected To Ground To Probe (A924) Fused B+ Circuit At Brake Lamp Activation Relay Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Brake Lamp Activation Relay.

Start the engine.

Using a 12-volt test light connected to ground, probe the (F941) Fused Run/Start Relay Output Circuit at the Brake Lamp Activation Relay harness connector.

Does the test light illuminate brightly?

Yes

Go To 5.

No

Check for open Fuse, if ok repair open or short to ground in the (F941) Fused Run/Start Relay Output Circuit or short to ground in (B401) Brake Lamp Activation Relay Control circuit.

Perform **ABS VERIFICATION TEST**.

5. BRAKE LAMP ACTIVATION RELAY

Fig. 49: Measuring The Resistance Of The Brake Lamp Activation Relay Control Circuit Between The Brake Lamp Activation Relay And The Anti-Lock Brake Module
Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance of the (B401) Brake Lamp Activation Relay Control Circuit between the Brake

Lamp Activation relay and the Anti-Lock Brake Module.

Is the resistance 5 ohms ?

Yes

Replace the Brake Lamp Activation Relay in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Repair open in the (B401) Brake Lamp Activation Relay Control circuit.

Perform **ABS VERIFICATION TEST**.

C1091-ABS BRAKE LAMP CONTROL CIRCUIT HIGH

Circuit Schematic

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

RELAY-BRAKE LAMP ACTIVATION

MODULE-ANTI-LOCK BRAKES (ESP)

01400c10

Fig. 50: ABS Brake Lamp Control Circuit Schematic
Courtesy of CHRYSLER LLC

Monitor Conditions

When Monitored:

Continuous monitoring.

When Set:

When monitoring the Brake Lamp Activation Relay Control circuit the module detects a short to B+.

Possible Causes

Possible Causes
(B401) BRAKE LAMP ACTIVATION RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE BRAKE LAMP ACTIVATION RELAY ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C1091-ABS BRAKE LAMP CONTROL CIRCUIT HIGH

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Start the engine.

Apply brake pedal firmly with at least 80 bar (1160 psi.).

With the scan tool, read DTCs.

Does the scan tool display: C1091-ABS BRAKE LAMP CONTROL CIRCUIT HIGH?

Yes

Go To 2.

No

Refer to the INTERMITTENT CONDITION diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector and the Brake Lamp Activation Relay harness

connector.

Is the Anti-Lock Brake Module or any of the connectors/terminals damaged?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 3.

3. CHECK (B401) BRAKE LAMP ACTIVATION RELAY CONTROL SHORTED TO VOLTAGE

81d6399a

Fig. 51: Probing The Brake Lamp Activation Relay Control At The Brake Lamp Activation Relay Harness Connector Using A 12-Volt Test Light Connected To Ground
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Anti-Lock Brake Module

Disconnect the Brake Lamp Activation Relay.

Start the engine.

Using a 12-volt test light connected to ground, probe the (B401) Brake Lamp Activation Relay Control at

the Brake Lamp Activation Relay harness connector.

Does the test light illuminate brightly?

Yes

Repair the short to voltage in the (B401) Brake Lamp Activation Relay Control Circuit

Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. BRAKE LAMP ACTIVATION RELAY

81d6399e

Fig. 52: Measuring Resistance Across Relay Between (B122) Brake Lamp Activation Relay Control Circuit And ((A924) Fused B+ Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance across the relay between the (B401) Brake Lamp Activation Relay Control Circuit and the (F941) Fused Run/Start Relay Output Circuit.

Is the resistance 75 ohms $\pm$ 5 ohms?

Yes

Replace the Anti-Lock Brake Module in accordance with the service information.
Perform **ABS VERIFICATION TEST**.

No

Replace the Brake Lamp Activation Relay in accordance with the Service Information.
Perform **ABS VERIFICATION TEST**.

C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuous monitoring.

Set Conditions

• **Set Condition:**

If the Anti-Lock Brake Module detects that the calculated steering wheel angle and the actual steering angle disagree.

Possible Causes

Possible Causes
VEHICLE DAMAGE STEERING COLUMN / INTERMEDIATE SHAFT DAMAGE STEERING ANGLE SENSOR LOOSE STEERING ANGLE SENSOR ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. PERFORM TEST DRIVE & VERIFY DTC IS STILL ACTIVE

NOTE: **If present, diagnose and repair DTC C123F-STEERING ANGLE SENSOR COMPARATIVE PERFORMANCE before diagnosing this DTC.**

Turn the ignition on.

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

Test drive the vehicle by driving straight at a velocity between 10 and 25 km/hr (6 and 15 mph.) for 1 minute.

Park the vehicle.

Turn the steering wheel from stop to stop.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

Go To 2.

No

The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the **ABS INTERMITTENT CONDITION**.

2. CHECK STEERING ANGLE SENSOR OUTPUT

Start the engine.

Center the steering wheel.

With the scan tool, read the Steering Angle Sensor Position.

Is the Steering Angle Sensor Position within $\pm 15^\circ$?

Yes

Go To 3.

No

Go To 5.

3. INSPECT VEHICLE, STEERING COLUMN, & INTERMEDIATE SHAFT FOR DAMAGE

NOTE: If possible, check vehicle repair history for collision damage. ABS module

must be reinitialized after repair.

Turn the ignition off.

Inspect the vehicle for damage causing tracking problems.

Inspect the steering column and intermediate shaft for damage.

Were any problems found?

Yes

Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.

Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. CHECK STEERING ANGLE SENSOR INSTALLATION

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Proper Steering Angle Sensor installation is crucial for proper operation.

Verify that the Steering Angle Sensor is properly installed.

Is the Steering Angle Sensor properly installed?

Yes

Go To 5.

No

Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.

Perform **ABS VERIFICATION TEST**.

5. **CHECK STEERING ANGLE SENSOR OUTPUT WHILE ROTATING THE STEERING WHEEL**

With the scan tool, read the Steering Angle Sensor Position while rotating the steering wheel to the right and then to the left. The Steering Angle Sensor Position should decrease when rotating the steering wheel to the right and increase when rotating the steering wheel to the left.

Did the steering angle change accordingly?

Yes

Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Replace the Steering Angle Sensor in accordance with the Service Information and clear offsets by initializing ECU with wheels pointing straight ahead.

Perform **ABS VERIFICATION TEST**.

C121A-STEERING ANGLE SENSOR NOT INITIALIZED

Circuit Schematic

Fig. 53: Steering Angle Sensor circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Monitor Conditions

When Monitored:

Continuous monitoring.

Set Conditions

- **Set Condition:**

When the Anti-Lock Brake Module detects the Steering Angle Sensor reporting a non initialized status failure after an initialization occurred.

Possible Causes

Possible Causes
(F943) FUSED B(+) CIRCUIT OPEN (Z910) GROUND CIRCUIT OPEN STEERING CONTROL MODULE

Diagnostic Test

1. **CHECK FOR A DTC C121A-STEERING ANGLE SENSOR NOT INITIALIZED**

NOTE: If present, diagnose and repair DTC C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE, or C1240-STEERING ANGLE SENSOR OVERTRAVEL PERFORMANCE before diagnosing this DTC.

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Road test the vehicle over 30 km/h (19 mph) for at least 30 seconds.

With the scan tool, read and record DTCs.

Does the scan tool display: C121A-STEERING ANGLE SENSOR NOT INITIALIZED?

Yes

Go To 2.

No

Perform the ABS Intermittent Condition diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

2. CHECK THE VOLTAGE ON THE (F943) FUSED B(+) CIRCUIT

8182e61e

Fig. 54: Measuring Voltage Of Fused Ignition Switch Output (Run-ACC) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Steering Control Module harness connector.

Turn the ignition on.

Measure the voltage of the (F943) Fused B(+) circuit.

Is the voltage above 10 volts?

Yes

Go To 3.

No

Repair the (F943) Fused B(+) circuit for an open.

Perform **ABS VERIFICATION TEST**.

3. CHECK THE RESISTANCE OF THE (Z910) GROUND CIRCUIT

SENSOR-
STEERING
ANGLE

8182e643

Fig. 55: Checking Ground Circuit For High Resistance
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Steering Control Module harness connector.

Measure the resistance between the (Z910) Ground circuit and ground.

Is the resistance below 5.0 ohms?

Yes

Replace the Steering Control Module in accordance with the Service Information.
Perform **ABS VERIFICATION TEST**.

No

Repair the (Z910) Ground circuit for an open.
Perform **ABS VERIFICATION TEST**.

C121C-TORQUE REQUEST SIGNAL DENIED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the engine running and RPM greater than 360.

Set Conditions

- **Set Condition:**

When the Powertrain Control Module indicates, for an extended period of time, that engine management relevant for Automatic Yaw Control/Traction Control System control can not be accomplished.

Possible Causes

Possible Causes
ANTI-LOCK BRAKE MODULE
POWERTRAIN CONTROL MODULE

Diagnostic Test

1. CHECK FOR A DTC C121C-TORQUE REQUEST SIGNAL DENIED

NOTE: This DTC must be active for the results of this test to be valid and this DTC may set while driving under severe load conditions.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch from off to on.

Start Engine.

With the scan tool, read and record DTCs and monitor ESP Torque Request status.

Does the scan tool display: C121C-TORQUE REQUEST SIGNAL DENIED?

Yes

Go To 2.

No

Refer to the INTERMITTENT CONDITION diagnostic procedure. See **DIAGNOSIS AND TESTING**.

2. CHECK THE POWERTRAIN DTCS

With the scan tool, read and record Powertrain DTCs.

Were any Powertrain related DTCs found?

Yes

Repair the Powertrain System in accordance with the Service Information.

No

Go To 3.

3. ESP TORQUE REQUEST SIGNAL

Engine started.

With the scan tool, read the Allow ESP Torque Request status bit.

Was the Allow ESP Torque Request showing NOT set?

Yes

Replace the Powertrain Module in accordance with the Service Information.

No

Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

C121D-BRAKE PRESSURE SENSOR CIRCUIT

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

• **Set Condition:**

When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor Signal is out of range.

Possible Causes

Possible Causes
AIR IN BRAKE SYSTEM/WORN MECHANICAL COMPONENTS
ECU INTERNAL FAILURE
HCU INTERNAL FAILURE

Diagnostic Test

1. CHECK FOR A DTC C121D-BRAKE PRESSURE SENSOR CIRCUIT

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Start the engine.

Slowly depress and release the brake pedal.

With the scan tool, read and record DTCs.

Does the scan tool display: C121D-BRAKE PRESSURE SENSOR CIRCUIT?

Yes

Go To 2.

No

Refer to the INTERMITTENT CONDITION diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION.**

2. HCU/ECU ISOLATION

Turn the ignition off.

Separate the ECU from the HCU.

With the scan tool, monitor brake pressure.

Does the scan tool display brake pressure above 218 bar (3162 psi)?

Yes

Replace the HCU in accordance with the Service Information.
Perform **ABS VERIFICATION TEST**.

No

Replace the ECU in accordance with the Service Information.
Perform **ABS VERIFICATION TEST**.

C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continues monitoring.

Set Conditions

- **Set Condition:**

When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor Signal is out of range.

Possible Causes

Possible Causes
ECU INTERNAL FAILURE HCU INTERNAL FAILURE

Diagnostic Test

1. **CHECK FOR A DTC C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE**

NOTE: **This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Start the engine.

Depress and release the brake pedal.

With the scan tool, read and record DTCs.

Does the scan tool display: C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE?

Yes

Go To 2.

No

Refer to the INTERMITTENT CONDITION diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

2. HCU/ECU ISOLATION

Turn the ignition off.

Separate the ECU from the HCU.

With the scan tool, monitor brake pressure.

Does the scan tool display brake pressure above 218 bar (3162 psi)?

Yes

Replace the HCU in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Replace the ECU in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

C1231-DRIVE TEST: STEERING ANGLE SENSOR

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

During the Drive Test.

Set Conditions

- **Set Condition:**

If the Anti-Lock Brakes Module detects implausible Steering Angle Sensor data.

Possible Causes

Possible Causes
STEERING ANGLE SENSOR INSTALLATION
STEERING ANGLE SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. **CHECK FOR A DTC C1231-DRIVE TEST: STEERING ANGLE SENSOR**

NOTE: **This DTC must be active for the results of this test to be valid.**

NOTE: **If any of the following DTCs are present they must be repaired before continuing.**

DTC C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE

DTC C123F-STEERING ANGLE SENSOR COMPARATIVE PERFORMANCE

DTC C1240-STEERING ANGLE SENSOR ANGLE OVERTRAVEL PERFORMANCE

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

Perform ECU initialization with drive test. Perform **ABS VERIFICATION TEST**.

NOTE: The drive test requires a 90° turn.

Start the engine.

With the scan tool, read and record DTCs.

Does the scan tool display: C1231-DRIVE TEST: STEERING ANGLE SENSOR?

Yes

Go To 2.

No

Refer to the INTERMITTENT CONDITION diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION.**

2. VERIFY THAT THE STEERING ANGLE SENSOR IS ACTIVE ON THE BUS

With the scan tool, select Steering Control Module.

Verify that the Steering Angle Sensor is active on the bus.

Is the Steering Angle Sensor active on the bus?

Yes

Go To 3.

No

Refer to **DIAGNOSIS AND TESTING** for No Response related diagnostic procedures.

3. CHECK STEERING ANGLE

Turn steering wheel so wheels point in a straight ahead position.

With scan tool check steering angle.

Is the Steering Angle reading within ± 15 degrees?

Yes

Go To 4.

No

Go To 5.

4. CHECK STEERING ANGLE CHANGE

Turn steering wheel so wheels point in a straight ahead position.

With scan tool check steering angle.

Slowly rotate steering wheel while looking for a smooth change. The degrees will decrease to the right and increase when rotating steering wheel to the left.

Did the steering angle change accordingly?

Yes

Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Replace the Steering Angle Sensor in accordance with the Service Information and clear offsets by initializing ECU with wheels pointing straight ahead.

Perform **ABS VERIFICATION TEST**.

5. CHECK STEERING ANGLE SENSOR INSTALLATION

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Proper Steering Angle Sensor installation is crucial for proper operation.

Turn the ignition off.

Verify that the Steering Angle Sensor is properly installed. Refer to **INSTALLATION** .

Is the Steering Angle Sensor properly installed?

Yes

Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.

Perform **ABS VERIFICATION TEST**.

C1232-DRIVE TEST: PRESSURE SENSOR

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

During the Drive Test.

Set Conditions

- **Set Condition:**

If the Pressure Sensor fails to activate.

Possible Causes

Possible Causes
HYDRAULIC / BRAKE SYSTEM COMPONENT INSTALLATION
INTEGRATED CONTROL UNIT
PRESSURE SENSOR (HYDRAULIC CONTROL UNIT)
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **CHECK FOR A DTC C1232-DRIVE TEST: PRESSURE SENSOR**

NOTE: **If present, diagnose and repair all other DTCs before diagnosing this DTC.
This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

Perform ECU initialization with drive test. Perform **ABS VERIFICATION TEST**.

Start the engine.

With the scan tool, read and record DTCs.

Does the scan tool display: C1232-DRIVE TEST: PRESSURE SENSOR?

Yes

Go To 2.

No

Refer to the INTERMITTENT CONDITION diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

2. **CHECK HYDRAULIC SYSTEM & BRAKE SYSTEM COMPONENT INSTALLATION & FUNCTION**

Verify that the Anti-Lock Brakes Module and Hydraulic Control Unit are properly installed.

Verify that the hydraulic system is properly filled and bled.

Verify that the brake system components are installed and functioning properly.

Were any problems found?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Clean contacts in HCU first if problem reoccurs replace the Integrated Control Unit in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

C1234-DRIVE TEST: SENSOR CLUSTER INSTALLATION

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

During the Drive Test.

Set Conditions

• **Set Condition:**

If the Anti-Lock Brakes Module detects implausible Dynamics Sensor data.

Possible Causes

Possible Causes

DYNAMICS SENSOR INSTALLATION
DYNAMICS SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. CHECK FOR A DTC C1234-DRIVE TEST: SENSOR CLUSTER INSTALLATION

NOTE: **If present, diagnose and repair all other DTCs before diagnosing this DTC.
This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

Perform ECU initialization with drive test. Perform **ABS VERIFICATION TEST**.

Start the engine.

With the scan tool, read and record DTCs.

Does the scan tool display: C1234-DRIVE TEST: SENSOR CLUSTER INSTALLATION?

Yes

Go To 2.

No

Refer to the INTERMITTENT CONDITION diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

2. CHECK THE DYNAMICS SENSOR INSTALLATION

NOTE: **Dynamics Sensor installation and mounting bolt torque is crucial for
proper operation.**

Turn the ignition off.

Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.

Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

Were any problems found?

Yes

Repair as necessary.
Perform **ABS VERIFICATION TEST**.

No

Replace the Dynamics Sensor in accordance with the Service Information.
Perform **ABS VERIFICATION TEST**.

C1238-DRIVE TEST: UNSUCCESSFUL

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

During the Drive Test.

Set Conditions

• **Set Condition:**

If the Anti-Lock Brakes Module detects a fault with the Steering Angle Sensor, the Pressure Sensor, or the Dynamics Sensor.

Possible Causes

Possible Causes
STEERING ANGLE SENSOR PRESSURE SENSOR DYNAMICS SENSOR ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. DIAGNOSE & REPAIR ALL DTCs

Repair

Diagnose and repair all DTCs.

C1239-EMISSIONS ROLLS TEST ACTIVE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Theory Of Operation

The functional effects are that the output signal for all wheel speeds mimic the wheel with the highest wheel speed.

This DTC sets when the Emissions Rolls Test is active.

Close out the Emissions Rolls Test though the Gateway Module.

C123B-ESP SYSTEM CONTROL TOO LONG

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- Set Condition:**

When the Anti-Lock Brake Module indicates ESP control lasting longer the 10 seconds.

Possible Causes

Possible Causes
HYDRAULIC/BRAKE ISSUE
DYNAMICS SENSOR
INTEGRATED CONTROL MODULE
STEERING ANGLE SENSOR
WHEEL ALIGNMENT

Diagnostic Test

1. CHECK FOR A DTC C123B-ESP SYSTEM CONTROL TOO LONG

NOTE: If other DTCs are set they must be repaired before continuing. To help in the service of the ESP System, it is recommend speaking to the customer to find out what type of environment they were driving in when the ESP

concern took place, heavy rain, snow or ice. This should be considered normal operation and no repair is necessary. This DTC may set while driving under excessive driving conditions.

Turn the ignition on.

Perform ECU initialization with drive test. Perform ABS VERIFICATION TEST.

NOTE: Drive test must be performed correctly for ECU to initialize.

Cycle the ignition switch from off to on.

Did the ECU initialization/drive test pass?

Yes

Go To 2.

No

Refer to associated drive test diagnostic procedure.

Refer to the DTC list. See DIAGNOSIS AND TESTING.

2. CHECK STEERING ANGLE SIGNAL

Turn steering wheel so wheels point in a straight ahead position.

With scan tool read Steering Angle Sensor Signal.

Is the Steering Angle reading within ± 6 degrees?

Yes

Go To 4.

No

Go To 3.

3. CHECK STEERING ANGLE INSTALLATION AND WHEEL ALIGNMENT

NOTE: Proper Steering Angle Sensor installation is crucial for proper operation.

Turn the ignition off.

Inspect the vehicle for damage causing tracking problems or steering wheel misalignment.

Inspect the steering column and intermediate shaft for damage.

Verify that the Steering Angle Sensor is properly installed.

Were any problems found?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Replace the Steering Angle Sensor in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

4. CHECK HYDRAULIC SYSTEM & BRAKE SYSTEM COMPONENT INSTALLATION & FUNCTION

Verify that the Anti-Lock Brakes Module and Hydraulic Control Unit are properly installed.

Verify that the hydraulic system is properly filled and bled.

Verify that the brake system components are installed and functioning properly.

Were any problems found?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 5.

5. REPLACE THE INTEGRATED CONTROL MODULE & VERIFY IF THE DTC IS STILL ACTIVE

Replace the Integrated Control Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

Connect all previously disconnected components and connectors.

Turn the ignition on.

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

WARNING: Ensure brake capability is available before road testing.

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 20 km/h (6 and 12 mph).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

Replace the Dynamics Sensor in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Test complete.

C123C-DYNAMICS SENSOR MOUNTING/INSTALLATION PERFORMANCE

Circuit Schematic

81d0#51

Fig. 56: Dynamics Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

After initialization and no under voltage condition.

Set Conditions

- **Set Condition:**

If the Anti-Lock Brakes Module detects implausible Dynamics Sensor values.

Possible Causes

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
DYNAMICS SENSOR INSTALLATION
DYNAMICS SENSOR
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

NOTE: If present, diagnose and repair DTC C2114-DYNAMICS SENSOR SUPPLY VOLTAGE LOW or DTC C2115-DYNAMICS SENSOR SUPPLY VOLTAGE HIGH before diagnosing this DTC.

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

WARNING: Ensure brake capability is available before road testing.

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 20 km/h (6 and 12 mph).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

Go To 2.

No

The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the **ABS INTERMITTENT CONDITION.**

2. CHECK THE DYNAMICS SENSOR INSTALLATION

NOTE: **Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.**

Turn the ignition off.

Check the Dynamics Sensor to ensure properly oriented in vehicle with connector rearward in vehicle behind the park brake sled on center tunnel.

Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

Were any problems found?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST.**

No

Go To 3.

3. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

Were any problems found?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. **REPLACE DYNAMICS SENSOR & VERIFY IF DTC IS STILL ACTIVE**

Replace the Dynamics Sensor in accordance with the Service Information. Perform ABS VERIFICATION TEST. See **STANDARD PROCEDURE**.

Turn the ignition on.

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

WARNING: Ensure brake capability is available before road testing.

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/h (6 and 15 mph).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Test Complete.

Perform **ABS VERIFICATION TEST**.

C123F-STEERING ANGLE SENSOR COMPARATIVE PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

During continuous driving.

Set Conditions

- **Set Condition:**

If the Anti-Lock Brakes Module detects that either the calculated steering wheel angle offset or the steering wheel angle signal measured output is implausible or has the wrong sign.

Possible Causes

Possible Causes
VEHICLE DAMAGE STEERING COLUMN / INTERMEDIATE SHAFT DAMAGE STEERING WHEEL ALIGNMENT STEERING ANGLE SENSOR LOOSE STEERING ANGLE SENSOR IMPROPERLY INSTALLED (WRONG MOUNTING POSITION) STEERING ANGLE SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. PERFORM TEST DRIVE & VERIFY DTC IS STILL ACTIVE

NOTE: If present, diagnose and repair DTC C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE, C121A-STEERING ANGLE SENSOR NOT INITIALIZED, or C1240-STEERING ANGLE SENSOR OVERTRAVEL PERFORMANCE before diagnosing this DTC.

Turn the ignition on.

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/h (6 and 15 mph).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

Go To 2.

No

Perform the ABS Intermittent Condition diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION.**

2. INSPECT VEHICLE, STEERING COLUMN, & INTERMEDIATE SHAFT FOR DAMAGE

NOTE: If possible, check vehicle repair history for collision damage.

Turn the ignition off.

Inspect the vehicle for damage causing tracking problems or steering wheel misalignment.

Inspect the steering column and intermediate shaft for damage.

Were any problems found?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST.**

No

Go To 3.

3. CHECK STEERING ANGLE SENSOR OUTPUT

Start the engine.

Turn the steering wheel so wheels point in a straight ahead position.

With the scan tool, read the Steering Angle Sensor position.

Is the Steering Angle Sensor Position within $\pm 15^\circ$ degrees?

Yes

Go To 5.

No

Go To 4.

4. **CHECK STEERING ANGLE SENSOR INSTALLATION**

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Proper Steering Angle Sensor installation is crucial for proper operation.

Verify that the Steering Angle Sensor is properly installed.

Is the Steering Angle Sensor properly installed?

Yes

Go To 5.

No

Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.

Perform **ABS VERIFICATION TEST**.

5. **CHECK STEERING ANGLE SENSOR OUTPUT WHILE ROTATING THE STEERING WHEEL**

With the scan tool, read the Steering Angle Sensor position while rotating the steering wheel to the right and then to the left. The Steering Angle Sensor position should decrease when rotating the steering wheel to the right and increase when rotating the steering wheel to the left.

Did the steering angle change accordingly?

Yes

Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Replace the Steering Angle Sensor in accordance with the Service Information and clear offsets by initializing ECU with wheels pointing straight ahead.

Perform the ABS VERIFICATION TEST. See **STANDARD PROCEDURE**.

C1240-STEERING ANGLE SENSOR OVERTRAVEL PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With ignition on, but not if a CAN time out failure is detected.

Or, if a fault is detected by the Steering Angle Sensor.

Set Conditions

- **Set Condition:**

If the Anti-Lock Brakes Module detects that the absolute value of the measured steering wheel angle is greater than 720 degrees.

Possible Causes

Possible Causes
VEHICLE DAMAGE STEERING COLUMN / INTERMEDIATE SHAFT DAMAGE STEERING WHEEL ALIGNMENT STEERING ANGLE SENSOR LOOSE STEERING ANGLE SENSOR IMPROPERLY INSTALLED (WRONG MOUNTING POSITION) STEERING ANGLE SENSOR

Diagnostic Test

1. PERFORM TEST DRIVE & VERIFY DTC IS STILL ACTIVE

Turn the ignition on.

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

Turn steering wheel from lock to lock.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

Go To 2.

No

Perform the ABS Intermittent Condition diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

2. CHECK STEERING ANGLE SENSOR OUTPUT

Start the engine.

Center the steering wheel.

With the scan tool, read the Steering Angle Sensor Position.

Is the Steering Angle Sensor Position within $\pm 15^\circ$?

Yes

Go To 4.

No

Go To 3.

3. INSPECT VEHICLE, STEERING COLUMN, & INTERMEDIATE SHAFT FOR DAMAGE

NOTE: **If possible, check vehicle repair history for collision damage.**

Turn the ignition off.

Inspect the vehicle for damage causing tracking problems or steering wheel misalignment.

Inspect the steering column and intermediate shaft for damage.

Center the steering wheel.

With the scan tool, read the Steering Angle Sensor Position.

Is the Steering Angle Sensor Position within $\pm 15^\circ$?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. **CHECK STEERING ANGLE CHANGE**

Turn steering wheel so wheels point in a straight ahead position.

With scan tool check steering angle if reading travels to 720 degrees while rotating wheel from lock to lock.

NOTE: Sensor damage can occur if wheel is turned over 720 degrees.

Rotate steering wheel to the right and the degrees will decrease and rotate steering wheel to the left and the degrees will increase.

Did the steering angle change accordingly and display less than 720 degrees from lock to lock?

Yes

Go To 5.

No

Replace the Steering Angle Sensor in accordance with the Service Information and clear offsets by initializing ECU with wheels pointing straight ahead.

Perform **ABS VERIFICATION TEST**.

5. **CHECK STEERING ANGLE SENSOR INSTALLATION**

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Proper Steering Angle Sensor installation is crucial for proper operation.

Verify that the Steering Angle Sensor is properly installed. Refer to **INSTALLATION** .

Is the Steering Angle Sensor properly installed?

Yes

Replace the Steering Angle Sensor and clear offsets by initializing ECU with wheels pointing straight ahead, in accordance with the Service Information.
Perform **ABS VERIFICATION TEST**.

No

Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.
Perform **ABS VERIFICATION TEST**.

C1243-G SENSOR NOT INITIALIZED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Once after ignition on.

Set Conditions

- **Set Condition:**

If the stored zero point calibration value of the longitudinal acceleration sensor is invalid.

Possible Causes

Possible Causes
DYNAMICS SENSOR NOT CALIBRATED
DYNAMICS SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. PERFORM ECU INITIALIZATION

Turn the ignition on.

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

Perform ECU initialization with drive test. Perform **ABS VERIFICATION TEST**.

NOTE: The ECU Initialization process must include driving the vehicle into a 90° turn.

Park the vehicle.

Go To 2.

2. **VERIFY IF DTC IS STILL ACTIVE**

Cycle the ignition switch.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/h (6 and 15 mph).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

NOTE: Vehicles without a Dynamics Sensor replace Anti-Lock Brake Module.

Replace the Dynamics Sensor or Anti-Lock Brake Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Perform the ABS Intermittent Condition diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

C2100-BATTERY VOLTAGE LOW

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuous monitoring.

Set Conditions

- **Set Condition:**

If the Anti-Lock Brake Module detects system voltage is below 9.3 volts.

Possible Causes

Possible Causes
DTCS IN THE ECM/PCM CHARGING SYSTEM FAILURE ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. **DTCS IN THE PCM**

NOTE: **This DTC must be active for the results of this test to be valid.**

NOTE: **Light will be on and not set a DTC when battery voltage is below 9.3 volts and no wheel speed.**

Turn the ignition on.

With the scan tool, read and record DTCs from the PCM.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Start the engine.

Road test the vehicle over 6 km/h (3.4 mph).

NOTE: **Vehicle must be driven above 6 km/h (3.4 mph) for set conditions to be met.**

With the scan tool, read and record DTCs.

With the scan tool read DTCs from the PCM.

Are any charging system codes present?

Yes

Repair the charging system DTC in the PCM.

Perform **POWERTRAIN VERIFICATION TEST**.

No

Go To 2.

2. CHARGING SYSTEM FAILURE

Start the engine.

Connect voltmeter to vehicle battery.

Is the vehicle battery voltage under 9.3 volts?

No

Go To 3.

Yes

Repair the charging system per service information.

Perform **ABS VERIFICATION TEST**.

3. CHARGING POWER SUPPLY VOLTAGE

With a scan tool read Power Supply Voltage.

Is Power Supply Voltage under 9.3 volts?

No

Refer to the INTERMITTENT CONDITION Diagnostic Procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

Yes

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuous monitoring.

Set Conditions

- **Set Condition:**

If the Anti-Lock Brake Module detects system voltage is above 16.8 volts.

Possible Causes

Possible Causes
DTCs IN THE PCM ANTI-LOCK BRAKES MODULE CHARGING SYSTEM FAILURE

Diagnostic Test

NOTE: **This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, read and record DTCs from the PCM.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Start the engine.

With the scan tool, read and record DTCs.

With the scan tool read DTCs from the PCM.

Are any charging system codes present?

Yes

Repair the charging system DTC in the PCM.
Perform **POWERTRAIN VERIFICATION TEST** .

No

Go To 1.

CHARGING SYSTEM FAILURE

Start the engine.

Connect voltmeter to vehicle battery.

Is the vehicle battery voltage over 16.8 volts?

No

Go To 2.

Yes

Repair the charging system per service information.

Perform **ABS VERIFICATION TEST**.

CHARGING POWER SUPPLY VOLTAGE

With a scan tool read Power Supply Voltage.

Is Power Supply Voltage over 16.8 volts?

No

Refer to the INTERMITTENT CONDITION Diagnostic Procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

Yes

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

C2105-ABS VALVE SUPPLY VOLTAGE CIRCUIT LOW

Circuit Schematic

81d0b12

Fig. 57: ABS Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

- Set Condition:

The monitor function test the supply voltage of the valves via the valve feedback lines. If three or more valve response faults occur simultaneously or battery voltage and relay voltage differ by 0.8 volts for 500 mSec, a DTC is set.

Possible Causes

Possible Causes
LOW VOLTAGE AT THE ABM ABM INTERNAL

Diagnostic Test

1. LOW VOLTAGE AT THE ABM

With the scan tool read ABS Valve Feed and Power Supply Voltage in the ABM and compare the two reading to actual battery voltage from a voltmeter.

NOTE: **Battery must be fully charged.**

Are all readings within .8 of a volt?

Yes

Replace the ABM per service information.
Perform **ABS VERIFICATION TEST**.

No

Go To 2.

2. ABM INTERNAL

Turn key off.

Disconnect the ABM harness connector.

NOTE: **Check connector - Clean/repair as necessary.**

Turn key on, engine off.

With a test light check (A111) and (A107) Fused B+ output.

Is test light bright like when connected to the battery?

Yes

Replace the ABM per service information.

Perform **ABS VERIFICATION TEST**.

No

Repair the high resistance in the circuits.

Perform **ABS VERIFICATION TEST**.

C2114-DYNAMICS SENSOR SUPPLY VOLTAGE LOW

Circuit Schematic

81d0#51

Fig. 58: Dynamics Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuous monitoring.

Set Conditions

- **Set Condition:**

The Anti-Lock Brake Module detects less than 6.5 volts being supplied to the dynamics sensor.

Possible Causes

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE (F941) DYNAMICS SENSOR SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE (Z914) DYNAMICS SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE DYNAMICS SENSOR ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

Go To 2.

No

Perform the ABS Intermittent Condition diagnostic procedure.
Refer to the **ABS INTERMITTENT CONDITION.**

2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Turn the ignition off.

Check all related wiring for pinched, chafed, pierced, and partially broken wires.

Check all related connectors for broken, bent, pushed out, and corroded terminals.

Were any problems found?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 3.

3. CHECK (F941) DYNAMICS SENSOR SUPPLY CIRCUIT & (Z914) DYNAMICS SENSOR GROUND CIRCUIT FUNCTION

81d0ff61

Fig. 59: Measuring The Voltage Between The Dynamics Sensor Supply Circuit And The Dynamics Sensor Ground Circuit

Courtesy of CHRYSLER LLC

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Measure the voltage between the (F941) Dynamics Sensor Supply Circuit and the (Z914) Dynamics Sensor Ground Circuit.

Is the voltage above 6.5 volts?

Yes

Replace the Dynamics Sensor in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. **CHECK (F941) DYNAMICS SENSOR SUPPLY CIRCUIT FOR OPEN OR HIGH RESISTANCE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, probe the (F941) Dynamics Sensor Supply circuit.

Does the test light illuminate as brightly as when connected directly to B+?

Yes

Go To 5.

No

Repair the (F941) Dynamics Sensor Supply circuit for open or high resistance.

Perform **ABS VERIFICATION TEST**.

5. **CHECK (Z914) DYNAMICS SENSOR GROUND CIRCUIT FOR OPEN OR HIGH RESISTANCE**

Using a 12-volt test light connected to B+, probe the (Z914) Dynamics Sensor Ground circuit.

Does the test light illuminate brightly?

Yes

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Repair the (Z914) Dynamics Sensor Ground circuit for open or high resistance.

Perform **ABS VERIFICATION TEST**.

C2115-DYNAMICS SENSOR SUPPLY VOLTAGE HIGH

Circuit Schematic

81d0#51

Fig. 60: Dynamics Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Upon ignition on, prior to switching the (F941) Dynamics Sensor Supply circuit power on.

Set Conditions

- **Set Condition:**

If the Anti-Lock Brakes Module detects a voltage supplied to the Dynamics Sensor greater than 19.5 volts.

Possible Causes

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE (F941) DYNAMICS SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE DYNAMICS SENSOR ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

Go To 2.

No

Perform the ABS Intermittent Condition diagnostic procedure.
Refer to the **ABS INTERMITTENT CONDITION**.

2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Turn the ignition off.

Check all related wiring for pinched, chafed, pierced, and partially broken wires.

Check all related connectors for broken, bent, pushed out, and corroded terminals.

Were any problems found?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 3.

3. CHECK (F941) DYNAMICS SENSOR SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE

Disconnect the Anti-Lock Brakes Module harness connector.

Turn the ignition on.

Connect volt meter and measure the voltage of the (F941) Dynamics Sensor Supply Circuit.

Is the voltage above 19.5 volts?

Yes

Replace the Dynamics Sensor in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. CHECK (F941) DYNAMICS SENSOR SUPPLY CIRCUIT FOR OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, probe the (F941) Dynamics Sensor Supply circuit.

Does the test light illuminate as brightly as when connected directly to B+?

Yes

Go To 5.

No

Repair the (F941) Dynamics Sensor Supply circuit for open or high resistance.

Perform **ABS VERIFICATION TEST**.

5. CHECK (Z914) DYNAMICS SENSOR GROUND CIRCUIT FOR OPEN OR HIGH RESISTANCE

Using a 12-volt test light connected to B+, probe the (Z914) Dynamics Sensor Ground circuit.

Does the test light illuminate brightly?

Yes

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Repair the (Z914) Dynamics Sensor Ground circuit for open or high resistance.

Perform **ABS VERIFICATION TEST**.

C2116-ABS PUMP MOTOR SUPPLY LOW VOLTAGE

Circuit Schematic

81d0b12

Fig. 61: ABS Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on and the ABS Pump Motor deactivated, but not if supply voltage faults are detected.

Or, if the control is switched off.

Set Conditions

- **Set Condition:**

If the Anti-Lock Brakes Module detects either a low voltage condition when the ABS Pump Motor is activated or deactivated or a high voltage condition when the ABS Pump Motor is deactivated.

Possible Causes

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
ABS PUMP MOTOR FUSE OPEN
(A107) FUSED B(+) CIRCUIT SHORTED TO GROUND, OPEN, OR HIGH RESISTANCE
(Z903) GROUND CIRCUIT OPEN, OR HIGH RESISTANCE
ANTI-LOCK BRAKES MODULE
PUMP MOTOR (HYDRAULIC CONTROL UNIT)

Diagnostic Test

1. **CHECK FOR A DTC C2116-ABS PUMP MOTOR SUPPLY LOW VOLTAGE**

NOTE: **This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

Road test the vehicle over 40 km/h (25 mph).

NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.**

With the scan tool, read DTCs.

Does the scan tool display: C2116-ABS PUMP MOTOR SUPPLY LOW VOLTAGE?

Yes

Go To 2.

No

Perform the ABS Intermittent Condition diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Turn the ignition off.

Visually inspect the Anti-Lock Brakes Module harness connector and wiring harness for damage.

Check all related wiring for pinched, chafed, pierced, and partially broken wires.

Check all related connectors for broken, bent, pushed out, and corroded terminals.

Were any problems found?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 3.

3. CHECK ABS PUMP MOTOR FUSE

Remove and visually inspect the ABS Pump Motor fuse.

Is the fuse open?

Yes

Go To 4.

No

Go To 5.

4. CHECK (A107) FUSED B(+) CIRCUIT FOR A SHORT TO GROUND

**MODULE-
ANTILOCK
BRAKES**

816f6b5a

Fig. 62: Checking Fused B(+) Circuit For Short To Ground
Courtesy of CHRYSLER LLC

Disconnect the Anti-Lock Brakes Module harness connector.

Measure the resistance of the (A107) Fused B(+) circuit between ground and the Anti-Lock Brakes Module harness connector.

Is the resistance below 10k ohms?

Yes

Repair the (A107) Fused B(+) circuit for a short to ground.

Perform **ABS VERIFICATION TEST**.

No

Go To 5.

5. CHECK (A107) FUSED B(+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

Fig. 63: Checking Fused B(+) Circuit
Courtesy of CHRYSLER LLC

Replace the ABS Pump Motor fuse.

Using a 12-volt test light connected to ground, probe the (A107) Fused B(+) circuit.

NOTE: **The test light should illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly?

Yes

Go To 6.

No

Repair the (A107) Fused B(+) circuit for an open or high resistance.

Perform **ABS VERIFICATION TEST**.

6. CHECK (Z903) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

**MODULE-
ANTILOCK
BRAKES**

81700845

Fig. 64: Checking Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER LLC

Using a 12-volt test light connected to 12 volts, probe the (Z903) Ground circuit.

NOTE: The test light should illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly on both circuits?

Yes

Go To 7.

No

Repair (Z903) circuit for an open or high resistance.

Perform **ABS VERIFICATION TEST**.

7. REPLACE ANTI-LOCK BRAKES MODULE & VERIFY IF DTC IS STILL ACTIVE

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

Turn the ignition on.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

Replace the Hydraulic Control Unit in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Perform the ABS Intermittent Condition diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

C2200-ANTI-LOCK BRAKE MODULE INTERNAL

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Ignition on. The Anti-Lock Brake Module monitors its internal microprocessors for correct operation.

Set Conditions

- **Set Condition:**

If the Anti-lock brake module detects an internal fault, the DTC is set.

Possible Causes

Possible Causes
ABM - INTERNAL FAULT

Diagnostic Test

1. ABM INTERNAL FAILURE DTC PRESENT

Turn the ignition on.

With the scan tool, read DTCs.

With the scan tool, erase DTCs.

Turn the ignition off.

Turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display ANTI-LOCK BRAKE MODULE INTERNAL FAILURE?

Yes

Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform **ABS VERIFICATION TEST**.

No

Perform the ABS Intermittent Condition diagnostic procedure.
Refer to the **ABS INTERMITTENT CONDITION**.

C2202-ORIGINAL VIN MISMATCH/MISSING

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

At power up, VIN is read off the CAN bus.

Set Conditions

- **Set Condition:**

The VIN stored in the ABM does not match the VIN read off of the CAN bus.

Possible Causes

Possible Causes
ABM MOVED FROM DIFFERENT VEHICLE WRONG VIN PROGRAMMED INTO VEHICLE

Diagnostic Test

1. CHECK FOR A DTC C2202-ORIGINAL VIN MISMATCH/MISSING

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

Perform ECU initialization with drive test. Perform **ABS VERIFICATION TEST**.

Start the engine.

With the scan tool, read and record DTCs.

Does the scan tool display: C2202-ORIGINAL VIN MISMATCH/MISSING?

Yes

Go To 2.

No

ABM has learned new VIN.

Perform **ABS VERIFICATION TEST**.

2. WRONG VIN PROGRAMMED INTO VEHICLE

Is the VIN stored in the ABM and PCM the same?

Yes

Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Reprogram the VIN per service information.

Perform **ABS VERIFICATION TEST**.

C2204-DYNAMICS SENSOR INTERNAL

Circuit Schematic

81d0#51

Fig. 65: Dynamics Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously monitored.

Set Conditions

- **Set Condition:**

If the Anti-Lock Brakes Module detects that the Lateral Sensor or Yaw sensor signal sent from the Dynamics sensor is out of range or implausible at standstill and with speed.

Possible Causes

Possible Causes
DYNAMICS SENSOR INSTALLATION DYNAMICS SENSOR ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

WARNING: Ensure brake capability is available before road testing.

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 20 km/h (6 and 12 mph).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

Go To 2.

No

Perform the ABS Intermittent Condition diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

2. CHECK THE DYNAMICS SENSOR INSTALLATION

NOTE: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.

Turn the ignition off.

Check the Dynamics Sensor to ensure properly oriented in vehicle with connector rearward in vehicle behind the park brake sled on center tunnel.

Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

Were any problems found?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 3.

3. DYNAMICS SENSOR

Connect all previously disconnected components and connectors.

WARNING: Ensure brake capability is available before road testing.

Replace the Dynamics Sensor in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

Did DTC C2204-DYNAMICS SENSOR INTERNAL reset?

Yes

Replace the Anti-Lock Brake Module
Perform **ABS VERIFICATION TEST**.

No

Repair is complete.

C2205-STEERING ANGLE SENSOR INTERNAL

Circuit Schematic

Monitor Conditions

When Monitored:

With ignition on, but not if supply voltage faults are detected.

Set Conditions

- **Set Condition:**

If the Anti-Lock Brakes Module detects that the Steering Angle Sensor sends an internal failure message.

Possible Causes

Possible Causes
STEERING ANGLE SENSOR

Diagnostic Test

1. **CHECK FOR A DTC C2205-STEERING ANGLE SENSOR INTERNAL**

NOTE: **This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

WARNING: Ensure brake capability is available before road testing.

Start the vehicle and turn the wheel from lock to lock.

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/h (6 and 15 mph).

Park the vehicle.

With the scan tool, read and record DTCs.

Does the scan tool display: C2205-STEERING ANGLE SENSOR INTERNAL?

Yes

Replace the Steering Angle Sensor in accordance with the Service Information.
Perform **ABS VERIFICATION TEST**.

No

Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform **ABS VERIFICATION TEST**.

C2206-VEHICLE CONFIGURATION MISMATCH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

When the Anti-Lock Brake Module detects the signal from the gateway module relevant for vehicle characteristic is missing or does not match for a period greater than the specified fault duration.

Possible Causes

Possible Causes
TIPM / PCM NOT CONFIGURED CORRECTLY ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C2206-VEHICLE CONFIGURATION MISMATCH

NOTE: This DTC must be active for the results of this test to be valid.

NOTE: This DTC will be active when a new module is installed until initialization is performed.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Perform ECU initialization on ABM. Perform **ABS VERIFICATION TEST**.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTCs.

Does the scan tool display: C2206-VEHICLE CONFIGURATION MISMATCH?

Yes

Go To 2.

No

Perform the ABS Intermittent Condition diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

2. VERIFY THAT THE TIPM/PCM IS CONFIGURED CORRECTLY

Turn the ignition on.

Check the following data to verify the TIPM/PCM is configured correctly. Engine Displacement (PCM), XWD 4x4, all Wheel Drive, (TIPM), Vehicle Line (TIPM), Transference type 0= 253 1=256.

NOTE: **The DTC will be active when a new controller is installed until initialization is performed.**

Was the TIPM/PCM configured correctly?

Yes

Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Reprogram the appropriate module.

Perform **ABS VERIFICATION TEST** or **POWERTRAIN VERIFICATION TEST** .

U0002-CAN C BUS OFF PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- Set Condition:**

The Anti-Lock Brake Module detects a corrupt CAN C Bus message.

Possible Causes

Possible Causes
(D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND
(D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND
(D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
(D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE
(D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT
ANTILOCK BRAKE MODULE
POWERTRAIN CONTROL MODULE
ENGINE CONTROL MODULE (DIESEL ONLY)
TRANSMISSION CONTROL MODULE
STEERING ANGLE SENSOR
AUTOMATIC SWAY BAR SYSTEM MODULE
WIRELESS CONTROL MODULE
OCCUPANT RESTRAINT CONTROLLER MODULE
OCCUPANT CLASSIFICATION MODULE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase TIPM DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. ANTILOCK BRAKE MODULE - INTERNAL SHORT

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes

Go To 3.

No

Inspect the wiring and connectors for damage or shorted circuits in accordance with the service information. If ok, replace and program the Anti-Lock Brake Module in accordance with the service information.

Perform **ABS VERIFICATION TEST**.

3. POWERTRAIN CONTROL MODULE - INTERNAL SHORT

Turn the ignition off.

Disconnect the Powertrain Control Module C1 harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes

Go To 4.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Powertrain Control Module in accordance with the service information.

Perform **POWERTRAIN VERIFICATION TEST** .

4. ENGINE CONTROL MODULE (DIESEL ONLY) - INTERNAL SHORT

Turn the ignition off.

NOTE: **If vehicle is not equipped with this module, answer yes to the question.**

Disconnect the Engine Control Module harness connectors.

Turn the ignition on.

With the scan tool, record and erase TIPM DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes

Go To 5.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the

Engine Control Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

5. TRANSMISSION CONTROL MODULE - INTERNAL SHORT

Turn the ignition off.

NOTE: **If vehicle is not equipped with this module, answer yes to the question.**

Disconnect the Transmission Control Module harness connectors.

Turn the ignition on.

With the scan tool, record and erase TIPM DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes

Go To 6.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Transmission Control Module in accordance with the service information.

Perform **POWERTRAIN VERIFICATION TEST** .

6. STEERING ANGLE SENSOR - INTERNAL SHORT

Turn the ignition off.

NOTE: **If vehicle is not equipped with this module, answer yes to the question.**

Disconnect the Steering Angle Sensor harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes

Go To 7.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Steering Angle Sensor in accordance with the service information.

Perform **ABS VERIFICATION TEST**.

7. AUTOMATIC SWAY BAR SYSTEM MODULE - INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Automatic Sway Bar System Module harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes

Go To 8.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Automatic Sway Bar System Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

8. WIRELESS CONTROL MODULE - INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Wireless Control Module harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes

Go To 9.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Wireless Control Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

9. **OCCUPANT RESTRAINT CONTROLLER MODULE - INTERNAL SHORT**

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Occupant Restraint Controller Module harness connectors.

Turn the ignition on.

With the scan tool, record and erase TIPM DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes

Go To 10.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Occupant Restraint Controller Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

10. OCCUPANT CLASSIFICATION MODULE - INTERNAL SHORT

Turn the ignition off.

NOTE: **If vehicle is not equipped with this module, answer yes to the question.**

Disconnect the Occupant Classification Module harness connectors.

Turn the ignition on.

With the scan tool, record and erase TIPM DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes

Go To 11.

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Occupant Classification Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

11. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

Fig. 67: Checking Voltage Between CAN C Bus (+) Circuit & Ground
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Totally Integrated Power Module C1 harness connector.

Turn the ignition on.

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is there any voltage present?

Yes

Repair the (D65) CAN C Bus (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 12.

12. (D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE

Fig. 68: Measuring Voltage Between CAN C Bus (-) Circuit & Ground
 Courtesy of CHRYSLER LLC

Measure the voltage between the (D64) CAN C Bus (-) circuit and ground.

Is there any voltage present?

Yes

Repair the (D64) CAN C Bus (-) circuit for a short to voltage.
 Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 13.

13. **(D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND**

MODULE-
TOTALLY
INTEGRATED
POWER C1

8198930f

Fig. 69: Checking CAN C Bus (+) Circuit For Short To Ground
Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance between ground and the (D65) CAN C Bus (+) circuit.

Is any resistance present?

Yes

Repair the (D65) CAN C Bus (+) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 14.

14. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND

INTEGRATED
POWER C1

8198931a

Fig. 70: Measuring Resistance Between Ground & CAN C Bus (-) Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is any resistance present?

Yes

Repair the (D64) CAN C Bus (-) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 15.

15. **(D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT**

Fig. 71: Checking Resistance Between CAN C Bus (+) Circuit & CAN C Bus (-) Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between the (D65) CAN C Bus (+) circuit and the (D64) CAN C Bus (-) circuit.

Is any resistance present?

Yes

Repair the (D65) CAN C Bus (+) circuit for a short to the (D64) CAN C Bus (-) circuit.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Totally Integrated Power Module in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

U0100-LOST COMMUNICATION WITH ECM/PCM

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed

Set Conditions

- **Set Condition:**

If the Anti-Lock Brakes Module fails to receive bus messages from the ECM or PCM for approximately 500 ms.

Possible Causes

Possible Causes
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CAN C BUS CIRCUITS OPEN OR SHORTED
ECM OR PCM POWER AND GROUND
ECM OR PCM
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

NOTE: **Verify the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

Go To 2.

No

The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires. Refer to the **ABS INTERMITTENT CONDITION**.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs related to the conditions listed above?

Yes

Diagnose and repair the DTC(s). Refer to **DIAGNOSTIC CODE INDEX**.

No

Go To 3.

3. VERIFY THAT THE ECM OR PCM IS ACTIVE ON THE BUS

With the scan tool, select ECU View.

Verify that the ECM or PCM is active on the bus.

Is the ECM or PCM active on the bus?

Yes

Go To 4.

No

Perform ***STORED LOST COMMUNICATION DTCS** .

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs "Logged Against" the ECM or PCM?

Yes

Replace/update the ECM or PCM in accordance with the service information.

Perform **POWERTRAIN VERIFICATION TEST** .

No

Replace the Anti-Lock Brakes Module in accordance with the service information.

Perform **ABS VERIFICATION TEST**.

U0101-LOST COMMUNICATION WITH TCM

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed

Set Conditions

- Set Condition:**

If the Anti-Lock Brakes Module fails to receive bus messages from the TCM for approximately 500 ms.

Possible Causes

Possible Causes
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CAN C BUS CIRCUITS OPEN OR SHORTED
TCM POWER AND GROUND
PCM DTCs PRESENT
TCM
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

- NOTE:

Verify the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
- NOTE:

If present, diagnose and repair DTC U0002-CAN C BUS OFF PERFORMANCE, DTC or DTC U1502-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM TIPM before diagnosing this DTC.

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

Go To 2.

No

Perform ***STORED LOST COMMUNICATION DTCS** .

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs related to the conditions listed above?

Yes

Diagnose and repair the DTC(s). Refer to **DIAGNOSTIC CODE INDEX**.

No

Go To 3.

3. VERIFY THAT THE TCM IS ACTIVE ON THE BUS

With the scan tool, select ECU View.

Verify that the TCM is active on the bus.

Is the TCM active on the bus?

Yes

Go To 4.

No

Refer to **DIAGNOSTIC CODE INDEX** for a no response test procedure.

Perform **BODY VERIFICATION TEST - VER 1** .

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs "Logged Against" the TCM?

Yes

Replace/update the TCM in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Anti-Lock Brakes Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

U0125-LOST COMMUNICATION WITH DYNAMICS SENSOR

Circuit Schematic

81d0#51

Fig. 72: Dynamics Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuous monitoring.

Set Conditions

- **Set Condition:**

If the Anti-Lock Brakes Module fails to receive bus messages from the Dynamics Sensor.

Possible Causes

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT SHORTED TO GROUND, SHORTED TO VOLTAGE, OR OPEN (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT SHORTED TO GROUND, SHORTED TO VOLTAGE, OR OPEN DYNAMICS SENSOR ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

NOTE: If present, diagnose and repair DTC C2114-DYNAMICS SENSOR SUPPLY VOLTAGE LOW or DTC C2115-DYNAMICS SENSOR SUPPLY VOLTAGE HIGH before proceeding.

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

Go To 2.

No

The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the **ABS INTERMITTENT CONDITION**.

2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

Were any problems found?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 3.

3. CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE

81d16324

Fig. 73: Measuring The Voltage Of The Dynamics Sensor High Data Link Circuit
Courtesy of CHRYSLER LLC

Disconnect the Anti-Lock Brakes Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (D465) Dynamics Sensor High Data Link circuit.

Is there any voltage present?

Yes

Repair the (D465) Dynamics Sensor High Data Link circuit for a short to voltage.

Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. **CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO GROUND**

81d16331

Fig. 74: Measuring The Resistance Of The Dynamics Sensor High Data Link Circuit Between Ground And The Dynamics Sensor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance of the (D465) Dynamics Sensor High Data Link circuit between ground and the Dynamics Sensor harness connector.

Is the resistance below 5.0 ohms?

Yes

Repair the (D465) Dynamics Sensor High Data Link circuit for a short to ground.

Perform **ABS VERIFICATION TEST**.

No

Go To 5.

5. **CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR AN OPEN**

81d16335

Fig. 75: Measuring The Resistance Of The Dynamics Sensor High Data Link Circuit Between The Dynamics Sensor Harness Connector And The Anti-Lock Brakes Module Harness Connector
 Courtesy of CHRYSLER LLC

Measure the resistance of the (D465) Dynamics Sensor High Data Link circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.

Is the resistance below 5.0 ohms?

Yes

Go To 6.

No

Repair the (D465) Dynamics Sensor High Data Link circuit for an open.

Perform **ABS VERIFICATION TEST**.

6. CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE

814f0405

Fig. 76: Checking Dynamics Sensor High Data Link Circuit For Short To Voltage
 Courtesy of CHRYSLER LLC

Turn the ignition on.

Measure the voltage of the (D464) Dynamics Sensor Low Data Link circuit.

Is there any voltage present?

Yes

Repair the (D464) Dynamics Sensor Low Data Link circuit for a short to voltage.
 Perform **ABS VERIFICATION TEST**.

No

Go To 7.

7. CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO

GROUND

814f0412

Fig. 77: Checking Dynamics Sensor High Data Link Circuit For Short To Ground
Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance of the (D464) Dynamics Sensor Low Data Link circuit between ground and the Dynamics Sensor harness connector.

Is the resistance below 5.0 ohms?

Yes

Repair the (D464) Dynamics Sensor Low Data Link circuit for a short to ground.
Perform **ABS VERIFICATION TEST**.

No

Go To 8.

8. **CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR AN OPEN**

81d16361

Fig. 78: Measuring The Resistance Of The Dynamics Sensor Low Data Link Circuit Between The Dynamics Sensor Harness Connector And The Anti-Lock Brakes Module Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (D464) Dynamics Sensor Low Data Link circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.

Is the resistance below 5.0 ohms?

Yes

Replace the Dynamics Sensor in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Repair the (D464) Dynamics Sensor Low Data Link circuit for an open.

Perform ABS VERIFICATION TEST.

U0126-LOST COMMUNICATION WITH STEERING ANGLE SENSOR

Circuit Schematic

Fig. 79: Steering Angle Sensor circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed

Set Conditions

- Set Condition:**

If the Anti-Lock Brakes Module fails to receive bus messages from the Steering Angle Sensor for approximately 500 ms.

Possible Causes

Possible Causes
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CAN C BUS CIRCUITS OPEN OR SHORTED
STEERING ANGLE SENSOR POWER AND GROUND
STEERING ANGLE SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: **Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

Go To 2.

No

The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the **ABS INTERMITTENT CONDITION**.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs related to the conditions listed above?

Yes

Diagnose and repair the DTC(s). Refer to **DIAGNOSTIC CODE INDEX**.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. VERIFY THAT THE STEERING ANGLE SENSOR IS ACTIVE ON THE BUS

With the scan tool, select ECU View.

Verify that the Steering Angle Sensor is active on the bus.

Is the Steering Angle Sensor active on the bus?

Yes

Go To 4.

No

Refer to ***STORED LOST COMMUNICATION DTCS** .

Perform **BODY VERIFICATION TEST - VER 1** .

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs**

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs "Logged Against" the STEERING ANGLE SENSOR?

Yes

Replace/update the Steering Angle Sensor in accordance with the service information.
Perform **ABS VERIFICATION TEST**.

No

Replace the Anti-Lock Brakes Module in accordance with the service information.
Perform **ABS VERIFICATION TEST**.

U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- TIPM is configured correctly

Set Conditions

• **Set Condition:**

Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately 2 to 5 seconds.

Possible Causes

Possible Causes
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED CONTROL MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes

Go To 2.

No

Refer to ***STORED LOST COMMUNICATION DTCS** .

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

Diagnose and repair the DTC. Refer to **DIAGNOSTIC CODE INDEX** for a complete list of the symptoms.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. VERIFY THAT THE TIPM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the TIPM is active on the bus.

Is the TIPM active on the bus?

Yes

Go To 4.

No

Refer to **DIAGNOSIS AND TESTING** for No Response diagnostic procedures.

Perform **BODY VERIFICATION TEST - VER 1** .

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS "Logged Against" the TIPM?

Yes

Replace/update the Front Control Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace/update the module that set this DTC in accordance with the service information

Perform **BODY VERIFICATION TEST - VER 1** .

U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously with the ignition on.

Set Conditions

• **Set Condition:**

When the Anti-Lock Brake Module detects an incorrect CAN message from the Engine Module.

Possible Causes

Possible Causes
ABM CAN BUS DTCS ENGINE DTCS ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

Does the scan tool display: U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM?

Yes

Go To 2.

No

Perform the ABS Intermittent Condition diagnostic procedure.

Refer to the **ABS INTERMITTENT CONDITION**.

2. CHECK IF TIPM CAN BUS DTCs ARE PRESENT

With the scan tool, read TIPM DTCs.

Are there any TIPM CAN BUS DTCs present?

Yes

Refer to the appropriate diagnostic. See **DIAGNOSIS AND TESTING**.

Perform **ABS VERIFICATION TEST**.

No

Go To 3.

3. CHECK IF ENGINE DTCs ARE PRESENT

With the scan tool, read Engine DTCs.

Are there any Engine DTCs present?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and diagnose the appropriate symptom.

Perform **ABS VERIFICATION TEST**.

No

Using the schematics as a guide, check the Anti-Lock Brake Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module per the Service Information.

Perform **ABS VERIFICATION TEST**.

U0429-IMPLAUSIBLE DATA RECEIVED FROM SCM

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With ignition on, but not if low voltage is detected.

Or, if a CAN Bus off event is detected.

Set Conditions

• **Set Condition:**

If the Anti-Lock Brakes Module detects either the sequence or integrity of the Steering Angle Sensor messages is invalid.

Possible Causes

Possible Causes
CAN C BUS CIRCUIT(S) SHORTED LOAD TOO HIGH ON CAN C BUS STEERING ANGLE SENSOR DTCs PRESENT ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. CHECK IF COMMUNICATION RELATED DTCs ARE PRESENT

Turn the ignition on.

With the scan tool, read ABS DTCs.

Are any Communication related DTCs present?

Yes

Diagnose and repair the DTC(s). Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

Perform **ABS VERIFICATION TEST**.

No

Go To 2.

2. CHECK IF OTHER STEERING ANGLE SENSOR RELATED DTCs ARE PRESENT

With the scan tool, read ABS DTCs.

Are any other STEERING ANGLE SENSOR DTCs present?

Yes

Diagnose and repair the DTC(s). Refer to **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

Perform **ABS VERIFICATION TEST**.

No

Replace the Steering Angle Sensor in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

U1003-ESP CAN C BUS PERFORMANCE

Circuit Schematic

81d0#51

Fig. 80: Dynamics Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

- **Set Condition:**

If the Anti-Lock Brakes Module detects too many CAN Bus off events on the Dynamics Sensor Data Link circuits.

Possible Causes

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN DYNAMICS SENSOR ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

Go To 2.

No

The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires. Refer to the **ABS INTERMITTENT CONDITION**.

2. **INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS**

Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

Were any problems found?

Yes

Repair as necessary.

Perform **ABS VERIFICATION TEST**.

No

Go To 3.

3. **CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE**

81d16324

Fig. 81: Measuring The Voltage Of The Dynamics Sensor High Data Link Circuit
Courtesy of CHRYSLER LLC

Disconnect the Anti-Lock Brakes Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (D465) Dynamics Sensor High Data Link circuit.

Is there any voltage present?

Yes

Repair the (D465) Dynamics Sensor High Data Link circuit for a short to voltage.

Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. **CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO GROUND**

81d16331

Fig. 82: Measuring The Resistance Of The Dynamics Sensor High Data Link Circuit Between Ground And The Dynamics Sensor Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance of the (D465) Dynamics Sensor High Data Link circuit between ground and the Dynamics Sensor harness connector.

Is the resistance below 5.0 ohms?

Yes

Repair the (D465) Dynamics Sensor High Data Link circuit for a short to ground.
Perform **ABS VERIFICATION TEST**.

No

Go To 5.

5. CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR AN OPEN

81d16335

Fig. 83: Measuring The Resistance Of The Dynamics Sensor High Data Link Circuit Between The Dynamics Sensor Harness Connector And The Anti-Lock Brakes Module Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (D465) Dynamics Sensor High Data Link circuit between the Dynamics

Sensor harness connector and the Anti-Lock Brakes Module harness connector.

Is the resistance below 5.0 ohms?

Yes

Go To 6.

No

Repair the (D465) Dynamics Sensor High Data Link circuit for an open.

Perform **ABS VERIFICATION TEST**.

6. CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE

Fig. 84: Checking Dynamics Sensor High Data Link Circuit For Short To Voltage
Courtesy of CHRYSLER LLC

Turn the ignition on.

Measure the voltage of the (D464) Dynamics Sensor Low Data Link circuit.

Is there any voltage present?

Yes

Repair the (D464) Dynamics Sensor Low Data Link circuit for a short to voltage.
Perform **ABS VERIFICATION TEST**.

No

Go To 7.

7. CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO GROUND

814f0412

Fig. 85: Checking Dynamics Sensor High Data Link Circuit For Short To Ground

Courtesy of CHRYSLER LLC

Turn the ignition off.

Measure the resistance of the (D464) Dynamics Sensor Low Data Link circuit between ground and the Dynamics Sensor harness connector.

Is the resistance below 5.0 ohms?

Yes

Repair the (D464) Dynamics Sensor Low Data Link circuit for a short to ground.

Perform **ABS VERIFICATION TEST**.

No

Go To 8.

8. **CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR AN OPEN**

81d16361

Fig. 86: Measuring The Resistance Of The Dynamics Sensor Low Data Link Circuit Between The

Dynamics Sensor Harness Connector And The Anti-Lock Brakes Module Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (D464) Dynamics Sensor Low Data Link circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.

Is the resistance below 5.0 ohms?

Yes

Go To 9.

No

Repair the (D464) Dynamics Sensor Low Data Link circuit for an open.

Perform **ABS VERIFICATION TEST**.

9. REPLACE DYNAMICS SENSOR & VERIFY IF DTC IS STILL ACTIVE

Replace the Dynamics Sensor in accordance with the Service Information. Perform ABS VERIFICATION TEST. See **STANDARD PROCEDURE**.

Turn the ignition on.

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

WARNING: Ensure brake capability is available before road testing.

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/h (6 and 15 mph).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

No

Test Complete.
Perform **ABS VERIFICATION TEST**.

U1501-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM ECM/PCM

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously, with ignition on.

Set Conditions

- **Set Condition:**

If the Anti-Lock Brakes Module detects bus messages from the Engine Control Module (ECM) or Powertrain Control Module (PCM) are of improper data length.

Possible Causes

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CAN C BUS CIRCUITS OPEN OR SHORTED
ECM OR PCM DTCs PRESENT
ECM OR PCM
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

Go To 2.

No

The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the **ABS INTERMITTENT CONDITION**.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs related to the conditions listed above?

Yes

Diagnose and repair the DTC(s). Refer to **DIAGNOSTIC CODE INDEX**.

No

Go To 3.

3. CHECK IF ECM OR PCM DTCs ARE PRESENT

With the scan tool, read ECM or PCM DTCs.

Are any DTCs present?

Yes

Diagnose and repair the DTC(s). Refer to **DIAGNOSTIC CODE INDEX** .
Perform **ABS VERIFICATION TEST**.

No

Go To 4.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs "Logged Against" the ECM or PCM?

Yes

Replace/update the ECM or PCM in accordance with the service information.

Perform **POWERTRAIN VERIFICATION TEST** .

Perform **ABS VERIFICATION TEST**.

No

Using the schematics as a guide, check the Anti-Lock Brakes Module pins, terminals, and connectors for corrosion, damage, and terminal push out. Pay particular attention to all Communication circuits. If no problems are found, replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

U1502-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM TCM

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously, with ignition on.

Set Conditions

- **Set Condition:**

If the Anti-Lock Brakes Module detects bus messages from the Transmission Control Module (TCM) are of improper data length.

Possible Causes

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CAN C BUS CIRCUITS OPEN OR SHORTED
TCM DTCs PRESENT
TCM
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. **VERIFY DTC IS ACTIVE**

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes

Go To 2.

No

The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the **ABS INTERMITTENT CONDITION**.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs**

With the scan tool, read all active DTCs from all CAN C Bus modules.

NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs related to the conditions listed above?

Yes

Diagnose and repair the DTC(s). Refer to **DIAGNOSTIC CODE INDEX**.

No

Go To 3.

3. **CHECK IF TCM DTCs ARE PRESENT**

With the scan tool, read TCM DTCs.

Are any TCM DTCs present?

Yes

Diagnose and repair the DTC(s).
Perform **42RLE TRANSMISSION VERIFICATION TEST** .

No

Using the schematics as a guide, check the Anti-Lock Brakes Module pins, terminals, and connectors for corrosion, damage, and terminal push out. Pay particular attention to all Communication circuits. If no problems are found, replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform **ABS VERIFICATION TEST**.

U1503-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM FCM

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously with the ignition on.

Set Conditions

- **Set Condition:**

When the Anti-Lock Brake Module detects an incorrect CAN message from the Totally Integrated Power Module (TIPM).

Possible Causes

Possible Causes
TIPM CAN BUS DTCS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK IF TIPM CAN BUS DTCs ARE PRESENT

With the scan tool, read TIPM DTCs.

Are there any TIPM CAN BUS DTCs present?

Yes

Refer to **ELECTRONIC CONTROL MODULES - ELECTRICAL DIAGNOSTICS** and diagnose the appropriate symptom.

Perform **ABS VERIFICATION TEST**.

No

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform **ABS VERIFICATION TEST**.

STANDARD PROCEDURE

ABS VERIFICATION TEST

Diagnostic Test

1. ABS VERIFICATION TEST

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

NOTE: If the ABM (Anti-Lock Brake Module), SAS (Steering Angle Sensor), Dynamics Sensor was replaced, it must be initialized using the scan tool. If not initialized, the ABS indicator will flash continuously with no DTCs. To initialize the ABM and clear offsets have wheels pointing straight ahead and follow the directions on the scan tool. The drive test requires a 90° turn. If the Dynamics Sensor was replaced, test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/h (6 and 15 mph).

1. Turn the ignition off.
2. Connect all previously disconnected components and connectors.
3. Verify all accessories are turned off and the battery is fully charged.
4. Verify that the ignition is on, with the scan tool, erase all Diagnostic Trouble Codes from All modules. Start the engine and allow it to run for 2 minutes and fully operate the system that was indicating the failure.
5. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the scan tool, read DTCs from all modules.
6. If any Diagnostic Trouble Codes are present, return to symptom list and trouble shoot new or recurring symptom.

NOTE: For Sensor Signal and Pump Motor faults, the ABM must sense all 4 wheels at 12 km/h (7.5

mph) before it will extinguish the ABS indicator.

7. If there are no DTCs present after turning ignition on, road test the vehicle for at least 5 minutes. Perform several anti-lock braking stops.

8. Again, with the scan tool read DTCs. If any DTCs are present, refer to DIAGNOSTIC CODE INDEX in the applicable article for the diagnostic test procedure and troubleshoot the new or recurring symptom.

9. If there are no Diagnostic Trouble Codes (DTCs) present, and the customer's concern can no longer be duplicated, the repair is complete.

Are any DTCs present or is the original concern still present?

Yes

Repair is not complete, refer to appropriate symptom.

No

Repair is complete.

2008 BRAKES

ABS - Service Information - Liberty

ABS - SERVICE INFORMATION

DESCRIPTION

ABS

The purpose of the antilock brake system (ABS) is to prevent wheel lockup under braking conditions on virtually any type of road surface. Antilock braking is desirable because a vehicle that is stopped without locking the wheels retains directional stability and some steering capability. This allows the driver to retain greater control of the vehicle during braking.

ANTILOCK BRAKE SYSTEM WITH TRACTION CONTROL

Fig. 1: ABM WIRING CONNECTOR

Courtesy of CHRYSLER LLC

This vehicle uses an antilock brake system designated System 8. For this vehicle, the antilock brake system comes standard with Electronic Stability Program (ESP) and All-Speed Traction Control.

This antilock brake system uses components of the base brake system, but also features the following components:

- Integrated Control Unit (ICU) - Hydraulic Control Unit (HCU) and Antilock Brake Module (ABM)
- Wheel Speed Sensors (WSS) - Four sensors (one at each wheel)

The is made up of the Hydraulic Control Unit (HCU) and the Antilock Brake Module (ABM). For additional information on these components, see **DESCRIPTION** for Hydraulic Control Unit (HCU). Refer to **DESCRIPTION** for Antilock Brake Module (ABM).

ALL-SPEED TRACTION CONTROL

The TCS is an all-speed traction control system that functions up to the maximum allowed vehicle speed. TCS enhances vehicle stability and mobility by reducing wheel spin when accelerating on slippery surfaces. TCS controls wheel spin by applying the brakes and/or reducing engine power.

BRAKE ASSIST SYSTEM (BAS)

The BAS is designed to optimize the vehicle's braking capability during emergency braking maneuvers. The system detects an emergency braking situation by sensing the rate and amount of brake application and then applies optimum pressure to the brakes. This can help reduce braking distances. The BAS complements the antilock brake system (ABS). Applying the brakes very quickly results in the best BAS assistance.

ELECTRONIC ROLL MITIGATION (ERM)

This system anticipates the potential for wheel lift by monitoring the driver's steering wheel input and the speed of the vehicle. When ERM determines that the rate of change of the steering wheel angle and vehicle's speed are sufficient to potentially cause wheel lift, it applies the appropriate brake and may reduce engine power to lessen the chance that wheel lift will occur. ERM will only intervene during very severe or evasive driving maneuvers.

ERM can only reduce the chance of wheel lift occurring during severe or evasive driving maneuvers. It can not prevent wheel lift due to other factors such as road conditions, leaving the roadway or striking objects or other vehicles.

ELECTRONIC STABILITY PROGRAM (ESP)

The ESP system enhances directional control and stability of the vehicle under various driving conditions. ESP corrects for over/under steering of the vehicle by applying the brake of the appropriate wheel to assist in counteracting the over/under steer condition. Engine power may also be reduced to help the vehicle maintain the desired path. ESP uses sensors in the vehicle to determine the vehicle path intended by the driver and compares it to the actual path of the vehicle. When the actual path does not match the intended path, ESP applies the brake of the appropriate wheel to assist in counteracting the oversteer or understeer condition

Oversteer - when the vehicle is turning more than appropriate for the steering wheel position.

Understeer - when the vehicle is turning less than appropriate for the steering wheel position.

The "ESP/TCS Indicator Light" located in the instrument cluster, starts to flash as soon as the tires lose traction and the ESP system becomes active. The "ESP/TCS Indicator Light" also flashes when TCS is active.

ELECTRONIC VARIABLE BRAKE PROPORTIONING

Vehicles equipped with ABS use EVBP to balance front-to-rear braking. The EVBP is used in place of a rear brake proportioning valve. The EVBP system controls the slip of the rear wheels during braking at low to moderate deceleration, up until the point where ABS control is necessary. The brake pressure at the rear wheels is controlled by using the inlet and outlet valves located in the hydraulic control unit (HCU).

EVBP activation should not be perceptible by the customer because there is no pump motor noise and almost no brake pedal feedback.

OPERATION

ANTILOCK BRAKE SYSTEM WITH TRACTION CONTROL

ABS

There are a few performance characteristics of the Antilock Brake System (ABS) that may at first seem abnormal, but in fact are normal. These characteristics are described below.

NORMAL BRAKING

Under normal braking conditions, the ABS functions the same as a standard base brake system with a front/rear split master cylinder and conventional vacuum assist.

ABS BRAKING

ABS operation is available at all vehicle speeds above 5-8 km/h (3-5 mph). If a wheel locking tendency is detected during a brake application, the brake system enters the ABS mode. During ABS braking, hydraulic pressure in the four wheel circuits is modulated to prevent any wheel from locking. Each wheel circuit is designed with a set of electric solenoids to allow wheel lockup which may be perceived at the very end of an ABS stop and is considered normal.

During an ABS event, the Integrated Control Unit (ICU) regulates hydraulic pressure at all 4 of the vehicle's wheels.

The hydraulic pressure at each front wheel is controlled independently (relative to the amount of slip at each wheel) in order to maximize the braking force generated by the front brakes. The rear wheels are controlled such that the hydraulic pressure at either rear wheel does not exceed that of the highest slip rear wheel in order to maintain vehicle stability.

The system can build and release pressure at each wheel, depending on signals generated by the Wheel Speed Sensors (WSS) at each wheel and received at the Antilock Brake Module (ABM).

NOISE AND BRAKE PEDAL FEEL

During ABS braking, some brake pedal movement may be felt. In addition, ABS braking will create ticking, popping, or groaning noises heard by the driver. This is normal and is due to pressurized fluid being transferred between the master cylinder and the brakes. If ABS operation occurs during hard braking, some pulsation may be felt in the vehicle body due to fore and aft movement of the suspension as brake pressures are modulated.

At the end of an ABS stop, ABS is turned off when the vehicle is slowed to a speed of 5-6 km/h (3-4 mph). There may be a slight brake pedal drop anytime that the ABS is deactivated, such as at the end of the stop when the vehicle speed is less than 5 km/h (3 mph) or during an ABS stop where ABS is no longer required. These conditions exist when a vehicle is being stopped on a road surface with patches of ice, loose gravel, or sand on it. Also, stopping a vehicle on a bumpy road surface activates ABS because of the wheel hop caused by the bumps.

TIRE NOISE AND MARKS

Although the ABS system prevents complete wheel lockup, some wheel slip is desired in order to achieve optimum braking performance. Wheel slip is defined as follows: 0 percent slip means the wheel is rolling freely and 100 percent slip means the wheel is fully locked. During brake pressure modulation, wheel slip is allowed to reach up to 25-30 percent. This means that the wheel rolling velocity is 25-30 percent less than that of a free rolling wheel at a given vehicle speed. This slip may result in some tire chirping, depending on the road surface. This sound should not be interpreted as total wheel lockup.

Complete wheel lockup normally leaves black tire marks on dry pavement. The ABS will not leave dark black tire marks since the wheel never reaches a fully locked condition. However, tire marks may be noticeable as light patched marks.

START-UP AND DRIVE-OFF CYCLES

When the ignition is turned on, a popping sound and a slight brake pedal movement may be noticed. The ABS warning lamp will also be on for up to 5 seconds after the ignition is turned on.

When the vehicle is first driven off, a humming may be heard or felt by the driver at approximately 12-25 mph (20-40 km/h). All of these conditions are a normal function of ABS as the system is performing a diagnosis check.

PREMATURE ABS CYCLING

Symptoms of premature ABS cycling include: clicking sounds from the solenoid valves; pump/motor running; and pulsations in the brake pedal. Premature ABS cycling can occur at any braking rate of the vehicle and on any type of road surface. Neither the red BRAKE indicator lamp, nor the amber ABS indicator lamp, illuminate and no fault codes are stored in the ABM.

Premature ABS cycling is a condition that needs to be correctly assessed when diagnosing problems with the antilock brake system. It may be necessary to use a scan tool to detect and verify premature ABS cycling.

Check the following common causes when diagnosing premature ABS cycling: damaged wheel bearings (causing tone wheel issues); damaged wheel bearing housings where wheel speed sensors mount; and loose wheel speed sensor mounting bolts.

After diagnosing the defective component, repair or replace it as required. When the component repair or replacement is completed, test drive the vehicle to verify that premature ABS cycling has been corrected.

ALL-SPEED TRACTION CONTROL

Traction control systems sense impending wheel spin based on a model of the rate of change of wheel speed under normal traction conditions. The All-Speed Traction Control uses signals from the same wheel speed sensors as ABS to determine when to apply the brakes to one or more wheels and when to reduce engine torque output using the Electronic Throttle Control (ETC) to prevent wheel slip during acceleration. Throttle control makes the vehicle less reliant on brake application alone to maintain traction, increasing the operating speed range and more closely modulates speed, resulting in smoother operation. With All-Speed Traction Control reducing engine torque as well as applying the brakes, it is possible to achieve almost seamless torque application at the wheels.

If the wheel slip is severe enough to require throttle intervention, All-Speed Traction Control will reduce engine torque and sometimes upshift the transmission to avoid the condition. In milliseconds, All-Speed Traction Control interrogates the engine control system to determine the current torque output, determines how much the torque output the current conditions will allow, and signals this requirement to the engine control system, which reduces the torque by partially closing the throttle. With execution of the torque reduction, the brake system reduces brake pressure to make the transition smooth, while maintaining forward progress. By reducing engine power, braking effectiveness is maintained and the system can operate throughout the normal vehicle speed range. That is why the system is identified as providing "all-speed" traction control.

With AWD, where front-wheel slip can occur, the degree of throttle intervention is relatively less than with rear-wheel drive. The difference in speed capability and the degree of throttle intervention between rear-wheel drive and all-wheel drive is due to the fact that non-driven front wheels on a rear-wheel drive vehicle give the system an accurate vehicle speed reference on which to base responses. With AWD, the possibility that the front wheels may also be slipping makes appropriate corrective action more difficult to determine, thus limiting the effective speed range. Offsetting this is the fact that loss of traction is less likely with AWD because torque is transmitted through all four wheels to begin with. In actual driving situations on snow or ice, the rear-wheel drive and AWD systems respond in essentially the same way up to the 45 mph (72 km/h) limit of the AWD system.

ELECTRONIC STABILITY PROGRAM (ESP)

To determine whether the car is responding properly to cornering commands, ESP uses steering wheel angle, yaw (turning) rate and lateral acceleration sensors (combined into Dynamics Sensor). Using signals from these sensors, in addition to individual wheel speed sensor signals, the system determines appropriate brake and throttle actions. Once initiated, ESP operates much like All-Speed Traction Control, except that the goal is directional stability. If the vehicle yaw response, or rate of turning, is inconsistent with the steering angle and vehicle speed indications, the ESP system applies the brakes and, if necessary closes the throttle, to restore control. This occurs whether the vehicle is turning too rapidly (oversteering) or not rapidly enough (understeering).

TSC (Trailer Sway Control)

TSC uses sensors in the vehicle to recognize an excessively swaying trailer and will take the appropriate actions to attempt to stop the sway. The system may reduce engine power and apply the brake of the appropriate wheel (s) to counteract the sway of the trailer. TSC will become active automatically once an excessively swaying trailer is recognized. No driver action is required.

ELECTRONIC VARIABLE BRAKE PROPORTIONING

Upon entry into EVBP the inlet valve for the rear brake circuit is switched ON so that the fluid supply from the master cylinder is shut off. In order to decrease the rear brake pressure, the outlet valve for the rear brake circuit is pulsed. This allows fluid to enter the Low Pressure Accumulator (LPA) in the Hydraulic Control Unit (HCU) resulting in a drop in fluid pressure to the rear brakes. In order to increase the rear brake pressure, the outlet valve is switched off and the inlet valve is pulsed. This increases the pressure to the rear brakes. This back-and-forth process will continue until the required slip difference is obtained. At the end of EVBP braking (brakes released) the fluid in the LPA drains back to the master cylinder by switching on the ESV valve.

The EVBP will remain functional during many ABS fault modes. If both the red BRAKE and amber ABS

warning indicators are illuminated, the EVBP may not be functioning.

DIAGNOSIS AND TESTING

ANTILOCK BRAKING SYSTEM

The ABS brake system performs several self-tests every time the ignition switch is turned on and the vehicle is driven. The ABM monitors the systems input and output circuits to verify the system is operating correctly. If the on board diagnostic system senses that a circuit is malfunctioning the system will set a trouble code in its memory.

NOTE: An audible noise may be heard during the self-test. This noise should be considered normal.

NOTE: The scan tool is used to diagnose the ABS system.

STANDARD PROCEDURE

ABS BRAKE BLEEDING

ABS system bleeding requires conventional bleeding methods plus use of a scan tool. The procedure involves performing a base brake bleeding, followed by use of the scan tool to cycle and bleed the HCU pump and solenoids. A second base brake bleeding procedure is then required to remove any air remaining in the system.

- 1. Perform base brake bleeding. See STANDARD PROCEDURE . .
- 2. Connect scan tool to the Data Link Connector.
- 3. Select ANTILOCK BRAKES, followed by MISCELLANEOUS, then ABS BRAKES. Follow the instructions displayed. When scan tool displays TEST COMPLETE, disconnect scan tool and proceed.
- 4. Perform base brake bleeding a second time. See STANDARD PROCEDURE .
- 5. Top off master cylinder fluid level and verify proper brake operation before moving vehicle.

SPECIFICATIONS

ABS BRAKES

TORQUE SPECIFICATIONS

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.

ICU bracket nut to vehicle	10	-	85

ELECTRICAL

DESCRIPTION

REAR WHEEL SPEED SENSOR

A wheel speed sensor is used at each wheel. The front sensors are mounted to the steering knuckles. Front tone wheels are internal to the front bearing. The rear sensors are mounted at the outboard end of the axle. Tone wheels are mounted to the outboard ends of the front and rear axle shafts. The gear type tone wheel serves as the trigger mechanism for each sensor.

OPERATION

REAR WHEEL SPEED SENSOR

The sensors convert wheel speed into a small digital signal. The ABM sends 12 volts to the sensors. The sensor has an internal magneto resistance bridge that alters the voltage and amperage of the signal circuit. This voltage and amperage is changed by magnetic induction when the toothed tone wheel passes the wheel speed sensor. This digital signal is sent to the ABM. The ABM measures the voltage and amperage of the digital signal for each wheel.

SENSOR-WHEEL SPEED-FRONT

REMOVAL

SENSOR-WHEEL SPEED-FRONT

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the caliper adapter. Refer to **REMOVAL** .

CAUTION: Never allow the disc brake caliper to hang from the brake hose. Damage to the brake hose will result. Provide a suitable support to hang the caliper securely.

4. Remove the disc brake rotor. Refer to **REMOVAL** .

Fig. 2: Removing/Installing Wheel Speed Sensor
Courtesy of CHRYSLER LLC

5. Remove the wheel speed sensor mounting bolt (2) to the hub (3).
6. Remove the wheel speed sensor wire (1) from the hub/bearing and through the brake shield.
7. Remove the wheel speed sensor wire hold down clips.
8. Remove the locking connector at the wheel liner from the sensor connector.
9. Remove the wheel speed sensor from the vehicle.

INSTALLATION

SENSOR-WHEEL SPEED-FRONT

Fig. 3: Removing/Installing Wheel Speed Sensor
Courtesy of CHRYSLER LLC

NOTE: When installing, do not rotate sensor, as this may cause the sensor to rub on the tone ring and be damaged.

1. Install the wheel speed sensor to the vehicle.
2. Install the wheel speed sensor (1) through the brake shield and to the hub/bearing (3).
3. Install the wheel speed sensor wire hold down routing clips.
4. Install the wheel speed sensor mounting bolt (2) to the hub (3). Tighten the mounting bolt to 8 N.m (71 in. lbs.).
5. Install the disc brake rotor. Refer to **INSTALLATION**.
6. Install the disc brake caliper adapter. Refer to **INSTALLATION**.
7. Install the tire and wheel assembly. Refer to **STANDARD PROCEDURE**.

SENSOR- WHEEL SPEED-REAR

REMOVAL

SENSOR-WHEEL SPEED-REAR

Fig. 4: CALIPER MOUNT
Courtesy of CHRYSLER LLC

1. Raise and support the vehicle.
2. Disengage the locking tab connector (1).
3. Disconnect the wheel speed sensor electrical connector (1).
4. Remove the wheel speed sensor mounting bolt (2) from the rear support plate.
5. Remove the wheel speed sensor from the support plate.

INSTALLATION

SENSOR-WHEEL SPEED-REAR

Fig. 5: CALIPER MOUNT
Courtesy of CHRYSLER LLC

1. Insert the wheel speed sensor through the support plate.
2. Tighten the wheel speed sensor bolt (2) to 9 N.m (80 in. lbs.).
3. Secure the wheel speed sensor wire to the routing clips. Verify that the sensor wire is secure and clear of the rotating components.
4. Reconnect the wheel speed sensor electrical connector (1).

NOTE: **Make sure the connector locking tab is fully engaged and locked in position.**

5. Lower the vehicle.

SENSOR-DYNAMICS

DESCRIPTION

SENSOR - DYNAMICS

Fig. 6: DYNAMICS SENSOR
Courtesy of CHRYSLER LLC

The Yaw Rate and Lateral Acceleration Sensors are housed into one unit known as the Dynamics Sensor (2). The sensor is used to measure side-to-side (Lateral) motion and vehicle rotational sensing (how fast the vehicle is turning - Yaw).

Yaw and Lateral Acceleration Sensors cannot be serviced separately. The entire Dynamics Sensor (2) must be replaced when necessary.

REMOVAL

SENSOR-DYNAMICS

81a5fa8e

Fig. 7: DYNAMICS SENSOR
Courtesy of CHRYSLER LLC

1. Remove the center console. Refer to **REMOVAL** .
2. Disconnect electrical connector (3) from the dynamics sensor (2).
3. Remove the two nuts (1) securing the sensor to the floor.
4. Remove the sensor (2).

INSTALLATION

SENSOR-DYNAMICS

81a5fa8e

Fig. 8: DYNAMICS SENSOR
Courtesy of CHRYSLER LLC

1. Install the dynamics sensor (2) to the vehicle.
2. Install the electrical connector (3) making sure that the connector is fully seated into the sensor (2)
3. Install the two retaining nuts (1) and tighten to 9 N.m (80 in. lbs.).

4. Install the floor console. Refer to **INSTALLATION** .

SENSOR-STEERING ANGLE

DESCRIPTION

SENSOR-STEERING ANGLE

NOTE: **Steering angle sensor is part of the airbag clockspring and is not serviced separately from the clockspring.**

Under transient cornering conditions the lateral acceleration sensor does not measure the true sway force on the car. In order to compensate for this the system uses the driver's steering command (Steering angle sensor) and vehicle speed to estimate the true sway force. This signal is matched with the lateral acceleration sensor signal to ensure a significantly-reduced transient sway of the vehicle body.

REMOVAL

SENSOR-STEERING ANGLE

NOTE: **Steering angle sensor is part of the airbag clockspring and is not serviced separately from the clockspring.**

1. For removal of the steering angle sensor, refer to **REMOVAL** .

INSTALLATION

SENSOR-STEERING ANGLE

NOTE: **Steering angle sensor is part of the airbag clockspring and is not serviced separately from the clockspring.**

1. For installation of the steering angle sensor, refer to **INSTALLATION** .

ESP SWITCH

DESCRIPTION

SWITCH - ESP

81a28090

Fig. 9: Identifying Instrument Panel Switches
Courtesy of CHRYSLER LLC

The ESP switch (5) is located in the center stack (1) of the instrument panel. If the switch is damaged or inoperative, the complete accessory switch bank assembly must be replaced.

REMOVAL

SWITCH - ESP

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: The ESP switch is integral to the accessory switch bank and cannot be serviced separately. The complete accessory switch bank assembly must be replaced.

81a290cd

Fig. 10: SWITCH BANK REMOVAL
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the center bezel from the instrument panel. Refer to **REMOVAL** .
3. Remove the four screws (2) that secure the accessory switch bank (3) to the back of the center bezel (1) and remove the switch bank.

INSTALLATION

SWITCH - ESP

81a290cd

Fig. 11: SWITCH BANK REMOVAL
 Courtesy of CHRYSLER LLC

NOTE: There are different accessory switch banks available based on the option content of the vehicle. Ensure the switch pod being installed matches the vehicle options.

1. Position the accessory switch bank (3) onto the back of the instrument panel center bezel (1).
2. Install the four screws (2) that secure the accessory switch bank to the center bezel. Tighten the screws to 2 N.m (17 in. lbs.).
3. Install the center bezel onto the instrument panel. Refer to **INSTALLATION** .
4. Connect the battery negative cable.
5. Verify ESP system operation.

HYDRAULIC/MECHANICAL

HCU (HYDRAULIC CONTROL UNIT)

DESCRIPTION

HYDRAULIC CONTROL UNIT

The HCU consists of a valve body, pump motor, and pressure sensor.

OPERATION

HYDRAULIC CONTROL UNIT

Accumulators in the valve body store extra fluid released to the system for ABS mode operation. The pump is used to clear the accumulators of brake fluid and is operated by a DC type motor. The motor is controlled by the ABM.

The valves modulate brake pressure during antilock braking and are controlled by the ABM.

The HCU provides four channel pressure control to the front and rear brakes. Two channels control the rear wheel brakes individually. The two remaining channels control the front wheel brakes individually.

During antilock braking, the solenoid valves are opened and closed as needed. The valves are not static. They are cycled rapidly and continuously to modulate pressure and control wheel slip and deceleration.

During normal braking, the HCU solenoid valves and pump are not activated. The master cylinder and power booster operate the same as a vehicle without an ABS brake system.

During antilock braking, solenoid valve pressure modulation occurs in three stages, pressure increase, pressure hold, and pressure decrease. The valves are all contained in the valve body portion of the HCU.

PRESSURE DECREASE

The outlet valve is opened and the inlet valve is closed during the pressure decrease cycle.

A pressure decrease cycle is initiated when speed sensor signals indicate high wheel slip at one or more wheels. At this point, the ABM closes the inlet then opens the outlet valve, which also opens the return circuit to the accumulators. Fluid pressure is allowed to bleed off (decrease) as needed to prevent wheel lock.

Once the period of high wheel slip has ended, the ABM closes the outlet valve and begins a pressure increase or hold cycle as needed.

PRESSURE HOLD

Both solenoid valves are closed in the pressure hold cycle. Fluid apply pressure in the control channel is maintained at a constant rate. The ABM maintains the hold cycle until sensor inputs indicate a pressure change is necessary.

PRESSURE INCREASE

The inlet valve is open and the outlet valve is closed during the pressure increase cycle. The pressure increase cycle is used to counteract unequal wheel speeds. This cycle controls re-application of fluid apply pressure due to changing road surfaces or wheel speed.

REMOVAL

HYDRAULIC CONTROL UNIT

1. Install prop rod on the brake pedal to keep pressure on the brake system.
2. Remove negative battery cable from the battery.
3. Pull up on the ICU harness connector release and remove connector.

Fig. 12: HCU LINES

Courtesy of CHRYSLER LLC

4. Remove brake lines (1) from the ICU (2).

Fig. 13: ABM BRACKET
 Courtesy of CHRYSLER LLC

5. Remove the bolt attaching the bracket to the ICU unit (2) by pulling the unit from the bracket (1).

DISASSEMBLY

HYDRAULIC CONTROL UNIT

Fig. 14: ICU MOUNTING BRACKET
 Courtesy of CHRYSLER LLC

1. If the mounting bracket (2) needs to be removed from the HCU, loosen the two mounting nuts (1), then slide the mounting bracket off the two grommets and mounting pin (3).

81992b16

Fig. 15: ABM MOUNTING SCREWS (W/ESP)
 Courtesy of CHRYSLER LLC

2. Remove four screws (1) attaching antilock brake module (ABM) (2) to hydraulic control unit (HCU).

81992b7

Fig. 16: REMOVE/INSTALL ABM
 Courtesy of CHRYSLER LLC

CAUTION: When removing ABM from HCU, be sure to completely separate the two components (approximately 38 mm (1.5 inches)) before removing ABM. Otherwise, damage to the pressure sensor will result requiring HCU replacement.

3. Slide ABM (1) off HCU (2).

ASSEMBLY

HYDRAULIC CONTROL UNIT

CAUTION: Inspect seal around mating edge of ABM to ensure seal is in good shape.

1. Clean any debris off the mating surfaces of the antilock brake module (ABM) and hydraulic control unit (HCU).

81992bb7

Fig. 17: REMOVE/INSTALL ABM

Courtesy of CHRYSLER LLC

CAUTION: When installing ABM to HCU, care must be taken not to damage the pressure sensor. If damaged, HCU replacement is necessary.

2. Align ABM (1) solenoids and pump/motor wiring with HCU (2) valves and wiring passage. Slide ABM onto HCU.

81992b16

Fig. 18: ABM MOUNTING SCREWS (W/ESP)

Courtesy of CHRYSLER LLC

3. Install four screws (1) attaching ABM to HCU. Tighten mounting screws to 6 N.m (53 in. lbs.).

Fig. 19: ICU MOUNTING BRACKET
Courtesy of CHRYSLER LLC

4. If the mounting bracket (2) needs to be installed on the HCU, slide the mounting bracket grommet over the mounting pin (3) and two grommet cutouts over the grommets on the HCU mounted studs. Tighten the mounting nuts to 8 N.m (71 in. lbs.)
5. Install the HCU in the vehicle. Refer to **INSTALLATION**.

INSTALLATION

HYDRAULIC CONTROL UNIT

Fig. 20: ABM BRACKET
Courtesy of CHRYSLER LLC

NOTE: If the ABM module is being replaced with a new ABM module it must be

reprogrammed with the use of a scan tool.

1. Install ABM (2) on the mounting bracket rubber pockets (1).

Fig. 21: HCU LINES

Courtesy of CHRYSLER LLC

2. Install brake lines to the ABM (2) and tighten to 20 N.m (180 in. lbs.).
3. Install wiring harness connector to the ABM and push down on the release to secure the connector.
4. Install negative battery cable to the battery.
5. Bleed ABS brake system. See **STANDARD PROCEDURE**.

AUDIO/VIDEO SYSTEMS - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW

Circuit Schematic

01940215

Fig. 1: Front Left Audio Speaker Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the radio on.

Set Conditions

- **Set Condition:**
- When the output circuit is LOW for more than three seconds.

Possible Causes

Possible Causes
(X201) LEFT FRONT SPEAKERS (+) CIRCUIT SHORTED TO GROUND
(X291) LEFT FRONT SPEAKERS (-) CIRCUIT SHORTED TO GROUND
SPEAKER

Diagnostic Test

1. **INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, clear all Radio DTC's.

Turn the Radio on.

With the scan tool, read the DTC information.

Does the scan tool read: B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **(X201) LEFT FRONT SPEAKERS (+) CIRCUIT SHORTED TO GROUND**

819c0219

Fig. 2: Measuring Resistance Between Ground And Left Front Speakers (+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Radio harness connector.

Disconnect the Front Left Audio Speaker harness connector.

Measure the resistance between ground and the (X201) Left Front Speakers (+) circuit.

Is the resistance below 1000.0 ohms?

Yes

Repair the (X201) Left Front Speakers (+) circuit for a short to ground condition.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. (X291) LEFT FRONT SPEAKERS (-) CIRCUIT SHORTED TO GROUND

819c022c

Fig. 3: Measuring Resistance Between Ground And Left Front Speakers (-) Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (X291) Left Front Speakers (-) circuit.

Is the resistance below 1000.0 ohms?

Yes

Repair the (X291) Left Front Speakers (-) circuit for a short to ground condition.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. SPEAKER

Connect the Radio harness connector.

With the Front Left Audio Speaker still disconnected, turn the ignition on.

Turn the Radio on.

With the scan tool, clear all Radio DTC's.

With the scan tool, read the DTC information.

Does the scan tool read: B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

Replace the Front Left Audio Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH

Circuit Schematic

01940215

Fig. 4: Front Left Audio Speaker Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Possible Causes

Possible Causes
(X201) LEFT FRONT SPEAKERS (+) CIRCUIT SHORTED TO VOLTAGE
(X291) LEFT FRONT SPEAKERS (-) CIRCUIT SHORTED TO VOLTAGE
SPEAKER

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Radio DTCs.

Does the scan tool display active: B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. (X201) LEFT FRONT SPEAKERS (+) CIRCUIT SHORTED TO VOLTAGE

819c027b

Fig. 5: Measuring Voltage Of Left Front Speakers (+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Radio harness connector.

Disconnect the Left Front Audio Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X201) Left Front Speakers (+) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X201) Left Front Speakers (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. (X291) LEFT FRONT SPEAKERS (-) CIRCUIT SHORTED TO VOLTAGE

819c0283

Fig. 6: Measuring Voltage On Left Front Speakers (-) Circuit
Courtesy of CHRYSLER LLC

Measure for voltage on the (X291) Left Front Speakers (-) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X291) Left Front Speakers (-) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Radio in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN

Circuit Schematic

Fig. 7: Front Left Audio Speaker Output Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the radio on.

Set Conditions

- **Set Condition:**
- When the output circuit is open for more than three seconds. The radio will not set the fault if the radio confirms an amplifier is on the BUS.

Possible Causes

Possible Causes
(X201) LEFT FRONT SPEAKERS (+) CIRCUIT OPEN (X291) LEFT FRONT SPEAKERS (-) CIRCUIT OPEN SPEAKER

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all Radio DTC's.

Turn the Radio on.

With the scan tool, read the DTC information.

Does the scan tool read: B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken

wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1**.

2. (X201) LEFT FRONT SPEAKERS (+) CIRCUIT OPEN

819c052f

Fig. 8: Measuring Resistance Of Left Front Speakers (+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Radio harness connector.

Disconnect the Front Left Audio Speaker harness connector.

Measure the resistance of the (X201) Left Front Speakers (+) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes

Go To 3.

No

Repair the (X201) Left Front Speakers (+) circuit for an open condition.

Perform **BODY VERIFICATION TEST - VER 1** .

3. (X291) LEFT FRONT SPEAKERS (-) CIRCUIT OPEN

819c0552

Fig. 9: Measuring Resistance Of Left Front Speakers (-) Circuit
Courtesy of CHRYSLER LLC

Measure the resistance of the (X291) Left Front Speakers (-) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes

Go To 4.

No

Repair the (X291) Left Front Speakers (-) circuit for an open condition.

Perform **BODY VERIFICATION TEST - VER 1** .

4. **SPEAKER**

Connect the Radio harness connector.

With the Front Left Audio Speaker still disconnected, turn the ignition on.

Turn the Radio on.

With the scan tool, clear all Radio DTC's.

With the scan tool, read the DTC information.

Does the scan tool read: B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Replace the Front Left Audio Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW

Circuit Schematic

019c057c

Fig. 10: Front Right Audio Speaker Output Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the radio on.

Set Conditions

- **Set Condition:**
- When the output circuit is LOW for more than three seconds.

Possible Causes

Possible Causes
(X202) RIGHT FRONT SPEAKERS (+) CIRCUIT SHORTED TO GROUND
(X292) RIGHT FRONT SPEAKERS (-) CIRCUIT SHORTED TO GROUND
SPEAKER

Diagnostic Test

1. **INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, clear all Radio DTC's.

Turn the Radio on.

With the scan tool, read the DTC information.

Does the scan tool read: B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **(X202) RIGHT FRONT SPEAKERS (+) CIRCUIT SHORTED TO GROUND**

819c0581

Fig. 11: Measuring Resistance Between Ground And Right Front Speakers Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Radio harness connector.

Disconnect the Front Right Audio Speaker harness connector.

Measure the resistance between ground and the (X202) Right Front Speakers (+) circuit.

Is the resistance below 1000.0 ohms?

Yes

Repair the (X202) Right Front Speakers (+) circuit for a short to ground condition.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. (X292) RIGHT FRONT SPEAKERS (-) CIRCUIT SHORTED TO GROUND

819c0593

Fig. 12: Measuring Resistance Between Ground And Right Front Speakers (-) Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (X292) Right Front Speakers (-) circuit.

Is the resistance below 1000.0 ohms?

Yes

Repair the (X292) Right Front Speakers (-) circuit for a short to ground condition.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. SPEAKER

Connect the Radio harness connector.

With the Front Right Audio Speaker still disconnected, turn the ignition on.

Turn the Radio on.

With the scan tool, clear all Radio DTC's.

With the scan tool, read the DTC information.

Does the scan tool read: B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

Replace the Front Right Audio Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B1406-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH

Circuit Schematic

Repair the (X206) Right Rear Speaker (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. (X296) RIGHT REAR SPEAKER (-) CIRCUIT SHORTED TO VOLTAGE

819c0ba8

Fig. 33: Measuring Voltage On Right Rear Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Measure for voltage on the (X296) Right Rear Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X296) Right Rear Speaker (-) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Radio in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN

Circuit Schematic

Fig. 34: Rear Right Audio Speaker Output Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the radio on.

Set Conditions

- **Set Condition:**
- When the output circuit is open for more than three seconds. The radio will not set the fault if the radio confirms an amplifier is on the BUS.

Possible Causes

Possible Causes
(X206) RIGHT REAR SPEAKER (+) CIRCUIT OPEN (X296) RIGHT REAR SPEAKER (-) CIRCUIT OPEN SPEAKER

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all Radio DTC's.

Turn the Radio on.

With the scan tool, read the DTC information.

Does the scan tool read: B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken

wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1**.

2. (X206) RIGHT REAR SPEAKER (+) CIRCUIT OPEN

819c0bb5

Fig. 35: Measuring Resistance Of Right Rear Speaker (+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Radio harness connector.

Disconnect the Rear Right Audio Speaker harness connector.

Measure the resistance of the (X206) Right Rear Speaker (+) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes

Go To 3.

No

Repair the (X206) Right Rear Speaker (+) circuit for an open condition.

Perform **BODY VERIFICATION TEST - VER 1** .

3. **(X296) RIGHT REAR SPEAKER (-) CIRCUIT OPEN**

819c0bc3

Fig. 36: Measuring Resistance Of Right Rear Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Measure the resistance of the (X296) Right Rear Speaker (-) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes

Go To 4.

No

Repair the (X296) Right Rear Speaker (-) circuit for an open condition.
Perform **BODY VERIFICATION TEST - VER 1** .

4. SPEAKER

Connect the Radio harness connector.

With the Rear Right Audio Speaker still disconnected, turn the ignition on.

Turn the Radio on.

With the scan tool, clear all Radio DTC's.

With the scan tool, read the DTC information.

Does the scan tool read: B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Replace the Rear Right Audio Speaker in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B1420-AUDIO CASSETTE ERROR/INOPERABLE CASSETTE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously with the ignition on and the Radio Cassette player turned on.

Set Conditions

- **Set Condition:**

The code will set when a damaged Cassette is placed in the Cassette Player.

Possible Causes

Possible Causes

CASSETTE READ FAILURE

Diagnostic Test

1. **RADIO**

Replace the problem Cassette with a good, clean, undamaged, cassette.

Turn the Radio cassette player on.

With the scan tool, read DTC's.

Does the scan tool display active: B1420-AUDIO CASSETTE ERROR/INOPERABLE CASSETTE?

Yes

Eject the inoperative cassette and replace the Radio/Cassette Player in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B1421-AUDIO CD READ ERROR/INOPERABLE DISC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously with the ignition on and the radio CD player turned on.

Set Conditions

- **Set Condition:**
- The code will set if a CD that is not formatted as a music CD is installed in the radio CD player.

Possible Causes

Possible Causes
CD READ FAILURE

Diagnostic Test

1. RADIO

Replace the problem CD with a good, clean, unscratched, music CD.

Turn the radio CD player on.

With the scan tool, read DTC's.

Does the scan tool display: B1421 AUDIO CD READ ERROR/INOPERABLE DISC?

Yes

Eject the inoperative CD and replace the CD in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B1422-AUDIO DVD READ ERROR/INOPERABLE DISC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously with the ignition on and the DVD player turned on.

Set Conditions

- **Set Condition:**

The code will set if a DVD that is not formatted as a DVD is installed in the DVD player.

Possible Causes

Possible Causes
DVD READ FAILURE

Diagnostic Test

1. DVD PLAYER

Replace the problem DVD with a good, clean, unscratched DVD.

Turn the DVD player on.

With the scan tool, read DTC's.

Does the scan tool display active: B1422-AUDIO DVD READ ERROR/INOPERABLE DISC?

Yes

Eject the inoperative DVD and replace the DVD in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B1423-VES DVD READ ERROR/INOPERABLE DISC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously with the ignition on and the DVD player turned on.

Set Conditions

- **Set Condition:**

The code will set if a DVD that is not formatted as a DVD is installed in the DVD player.

Possible Causes

Possible Causes
DVD READ FAILURE

Diagnostic Test

1. **DVD PLAYER**

Replace the problem DVD with a good, clean, unscratched DVD.

Turn the DVD player on.

With the scan tool, read DTC's.

Does the scan tool display active: B1423-VES DVD READ ERROR/INOPERABLE DISC?

Yes

Eject the inoperative DVD and replace the DVD in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B1424-IMPROPER DVD-WRONG REGION

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously with the ignition on and the DVD player turned on.

Set Conditions

- **Set Condition:**

The code will set if a DVD that is not formatted as a DVD is installed in the DVD player.

Possible Causes

Possible Causes
DVD READ FAILURE

Diagnostic Test

1. DVD PLAYER

Replace the problem DVD with a good, clean, unscratched DVD.

Turn the DVD player on.

With the scan tool, read DTC's.

Does the scan tool display active: B1424-IMPROPER DVD-WRONG REGION?

Yes

Eject the inoperative DVD and replace the DVD in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B1429-RADIO DISPLAY HIGH TEMPERATURE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously with the ignition and Radio on.

Set Conditions

- Set Condition:**

The code will set if the temperature inside the Radio is above +65°C (+145°F)

Possible Causes

Possible Causes
HIGH TEMPERATURE FAILURE

Diagnostic Test

1. VERIFY THAT DTC B1429-RADIO DISPLAY HIGH TEMPERATURE IS ACTIVE.

With the scan tool, clear all DTC's.

Start the engine and allow the engine to reach normal operating temperature.

If the vehicle has been in the hot sunlight or extreme cold, move the vehicle indoors and open the doors to allow the inside temperature to stabilize.

The Radio should operate between -23°C and +65°C (-10°F and +145°F).

With the scan tool, read DTC's.

Does the scan tool display active: B1429-RADIO DISPLAY HIGH TEMPERATURE?

Yes

Replace the Radio in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B142A-RADIO UNIT HIGH TEMPERATURE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously with the ignition and Radio on.

Set Conditions

- **Set Condition:**

The code will set if the temperature inside the Radio is above +65°C (+145°F)

Possible Causes

Possible Causes
HIGH TEMPERATURE FAILURE

Diagnostic Test

1. VERIFY THAT DTC B142A-RADIO UNIT HIGH TEMPERATURE IS ACTIVE.

With the scan tool, erase the DTC's.

Start the engine and allow the engine to reach normal operating temperature.

If the vehicle has been in the hot sunlight or extreme cold, move the vehicle indoors and open the doors to allow the inside temperature to stabilize.

The Radio should operate between -23°C and +65°C (-10°F and +145°F).

With the scan tool, read DTC's.

Does the scan tool display active: B142A-RADIO UNIT HIGH TEMPERATURE?

Yes

Replace the Radio in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B142C-VES VIDEO SCREEN DISCONNECTED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on and the Radio in Video mode.

Set Conditions

• **Set Condition:**

With the Radio in Video mode, the Radio does not detect a VES Video Screen.

Possible Causes

Possible Causes
BAD VES VIDEO SCREEN CONNECTION RADIO

Diagnostic Test

1. TEST VES VIDEO SCREEN CONNECTION

Turn the ignition off.

Disconnect the VES Video Screen connector.

Inspect the VES Video Screen connection.

Was the VES Video Screen connection clean and secure?

Yes

Go To 2.

No

Repair the VES Video Screen connection as needed.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **VES VIDEO SCREEN**

Refer to the Audio System in the Service Information and test the VES Video Screen in accordance with the Service Procedure.

Is the Antenna ok?

Yes

Go To 3.

No

Repair or replace the VES Video Screen in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. **RADIO**

NOTE: **Reconnect all previously disconnected components.**

NOTE: **Move vehicle outside approximately 30ft (9.14m) from any structure.**

Turn the ignition on.

Turn the Radio on.

With the scan tool, clear all DTC's, put the Radio in mode.

With the scan tool, read DTC's.

Does the scan tool display active: B142C-VES VIDEO SCREEN DISCONNECTED?

Yes

Replace the Radio in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B142D-AUDIO ANTENNA NOT CONNECTED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on and the Radio in seek mode.

Set Conditions

- **Set Condition:**

With the Radio in seek mode for two loops around the band. The Radio does not detect an Antenna connection or does not receive a Radio station signal.

Possible Causes

Possible Causes
BAD ANTENNA CONNECTION RADIO

Diagnostic Test

1. **TEST ANTENNA**

Turn the ignition off.

Disconnect the Radio Antenna connector.

Inspect the Radio Antenna connection.

Was the Antenna connection clean and secure?

Yes

Go To 2.

No

Repair the Antenna connection as needed.

Perform **BODY VERIFICATION TEST - VER 1** .

2. ANTENNA

Refer to the Audio System in the Service Information and test the antenna in accordance with the Service Procedure.

Is the Antenna ok?

Yes

Go To 3.

No

Repair or replace the Antenna assembly in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. RADIO

NOTE: **Reconnect all previously disconnected components.**

NOTE: **Move vehicle outside approximately 30ft (9.14m) from any structure.**

Turn the ignition on.

Turn the Radio on.

With the scan tool, clear all DTC's, put the Radio in seek up and down mode for 2 loops around the band cycle before proceeding.

With the scan tool, read DTC's.

Does the scan tool display active: B142D-AUDIO ANTENNA NOT CONNECTED?

Yes

Replace the Radio in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B142E-GPS ANTENNA NOT CONNECTED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on and the Radio in Navigation mode.

Set Conditions

- **Set Condition:**

With the Radio in Navigation mode. The Radio does not detect an Antenna connection or does not receive a Navigation (GPS) signal.

Possible Causes

Possible Causes
BAD ANTENNA CONNECTION RADIO ANTENNA

Diagnostic Test

1. **TEST ANTENNA**

Turn the ignition off.

Disconnect the GPS Antenna connector.

Inspect the GPS Antenna connection.

Was the Antenna connection clean and secure?

Yes

Go To 2.

No

Repair the Antenna connection as needed.
Perform **BODY VERIFICATION TEST - VER 1** .

2. **ANTENNA**

Refer to the Audio System in the Service Information and test the antenna in accordance with the Service Procedure.

Is the Antenna ok?

Yes

Go To 3.

No

Repair or replace the Antenna assembly in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. **RADIO**

NOTE: Reconnect all previously disconnected components.

NOTE: Move vehicle outside approximately 30ft (9.14m) from any structure.

Turn the ignition and Radio on.

With the scan tool, clear all DTC's and operate the Navigation system.

With the scan tool, read DTC's.

Does the scan tool display active: B142E-GPS ANTENNA NOT CONNECTED?

Yes

Replace the Radio in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B142F-SATELLITE RADIO ANTENNA NOT CONNECTED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on and the Satellite Radio in seek mode.

Set Conditions

- **Set Condition:**
- With the radio in seek mode for two loops around the band. The radio does not detect an antenna

connection or does not receive a radio satellite signal.

Possible Causes

Possible Causes
BAD ANTENNA CONNECTION SATELLITE RADIO RECEIVER

Diagnostic Test

1. TEST ANTENNA

Turn the ignition off.

Disconnect the Satellite Radio Antenna connector.

Inspect the Satellite Radio Antenna connection.

Was the Antenna connection clean and secure?

Yes

Go To 2.

No

Repair the Antenna connection as needed.

Perform **BODY VERIFICATION TEST - VER 1** .

2. SATELLITE RADIO ANTENNA

Refer to the Audio System in the service information and test the antenna in accordance with the service procedure.

Is the Antenna ok?

Yes

Go To 3.

No

Repair or replace the Antenna assembly as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

3. SATELLITE RADIO RECEIVER

NOTE: Reconnect all previously disconnected components.

NOTE: **Move vehicle outside approximately 30ft (9.144m) from any structure.**

Turn the ignition and radio on.

With the scan tool, erase the audio DTC's, put the satellite radio in seek up and down mode for 2 loops around the band cycle before proceeding.

With the scan tool, read the audio DTC's.

Did this DTC reset?

Yes

Replace the Satellite Radio Receiver in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B1430 SATELLITE RADIO ANTENNA INTERNAL PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- The Satellite Radio Antenna detects a software checksum test failure.

Possible Causes

Possible Causes
SATELLITE RADIO ANTENNA

Diagnostic Test

1. **REPLACE THE SATELLITE RADIO ANTENNA**

When this code is set, the Satellite Radio Antenna must be replaced.

Repair

Replace the Satellite Radio Antenna in accordance with the Service Information. Refer to **STANDARD PROCEDURE** . Refer to **STANDARD PROCEDURE** .

B1460-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ± 1 sec.

Possible Causes

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1460-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

Yes

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW

Circuit Schematic

Fig. 37: Channel 1 Audio Speaker Output Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes

Possible Causes
(X201) AMPLIFIED LEFT FRONT I/P SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X291) AMPLIFIED LEFT FRONT I/P SPEAKER (-) CIRCUIT SHORTED TO GROUND
LEFT FRONT I/P SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK THE (X201) AMPLIFIED LEFT FRONT I/P SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

819c0f14

Fig. 38: Measuring Resistance Between Ground And (X201) Amplified Left Front I/P Speaker (+) Circuit

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Left I/P Speaker harness connector.

Measure the resistance between ground and the (X201) Amplified Left Front I/P Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X201) Amplified Left Front I/P Speaker (+) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK THE (X291) AMPLIFIED LEFT FRONT I/P SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 39: Measuring Resistance Between Ground And Amplified Left Front I/P Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (X291) Amplified Left Front I/P Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X291) Amplified Left Front I/P Speaker (-) for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. **CHECK OPERATION OF THE AMPLIFIED LEFT FRONT I/P SPEAKER**

Fig. 40: Measuring Resistance Of Speaker Circuit Between Amplifier C2 Harness Connector And Ground
Courtesy of CHRYSLER LLC

Reconnect and reinstall the Left Front I/P Speaker.

Measure the resistance of the speaker circuit between the Amplifier C2 harness connector and ground.

Is the resistance below 10K ohms?

Yes

Replace the Left Front I/P Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1462-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

Circuit Schematic

81N09477

Fig. 41: Channel 1 Audio Speaker Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- The amplifier detects a short to battery condition on the output circuit.

Possible Causes

Possible Causes
(X201) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X291) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1462-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK FOR VOLTAGE ON THE (X201) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT**

Fig. 42: Measuring For Voltage On (X201) Amplified Left I/P Speaker (+) Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Amplified Left I/P Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X201) Amplified Left I/P Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X201) Amplified Left I/P Speaker (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK FOR VOLTAGE ON THE (X291) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT**

Fig. 43: Measuring For Voltage On (X291) Amplified Left I/P Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Measure for voltage on the (X291) Amplified Left I/P Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X291) Amplified Left I/P Speaker (-) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1463-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Amplifier BUS wake-up. Amplifier reset with scan tool.

Set Conditions

- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes

Possible Causes
(X201) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT OPEN (X291) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT OPEN LEFT FRONT I/P SPEAKER AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1463-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1**.

2. CHECK THE OPERATION OF THE LEFT FRONT I/P SPEAKER

Fig. 44: Measuring Voltage Of Amplified Left I/P Speaker Circuits In Amplified Left I/P Speaker Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Left I/P Speaker harness connector.

Turn the ignition on.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Left I/P Speaker circuits in the Amplified Left I/P Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes

Replace the Amplified Left I/P Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 3.

3. **CHECK THE (X201) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT FOR AN OPEN**

Fig. 45: Measuring Resistance Of (X201) Amplified Left I/P Speaker (+) Circuit Between Amplifier C2 Harness Connector And Amplified Left I/P Speaker Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X201) Amplified Left I/P Speaker (+) circuit between the Amplifier C2 harness connector and the Amplified Left I/P Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Go To 4.

No

Repair the (X201) Amplified Left I/P Speaker (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1**.

4. **CHECK THE (X291) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT FOR AN OPEN**

Fig. 46: Measuring Resistance Of (X291) Amplified Left I/P Speaker (-) Circuit Between Amplifier C2 Harness Connector And Amplified Left I/P Speaker Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (X291) amplified Left I/P Speaker (-) circuit between the Amplifier C2 harness connector and the Amplified Left I/P Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Replace the Amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (X291) Amplified Left I/P Speaker (-) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

B1464-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

Circuit Schematic

81N09477

Fig. 47: Channel 1 Audio Speaker Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on. Radio volume at 25 or higher.

Set Conditions

- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes

Possible Causes
(X201) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT SHORTED TO THE (X291) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT AMPLIFIED LEFT I/P SPEAKER AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1464-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE OPERATION OF THE AMPLIFIED LEFT I/P SPEAKER

Turn the ignition off.

Disconnect the Amplified Left I/P Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes

Replace the Amplified Left I/P Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK THE (X201) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT, AND THE (X291) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

Fig. 48: Measuring Resistance Between (X201) Amplified Left I/P Speaker (+) Circuit And (X291) Amplified Left I/P Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Disconnect the Amplifier C2 harness connector.

Measure the resistance between the (X201) Amplified Left I/P Speaker (+) circuit, and the (X291) Amplified Left I/P Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X201) Amplified Left I/P Speaker (+) circuit, and the (X291) Amplified Left I/P Speaker (-) circuit for a short together.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1465-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read amplifier DTCs.

Does the scan tool display active: B1465-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

Yes

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

B1466-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT LOW

Circuit Schematic

010c13a5

Fig. 49: Channel 2 Audio Speaker Output Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes

Possible Causes
(X202) AMPLIFIED RIGHT FRONT I/P SPEAKER (+) CIRCUIT SHORTED TO GROUND (X292) AMPLIFIED RIGHT FRONT I/P SPEAKER (-) CIRCUIT SHORTED TO GROUND RIGHT FRONT I/P SPEAKER AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1466-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK THE (X202) AMPLIFIED RIGHT FRONT I/P SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

819c142f

Fig. 50: Measuring Resistance Between Ground And (X202) Amplified Right Front I/P Speaker (+) Circuit

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Right Front I/P Speaker harness connector.

Measure the resistance between ground and the (X202) Amplified Right Front I/P Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X202) Amplified Right Front I/P Speaker (+) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK THE (X292) AMPLIFIED RIGHT FRONT I/P SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 51: Measuring Resistance Between Ground And (X292) Amplified Right Front I/P Speaker (-) Circuit

Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (X292) Amplified Right Front I/P Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X292) Amplified Right Front I/P Speaker (-) for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. CHECK OPERATION OF THE AMPLIFIED RIGHT FRONT I/P SPEAKER

Fig. 52: Measuring Resistance Of Speaker Circuit Between Amplifier C2 Harness Connector And Ground

Courtesy of CHRYSLER LLC

Reconnect and reinstall the Right Front I/P Speaker.

Measure the resistance of the speaker circuit between the Amplifier C2 harness connector and ground.

Is the resistance below 10K ohms?

Yes

Replace the Right Front I/P Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1467-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

Circuit Schematic

019c13a5

Fig. 53: Channel 2 Audio Speaker Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- The amplifier detects a short to battery condition on the output circuit.

Possible Causes

Possible Causes
(X202) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X292) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1467-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK FOR VOLTAGE ON THE (X202) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT**

819c16c6

Fig. 54: Measuring For Voltage On (X202) Amplified Right I/P Speaker (+) Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Amplified Right I/P Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X202) Amplified Right I/P Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X202) Amplified Right I/P Speaker (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK FOR VOLTAGE ON THE (X292) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT

Measure for voltage on the (X292) Amplified Right I/P Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X292) Amplified Right I/P Speaker (-) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1468-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

Circuit Schematic

AMPLIFIER-RADIO C2

SPEAKER-INSTRUMENT PANEL-RIGHT

019c13a5

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Amplifier BUS wake-up. Amplifier reset with scan tool.

Set Conditions

- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes

Possible Causes
(X202) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT OPEN
(X292) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT OPEN
RIGHT I/P SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1468-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE OPERATION OF THE RIGHT FRONT I/P SPEAKER

Fig. 56: Measuring Voltage Of Amplified Right I/P Speaker Circuits In Amplified Right I/P Speaker Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Right I/P Speaker harness connector.

Turn the ignition on.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Right I/P Speaker circuits in the Amplified Right I/P Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes

Replace the Amplified Right I/P Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 3.

3. CHECK THE (X202) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT FOR AN OPEN

819c16de

Fig. 57: Measuring Resistance Of (X202) Amplified Right I/P Speaker (+) Circuit Between Amplifier C2 Harness Connector And Amplified Right I/P Speaker Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X202) Amplified Right I/P Speaker (+) circuit between the Amplifier C2 harness connector and the Amplified Right I/P Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Go To 4.

No

Repair the (X202) Amplified Right I/P Speaker (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. **CHECK THE (X292) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT FOR AN OPEN**

Fig. 58: Measuring Resistance Of (X292) Amplified Right I/P Speaker (-) Circuit Between Amplifier C2 Harness Connector And Amplified Right I/P Speaker Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (X292) Amplified Right I/P Speaker (-) circuit between the Amplifier C2 harness connector and the Amplified Right I/P Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (X292) Amplified Right I/P Speaker (-) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1 .**

B1469-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

Circuit Schematic

**AMPLIFIER-
RADIO C2**

**SPEAKER-
INSTRUMENT
PANEL-
RIGHT**

Fig. 59: Channel 2 Audio Speaker Output Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on. Radio volume at 25 or higher.

Set Conditions

- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes

Possible Causes
(X202) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT SHORTED TO THE (X292) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT AMPLIFIED RIGHT I/P SPEAKER AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1469-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE OPERATION OF THE AMPLIFIED RIGHT I/P SPEAKER

Turn the ignition off.

Disconnect the Amplified Right I/P Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes

Replace the Amplified Right I/P Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK THE (X202) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT, AND THE (X292) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

819c16fd

Fig. 60: Measuring Resistance Between (X202) Amplified Right I/P Speaker (+) Circuit And (X292) Amplified Right I/P Speaker (-) Circuit
 Courtesy of CHRYSLER LLC

Disconnect the Amplifier C2 harness connector.

Measure the resistance between the (X202) Amplified Right I/P Speaker (+) circuit, and the (X292) Amplified Right I/P Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X202) Amplified Right I/P Speaker (+) circuit, and the (X292) Amplified Right I/P Speaker (-) circuit for a short together.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B146A-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146A-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

Yes

Replace the amplifier in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform **BODY VERIFICATION TEST - VER 1** .

B146B-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT LOW

Circuit Schematic

010c10af

Fig. 61: Channel 3 Audio Speaker Output Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes

Possible Causes
(X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUIT SHORTED TO GROUND
LEFT FRONT SPEAKER
AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146B-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK THE (X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

819c1937

Fig. 62: Measuring Resistance Between Ground And (X209) Amplified Left Front Speaker (+) Circuit

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Left Front Speaker harness connector.

Measure the resistance between ground and the (X209) Amplified Left Front Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X209) Amplified Left Front Speaker (+) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK THE (X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

819c1977

Fig. 63: Measuring Resistance Between Ground And (X299) Amplified Left Front Speaker (-) Circuit

Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (X299) Amplified Left Front Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X299) Amplified Left Front Speaker (-) for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. CHECK OPERATION OF THE AMPLIFIED LEFT FRONT SPEAKER

819c19ba

Fig. 64: Measuring Resistance Of Speaker Circuit Between Amplifier C1 Harness Connector And Ground

Courtesy of CHRYSLER LLC

Reconnect and reinstall the Left Front Speaker.

Measure the resistance of the speaker circuit between the Amplifier C1 harness connector and ground.

Is the resistance below 10K ohms?

Yes

Replace the Left Front Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B146C-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

Circuit Schematic

010c10a1

Fig. 65: Channel 3 Audio Speaker Output Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- The amplifier detects a short to battery condition on the output circuit.

Possible Causes

Possible Causes
(X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146C-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK FOR VOLTAGE ON THE (X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT

819c1a0a

Fig. 66: Measuring For Voltage On (X209) Amplified Left Front Speaker (+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Amplified Left Front Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X209) Amplified Left Front Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X209) Amplified Left Front Speaker (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK FOR VOLTAGE ON THE (X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUIT**

819c1a4a

Fig. 67: Measuring For Voltage On (X299) Amplified Left Front Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Measure for voltage on the (X299) Amplified Left Front Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X299) Amplified Left Front Speaker (-) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1 .**

Monitor Conditions

When Monitored:

Amplifier BUS wake-up. Amplifier reset with scan tool.

Set Conditions

- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes

Possible Causes
(X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT OPEN (X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUIT OPEN AMPLIFIED LEFT FRONT SPEAKER AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146D-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE OPERATION OF THE AMPLIFIED LEFT FRONT SPEAKER

819c1aa2

Fig. 69: Measuring Voltage Of Amplified Left Front Speaker Circuits In Amplified Left Front Speaker Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplified Left Front Speaker harness connector.

Turn the ignition on.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Left Front Speaker circuits in the Amplified Left Front Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes

Replace the Amplified Left Front Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK THE (X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT FOR AN OPEN**

819c1aad

Fig. 70: Measuring Resistance Of (X209) Amplified Left Front Speaker (+) Circuit Between Amplifier C1 Harness Connector And Amplified Left Front Speaker Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X209) Amplified Left Front Speaker (+) circuit between the Amplifier C1 harness connector and the Amplified Left Front Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Go To 4.

No

Repair the (X209) Amplified Left Front Speaker (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. CHECK THE (X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUIT FOR AN OPEN

819c1ab4

Fig. 71: Measuring Resistance Of (X299) Amplified Left Front Speaker (-) Circuit Between Amplifier C1 Harness Connector And Amplified Left Front Speaker Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (X299) Amplified Left Front Speaker (-) circuit between the Amplifier C1 harness connector and the Amplified Left Front Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (X299) Amplified Left Front Speaker (-) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

B146E-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

Circuit Schematic

Fig. 72: Channel 3 Audio Speaker Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on. Radio volume at 25 or higher.

Set Conditions

- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes

Possible Causes
(X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT SHORTED TO THE (X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUIT
AMPLIFIED LEFT FRONT SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146E-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE OPERATION OF THE AMPLIFIED LEFT FRONT SPEAKER

Turn the ignition off.

Disconnect the Amplified Left Front Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes

Replace the Amplified Left Front Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK THE (X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT, AND THE (X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

SPEAKER-
LEFT
FRONT

819c1ac0

Fig. 73: Measuring Resistance Between (X209) Amplified Left Front Speaker (+) Circuit And (X299) Amplified Left Front Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Disconnect the Amplifier C1 harness connector.

Measure the resistance between the (X209) Amplified Left Front Speaker (+) circuit, and the (X299) Amplified Left Front Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X209) Amplified Left Front Speaker (+) circuit, and the (X299) Amplified Left Front Speaker (-) circuit for a short together.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B146F-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes

Possible Causes
(X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUIT SHORTED TO GROUND
RIGHT FRONT SPEAKER
AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1470-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK THE (X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

819c26a3

Fig. 75: Measuring Resistance Between Ground And (X208) Amplified Right Front Speaker (+) Circuit

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Right Front Speaker harness connector.

Measure the resistance between ground and the (X208) Amplified Right Front Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X208) Amplified Right Front Speaker (+) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK THE (X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

819c26c6

Fig. 76: Measuring Resistance Between Ground And (X298) Amplified Right Front Speaker (-) Circuit

Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (X298) Amplified Right Front Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X298) Amplified Right Front Speaker (-) for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 4.

4. CHECK OPERATION OF THE AMPLIFIED RIGHT FRONT SPEAKER

Fig. 77: Measuring Resistance Of Speaker Circuit Between Amplifier C1 Harness Connector And Ground

Courtesy of CHRYSLER LLC

Reconnect and reinstall the Right Front Speaker.

Measure the resistance of the speaker circuit between the Amplifier C1 harness connector and ground.

Is the resistance below 10K ohms?

Yes

Replace the Right Front Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1471-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

Circuit Schematic

019c3000

Possible Causes
(X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1471-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK FOR VOLTAGE ON THE (X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT**

819c293e

Fig. 79: Measuring For Voltage On (X208) Amplified Right Front Speaker (+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Amplified Right Front Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X208) Amplified Right Front Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X208) Amplified Right Front Speaker (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK FOR VOLTAGE ON THE (X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUIT**

819c2947

Fig. 80: Measuring For Voltage On (X298) Amplified Right Front Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Measure for voltage on the (X298) Amplified Right Front Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X298) Amplified Right Front Speaker (-) circuit for a short to voltage.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1472-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

Circuit Schematic

019c3000

Fig. 81: Channel 4 Audio Speaker Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Amplifier BUS wake-up. Amplifier reset with scan tool.

Set Conditions

- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes

Possible Causes
(X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT OPEN
(X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUIT OPEN
AMPLIFIED RIGHT FRONT SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1472-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE OPERATION OF THE AMPLIFIED RIGHT FRONT SPEAKER

Fig. 82: Measuring Voltage Of Amplified Right Front Speaker Circuits In Amplified Right Front Speaker Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplified Right Front Speaker harness connector.

Turn the ignition on.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Right Front Speaker circuits in the Amplified Right Front Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes

Replace the Amplified Right Front Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK THE (X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT FOR AN OPEN

819c295c

Fig. 83: Measuring Resistance Of (X208) Amplified Right Front Speaker (+) Circuit Between Amplifier C1 Harness Connector And Amplified Right Front Speaker Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X208) Amplified Right Front Speaker (+) circuit between the Amplifier C1 harness connector and the Amplified Right Front Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Go To 4.

No

Repair the (X208) Amplified Right Front Speaker (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1**.

4. **CHECK THE (X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUIT FOR AN OPEN**

819c2962

Fig. 84: Measuring Resistance Of (X298) Amplified Right Front Speaker (-) Circuit Between Amplifier C1 Harness Connector And Amplified Right Front Speaker Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (X298) Amplified Right Front Speaker (-) circuit between the Amplifier C1 harness connector and the Amplified Right Front Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Repair the (X298) Amplified Right Front Speaker (-) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

B1473-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

Circuit Schematic

Fig. 85: Channel 4 Audio Speaker Output Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on. Radio volume at 25 or higher.

Set Conditions

- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes

Possible Causes
(X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT SHORTED TO THE (X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUIT AMPLIFIED RIGHT FRONT SPEAKER AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1473-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE OPERATION OF THE AMPLIFIED RIGHT FRONT SPEAKER

Turn the ignition off.

Disconnect the Amplified Right Front Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes

Replace the Amplified Right Front Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK THE (X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT, AND THE (X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

819c29c2

Fig. 86: Measuring Resistance Between (X208) Amplified Right Front Speaker (+) Circuit And (X298) Amplified Right Front Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Disconnect the Amplifier C1 harness connector.

Measure the resistance between the (X208) Amplified Right Front Speaker (+) circuit, and the (X298) Amplified Right Front Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X208) Amplified Right Front Speaker (+) circuit, and the (X298) Amplified Right Front Speaker (-) circuit for a short together.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1474-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1474-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

Yes

Replace the amplifier in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform **BODY VERIFICATION TEST - VER 1** .

B1475-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT LOW

Circuit Schematic

010c0070

Fig. 87: Channel 5 Audio Speaker Output Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes

Possible Causes
(X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUIT SHORTED TO GROUND
LEFT REAR SPEAKER
AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1475-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK THE (X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

819c2bb5

Fig. 88: Measuring Resistance Between Ground And Amplified Left Rear Speaker (+) Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Left Rear Speaker harness connector.

Measure the resistance between ground and the (X205) Amplified Left Rear Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X205) Amplified Left Rear Speaker (+) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 3.

3. **CHECK THE (X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

819c2bf0

Fig. 89: Measuring Resistance Between Ground And Amplified Left Rear Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (X295) Amplified Left Rear Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X295) Amplified Left Rear Speaker (-) for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. CHECK OPERATION OF THE AMPLIFIED LEFT REAR SPEAKER

819c2bfb

Fig. 90: Measuring Resistance Of Speaker Circuit Between Amplifier C2 Harness Connector And Ground

Courtesy of CHRYSLER LLC

Reconnect and reinstall the Left Rear Speaker.

Measure the resistance of the speaker circuit between the Amplifier C2 harness connector and ground.

Is the resistance below 10K ohms?

Yes

Replace the Left Rear Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1476-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

Circuit Schematic

019c2073

Fig. 91: Channel 5 Audio Speaker Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- The amplifier detects a short to battery condition on the output circuit.

Possible Causes

Possible Causes
(X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1476-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK FOR VOLTAGE ON THE (X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT**

Fig. 92: Measuring For Voltage On (X205) Amplified Left Rear Speaker (+) Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Amplified Left Rear Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X205) Amplified Left Rear Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X205) Amplified Left Rear Speaker (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK FOR VOLTAGE ON THE (X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUIT**

Fig. 93: Measuring For Voltage On (X295) Amplified Left Rear Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Measure for voltage on the (X295) Amplified Left Rear Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X295) Amplified Left Rear Speaker (-) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1477-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

Circuit Schematic

Fig. 94: Channel 5 Audio Speaker Output Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Amplifier BUS wake-up. Amplifier reset with scan tool.

Set Conditions

- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes

Possible Causes
(X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT OPEN (X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUIT OPEN LEFT REAR SPEAKER AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1477-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1**.

2. CHECK THE OPERATION OF THE AMPLIFIED LEFT REAR SPEAKER

819c2d99

Fig. 95: Measuring Voltage Of Amplified Left Rear Speaker Circuits In Amplified Left Rear Speaker Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Left Rear Speaker harness connector.

Turn the ignition on.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Left Rear Speaker circuits in the Amplified Left Rear Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes

Replace the Amplified Left Rear Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 3.

3. **CHECK THE (X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT FOR AN OPEN**

Fig. 96: Measuring Resistance Of (X205) Amplified Left Rear Speaker (+) Circuit Between Amplifier C2 Harness Connector And Amplified Left Rear Speaker Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X205) Amplified Left Rear Speaker (+) circuit between the Amplifier C2 harness connector and the Amplified Left Rear Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Go To 4.

No

Repair the (X205) Amplified Left Rear Speaker (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1**.

4. **CHECK THE (X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUIT FOR AN OPEN**

819c2df0

Fig. 97: Measuring Resistance Of (X295) Amplified Left Rear Speaker (-) Circuit Between Amplifier C2 Harness Connector And Amplified Left Rear Speaker Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (X295) Amplified Left Rear Speaker (-) circuit between the Amplifier C2 harness connector and the Amplified Left Rear Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (X295) Amplified Left Rear Speaker (-) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

B1478-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

Circuit Schematic

019c2073

Fig. 98: Channel 5 Audio Speaker Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on. Radio volume at 25 or higher.

Set Conditions

- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes

Possible Causes
(X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT SHORTED TO THE (X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUIT AMPLIFIED LEFT REAR SPEAKER AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1478-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE OPERATION OF THE AMPLIFIED LEFT REAR SPEAKER

Turn the ignition off.

Disconnect the Amplified Left Rear Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes

Replace the Amplified Left Rear Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK THE (X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT, AND THE (X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

819c2e06

Fig. 99: Measuring Resistance Between (X205) Amplified Left Rear Speaker (+) Circuit And (X295) Amplified Left Rear Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Disconnect the Amplifier C2 harness connector.

Measure the resistance between the (X205) Amplified Left Rear Speaker (+) circuit, and the (X295) Amplified Left Rear Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X205) Amplified Left Rear Speaker (+) circuit, and the (X295) Amplified Left Rear Speaker (-) circuit for a short together.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1479-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1479-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

Yes

Replace the amplifier in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform **BODY VERIFICATION TEST - VER 1** .

B147A-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT LOW

Circuit Schematic

Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes

Possible Causes
(X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUIT SHORTED TO GROUND
RIGHT REAR SPEAKER
AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B147A-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK THE (X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

819c2f1a

Fig. 101: Measuring Resistance Between Ground And (X206) Amplified Right Rear Speaker (+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Right Rear Speaker harness connector.

Measure the resistance between ground and the (X206) Amplified Right Rear Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X206) Amplified Right Rear Speaker (+) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK THE (X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 102: Measuring Resistance Between Ground And (X296) Amplified Right Rear Speaker (-) Circuit

Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (X296) Amplified Right Rear Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X296) Amplified Right Rear Speaker (-) for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. CHECK OPERATION OF THE AMPLIFIED RIGHT REAR SPEAKER

819c2f24

Fig. 103: Measuring Resistance Of Speaker Circuit Between Amplifier C2 Harness Connector And Ground

Courtesy of CHRYSLER LLC

Reconnect and reinstall the Right Rear Speaker.

Measure the resistance of the speaker circuit between the Amplifier C2 harness connector and ground.

Is the resistance below 10K ohms?

Yes

Replace the Right Rear Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B147B-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

Set Conditions

- **Set Condition:**
- The amplifier detects a short to battery condition on the output circuit.

Possible Causes

Possible Causes
(X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B147B-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK FOR VOLTAGE ON THE (X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT**

Fig. 105: Measuring Voltage On Amplified Right Rear Speaker (+) Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Amplified Right Rear Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X206) Amplified Right Rear Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X206) Amplified Right Rear Speaker (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK FOR VOLTAGE ON THE (X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUIT**

Fig. 106: Measuring For Voltage On (X296) Amplified Right Rear Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Measure for voltage on the (X296) Amplified Right Rear Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X296) Amplified Right Rear Speaker (-) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B147C-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

Circuit Schematic

Fig. 107: Channel 6 Audio Speaker Output Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Amplifier BUS wake-up. Amplifier reset with scan tool.

Set Conditions

- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes

Possible Causes
(X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT OPEN (X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUIT OPEN RIGHT REAR SPEAKER AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B147C-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE OPERATION OF THE RIGHT REAR SPEAKER

819c315a

Fig. 108: Measuring Voltage Of Amplified Right Rear Speaker Circuits In Amplified Right Rear Speaker Harness Connector

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Right Rear Speaker harness connector.

Turn the ignition on.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Right Rear Speaker circuits in the Amplified Right Rear Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes

Replace the Amplified Right Rear Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK THE (X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT FOR AN OPEN**

Fig. 109: Measuring Resistance Of (X206) Amplified Right Rear Speaker (+) Circuit Between Amplifier C2 Harness Connector And Amplified Right Rear Speaker Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X206) Amplified Right Rear Speaker (+) circuit between the Amplifier C2 harness connector and the Amplified Right Rear Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Go To 4.

No

Repair the (X206) Amplified Right Rear Speaker (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. CHECK THE (X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUIT FOR AN OPEN

Fig. 110: Measuring Resistance Of (X296) Amplified Right Rear Speaker (-) Circuit Between Amplifier C2 Harness Connector And Amplified Right Rear Speaker Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (X296) Amplified Right Rear Speaker (-) circuit between the Amplifier C2 harness connector and the Amplified Right Rear Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (X296) Amplified Right Rear Speaker (-) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

B147D-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

Circuit Schematic

 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on. Radio volume at 25 or higher.

Set Conditions

- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes

Possible Causes
(X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT SHORTED TO THE (X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUIT AMPLIFIED RIGHT REAR SPEAKER AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, clear Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B147D-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE OPERATION OF THE AMPLIFIED RIGHT REAR SPEAKER

Turn the ignition off.

Disconnect the Amplified Right Rear Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes

Replace the Amplified Right Rear Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK THE (X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT, AND THE (X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

819c320d

Fig. 112: Measuring Resistance Between (X206) Amplified Right Rear Speaker (+) Circuit And (X296) Amplified Right Rear Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Disconnect the Amplifier C2 harness connector.

Measure the resistance between the (X206) Amplified Right Rear Speaker (+) circuit, and the (X296) Amplified Right Rear Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X206) Amplified Right Rear Speaker (+) circuit, and the (X296) Amplified Right Rear Speaker (-) circuit for a short together.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B2222-SATELLITE RADIO RECEIVER INTERNAL

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- The Satellite Radio Receiver detects a software checksum test failure.

Possible Causes

Possible Causes
SATELLITE RADIO RECEIVER

Diagnostic Test

1. **REPLACE THE SATELLITE RADIO RECEIVER**

When this code is set, the Satellite Radio must be replaced.

Repair

Replace the Satellite Radio Receiver in accordance with the Service Information. Refer to **STANDARD PROCEDURE** (ELECTRICAL DIAGNOSTICS). Refer to **STANDARD PROCEDURE** (SERVICE INFORMATION).

U0019-CAN INTERIOR BUS(+)/(-) CIRCUIT

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

- **Set Condition:**
- Whenever the CAN INTERIOR BUS (+) or INTERIOR BUS (-) circuit is open, shorted to voltage or shorted to ground, this code will set.

Possible Causes

Possible Causes
CAN INTERIOR BUS DTCs IN THE TOTALLY INTEGRATED POWER MODULE (D264) CAN INTERIOR BUS (-) CIRCUIT OPEN (D265) CAN INTERIOR BUS (+) CIRCUIT OPEN AMPLIFIER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display: U0019-CAN INTERIOR BUS CIRCUIT?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1**.

2. CHECK TOTALLY INTEGRATED POWER MODULE DTCs

With the scan tool, read Totally Integrated Power Module DTCs

Does the scan tool display any CAN INTERIOR BUS DTCs - ACTIVE?

Yes

Refer to the symptom list for problems related to Communication in **ELECTRONIC CONTROL**

MODULES - ELECTRICAL DIAGNOSTICS .

No

Go to 3.

3. CAN INTERIOR BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Totally Integrated Power Module C7 harness connector.

Measure the resistance of the (D265) CAN INTERIOR BUS (+) circuit between the Totally Integrated Power Module C7 harness connector and the Amplifier C1 harness connector.

Is the resistance below 2.0 ohms?

Yes

Go To 4.

Perform **BODY VERIFICATION TEST - VER 1 .**

No

Repair the CAN INTERIOR BUS (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1 .**

4. CAN INTERIOR BUS (-) CIRCUIT OPEN

Measure the resistance of the (D264) CAN INTERIOR BUS (-) circuit between the Totally Integrated Power Module C7 harness connector and the Amplifier C1 harness connector.

Is the resistance below 2.0 ohms?

Yes

Replace the Amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1 .**

No

Repair the CAN INTERIOR BUS (-) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1 .**

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

- **Set Condition:**
- Whenever the CAN INTERIOR BUS (+) or INTERIOR BUS (-) circuit is open, shorted to voltage or shorted to ground, this code will set.

Possible Causes

Possible Causes
CAN INTERIOR BUS DTCs IN THE TOTALLY INTEGRATED POWER MODULE (D264) CAN INTERIOR BUS (-) CIRCUIT OPEN (D265) CAN INTERIOR BUS (+) CIRCUIT OPEN AMPLIFIER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display: U0020-CAN INTERIOR BUS OFF PERFORMANCE?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK FRONT CONTROL MODULE DTCs**

With the scan tool, read Totally Integrated Power Module DTCs.

Does the scan tool display any CAN INTERIOR BUS DTCs - ACTIVE?

Yes

Refer to the symptom list for problems related to Communication in **ELECTRONIC CONTROL MODULES - ELECTRICAL DIAGNOSTICS** .

No

Go to 3.

3. **CAN INTERIOR BUS (+) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Totally Integrated Power Module C7 harness connector.

Measure the resistance of the (D265) CAN INTERIOR BUS (+) circuit between the Totally Integrated Power module C7 harness connector and the Amplifier C1 harness connector.

Is the resistance below 2.0 ohms?

Yes

Go To 4.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the CAN INTERIOR BUS (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. **CAN INTERIOR BUS (-) CIRCUIT OPEN**

Measure the resistance of the (D264) CAN INTERIOR BUS (-) circuit between the Totally Integrated Power Module C7 harness connector and the Amplifier C1 harness connector.

Is the resistance below 2.0 ohms?

Yes

Replace the Amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the CAN INTERIOR BUS (-) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0154-LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0184-LOST COMMUNICATION WITH RADIO

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0195-LOST COMMUNICATION WITH SDAR

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0197-LOST COMMUNICATION WITH HANDS FREE MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0199-LOST COMMUNICATION WITH DRIVERS DOOR MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0200-LOST COMMUNICATION WITH PASSENGER DOOR MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

AUDIO/VIDEO SYSTEMS - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW

Circuit Schematic

01940215

Fig. 1: Front Left Audio Speaker Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the radio on.

Set Conditions

- **Set Condition:**
- When the output circuit is LOW for more than three seconds.

Possible Causes

Possible Causes
(X201) LEFT FRONT SPEAKERS (+) CIRCUIT SHORTED TO GROUND
(X291) LEFT FRONT SPEAKERS (-) CIRCUIT SHORTED TO GROUND
SPEAKER

Diagnostic Test

1. **INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, clear all Radio DTC's.

Turn the Radio on.

With the scan tool, read the DTC information.

Does the scan tool read: B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **(X201) LEFT FRONT SPEAKERS (+) CIRCUIT SHORTED TO GROUND**

819c0219

Fig. 2: Measuring Resistance Between Ground And Left Front Speakers (+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Radio harness connector.

Disconnect the Front Left Audio Speaker harness connector.

Measure the resistance between ground and the (X201) Left Front Speakers (+) circuit.

Is the resistance below 1000.0 ohms?

Yes

Repair the (X201) Left Front Speakers (+) circuit for a short to ground condition.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 3.

3. (X291) LEFT FRONT SPEAKERS (-) CIRCUIT SHORTED TO GROUND

819c022c

Fig. 3: Measuring Resistance Between Ground And Left Front Speakers (-) Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (X291) Left Front Speakers (-) circuit.

Is the resistance below 1000.0 ohms?

Yes

Repair the (X291) Left Front Speakers (-) circuit for a short to ground condition.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. SPEAKER

Connect the Radio harness connector.

With the Front Left Audio Speaker still disconnected, turn the ignition on.

Turn the Radio on.

With the scan tool, clear all Radio DTC's.

With the scan tool, read the DTC information.

Does the scan tool read: B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

Replace the Front Left Audio Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH

Circuit Schematic

01940215

Fig. 4: Front Left Audio Speaker Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Possible Causes

Possible Causes
(X201) LEFT FRONT SPEAKERS (+) CIRCUIT SHORTED TO VOLTAGE
(X291) LEFT FRONT SPEAKERS (-) CIRCUIT SHORTED TO VOLTAGE
SPEAKER

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Radio DTCs.

Does the scan tool display active: B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. (X201) LEFT FRONT SPEAKERS (+) CIRCUIT SHORTED TO VOLTAGE

819c027b

Fig. 5: Measuring Voltage Of Left Front Speakers (+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Radio harness connector.

Disconnect the Left Front Audio Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X201) Left Front Speakers (+) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X201) Left Front Speakers (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. (X291) LEFT FRONT SPEAKERS (-) CIRCUIT SHORTED TO VOLTAGE

819c0283

Fig. 6: Measuring Voltage On Left Front Speakers (-) Circuit
Courtesy of CHRYSLER LLC

Measure for voltage on the (X291) Left Front Speakers (-) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X291) Left Front Speakers (-) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Radio in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN

Circuit Schematic

Fig. 7: Front Left Audio Speaker Output Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the radio on.

Set Conditions

- **Set Condition:**
- When the output circuit is open for more than three seconds. The radio will not set the fault if the radio confirms an amplifier is on the BUS.

Possible Causes

Possible Causes
(X201) LEFT FRONT SPEAKERS (+) CIRCUIT OPEN (X291) LEFT FRONT SPEAKERS (-) CIRCUIT OPEN SPEAKER

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all Radio DTC's.

Turn the Radio on.

With the scan tool, read the DTC information.

Does the scan tool read: B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken

wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1**.

2. (X201) LEFT FRONT SPEAKERS (+) CIRCUIT OPEN

819c052f

Fig. 8: Measuring Resistance Of Left Front Speakers (+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Radio harness connector.

Disconnect the Front Left Audio Speaker harness connector.

Measure the resistance of the (X201) Left Front Speakers (+) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes

Go To 3.

No

Repair the (X201) Left Front Speakers (+) circuit for an open condition.

Perform **BODY VERIFICATION TEST - VER 1** .

3. (X291) LEFT FRONT SPEAKERS (-) CIRCUIT OPEN

819c0552

Fig. 9: Measuring Resistance Of Left Front Speakers (-) Circuit
Courtesy of CHRYSLER LLC

Measure the resistance of the (X291) Left Front Speakers (-) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes

Go To 4.

No

Repair the (X291) Left Front Speakers (-) circuit for an open condition.

Perform **BODY VERIFICATION TEST - VER 1** .

4. **SPEAKER**

Connect the Radio harness connector.

With the Front Left Audio Speaker still disconnected, turn the ignition on.

Turn the Radio on.

With the scan tool, clear all Radio DTC's.

With the scan tool, read the DTC information.

Does the scan tool read: B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Replace the Front Left Audio Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW

Circuit Schematic

019c057c

Fig. 10: Front Right Audio Speaker Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the radio on.

Set Conditions

- **Set Condition:**
- When the output circuit is LOW for more than three seconds.

Possible Causes

Possible Causes
(X202) RIGHT FRONT SPEAKERS (+) CIRCUIT SHORTED TO GROUND
(X292) RIGHT FRONT SPEAKERS (-) CIRCUIT SHORTED TO GROUND
SPEAKER

Diagnostic Test

1. **INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, clear all Radio DTC's.

Turn the Radio on.

With the scan tool, read the DTC information.

Does the scan tool read: B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **(X202) RIGHT FRONT SPEAKERS (+) CIRCUIT SHORTED TO GROUND**

819c0581

Fig. 11: Measuring Resistance Between Ground And Right Front Speakers Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Radio harness connector.

Disconnect the Front Right Audio Speaker harness connector.

Measure the resistance between ground and the (X202) Right Front Speakers (+) circuit.

Is the resistance below 1000.0 ohms?

Yes

Repair the (X202) Right Front Speakers (+) circuit for a short to ground condition.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. (X292) RIGHT FRONT SPEAKERS (-) CIRCUIT SHORTED TO GROUND

819c0593

Fig. 12: Measuring Resistance Between Ground And Right Front Speakers (-) Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (X292) Right Front Speakers (-) circuit.

Is the resistance below 1000.0 ohms?

Yes

Repair the (X292) Right Front Speakers (-) circuit for a short to ground condition.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. **SPEAKER**

Connect the Radio harness connector.

With the Front Right Audio Speaker still disconnected, turn the ignition on.

Turn the Radio on.

With the scan tool, clear all Radio DTC's.

With the scan tool, read the DTC information.

Does the scan tool read: B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

Replace the Front Right Audio Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B1406-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH

Circuit Schematic

019c057c

Fig. 13: Front Right Audio Speaker Output Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Possible Causes

Possible Causes
(X202) RIGHT FRONT SPEAKERS (+) CIRCUIT SHORTED TO VOLTAGE
(X292) RIGHT FRONT SPEAKERS (-) CIRCUIT SHORTED TO VOLTAGE
SPEAKER

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Radio DTCs.

Does the scan tool display active: B1406-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. (X202) RIGHT FRONT SPEAKERS (+) CIRCUIT SHORTED TO VOLTAGE

819c073b

Fig. 14: Measuring Voltage On Right Front Speakers (+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Radio harness connector.

Disconnect the Right Front Audio Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X202) Right Front Speakers (+) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X202) Right Front Speakers (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. (X292) RIGHT FRONT SPEAKERS (-) CIRCUIT SHORTED TO VOLTAGE

819c0746

Fig. 15: Measuring Voltage On Right Front Speakers (-) Circuit
Courtesy of CHRYSLER LLC

Measure for voltage on the (X292) Right Front Speakers (-) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X292) Right Front Speakers (-) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Radio in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN

Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the radio on.

Set Conditions

- **Set Condition:**
- When the output circuit is open for more than three seconds. The radio will not set the fault if the radio confirms an amplifier is on the BUS.

Possible Causes

Possible Causes
(X202) RIGHT FRONT SPEAKERS (+) CIRCUIT OPEN (X292) RIGHT FRONT SPEAKERS (-) CIRCUIT OPEN SPEAKER

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all Radio DTC's.

Turn the Radio on.

With the scan tool, read the DTC information.

Does the scan tool read: B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken

wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1**.

2. (X202) RIGHT FRONT SPEAKERS (+) CIRCUIT OPEN

819c074d

Fig. 17: Measuring Resistance Of Right Front Speakers (+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Radio harness connector.

Disconnect the Front Right Audio Speaker harness connector.

Measure the resistance of the (X202) Right Front Speakers (+) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes

Go To 3.

No

Repair the (X202) Right Front Speakers (+) circuit for an open condition.

Perform **BODY VERIFICATION TEST - VER 1** .

3. **(X292) RIGHT FRONT SPEAKERS (-) CIRCUIT OPEN**

819c0751

Fig. 18: Measuring Resistance Of Right Front Speakers (-) Circuit
Courtesy of CHRYSLER LLC

Measure the resistance of the (X292) Right Front Speakers (-) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes

Go To 4.

No

Repair the (X292) Right Front Speakers (-) circuit for an open condition.

Perform **BODY VERIFICATION TEST - VER 1** .

4. **SPEAKER**

Connect the Radio harness connector.

With the Front Right Audio Speaker still disconnected, turn the ignition on.

Turn the Radio on.

With the scan tool, clear all Radio DTC's.

With the scan tool, read the DTC information.

Does the scan tool read: B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Replace the Front Right Audio Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW

Circuit Schematic

RADIO

SPEAKER-LEFT REAR

With the radio on.

Set Conditions

- **Set Condition:**
- When the output circuit is LOW for more than three seconds.

Possible Causes

Possible Causes
(X205) LEFT REAR SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X295) LEFT REAR SPEAKER (-) CIRCUIT SHORTED TO GROUND
SPEAKER

Diagnostic Test

1. **INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, clear all Radio DTC's.

Turn the Radio on.

With the scan tool, read the DTC information.

Does the scan tool read: B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **(X205) LEFT REAR SPEAKER (+) CIRCUIT SHORTED TO GROUND**

819c08f2

Fig. 20: Measuring Resistance Between Ground And Left Rear Speaker (+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Radio harness connector.

Disconnect the Rear Left Audio Speaker harness connector.

Measure the resistance between ground and the (X205) Left Rear Speaker (+) circuit.

Is the resistance below 1000.0 ohms?

Yes

Repair the (X205) Left Rear Speaker (+) circuit for a short to ground condition.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. (X295) LEFT REAR SPEAKER (-) CIRCUIT SHORTED TO GROUND

819c0904

Fig. 21: Measuring Resistance Between Ground And Left Rear Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (X295) Left Rear Speaker (-) circuit.

Is the resistance below 1000.0 ohms?

Yes

Repair the (X295) Left Rear Speaker (-) circuit for a short to ground condition.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. **SPEAKER**

Connect the Radio harness connector.

With the Rear Left Audio Speaker still disconnected, turn the ignition on.

Turn the Radio on.

With the scan tool, clear all Radio DTC's.

With the scan tool, read the DTC information.

Does the scan tool read: B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

Replace the Rear Left Audio Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B140A-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH

Circuit Schematic

RADIO

SPEAKER-LEFT REAR

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Possible Causes

Possible Causes
(X205) LEFT REAR SPEAKER (+) CIRCUIT SHORTED TO VOLTAGE
(X295) LEFT REAR SPEAKER (-) CIRCUIT SHORTED TO VOLTAGE
SPEAKER

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Radio DTCs.

Does the scan tool display active: B140A-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. (X205) LEFT REAR SPEAKER (+) CIRCUIT SHORTED TO VOLTAGE

819c0960

Fig. 23: Measuring For Voltage On Left Rear Speaker (+) Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Radio harness connector.

Disconnect the Left Rear Audio Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X205) Left Rear Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X205) Left Rear Speaker (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. (X295) LEFT REAR SPEAKER (-) CIRCUIT SHORTED TO VOLTAGE

819c0971

Fig. 24: Measuring For Voltage On Left Rear Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Measure for voltage on the (X295) Left Rear Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X295) Left Rear Speaker (-) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Radio in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN

Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the radio on.

Set Conditions

- **Set Condition:**
- When the output circuit is open for more than three seconds. The radio will not set the fault if the radio confirms an amplifier is on the BUS.

Possible Causes

Possible Causes
(X205) LEFT REAR SPEAKER (+) CIRCUIT OPEN
(X295) LEFT REAR SPEAKER (-) CIRCUIT OPEN
SPEAKER

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all Radio DTC's.

Turn the Radio on.

With the scan tool, read the DTC information.

Does the scan tool read: B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken

wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1**.

2. (X205) LEFT REAR SPEAKER (+) CIRCUIT OPEN

819c0975

Fig. 26: Measuring Resistance Of Left Rear Speaker (+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Radio harness connector.

Disconnect the Rear Left Audio Speaker harness connector.

Measure the resistance of the (X205) Left Rear Speaker (+) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes

Go To 3.

No

Repair the (X205) Left Rear Speaker (+) circuit for an open condition.

Perform **BODY VERIFICATION TEST - VER 1** .

3. (X295) LEFT REAR SPEAKER (-) CIRCUIT OPEN

819c097c

Fig. 27: Measuring Resistance Of Left Rear Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Measure the resistance of the (X295) Left Rear Speaker (-) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes

Go To 4.

No

Repair the (X295) Left Rear Speaker (-) circuit for an open condition.

Perform **BODY VERIFICATION TEST - VER 1** .

4. **SPEAKER**

Connect the Radio harness connector.

With the Rear Left Audio Speaker still disconnected, turn the ignition on.

Turn the Radio on.

With the scan tool, clear all Radio DTC's.

With the scan tool, read the DTC information.

Does the scan tool read: B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Replace the Rear Left Audio Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B140D-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW

Fig. 36: Measuring Resistance Of Right Rear Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Measure the resistance of the (X296) Right Rear Speaker (-) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes

Go To 4.

No

Repair the (X296) Right Rear Speaker (-) circuit for an open condition.
Perform **BODY VERIFICATION TEST - VER 1** .

4. **SPEAKER**

Connect the Radio harness connector.

With the Rear Right Audio Speaker still disconnected, turn the ignition on.

Turn the Radio on.

With the scan tool, clear all Radio DTC's.

With the scan tool, read the DTC information.

Does the scan tool read: B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Replace the Rear Right Audio Speaker in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B1420-AUDIO CASSETTE ERROR/INOPERABLE CASSETTE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously with the ignition on and the Radio Cassette player turned on.

Set Conditions

- **Set Condition:**

The code will set when a damaged Cassette is placed in the Cassette Player.

Possible Causes

Possible Causes

CASSETTE READ FAILURE

Diagnostic Test

1. **RADIO**

Replace the problem Cassette with a good, clean, undamaged, cassette.

Turn the Radio cassette player on.

With the scan tool, read DTC's.

Does the scan tool display active: B1420-AUDIO CASSETTE ERROR/INOPERABLE CASSETTE?

Yes

Eject the inoperative cassette and replace the Radio/Cassette Player in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B1421-AUDIO CD READ ERROR/INOPERABLE DISC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously with the ignition on and the radio CD player turned on.

Set Conditions

- **Set Condition:**
- The code will set if a CD that is not formatted as a music CD is installed in the radio CD player.

Possible Causes

Possible Causes
CD READ FAILURE

Diagnostic Test

1. RADIO

Replace the problem CD with a good, clean, unscratched, music CD.

Turn the radio CD player on.

With the scan tool, read DTC's.

Does the scan tool display: B1421 AUDIO CD READ ERROR/INOPERABLE DISC?

Yes

Eject the inoperative CD and replace the CD in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B1422-AUDIO DVD READ ERROR/INOPERABLE DISC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously with the ignition on and the DVD player turned on.

Set Conditions

- **Set Condition:**

The code will set if a DVD that is not formatted as a DVD is installed in the DVD player.

Possible Causes

Possible Causes
DVD READ FAILURE

Diagnostic Test

1. DVD PLAYER

Replace the problem DVD with a good, clean, unscratched DVD.

Turn the DVD player on.

With the scan tool, read DTC's.

Does the scan tool display active: B1422-AUDIO DVD READ ERROR/INOPERABLE DISC?

Yes

Eject the inoperative DVD and replace the DVD in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B1423-VES DVD READ ERROR/INOPERABLE DISC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously with the ignition on and the DVD player turned on.

Set Conditions

- **Set Condition:**

The code will set if a DVD that is not formatted as a DVD is installed in the DVD player.

Possible Causes

Possible Causes
DVD READ FAILURE

Diagnostic Test

1. **DVD PLAYER**

Replace the problem DVD with a good, clean, unscratched DVD.

Turn the DVD player on.

With the scan tool, read DTC's.

Does the scan tool display active: B1423-VES DVD READ ERROR/INOPERABLE DISC?

Yes

Eject the inoperative DVD and replace the DVD in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B1424-IMPROPER DVD-WRONG REGION

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously with the ignition on and the DVD player turned on.

Set Conditions

- **Set Condition:**

The code will set if a DVD that is not formatted as a DVD is installed in the DVD player.

Possible Causes

Possible Causes
DVD READ FAILURE

Diagnostic Test

1. DVD PLAYER

Replace the problem DVD with a good, clean, unscratched DVD.

Turn the DVD player on.

With the scan tool, read DTC's.

Does the scan tool display active: B1424-IMPROPER DVD-WRONG REGION?

Yes

Eject the inoperative DVD and replace the DVD in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B1429-RADIO DISPLAY HIGH TEMPERATURE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously with the ignition and Radio on.

Set Conditions

- Set Condition:**

The code will set if the temperature inside the Radio is above +65°C (+145°F)

Possible Causes

Possible Causes
HIGH TEMPERATURE FAILURE

Diagnostic Test

1. VERIFY THAT DTC B1429-RADIO DISPLAY HIGH TEMPERATURE IS ACTIVE.

With the scan tool, clear all DTC's.

Start the engine and allow the engine to reach normal operating temperature.

If the vehicle has been in the hot sunlight or extreme cold, move the vehicle indoors and open the doors to allow the inside temperature to stabilize.

The Radio should operate between -23°C and +65°C (-10°F and +145°F).

With the scan tool, read DTC's.

Does the scan tool display active: B1429-RADIO DISPLAY HIGH TEMPERATURE?

Yes

Replace the Radio in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B142A-RADIO UNIT HIGH TEMPERATURE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously with the ignition and Radio on.

Set Conditions

- **Set Condition:**

The code will set if the temperature inside the Radio is above +65°C (+145°F)

Possible Causes

Possible Causes
HIGH TEMPERATURE FAILURE

Diagnostic Test

1. VERIFY THAT DTC B142A-RADIO UNIT HIGH TEMPERATURE IS ACTIVE.

With the scan tool, erase the DTC's.

Start the engine and allow the engine to reach normal operating temperature.

If the vehicle has been in the hot sunlight or extreme cold, move the vehicle indoors and open the doors to allow the inside temperature to stabilize.

The Radio should operate between -23°C and +65°C (-10°F and +145°F).

With the scan tool, read DTC's.

Does the scan tool display active: B142A-RADIO UNIT HIGH TEMPERATURE?

Yes

Replace the Radio in accordance with the Service Information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B142C-VES VIDEO SCREEN DISCONNECTED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on and the Radio in Video mode.

Set Conditions

- **Set Condition:**

With the Radio in Video mode, the Radio does not detect a VES Video Screen.

Possible Causes

Possible Causes
BAD VES VIDEO SCREEN CONNECTION RADIO

Diagnostic Test

1. TEST VES VIDEO SCREEN CONNECTION

Turn the ignition off.

Disconnect the VES Video Screen connector.

Inspect the VES Video Screen connection.

Was the VES Video Screen connection clean and secure?

Yes

Go To 2.

No

Repair the VES Video Screen connection as needed.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **VES VIDEO SCREEN**

Refer to the Audio System in the Service Information and test the VES Video Screen in accordance with the Service Procedure.

Is the Antenna ok?

Yes

Go To 3.

No

Repair or replace the VES Video Screen in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. **RADIO**

NOTE: **Reconnect all previously disconnected components.**

NOTE: **Move vehicle outside approximately 30ft (9.14m) from any structure.**

Turn the ignition on.

Turn the Radio on.

With the scan tool, clear all DTC's, put the Radio in mode.

With the scan tool, read DTC's.

Does the scan tool display active: B142C-VES VIDEO SCREEN DISCONNECTED?

Yes

Replace the Radio in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B142D-AUDIO ANTENNA NOT CONNECTED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on and the Radio in seek mode.

Set Conditions

- **Set Condition:**

With the Radio in seek mode for two loops around the band. The Radio does not detect an Antenna connection or does not receive a Radio station signal.

Possible Causes

Possible Causes
BAD ANTENNA CONNECTION RADIO

Diagnostic Test

1. TEST ANTENNA

Turn the ignition off.

Disconnect the Radio Antenna connector.

Inspect the Radio Antenna connection.

Was the Antenna connection clean and secure?

Yes

Go To 2.

No

Repair the Antenna connection as needed.

Perform **BODY VERIFICATION TEST - VER 1** .

2. ANTENNA

Refer to the Audio System in the Service Information and test the antenna in accordance with the Service Procedure.

Is the Antenna ok?

Yes

Go To 3.

No

Repair or replace the Antenna assembly in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. RADIO

NOTE: **Reconnect all previously disconnected components.**

NOTE: **Move vehicle outside approximately 30ft (9.14m) from any structure.**

Turn the ignition on.

Turn the Radio on.

With the scan tool, clear all DTC's, put the Radio in seek up and down mode for 2 loops around the band cycle before proceeding.

With the scan tool, read DTC's.

Does the scan tool display active: B142D-AUDIO ANTENNA NOT CONNECTED?

Yes

Replace the Radio in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B142E-GPS ANTENNA NOT CONNECTED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on and the Radio in Navigation mode.

Set Conditions

- **Set Condition:**

With the Radio in Navigation mode. The Radio does not detect an Antenna connection or does not receive a Navigation (GPS) signal.

Possible Causes

Possible Causes
BAD ANTENNA CONNECTION RADIO ANTENNA

Diagnostic Test

1. **TEST ANTENNA**

Turn the ignition off.

Disconnect the GPS Antenna connector.

Inspect the GPS Antenna connection.

Was the Antenna connection clean and secure?

Yes

Go To 2.

No

Repair the Antenna connection as needed.
Perform **BODY VERIFICATION TEST - VER 1** .

2. **ANTENNA**

Refer to the Audio System in the Service Information and test the antenna in accordance with the Service Procedure.

Is the Antenna ok?

Yes

Go To 3.

No

Repair or replace the Antenna assembly in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

3. RADIO

NOTE: Reconnect all previously disconnected components.

NOTE: Move vehicle outside approximately 30ft (9.14m) from any structure.

Turn the ignition and Radio on.

With the scan tool, clear all DTC's and operate the Navigation system.

With the scan tool, read DTC's.

Does the scan tool display active: B142E-GPS ANTENNA NOT CONNECTED?

Yes

Replace the Radio in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B142F-SATELLITE RADIO ANTENNA NOT CONNECTED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on and the Satellite Radio in seek mode.

Set Conditions

- **Set Condition:**
- With the radio in seek mode for two loops around the band. The radio does not detect an antenna

connection or does not receive a radio satellite signal.

Possible Causes

Possible Causes
BAD ANTENNA CONNECTION SATELLITE RADIO RECEIVER

Diagnostic Test

1. TEST ANTENNA

Turn the ignition off.

Disconnect the Satellite Radio Antenna connector.

Inspect the Satellite Radio Antenna connection.

Was the Antenna connection clean and secure?

Yes

Go To 2.

No

Repair the Antenna connection as needed.

Perform **BODY VERIFICATION TEST - VER 1** .

2. SATELLITE RADIO ANTENNA

Refer to the Audio System in the service information and test the antenna in accordance with the service procedure.

Is the Antenna ok?

Yes

Go To 3.

No

Repair or replace the Antenna assembly as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

3. SATELLITE RADIO RECEIVER

NOTE: Reconnect all previously disconnected components.

NOTE: **Move vehicle outside approximately 30ft (9.144m) from any structure.**

Turn the ignition and radio on.

With the scan tool, erase the audio DTC's, put the satellite radio in seek up and down mode for 2 loops around the band cycle before proceeding.

With the scan tool, read the audio DTC's.

Did this DTC reset?

Yes

Replace the Satellite Radio Receiver in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

B1430 SATELLITE RADIO ANTENNA INTERNAL PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- The Satellite Radio Antenna detects a software checksum test failure.

Possible Causes

Possible Causes
SATELLITE RADIO ANTENNA

Diagnostic Test

1. **REPLACE THE SATELLITE RADIO ANTENNA**

When this code is set, the Satellite Radio Antenna must be replaced.

Repair

Replace the Satellite Radio Antenna in accordance with the Service Information. Refer to **STANDARD PROCEDURE** . Refer to **STANDARD PROCEDURE** .

B1460-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ± 1 sec.

Possible Causes

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1460-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

Yes

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW

Circuit Schematic

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK THE (X201) AMPLIFIED LEFT FRONT I/P SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

819c0f14

Fig. 38: Measuring Resistance Between Ground And (X201) Amplified Left Front I/P Speaker (+) Circuit

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Left I/P Speaker harness connector.

Measure the resistance between ground and the (X201) Amplified Left Front I/P Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X201) Amplified Left Front I/P Speaker (+) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK THE (X291) AMPLIFIED LEFT FRONT I/P SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

819c0f21

Fig. 39: Measuring Resistance Between Ground And Amplified Left Front I/P Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (X291) Amplified Left Front I/P Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X291) Amplified Left Front I/P Speaker (-) for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. **CHECK OPERATION OF THE AMPLIFIED LEFT FRONT I/P SPEAKER**

Fig. 40: Measuring Resistance Of Speaker Circuit Between Amplifier C2 Harness Connector And Ground
Courtesy of CHRYSLER LLC

Reconnect and reinstall the Left Front I/P Speaker.

Measure the resistance of the speaker circuit between the Amplifier C2 harness connector and ground.

Is the resistance below 10K ohms?

Yes

Replace the Left Front I/P Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1462-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

Circuit Schematic

81N09477

Fig. 41: Channel 1 Audio Speaker Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- The amplifier detects a short to battery condition on the output circuit.

Possible Causes

Possible Causes
(X201) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X291) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1462-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK FOR VOLTAGE ON THE (X201) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT**

Fig. 42: Measuring For Voltage On (X201) Amplified Left I/P Speaker (+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Amplified Left I/P Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X201) Amplified Left I/P Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X201) Amplified Left I/P Speaker (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK FOR VOLTAGE ON THE (X291) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT**

Fig. 43: Measuring For Voltage On (X291) Amplified Left I/P Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Measure for voltage on the (X291) Amplified Left I/P Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X291) Amplified Left I/P Speaker (-) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1463-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Amplifier BUS wake-up. Amplifier reset with scan tool.

Set Conditions

- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes

Possible Causes
(X201) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT OPEN (X291) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT OPEN LEFT FRONT I/P SPEAKER AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1463-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1**.

2. CHECK THE OPERATION OF THE LEFT FRONT I/P SPEAKER

Fig. 44: Measuring Voltage Of Amplified Left I/P Speaker Circuits In Amplified Left I/P Speaker Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Left I/P Speaker harness connector.

Turn the ignition on.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Left I/P Speaker circuits in the Amplified Left I/P Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes

Replace the Amplified Left I/P Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 3.

3. **CHECK THE (X201) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT FOR AN OPEN**

Fig. 45: Measuring Resistance Of (X201) Amplified Left I/P Speaker (+) Circuit Between Amplifier C2 Harness Connector And Amplified Left I/P Speaker Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X201) Amplified Left I/P Speaker (+) circuit between the Amplifier C2 harness connector and the Amplified Left I/P Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Go To 4.

No

Repair the (X201) Amplified Left I/P Speaker (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1**.

4. **CHECK THE (X291) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT FOR AN OPEN**

Fig. 46: Measuring Resistance Of (X291) Amplified Left I/P Speaker (-) Circuit Between Amplifier C2 Harness Connector And Amplified Left I/P Speaker Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (X291) amplified Left I/P Speaker (-) circuit between the Amplifier C2 harness connector and the Amplified Left I/P Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Replace the Amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (X291) Amplified Left I/P Speaker (-) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

B1464-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

Circuit Schematic

81N09477

Fig. 47: Channel 1 Audio Speaker Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on. Radio volume at 25 or higher.

Set Conditions

- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes

Possible Causes
(X201) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT SHORTED TO THE (X291) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT AMPLIFIED LEFT I/P SPEAKER AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1464-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE OPERATION OF THE AMPLIFIED LEFT I/P SPEAKER

Turn the ignition off.

Disconnect the Amplified Left I/P Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes

Replace the Amplified Left I/P Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK THE (X201) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT, AND THE (X291) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

Fig. 48: Measuring Resistance Between (X201) Amplified Left I/P Speaker (+) Circuit And (X291) Amplified Left I/P Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Disconnect the Amplifier C2 harness connector.

Measure the resistance between the (X201) Amplified Left I/P Speaker (+) circuit, and the (X291) Amplified Left I/P Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X201) Amplified Left I/P Speaker (+) circuit, and the (X291) Amplified Left I/P Speaker (-) circuit for a short together.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1465-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read amplifier DTCs.

Does the scan tool display active: B1465-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

Yes

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

B1466-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT LOW

Circuit Schematic

010c13a5

Fig. 49: Channel 2 Audio Speaker Output Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes

Possible Causes
(X202) AMPLIFIED RIGHT FRONT I/P SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X292) AMPLIFIED RIGHT FRONT I/P SPEAKER (-) CIRCUIT SHORTED TO GROUND
RIGHT FRONT I/P SPEAKER
AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1466-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK THE (X202) AMPLIFIED RIGHT FRONT I/P SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

819c142f

Fig. 50: Measuring Resistance Between Ground And (X202) Amplified Right Front I/P Speaker (+) Circuit

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Right Front I/P Speaker harness connector.

Measure the resistance between ground and the (X202) Amplified Right Front I/P Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X202) Amplified Right Front I/P Speaker (+) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK THE (X292) AMPLIFIED RIGHT FRONT I/P SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 51: Measuring Resistance Between Ground And (X292) Amplified Right Front I/P Speaker (-) Circuit

Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (X292) Amplified Right Front I/P Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X292) Amplified Right Front I/P Speaker (-) for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. CHECK OPERATION OF THE AMPLIFIED RIGHT FRONT I/P SPEAKER

Fig. 52: Measuring Resistance Of Speaker Circuit Between Amplifier C2 Harness Connector And Ground

Courtesy of CHRYSLER LLC

Reconnect and reinstall the Right Front I/P Speaker.

Measure the resistance of the speaker circuit between the Amplifier C2 harness connector and ground.

Is the resistance below 10K ohms?

Yes

Replace the Right Front I/P Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1467-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

Circuit Schematic

019c13a5

Fig. 53: Channel 2 Audio Speaker Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- The amplifier detects a short to battery condition on the output circuit.

Possible Causes

Possible Causes
(X202) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X292) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1467-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK FOR VOLTAGE ON THE (X202) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT**

819c16c6

Fig. 54: Measuring For Voltage On (X202) Amplified Right I/P Speaker (+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Amplified Right I/P Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X202) Amplified Right I/P Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X202) Amplified Right I/P Speaker (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK FOR VOLTAGE ON THE (X292) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT

Measure for voltage on the (X292) Amplified Right I/P Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X292) Amplified Right I/P Speaker (-) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1468-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

Circuit Schematic

AMPLIFIER-RADIO C2

SPEAKER-INSTRUMENT PANEL-RIGHT

Monitor Conditions

When Monitored:

Amplifier BUS wake-up. Amplifier reset with scan tool.

Set Conditions

- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes

Possible Causes
(X202) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT OPEN
(X292) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT OPEN
RIGHT I/P SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1468-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE OPERATION OF THE RIGHT FRONT I/P SPEAKER

Fig. 56: Measuring Voltage Of Amplified Right I/P Speaker Circuits In Amplified Right I/P Speaker Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Right I/P Speaker harness connector.

Turn the ignition on.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Right I/P Speaker circuits in the Amplified Right I/P Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes

Replace the Amplified Right I/P Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 3.

3. CHECK THE (X202) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT FOR AN OPEN

Fig. 57: Measuring Resistance Of (X202) Amplified Right I/P Speaker (+) Circuit Between Amplifier C2 Harness Connector And Amplified Right I/P Speaker Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X202) Amplified Right I/P Speaker (+) circuit between the Amplifier C2 harness connector and the Amplified Right I/P Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Go To 4.

No

Repair the (X202) Amplified Right I/P Speaker (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. **CHECK THE (X292) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT FOR AN OPEN**

Fig. 58: Measuring Resistance Of (X292) Amplified Right I/P Speaker (-) Circuit Between Amplifier C2 Harness Connector And Amplified Right I/P Speaker Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (X292) Amplified Right I/P Speaker (-) circuit between the Amplifier C2 harness connector and the Amplified Right I/P Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (X292) Amplified Right I/P Speaker (-) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1 .**

B1469-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

Circuit Schematic

AMPLIFIER-RADIO C2

SPEAKER-INSTRUMENT PANEL-RIGHT

Fig. 59: Channel 2 Audio Speaker Output Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on. Radio volume at 25 or higher.

Set Conditions

- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes

Possible Causes
(X202) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT SHORTED TO THE (X292) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT AMPLIFIED RIGHT I/P SPEAKER AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1469-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE OPERATION OF THE AMPLIFIED RIGHT I/P SPEAKER

Turn the ignition off.

Disconnect the Amplified Right I/P Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes

Replace the Amplified Right I/P Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK THE (X202) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT, AND THE (X292) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

819c16fd

Fig. 60: Measuring Resistance Between (X202) Amplified Right I/P Speaker (+) Circuit And (X292) Amplified Right I/P Speaker (-) Circuit
 Courtesy of CHRYSLER LLC

Disconnect the Amplifier C2 harness connector.

Measure the resistance between the (X202) Amplified Right I/P Speaker (+) circuit, and the (X292) Amplified Right I/P Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X202) Amplified Right I/P Speaker (+) circuit, and the (X292) Amplified Right I/P Speaker (-) circuit for a short together.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B146A-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes

Possible Causes
(X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUIT SHORTED TO GROUND
LEFT FRONT SPEAKER
AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146B-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK THE (X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

819c1937

Fig. 62: Measuring Resistance Between Ground And (X209) Amplified Left Front Speaker (+) Circuit

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Left Front Speaker harness connector.

Measure the resistance between ground and the (X209) Amplified Left Front Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X209) Amplified Left Front Speaker (+) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK THE (X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

819c1977

Fig. 63: Measuring Resistance Between Ground And (X299) Amplified Left Front Speaker (-) Circuit

Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (X299) Amplified Left Front Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X299) Amplified Left Front Speaker (-) for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. CHECK OPERATION OF THE AMPLIFIED LEFT FRONT SPEAKER

819c19ba

Fig. 64: Measuring Resistance Of Speaker Circuit Between Amplifier C1 Harness Connector And Ground

Courtesy of CHRYSLER LLC

Reconnect and reinstall the Left Front Speaker.

Measure the resistance of the speaker circuit between the Amplifier C1 harness connector and ground.

Is the resistance below 10K ohms?

Yes

Replace the Left Front Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B146C-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

- The amplifier detects a short to battery condition on the output circuit.

Possible Causes

Possible Causes
(X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146C-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK FOR VOLTAGE ON THE (X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT**

819c1a0a

Fig. 66: Measuring For Voltage On (X209) Amplified Left Front Speaker (+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Amplified Left Front Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X209) Amplified Left Front Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X209) Amplified Left Front Speaker (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK FOR VOLTAGE ON THE (X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUIT**

819c1a4a

Fig. 67: Measuring For Voltage On (X299) Amplified Left Front Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Measure for voltage on the (X299) Amplified Left Front Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X299) Amplified Left Front Speaker (-) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B146D-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

Circuit Schematic

**SPEAKER-
LEFT
FRONT**

**AMPLIFIER-
RADIO C1**

Fig. 68: Channel 3 Audio Speaker Output Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Amplifier BUS wake-up. Amplifier reset with scan tool.

Set Conditions

- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes

Possible Causes
(X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT OPEN
(X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUIT OPEN
AMPLIFIED LEFT FRONT SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146D-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1**.

2. CHECK THE OPERATION OF THE AMPLIFIED LEFT FRONT SPEAKER

819c1aa2

Fig. 69: Measuring Voltage Of Amplified Left Front Speaker Circuits In Amplified Left Front Speaker Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplified Left Front Speaker harness connector.

Turn the ignition on.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Left Front Speaker circuits in the Amplified Left Front Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes

Replace the Amplified Left Front Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 3.

3. **CHECK THE (X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT FOR AN OPEN**

819c1aad

Fig. 70: Measuring Resistance Of (X209) Amplified Left Front Speaker (+) Circuit Between Amplifier C1 Harness Connector And Amplified Left Front Speaker Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X209) Amplified Left Front Speaker (+) circuit between the Amplifier C1 harness connector and the Amplified Left Front Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Go To 4.

No

Repair the (X209) Amplified Left Front Speaker (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. CHECK THE (X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUIT FOR AN OPEN

819c1ab4

Fig. 71: Measuring Resistance Of (X299) Amplified Left Front Speaker (-) Circuit Between Amplifier C1 Harness Connector And Amplified Left Front Speaker Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (X299) Amplified Left Front Speaker (-) circuit between the Amplifier C1 harness connector and the Amplified Left Front Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (X299) Amplified Left Front Speaker (-) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

B146E-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

Circuit Schematic

010c10a1

Fig. 72: Channel 3 Audio Speaker Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on. Radio volume at 25 or higher.

Set Conditions

- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes

Possible Causes
(X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT SHORTED TO THE (X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUIT AMPLIFIED LEFT FRONT SPEAKER AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146E-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE OPERATION OF THE AMPLIFIED LEFT FRONT SPEAKER

Turn the ignition off.

Disconnect the Amplified Left Front Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes

Replace the Amplified Left Front Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK THE (X209) AMPLIFIED LEFT FRONT SPEAKER (+) CIRCUIT, AND THE (X299) AMPLIFIED LEFT FRONT SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

SPEAKER-
LEFT
FRONT

819c1ac0

Fig. 73: Measuring Resistance Between (X209) Amplified Left Front Speaker (+) Circuit And (X299) Amplified Left Front Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Disconnect the Amplifier C1 harness connector.

Measure the resistance between the (X209) Amplified Left Front Speaker (+) circuit, and the (X299) Amplified Left Front Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X209) Amplified Left Front Speaker (+) circuit, and the (X299) Amplified Left Front Speaker (-) circuit for a short together.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B146F-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read amplifier DTCs.

Does the scan tool display active: B146F-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

Yes

Replace the amplifier in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform **BODY VERIFICATION TEST - VER 1** .

B1470-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT LOW

Circuit Schematic

01042000

Fig. 74: Channel 4 Audio Speaker Output Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes

Possible Causes
(X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUIT SHORTED TO GROUND
RIGHT FRONT SPEAKER
AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1470-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK THE (X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

819c26a3

Fig. 75: Measuring Resistance Between Ground And (X208) Amplified Right Front Speaker (+) Circuit

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Right Front Speaker harness connector.

Measure the resistance between ground and the (X208) Amplified Right Front Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X208) Amplified Right Front Speaker (+) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK THE (X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

819c26c6

Fig. 76: Measuring Resistance Between Ground And (X298) Amplified Right Front Speaker (-) Circuit

Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (X298) Amplified Right Front Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X298) Amplified Right Front Speaker (-) for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 4.

4. CHECK OPERATION OF THE AMPLIFIED RIGHT FRONT SPEAKER

819c2716

Fig. 77: Measuring Resistance Of Speaker Circuit Between Amplifier C1 Harness Connector And Ground

Courtesy of CHRYSLER LLC

Reconnect and reinstall the Right Front Speaker.

Measure the resistance of the speaker circuit between the Amplifier C1 harness connector and ground.

Is the resistance below 10K ohms?

Yes

Replace the Right Front Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1471-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

Circuit Schematic

019c3000

Fig. 78: Channel 4 Audio Speaker Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- The amplifier detects a short to battery condition on the output circuit.

Possible Causes

Possible Causes
(X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1471-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK FOR VOLTAGE ON THE (X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT**

819c293e

Fig. 79: Measuring For Voltage On (X208) Amplified Right Front Speaker (+) Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Amplified Right Front Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X208) Amplified Right Front Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X208) Amplified Right Front Speaker (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK FOR VOLTAGE ON THE (X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUIT**

819c2947

Fig. 80: Measuring For Voltage On (X298) Amplified Right Front Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Measure for voltage on the (X298) Amplified Right Front Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X298) Amplified Right Front Speaker (-) circuit for a short to voltage.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1472-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

Circuit Schematic

019c3000

Fig. 81: Channel 4 Audio Speaker Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Amplifier BUS wake-up. Amplifier reset with scan tool.

Set Conditions

- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes

Possible Causes
(X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT OPEN
(X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUIT OPEN
AMPLIFIED RIGHT FRONT SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1472-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE OPERATION OF THE AMPLIFIED RIGHT FRONT SPEAKER

Fig. 82: Measuring Voltage Of Amplified Right Front Speaker Circuits In Amplified Right Front Speaker Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplified Right Front Speaker harness connector.

Turn the ignition on.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Right Front Speaker circuits in the Amplified Right Front Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes

Replace the Amplified Right Front Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK THE (X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT FOR AN OPEN

819c295c

Fig. 83: Measuring Resistance Of (X208) Amplified Right Front Speaker (+) Circuit Between Amplifier C1 Harness Connector And Amplified Right Front Speaker Harness Connector
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X208) Amplified Right Front Speaker (+) circuit between the Amplifier C1 harness connector and the Amplified Right Front Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Go To 4.

No

Repair the (X208) Amplified Right Front Speaker (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. **CHECK THE (X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUIT FOR AN OPEN**

819c2962

Fig. 84: Measuring Resistance Of (X298) Amplified Right Front Speaker (-) Circuit Between Amplifier C1 Harness Connector And Amplified Right Front Speaker Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (X298) Amplified Right Front Speaker (-) circuit between the Amplifier C1 harness connector and the Amplified Right Front Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (X298) Amplified Right Front Speaker (-) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

B1473-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

Circuit Schematic

Fig. 85: Channel 4 Audio Speaker Output Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on. Radio volume at 25 or higher.

Set Conditions

- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes

Possible Causes
(X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT SHORTED TO THE (X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUIT AMPLIFIED RIGHT FRONT SPEAKER AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1473-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT
SHORTED TOGETHER?**

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE OPERATION OF THE AMPLIFIED RIGHT FRONT SPEAKER

Turn the ignition off.

Disconnect the Amplified Right Front Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes

Replace the Amplified Right Front Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK THE (X208) AMPLIFIED RIGHT FRONT SPEAKER (+) CIRCUIT, AND THE (X298) AMPLIFIED RIGHT FRONT SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

819c29c2

Fig. 86: Measuring Resistance Between (X208) Amplified Right Front Speaker (+) Circuit And (X298) Amplified Right Front Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Disconnect the Amplifier C1 harness connector.

Measure the resistance between the (X208) Amplified Right Front Speaker (+) circuit, and the (X298) Amplified Right Front Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X208) Amplified Right Front Speaker (+) circuit, and the (X298) Amplified Right Front Speaker (-) circuit for a short together.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1474-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1474-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

Yes

Replace the amplifier in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform **BODY VERIFICATION TEST - VER 1** .

B1475-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT LOW

Circuit Schematic

010c0070

Fig. 87: Channel 5 Audio Speaker Output Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes

Possible Causes
(X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUIT SHORTED TO GROUND
LEFT REAR SPEAKER
AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1475-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK THE (X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

819c2bb5

Fig. 88: Measuring Resistance Between Ground And Amplified Left Rear Speaker (+) Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Left Rear Speaker harness connector.

Measure the resistance between ground and the (X205) Amplified Left Rear Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X205) Amplified Left Rear Speaker (+) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 3.

3. **CHECK THE (X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

819c2bf0

Fig. 89: Measuring Resistance Between Ground And Amplified Left Rear Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (X295) Amplified Left Rear Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X295) Amplified Left Rear Speaker (-) for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. CHECK OPERATION OF THE AMPLIFIED LEFT REAR SPEAKER

Fig. 90: Measuring Resistance Of Speaker Circuit Between Amplifier C2 Harness Connector And Ground

Courtesy of CHRYSLER LLC

Reconnect and reinstall the Left Rear Speaker.

Measure the resistance of the speaker circuit between the Amplifier C2 harness connector and ground.

Is the resistance below 10K ohms?

Yes

Replace the Left Rear Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1476-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

Circuit Schematic

Fig. 91: Channel 5 Audio Speaker Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- The amplifier detects a short to battery condition on the output circuit.

Possible Causes

Possible Causes
(X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1476-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK FOR VOLTAGE ON THE (X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT**

Fig. 92: Measuring For Voltage On (X205) Amplified Left Rear Speaker (+) Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Amplified Left Rear Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X205) Amplified Left Rear Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X205) Amplified Left Rear Speaker (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK FOR VOLTAGE ON THE (X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUIT**

Fig. 93: Measuring For Voltage On (X295) Amplified Left Rear Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Measure for voltage on the (X295) Amplified Left Rear Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X295) Amplified Left Rear Speaker (-) circuit for a short to voltage.
Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1477-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

Circuit Schematic

Fig. 94: Channel 5 Audio Speaker Output Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Amplifier BUS wake-up. Amplifier reset with scan tool.

Set Conditions

- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes

Possible Causes
(X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT OPEN (X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUIT OPEN LEFT REAR SPEAKER AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1477-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1**.

2. CHECK THE OPERATION OF THE AMPLIFIED LEFT REAR SPEAKER

819c2d99

Fig. 95: Measuring Voltage Of Amplified Left Rear Speaker Circuits In Amplified Left Rear Speaker Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Left Rear Speaker harness connector.

Turn the ignition on.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Left Rear Speaker circuits in the Amplified Left Rear Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes

Replace the Amplified Left Rear Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 3.

3. **CHECK THE (X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT FOR AN OPEN**

Fig. 96: Measuring Resistance Of (X205) Amplified Left Rear Speaker (+) Circuit Between Amplifier C2 Harness Connector And Amplified Left Rear Speaker Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X205) Amplified Left Rear Speaker (+) circuit between the Amplifier C2 harness connector and the Amplified Left Rear Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Go To 4.

No

Repair the (X205) Amplified Left Rear Speaker (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1**.

4. **CHECK THE (X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUIT FOR AN OPEN**

Fig. 97: Measuring Resistance Of (X295) Amplified Left Rear Speaker (-) Circuit Between Amplifier C2 Harness Connector And Amplified Left Rear Speaker Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (X295) Amplified Left Rear Speaker (-) circuit between the Amplifier C2 harness connector and the Amplified Left Rear Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (X295) Amplified Left Rear Speaker (-) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

B1478-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

Circuit Schematic

019c2073

Fig. 98: Channel 5 Audio Speaker Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on. Radio volume at 25 or higher.

Set Conditions

- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes

Possible Causes
(X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT SHORTED TO THE (X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUIT AMPLIFIED LEFT REAR SPEAKER AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1478-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE OPERATION OF THE AMPLIFIED LEFT REAR SPEAKER

Turn the ignition off.

Disconnect the Amplified Left Rear Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes

Replace the Amplified Left Rear Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK THE (X205) AMPLIFIED LEFT REAR SPEAKER (+) CIRCUIT, AND THE (X295) AMPLIFIED LEFT REAR SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

819c2e06

Fig. 99: Measuring Resistance Between (X205) Amplified Left Rear Speaker (+) Circuit And (X295) Amplified Left Rear Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Disconnect the Amplifier C2 harness connector.

Measure the resistance between the (X205) Amplified Left Rear Speaker (+) circuit, and the (X295) Amplified Left Rear Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X205) Amplified Left Rear Speaker (+) circuit, and the (X295) Amplified Left Rear Speaker (-) circuit for a short together.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1479-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1479-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

Yes

Replace the amplifier in accordance with the service information.
Perform **BODY VERIFICATION TEST - VER 1** .

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform **BODY VERIFICATION TEST - VER 1** .

B147A-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT LOW

Circuit Schematic

810c2006

Fig. 100: Channel 6 Audio Speaker Output Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes

Possible Causes
(X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUIT SHORTED TO GROUND
RIGHT REAR SPEAKER
AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B147A-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK THE (X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

Fig. 101: Measuring Resistance Between Ground And (X206) Amplified Right Rear Speaker (+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Right Rear Speaker harness connector.

Measure the resistance between ground and the (X206) Amplified Right Rear Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X206) Amplified Right Rear Speaker (+) circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK THE (X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 102: Measuring Resistance Between Ground And (X296) Amplified Right Rear Speaker (-) Circuit

Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (X296) Amplified Right Rear Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X296) Amplified Right Rear Speaker (-) for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. CHECK OPERATION OF THE AMPLIFIED RIGHT REAR SPEAKER

819c2f24

Fig. 103: Measuring Resistance Of Speaker Circuit Between Amplifier C2 Harness Connector And Ground

Courtesy of CHRYSLER LLC

Reconnect and reinstall the Right Rear Speaker.

Measure the resistance of the speaker circuit between the Amplifier C2 harness connector and ground.

Is the resistance below 10K ohms?

Yes

Replace the Right Rear Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B147B-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

Circuit Schematic

810c306

Fig. 104: Channel 6 Audio Speaker Output Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- The amplifier detects a short to battery condition on the output circuit.

Possible Causes

Possible Causes
(X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B147B-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK FOR VOLTAGE ON THE (X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT**

Fig. 105: Measuring Voltage On Amplified Right Rear Speaker (+) Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Amplified Right Rear Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X206) Amplified Right Rear Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X206) Amplified Right Rear Speaker (+) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. **CHECK FOR VOLTAGE ON THE (X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUIT**

Fig. 106: Measuring For Voltage On (X296) Amplified Right Rear Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Measure for voltage on the (X296) Amplified Right Rear Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes

Repair the (X296) Amplified Right Rear Speaker (-) circuit for a short to voltage.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1 .**

B147C-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

Circuit Schematic

Fig. 107: Channel 6 Audio Speaker Output Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Amplifier BUS wake-up. Amplifier reset with scan tool.

Set Conditions

- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes

Possible Causes
(X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT OPEN (X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUIT OPEN RIGHT REAR SPEAKER AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B147C-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1**.

2. CHECK THE OPERATION OF THE RIGHT REAR SPEAKER

819c315a

Fig. 108: Measuring Voltage Of Amplified Right Rear Speaker Circuits In Amplified Right Rear Speaker Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Right Rear Speaker harness connector.

Turn the ignition on.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Right Rear Speaker circuits in the Amplified Right Rear Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes

Replace the Amplified Right Rear Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 3.

3. **CHECK THE (X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT FOR AN OPEN**

Fig. 109: Measuring Resistance Of (X206) Amplified Right Rear Speaker (+) Circuit Between Amplifier C2 Harness Connector And Amplified Right Rear Speaker Harness Connector
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X206) Amplified Right Rear Speaker (+) circuit between the Amplifier C2 harness connector and the Amplified Right Rear Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Go To 4.

No

Repair the (X206) Amplified Right Rear Speaker (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. CHECK THE (X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUIT FOR AN OPEN

Fig. 110: Measuring Resistance Of (X296) Amplified Right Rear Speaker (-) Circuit Between Amplifier C2 Harness Connector And Amplified Right Rear Speaker Harness Connector
Courtesy of CHRYSLER LLC

Measure the resistance of the (X296) Amplified Right Rear Speaker (-) circuit between the Amplifier C2 harness connector and the Amplified Right Rear Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the (X296) Amplified Right Rear Speaker (-) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

B147D-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

Circuit Schematic

810c306

Fig. 111: Channel 6 Audio Speaker Output Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on. Radio volume at 25 or higher.

Set Conditions

- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes

Possible Causes
(X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT SHORTED TO THE (X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUIT AMPLIFIED RIGHT REAR SPEAKER AMPLIFIER

Diagnostic Test

1. **CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, clear Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B147D-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes

Go To 2.

No

The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK THE OPERATION OF THE AMPLIFIED RIGHT REAR SPEAKER

Turn the ignition off.

Disconnect the Amplified Right Rear Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes

Replace the Amplified Right Rear Speaker in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 3.

3. CHECK THE (X206) AMPLIFIED RIGHT REAR SPEAKER (+) CIRCUIT, AND THE (X296) AMPLIFIED RIGHT REAR SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

819c320d

Fig. 112: Measuring Resistance Between (X206) Amplified Right Rear Speaker (+) Circuit And (X296) Amplified Right Rear Speaker (-) Circuit
Courtesy of CHRYSLER LLC

Disconnect the Amplifier C2 harness connector.

Measure the resistance between the (X206) Amplified Right Rear Speaker (+) circuit, and the (X296) Amplified Right Rear Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X206) Amplified Right Rear Speaker (+) circuit, and the (X296) Amplified Right Rear Speaker (-) circuit for a short together.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B2222-SATELLITE RADIO RECEIVER INTERNAL

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**
- The Satellite Radio Receiver detects a software checksum test failure.

Possible Causes

Possible Causes
SATELLITE RADIO RECEIVER

Diagnostic Test

1. **REPLACE THE SATELLITE RADIO RECEIVER**

When this code is set, the Satellite Radio must be replaced.

Repair

Replace the Satellite Radio Receiver in accordance with the Service Information. Refer to **STANDARD PROCEDURE** (ELECTRICAL DIAGNOSTICS). Refer to **STANDARD PROCEDURE** (SERVICE INFORMATION).

U0019-CAN INTERIOR BUS(+)/(-) CIRCUIT

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

- **Set Condition:**
- Whenever the CAN INTERIOR BUS (+) or INTERIOR BUS (-) circuit is open, shorted to voltage or shorted to ground, this code will set.

Possible Causes

Possible Causes
CAN INTERIOR BUS DTCs IN THE TOTALLY INTEGRATED POWER MODULE (D264) CAN INTERIOR BUS (-) CIRCUIT OPEN (D265) CAN INTERIOR BUS (+) CIRCUIT OPEN AMPLIFIER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display: U0019-CAN INTERIOR BUS CIRCUIT?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1**.

2. CHECK TOTALLY INTEGRATED POWER MODULE DTCs

With the scan tool, read Totally Integrated Power Module DTCs

Does the scan tool display any CAN INTERIOR BUS DTCs - ACTIVE?

Yes

Refer to the symptom list for problems related to Communication in **ELECTRONIC CONTROL**

MODULES - ELECTRICAL DIAGNOSTICS .

No

Go to 3.

3. CAN INTERIOR BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Totally Integrated Power Module C7 harness connector.

Measure the resistance of the (D265) CAN INTERIOR BUS (+) circuit between the Totally Integrated Power Module C7 harness connector and the Amplifier C1 harness connector.

Is the resistance below 2.0 ohms?

Yes

Go To 4.

Perform **BODY VERIFICATION TEST - VER 1 .**

No

Repair the CAN INTERIOR BUS (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1 .**

4. CAN INTERIOR BUS (-) CIRCUIT OPEN

Measure the resistance of the (D264) CAN INTERIOR BUS (-) circuit between the Totally Integrated Power Module C7 harness connector and the Amplifier C1 harness connector.

Is the resistance below 2.0 ohms?

Yes

Replace the Amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1 .**

No

Repair the CAN INTERIOR BUS (-) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1 .**

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Continuously.

Set Conditions

- **Set Condition:**
- Whenever the CAN INTERIOR BUS (+) or INTERIOR BUS (-) circuit is open, shorted to voltage or shorted to ground, this code will set.

Possible Causes

Possible Causes
CAN INTERIOR BUS DTCs IN THE TOTALLY INTEGRATED POWER MODULE (D264) CAN INTERIOR BUS (-) CIRCUIT OPEN (D265) CAN INTERIOR BUS (+) CIRCUIT OPEN AMPLIFIER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display: U0020-CAN INTERIOR BUS OFF PERFORMANCE?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **CHECK FRONT CONTROL MODULE DTCs**

With the scan tool, read Totally Integrated Power Module DTCs.

Does the scan tool display any CAN INTERIOR BUS DTCs - ACTIVE?

Yes

Refer to the symptom list for problems related to Communication in **ELECTRONIC CONTROL MODULES - ELECTRICAL DIAGNOSTICS** .

No

Go to 3.

3. **CAN INTERIOR BUS (+) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Totally Integrated Power Module C7 harness connector.

Measure the resistance of the (D265) CAN INTERIOR BUS (+) circuit between the Totally Integrated Power module C7 harness connector and the Amplifier C1 harness connector.

Is the resistance below 2.0 ohms?

Yes

Go To 4.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the CAN INTERIOR BUS (+) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

4. **CAN INTERIOR BUS (-) CIRCUIT OPEN**

Measure the resistance of the (D264) CAN INTERIOR BUS (-) circuit between the Totally Integrated Power Module C7 harness connector and the Amplifier C1 harness connector.

Is the resistance below 2.0 ohms?

Yes

Replace the Amplifier in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Repair the CAN INTERIOR BUS (-) circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1** .

U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0154-LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0184-LOST COMMUNICATION WITH RADIO

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0195-LOST COMMUNICATION WITH SDAR

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0197-LOST COMMUNICATION WITH HANDS FREE MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0199-LOST COMMUNICATION WITH DRIVERS DOOR MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

U0200-LOST COMMUNICATION WITH PASSENGER DOOR MODULE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

2008 ACCESSORIES AND EQUIPMENT

Audio/Video Systems - Service Information - Liberty

AUDIO/VIDEO - SERVICE INFORMATION

DESCRIPTION

AUDIO

Several combinations of radio receivers and speaker systems are offered on this model. The audio system uses an ignition switched source of battery current so that the system will only operate when the ignition switch is in the RUN or ACCESSORY positions.

The audio system includes the following components:

- Antenna
- Power amplifier
- Radio noise suppression components
- Radio receiver
- Remote radio switches (if equipped)
- Speakers
- Subwoofer

Certain functions and features of the audio system rely upon resources shared with other electronic modules in the vehicle over the Controlled Area Network (CAN). The data bus network allows the sharing of sensor information. For diagnosis of these electronic modules or of the data bus network, the use of a scan tool and the proper Diagnostic Procedures information is recommended.

OPERATION

OPERATION

The audio system components are designed to provide audio entertainment and information through the reception, tuning and amplification of locally broadcast radio signals in both the Amplitude Modulating (AM) and Frequency Modulating (FM) commercial frequency ranges.

The audio system components operate on battery current received through a fuse in the Totally Integrated Power Module (TIPM) on a fused ignition switch output (RUN-ACC) circuit so that the system will only operate when the ignition switch is in the Run or Accessory positions.

On vehicles that are equipped with the optional remote radio switches, the Cab Compartment Node (CCN) receives hard wired resistor multiplexed inputs from the remote radio switches. The programming in the CCN allows it to process those inputs and send the proper messages to the radio receiver over the Controlled Area Network (CAN) to control the radio volume up or down, station seek up or down, preset station advance, and mode advance functions.

Refer to the owner's manual for more information on the features, use and operation of each of the available audio systems.

DIAGNOSIS AND TESTING

AUDIO

AUDIO SYSTEM

Any diagnosis of the Audio system should begin with the use of scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic information.

Refer to the appropriate wiring information.

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

AUDIO SYSTEM DIAGNOSIS TABLE

CONDITION	POSSIBLE CAUSES	CORRECTION
NO AUDIO	1. Fuse faulty.	1. Check radio fuse and Ignition-Off Draw (IOD) fuse in Totally Integrated Power Module (TIPM). Replace fuses, if required.
	2. Radio connector faulty.	2. Check for loose or corroded radio connector. Repair, if required.
	3. Wiring faulty.	3. Check for shorted or open wires. Repair wiring, if required.
	4. Radio ground faulty.	4. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	5. Speakers faulty.	5. Replace speaker as necessary.
	6. Radio faulty.	6. Refer to appropriate Diagnostic Service Information.
NO RADIO DISPLAY	1. Fuse faulty.	1. Check radio fuse and Ignition-Off Draw (IOD) fuse in Junction Block (JB). Replace fuses, if required.
	2. Radio connector faulty.	2. Check for loose or corroded radio connector. Repair, if required.
	3. Wiring faulty.	3. Check for battery voltage at radio connector. Repair wiring, if required.
	4. Radio ground faulty.	4. Check for continuity between radio

		chassis and a known good ground. There should be continuity. Repair ground, if required.
	5. Radio faulty.	5. Refer to appropriate Diagnostic Service Information.
POOR RADIO RECEPTION	1. Antenna faulty.	1. See DIAGNOSIS AND TESTING .
	2. Radio ground faulty.	2. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	3. Radio noise suppression faulty.	3. Repair or replace ground strap as necessary.
	4. Radio faulty.	4. Refer to appropriate Diagnostic Service Information.
SOUND DISTORTION (VIBRATION FROM SPEAKER AREA, BUZZING - HUMMING)	1. Door trim panel loose or missing fasteners.	1. Inspect door trim panel and correct as necessary. Replace any missing fasteners.
	2. Water shield loose or misaligned.	2. Inspect water shield and adjust as required.
	3. Items placed in door trim panel map pockets vibrating or moving from side to side.	3. Remove items from door trim panel. Ensure that vibration is no longer present.
NO COMPACT DISC/DVD OPERATION	1. Faulty CD/DVD.	1. Insert known good CD/DVD and test operation.
	2. Foreign material on CD/DVD.	2. Clean CD/DVD and test operation.
	3. Condensation on CD/DVD or optics.	3. Allow temperature of vehicle interior to stabilize and test operation.
	4. Faulty CD/DVD player.	4. Refer to appropriate Diagnostic Service Information.

MANUAL DISC EJECT-NAVIGATION RADIO

1. Ensure all fuses are installed in the vehicle to operate accessories.
2. Turn ignition to ACC and power on radio.
3. Press OPEN/CLOSE button on radio and verify that disc will not eject automatically.
4. If disc will not eject automatically, use the following combination of buttons to manually eject disc:
 - With display open press and hold NAV button on right side.
 - Press SEEK UP and SEEK DOWN at the same time on left side.
5. Remove the disc from the radio.

AMPLIFIER

REMOVAL

REMOVAL

Fig. 1: Removing Amplifier
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the rear quarter trim panel. Refer to **REMOVAL** .
3. Remove the mounting fasteners.
4. Disconnect the electrical connectors and remove the amplifier.

INSTALLATION

INSTALLATION

Fig. 2: Installing Amplifier
Courtesy of CHRYSLER LLC

1. Connect the electrical connectors and install the amplifier.
2. Install the amplifier mounting fasteners.
3. Install the rear quarter trim panel. Refer to **INSTALLATION** .
4. Connect the battery negative cable.

ANTENNA BODY & CABLE

DESCRIPTION

ANTENNA BODY AND CABLE

DOMESTIC

All models feature a roof-mounted active mast antenna. This is a combination antenna that receives both AM/FM and satellite digital audio. The antenna cables are routed along the left side of the under the headliner, down the A-pillar to the instrument panel. For antenna removal, see **REMOVAL**. For antenna installation, see **INSTALLATION**.

OPERATION

ANTENNA BODY AND CABLE

The antenna body and cable connects the antenna mast to the radio. The radio antenna is an electromagnetic circuit component used to capture radio frequency signals that are broadcast by local commercial radio stations in both the Amplitude Modulating (AM) and Frequency Modulating (FM) frequency ranges. These electromagnetic radio frequency signals induce small electrical modulations into the antenna as they move past the mast. The antenna body transfers the weak electromagnetic radio waves induced into the antenna into the center conductor of the flexible primary antenna coaxial cable. The braided outer shield of the antenna coaxial cable is grounded through both the antenna body and the radio chassis, effectively shielding the radio waves as they are conducted to the radio. The radio then tunes and amplifies the weak radio signals into stronger electrical signals in order to operate the audio system speakers.

DIAGNOSIS AND TESTING

ANTENNA BODY AND CABLE

Fig. 3: Antenna Tests - Typical
 Courtesy of CHRYSLER LLC

The following four tests are used to diagnose the antenna with an ohmmeter:

- Test 1** - Mast to ground test
- Test 2** - Tip-of-mast to tip-of-conductor test
- Test 3** - Body ground to battery ground test
- Test 4** - Body ground to antenna coaxial cable shield test.

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way

to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

The ohmmeter test lead connections for each test are shown in the illustration.

NOTE: This model has a two-piece antenna coaxial cable. Tests 2 and 4 must be conducted in two steps to isolate an antenna cable problem. First, test the primary antenna cable (integral to the antenna body and cable) from the coaxial cable connector behind the right side kick panel to the antenna body. Then, test the secondary antenna cable (instrument panel antenna cable) from the coaxial cable connector behind the right side kick panel to the coaxial cable connector at the radio.

TEST 1

Test 1 determines if the antenna mast is insulated from ground. Proceed as follows:

1. Disconnect and isolate the antenna coaxial cable connector behind the right side kick panel.
2. Touch one ohmmeter test lead to the tip of the antenna mast. Touch the other test lead to known ground. Check the ohmmeter reading for continuity.
3. There should be no continuity. If OK, go to Test 2. If not OK, replace the faulty antenna body and cable.

TEST 2

Test 2 checks the antenna conductor components for an open circuit. This test should be performed first on the entire antenna circuit, from the antenna mast to the center conductor of the coaxial cable connector at the radio. If an open circuit is detected, each of the three antenna conductor components (antenna mast, antenna body and cable, instrument panel antenna cable) should be isolated and tested individually to locate the exact component that is the source of the open circuit. To begin this test, proceed as follows:

1. Disconnect the instrument panel antenna cable coaxial connector from the back of the radio.
2. Touch one ohmmeter test lead to the tip of the antenna mast. Touch the other test lead to the center conductor pin of the instrument panel antenna cable coaxial connector for the radio. Check the ohmmeter reading for continuity.
3. There should be continuity. The ohmmeter should register only a fraction of an ohm resistance. High or infinite resistance indicates a damaged or open antenna conductor. If OK, go to Test 3. If not OK, isolate and test each of the individual antenna conductor components. Replace only the faulty antenna conductor component.

TEST 3

Test 3 checks the condition of the vehicle body ground connection. To begin this test, proceed as follows:

1. This test must be performed with the battery positive cable disconnected from the battery. Disconnect and isolate both battery cables, negative cable first.
2. Reconnect the battery negative cable.

3. Touch one ohmmeter test lead to a good clean ground point on the vehicle fender. Touch the other test lead to the battery negative terminal post. Check the ohmmeter reading for continuity.
4. There should be continuity. The ohmmeter should register less than one ohm resistance. High or infinite resistance indicates a loose, corroded, or damaged connection between the battery negative terminal and the vehicle body. If OK, go to Test 4. If not OK, check the battery negative cable connection to the vehicle body and the radio noise suppression ground strap connections to the engine and the vehicle body for being loose or corroded. Clean or tighten these connections as required.

TEST 4

Test 4 checks the condition of the connection between the antenna coaxial cable shield and the vehicle body ground as follows:

1. Disconnect and isolate the antenna coaxial cable connector behind the right side kick panel.
2. Touch one ohmmeter test lead to a good clean ground point on the vehicle fender. Touch the other test lead to the outer crimp on the antenna coaxial cable connector. Check the ohmmeter reading for continuity.
3. There should be continuity. The ohmmeter should register less than one ohm resistance. High or infinite resistance indicates a loose, corroded, or damaged connection between the antenna body and the vehicle body or between the antenna body and the antenna coaxial cable shield. If not OK, clean the antenna body to fender mating surfaces and tighten the antenna cap nut to specifications.
4. Check the resistance again with an ohmmeter. If the resistance is still more than one ohm, replace the faulty antenna body and cable.

REMOVAL

ANTENNA BODY AND CABLE

1. Disconnect the battery negative cable.
2. Remove the headliner. Refer to **REMOVAL** .
3. Disconnect the electrical connectors.
4. Remove the routing clips and remove the cable.

INSTALLATION

ANTENNA BODY AND CABLE

1. Install the cable and routing clips.
2. Connect the electrical connectors.
3. Install the headliner. Refer to **INSTALLATION** .
4. Connect the battery negative cable.

ANTENNA-SATELLITE

OPERATION

ANTENNA - SATELLITE RADIO

The satellite receiver is housed within the radio and is no longer a separate module. The satellite radio antenna receives signals from orbiting satellites and sends these signals to the radio. The satellite radio antenna must have open space in which to operate. Items carried on the roof, parking inside etc. can have an effect on the antenna's ability to receive signals.

REMOVAL

ANTENNA BODY AND CABLE

Fig. 4: Removing Antenna
Courtesy of CHRYSLER LLC

1. Disconnect the battery negative cable.
2. Lower the rear section of the headliner to gain access the antenna, ensuring that the headliner does not crease. Refer to **REMOVAL** .
3. Remove the mounting fastener.
4. Disconnect the electrical connectors and remove the antenna.

INSTALLATION

ANTENNA BODY AND CABLE

Fig. 5: Installing Antenna
Courtesy of CHRYSLER LLC

1. Connect the electrical connectors.
2. Install the antenna and mounting fastener.
3. Install the headliner. Refer to **INSTALLATION** .
4. Connect the battery negative cable.

CABLE-INSTRUMENT PANEL ANTENNA

REMOVAL

INSTRUMENT PANEL ANTENNA CABLE

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

1. Disconnect and isolate the battery negative cable.
2. Remove the instrument panel. Refer to **REMOVAL** .

CAUTION: Pulling the antenna cable straight out of the radio without pulling on the locking antenna connector could damage the cable or radio.

3. Disconnect the antenna cable from radio by pulling the locking antenna connector (2) away from radio.
4. Disengage each of the retainers that secure the cable to the instrument panel.
5. Remove the cable from the instrument panel.

INSTALLATION

INSTRUMENT PANEL ANTENNA CABLE

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

1. Position the instrument panel antenna cable onto the instrument panel.
2. Engage each of the retainers that secure the cable to the back side of the instrument panel.
3. Connect cable to radio.
4. Install instrument panel. Refer to **INSTALLATION** .
5. Connect the battery negative cable.

RADIO

DESCRIPTION

RADIO

NOTE: The USB protective door can be serviced separately and does not require the replacement of the entire radio assembly.

RADIO

Available radios include:

- AM/FM Stereo Radio w/CD/MP3 Audio player and AUX jack with and without Satellite Radio (RES).
- AM/FM Stereo Radio w/6-CD/DVD player and AUX jack with and without Satellite Radio (REQ).
- 6.5" Integrated Touch Screen AM/FM Stereo Radio, Satellite Radio, Single Disc CD/DVD player. (CD/DVD/MP3/WMA Audio, DVD Video) w/ Full Map Navigation with GPS Antenna and Real Time Traffic (RER).

All radio receivers can communicate on the Controlled Area Network (CAN).

OPERATION

RADIO

The radio receiver operates only when the ignition switch is in the ON or ACCESSORY positions.

For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** article .

STANDARD PROCEDURE

RADIO BACKUP

The radio hard drive (HDD) can be backed up to save customer data in the event that a radio replacement is required. This procedure can only be done with all radios with a hard disk drive. All other radios do not have a HDD.

1. Turn the ignition to RUN, engine OFF.
2. Power on the external HDD.
3. Connect the external HDD to the radio using the USB (Universal Serial Bus) cable. The radio display will change to the "Manage My Files" screen.
4. Connect the scan tool and preform the following steps to place the radio into "Dealership Mode":
 - ECU View
 - Radio
 - Misc. Functions
 - Service Mode
 - Start
 - Next
5. Follow the on screen instructions on the radio to back up the radio HDD.

REMOVAL

RADIO

NOTE: The USB protective door can be serviced separately and does not require the replacement of the entire radio assembly.

NOTE: REQ and RET radios only must be put into "Transportation Mode" before removal. With Ignition in RUN or ACCESSORY, press SET and SCAN simultaneously until the radio displays "TRANSPORTATION" on the display or for 5 seconds.

1. Disconnect and isolate the battery negative cable.
2. Remove the instrument panel center trim panel.
3. Remove the radio mounting fasteners.

CAUTION: Pulling the antenna cable straight out of the radio without pulling on the locking antenna connector could damage the cable or radio.

4. Disconnect the antenna cable by pulling the locking antenna connector away from the radio.
5. Disconnect the electrical harness connector(s).
6. Remove radio from instrument panel.

INSTALLATION

RADIO

1. Connect the wire harness connector(s).
2. Connect the antenna cable.
3. Install the radio to the instrument panel.
4. Install and tighten the radio mounting fasteners.
5. Install the instrument panel center trim panel.
6. Connect the battery negative cable.

RADIO NOISE SUPPRESSION COMPONENTS

DESCRIPTION

RADIO NOISE SUPPRESSION COMPONENTS

Radio Frequency Interference (RFI) and ElectroMagnetic Interference (EMI) can be produced by any on-board or external source of electromagnetic energy. These electromagnetic energy sources can radiate electromagnetic signals through the air, or conduct them through the vehicle electrical system.

When the audio system converts RFI or EMI to an audible acoustic wave form, it is referred to as radio noise. This undesirable radio noise is generally manifested in the form of "buzzing," "hissing," "popping," "clicking," "crackling," and/or "whirring" sounds. In most cases, RFI and EMI radio noise can be suppressed using a combination of vehicle and component grounding, filtering and shielding techniques. This vehicle is equipped with factory-installed radio noise suppression devices that were designed to minimize exposure to typical sources of RFI and EMI; thereby, minimizing radio noise complaints.

Radio noise suppression is accomplished primarily through circuitry or devices that are integral to the factory-installed radios, audio power amplifiers and other on-board electrical components such as generators, wiper motors, blower motors, and fuel pumps that have been found to be potential sources of RFI or EMI. External radio noise suppression devices that are used on this vehicle to control RFI or EMI, and can be serviced, include the following:

- **Engine-to-body ground strap** - This length of braided ground strap has an eyelet terminal connector crimped to each end. One end is secured to the engine cylinder head(s). The other is secured to the plenum.
- **Resistor-type spark plugs** - This type of spark plug has an internal resistor connected in series between the spark plug terminal and the center electrode to help reduce the production of electromagnetic radiation that can result in radio noise.

OPERATION

RADIO NOISE SUPPRESSION COMPONENTS

There are two common strategies that can be used to suppress Radio Frequency Interference (RFI) and ElectroMagnetic Interference (EMI) radio noise. The first suppression strategy involves preventing the

production of RFI and EMI electromagnetic signals at their sources. The second suppression strategy involves preventing the reception of RFI and EMI electromagnetic signals by the audio system components.

The use of braided ground straps in key locations is part of the RFI and EMI prevention strategy. These ground straps ensure adequate ground paths, particularly for high current components such as many of those found in the starting, charging, ignition, engine control and transmission control systems. An insufficient ground path for any of these high current components may result in radio noise caused by induced voltages created as the high current seeks alternative ground paths through components or circuits intended for use by, or in close proximity to the audio system components or circuits.

Preventing the reception of RFI and EMI is accomplished by ensuring that the audio system components are correctly installed in the vehicle. Loose, corroded or improperly soldered wire harness connections, improperly routed wiring and inadequate audio system component grounding can all contribute to the reception of RFI and EMI. A properly grounded antenna body and radio chassis, as well as a shielded antenna coaxial cable with clean and tight connections will each help reduce the potential for reception of RFI and EMI.

REMOVAL

RADIO NOISE SUPPRESSION COMPONENTS

- 1. Disconnect and isolate the battery negative cable.
- 2. Remove the retaining bolt from the transmission bell housing.
- 3. Remove the retaining nut from the plenum.

INSTALLATION

RADIO NOISE SUPPRESSION COMPONENTS

- 1. Install the retaining nut and ground strap to the plenum.
- 2. Install retaining bolt to the transmission bell housing.
- 3. Connect the battery negative cable.

REMOTE SWITCHES

DESCRIPTION

REMOTE SWITCHES

Radio controls are mounted on the back of the steering wheel. The controls provide convenient no-look operation and operate the following functions:

Right side

A rocker switch that increases or decreases the volume

A push button that selects modes. Repeatedly pressing the button selects from among AM radio, FM radio and CD changer. If the vehicle is equipped with Satellite Digital Audio Radio (SDAR) or the Video Entertainment System™, these are also included in the selection.

Left side

A rocker switch with functions that vary depending on the mode: in a radio mode, the frequency increases or decreases; if a CD is playing, the player skips to the next or previous track; if SDAR is playing the tuner skips to the next or previous channel.

A push button that steps through preset selections: if the radio is playing, pressing the button selects the next preset frequency; if a CD is playing, the changer selects the next disc; if SDAR is playing the next preset channel is selected.

OPERATION

REMOTE SWITCHES

The six switches in the two remote radio switch units are normally open, resistor multiplexed momentary switches that are hard wired to the Cab Compartment Node (CCN) through the clockspring. The CCN sends a five volt reference signal to both switch units on one circuit, and senses the status of all of the switches by reading the voltage drop on a second circuit.

When the CCN senses an input (voltage drop) from any one of the remote radio switches, it sends the proper switch status messages on the Controlled Area Network (CAN) to the radio receiver. The electronic circuitry within the radio receiver is programmed to respond to these remote radio switch status messages by adjusting the radio settings as requested. For diagnosis of the CCN or the CAN data bus, the use of a scan tool and the proper Diagnostic article are recommended.

DIAGNOSIS AND TESTING

REMOTE SWITCHES

Any diagnosis of the Audio system should begin with the use of scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic information.

For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** article .

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

1. Disconnect and isolate the battery negative cable. Remove the remote radio switch(es) from the steering wheel. See **REMOVAL**.
2. Use an ohmmeter to check the switch resistances as shown in the REMOTE RADIO SWITCH TEST chart. If the remote radio switch resistances check OK, go to step 3. If not OK, replace the faulty switch.

REMOTE RADIO SWITCH TEST TABLE

--	--	--

Switch	Switch Position	Resistance
Right (White)	Volume Up	1.210 Kilohms $\pm$ 1%
Right (White)	Volume Down	3.010 Kilohms $\pm$ 1%
Right (White)	Mode Advance	0.0511 Kilohms $\pm$ 1%
Left (Black)	Seek Up	0.261 Kilohms $\pm$ 1%
Left (Black)	Seek Down	0.681 Kilohms $\pm$ 1%
Left (Black)	Pre-Set Station Advance	0.162 Kilohms $\pm$ 1%

3. Reconnect the battery negative cable. Turn the ignition switch to the On position. Check for 5 volts at the radio control mux circuit cavities of the steering wheel wire harness connectors for both remote radio switches. If OK, go to step 4. If not OK, repair the open or shorted radio control mux circuit as required.
4. Disconnect and isolate the battery negative cable. Disconnect the 22-way instrument panel wire harness connector from the CCN. Check for continuity between the remote radio switch ground circuit cavities of the steering wheel wire harness connectors for both remote radio switches and a good ground. There should be no continuity. If not OK, repair the shorted remote radio switch ground circuit as required.

REMOVAL

REMOTE SWITCHES

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

1. Disconnect and isolate the battery negative cable.
2. Remove the driver side airbag from the vehicle. Refer to **REMOVAL** .
3. Remove the speed control switches.
4. Unplug the wire harness connector from the remote radio switch.
5. Depress the tabs on each side of each switch and push the switch through the rear steering wheel cover.

INSTALLATION

REMOTE SWITCHES

WARNING: Disable the airbag system before attempting any steering wheel, steering

column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

1. Install remote radio switch to the steering wheel.
2. Connect the wire harness to the remote radio switch.
3. Install the speed control switches.
4. Install the driver side airbag. Refer to **INSTALLATION** .
5. Connect the battery negative cable.

SPEAKER

DESCRIPTION

SPEAKER

STANDARD

The standard equipment speaker system includes speakers in six locations. One 6.4 centimeter (2.50 inch) diameter speaker is installed on each end of the instrument panel top pad. One 16.5 centimeter (6.5 inch) full-range speaker is located in each front door. There is also one full-range 16.5 centimeter (6.5 inch) diameter full-range speaker located in each rear door.

PREMIUM

The optional premium speaker system features nine Premium model speakers. Each of the standard speakers are replaced with Premium model speakers. One 6.4 centimeter (2.50 inch) diameter speaker is installed on each end of the instrument panel top pad. One 16.5 centimeter (6.5 inch) Premium woofer is located in each front door. There is also one full-range 16.5 centimeter (6.5 inch) diameter Premium full-range speaker located in each rear door as well as one 1.9 centimeter (.75 inch) tweeter in each rear door. A 20.3 centimeter (8 inch) subwoofer is located in the rear cargo area. The premium speaker system also includes a power amplifier rated at 368 watts.

OPERATION

SPEAKER

Two wires connected to each speaker, one feed circuit (+) and one return circuit (-), allow the audio output signal electrical current to flow through the voice coil. For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** article . The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

DIAGNOSIS AND TESTING

SPEAKER

Any diagnosis of the Audio system should begin with the use of scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic information.

Refer to the appropriate wiring information.

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

CAUTION: The speaker output of the radio is a "floating ground" system. Do not allow any speaker lead to short to ground, as damage to the radio may result.

NOTE: If poor sound quality is noted in the audio system, check the Cabin Equalization curve programmed in the TIPM. Make sure a base speaker system has the Base Cabin Equalization Curve programmed to the vehicle. If the vehicle has a premium speaker system, make sure the Premium Cabin Equalization Curve is programmed to the vehicle

1. If all speakers are inoperative, check the fuses in the Totally Integrated Power Module (TIPM). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
2. Turn the ignition switch to the ON position. Turn the radio receiver ON. Adjust the balance and fader control controls to check the performance of each individual speaker. Note the speaker locations that are not performing correctly. Go to Step 3.
3. Turn the radio receiver OFF. Turn the ignition OFF. Disconnect and isolate the battery negative cable. If vehicle is **not** equipped with an amplifier, remove the radio receiver. If vehicle is equipped with an amplifier, disconnect wire harness connector at output side of amplifier. Go to Step 4.
4. Check both the speaker feed (+) circuit and return (-) circuit cavities for the inoperative speaker at the radio receiver wire harness connector for continuity to ground. There should be no continuity. If OK, go to Step 5. If not OK, repair the shorted speaker feed (+) and/or return (-) circuits(s) to the speaker as required.
5. Disconnect wire harness connector at the inoperative speaker. Check for continuity between the speaker feed (+) circuit cavities of the radio receiver wire harness connector and the speaker wire harness connector. Repeat the check between the speaker return (-) circuit cavities of the radio receiver wire harness connector and the speaker wire harness connector. In each case, there should be continuity. If OK, replace the faulty speaker. If not OK, repair the open speaker feed (+) and/or return (-) circuits(s) as required.

REMOVAL

SPEAKER

FRONT DOOR	Refer to <u>FRONT DOOR</u> removal procedure.
INSTRUMENT PANEL	Refer to <u>INSTRUMENT PANEL</u> removal procedure.
REAR DOOR	Refer to <u>REAR DOOR</u> removal procedure.
SUBWOOFER	Refer to <u>SUBWOOFER</u> removal procedure.

FRONT DOOR

Fig. 6: Removing Speaker
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the front door trim panel. Refer to **REMOVAL** .
3. Remove the speaker mounting fasteners.
4. Remove the speaker from the door and disconnect the wire harness connector.

INSTRUMENT PANEL

Fig. 7: Removing Speaker In Instrument Panel
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the air outlet. Refer to **REMOVAL** .
3. Remove speaker mounting fasteners.
4. Remove speaker (1) and disconnect the wire harness connector.

REAR DOOR

Fig. 8: Rear Door Speaker
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the rear door trim panel. Refer to **REMOVAL** .
3. Remove the speaker mounting fasteners.
4. Remove the speaker (1) from the door and disconnect the wire harness connector (3).

SUBWOOFER

Fig. 9: Removing Subwoofer
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the speaker grille fasteners and remove the speaker grille.
3. Remove the speaker mounting fasteners.
4. Remove the speaker and disconnect the electrical connector.

INSTALLATION

SPEAKER

FRONT DOOR	Refer to <u>FRONT DOOR</u> installation procedure.

AUTOMATIC TRANSMISSION 42RLE - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

P0122-TPS/APPS CIRCUIT LOW

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Theory Of Operation

The powertrain controller receives the throttle position signal from the Throttle Position Sensor (TPS). The controller provides the TPS with a 5 volt pull up and a sensor ground. The signal is checked for being out of

range as well as for intermittent operation (excessive signal changes). The engine controller transmits the throttle value onto the Bus. Most engine controllers will calculate the throttle value if the throttle signal is lost. If an error is detected by the transmission controller and the throttle value is available on the Bus, the Bus value will be used, normal operation will continue, and a TPS code will be set. If an error is detected and the throttle value is not available on the Bus, normal operation will be discontinued, a TPS DTC will be set, and the MIL will be turned on after 5 minutes of calculated operation.

Monitor Conditions

When Monitored:

Continuously with the ignition on and engine running.

Set Conditions

- **Set Condition:**

This DTC will set if the monitored TPS voltage drops below.078 volts for the period of 0.48 seconds.

Possible Causes

Possible Causes
RELATED TPS ENGINE DTCS PRESENT POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **DETERMINING IF RELATED ENGINE TPS DTCS ARE PRESENT**

With the scan tool, check Engine DTCs, including pending DTCs and one trip failures.

Are there any Engine TPS DTCs present?

Yes

Refer to appropriate Engine ELECTRICAL DIAGNOSTICS article and perform the appropriate diagnostic procedure.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go to 2.

2. **CHECK IF THE DTC IS CURRENT**

With the scan tool, record the Event Data to help identify the conditions in which the DTC was set.

With the scan tool, erase Transmission DTCs.

NOTE: Clearing DTCs does NOT erase the Event Data. To erase the Event Data you must either perform a Quick Learn procedure or battery disconnect (if available) with the scan tool, or manually disconnect the battery. Whatever method used might reset certain learned transmission values to controller defaults and may cause poor shift quality until those values are relearned.

Drive the vehicle and try to duplicate the conditions in which the DTC was reported by the Event Data.

With the scan tool, read Transmission DTCs.

Does this DTC reset?

Yes

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go to 3.

3. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Pay particular attention to the TPS signal and sensor ground circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

Repair as necessary.
Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0123-TPS/APP CIRCUIT HIGH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The powertrain controller receives the throttle position signal from the Throttle Position Sensor (TPS). The controller provides the TPS with a 5 volt pull up and a sensor ground. The signal is checked for being out of range as well as for intermittent operation (excessive signal changes). The engine controller transmits the throttle value onto the Bus. Most engine controllers will calculate the throttle value if the throttle signal is lost. If an error is detected by the transmission controller and the throttle value is available on the Bus, the Bus value will be used, normal operation will continue, and a TPS code will be set. If an error is detected and the throttle value is not available on the Bus, normal operation will be discontinued, a TPS DTC will be set, and the MIL will be turned on after 5 minutes of calculated operation.

Monitor Conditions

When Monitored:

Continuously with the ignition on and engine running.

Set Conditions

- Set Condition:**

This DTC will set if the monitored TPS voltage rises above 4.94 volts for the period of 0.48 seconds.

Possible Causes

Possible Causes
RELATED TPS ENGINE DTCS PRESENT POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

- 1. DETERMINING IF RELATED ENGINE TPS DTCS ARE PRESENT**

With the scan tool, check Engine DTCs, including pending DTCs and one trip failures.

Are there any Engine TPS DTCs present?

Yes

Refer to appropriate Engine ELECTRICAL DIAGNOSTICS article and perform the appropriate diagnostic procedure.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go to 2.

2. CHECK TO SEE IF DTC IS CURRENT

With the scan tool, record the Event Data to help identify the conditions in which the DTC was set.

With the scan tool, erase Transmission DTCs.

NOTE: **Clearing DTCs does NOT erase the Event Data. To erase the Event Data you must either perform a Quick Learn procedure or battery disconnect (if available) with the scan tool, or manually disconnect the battery. Whatever method used might reset certain learned transmission values to controller defaults and may cause poor shift quality until those values are relearned.**

Drive the vehicle and try to duplicate the conditions in which the DTC was reported by the Event Data.

With the scan tool, read Transmission DTCs.

Does this DTC reset?

Yes

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go to 3.

3. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Pay particular attention to the TPS signal and sensor ground circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0124-TPS/APP INTERMITTENT

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The powertrain controller receives the throttle position signal from the Throttle Position Sensor (TPS). The controller provides the TPS with a 5 volt pull up and a sensor ground. The signal is checked for being out of range as well as for intermittent operation (excessive signal changes). The engine controller transmits the throttle value onto the Bus. Most engine controllers will calculate the throttle value if the throttle signal is lost. If an error is detected by the transmission controller and the throttle value is available on the Bus, the Bus value will be used, normal operation will continue, and a TPS code will be set. If an error is detected and the throttle value is not available on the Bus, normal operation will be discontinued, a TPS DTC will be set, and the MIL will be turned on after 5 minutes of calculated operation.

Monitor Conditions

When Monitored:

Continuously with the ignition on and engine running.

Set Conditions

- **Set Condition:**

This DTC will set if the monitored TPS throttle angle between the angles of 6° and 120° and the degree change is greater than 5° within a period of less than 7.0 ms.

Possible Causes

Possible Causes
RELATED TPS ENGINE DTCS PRESENT THROTTLE POSITION SENSOR POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **CHECK IF RELATED ENGINE TPS DTCS ARE PRESENT**

With the scan tool, check Engine DTCs, including pending DTCs and one trip failures.

Are there any Engine TPS DTCs present?

Yes

Refer to appropriate Engine ELECTRICAL DIAGNOSTICS article and perform the appropriate diagnostic procedure.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go to 2.

2. **CHECK IF THE DTC IS CURRENT**

With the scan tool, record the Event Data to help identify the conditions in which the DTC was set.

With the scan tool, erase Transmission DTCs.

NOTE: **Clearing DTCs does NOT erase the Event Data. To erase the Event Data you must either perform a Quick Learn procedure or battery disconnect (if available) with the scan tool, or manually disconnect the battery. Whatever method used might reset certain learned transmission values to controller defaults and may cause poor shift quality until those values are relearned.**

Drive the vehicle and try to duplicate the conditions in which the DTC was reported by the Event Data.

With the scan tool, read Transmission DTCs.

Does this DTC reset?

Yes

Go to 3.

No

Go to 4.

3. CHECK THE THROTTLE POSITION SENSOR OPERATION

Ignition on, engine not running.

With the scan tool, under Transmission Sensors, monitor the TPS voltage in the following step.

Slowly open and close the throttle while checking for erratic voltage changes.

Did the TPS voltage change smooth and consistent?

Yes

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

Perform **42RLE TRANSMISSION VERIFICATION TEST.**

No

Replace the Throttle Position Sensor per the Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST.**

4. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Pay particular attention to the TPS signal and sensor ground circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST.**

No

Test Complete.

P0218-HIGH TEMPERATURE OPERATION ACTIVATED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The DTC is an informational code only and is being set to aid the technician in determining root cause of a customer driveability issue. The code is also intended to alert the technician to determine if a cooling system malfunction has occurred or if an additional transmission air to oil cooler should be added to the vehicle if the customer regularly drives in a manner that overheats the transmission.

Monitor Conditions

When Monitored:

Whenever the engine is running.

Set Conditions

- **Set Condition:**

Immediately when an Overheat shift schedule is activated when the Transmission Oil Temperature reaches 115° C (240° F).

Possible Causes

Possible Causes
ENGINE COOLING SYSTEM OPERATION TRANSMISSION OIL COOLER PLUGGED HIGH TEMPERATURE OPERATIONS ACTIVATED

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. CHECK ENGINE COOLING SYSTEM

Perform Engine Cooling System diagnostics per the Service Information.

Is the Engine Cooling System functioning properly?

Yes

Go to 2.

No

Repair the cause of the engine overheating. Refer to **42RLE - SERVICE INFORMATION** article for the related diagnostic or repair procedures.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

2. TRANSMISSION OIL COOLER RESTRICTED

Check the Transmission Oil Cooler Flow in accordance with the Service Information.

Is the transmission oil cooler restricted or plugged?

Yes

Repair the cause of the plugged Transmission Oil Cooler as necessary and repair or replace the Transmission Oil Cooler per the Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go to 3.

3. HIGH TEMPERATURE OPERATION

This DTC is an informational DTC designed to aid the Technician in diagnosing shift quality complaints.

This DTC indicates that the transmission has been operating in the "Overheat" shift schedule which may generate a customer complaint.

The customer driving patterns may indicate the need for an additional transmission oil cooler.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

If there are no possible causes remaining, view repair.

Repair

Repair the cause of transmission overheating per the Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

P0562-BATTERY VOLTAGE LOW

Circuit Schematic

0100001

Fig. 1: Transmission Control Output Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Transmission damage may occur if there is insufficient supply voltage to properly control the solenoids. To prevent this possibility, the battery voltage is monitored and the system is placed in logical limp-in if the battery voltage drops below the limit.

Monitor Conditions

When Monitored:

With the engine running and the PCM has closed the Transmission Control Relay.

Set Conditions

- **Set Condition:**

If the battery voltage of the Transmission Control Relay Output Sense circuit(s) to the PCM is less- than 10.0 volts for the period of 15 seconds. Note: P0562 generally indicates a gradually falling battery voltage or a resistive connection(s) to the PCM. The DTC will also set if the battery voltage sensed at the PCM is less than 6.5 volts for 200ms or when Transmission Control Relay Output circuits are less than 7.2 volts for 200ms.

Possible Causes

Possible Causes
RELATED CHARGING SYSTEM DTC'S TRANSMISSION CONTROL RELAY (Z933) GROUND CIRCUIT OPEN OR HIGH RESISTANCE (T16) TRANSMISSION CONTROL OUTPUT TO TCM OPEN OR HIGH RESISTANCE TOTALLY INTEGRATED POWER MODULE (TIPM) POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Transmission damage may occur if there is insufficient supply voltage to properly control the solenoids. To prevent this possibility, the battery voltage is monitored and the system is placed in logical limp-in if the battery voltage drops below the limit.

Diagnostic Test

1. **CHECK FOR RELATED CHARGING SYSTEM DTC'S**

With the scan tool, read the Engine DTC's.

Are there any Charging System related DTCs present?

Yes

Refer to **CHARGING SYSTEM** and repair any Charging System DTCs before proceeding. After repairing the Charging System DTCs, perform the Transmission Verification test to verify the transmission and or controller was not damaged.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go To 2.

2. CHECK FOR TIPM DTCS

NOTE: **Generator, battery, and charging system must be fully functional before performing this test.**

With the scan tool, read TIPM DTCs.

Are there any TIPM TCM Power Control Circuit DTCs present also?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate symptom.

No

Go To 3.

3. CONDITION P0562 PRESENT

With the scan tool, read Transmission DTCs.

With the scan tool, check the STARTS SINCE SET counter for P0562.

NOTE: **This counter only applies to the last DTC set.**

Is the STARTS SINCE SET counter set at 0?

Yes

Go To 4.

No

Go To 6.

4. CHECK THE (Z933) GROUND CIRCUITS FOR AN OPEN

8199cef7

Fig. 2: Checking (Z933) Ground Circuits In Appropriate Terminals Of Miller Tool #8815
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Using a 12-volt test light connected to 12-volts, check the (Z933) Ground circuits in the appropriate terminals of Miller tool #8815.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly for all the Ground circuits?

Yes

Go To 5.

No

Repair the (Z933) Ground circuit for an open circuit or high resistance.

Perform **42RLE TRANSMISSION VERIFICATION TEST.**

5. **CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN**

8199cf1e

Fig. 3: Checking All (T16) Transmission Control Output Circuits
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Disconnect the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector (if equipped).

Ignition on, engine not running.

With the scan tool under TIPM, actuate the Transmission.

Using a 12-volt test light connected to ground, check all (T16) Transmission Control Output circuits.

NOTE: The (T16) Transmission Control Output circuit branches off to both Transmission Solenoid/Pressure Switch Assembly, PCM and (if equipped) the Line Pressure Sensor/Variable Force Solenoid Assembly.

Does the test light illuminate brightly while cycling on and off on all (T16) Transmission Control Output circuits?

Yes

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Repair the (T16) Transmission Control Relay Output circuit(s) for an open or high resistance.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorts and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0602-CONTROL MODULE PROGRAMMING ERROR/NOT PROGRAMMED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The controller is programmed during manufacturing with generic software to facilitate testing. This software does not have the proper calibrations to control a transmission in a vehicle. The check for generic software is made at power-up. If generic software is found, the MIL will light immediately and the MIL will stay on even if the fault is cleared, until the proper software is installed. Note: Transmission will be placed in limp-in mode.

Monitor Conditions

When Monitored:

Check for generic software is made at power-up.

Set Conditions

- **Set Condition:**

If generic software is found, the MIL will light immediately. This DTC is designed to signal the technician that the controller still has generic software installed.

Possible Causes

Possible Causes
PCM - PROGRAMMING ERROR

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. CONTROL MODULE PROGRAMMING ERROR

NOTE: **Controller is programmed with generic software and will not allow the correct vehicle Powertrain management.**

Record the controller part number.

Update the controller with the correct software in accordance with the Service Information.

Verify that the controller updated successfully.

Test Complete

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

P0604-INTERNAL CONTROL MODULE RAM

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

After the controller is reset, the microprocessor checks the integrity of each RAM location by writing to it and reading back from it. The read value should be the same as the written value. MIL on after 10 seconds of vehicle operation and transmission will be placed in limp-in.

Monitor Conditions

When Monitored:

One time after the ignition key is turned to the run position.

Set Conditions

- **Set Condition:**

The read value does not match the written value in any RAM location.

Possible Causes

Possible Causes
PCM - INTERNAL ERROR

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **PCM - INTERNAL ERROR**

If there are no possible causes remaining, view repair.

Repair

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

P0605-INTERNAL CONTROL MODULE ROM

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

After the controller is reset, the microprocessor checks the integrity of the program memory (ROM). A checksum is calculated by adding all used bytes in the program memory. The sum should be the same as a known constant stored in memory. MIL on after 10 seconds of vehicle operation and transmission will be placed in limp-in.

Monitor Conditions

When Monitored:

One time after the ignition key is turned to the run position.

Set Conditions

- **Set Condition:**

If the ROM checksum does not match a known constant.

Possible Causes

Possible Causes
PCM - INTERNAL ERROR

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. PCM - INTERNAL ERROR

Using the schematics as a guide, inspect the wiring and connectors. Repair as necessary. Pay particular attention to all power and ground circuits.

If there are no possible causes remaining, view repair.

Repair

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

P0613-INTERNAL TRANSMISSION PROCESSOR

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The internal watchdog is a separate hardware circuit which continuously monitors the microprocessor. To make sure the transmission is operating properly, the watchdog must receive a signal from the microprocessor within a specific time window. MIL on after 10 seconds of vehicle operation and transmission will be placed in limp-in.

Monitor Conditions

When Monitored:

After the ignition key is turned to the run position and 60 seconds thereafter.

Set Conditions

- **Set Condition:**

Either of the following conditions occur 3 times in less than 590 milliseconds: The watchdog line remains high after the watchdog test or the transmission relay coil is energized and remains on after the watchdog delay expires.

Possible Causes

Possible Causes
PCM - INTERNAL ERROR

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **PCM - INTERNAL ERROR**

Using the schematics as a guide, inspect the wiring and connectors. Repair as necessary. Pay particular attention to all power and ground circuits.

If there are no possible causes remaining, view repair.

Repair

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

P0706-TRANSMISSION RANGE SENSOR RATIONALITY

Circuit Schematic

0199616a

Fig. 4: Transmission Range Sensor Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

The C1 through C4 (T41, T42, T3, and T1) Signal circuits communicate the shift lever position to the PCM. Each circuit is terminated at the transmission with a switch. Each switch can be either open or closed, depending on the shift lever position. The PCM can decode this information and determine the shift lever position. Each shift lever position has a certain combination of switches, which will be open and closed, this is called a PRNDL code. There are 4 switches, therefore: there are many possible combinations of open and closed switches (codes). However, there are only 9 valid codes (8 for AutoStick), one for each gear position and three recognized between gear codes. The remainder of the codes should never occur, these are called invalid codes. The following chart shows the normal switch states for each shift lever position.

Monitor Conditions

When Monitored:

Continuously with the ignition on.

Set Conditions

- Set Condition:**

The DTC will set if the controller detects an invalid PRNDL code which lasts for more than 0.042 seconds.

Possible Causes

Possible Causes
SHIFTER OUT OF ADJUSTMENT
TRS SIGNAL CIRCUIT OPEN
TRS SIGNAL CIRCUIT SHORT TO GROUND
TRS SIGNAL CIRCUIT SHORT TO VOLTAGE
METAL DEBRIS IN OIL PAN
TRANSMISSION RANGE SENSOR
POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

TRS SWITCH STATES

SLP	T41 (C1)	T42 (C2)	T3 (C3)	T1 (C4)
P	CLOSED	CLOSED	CLOSED	OPEN
R	OPEN	CLOSED	OPEN	OPEN
N	CLOSED	CLOSED	OPEN	CLOSED
OD	OPEN	OPEN	OPEN	CLOSED
3 or AutoStick if equipped	OPEN	OPEN	CLOSED	OPEN
L	OPEN	CLOSED	CLOSED	CLOSED

SHIFT LEVER ERROR CODES REPORTED BY SCAN TOOL

ERROR CODE	SWITCH CIRCUIT STUCK	SWITCH POSITION
1	T1 (C4)	OPEN
2	T1 (C4)	CLOSED
3	T3 (C3)	OPEN
4	T3 (C3)	CLOSED
5	T42 (C2)	OPEN
6	T42 (C2)	CLOSED
7	T41 (C1)	OPEN
8	T41 (C1)	CLOSED

Diagnostic Test

1. CHECK IF THE DTC IS CURRENT

With the scan tool, perform the Shift Lever Position Test.

Select the test outcome from the following:

Test passes:

Go to step 6.

Test fails with Error Code:

Go to step 2.

Test fails without Error Code:

Perform the Gearshift Adjustment Procedure per the Service Information.

Perform the PRNDL Fault Clearing Procedure. See **STANDARD PROCEDURE**.

2. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the scan tool, perform the Shift Lever Position Test.

When the scan tool instructs you to put the Gear Selector in a particular position, you must do so using the selector switch on the Transmission Simulator.

The LED for the gear position in question must be illuminated on the Transmission Simulator prior to pressing "ENTER" on the scan tool.

NOTE: When the scan tool requests the O/D off button be depressed, you must use the O/D OFF button in the vehicle or you will fail the Shift Lever Position Test with an error code 11 or OD-TOW/HALL STUCK OPEN.

NOTE: If the Shift Lever Position test fails, make sure to note the identification of the TRS Signal circuit for future reference.

Did the Shift Lever Position test pass?

Yes

Remove the Oil Pan and Main Valve Body Assembly per the Service Information. Check for metal debris on top of the TRS Assembly. If debris is present, determine the cause of the debris and repair the transmission as necessary. If no problems are found, replace the Transmission TRS Assembly per the Service Information.

Perform the PRNDL Fault Clearing Procedure. See **STANDARD PROCEDURE**.

No

Go to step 3.

3. TRS SIGNAL CIRCUIT OPEN

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the PCM harness connectors and install Miller tool #8815.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the identified (T41, T42, T3, and T1) TRS Signal circuit, from the Transmission Solenoid/TRS Assembly harness connector to the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

Repair the identified (T41, T42, T3, and T1) TRS Signal circuit for an open.
Perform the PRNDL Fault Clearing Procedure. See **STANDARD PROCEDURE**.

No

Go to step 4.

4. TRS SIGNAL CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the identified (T41, T42, T3, and T1) TRS Signal circuit.

Is the resistance below 5.0 ohms?

Yes

Repair the identified (T41, T42, T3, and T1) TRS Signal circuit for a short to ground.
Perform the PRNDL Fault Clearing Procedure. See **STANDARD PROCEDURE**.

No

Go to step 5.

5. TRS SIGNAL CIRCUIT SHORT TO OTHER CIRCUITS

Measure the resistance between the identified (T41, T42, T3, and T1) TRS Signal circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

Is the resistance below 100k ohms between the identified (T41, T42, T3, and T1) TRS Signal circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?

Yes

Repair the identified (T41, T42, T3, and T1) TRS Signal circuit for a short to other circuit(s).
Perform the PRNDL Fault Clearing Procedure. See **STANDARD PROCEDURE**.

No

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

Perform the PRNDL Fault Clearing Procedure. See **STANDARD PROCEDURE**.

6. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

Repair as necessary.

Perform the PRNDL Fault Clearing Procedure. See **STANDARD PROCEDURE**.

No

Test Complete.

P0711-TRANSMISSION TEMPERATURE SENSOR PERFORMANCE

Circuit Schematic

0199616a

Fig. 5: Transmission Range Sensor Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

The temperature sensor is used to sense the temperature of the transmission fluid. Transmission fluid temperature can affect shift quality, torque converter operation and when or if some diagnostics are run. A failed temperature sensor could affect the OBD diagnostics. If a problem occurs in the transmission temperature sensor circuit, transmission temperature will be based on a calculated value.

Monitor Conditions

When Monitored:

Continuously with the ignition on and engine running.

Set Conditions

- **Set Condition:**

DTC will set when the transmission temperature does not reach a normal operating temperature within a given time frame. Time is variable due to ambient temperature. Approximate DTC set time is 10 to 35 minutes. The following are starting temperature to warm up times to set this DTC: starting temperature - 40° C (-40° F) warm up time 35 minutes, starting temperature -28° C (-20° F) 25 minutes, starting temperature -6.6° C (20° F) 20 minutes, starting temperature 15.5 ° C (60° F) 10 minutes. When the fault is set, calculated temperature is substituted for measured temperature, however the DTC is stored only after three consecutive occurrences.

Possible Causes

Possible Causes
RELATED TRANSMISSION TEMPERATURE DTCS PRESENT
TRANSMISSION TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **CHECK FOR RELATED TRANSMISSION TEMPERATURE DTCS**

With the scan tool, read DTCS.

Are there any other Transmission Temperature Sensor DTCS present?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

No

Go to 2.

2. **CHECK IF THE DTC IS CURRENT**

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

Go to 3.

No

Go to 4.

3. **PCM AND WIRING**

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, turn the Input/Output switch to OFF.

With the scan tool, monitor the Transmission Temperature voltage while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.

Compare the scan tool readings with the numbers listed on the Transmission Simulator.

Do the readings on the Transmission Simulator match the scan tool readings (± 0.2 volts)?

Yes

Replace Transmission Range Sensor (TRS) Assembly per the Service Information.
Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins and for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

4. **CHECK THE WIRING AND CONNECTORS**

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0712-TRANSMISSION TEMPERATURE SENSOR LOW

Circuit Schematic

0199616a

Fig. 6: Transmission Range Sensor Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

The temperature sensor is used to sense the temperature of the transmission fluid. Transmission fluid temperature can affect shift quality, torque converter operation and when or if some diagnostics are run. A failed temperature sensor could affect the OBD diagnostics. If a problem occurs in the transmission temperature sensor circuit, transmission temperature will be based on a calculated value.

Monitor Conditions

When Monitored:

Continuously with the ignition on and engine running.

Set Conditions

- **Set Condition:**

The DTC will set when the monitored Temperature Sensor voltage drops below 0.078 volts for the period of 1.45 seconds. When the fault is set, calculated temperature is substituted for measured temperature, however the fault code is stored only after three consecutive occurrences of the fault.

Possible Causes

Possible Causes
RELATED DTCS PRESENT (T54) TRANSMISSION TEMPERATURE SIGNAL CIRCUIT SHORT TO GROUND TRANSMISSION TEMPERATURE SENSOR POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **CHECK IF RELATED DTCS ARE PRESENT**

With the scan tool, read DTCs.

Are there any Speed Sensor DTCs present?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

No

Go to 2.

2. **CHECK IF THE DTC IS CURRENT**

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

Go to 3.

No

Go to 5.

3. CHECK THE PCM AND WIRING WITH THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, turn the Input/Output switch to OFF.

With the scan tool, monitor the Transmission Temperature voltage while turning the Thermistor voltage switch to all three positions on the Transmission Simulator.

Compare the scan tool readings with the numbers listed on the Transmission Simulator.

Do the readings on the Transmission Simulator match the scan tool readings ± 0.2 volts?

Yes

Replace Transmission Range Sensor (TRS) Assembly per the Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go to 4.

4. CHECK THE (T54) TRANSMISSION TEMPERATURE SIGNAL CIRCUIT FOR A SHORT TO

GROUND

8199d30f

Fig. 7: Measuring Resistance Between Ground And Transmission Temperature Signal Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Disconnect the TRS Assembly harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance between ground and the (T54) Transmission Temperature Signal circuit.

Is the resistance below 5.0 ohms?

Yes

Repair the (T54) Transmission Temperature Signal circuit for a short to ground.

Perform **42RLE TRANSMISSION VERIFICATION TEST.**

No

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

5. **CHECK THE WIRING AND CONNECTORS**

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0713-TRANSMISSION TEMPERATURE SENSOR HIGH

Circuit Schematic

0199616a

Fig. 8: Transmission Range Sensor Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

The temperature sensor is used to sense the temperature of the transmission fluid. Transmission fluid temperature can affect shift quality, torque converter operation and when or if some diagnostics are run. A failed temperature sensor could affect the OBD diagnostics. If a problem occurs in the transmission temperature sensor circuit, transmission temperature will be based on a calculated value.

Monitor Conditions

When Monitored:

Continuously with the ignition on and engine running.

Set Conditions

- **Set Condition:**

The DTC will set when the monitored Temperature Sensor voltage rises above 4.94 volts for the period of 1.45 seconds. When the fault is set, calculated temperature is substituted for measured temperature, however the fault code is stored only after three consecutive occurrences of the fault.

Possible Causes

Possible Causes
(K900) SENSOR GROUND OPEN (T54) TRANSMISSION TEMPERATURE SIGNAL CIRCUIT OPEN (T54) TRANSMISSION TEMPERATURE SIGNAL CIRCUIT SHORT TO VOLTAGE TRANSMISSION TEMPERATURE SENSOR POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **CHECK IF THE DTC IS CURRENT**

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

Go to 2.

No

Go to 6.

2. **CHECK THE PCM AND WIRING WITH THE TRANSMISSION SIMULATOR**

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, turn the Input/Output switch to OFF.

With the scan tool, monitor the Transmission Temperature voltage while turning the Thermistor voltage switch to all three positions on the Transmission Simulator.

Compare the scan tool readings with the numbers listed on the Transmission Simulator.

Do the readings on the Transmission Simulator match the scan tool readings (± 0.2 volts)?

Yes

Replace Transmission Range Sensor (TRS) Assembly per the Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go to 3.

3. CHECK THE (T54) TRANSMISSION TEMPERATURE SIGNAL CIRCUIT FOR AN OPEN

8199d341

Fig. 9: Measuring Resistance Of Transmission Temperature Signal Circuit Between TRS Harness Connector And Appropriate Terminal Of Miller Tool #8815
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Disconnect the TRS harness connector

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the Transmission Temperature Signal circuit between the TRS harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

Repair the Transmission Temperature Signal circuit for an open.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go to 4.

4. CHECK THE (K900) SENSOR GROUND CIRCUIT FOR AN OPEN

Fig. 10: Measuring Resistance Of (K900) Sensor Ground Circuit Between TRS Harness Connector And Appropriate Terminal Of Miller Tool #8815
Courtesy of CHRYSLER LLC

Disconnect the PCM C2 harness connector.

Measure the resistance of the (K900) Sensor Ground circuit between the TRS harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

Repair the (K900) Sensor Ground circuit for an open.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go to 5.

5. CHECK THE (T54) TRANSMISSION TEMPERATURE SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

8199d357

Fig. 11: Measuring Voltage Of (T54) Transmission Temperature Sensor Signal Circuit In Appropriate Terminal Of Miller Tool #8815
 Courtesy of CHRYSLER LLC

Ignition on, engine not running.

With the scan tool under TIPM, actuate the Transmission.

Measure the voltage of the (T54) Transmission Temperature Sensor Signal circuit in the appropriate terminal of Miller tool #8815.

Is the voltage above 0.5 volts?

Yes

Repair the (T54) Transmission Temperature Sensor Signal circuit for a short to voltage.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

6. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0714-TRANSMISSION TEMPERATURE SENSOR INTERMITTENT

Circuit Schematic

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

The temperature sensor is used to sense the temperature of the transmission fluid. Transmission fluid temperature can affect shift quality, torque converter operation and when or if some diagnostics are run. A failed temperature sensor could affect the OBD diagnostics. If a problem occurs in the transmission temperature sensor circuit, transmission temperature will be based on a calculated value.

Monitor Conditions

When Monitored:

Continuously with the ignition on and engine running.

Set Conditions

- **Set Condition:**

The DTC will set when the monitored Temperature Sensor voltage fluctuates or changes abruptly within a predetermined period of time.

Possible Causes

Possible Causes
TRANSMISSION TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **CHECK IF THE DTC IS CURRENT**

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

Go to 2.

No

Go to 3.

2. **CHECK THE PCM AND WIRING WITH THE TRANSMISSION SIMULATOR**

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, turn the Input/Output switch to OFF.

With the scan tool, monitor the Transmission Temperature voltage while turning the Thermistor voltage switch to all three positions on the Transmission Simulator.

Compare the scan tool readings with the numbers listed on the Transmission Simulator.

Do the readings on the Transmission Simulator match a non-fluctuating scan tool reading (± 0.2 volts)?

Yes

Replace Transmission Range Sensor (TRS) Assembly per the Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

3. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0716-INPUT SPEED SENSOR 1 CIRCUIT PERFORMANCE

Circuit Schematic

019946509

Fig. 13: Speed Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The transmission control system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through system checks.

Monitor Conditions

When Monitored:

The transmission gear ratio is monitored continuously while the transmission is in gear.

Set Conditions

- **Set Condition:**

If there is an excessive change in the Input rpm in any valid gear (R, 1st, 2nd, 3rd, or 4th).

Possible Causes

Possible Causes
(T52) INPUT SPEED SIGNAL CIRCUIT OPEN
(T13) SENSOR GROUND CIRCUIT OPEN
(T52) INPUT SPEED SIGNAL CIRCUIT SHORT TO GROUND
(T52) INPUT SPEED SIGNAL CIRCUIT SHORT TO VOLTAGE
(T13) SENSOR GROUND CIRCUIT SHORT TO VOLTAGE
INPUT SPEED SENSOR
POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **CHECK IF THE DTC IS CURRENT**

Start the engine.

Place the shifter in Park.

With the scan tool, read the Input Speed Sensor rpm.

Is the Input Speed Sensor reading below 400 rpm?

Yes

Go to 2.

No

Go to 8.

2. CHECK THE PCM AND WIRING WITH THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, set the "Input/Output Speed" switch to "ON" and the rotary switch to the "3000/1250" position.

With the scan tool, read the Input and Output rpm.

Does the Input speed read 3000 rpm and the Output speed read 1250 rpm ($\pm$ 50 rpm)?

Yes

Replace the Input Speed Sensor per the Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go to 3.

3. CHECK THE (T52) INPUT SPEED SIGNAL CIRCUIT FOR AN OPEN

8199d524

Fig. 14: Measuring Resistance Of (T52) Input Speed Signal Circuit Between Input Speed Sensor Harness Connector And Appropriate Terminal Of Miller Tool #8815
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Disconnect the Input Speed Sensor harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T52) Input Speed Signal circuit between the Input Speed Sensor harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

Repair the (T52) Input Speed Signal circuit for an open.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go to 4.

4. CHECK THE (T13) SENSOR GROUND CIRCUIT FOR AN OPEN

8199d528

Fig. 15: Measuring Resistance Of (T13) Sensor Ground Circuit Between Input Speed Sensor Harness Connector And Appropriate Terminal Of Miller Tool #8815
Courtesy of CHRYSLER LLC

Measure the resistance of the (T13) Sensor Ground circuit between the Input Speed Sensor harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

Repair the (T13) Sensor Ground circuit for an open.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go to 5.

5. CHECK THE (T52) INPUT SPEED SIGNAL CIRCUIT FOR A SHORT TO GROUND

8199d52c

Fig. 16: Measuring Resistance Between Ground And (T52) Input Speed Signal Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (T52) Input Speed Signal circuit.

Is the resistance Below 5.0 ohms?

Yes

Repair the (T52) Input Speed Signal circuit for a short to ground.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go to 6.

6. CHECK THE (T52) INPUT SPEED SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

8199d534

Fig. 17: Measuring Voltage Of (T52) Input Speed Signal Circuit
Courtesy of CHRYSLER LLC

Disconnect the Output Speed Sensor harness connector.

Ignition on, engine not running.

With the scan tool under TIPM, actuate the Transmission.

Measure the voltage of the (T52) Input Speed Signal circuit.

Is the voltage above 0.5 volt?

Yes

Repair the (T52) Input Speed Signal circuit for a short to voltage.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go to 7.

7. CHECK THE (T13) SENSOR GROUND CIRCUIT FOR A SHORT TO VOLTAGE

8199d530

Fig. 18: Measure Voltage Of Sensor Ground Circuit
Courtesy of CHRYSLER LLC

With the scan tool under TIPM, actuate the Transmission.

Measure the voltage of the (T13) Sensor Ground circuit.

Is the voltage above 0.5 volts?

Yes

Repair the (T13) Speed Sensor Ground circuit for a short to voltage.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

8. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0721-OUTPUT SPEED SENSOR CIRCUIT PERFORMANCE

Circuit Schematic

019946500

Fig. 19: Speed Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through system checks.

Monitor Conditions

When Monitored:

The transmission gear ratio is monitored continuously while the transmission is in gear.

Set Conditions

- **Set Condition:**

If there is an excessive change in the Output rpm in any gear.

Possible Causes

Possible Causes
(T14) OUTPUT SPEED SIGNAL CIRCUIT OPEN
(T13) SENSOR GROUND CIRCUIT OPEN
(T14) OUTPUT SPEED SIGNAL CIRCUIT SHORT TO GROUND
(T14) OUTPUT SPEED SIGNAL CIRCUIT SHORT TO VOLTAGE
(T13) SENSOR GROUND CIRCUIT SHORT TO VOLTAGE
OUTPUT SPEED SENSOR
POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **CHECK IF THE DTC IS CURRENT**

Start the engine in Park.

Raise the drive wheels off of the ground.

WARNING: Properly support the vehicle.

Firmly apply the brakes and place the transmission selector in Drive.

WARNING: Be sure to keep hands and feet clear of rotating wheels.

Release the brakes and allow the drive wheels to spin freely.

NOTE: **The drive wheels must be turning at this point.**

With the scan tool, read the Output rpm

Is the Output rpm below 100?

Yes

Go to 2.

No

Go to 8.

2. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, set the "Input/Output Speed" switch to "ON" and the rotary switch to the "3000/1250" position.

With the scan tool, read the Input and Output rpm.

Does the Input rpm read 3000 and the Output rpm read 1250 (within 50 rpm)?

Yes

Replace the Output Speed per the Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go to 3.

3. **CHECK THE (T14) OUTPUT SPEED SIGNAL CIRCUIT FOR AN OPEN**

8199eac2

Fig. 20: Measuring Resistance Of (T14) Output Speed Signal Circuit Between Output Speed Harness Connector And Appropriate Terminal Of Miller Tool #8815
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Disconnect the Output Speed harness connector.

NOTE: Check connectors - Clean/repair as necessary.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T14) Output Speed Signal circuit between the Output Speed harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

Repair the (T14) Output Speed Signal circuit for an open.
Perform **42RLE TRANSMISSION VERIFICATION TEST.**

No

Go to 4.

4. CHECK THE (T13) SENSOR GROUND CIRCUIT FOR AN OPEN

8199f7f4

Fig. 21: Measuring Resistance Of Sensor Ground Circuit Between Output Speed Sensor Harness Connector And Appropriate Terminal Of Miller Tool #8815
Courtesy of CHRYSLER LLC

Measure the resistance of the Sensor Ground circuit between the Output Speed Sensor harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

Repair the (T13) Sensor Ground circuit for an open.
Perform **42RLE TRANSMISSION VERIFICATION TEST.**

No

Go to 5.

5. CHECK THE (T14) OUTPUT SPEED SIGNAL CIRCUIT FOR A SHORT TO GROUND

8199f785

Fig. 22: Measuring Resistance Between Ground And (T14) Output Speed Signal Circuit
Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (T14) Output Speed Signal circuit.

Is the resistance below 5.0 ohms?

Yes

Repair the (T14) Output Speed Signal circuit for a short to ground.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go to 6.

6. CHECK THE (T14) OUTPUT SPEED SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

8199f7e1

Fig. 23: Measuring Voltage Of (T14) Output Speed Signal Circuit
Courtesy of CHRYSLER LLC

Ignition on, engine not running.

With the scan tool under TIPM, actuate the Transmission.

Measure the voltage of the (T14) Output Speed Signal circuit.

Is the voltage above 0.5 volt?

Yes

Repair the (T14) Output Speed Signal circuit for a short to voltage.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go to 7.

7. CHECK THE (T13) SENSOR GROUND CIRCUIT FOR A SHORT TO VOLTAGE

8199f843

Fig. 24: Measuring Voltage Of (T13) Speed Sensor Ground Circuit
Courtesy of CHRYSLER LLC

With the scan tool under TIPM, actuate the Transmission.

Measure the voltage of the (T13) Speed Sensor Ground circuit.

Is the voltage above 0.5 volts?

Yes

Repair the (T13) Sensor Ground circuit for a short to voltage.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

8. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0726-ENGINE SPEED INPUT CIRCUIT RANGE/PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The PCM uses a dual port RAM internal to the controller to send the engine speed signal to the Transmission Control System. The calculated engine RPM is compared to a minimum and maximum value. If the PCM interprets this signal to be out of range when the engine is running the code is set. The MIL illuminates after 10 seconds of vehicle operation and the transmission system defaults to limp-in mode.

Monitor Conditions

When Monitored:

Whenever the engine is running.

Set Conditions

• **Set Condition:**

The Engine rpm is less than 390 or greater than 8000 for more than 2 seconds while the engine is running.

Possible Causes

Possible Causes
ENGINE DTCS PRESENT POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. CHECK IF THE DTC IS CURRENT

Start the engine.

NOTE: This DTC is not a Transmission Input Speed Sensor DTC.

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter set at 0 for this DTC ?

Yes

Go to 2.

No

Go to 3.

2. CHECK IF ENGINE DTCS ARE PRESENT

With the scan tool, read engine DTCs.

Are there any engine DTCs present?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

3. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0731-GEAR RATIO ERROR IN 1ST

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through data checks. When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding gear ratio error trouble code is set. The transmission will go into limp-in mode after four gear ratio error events occur in a given driving cycle.

Monitor Conditions

When Monitored:

The Transmission gear ratio is monitored continuously while the transmission is in gear.

Set Conditions

- Set Condition:**

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio when compared to the known gear ratio.

Possible Causes

Possible Causes
RELATED TRANSMISSION DTCS PRESENT
INTERMITTENT GEAR RATIO ERRORS

INTERNAL TRANSMISSION

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. CHECK FOR RELATED TRANSMISSION DTCS

With the scan tool, read Transmission DTCS.

If any of these DTCS are present, perform their respective tests first.

Are there any Loss of Prime, Line Pressure Sensor and/or Speed Sensor DTCS present?

Yes

Refer to appropriate diagnostic procedure, see **DIAGNOSTIC CODE INDEX** . If any of these DTCS are present, they will cause a gear ratio error. Perform the test for Loss of Prime first if it is present.

No

Go to 2.

2. CHECK TO SEE IF P0731 IS CURRENT

With the scan tool, perform the 1st gear clutch test. Follow the instructions on the scan tool.

Increase the throttle angle or TPS Degree to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

Did the Clutch Test pass, Input Speed remain at zero?

Yes

Go to 3.

No

Repair internal Transmission as necessary. Check all of the components related to the UD and LR clutches. Inspect the Oil Pump and repair or replace as necessary. Refer to **42RLE - SERVICE INFORMATION** for the proper repair procedures.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

3. CHECK FOR INTERMITTENT OPERATION

The conditions to set this DTC are not current at this time.

Check the gearshift linkage adjustment.

Gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits. If the vehicle passes the Clutch Test and still sets Gear Ratio DTC, check the Speed Sensors for proper operation.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Check the wiring and connectors for the Speed Sensors for a good connection, then perform a wiggle test using the Transmission Simulator.

This DTC can also be set under extreme temperature conditions. This is usually caused by an internal problem. Verify if the problem is only experienced under extreme hot or cold conditions.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0732-GEAR RATIO ERROR IN 2ND

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified

through data checks. When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding gear ratio error trouble code is set. The transmission will go into limp-in mode after four gear ratio error events occur in a given driving cycle.

Monitor Conditions

When Monitored:

The Transmission gear ratio is monitored continuously while the transmission is in gear.

Set Conditions

- **Set Condition:**

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio when compared to the known gear ratio.

Possible Causes

Possible Causes
RELATED TRANSMISSION DTCS PRESENT
TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY
INTERMITTENT GEAR RATIO ERRORS
INTERNAL TRANSMISSION

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **CHECK IF RELATED TRANSMISSION DTCS ARE PRESENT**

With the scan tool, read Transmission DTCs.

If any of these DTCs are present, perform their respective tests first.

Are there any Loss of Prime, Line Pressure Sensor and/or Speed Sensor DTCs present?

Yes

Refer to appropriate diagnostic procedure, see **DIAGNOSTIC CODE INDEX**. If any of these DTCs are present, they will cause a gear ratio error. Perform the test for Loss of Prime first if it is present.

No

Go to 2.

2. **CHECK IF THE DTC IS CURRENT**

With the scan tool, perform the 2nd gear clutch test. Follow the instructions on the scan tool.

Increase the throttle angle or TPS Degree to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

Did the Clutch Test pass, Input Speed remain at zero?

Yes

Go to 3.

No

Go to 4.

3. **CHECK FOR INTERMITTENT OPERATION**

The conditions to set this DTC are not current at this time.

Check the gearshift linkage adjustment.

Gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits. If the vehicle passes the Clutch Test and still sets Gear Ratio DTC, check the Speed Sensors for proper operation.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Check the wiring and connectors to the Speed Sensors for a good connection, then perform a wiggle test using the Transmission Simulator.

This DTC can also be set under extreme temperature conditions. This is usually caused by an internal problem. Verify if the problem is only experienced under extreme hot or cold conditions.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

4. CHECK FOR RELATED PRESSURE SWITCH DTCS

With the scan tool, read Transmission DTCS.

Are the DTCS P0845 and/or P0846 present also?

Yes

Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Repair internal Transmission per the Service Information. Check all of the components related to the UD and 2/4 clutches. Inspect the Oil Pump and repair or replace as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

P0733-GEAR RATIO ERROR IN 3RD

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through data checks. When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding gear ratio error trouble code is set. The transmission will go into limp-in mode after four gear ratio error events occur in a given driving cycle.

Monitor Conditions

When Monitored:

The Transmission gear ratio is monitored continuously while the transmission is in gear.

Set Conditions

- **Set Condition:**

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio when compared to the known gear ratio.

Possible Causes

Possible Causes
RELATED TRANSMISSION DTCS PRESENT
INTERMITTENT GEAR RATIO ERRORS
TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY
INTERNAL TRANSMISSION

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **CHECK IF RELATED TRANSMISSION DTCS ARE PRESENT**

With the scan tool, read Transmission DTCs.

If any of these DTCs are present, perform their respective tests first.

Are there any Loss of Prime, Line Pressure Sensor and/or Speed Sensor DTCs present?

Yes

Refer to appropriate diagnostic procedure, see **DIAGNOSTIC CODE INDEX**. If any of these DTCs are present, they will cause a gear ratio error. Perform the test for Loss of Prime first if it is present.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go To 2.

2. **CHECK IF THE DTC IS CURRENT**

With the scan tool, perform the 3rd gear clutch test. Follow the instructions on the scan tool.

Increase the throttle angle or TPS Degree to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

Did the Clutch Test pass, Input Speed remain at zero?

Yes

Go To 3.

No

Go To 4.

3. CHECK FOR INTERMITTENT OPERATION

The conditions to set this DTC are not current at this time.

Check the gearshift linkage adjustment.

Gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits. If the vehicle passes the Clutch Test and still sets Gear Ratio DTC, check the Speed Sensors for proper operation.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Check the wiring and connectors for the Speed Sensors for a good connection, then perform a wiggle test using the Transmission Simulator.

This DTC can also be set under extreme temperature conditions, this is usually caused by an internal problem. Verify if the problem is only experienced under extreme hot or cold conditions.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST.**

No

Test Complete.

4. **CHECK FOR RELATED PRESSURE SWITCH DTCS**

With the scan tool, read Transmission DTCS.

Are the DTCS P0870 and/or P0871 present also?

Yes

Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.
Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Repair internal Transmission per the Service Information. Check all of the components related to the UD and O/D clutches. Inspect the Oil Pump and repair or replace as necessary.
Perform **42RLE TRANSMISSION VERIFICATION TEST**.

P0734-GEAR RATIO ERROR IN 4TH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through data checks. When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding gear ratio error trouble code is set. The transmission will go into limp-in mode after four gear ratio error events occur in a given driving cycle.

Monitor Conditions

When Monitored:

The Transmission gear ratio is monitored continuously while the transmission is in gear.

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio when compared to the known gear ratio.

Possible Causes

Possible Causes
RELATED TRANSMISSION DTCS PRESENT

INTERMITTENT GEAR RATIO ERRORS TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY INTERNAL TRANSMISSION

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. CHECK IF RELATED TRANSMISSION DTCS ARE PRESENT

With the scan tool, read Transmission DTCs.

If any of these DTCs are present, perform their respective tests first.

Are there any Loss of Prime, Line Pressure Sensor and/or Speed Sensor DTCs present?

Yes

Refer to appropriate diagnostic procedure, see **DIAGNOSTIC CODE INDEX**. If any of these DTCs are present, they will cause a gear ratio error. Perform the test for Loss of Prime first if it is present.

No

Go to 2.

2. CHECK IF THE DTC IS CURRENT

With the scan tool, perform the 4th gear clutch test. Follow the instructions on the scan tool.

Increase the throttle angle or TPS Degree to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

Did the Clutch Test pass, Input Speed remain at zero?

Yes

Go to 3.

No

Go to 4.

3. CHECK FOR INTERMITTENT OPERATION

The conditions to set this DTC are not current at this time.

Check the gearshift linkage adjustment.

Gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits. If the vehicle passes the Clutch Test and still sets a Gear Ratio DTC, check the Speed Sensors for proper operation.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Check the wiring and connectors for the Speed Sensors for a good connection, then perform a wiggle test using the Transmission Simulator.

This DTC can also be set under extreme temperature conditions, this is usually caused by an internal problem. Verify if the problem is only experienced under extreme hot or cold conditions.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

4. CHECK FOR RELATED PRESSURE SWITCH DTCS

With the scan tool, read Transmission DTCs.

Are the DTCs P0870 and/or P0871 present also?

Yes

Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.
Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Repair internal Transmission per the Service Information. Check all of the components related to the O/D and 2/4 clutches. Inspect the Oil Pump and repair or replace as necessary.
Perform **42RLE TRANSMISSION VERIFICATION TEST**.

P0736-GEAR RATIO ERROR IN REVERSE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The transmission system uses two speed sensors, one to measure input rpm and one to measure output rpm. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through data checks. When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding gear ratio error trouble code is set. The transmission will go into limp-in mode after four gear ratio error events occur in a given driving cycle.

Monitor Conditions

When Monitored:

The Transmission gear ratio is monitored continuously while the transmission is in gear.

Set Conditions

• **Set Condition:**

If the ratio of the Input rpm to the Output rpm does not match the current gear ratio when compared to the known gear ratio.

Possible Causes

Possible Causes
RELATED TRANSMISSION DTCS PRESENT
INTERMITTENT GEAR RATIO ERRORS
INTERNAL TRANSMISSION

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. DETERMINING IF RELATED TRANSMISSION DTCS ARE PRESENT

With the scan tool, read Transmission DTCs.

If any of these DTCs are present, perform their respective tests first.

Are there any Loss of Prime, Line Pressure Sensor and/or Speed Sensor DTCs present?

Yes

Refer to appropriate diagnostic procedure, see **DIAGNOSTIC CODE INDEX**. If any of these DTCs are present, they will cause a gear ratio error. Perform the test for Loss of Prime first if it is present.

No

Go to 2.

2. CHECK TO SEE IF P0731 IS CURRENT

With the scan tool, perform the Reverse gear clutch test. Follow the instructions on the scan tool.

Increase the throttle angle or TPS Degree to 30° for no more than a few seconds.

CAUTION: Do not overheat the transmission.

Did the Clutch Test pass, Input Speed remain at zero?

Yes

Go to 3.

No

Repair internal Transmission per the Service Information. Check all of the components related to the Reverse and L/R clutches. Inspect the Oil Pump and repair or replace as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

3. CHECK FOR INTERMITTENT OPERATION

The conditions to set this DTC are not current at this time.

Check the gearshift linkage adjustment.

Gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits. If the vehicle passes the Clutch Test and still sets Gear Ratio DTC, check the Speed Sensors for proper operation.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Check the wiring and connectors related to the Speed Sensors for a good connection, then perform a wiggle test using the Transmission Simulator.

This DTC can also be set under extreme temperature conditions, this is usually caused by an internal problem. Verify if the problem is only experienced under extreme hot or cold conditions.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0740-TCC OUT OF RANGE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

When in 2nd, 3rd, or 4th gear, the Torque Converter Clutch (TCC) can be locked or partially locked when certain conditions are met. The TCC piston is electronically modulated by increasing the duty cycle of the LR/TCC solenoid until the torque converter slip difference (difference between engine and turbine speed) is within 60 rpm. Then the LR/TCC solenoid is fully energized (FEMCC / 100% duty cycle). Torque converter slip is monitored in FEMCC to ensure adequate clutch capacity. The transmission will attempt normal EMCC operation (not in limp-in) even after the MIL is illuminated. MIL will illuminate after 5 minutes of accumulated slip in FEMCC.

Monitor Conditions

When Monitored:

The Torque Converter Clutch (TCC) is in FEMCC or PEMCC, Transmission temperature is hot, Engine temperature is greater than 38° C or 100° F, Transmission Input Speed greater than engine speed, TPS less than 30°, and brake not applied.

Set Conditions

- **Set Condition:**

The TCC is modulated by controlling the duty cycle of the L/R Solenoid until the difference between the Engine rpm and the Transmission Input Speed rpm or duty cycle is within a desired range. The DTC is set after the period of 10 seconds and 3 occurrences of either: FEMCC - with slip greater than 100 rpm or PEMCC - duty cycle greater than 85%.

Possible Causes

Possible Causes
RELATED L/R SOLENOID OR PRESSURE SWITCH DTCS PRESENT INTERNAL TRANSMISSION

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **CHECK FOR RELATED DTCS**

With the scan tool, read DTCS.

Are the DTCS P0750 and/or P0841 present also?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate symptom.

No

Go to 2.

2. **CHECK IF THE DTC IS CURRENT**

Ignition on, engine not running.

With the scan tool, record and erase DTCS.

Drive the vehicle until it is fully warmed up to at least 43° C (110° F).

Perform the following step 3 times.

Drive the vehicle at 80 km/h (50 mph) and allow 4th gear to engage for at least 10 seconds. Close the throttle, then tip back in until the throttle angle is between 25 and 29 degrees. Note that if you go over 30 degrees, you must back off of the throttle and retry.

Did the TCC engage during any of the attempts?

Yes

Go to 3.

No

Perform the Hydraulic Pressure test per **42RLE - SERVICE INFORMATION** and repair the internal transmission components and Torque convertor as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

3. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

This DTC can also be set under extreme temperature conditions. This is usually caused by an internal problem. Verify if the problem is only experienced under extreme hot or cold conditions.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0750-LR SOLENOID CIRCUIT

Circuit Schematic

019a117a

Fig. 25: Transmission Solenoid/Pressure Switch Assembly Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Four solenoids are used to control the friction elements (clutches). The continuity of the solenoids circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the PCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a gear ratio or pressure switch error occurs. In this case, one failure will result in the appropriate DTC being set. The MIL will illuminate and the transmission goes into Neutral, if the DTC is set above 35 Km/h (22 mph), limp-in mode when vehicle speed is below 35 Km/h (22 mph).

Monitor Conditions

When Monitored:

Initially at ignition on, then every 10 seconds thereafter. The solenoids will also be tested immediately after a gear ratio error or pressure switch error is detected.

Set Conditions

- Set Condition:**

Three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

Possible Causes

Possible Causes
RELATED TIPM TCM POWER CONTROL CIRCUIT DTCS PRESENT (T20) L/R CONTROL CIRCUIT OPEN (T20) L/R CONTROL CIRCUIT SHORT TO GROUND (T20) L/R CONTROL CIRCUIT SHORT TO VOLTAGE TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **DETERMINING IF RELATED TIPM TCM POWER CONTROL CIRCUIT DTCS PRESENT**

With the scan tool, read TIPM DTCs.

Are there any TIPM TCM Power Control Circuit DTCs present also?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

No

Go to 2.

2. CHECK IF THE DTC IS CURRENT

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 0 for this DTC?

Yes

Go to 3.

No

Go to 8.

3. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the scan tool, actuate the L/R Solenoid.

Monitor the L/R Solenoid LED on the Transmission Simulator.

Did the L/R Solenoid LED on the Transmission Simulator blink on and off during actuation?

Yes

Go to 4.

No

Go to 5.

4. CHECK WIRING USING THE TRANSMISSION SIMULATOR

With the scan tool, continue to actuate the L/R Solenoid.

While monitoring the L/R Solenoid LED on the Transmission Simulator, wiggle the related wiring harness and connectors.

Did the L/R Solenoid LED on the Transmission Simulator continue to blink on and off during the wiggle test?

Yes

Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Repair wiring or connectors as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

5. CHECK THE (T20) L/R CONTROL CIRCUIT FOR AN OPEN

**ASSEMBLY-

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the scan tool, actuate the OD Solenoid.

Monitor the OD Solenoid LED on the Transmission Simulator.

Did the OD Solenoid LED on the Transmission Simulator blink on and off during actuation?

Yes

Go to 4.

No

Go to 5.

4. CHECK WIRING USING THE TRANSMISSION SIMULATOR

With the scan tool, continue to actuate the OD Solenoid.

While monitoring the OD Solenoid LED on the Transmission Simulator, wiggle the related wiring harness and connectors.

Did the OD Solenoid LED on the Transmission Simulator continue to blink on and off during the wiggle test?

Yes

Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Repair wiring or connectors as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

5. CHECK THE (T60) OD CONTROL CIRCUIT FOR AN OPEN

**ASSEMBLY-
TRANSMISSION
SOLENOID/PRESSURE
SWITCH
(42 RLE)**

**PCM PINOUT
BOX 8815**

812a5ab7

Courtesy of CHRYSLER LLC

Ignition on, engine not running.

With the scan tool under TIPM, actuate the Transmission.

Measure the voltage of the (T60) OD Control circuit.

Is the voltage above 0.5 volts?

Yes

Repair the (T60) OD Control circuit for a short to voltage.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

8. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

Additional Wiring

019e117e

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Four solenoids are used to control the friction elements (clutches). The continuity of the solenoid circuits is periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the PCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a gear ratio or pressure switch error occurs. In this case, one failure will result in the appropriate DTC being set. The MIL will illuminate and the transmission goes into Neutral, if the DTC is set above 35 Km/h (22 mph), limp-in mode when vehicle speed is below 35 Km/h (22 mph).

Monitor Conditions

When Monitored:

Initially at ignition on, then every 10 seconds thereafter. The solenoids will also be tested immediately after a gear ratio error or pressure switch error is detected.

Set Conditions

- **Set Condition:**

Three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0841-LR PRESSURE SWITCH RATIONALITY

Circuit Schematic

The Transmission system uses three pressure switches to monitor the fluid pressure in the LR, 2/4, and OD elements. The pressure switches are continuously monitored for the correct states in each gear. If a set condition is identified, 1st gear and torque converter lock-up (EMCC) will be inhibited. The vehicle will launch in 2nd gear and shift normally through the gears without allowing EMCC. If during the same key start, the set condition is no longer valid, the transmission will return to normal operation (1st and EMCC available). Limp-in will not occur unless DTC P0841 is accompanied by a code P0706 and the MIL will illuminate after 5 minutes of substituted operation.

Monitor Conditions

When Monitored:

Whenever the engine is running.

Set Conditions

- Set Condition:

The DTC is set if one of the pressure switches are open or closed at the wrong time in a given gear. If the problem is identified for 3 successive key starts, the transmission will go into limp-in mode and the MIL will turn on after 10 seconds of vehicle operation.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

Circuit Schematic

019a117a

Fig. 45: Transmission Solenoid/Pressure Switch Assembly Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Pressure switches are normally off or open (no pressure applied) and read high (+12 volts). When an element is applied, the corresponding pressure switch closes to ground (0 volts) or turns on. The controller tests the OD and 2/4 pressure switches when they are off (when the corresponding friction element is not applied) by briefly applying the OD and 2/4 elements which will cause the corresponding pressure switch to close. The test verifies that the switches are operational and that the switch will close when the corresponding element is applied. If a switch fails to respond, it is re-tested. The MIL illuminates and the transmission system defaults to limp-in mode.

Monitor Conditions

When Monitored:

In any forward gear with engine speed above 1000 RPM, shortly after a shift and every minute thereafter.

Set Conditions

- **Set Condition:**

After a shift into a forward gear, with engine speed greater than 1000 rpm the PCM momentarily turns on element pressure to the clutch circuits that don't have pressure to verify that the correct pressure switch closes. If the pressure switch does not close 2 times the DTC sets

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0846-2/4 PRESSURE SWITCH RATIONALITY

Circuit Schematic

The Transmission system uses three pressure switches to monitor the fluid pressure in the LR, 2/4, and OD elements. The pressure switches are continuously monitored for the correct states in each gear. The 2/4 pressure switch monitors the fluid pressure to the 2/4 clutch to confirm proper operation of the 2/4 solenoid. If the 2/4 pressure switch is identified as closed in P or N, the code will immediately be set and normal operation will be allowed for that given key start. If the problem is identified for 3 successive ignition cycles, the transmission will go into limp-in mode.

Monitor Conditions

When Monitored:

Whenever the engine is running.

Set Conditions

- Set Condition:**

The DTC is set if one of the pressure switches are open or closed at the wrong time in a given gear. If the problem is identified for 3 successive key starts, the transmission will go into limp-in mode and the MIL will turn on after 10 seconds of vehicle operation.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

8. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

Circuit Schematic

Fig. 54: Line Pressure Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Line pressure is measured by the Line Pressure Sensor (LPS) and regulation is achieved by changing the duty cycle of the Pressure Control Solenoid (PCS) controlled by the Transmission Control System. (5% duty cycle = solenoid off = Max line pressure, 62% duty cycle = solenoid on = Min line pressure). The Transmission Control System calculates the desired line pressure based on inputs from both the engine and transmission.

The Transmission Control System calculates torque input to the transmission and uses it as the primary input to the desired line pressure calculation. This is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 or 931 kPa (120 or 135 psi) during shifts and in Park and Neutral to ensure consistent shift quality. The desired line pressure is continuously being compared to the actual line pressure. If the actual line pressure is consistently lower than the target while driving, the line pressure low DTC P0868 will set.

Monitor Conditions

When Monitored:

Continuously while driving in a forward gear.

Set Conditions

- Set Condition:**

The PCM continuously monitors Actual Line Pressure and compares it to Desired Line Pressure. If the Actual Line Pressure is more than 10 psi below Desired Line Pressure, this DTC will set.

Possible Causes

Possible Causes
CHECK FOR RELATED DTCS
LOW FLUID LEVEL
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND
(F856) 5-VOLT SUPPLY CIRCUIT SHORT TO VOLTAGE
(T118) LP VFS CONTROL CIRCUIT SHORT TO ANOTHER CIRCUIT
INTERNAL TRANSMISSION
LINE PRESSURE SENSOR
CRACKED, PLUGGED, OR MIS-INSTALLED OIL FILTER
STUCK OR STICKING MAIN REGULATOR VALVE
POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **CHECK FOR RELATED DTCS**

With the scan tool, read DTCs

Is the DTC P0932 present also?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate symptom.

No

Go to 2.

2. CHECK IF THE DTC IS CURRENT

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

Go to 3.

No

Go to 10.

3. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the from the TIPM.

CAUTION: Removal of the from the TIPM will prevent the vehicle from being started in gear.

WARNING: The must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

On the Transmission Simulator select the "OFF" position of the "Input/Output Speed" switch.

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure during the following steps.

Using the Transmission Simulator, set the rotary knob to each of the 3 line pressure positions.

NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.

Did the Line Pressure read within ± 14 kPa or 2.0 psi in all three positions?

Yes

Go to 4.

No

Go to 6.

4. CHECK THE LINE PRESSURE SENSOR

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333 and reconnect all previously disconnected connectors.

Install a Pressure Gauge, 0 to 2000 kPa or 0 to 300 psi to the L/R test port.

Start the engine in Park.

Monitor the line pressure readings of both the scan tool and the pressure gauge and compare the two readings.

Is the line pressure gauge reading within 34 kPa or 5 psi of the scan tool reading?

Yes

Go to 5.

No

Replace the Line Pressure Sensor per the Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

5. CHECK FOR A PLUGGED TRANSMISSION OIL FILTER

Turn the ignition off to the lock position.

Remove and inspect the Transmission Oil Pan for excessive debris per the Service Information.

Remove and inspect the Transmission Oil Filter per the Service Information.

Does the Oil Pan contain excessive debris and/or is the Transmission Oil Filter plugged?

Yes

Repair as necessary. If the Transmission Oil Filter is plugged or there is excessive debris, refer to **42RLE - SERVICE INFORMATION** for the proper Hydraulic repair procedure.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Repair internal transmission and inspect the Transmission Oil Pump per **42RLE - SERVICE INFORMATION** and replace if necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

6. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE

**ASSEMBLY-
LINE PRESSURE
SENSOR/VARIABLE
FORCE SOLENOID
(RLE)**

816b7d58

Fig. 55: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER LLC

Disconnect the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Reconnect all previously disconnected connectors except the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector.

Ignition on, engine not running.

Measure the voltage of the (F856) 5-volt Supply circuit.

Is the voltage above 5.5 volts?

Yes

Repair the (F856) 5-volt Supply circuit for a short to voltage.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go to 7.

7. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN

8168994b

Fig. 56: Checking 5-Volt Supply Circuit For Open
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position.

Disconnect the PCM C1 harness connector and connect Miller tool #8815.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

Repair the (F856) 5-volt Supply circuit for an open.

Perform **42RLE TRANSMISSION VERIFICATION TEST.**

No

Go to 8.

8. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

81689ac2

Fig. 57: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (F856) 5-volt Supply circuit.

Is the resistance below 5.0 ohms?

Yes

Repair the (F856) 5-volt Supply circuit for a short to ground.
Perform **42RLE TRANSMISSION VERIFICATION TEST.**

No

Go to 9.

9. CHECK THE (T118) LP VFS CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

8168c257

Fig. 58: Checking Pressure Control Solenoid Control Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position.

Disconnect the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector.

Disconnect all PCM harness connectors.

Measure the resistance between the (T118) LP VFS Control circuit and all other circuits in the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector.

Is the resistance below 5.0 ohms between the (T118) LP VFS Control circuit and any other circuit (s) in the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector?

Yes

Repair the (T118) LP VFS Control circuit for a short to another circuit(s).
Perform **42RLE TRANSMISSION VERIFICATION TEST.**

No

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

10. **CHECK THE WIRING AND CONNECTORS**

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0869-LINE PRESSURE HIGH

Circuit Schematic

01942600

Fig. 59: Line Pressure Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Line pressure is measured by the Line Pressure Sensor (LPS) and regulation is achieved by changing the duty cycle of the Pressure Control Solenoid (PCS) controlled by the Transmission Control System. (5% duty cycle = solenoid off = Max line pressure, 62% duty cycle = solenoid on = Min line pressure). The Transmission Control System calculates the desired line pressure based on inputs from both the engine and transmission.

The Transmission Control System calculates torque input to the transmission and uses it as the primary input to the desired line pressure calculation. This is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 or 931 kPa (120 or 135 psi) during shifts and in Park and Neutral to ensure consistent shift quality. The desired line pressure is continuously being compared to the actual line pressure. If the actual line pressure is consistently higher than the highest desired line pressure ever used in the current gear, the line pressure high DTC P0869 will set.

Monitor Conditions

When Monitored:

Continuously while driving in a forward gear.

Set Conditions

- Set Condition:**

The PCM continuously monitors Actual Line Pressure. If the Actual Line Pressure reading is greater than the highest Desired Line Pressure ever used in the current gear, while the Pressure Control Solenoid duty cycle is at or near its maximum value (which should result in minimum line pressure), the DTC will set.

Possible Causes

Possible Causes
(F856) 5-VOLT SUPPLY CIRCUIT OPEN LINE PRESSURE SENSOR CONNECTION (T118) LP VFS CONTROL CIRCUIT OPEN (F856) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND (T118) LP VFS CONTROL CIRCUIT SHORT TO GROUND TRANSMISSION CONTROL OUTPUT CIRCUIT LINE PRESSURE SENSOR STUCK OR STICKING MAIN REGULATOR VALVE POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **CHECK FOR RELATED DTCS**

With the scan tool, read DTCs.

Are there any line pressure sensor or transmission relay output DTCs present also?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate symptom.

No

Go to 2.

2. CHECK IF THE DTC IS CURRENT

With the scan tool, read DTCs.

Is the status Active or is the Starts Since Set counter 2 or less for this DTC?

Yes

Go to 3.

No

Go to 9.

3. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure during the following step.

Using the Transmission Simulator, set the rotary switch to each of the 3 line pressure positions.

NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa

or 2.0 psi (0.2 volts) of the reading specified on the Transmission Simulator.

Did the Line Pressure read within ± 14 kPa or 2.0 psi (0.2 volts) in all three positions?

Yes

Go to 4.

No

Go to 5.

4. CHECK THE LINE PRESSURE SENSOR CALIBRATION

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit and reconnect all previously disconnected connectors.

Install the Line Pressure Gauge, Miller tool #C-3293, 0 to 2000 kPa or 0 to 300 psi in the L/R pressure port.

Start the engine in Park.

Monitor the Line Pressure readings on the scan tool and the pressure gauge.

Compare the Line Pressure readings between the scan tool and the pressure gauge.

Is the pressure gauge reading within 34 kPa or 5 psi of the scan tool reading?

Yes

Repair the internal transmission and inspect the Transmission Oil Pump per **42RLE - SERVICE INFORMATION** and replace if necessary. If no problem is found, replace the Pressure Control Solenoid.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Replace the Line Pressure Sensor per the Service information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

5. CHECK THE (T118) LP VFS CONTROL CIRCUIT FOR AN OPEN

816896d2

Fig. 60: Checking Pressure Control Solenoid Control Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the Powertrain Control Module C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (T118) LP VFS Control circuit between the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

Repair the (T118) LP VFS Control circuit for an open.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go to 6.

6. **CHECK THE (T118) LP VFS CONTROL CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (T118) LP VFS Control circuit.

Is the resistance below 5.0 ohms?

Yes

Repair the (T118) LP VFS Control circuit for a short to ground.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go to 7.

7. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 62: Checking 5-Volt Supply Circuit For Open
Courtesy of CHRYSLER LLC

Disconnect the PCM C1 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

Repair the (F856) 5-volt Supply circuit for an open.

Perform **42RLE TRANSMISSION VERIFICATION TEST.**

No

Go to 8.

8. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

81689ac2

Fig. 63: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (F856) 5-volt Supply circuit.

Is the resistance below 5.0 ohms?

Yes

Repair the (F856) 5-volt Supply circuit for a short to ground.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

9. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST.**

No

Test Complete.

P0870-OD HYDRAULIC PRESSURE TEST

Circuit Schematic

019a117a

Fig. 64: Transmission Solenoid/Pressure Switch Assembly Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Pressure switches are normally off or open (no pressure applied) and read high (+12 volts). When an element is applied, the corresponding pressure switch closes to ground (0 volts) or turns on. The controller tests the OD and 2/4 pressure switches when they are off (when the corresponding friction element is not applied) by briefly applying the OD and 2/4 elements which will cause the corresponding pressure switch to close. The test verifies that the switches are operational and that the switch will close when the corresponding element is applied. If a switch fails to respond, it is re-tested. The MIL illuminates and the transmission system defaults to limp-in mode.

Monitor Conditions

When Monitored:

In any forward gear with engine speed above 1000 rpm, shortly after a shift and every minute thereafter.

Set Conditions

- **Set Condition:**

After a shift into a forward gear, with engine speed greater than 1000 rpm, the PCM momentarily turns on element pressure to the clutch circuits that don't have pressure to identify the correct pressure switch closes. If the pressure switch does not close 2 times, the DTC sets.

Possible Causes

Possible Causes

Using a 12-volt test light connected to ground, check (T16) Transmission Control Output circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform Quick Learn.

Perform **42RLE TRANSMISSION VERIFICATION TEST.**

No

Repair the (T16) Transmission Control Relay Output circuit for an open. If the fuse is open make sure to check for a short to ground.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

9. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0871-OD PRESSURE SWITCH RATIONALITY

Circuit Schematic

The Transmission system uses three pressure switches to monitor the fluid pressure in the L/R, 2/4, and OD elements. The pressure switches are continuously monitored for the correct states in each gear. Normal operation will be experienced if no other codes are present. Transmission Control System will ignore the code. Limp-in condition will only occur if DTC P0871 is present with a DTC P0706.

Monitor Conditions

When Monitored:

Whenever the engine is running.

Set Conditions

- Set Condition:

The DTC is set if one of the pressure switches are open or closed at the wrong time in a given gear. If the problem is identified for 3 successive key starts, the transmission will go into limp-in mode and the MIL will turn on after 10 seconds of vehicle operation.

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The Transmission Control Output circuit is used to supply power to the Transmission Solenoid/TRS Assembly and to the PCM when in normal operating mode. The purpose of the Transmission Output circuit is to allow the Transmission Control System to turn off the power to the Transmission Solenoid/TRS Assembly in event that the transmission should need to be placed into limp-in mode due to a DTC.

After a PCM reset, (ignition switch turned to the run position, or after cranking the engine) the Transmission Control System verifies that the Transmission Output circuit is open by checking for voltage on the Transmission Output circuits before the Transmission Control System requests for the circuit to be powered up. The request is sent by a direct circuit control from the PCM to the TIPM. If the Transmission Control System detects less that 3.0 volts when the output is commanded on, the DTC will set. **Note: Inadequate Transmission Control Output voltage can also cause DTCs P0846, P0869, or P0871 to set. Repairing the P0882 fault should also eliminate the related DTCs.**

Monitor Conditions

When Monitored:

When the ignition is turned from "OFF" position to "RUN" position and/or the ignition is turned from "START" position to "RUN" position.

Set Conditions

- Set Condition:**

This DTC is set when there is less than 3.0 volts present at the transmission control output circuits located in the Powertrain Control Module (PCM) when the Transmission Control System request the power up of those circuits.

Possible Causes

Possible Causes
RELATED TIPM DTCS TRANSMISSION CONTROL RELAY (T15) TRANSMISSION CONTROL CIRCUIT SHORT TO GROUND (T15) TRANSMISSION CONTROL CIRCUIT OPEN POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. CHECK IF THE DTC P0882 IS CURRENT

With the scan tool, Check the STARTS SINCE SET counter for P0882.

NOTE: This counter only applies to the last DTC set.

Is the STARTS SINCE SET counter equal to 0?

Yes

Go To 2.

No

Go To 6.

2. CHECK FOR TIPM RELATED DTCS

With the scan tool, check TIPM DTCs.

Are there any TIPM TCM Power Control circuit DTCs present?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate symptom.

No

Go To 3.

3. TRANSMISSION CONTROL RELAY

Turn the ignition off to the lock position.

NOTE: Due to different power control configurations, the Transmission Control Relay may be referred to as a PCM relay.

Remove the Transmission Control Relay.

NOTE: Check connectors - Clean/repair as necessary.

Install a substitute Relay in place of the Transmission Control Relay.

Ignition on, engine not running.

With the scan tool, monitor the Switched Battery voltage in the next step.

NOTE: The switched battery voltage should remain steady and around 12-volts

Does the Switched Battery voltage remain a steady voltage (12-volts) and the DTC not reset?

Yes

Replace the Transmission Control Relay.

Perform 42RLE TRANSMISSION VERIFICATION TEST.

No

Go To 4.

4. CHECK THE (T15) TRANSMISSION CONTROL CIRCUIT FOR A SHORT TO GROUND

819ba527

Fig. 74: Measuring Resistance Between Ground And (T15) Transmission Control Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector and connect Miller tool #8815.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Disconnect the TIPM C1 harness connector.

Measure the resistance between ground and the (T15) Transmission Control circuit.

Is the resistance below 5.0 ohms?

Yes

Repair the (T15) Transmission Control circuit for a short to ground.

Perform **42RLE TRANSMISSION VERIFICATION TEST.**

No

Go To 5.

5. CHECK THE (T15) TRANSMISSION CONTROL CIRCUIT FOR AN OPEN

819ba510

Fig. 75: Measuring Resistance Of (T15) Transmission Control Circuit Between TIPM C1 Harness Connector And Appropriate Terminal Of Miller Tool #8815
Courtesy of CHRYSLER LLC

Measure the resistance of the (T15) Transmission Control circuit between the TIPM C1 harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

Repair the (T15) Transmission Control circuit for an open.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

6. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The Transmission Control Output circuit is used to supply power to the Transmission Solenoid/Pressure Switch Assembly and to the PCM when in normal operating mode. The purpose of the Transmission Output circuit is to allow the Transmission Control System to turn off the power to the Transmission Solenoid/TRS Assembly in the event that the transmission should need to be placed into limp-in mode due to a DTC.

After a PCM reset, (ignition switch turned to the run position, or after cranking the engine) the Transmission Control System verifies that the Transmission Output circuit is open by checking for voltage on the Transmission Output circuits before the Transmission Control System request for the circuit to be powered up. The request is sent by a direct circuit control from the PCM to the TIPM. If voltage is detected on the Transmission Output circuits before the request is sent, the DTC will set.

Monitor Conditions

When Monitored:

When the ignition is turned from "OFF" position to "RUN" position and/or the ignition is turned from "START" position to "RUN" position.

Set Conditions

- Set Condition:**

This DTC is set if the Powertrain Control Module senses greater than 3.0 volts on the Transmission Control Relay Output circuits prior to a request from the PCM to TIPM to energize the Transmission Output circuits.

Possible Causes

Possible Causes
TIPM DTCS PRESENT
TRANSMISSION CONTROL RELAY
(T15) TRANSMISSION CONTROL CIRCUIT SHORT TO VOLTAGE
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORT VOLTAGE
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **CHECK FOR TCM TIPM DTCS**

With the scan tool under TIPM, check for TCM Power Control circuit DTCs.

Are there any TIPM TCM Power Control circuit DTCS present?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate symptom.

No

Go To 2.

2. CHECK TO SEE IF DTC P0883 IS CURRENT

With the scan tool, check the STARTS SINCE SET counter.

NOTE: This counter only applies to the last DTC set.

Is the STARTS SINCE SET counter set to 0?

Yes

Go To 3.

No

Go To 7.

3. TRANSMISSION CONTROL RELAY

Turn the ignition off to the lock position.

Remove the Transmission Control Relay.

NOTE: Due to different power control configurations, the Transmission Control Relay may be referred to as a PCM relay.

NOTE: Check connectors - Clean/repair as necessary.

Install a substitute Relay in place of the Transmission Control Relay.

Ignition on, engine not running.

Does the DTC reset?

Yes

Go To 4.

No

Replace the Transmission Control Relay.

Perform 42RLE TRANSMISSION VERIFICATION TEST.

4. (T16) TRANSMISSION OUTPUT CIRCUIT SHORT TO VOLTAGE

Fig. 77: Measuring Voltage Of (T16) Transmission Control Output Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector and connect Miller tool #8815.

Disconnect the TIPM C2 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Ignition on, engine not running.

Measure the voltage of the (T16) Transmission Control Output circuits in the Miller tool #8815.

Is the voltage above 0.5 volts on any (T16) Transmission Control Output circuit?

Yes

Go To 5.

No

Go To 6.

5. CHECK THE TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY

Fig. 78: Measuring Voltage Of (T16) Transmission Control Output Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

Measure the voltage of the (T16) Transmission Control Output circuits in the Miller tool #8815.

Is the voltage above 0.5 volts?

Yes

Repair the (T16) Transmission Control Output circuit for a short to voltage.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

6. CHECK THE (T15) TRANSMISSION CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

8165fde7

Fig. 79: Checking Transmission Control Circuit For Short To Voltage
Courtesy of CHRYSLER LLC

Measure the voltage of the (T15) Transmission Control circuit.

Is the voltage above 0.5 volts?

Yes

Repair the (T15) Transmission Control circuit for a short to voltage.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

7. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

Repair as necessary.
Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0884-POWER UP AT SPEED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

If a vehicle loses power to the PCM, the vehicle will go to the 2nd gear mode since there is no power available to control the transmission solenoids. However if power is restored, the PCM will power-up and normal operation will be restored. This DTC identifies that power to the PCM was restored when the gear selector was in a "Drive" position while the vehicle was moving at speeds above 32 km/h (20 mph). If a customer shifts to Neutral and cycles the ignition key and quickly shifts to "Drive" while moving before the PCM comes out of its START ROUTINE, the DTC can be set. Therefore it is critical that this DTC diagnosis repair procedure should only be used if the vehicle is experiencing intermittent 2nd gear operation and subsequently a return to normal operation during normal driving. The transmission will not be placed in limp-in. This is an informational DTC to be used when attempting to diagnose an intermittent 2nd gear operation and subsequent return to normal transmission operation.

Monitor Conditions

When Monitored:

One time after each controller reset. Note: the Transmission Control Module is integrated with Powertrain Control Module. The Transmission Control Module has separate powers and grounds specifically to its portion of the PCM.

Set Conditions

- **Set Condition:**

This DTC will set if the PCM powers up and senses the vehicle in a valid forward gear (no PRNDL DTCs) with an output speed above 800 rpm, approximately 32 km/h or 20 mph.

Possible Causes

Possible Causes
INTERMITTENT POWER AND GROUND CIRCUITS

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. CHECK THE POWER AND GROUND CIRCUITS

This DTC is set when the PCM is initialized while the vehicle is moving in a valid forward gear. This is usually caused by a momentary loss of power to the Transmission portion of the PCM.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Check all of the Fused B(+), Fused Ignition Switch Output, and Ground circuits related to the PCM for an intermittent open or short to ground.

Perform a wiggle test on all wiring and connectors pertaining to the PCM while looking for shorted or open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

If there are no possible causes remaining, view repair.

Repair

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

(T15) TRANSMISSION CONTROL CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. CHECK IF THE DTC P0888 IS CURRENT

With the scan tool, Check the STARTS SINCE SET counter for P0888.

NOTE: **This counter only applies to the last DTC set.**

Is the STARTS SINCE SET counter equal to 0?

Yes

Go To 2.

No

Go To 6.

2. CHECK FOR TIPM RELATED DTCS

With the scan tool, check TIPM DTCS.

Are there any TIPM TCM Power Control circuit DTCS present?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate symptom.

No

Go To 3.

3. TRANSMISSION CONTROL RELAY

Turn the ignition off to the lock position.

NOTE: Due to different power control configurations, the Transmission Control Relay may be referred to as a PCM relay.

Remove the Transmission Control Relay.

NOTE: Check connectors - Clean/repair as necessary.

Install a substitute Relay in place of the Transmission Control Relay.

Ignition on, engine not running.

With the scan tool, monitor the Switched Battery voltage in the next step.

NOTE: The switched battery voltage should remain steady and around 12-volts.

Does the Switched Battery voltage remain a steady voltage (12-volts) and the DTC not reset?

Yes

Replace the Transmission Control Relay.

Perform 42RLE TRANSMISSION VERIFICATION TEST.

No

Go To 4.

4. **CHECK THE (T15) TRANSMISSION CONTROL CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance of the (T15) Transmission Control circuit between the TIPM C1 harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

Repair the (T15) Transmission Control circuit for an open.
Perform **42RLE TRANSMISSION VERIFICATION TEST.**

No

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

6. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0890-SWITCHED BATTERY

Circuit Schematic

819a117a

Fig. 83: Transmission Solenoid/Pressure Switch Assembly Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

The transmission relay is used to supply power to the solenoid pack when in normal operating mode and to turn off power to produce transmission limp-in mode. The relay output (which supplies power to the solenoid pack) is fed back to the controller. It is referred to as SWITCHED BATTERY. After a controller reset (ignition key turned to the RUN position or after cranking engine), the controller verifies that the relay contacts are open by checking for no voltage on Switched battery line (transmission control relay output) before the relay is energized. After switched battery is verified for no voltage, the voltage of each of the solenoid pack pressure switches is also checked. Since the solenoid pack is not powered up, there should be no voltage on any of the pressure switches.

Monitor Conditions

When Monitored:

One time after a reset (ignition key turned to the RUN position or after cranking engine).

Set Conditions

- **Set Condition:**

A fault is set if voltage greater than 4.5 volts is detected for 7 ms on any of the pressure switch circuits before the relay is energized. The transmission is placed in limp-In. The MIL is on after 10 seconds. of vehicle operation.

Possible Causes

Possible Causes
(T47) 2/4 PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
(T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE

(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORT VOLTAGE
TRANSMISSION SOLENOID/TRS ASSEMBLY
POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **CHECK FOR TCM TIPM DTCS**

With the scan tool under TIPM, check for TCM Power Control circuit DTCs.

Are there any TIPM TCM Power Control circuit DTCs present?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate symptom.

No

Go To 2.

2. CHECK TO SEE IF DTC P0891 IS CURRENT

With the scan tool, check the STARTS SINCE SET counter.

NOTE: **This counter only applies to the last DTC set.**

Is the STARTS SINCE SET counter set to 0?

Yes

Go To 3.

No

Go To 7.

3. TRANSMISSION CONTROL RELAY

Turn the ignition off to the lock position.

NOTE: **Due to different power control configurations, the Transmission Control Relay may be referred to as a PCM relay.**

Remove the Transmission Control Relay.

NOTE: **Check connectors - Clean/repair as necessary.**

Install a substitute relay in place of the Transmission Control Relay.

Ignition on, engine not running.

Does the DTC reset?

Yes

Go To 4.

No

Replace the Transmission Control Relay.

Perform 42RLE TRANSMISSION VERIFICATION TEST.

4. (T16) TRANSMISSION OUTPUT CIRCUIT SHORT TO VOLTAGE

Fig. 88: Measuring Voltage Of (T16) Transmission Control Output Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector and connect Miller tool #8815.

Disconnect the TIPM C2 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Ignition on, engine not running.

Measure the voltage of the (T16) Transmission Control Output circuits in the Miller tool #8815.

Is the voltage above 0.5 volts on any (T16) Transmission Control Output circuit?

Yes

Go To 5.

No

Go To 6.

5. CHECK THE TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY

Fig. 89: Measuring Voltage Of (T16) Transmission Control Output Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

Measure the voltage of the (T16) Transmission Control Output circuits in the Miller tool #8815.

Is the voltage above 0.5 volts?

Yes

Repair the (T16) Transmission Control Output circuit for a short to voltage.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

6. CHECK THE (T15) TRANSMISSION CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

8165fde7

Fig. 90: Checking Transmission Control Circuit For Short To Voltage
Courtesy of CHRYSLER LLC

Measure the voltage of the (T15) Transmission Control circuit.

Is the voltage above 0.5 volts?

Yes

Repair the (T15) Transmission Control circuit for a short to voltage.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

7. **CHECK WIRING AND CONNECTORS**

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

Repair as necessary.
Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0897-TRANSMISSION FLUID DETERIORATED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

To prevent a bump due to A/C clutch engagement, a temporary torque converter partial EMCC condition is established prior to A/C clutch engagement. A message is received over the bus indicating that A/C clutch engagement is imminent. Partial EMCC is then established and a reply message, "OK to engage A/C clutch" is sent via the bus. Partial EMCC will be held for 450 ms before returning to full EMCC. During the transition from full to partial EMCC, a turbine acceleration sum is calculated, if this value exceeds a threshold value for several transitions, degraded transmission fluid is indicated.

Monitor Conditions

When Monitored:

Each transition from full EMCC to partial EMCC for A/C bump prevention.

Set Conditions

- Set Condition:**

DTC set if 20 occurrences of a turbine acceleration sum. Fault Set Time: 20 transitions from full EMCC to partial EMCC. Transmission will not use partial EMCC. Established for A/C bump prevention.

Possible Causes

Possible Causes
WORN OUT/ BURNT TRANSAXLE FLUID

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. WORN OUT/ BURNT TRANSMISSION FLUID

Turn the ignition off to the lock position.

Flush the Transmission Oil Cooler and lines, replace the Transmission Oil Filter, refill with new Transmission Fluid, start the engine, and adjust the fluid per the Service Information.

NOTE: The Transmission Cooler must be flushed before proceeding.

Allow the engine to idle for 10 minutes, in Park.

Turn the ignition off to the lock position.

Again, flush the Transmission Oil Cooler and lines, replace the Transmission Oil Filter, refill with new Transmission Fluid, start the engine, and adjust the fluid per the Service Information.

With the scan tool, perform a Battery Disconnect.

NOTE: The Battery Disconnect must be done to re-enable EMCC during an A/C Clutch engagement.

NOTE: The vehicle may exhibit intermittent shudder during the first few hundred miles. The new Transmission Fluid will gradually penetrate the Torque Converter Clutch friction material and the shudder should disappear.

Erase the DTC and return the vehicle to the customer.

Did the DTC reset and/or does the vehicle still shudder after a few thousand miles?

Yes

Replace the Torque Converter per the Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0933-LINE PRESSURE SENSOR CIRCUIT PERFORMANCE

Circuit Schematic

Fig. 91: Line Pressure Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS). (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on inputs from the transmission and engine. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 to 931 kPa (120 to 135 psi) during shifts and in Park and Neutral to ensure consistent shift quality.

Monitor Conditions

When Monitored:

Continuously with the ignition on, engine running, with the transmission in gear.

Set Conditions

- Set Condition:**

The PCM continuously monitors Actual Line Pressure and compares it to Desired Line Pressure. If the Actual Line Pressure reading is more than 172.4 kPa (25 psi) higher than the Desired Line Pressure, but is less than the highest Line Pressure ever used in the current gear, the DTC sets.

Possible Causes

Possible Causes
RELATED DTC'S PRESENT LINE PRESSURE CONNECTOR AND WIRING INTERNAL TRANSMISSION POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. DETERMINING IF RELATED DTCS ARE PRESENT

With the scan tool, check for other transmission DTCs.

Are there any other line pressure related DTCs present?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate symptom. Perform the test for P0934 and/or P0935 first if present.

No

Go To 2.

2. COMPARE ACTUAL LINE PRESSURE TO DESIRED LINE PRESSURE

CAUTION: Apply Parking Brake

Start the engine.

CAUTION: Firmly apply the brakes.

With the scan tool, monitor the Line Pressure, Desired Line Pressure and the TPS degrees.

While firmly applying the brakes, place the shifter in Reverse, then slowly press the accelerator pedal to a TPS degree of 15°.

Compare the Line Pressure reading to the Desired Line Pressure reading on the scan tool.

Does the Line Pressure stay within ± 34 kPa or 5 psi of the Desired Line Pressure?

No

Go To 3.

Yes

Go To 5.

3. CHECK LINE PRESSURE CONNECTOR AND WIRING

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure Sensor voltage while wiggling the wiring harness and connectors pertaining to the Line Pressure Sensor/Variable Force Solenoid Assembly.

Did the voltage remain steady while wiggling the wiring harness and connectors?

Yes

Go To 4.

No

Disconnect and properly reconnect the Line Pressure Sensor/Variable Force Solenoid Assembly

connector. Inspect terminals and repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

4. CHECK PCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

With the Transmission Simulator select the "OFF" position on the "Input/Output Speed" switch.

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure during the following step.

With the Transmission Simulator, turn the selector switch to each of the 3 Line Pressure positions.

NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.

Did the Line Pressure read within ± 14 kPa or 2.0 psi in all three positions?

Yes

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Repair internal transmission and inspect the oil pump per **42RLE - SERVICE INFORMATION** and replace if necessary. If no problems are found, replace the Line Pressure Sensor/Variable Force Solenoid Assembly - possible cause is the Pressure Control Solenoid is stuck.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

5. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0934-LINE PRESSURE SENSOR CIRCUIT LOW

Circuit Schematic

01942600

Fig. 92: Line Pressure Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS). (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on inputs from the transmission and engine. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 to 931 kPa (120 to 135 PSI) during shifts and in Park and Neutral to ensure consistent shift quality.

The monitored Line Pressure Sensor voltage should always be between 0.35 and 4.75 volts. Any monitored voltages outside these parameters indicate a Line Pressure Sensor or wiring problem and will cause either DTC P0934 or P0935 to set.

Monitor Conditions

When Monitored:

Continuously with the ignition on and engine running.

Set Conditions

- Set Condition:**

This DTC will set when the monitored Line Pressure Sensor voltage is less than or equal to 0.35 volts for 0.18 seconds.

Possible Causes

Possible Causes
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND
(T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT SHORT TO GROUND
LINE PRESSURE SENSOR
POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. CHECK IF DTC IS CURRENT

With the scan tool, check the STARTS SINCE SET counter for P0934.

NOTE: **This counter only applies to the last DTC set.**

Is the STARTS SINCE SET counter 2 or less?

Yes

Go To 2.

No

Go To 6.

2. CHECK THE PCM AND WIRING

Turn the ignition off to the lock position.

Remove the from the TIPM.

CAUTION: Removal of the from the TIPM will prevent the vehicle from being started in gear.

WARNING: The must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the scan tool, under Transmission Sensors, monitor the Line Pressure.

Using the Transmission Simulator, set the rotary switch to each of the 3 line pressure positions.

NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.

Did the Line Pressure read within ± 14 kPa or 2.0 psi in all three positions?

Yes

Replace the Line Pressure Sensor per the Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST.**

No

Go To 3.

3. CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

8168ce0a

Fig. 93: Checking Line Pressure Sensor Signal Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector and connect Miller tool #8815.

Disconnect the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance between ground and the (T38) Line Pressure Sensor Signal circuit.

Is the resistance below 5.0 ohms?

Yes

Repair the (T38) Line Pressure Sensor Signal circuit for a short to ground.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go To 4.

4. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 94: Checking 5-Volt Supply Circuit For Open
Courtesy of CHRYSLER LLC

Disconnect the PCM C1 harness connector and connect Miller tool #8815.

Measure the resistance of the (F856) 5-volt Supply circuit between Line Pressure Sensor/Variable Force Solenoid Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance below 5.0 ohms?

Yes

Go To 5.

No

Repair the (F856) 5-volt Supply circuit for an open.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

5. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

81689ac2

Fig. 95: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER LLC

Disconnect the PCM C1 harness connector and connect Miller tool #8815.

Measure the resistance between ground and the (F856) 5-volt Supply circuit.

Is the resistance below 5.0 ohms?

Yes

Repair the (F856) 5-volt Supply circuit for a short to ground.

Perform **42RLE TRANSMISSION VERIFICATION TEST.**

No

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform **42RLE TRANSMISSION VERIFICATION TEST.**

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P0935-LINE PRESSURE SENSOR CIRCUIT HIGH

Circuit Schematic

01942600

Fig. 96: Line Pressure Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS). (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on inputs from the transmission and engine. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 to 931 kPa (120 to 135 PSI) during shifts and in Park and Neutral to ensure consistent shift quality.

The monitored Line Pressure Sensor voltage should always be between 0.35 and 4.75 volts. Any monitored voltages outside these parameters indicate a Line Pressure Sensor or wiring problem and will cause either DTC P0934 or P0935 to set.

Monitor Conditions

When Monitored:

Continuously with ignition on and engine running.

Set Conditions

- Set Condition:**

This DTC will set if the monitored Line Pressure Sensor voltage is greater than or equal to 4.75 volts for the period of 0.18 seconds

Possible Causes

Possible Causes
(T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT OPEN
(K900) SENSOR GROUND CIRCUIT OPEN
(T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE
LINE PRESSURE SENSOR
POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. CHECK TO SEE IF DTC IS CURRENT

With the scan tool, Check the STARTS SINCE SET counter for P0935.

NOTE: **This counter only applies to the last DTC set.**

Is the STARTS SINCE SET counter 2 or less?

Yes

Go To 2.

No

Go To 6.

2. CHECK THE PCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

Remove the from the TIPM.

CAUTION: Removal of the from the TIPM will prevent the vehicle from being started in gear.

WARNING: The must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure.

Using the Transmission Simulator, set the rotary switch to each of the 3 line pressure positions.

NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.

Did the Line Pressure read within ± 14 kPa or 2.0 psi in all three positions?

Yes

Replace the Line Pressure Sensor per the Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go To 3.

3. CHECK THE (K900) SENSOR GROUND CIRCUIT FOR AN OPEN

8168caac

Fig. 97: Checking Sensor Ground Circuit
 Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Disconnect the PCM C2 harness connector and connect Miller tool #8815.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of the (K900) Sensor Ground circuit from the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector to the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

Repair the (K900) Sensor Ground circuit for an open.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go To 4.

4. **CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**

8168ca63

Fig. 98: Checking Line Pressure Sensor Signal Circuit
Courtesy of CHRYSLER LLC

Disconnect the PCM C4 harness connector and connect Miller tool #8815.

Measure the resistance of the (T38) Line Pressure Sensor Signal circuit from the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector to the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

Repair the (T38) Line Pressure Sensor Signal circuit for an open.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go To 5.

5. **CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

**ASSEMBLY-
LINE PRESSURE
SENSOR/VARIABLE
FORCE SOLENOID
(RLE)**

**PCM PINOUT
BOX 8815**

816ac7bd

Fig. 99: Measuring Voltage Of (T38) Line Pressure Sensor Signal Circuit
Courtesy of CHRYSLER LLC

Ignition on, engine not running.

With the scan tool under TIPM, actuate the Transmission.

Measure the voltage of the (T38) Line Pressure Sensor Signal circuit.

Is the voltage above 5.5 volts?

Yes

Repair the (T38) Line Pressure Sensor Signal circuit for a short to voltage.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

6. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Where there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The Loss of Prime Test is used to prevent transmission defaults and erroneous fault codes during temporary loss of pump prime that may occur with low transmission fluid under severe braking conditions, start-up, etc. and to point towards more subtle problems such as a plugged or ruptured oil filter. The Loss of Prime fault is set by a loss of hydraulic pressure in the transmission system. This condition, if sustained, will result in the vehicle being unable to move.

Monitor Conditions

When Monitored:

Every 350 ms

Set Conditions

- Set Condition:**

If the transmission begins to slip in any forward gear, and the pressure switch or switches that should be closed for a given gear are open, a loss of prime test begins. All available elements (in 1st gear LR, 2/4 and OD, in 2nd, 3rd, and 4th gear 2/4 and OD) are turned on by the PCM to see if pump prime exists. The code is set if none of the pressure switches respond. The PCM will continue to run the loss of prime test until pump pressure returns. The vehicle will not move or the transmission will slip. Normal operation will continue if pump prime returns.

Possible Causes

Possible Causes
LOW TRANSMISSION FLUID LEVEL SHIFT LEVER POSITION PLUGGED TRANSMISSION FILTER TRANSMISSION OIL PUMP

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **CHECK IF THE DTC IS CURRENT**

Place the gear selector in Park.

Start the engine.

NOTE: **The Transmission Temperature must be at least 43° C (110° F) before**

performing the following steps.

The Transmission must be at operating temperature prior to checking pressure. Cold transmission fluid will result in higher pressure readings.

Place the Transmission in Reverse.

With the scan tool, observe the Transmission Pressure Switch states.

Are any of the Pressure Switches closed?

Yes

Go to 2.

No

Go to 4.

2. INTERMITTENT OPERATION

The conditions necessary to set this DTC are not present at this time.

Test drive the vehicle. Allow the Transmission to shift through all gears and ranges.

Was a delayed engagement and/or a no drive condition present during the test drive?

Yes

Go to 4.

No

Go to 3.

3. CHECK THE WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring while checking for shorted and open circuits.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

4. **SHIFT LEVER POSITION TEST**

With the scan tool, perform a Shift Lever Position test. Follow the instructions on the screen.

Did the Shift Lever Position Test pass?

Yes

Go to 5.

No

Perform the diagnostic procedure for P0706-TRANSMISSION RANGE SENSOR RATIONALITY.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

5. **CHECK FOR PLUGGED TRANSMISSION FILTER**

Remove the Transmission Pan and inspect the Transmission Fluid and Transmission Filter per the Service Information.

Does the Transmission Oil Pan contain excessive debris and/or is the Oil Filter plugged?

Yes

Repair the cause of the plugged Transmission Filter. Refer to **42RLE - SERVICE INFORMATION** for the proper repair procedure.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Replace the Transmission Oil Pump per the Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

P0992-2/4/OD HYDRAULIC PRESSURE TEST

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Pressure switches are normally off or open (no pressure applied) and read high (+12 volts). When an element is

applied, the corresponding pressure switch closes to ground (0 volts) or turns on. The controller tests the OD and 2/4 pressure switches when they are off (when the corresponding friction element is not applied) by briefly applying the OD and 2/4 elements which will cause the corresponding pressure switch to close. The test verifies that the switches are operational and that the switch will close when the corresponding element is applied. If a switch fails to respond, it is re-tested. The MIL illuminates and the transmission system defaults to limp-in mode.

Monitor Conditions

When Monitored:

In any forward gear with engine speed above 1000 rpm, shortly after a shift and every minute thereafter.

Set Conditions

- **Set Condition:**

After a shift into a forward gear, with engine speed greater than 1000 rpm, the PCM momentarily turns on element pressure to the clutch circuits that do not have pressure to identify that the correct pressure switch closes. If the pressure switch does not close 2 times the DTC sets.

Possible Causes

Possible Causes
CONDITION P0992 PRESENT

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **CHECK IF THE DTC IS CURRENT**

NOTE: **The vehicle must be driven to set this DTC. The transmission must be at operating temperature with the Engine rpm above 1000 rpm.**

This DTC is an indication of both the 2/4 and the O/D Hydraulic Pressure Switch DTCs being present.

Perform the diagnostic procedures for both P0845 and P0870.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

If there are no possible causes remaining, view repair.

Repair

Refer to **DIAGNOSTIC CODE INDEX** and perform the diagnostic procedures for P0845 and

P128B-TCM POWER CONTROL CIRCUIT 2 LOW - TIPM

[illegible]

Fig. 100: Transmission Control Output Circuit Schematic

01-08-051

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on. Battery voltage greater than 10 volts.

Set Conditions

- **Set Condition:**

A shorted condition is detected in the Transmission Control Output circuit.

Possible Causes

Possible Causes
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORT TO GROUND
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. **CHECK IF THE DTC IS ACTIVE**

Ignition on, engine not running.

With the scan tool, check TIPM DTCs.

Is the status Active for this DTC?

Yes

Go To 2.

No

Go To 5.

2. **CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORT TO GROUND**

819bb5a7

Fig. 101: Measure Resistance Between Ground And Transmission Control Output Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the TIPM C2 harness connector.

Disconnect the PCM C4 harness connector and install Miller tool #8815.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance between ground and the (T16) Transmission Control Output circuit.

Is the resistance below 5.0 ohms?

Yes

Repair the (T16) Transmission Control Output circuit for a short to ground.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go to 3.

3. CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN

819b5f73

Fig. 102: Checking (T16) Transmission Control Output Circuits
 Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position.

Reconnect the TIPM C2 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch harness connector.

Disconnect the Line Pressure Sensor/Variable Force Solenoid harness connector (if equipped).

Ignition on, engine not running.

Using the scan tool under the TIPM Actuators, actuate the Transmission.

Using a 12-volt test light connected to ground, check the (T16) Transmission Control Output circuits.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly at all the (T16) Transmission Control Output circuits?

Yes

Go To 4.

No

Repair the (T16) Transmission Control Output circuit for an open.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

4. TOTALLY INTEGRATED POWER MODULE

Using the schematics as a guide, inspect the wire harness and connectors.

Check the TIPM harness connector terminals for corrosion, damage, or terminal push out.

Pay particular attention to all power and ground circuits.

Were any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Replace the Totally Integrated Power Module per Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test complete.

P128C-TCM POWER CONTROL CIRCUIT 2 HIGH - TIPM

2. **CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN**

819b5f73

Fig. 106: Checking (T16) Transmission Control Output Circuits
 Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector and install Miller tool #8815.

Disconnect the Transmission Solenoid harness connector.

Disconnect the Line Pressure Sensor/Variable Force Solenoid harness connector (if equipped).

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Ignition on, engine not running.

Using the scan tool under the TIPM Actuators, actuate the Transmission.

Using a 12-volt test light connected to ground, check the (T16) Transmission Control Output circuits.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

Go To 3.

No

Repair the (T16) Transmission Control Output circuit for an open.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

3. TOTALLY INTEGRATED POWER MODULE

Using the schematics as a guide, inspect the wire harness and connectors.

Check the TIPM harness connector terminals for corrosion, damage, or terminal push out.

Pay particular attention to all power and ground circuits.

Were any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Replace the Totally Integrated Power Module per Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST.**

No

Test complete.

P128E-TCM POWER CONTROL CIRCUIT 2 OVERCURRENT - TIPM

Circuit Schematic

Monitor Conditions

When Monitored:

With the ignition on. Battery voltage greater than 10 volts.

Set Conditions

- **Set Condition:**

An overcurrent condition is detected in the TCM Power Control circuit. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes

Possible Causes
LINE PRESSURE SENSOR VARIABLE FORCE SOLENOID SOLENOID/PRESSURE SWITCH ASSEMBLY POWERTRAIN CONTROL MODULE (PCM) TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. **CHECK IF THE DTC IS ACTIVE**

Ignition on, engine not running.

With a scan tool, read TIPM DTCs.

Is the DTC active at this time?

Yes

Go To 2.

No

Go To 5.

2. **CHECK THE (T16) TRANSMISSION CONTROL OUTPUT**

819bb7af

Fig. 108: Checking Transmission Control Output
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the TIPM C2 harness connector.

Connect the positive probe of an ammeter to battery positive and connect the negative probe to the (T16) Transmission Control Output circuit in the TIPM C2 harness connector.

Read the amperage on the ammeter.

Does the amperage read below 2.0 amps?

Yes

Go To 4.

No

Go To 3.

3. CHECK THE PCM

819bb7af

Fig. 109: Checking Transmission Control Output
Courtesy of CHRYSLER LLC

Disconnect the ammeter from the TIPM C2 harness connector and battery positive.

Disconnect the PCM C4 harness connector.

Reconnect the positive probe of an ammeter to battery positive and connect the negative probe to the (T16) Transmission Control Output circuit in the TIPM C2 harness connector.

Read the amperage on the ammeter.

Does the amperage read below 2.0 amps?

Yes

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go To 4.

4. CHECK THE TRANSMISSION SOLENOIDS

Fig. 110: Checking Transmission Solenoids
Courtesy of CHRYSLER LLC

Disconnect the ammeter from the TIPM C2 harness connector.

Disconnect the PCM C4 harness connector and install Miller tool #8815.

Connect the positive probe of an ammeter to battery positive and connect the negative probe to the (T16) Transmission Control Output circuit in the TIPM C2 harness connector.

While monitoring the amperage reading of the ammeter and using a jumper wire, jump each solenoid control circuit to ground one at a time in the appropriate terminals of Miller tool #8815.

NOTE: The amperage draw should be approximately .02 milliampere on each solenoid circuit with the PCM C4 harness connector disconnected.

Does the amperage read between .05 and .015 milliampere $\pm$.005 milliampere on each solenoid tested?

Yes

Replace the Totally Integrated Control Module per the Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Depending on the identified circuit in the test, replace either Transmission Solenoid/Pressure Switch Assembly or the Line Pressure Solenoid (if equipped) per the Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P1684-BATTERY WAS DISCONNECTED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Note: This is not a fault code. It exists to provide reference information only. A battery backed RAM is used to maintain some learned values. When the battery is disconnected, this memory is lost. When the battery is reconnected, the loss of learned values will be detected by the controller. The code will be set and the learned values will be initialized to known constants and the learning process will continue. Setting the code has no effect except for re-initialization of learned values.

Monitor Conditions

When Monitored:

After a reset (ignition key turned to the RUN position).

Set Conditions

- **Set Condition:**

The checksum of the battery backed RAM does not match the stored checksum. Set Time: Less than 7 ms.

Possible Causes

Possible Causes
BATTERY WAS DISCONNECTED PCM WAS REPLACED OR DISCONNECTED QUICK LEARN WAS PERFORMED (A209) FUSED B+ CIRCUIT TO PCM OPEN (Z933) GROUND CIRCUIT(S) OPEN

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **BATTERY WAS DISCONNECTED**

Has the battery been disconnected, lost its charge, or been replaced recently?

Yes

Disconnecting or replacing the battery will set this DTC. Erase the DTC.
Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go To 2.

2. **CHECK IF THE QUICK LEARN WAS PERFORMED**

Has a Quick Learn procedure been performed?

Yes

Performing Quick Learn will set this DTC. Erase the DTC.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go To 3.

3. PCM REPLACED OR DISCONNECTED

Has the PCM been replaced or disconnected?

Yes

Replacing or disconnecting the PCM will set this DTC. Erase the DTC.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go To 4.

4. (A209) FUSED B(+) CIRCUIT

**PCM PINOUT
BOX 8815**

812ac99e

Fig. 112: Checking Fused B+ Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position.

Disconnect the PCM C1 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Using a 12-volt test light connected to ground, check the (A209) Fused B(+) circuit.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

Go To 5.

No

Repair the Fused B+ circuit for an open. If the fuse is open make sure to check for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST.

5. (Z933) GROUND CIRCUITS

8199cef7

Fig. 113: Checking (Z933) Ground Circuits In Appropriate Terminals Of Miller Tool #8815

Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

Using a 12-volt test light connected to 12-volts, check the (Z933) Ground circuits in the appropriate terminal of Miller tool #8815.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly for all of the ground circuits?

Yes

Go To 6.

No

Repair the Ground circuits for an open.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P1713-RESTRICTED MANUAL VALVE IN T2 RANGE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

Ignition on, engine running with the gear shift selector in a valid forward gear.

Set Conditions

- **Set Condition:**

This DTC sets whenever Transmission control system detects the manual valve is in the T2 range when it should be in OD. This is mainly an informational DTC.

Possible Causes

Possible Causes
RELATED TRANSMISSION DTCS PRESENT CUSTOMER DRIVING HABITS MIS-ADJUSTED SHIFTER CABLE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **DETERMINING IF RELATED DTCS ARE PRESENT**

With the scan tool, check for other transmission DTCS.

Are there any speed sensor or gear ratio DTCS present?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate symptom.

No

Go to 2.

2. **CHECK THE GEAR SHIFT CABLE FOR PROPER ADJUSTMENT**

Check the Gear shift cable adjustment per the Service Information.

Also check the cable for possible binding or improperly routed.

Is the Gear shift cable properly adjusted and not binding or improperly routed?

Yes

Go to 3.

No

Adjust the Shifter Assembly per the Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

3. CHECK CUSTOMER DRIVING HABIT

This DTC can be set if the customer does not move the shift lever completely into the OD position (in between gears) causing the manual valve to be in the T2 position.

When this occurs, the feed port to the clutch is restricted, the transmission will declare Neutral, and this DTC will set.

This DTC can also be set by simply bumping the shift lever toward Neutral while accelerating.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

If there are no possible causes remaining, view repair.

Repair

This DTC can be set by the shift lever in the wrong position or not completely in the OD position. Make sure the customer is properly informed.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

P1745-TRANSMISSION LINE PRESSURE TOO HIGH FOR TOO LONG

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

This DTC is an informational DTC to inform the technician that transmission has been operating in an open-loop line pressure control for 3220 kilometers (2000 miles) or 1000 2-3 upshifts resulting from a Line Pressure DTC. The 42RLE Transmission is not designed to operate in open-loop line pressure control for an extended period time. This DTC is intended to protect the transmission. If the DTC sets, the transmission controller will place the transmission into limp-in mode.

Monitor Conditions

When Monitored:

Continuously with ignition on.

Set Conditions

- **Set Condition:**

If the transmission has been operating in an open-loop line pressure control for 3220 kilometers (2000 miles) or 1000 2-3 upshifts.

Possible Causes

Possible Causes
LINE PRESSURE DTCS PRESENT

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **CHECK FOR RELATED DTCS**

With the scan tool, check for Transmission Line Pressure DTCS.

NOTE: In order to erase this DTC you must reset (erase) the VLP Shift Counter and the Output tooth counter which is a single procedure under Miscellaneous functions in the scan tool called "Clear Variable Line Pressure (VLP) counters".

View repair

Repair

Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate symptom. See **DIAGNOSIS AND TESTING**.

P1775-SOLENOID SWITCH VALVE LATCHED IN TCC POSITION

Circuit Schematic

The Solenoid Switch Valve, an internal, hydraulically operated valve, controls the direction of the transmission fluid when the LR solenoid is energized. When the solenoid switch valve is in the downshifted position and the LR solenoid is energized, fluid is directed to the LR element for 1st gear. When the solenoid switch valve is In the up-shifted position (2nd, 3rd, and 4th gear) and the LR solenoid is energized, fluid is directed into the Lockup Switch Valve which controls the Torque Converter Clutch. When shifting into 1st gear, a special sequence is followed to insure solenoid switch valve movement into the downshifted position. The LR pressure switch is monitored to confirm switch valve movement. If the solenoid switch valve movement is not confirmed (i.e. no LR pressure when the LR solenoid is energized), 2nd gear is substituted for 1st. No 1st gear (2nd gear is substituted). The transmission Torque converter FEMCC operation is inhibited. MIL on after 5 min. of substituted operation.

Monitor Conditions

When Monitored:

Prior to a shift into 1st gear.

Set Conditions

- Set Condition:**

Transmission temperature must be hot. DTC is set after six unsuccessful attempts to shift into 1st gear.

Possible Causes

Possible Causes
RELATED DTC P0841 PRESENT (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN (T50) L/R PRESSURE SWITCH SENSE CIRCUIT OPEN (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE INTERNAL TRANSMISSION POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. DETERMINING IF RELATED DTCS ARE PRESENT

With the scan tool, check for other Transmission DTCs.

Is the DTC P0841 present also?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate symptom.

No

Go To 2.

2. CHECK TO SEE IF DTC P1775 IS CURRENT

With the scan tool, view DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes

Go To 3.

No

Go To 8.

3. PCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector switch to L/R.

With the scan tool, monitor the L/R Pressure Switch State while pressing the Pressure Switch Test button.

Did the Pressure Switch state change from open to closed when the test button was pressed?

Yes

Repair internal transmission as necessary per the Service Information. Inspect the Solenoid Switch Valve per **42RLE - SERVICE INFORMATION** and repair or replace as necessary. If no problems are found, replace the Transmission Solenoid/Pressure Switch Assembly.

Perform 42RLE TRANSMISSION VERIFICATION TEST.

No

Go To 4.

4. (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN

819b5f73

Fig. 115: Checking (T16) Transmission Control Output Circuits
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Disconnect the PCM C4 harness connector.

With the scan tool under TIPM, actuate the Transmission.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal

to pin connection. Install Miller tool #8815 to perform diagnosis.

Using a 12-volt test light connected to ground, check all (T16) Transmission Control Relay Output circuits in the appropriate terminals of Miller tool #8815.

NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly on all (T16) Transmission Control Output circuits?

Yes

Go To 5.

No

Repair the (T16) Transmission Control Relay Output circuit for an open.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

5. (T50) L/R PRESSURE SWITCH SENSE CIRCUIT OPEN

**ASSEMBLY-
TRANSMISSION
SOLENOID/PRESSURE
SWITCH
(42 RLE)**

**PCM PINOUT
BOX 8815**

812a606b

Fig. 116: Checking L/R Pressure Switch Sense Circuit For Open
Courtesy of CHRYSLER LLC

With the scan tool under TIPM, stop the Transmission actuation.

Turn the ignition off to the lock position.

Measure the resistance of the (T50) L/R Pressure Switch Sense circuit between the Transmission Solenoid/Pressure Switch Assembly harness connector and the appropriate terminal of Miller tool #8815.

Is the resistance above 5.0 ohms?

Yes

Repair the (T50) L/R Pressure Switch Sense circuit for an open.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go To 6.

6. (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND

**ASSEMBLY-
TRANSMISSION
SOLENOID/PRESSURE
SWITCH
(42 RLE)**

**PCM PINOUT
BOX 8815**

812a6075

Fig. 117: Checking L/R Pressure Switch Sense Circuit For Short To Ground
Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (T50) L/R Pressure Switch Sense circuit.

Is the resistance below 5.0 ohms?

Yes

Repair the (T50) L/R Pressure Switch Sense circuit for a short to ground.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go To 7.

7. (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE

**ASSEMBLY-
TRANSMISSION

Ignition on, engine not running.

With the scan tool under TIPM, actuate the Transmission.

Measure the voltage of the (T50) L/R Pressure Switch Sense circuit.

Is the voltage above 0.5 volts?

Yes

Repair the (T50) L/R Pressure Switch Sense circuit for a short to voltage.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

8. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Test drive and verify if the transmission is launching in 2nd gear and/or no TCC engagement.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Are there 2nd gear launches and/or no TCC engagement?

Yes

Disassemble and inspect the Valve Body per **42RLE - SERVICE INFORMATION** and repair or replace as necessary. If no problems are found in the Valve Body, replace the Transmission Solenoid Pressure Switch Assembly.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

Circuit Schematic

Fig. 119: Transmission Solenoid/Pressure Switch Assembly Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The Solenoid Switch Valve, an internal, hydraulically operated valve, controls the direction of the transmission fluid when the L/R solenoid is energized. When the solenoid switch valve is in the downshifted position and the L/R solenoid is energized, fluid is directed to the L/R element for 1st gear. When the solenoid switch valve is In the up-shifted position (2nd, 3rd, and 4th gear) and the L/R solenoid is energized, fluid is directed into the Lockup Switch Valve which controls the Torque Converter Clutch. When doing PEMCC or FEMCC, the L/R pressure switch should indicate no pressure if the solenoid switch valve is in the L/R position. If the L/R pressure switch indicates pressure for some time while in partial or full EMCC, the EMCC operation is aborted and momentarily inhibited to avoid accidental application of the L/R clutch. EMCC is attempted again when there is no L/R pressure. The fourth detection of L/R pressure while in PEMCC or FEMCC will result in setting the DTC. Torque converter EMCC operation inhibited. MIL on after 5 min. of substituted operation.

Monitor Conditions

When Monitored:

Every 7 ms when doing PEMCC or FEMCC.

Set Conditions

- **Set Condition:**

Must be in partial or full EMCC. The DTC is set if L/R pressure is detected high for the fourth time.

Possible Causes

Possible Causes
RELATED DTC P0841 PRESENT DTC EVENT DATA SHOWS TRS CODE TR2 - SHIFT LEVER OR MANUAL CONTROL VALVE IN A INVALID POSITION SHIFTER CABLE OUT OF ADJUSTMENT SOLENOID SWITCH VALVE STICKING IN ITS BORE (T50) L/R PRESSURE SWITCH SENSE CIRCUIT OPEN (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE VALVE BODY POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **DETERMINING IF RELATED DTC'S ARE PRESENT**

With the scan tool, check for other Transmission DTCs.

Is the DTC P0841 present also?

Yes

Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate symptom.

No

Go To 2.

2. CHECK THE DTC EVENT DATA FOR TRS CODE TR2

With the scan tool, check the DTC EVENT DATA for P1776.

Does the DTC EVENT DATA show a TRS Code of TR2?

Yes

This indicates the shift lever and the manual control valve were in an invalid position between Neutral and OD. Check the shifter cable for: proper adjustment, binding, friction, improper routing, or the shifter was moved in transit. Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Go To 3.

3. CHECK TO SEE IF DTC P1776 IS CURRENT

With the scan tool, check the STARTS SINCE SET counter for P1776.

NOTE: **This counter only applies to the last DTC set.**

Is the status Active or is the STARTS SINCE SET counter 2 or less for this DTC?

Yes

Go To 4.

No

Go To 9.

4. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector switch to L/R.

With the scan tool, monitor the L/R Pressure Switch State while pressing the Pressure Switch Test button.

Did the Pressure Switch state change from open to closed when the test button was pressed?

Yes

Go To 5.

No

Go To 6.

5. CHECK THE SOLENOID SWITCH VALVE FOR STICKING

Remove the transmission oil pan and Valve body and inspect the Solenoid Switch Valve for sticking in its bore, repair or replace as necessary.

NOTE: This DTC may be caused by debris lodged in the Transmission Solenoid Switch Valve bore. If debris is found, clean the valve body and reassemble the transmission per the Service Information.

With the scan tool, record the DTC EVENT DATA for P1776 and erase DTCs.

Reassemble the transmission and test drive the vehicle. Try to duplicate the original set conditions using the DTC EVENT DATA recorded earlier.

With the scan tool, check Transmission DTCs.

Did the DTC P1776 reset?

Yes

Replace the Transmission Solenoid Assembly per the Service Information.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete

Perform **42RLE TRANSMISSION VERIFICATION TEST.**

With the scan tool under TIPM, actuate the Transmission.

Measure the voltage of the (T50) L/R Pressure Switch Sense circuit.

Is the voltage above 0.5 volts?

Yes

Repair the (T50) L/R Pressure Switch Sense circuit for a short to voltage.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

9. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Test drive the vehicle and verify if the transmission is launching in 2nd gear and/or there is no TCC engagement.

With the scan tool, check the EVENT DATA to help identify the conditions in which the DTC was set.

Check for any Service Information Tune-ups or Service Bulletins for possible causes that may apply.

Are there 2nd gear launches and/or no TCC engagement?

Yes

Disassemble and inspect the Valve Body per **42RLE - SERVICE INFORMATION** Inspect the Solenoid Switch Valve for sticking in its bore and repair or replace as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P1790-FAULT IMMEDIATELY AFTER SHIFT

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

This DTC is not stored alone. It is stored if a Gear Ratio DTC is detected immediately after shift. The existence of DTC P1790 indicates a mechanical or hydraulic (not electrical) related problems. It should be noted, however, that all mechanical problems don't necessarily result in DTC P1790. When this DTC exists, diagnosing the system should be based on the associated DTC and only mechanical causes should be considered.

Monitor Conditions

When Monitored:

After a Gear Ratio Error code is stored.

Set Conditions

- **Set Condition:**

After a Gear Ratio Error DTC has already been set. The DTC is set if the fault happened within 1.3 seconds of a shift. The DTC set time will vary from 1.214 seconds to 15 seconds.

Possible Causes

Possible Causes
FAULT AFTER SHIFT

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **FAULT AFTER SHIFT**

This DTC is set along with a Gear Ratio DTC. Perform the appropriate test for the Gear Ratio DTC stored.

NOTE: **Check Pending DTCs or 1 trip failures if there are no Active or Stored Gear Ratio DTCs.**

If there are no possible causes remaining, view repair.

Repair

Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate symptom.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

P1794-SPEED SENSOR GROUND ERROR

Circuit Schematic

019946500

Fig. 123: Speed Sensor Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The input and output speed sensors use a common ground circuit. The loss of this common ground results in the input signal being sensed for both. After a reset in Neutral, and after observing a specific ratio, the Speed Check Fault Counter will increment. Because the speed sensors and the thermistor share the same ground circuit, this DTC may indicate a loss of the common speed sensor ground. In some cases this fault will cause a Gear Ratio Error DTC to be set.

Monitor Conditions

When Monitored:

Every 7 ms after a controller reset with transmission in Neutral.

Set Conditions

- **Set Condition:**

After a PCM reset in Neutral and Input and Output sensor ratio equals 2.50 to 1.0 ± 50.0 RPM.

Possible Causes

Possible Causes
SPEED SENSOR GROUND CIRCUIT OPEN POWERTRAIN CONTROL MODULE

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. PCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Solenoid Relay from the TIPM.

CAUTION: Removal of the Starter Solenoid Relay from the TIPM will prevent the vehicle from being started in gear.

WARNING: The Starter Solenoid Relay must be removed from the TIPM. Failure to do so can result in personal injury or death.

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit 8333-1A.

Ignition on, engine not running.

With the Transmission Simulator, set the "Input/Output Speed" switch to "ON" and the rotary switch to the "3000/1250" position.

With the scan tool, monitor the Input and Output Speed Sensor readings.

Does the Input Speed read 3000 RPM and the Output Speed read 1250 RPM, $\pm$ 50 RPM?

Yes

Go To 2.

No

Go To 3.

2. (T13) SPEED SENSOR GROUND CIRCUIT OPEN

819b6b85

Fig. 124: Measuring Resistance Of Speed Sensor Ground Circuits
Courtesy of CHRYSLER LLC

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Disconnect the Input and Output Speed Sensor harness connectors.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness

connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.

Measure the resistance of both of the (T13) Speed Sensor Ground circuits from the appropriate terminal of special tool #8815 to the Input and Output Speed Sensor harness connectors.

Is the resistance above 5.0 ohms on either circuit?

Yes

Repair the (T13) Speed Sensor Ground circuit for an open.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

3. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Were there any problems found?

Yes

Repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Test Complete.

P1797-MANUAL SHIFT OVERHEAT

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The major cause of heat build up in the transmission is torque converter slip. With the transmission in the AutoStick® mode, the torque converter can slip during aggressive driving or heavy loading conditions such as trailer towing or driving up steep grades. In the non AutoStick® mode, internal controller logic prevents the transmission from overheating by managing the shift and EMCC schedule. In the AutoStick® mode, when the transmission or engine temperature approaches an overheat condition, the manual shift overheat DTC sets and the AutoStick® mode is temporarily suspended until the temperature returns to normal.

Monitor Conditions

When Monitored:

Continuously with engine running.

Set Conditions

- Set Condition:**

If the Engine Temperature exceeds 123° C (255° F) or the Transmission Temperature exceeds 135° C (275° F) while in AutoStick® mode. Note: Aggressive driving or driving in Low for extended periods of time will set this DTC.

Possible Causes

Possible Causes
MANUAL SHIFT OVERHEAT

Always perform the **42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE** before proceeding.

Diagnostic Test

1. **MANUAL SHIFT OVERHEAT**

This is an informational DTC only.

With the scan tool, check the Event Data to help identify the conditions in which the DTC was set.

Check the engine and transmission cooling system for proper operation.

Check the Radiator Cooling Fan operation.

Check the Transmission Cooling operation.

Check the Transmission Fluid Level per **42RLE - SERVICE INFORMATION** to verify that it is not overfilled.

NOTE: **Aggressive driving or driving in Low for extended periods of time will set this DTC.**

If there are no possible causes remaining, view repair.

Repair

If the Transmission Fluid is low, repair any Transmission Fluid leak as necessary and adjust the Transmission Fluid Level per the Service Information. Refer to **42RLE - SERVICE INFORMATION** for the related symptoms and repair as necessary.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

U0002-CAN C BUS OFF PERFORMANCE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The NGC controller communicates over the CAN C BUS. The transmission controller continuously monitors BUS activity. The CAN C BUS is also used to communicate transmission MIL status to the Engine Controller. If the Engine Controller is unable to communicate with the Transmission Controller, a DTC will set and the Engine Controller will illuminate the MIL.

Monitor Conditions

When Monitored:

Every 7 ms with:

- 1) Engine speed greater than 500 RPM.
- 2) Battery voltage between 10 and 16 volts.

Set Conditions

- **Set Condition:**

CAN C BUS messages are not received for 10 seconds.

Diagnose the U0002 CAN C BUS OFF PERFORMANCE as the U0001 CAN C BUS CIRCUIT test in appropriate Engine ELECTRICAL DIAGNOSTICS article for diagnostic procedures and for further possible causes.

U0100-LOST COMMUNICATION WITH ECM/PCM

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The NGC controller communicates over the CAN C BUS. The transmission controller continuously monitors BUS activity. The CAN C BUS is also used to communicate transmission MIL status to the Engine Controller. If the Engine Controller is unable to communicate with the Transmission Controller, a DTC will set and the Engine Controller will illuminate the MIL.

Monitor Conditions

When Monitored:

Every 7 ms with:

- 1) Engine speed greater than 500 RPM.
- 2) Battery voltage between 10 and 16 volts.

Set Conditions

- **Set Condition:**

CAN C BUS messages are not received for 10 seconds.

Refer to appropriate Engine ELECTRICAL DIAGNOSTICS article for diagnostic procedures and for further possible causes.

U0121-LOST COMMUNICATION WITH ABS

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The NGC controller communicates over the CAN C BUS. The transmission controller continuously monitors BUS activity. The CAN C BUS is also used to communicate transmission MIL status to the Engine Controller. If the Engine Controller is unable to communicate with the Transmission Controller, a DTC will set and the Engine Controller will illuminate the MIL.

Monitor Conditions

When Monitored:

Every 7 ms with:

- 1) Engine speed greater than 500 RPM.
- 2) Battery voltage between 10 and 16 volts.

Set Conditions

- **Set Condition:**

CAN C BUS messages are not received for 10 seconds.

Refer to appropriate Engine ELECTRICAL DIAGNOSTICS article for diagnostic procedures and for further possible causes.

U0141-LOST COMMUNICATION WITH FCM

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

The NGC controller communicates over the CAN C BUS. The transmission controller continuously monitors BUS activity. The CAN C BUS is also used to communicate transmission MIL status to the Engine Controller. If the Engine Controller is unable to communicate with the Transmission Controller, a DTC will set and the Engine Controller will illuminate the MIL.

Monitor Conditions

When Monitored:

Every 7 ms with:

- 1) Engine speed greater than 500 RPM.
- 2) Battery voltage between 10 and 16 volts.

Set Conditions

- **Set Condition:**

CAN C BUS messages are not received for 10 seconds.

Refer to appropriate Engine ELECTRICAL DIAGNOSTICS article for diagnostic procedures and for further possible causes.

STANDARD PROCEDURE

42RLE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Perform the following steps prior to any diagnostic procedure(s).

NOTE: Due to different power control configurations, the Transmission Control Relay (if equipped) may be referred to as a PCM relay.

1. Many transmission symptoms can be caused by a low fluid level. If the fluid level is low, locate and repair any leaks and fill the transmission to the proper fluid level. Refer to **42RLE - SERVICE INFORMATION** for the proper repair and fluid fill procedures.
2. Testing should only be performed with the battery fully charged to avoid false diagnosis.
3. With the scan tool check pinion factor (if equipped) for proper tire identification and program or reprogram if necessary.
4. With the scan tool, read Engine (PCM) DTCs. If Engine DTCs are present, refer to appropriate Engine ELECTRICAL DIAGNOSTICS article and perform to the appropriate diagnostic procedure(s) before proceeding.
5. With the scan tool, read Transmission (TCM) DTCs. Record all Stored, Active, and Pending DTC information. Diagnose any Pending DTC as a matured DTC.
6. With the scan tool, read and record any Event Data. Use this data to help identify the conditions in which the DTC was set.

NOTE: Event Data may exist even if no DTCs are stored. Clearing DTCs does NOT erase the Event Data. To erase Event Data information you must either with the scan tool perform a Quick Learn procedure, battery disconnect (if available), or manually disconnect the battery. Whatever method used can reset some learned transmission values to controller defaults. This may cause poor shift quality until those values are relearned. Most DTCs require two "bad trips" before they are stored and the MIL illuminates. The transmission may enter "limp-in" mode during the first bad trip. However, if the fault condition is not present in the next ignition cycle and a "good trip" has been completed, the one trip or "pending" DTC may be cleared. The pending DTC information will be stored in the Event Data even though the scan tool shows no DTCs present. If the customer reports a limp-in event and no DTCs are present, check the Event Data.

7. With the scan tool, perform the Shift Lever Position Test. If the test does not pass, refer to **P0706-TRANSMISSION RANGE SENSOR RATIONALITY**.
8. For Gear Ratio Error DTCs, use the scan tool to read and record the Clutch Volume Index (CVI) information.
9. Use the wiring diagram as a guide, inspect the wiring and connectors related to this circuit and repair as necessary.
10. Refer to the **When Monitored** and **Set Conditions** for this DTC. DTCs can set at ignition on, at start up, driving under specific conditions, and after controller diagnostic monitors have run.
11. Refer to applicable Technical Service Bulletins (TSBs) for controller software update information. Some conditions can be corrected by upgrading the Engine (PCM) or Transmission (TCM) controller software.
12. Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Did any of the above procedures repair the vehicle?

Yes

Testing is complete.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

No

Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure(s).

See **DIAGNOSIS AND TESTING**.

42RLE TRANSMISSION VERIFICATION TEST

Perform the following after completion of a diagnostic repair:

NOTE: **After completion of the Transmission Verification Test, the Powertrain Verification Test must be performed. Refer to appropriate Engine ELECTRICAL DIAGNOSTICS article.**

1. Reconnect any disconnected components.
2. With the scan tool, erase all Transmission and Engine DTCs.
3. With the scan tool check pinion factor (if equipped) for proper tire identification and program or reprogram if necessary.
4. Erase DTC P0700 under engine to turn the MIL off after completion of transmission repairs.
5. Perform a PRNDL FAULT CLEARING PROCEDURE after completion of repairs for P0706-TRANSMISSION RANGE SENSOR RATIONALITY. See **STANDARD PROCEDURE**.
6. If the Powertrain Control Module or the Transmission has been repaired or replaced, it is necessary to perform the scan tool Quick Learn Procedure.
7. If the Torque converter has been replaced, with the scan tool perform TCC BREAK-IN.
8. If the Powertrain Control Module or Front Control Module has been replaced you must reset the Pinion Factor in the Front Control Module.
9. With the scan tool, display Transmission Temperature. Start and run the engine until the Transmission Temperature is HOT, above 43° C or 110° F.
10. Check the transmission fluid and adjust if necessary. Refer to **42RLE - SERVICE INFORMATION** for the Fluid Fill procedure.
11. Road test the vehicle. With the scan tool, monitor the engine rpm. Make 15 to 20 1-2, 2-3, 3-4 upshifts. Perform these shifts from a standing start to 72 km/h (45 mph) with a constant throttle opening of 20 to 25 degrees.
12. With speeds below 40 km/h (25 mph), make 5 to 8 wide open throttle kickdowns to 1st gear. Allow at least 5 seconds each in 2nd and 3rd gear between each kickdown.
13. For a specific DTC, drive the vehicle to the Symptom's When Monitored/When Set conditions to verify the DTC is repaired.
14. If equipped with AutoStick®, upshift and downshift several times using the AutoStick® feature during the road test.

NOTE: **Use the OBDII task manager to run a Good Trip in each gear, this will**

confirm the repair and to ensure that the DTC has not re-matured.

15. Check for any Diagnostic Trouble Codes (DTCs) during and after the road test.

Did any Diagnostic Trouble Codes set during the road test?

Yes

Repair is not complete. Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate symptom (s).

No

Repair is complete.

PRNDL FAULT CLEARING PROCEDURE

1. With the scan tool, erase Transmission DTCs.
2. Cycle the ignition off, then start the vehicle.
3. Firmly apply the brakes and shift into Overdrive.

NOTE: Vehicle must remain in Overdrive for at least 3.0 seconds.

4. With the brakes firmly applied, shift slowly through all gears (PRNDL) as least three times, pausing momentarily in each gear.

NOTE: If all the PRNDL lights box individually then the error was cleared.

5. Shift into park and turn the ignition off to the lock position.
6. With the ignition on, engine not running, using the scan tool, read DTCs.

Does the DTC P0706 reset, or do all the PRNDL indicators remain boxed in park or neutral?

Yes

Return to the symptom list and perform diagnostics for P0706-TRANSMISSION RANGE SENSOR RATIONALITY.

No

Test Complete.

Perform **42RLE TRANSMISSION VERIFICATION TEST**.

ALL PRESSURE SPECIFICATIONS ARE PSI (ON HOIST, WITH WHEELS FREE TO TURN)

2008 ELECTRICAL

Battery System - Service Information - Liberty

BATTERY SYSTEM - SERVICE INFORMATION

DESCRIPTION

BATTERY SYSTEM

This vehicle is equipped with a single 12-volt battery. All of the components of the battery system are located within the engine compartment of the vehicle. The battery system for this vehicle contains the following components:

- **Battery** - The storage battery provides a reliable means of storing a renewable source of electrical energy within the vehicle.
- **Battery Cables** - The battery cables connect the positive and negative charged battery terminal posts to the vehicle electrical system.
- **Battery Hold down** - The battery hold down hardware secures the battery in the battery tray.
- **Battery Thermal Guard** - The battery thermal guard insulates the battery to protect it from engine compartment temperature extremes.
- **Battery Tray** - The battery tray provides a secure mounting location in the vehicle for the battery and an anchor point for the battery hold down hardware.

For battery system maintenance schedules, refer to **DESCRIPTION** . For the proper jump starting procedures, refer to **STANDARD PROCEDURE** .

OPERATION

BATTERY SYSTEM

The battery system is designed to provide a safe, efficient, reliable and mobile means of delivering and storing electrical energy. This electrical energy is required to operate the engine starting system, as well as to operate many of the other vehicle accessory systems for limited durations while the engine and/or the charging system are not operating. The battery system is also designed to provide a reserve of electrical energy to supplement the charging system for short durations while the engine is running and the electrical current demands of the vehicle exceed the output of the charging system. In addition to delivering, and storing electrical energy for the vehicle, the battery system serves as a capacitor and voltage stabilizer for the vehicle electrical system. It absorbs most abnormal or transient voltages caused by the switching of any of the electrical components or circuits in the vehicle.

DIAGNOSIS AND TESTING

BATTERY SYSTEM

The battery, starting, and charging systems in the vehicle operate with one another and must be tested as a complete system. In order for the engine to start and the battery to maintain its charge properly, all of the

components that are used in these systems must perform within specifications. It is important that the battery, starting, and charging systems be thoroughly tested and inspected any time a battery needs to be charged or replaced. The cause of abnormal battery discharge, overcharging or early battery failure must be diagnosed and corrected before a battery is replaced and before a vehicle is returned to service. The service information for these systems has been separated within this service information to make it easier to locate the specific information you are seeking. However, when attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used for the battery, starting, and charging systems include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, a volt/ohmmeter, a battery charger, a carbon pile rheostat (load tester) and a 12-volt test lamp may be required. All OBD-sensed systems are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for any failure it detects. Refer to **DIAGNOSIS AND TESTING** for the proper charging system on-board diagnostic test procedures.

MICRO 420 ELECTRICAL SYSTEM TESTER

The Micro 420 automotive battery system tester is designed to help diagnose the cause of a defective battery. See **STANDARD PROCEDURE** for directions on using the Micro 420 battery tester.

BATTERY SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
THE BATTERY SEEMS WEAK OR DEAD WHEN ATTEMPTING TO START THE ENGINE.	1. The electrical system ignition-off draw is excessive.	1. See <u>STANDARD PROCEDURE</u> for the proper test procedures. Repair the excessive ignition-off draw, as required.
	2. The charging system is inoperative.	2. Determine if the charging system is performing to specifications, refer to <u>DIAGNOSIS AND TESTING</u> . Repair the inoperative charging system, as required.
	3. The battery is discharged.	3. Determine the battery state-of-charge using the Micro 420 battery tester, see <u>STANDARD PROCEDURE</u> . Charge the battery as required.
	4. The battery terminal connections are loose or corroded.	4. See <u>DIAGNOSIS AND TESTING</u> . Clean and tighten the battery terminal connections, as required.
	5. The battery has an incorrect size or rating for this vehicle.	5. See <u>SPECIFICATIONS</u> for the proper size and rating. Replace an incorrect battery, as required.
	6. The battery is inoperative.	6. Determine the battery cranking capacity using the Micro 420 battery tester, see <u>STANDARD PROCEDURE</u> . Replace the inoperative battery, as required.
	7. The starting system is inoperative.	7. Determine if the starting system is performing to specifications. Refer to <u>DIAGNOSIS AND TESTING</u> . Repair the

	8. The battery is physically damaged.	inoperative starting system, as required. 8. Inspect the battery for loose terminal posts or a cracked and leaking case. Replace the damaged battery, as required.
THE BATTERY STATE OF CHARGE CANNOT BE MAINTAINED.	1. The battery has an incorrect size or rating for this vehicle. 2. The battery terminal connections are loose or corroded. 3. The electrical system ignition-off draw is excessive. 4. The battery is inoperative. 5. The starting system is inoperative. 6. The charging system is inoperative. 7. Electrical loads exceed the output of the charging system. 8. Slow driving or prolonged idling with high-amperage draw systems in use.	1. See <u>SPECIFICATIONS</u> for the proper size and rating. Replace an incorrect battery, as required. 2. See <u>DIAGNOSIS AND TESTING</u>. Clean and tighten the battery terminal connections, as required. 3. See <u>STANDARD PROCEDURE</u> for the proper test procedures. Repair the inoperative electrical system, as required. 4. Test the battery using the Micro 420 battery tester, see <u>STANDARD PROCEDURE</u>. Replace the inoperative battery, as required. 5. Determine if the starting system is performing to specifications. Refer to <u>DIAGNOSIS AND TESTING</u> . Repair the inoperative starting system, as required. 6. Determine if the charging system is performing to specifications, refer to <u>DIAGNOSIS AND TESTING</u> . Repair the inoperative charging system, as required. 7. Inspect the vehicle for aftermarket electrical equipment which might cause excessive electrical loads. 8. Advise the vehicle operator, as required.
THE BATTERY WILL NOT ACCEPT A CHARGE.	1. The battery is inoperative.	1. Test the battery using the Micro 420 battery tester, see <u>STANDARD PROCEDURE</u> . Replace the inoperative battery, as required.

STANDARD PROCEDURE

BATTERY CONNECTION PROCEDURE

NOTE: This reconnection procedure is to be performed anytime the battery has been disconnected.

1. Connect the battery negative cable to the battery post and tighten the clamp nut.
2. Install the rear compartment floor trim panel.

CAUTION: Once the battery has been connected, review and perform the following information as applicable.

ELECTRONIC STABILITY PROGRAM (ESP)

If the vehicle is equipped with ESP, once the battery is reconnected, the Steering Angle Sensor (SAS) in the clockspring needs to be calibrated. The SAS requires calibration anytime the battery or an ABS (ESP) component has been disconnected for any length of time. **If the SAS is not calibrated following battery reconnection, the ESP/BAS indicator lamp is illuminated following five ignition cycles indicating the need for calibration.**

To calibrate, perform the following:

1. Start the engine.
2. Center the steering wheel.
3. Turn the steering wheel all the way to the left until the internal stop in the steering gear is met, then turn the wheel all the way to the right until the opposite internal stop in the steering gear is met.
4. Center the steering wheel.
5. Stop the engine.

CLEANING

BATTERY SYSTEM

The following information details the recommended cleaning procedures for the battery and related components. In addition to the maintenance schedules found in this service information and the Owner's Manual, it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

Fig. 1: Cleaning Battery Cable Terminal Clamps Of All Corrosion And Removing Any Corrosion Using Wire Brush

Courtesy of CHRYSLER LLC

1. Clean the battery cable terminal clamps (2) of all corrosion. Remove any corrosion using a wire brush (1) or a post and terminal cleaning tool, and a sodium bicarbonate (baking soda) and warm water cleaning solution.
2. Clean the battery tray and battery hold down hardware of all corrosion. Remove any corrosion using a wire brush and a sodium bicarbonate (baking soda) and warm water cleaning solution. Paint any exposed bare metal.

Fig. 2: Removing Acid Film

Courtesy of CHRYSLER LLC

3. If the removed battery is to be reinstalled, clean the outside of the battery case (3) and the top cover with a sodium bicarbonate (baking soda) and warm water cleaning solution using a stiff bristle parts cleaning brush (1) to remove any acid film. Rinse the battery with clean water. Ensure that the cleaning solution does not enter the battery cells through the vent holes. If the battery is being replaced. See **SPECIFICATIONS** for the factory-installed battery specifications. Confirm that the replacement battery is the correct size and has the correct ratings for the vehicle.
4. Clean the battery thermal guard with a sodium bicarbonate (baking soda) and warm water cleaning solution using a stiff bristle parts cleaning brush to remove any acid film.

80accff2

Fig. 3: Cleaning Any Corrosion From Battery Terminal Posts With Wire Brush Or Post And Terminal Cleaner
Courtesy of CHRYSLER LLC

5. Clean any corrosion from the battery terminal posts with a wire brush or a post and terminal cleaner, and a sodium bicarbonate (baking soda) and warm water cleaning solution.

INSPECTION

BATTERY SYSTEM

The following information details the recommended inspection procedures for the battery and related components. In addition to the maintenance schedules found in this service information and the owner's manual, it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

1. Inspect the battery cable terminal clamps for damage. Replace any battery cable that has a damaged or deformed terminal clamp.
2. Inspect the battery tray and battery hold down hardware for damage. Replace any damaged parts.
3. Slide the thermal guard off of the battery case (if equipped). Inspect the battery case for cracks or other damage that could result in electrolyte leaks. Also, check the battery terminal posts for looseness. Batteries with damaged cases or loose terminal posts must be replaced.
4. Inspect the battery thermal guard for tears, cracks, deformation or other damage (if equipped). Replace any battery thermal guard that has been damaged.
5. Inspect the battery built-in test indicator sight glass (if equipped) for an indication of the battery condition. If the battery is discharged, charge as required.

SPECIFICATIONS

BATTERY SYSTEM

The battery Group Size number, the Cold Cranking Amperage (CCA) rating, and the Reserve Capacity (RC) rating or Ampere-Hours (AH) rating can be found on the original equipment battery label. Be certain that a replacement battery has the correct Group Size number, as well as CCA, and RC or AH ratings that equal or exceed the original equipment specification for the vehicle being serviced. Battery sizes and ratings are discussed in more detail below.

- **Group Size** - The outside dimensions and terminal placement of the battery conform to standards established by the Battery Council International (BCI). Each battery is assigned a BCI Group Size number to help identify a correctly-sized replacement.
- **Cold Cranking Amperage** - The Cold Cranking Amperage (CCA) rating specifies how much current (in amperes) the battery can deliver for thirty seconds at -18° C (0° F). Terminal voltage must not fall below 7.2 volts during or after the thirty second discharge period. The CCA required is generally higher as engine displacement increases, depending also upon the starter current draw requirements.
- **Reserve Capacity** - The Reserve Capacity (RC) rating specifies the time (in minutes) it takes for battery terminal voltage to fall below 10.5 volts, at a discharge rate of 25 amperes. RC is determined with the battery fully-charged at 26.7° C (80° F). This rating estimates how long the battery might last after a charging system failure, under minimum electrical load.
- **Ampere-Hours** - The Ampere-Hours (AH) rating specifies the current (in amperes) that a battery can deliver steadily for twenty hours, with the voltage in the battery not falling below 10.5 volts. This rating is also sometimes identified as the twenty-hour discharge rating.
- **Load Test Amperage** - The Load Test Amperage rating specifies the current (in amperes) that a battery should be tested at with the battery load test equipment. This value should always be 50 percent of the CCA. For example: if the CCA for this battery is 700 amps, the Load Test Amperage is 50 percent of that or 350 amps.

BATTERY

DESCRIPTION

BATTERY

Low-maintenance conventional batteries are used on vehicles equipped with a gasoline engine, these batteries have non-removable battery cell caps. Under normal service, the composition of this battery reduces gassing and water loss at normal charge rates.

Conventional batteries are made up of six individual cells that are connected in series. Each cell contains positive charged cell groups made of lead oxide, and negatively charged cell groups made of sponge lead. The cells are submerged in a sulfuric acid and water solution called electrolyte.

The battery is used to store electrical energy potential in a chemical form. When an electrical load is applied to the battery terminals, an electrochemical reaction occurs within the battery. This reaction causes the battery to discharge electrical current.

OPERATION

BATTERY

The battery is designed to store electrical energy in a chemical form. When an electrical load is applied to the terminals of the battery, an electrochemical reaction occurs. This reaction causes the battery to discharge electrical current from its terminals. As the battery discharges, a gradual chemical change takes place within each cell. The sulfuric acid in the electrolyte combines with the plate materials, causing both plates to slowly change to lead sulfate. At the same time, oxygen from the positive plate material combines with hydrogen from the sulfuric acid, causing the electrolyte to become mainly water. The chemical changes within the battery are caused by the movement of excess or free electrons between the positive and negative plate groups. This movement of electrons produces a flow of electrical current through the load device attached to the battery terminals.

As the plate materials become more similar chemically, and the electrolyte becomes less acid, the voltage potential of each cell is reduced. However, by charging the battery with a voltage higher than that of the battery itself, the battery discharging process is reversed. Charging the battery gradually changes the sulfated lead plates back into sponge lead and lead dioxide, and the water back into sulfuric acid. This action restores the difference in the electron charges deposited on the plates, and the voltage potential of the battery cells. For a battery to remain useful, it must be able to produce high-amperage current over an extended period. A battery must also be able to accept a charge, so that its voltage potential may be restored.

The battery is vented to release excess hydrogen gas that is created when the battery is being charged or discharged. However, even with these vents, hydrogen gas can collect in or around the battery. If hydrogen gas is exposed to flame or sparks, it may ignite. If the electrolyte level is low, the battery may arc internally and explode. If the battery is equipped with removable cell caps, add distilled water whenever the electrolyte level is below the top of the plates. If the battery cell caps cannot be removed, the battery must be replaced if the electrolyte level becomes low.

DIAGNOSIS AND TESTING

BATTERY

The battery must be completely charged and the terminals should be properly cleaned and inspected before diagnostic procedures are performed. See **CLEANING**, and **INSPECTION** for the proper battery cleaning and inspection procedures. See **STANDARD PROCEDURE** for the proper battery charging procedures.

MICRO 420 BATTERY TESTER

The Micro 420 automotive battery tester is designed to help diagnose the cause of an inoperative battery. See **STANDARD PROCEDURE** for instructions on the use of the Micro 420 battery tester.

WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING OR LOOSE POSTS, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY

MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.

A battery that will not accept a charge is inoperative, and must be replaced. Further testing is not required. A fully-charged battery must be load tested to determine its cranking capacity. A battery that is fully-charged, but does not pass the load test, is inoperative and must be replaced.

NOTE: Completely discharged batteries may take several hours to accept a charge.

STANDARD PROCEDURE

CONVENTIONAL BATTERY CHARGING

CAUTION: Vehicles equipped with a diesel engine utilize a unique spiral cell battery. This battery has a maximum charging voltage that must be used in order to restore the battery to its full potential, failure to use the spiral cell battery charging procedure could result in damage to the battery or personal injury. See STANDARD PROCEDURE for the appropriate procedure.

Battery charging is the means by which the battery can be restored to its full voltage potential. A battery is fully-charged when:

Micro 420 battery tester indicates battery is OK.

Open-circuit voltage of the battery is 12.65 volts or above.

Battery passes Load Test multiple times.

WARNING: If the battery shows signs of freezing, leaking, loose posts, do not test, assist-boost, or charge. The battery may arc internally and explode. Personal injury and/or vehicle damage may result.

WARNING: Explosive hydrogen gas forms in and around the battery. Do not smoke, use flame, or create sparks near the battery. Personal injury and/or vehicle damage may result.

WARNING: The battery contains sulfuric acid, which is poisonous and caustic. Avoid contact with the skin, eyes, or clothing. In the event of contact, flush with water and call a physician immediately. Keep out of the reach of children.

WARNING: If the battery is equipped with removable cell caps, be certain that each of the cell caps is in place and tight before the battery is returned to service. Personal injury and/or vehicle damage may result from loose or missing cell caps.

CAUTION: Always disconnect and isolate the battery negative cable before charging a battery. Do not exceed sixteen volts while charging a battery. Damage to the vehicle electrical system components may result.

CAUTION: Battery electrolyte will bubble inside the battery case during normal battery charging. Electrolyte boiling or being discharged from the battery vents indicates a battery overcharging condition. Immediately reduce the charging rate or turn off the charger to evaluate the battery condition. Damage to the battery may result from overcharging.

CAUTION: The battery should not be hot to the touch. If the battery feels hot to the touch, turn off the charger and let the battery cool before continuing the charging operation. Damage to the battery may result.

After the battery has been charged to an open-circuit voltage reading of 12.4 volts or greater, retest the battery with the Micro 420 tester or perform a load test to determine the battery cranking capacity. See **STANDARD PROCEDURE** for the proper battery test procedures. If the battery passes a load test, return the battery to service. If the battery fails a load test, it is faulty and must be replaced.

Clean and inspect the battery hold downs, tray, terminals, posts, and top before completing battery service. See **CLEANING** for the proper battery system cleaning procedures. See **INSPECTION** for the proper battery system inspection procedures.

CHARGING A COMPLETELY DISCHARGED CONVENTIONAL BATTERY

The following procedure should be used to recharge a completely discharged battery. Unless this procedure is properly followed, a good battery may be needlessly replaced.

Fig. 5: Conventional Battery Charger
 Courtesy of CHRYSLER LLC

1. Measure the voltage at the battery posts with a voltmeter, accurate to 1/10 (0.10) volt. If the reading is below ten volts, the battery charging current will be low. It could take some time before the battery accepts a current greater than a few milliamperes. Such low current may not be detectable on the ammeters built into many battery chargers.
2. Disconnect and isolate the battery negative cable. Connect the battery charger leads. Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.
3. Battery chargers vary in the amount of voltage and current they provide. The amount of time required for a battery to accept measurable charging current at various voltages is shown in the CHARGE RATE TABLE. If the charging current is still not measurable at the end of the charging time, the battery is faulty and must be replaced. If the charging current is measurable during the charging time, the battery may be good and the charging should be completed in the normal manner.

CONVENTIONAL BATTERY CHARGE RATE TABLE

Voltage	Minutes
16.0 volts maximum	up to 10 min.
14.0 to 15.9 volts	up to 20 min.
13.9 volts or less	up to 30 min.

CHARGING TIME REQUIRED

The time required to charge a battery will vary, depending upon the following factors:

- Battery Capacity** - A completely discharged heavy-duty battery requires twice the charging time of a small capacity battery.
- Temperature** - A longer time will be needed to charge a battery at -18° C (0° F) than at 27° C (80° F).

When a fast battery charger is connected to a cold battery, the current accepted by the battery will be very low at first. As the battery warms, it will accept a higher charging current rate (amperage).

Charger Capacity - A battery charger that supplies only five amperes will require a longer charging time. A battery charger that supplies twenty amperes or more will require a shorter charging time.

State-Of-Charge - A completely discharged battery requires more charging time than a partially discharged battery. Electrolyte is nearly pure water in a completely discharged battery. At first, the charging current (amperage) will be low. As the battery charges, the specific gravity of the electrolyte will gradually rise.

The CONVENTIONAL BATTERY CHARGING TIME TABLE gives an indication of the time required to charge a typical battery at room temperature based upon the battery state-of-charge and the charger capacity.

CONVENTIONAL BATTERY CHARGING TIME TABLE

Charging Amperage	5 Amps	10 Amps	20 Amps
Open Circuit Voltage	Hours Charging @ 21° C (70° F)		
12.25 to 12.49	6 hours	3 hours	1.5 hours
12.00 to 12.24	10 hours	5 hours	2.5 hours
10.00 to 11.99	14 hours	7 hours	3.5 hours
Below 10.00	18 hours	9 hours	4.5 hours

IGNITION-OFF DRAW TEST

NOTE: Verify all vehicle electronic modules are in "sleep mode" prior to performing this test. Failure to do so could result in inaccurate digital multi-meter readings.

The term Ignition-Off Draw (IOD) identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. A normal vehicle electrical system will draw from five to thirty-five milliamperes (0.005 to 0.035 ampere) with the ignition switch in the Off position, and all non-ignition controlled circuits in proper working order. Up to thirty-five milliamperes are needed to enable the memory functions for the Powertrain Control Module (PCM), digital clock, electronically tuned radio, and other modules which may vary with the vehicle equipment.

A vehicle that has not been operated for approximately twenty days, may discharge the battery to an inadequate level. When a vehicle will not be used for twenty days or more (stored), remove the IOD fuse from the Totally Integrated Power Module (TIPM). This will reduce battery discharging.

Excessive IOD can be caused by:

- Electrical items left on.
- Faulty or improperly adjusted switches.

Faulty or shorted electronic modules and components.

An internally shorted generator.

Intermittent shorts in the wiring.

If the IOD is over thirty-five milliamperes, the problem must be found and corrected before replacing a battery. In most cases, the battery can be charged and returned to service after the excessive IOD condition has been corrected.

1. Verify that all electrical accessories are off. Turn off all lamps, remove the ignition key, and close all doors. If the vehicle is equipped with an illuminated entry system or an electronically tuned radio, allow the electronic timer function of these systems to automatically shut off (time out). This may take up to three minutes.
2. Determine that the underhood lamp is operating properly, then disconnect the lamp wire harness connector or remove the lamp bulb.
3. Disconnect the battery negative cable.
4. Set an electronic digital multi-meter to its highest amperage scale. Connect the multi-meter between the disconnected battery negative cable terminal clamp and the battery negative terminal post. Make sure that the doors remain closed so that the illuminated entry system is not activated. The multi-meter amperage reading may remain high for up to three minutes, or may not give any reading at all while set in the highest amperage scale, depending upon the electrical equipment in the vehicle. The multi-meter leads must be securely clamped to the battery negative cable terminal clamp and the battery negative terminal post. If continuity between the battery negative terminal post and the negative cable terminal clamp is lost during any part of the IOD test, the electronic timer function will be activated and all of the tests will have to be repeated.
5. After about three minutes, the high-amperage IOD reading on the multi-meter should become very low or nonexistent, depending upon the electrical equipment in the vehicle. If the amperage reading remains high, remove and replace each fuse or circuit breaker in the Totally Integrated Power Module (TIPM), one at a time until the amperage reading becomes very low, or nonexistent. **Refer to the appropriate wiring information for complete TIPM fuse, circuit breaker, and circuit identification.** This will isolate each circuit and identify the circuit that is the source of the high-amperage IOD. If the amperage reading remains high after removing and replacing each fuse and circuit breaker, disconnect the wire harness from the generator. If the amperage reading now becomes very low or nonexistent, refer to **DIAGNOSIS AND TESTING** for the proper charging system diagnosis and testing procedures. After the high-amperage IOD has been corrected, switch the multi-meter to progressively lower amperage scales and, if necessary, repeat the fuse and circuit breaker remove-and-replace process to identify and correct all sources of excessive IOD. It is now safe to select the lowest milliamperage scale of the multi-meter to check the low-amperage IOD.

CAUTION: Do not open any doors, or turn on any electrical accessories with the lowest milliamperage scale selected, or the multi-meter may be damaged.

6. Observe the multi-meter reading. The low-amperage IOD should not exceed thirty-five milliamperes (0.035 ampere). If the current draw exceeds thirty-five milliamperes, isolate each circuit using the fuse and circuit breaker remove-and-replace process in step 5. The multi-meter reading will drop to within the acceptable limit when the source of the excessive current draw is disconnected. Repair this circuit as

required; whether a wiring short, incorrect switch adjustment, or a component failure is at fault.

OPEN-CIRCUIT VOLTAGE TEST

A battery open-circuit voltage (no load) test will show the approximate state-of-charge of a battery.

Before proceeding with this test, completely charge the battery. Refer to the appropriate battery charging procedure.

Fig. 6: Circuit Voltage Tester
Courtesy of CHRYSLER LLC

1. Before measuring the open-circuit voltage, the surface charge must be removed from the battery. Turn on the headlamps for fifteen seconds, then allow up to five minutes for the battery voltage to stabilize.
2. Disconnect and isolate both battery cables, negative cable first.
3. Using a voltmeter connected to the battery posts (see the instructions provided by the manufacturer of the voltmeter), measure the open-circuit voltage.

See the OPEN-CIRCUIT VOLTAGE TABLE. This voltage reading will indicate the battery state-of-charge, but will not reveal its cranking capacity. If a battery has an open-circuit voltage reading of 12.4 volts or greater, it may be load tested to reveal its cranking capacity.

OPEN CIRCUIT VOLTAGE TABLE	
Open Circuit Voltage	Charge Percentage
11.7 volts or less	0%
12.0 volts	25%
12.2 volts	50%
12.4 volts	75%
12.6 volts or more	100%

USING MICRO 420 BATTERY TESTER

Fig. 7: Micro 420 Battery Tester
Courtesy of CHRYSLER LLC

Always use the Micro 420 Instruction Manual that was supplied with the tester as a reference. If the Instruction Manual is not available the following procedure can be used:

WARNING: Always wear appropriate eye protection and use extreme caution when working with batteries.

BATTERY TESTING

1. If testing the battery OUT-OF-VEHICLE, clean the battery terminals with a wire brush before testing. If the battery is equipped with side post terminals, install and tighten the supplied lead terminal stud adapters. Do not use steel bolts. Failure to properly install the stud adapters, or using stud adapters that are dirty or worn-out may result in false test readings.
2. If testing the battery IN-THE-VEHICLE, make certain all of the vehicle accessory loads are OFF, including the ignition.
3. Connect the tester to the battery, the red clamp to the positive (+) terminal and the black clamp to the negative (-) terminal.

NOTE: Multiple batteries connected in parallel must have the ground cable disconnected to perform a battery test. Failure to disconnect may result in false battery test readings.

4. Using the ARROW key select **in** or **out** of vehicle testing and press ENTER to make a selection.
5. If not selected, choose the Cold Cranking Amp (CCA) battery rating. Or select the appropriate battery rating for your area (see menu). The tester will then run its self programmed test of the battery and display the results. Refer to the BATTERY TEST RESULTS TABLE.

CAUTION: If **REPLACE BATTERY** is the result of the test, this may mean a poor connection between the vehicle's cables and battery exists. After disconnecting the vehicle's battery cables from the battery, retest the battery using the **OUT-OF-VEHICLE** test before replacing.

6. While viewing the battery test result, press the **CODE** button and the tester will prompt you for the last 4 digits of the VIN. Use the **UP/DOWN** arrow buttons to scroll to the correct character; then press **ENTER** to select and move to the next digit. Then press the **ENTER** button to view the **SERVICE CODE**. Pressing the **CODE** button a second time will return you to the test results.

BATTERY TEST RESULTS	
GOOD BATTERY	Return to service
GOOD - RECHARGE	Fully charge battery and return to service
CHARGE & RETEST	Fully charge battery and retest battery
REPLACE BATTERY	Replace the battery and retest complete system
BAD-CELL REPLACE	Replace the battery and retest complete system

NOTE: The **SERVICE CODE** is required on every warranty claim submitted for battery replacement.

REMOVAL

BATTERY

WARNING: To protect the hands from battery acid, a suitable pair of heavy duty rubber gloves should be worn when removing or servicing a battery. Safety glasses also should be worn.

WARNING: Remove metallic jewelry to avoid injury by accidental arcing of battery current.

Fig. 8: Battery Negative Cable, Bolt, Retainer, Battery Tray, Battery & Battery Positive Cable
Courtesy of CHRYSLER LLC

NOTE: Left hand drive shown in illustration, right hand drive similar.

1. Loosen the pinch clamp bolt and disconnect and isolate the battery negative cable (1).
2. Loosen the pinch clamp bolt and disconnect the battery positive cable (6).
3. Loosen bolt (2) and remove the retainer (3) that holds the battery (5) to the battery tray (4).

Fig. 9: Thermal Guard & Battery
Courtesy of CHRYSLER LLC

4. Remove the battery from the vehicle.
5. Remove thermal guard (1) from battery (2).

INSTALLATION

BATTERY

WARNING: To protect the hands from battery acid, a suitable pair of heavy duty rubber gloves should be worn when removing or servicing a battery. Safety glasses also should be worn.

WARNING: Remove metallic jewelry to avoid injury by accidental arcing of battery current.

Fig. 10: Thermal Guard & Battery
 Courtesy of CHRYSLER LLC

NOTE: Left hand drive shown in illustration, right hand drive similar.

NOTE: When replacing battery, the thermal guard **MUST** be transferred to the new battery.

1. Carefully install the thermal guard (1) onto the battery (2).

Fig. 11: Battery Negative Cable, Bolt, Retainer, Battery Tray, Battery & Battery Positive Cable
 Courtesy of CHRYSLER LLC

2. Install battery (5) into the vehicle making sure that the thermal guard is present and battery is properly positioned on battery tray (4).
3. Install the battery hold down retainer (3) and bolt (2) making sure that it is properly positioned on battery (5). Tighten the hold down bolt to 7 N.m (62 in. lbs.)

4. Connect the battery positive cable (6) and tighten the pinch clamp nut to 5 N.m (45 in. lbs.)
5. Connect the battery negative cable (1) and tighten the pinch clamp nut to 5 N.m (45 in. lbs.)
6. Verify proper vehicle operation.

BATTERY CABLES

DESCRIPTION

BATTERY CABLE

The battery cables are large gauge, stranded copper wires sheathed within a heavy plastic or synthetic rubber insulating jacket. The wire used in the battery cables combines excellent flexibility and reliability with high electrical current carrying capacity. The battery cables feature a clamping type female battery terminal made of stamped sheet metal that is die cast onto one end of the battery cable wire. A pinch-bolt and nut are installed at the open end of the female battery terminal clamp. Large eyelet type terminals are crimped onto the opposite end of the battery cable wire and then soldered. The battery positive cable wires feature a larger female battery terminal clamp to allow connection to the larger battery positive terminal post. The battery negative cable wires have a smaller female battery terminal clamp.

Both the battery positive and negative cables are available for service replacement only as a unit with the battery wire harness, which may include portions of the wiring circuits for the generator and other components on some vehicles.

OPERATION

BATTERY CABLE

The battery cables connect the battery terminal posts to the vehicle electrical system. These cables also provide a path back to the battery for electrical current generated by the charging system for restoring the voltage potential of the battery. The female battery terminal clamps on the ends of the battery cable wires provide a strong and reliable connection of the battery cable to the battery terminal posts. The terminal pinch bolts allow the female terminal clamps to be tightened around the male terminal posts on the top of the battery. The eyelet terminals secured to the opposite ends of the battery cable wires from the female battery terminal clamps provide secure and reliable connection of the battery cables to the vehicle electrical system.

One wire has an eyelet terminal that connects the battery positive cable to the B(+) terminal stud of the Totally Integrated Power Module (TIPM), and the other wire has an eyelet terminal that connects the battery positive cable to the B(+) terminal stud of the engine starter motor solenoid. The battery negative cable terminal clamp has one wire as an eyelet terminal that connects the battery negative cable to the vehicle powertrain through a ground connection, typically on the engine cylinder block.

DIAGNOSIS AND TESTING

BATTERY CABLES

A voltage drop test will determine if there is excessive resistance in the battery cable terminal connections or the battery cable. If excessive resistance is found in the battery cable connections, the connection point should be disassembled, cleaned of all corrosion or foreign material, then reassembled. Following reassembly, check

the voltage drop for the battery cable connection and the battery cable again to confirm repair.

When performing the voltage drop test, it is important to remember that the voltage drop is giving an indication of the resistance between the two points at which the voltmeter probes are attached. **EXAMPLE:** When testing the resistance of the battery positive cable, touch the voltmeter leads to the battery positive cable terminal clamp and to the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud. If you probe the battery positive terminal post and the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud, you are reading the combined voltage drop in the battery positive cable terminal clamp-to-terminal post connection and the battery positive cable.

VOLTAGE DROP TEST

The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing this test, be certain that the following procedures are accomplished:

The battery is fully-charged and load tested.

Fully engage the parking brake.

If the vehicle is equipped with an automatic transmission, place the gearshift selector lever in the Park position. If the vehicle is equipped with a manual transmission, place the gearshift selector lever in the Neutral position and block the clutch pedal in the fully depressed position.

Verify that all lamps and accessories are turned off.

To prevent the engine from starting, remove the Automatic Shut Down (ASD) relay. The ASD relay can be found in the Fuse Block located in the left front bumper fascia. See the fuse and relay layout label affixed to the underside of the Fuse Block cover for ASD relay identification and location.

Fig. 12: Connecting Positive Lead Of Voltmeter To Battery Negative Terminal Post
Courtesy of CHRYSLER LLC

1. Connect the positive lead of the voltmeter (1) to the battery (2) negative terminal post. Connect the negative lead of the voltmeter (1) to the battery (2) negative cable terminal clamp. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery negative cable terminal clamp and the battery negative terminal post.

Fig. 13: Connecting Positive Lead Of Voltmeter To Battery Positive Terminal Post
 Courtesy of CHRYSLER LLC

2. Connect the positive lead of the voltmeter (1) to the battery (2) positive terminal post. Connect the negative lead of the voltmeter (1) to the battery (2) positive cable terminal clamp. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery positive cable terminal clamp and the battery positive terminal post.

Fig. 14: Connecting Voltmeter To Measure Between Battery Positive Cable Terminal Clamp And Starter Solenoid B(+) Terminal Stud
 Courtesy of CHRYSLER LLC

3. Connect the voltmeter (2) to measure between the battery positive cable terminal clamp (1) and the starter solenoid B(+) terminal stud (3). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery positive cable eyelet terminal connection at the starter solenoid B(+) terminal stud. Repeat the test. If the reading is still above 0.2 volt, replace the faulty battery positive cable.

NOTE: Left hand drive gasoline engine shown in illustration, right hand drive and diesel similar.

1. Loosen the pinch clamp bolt and disconnect and isolate the battery negative cable (2).
2. Loosen the pinch clamp bolt and disconnect the battery positive cable (1).
3. Remove the negative cable retaining stud (7) from the mounting surface on the inner fender. Remove the cable (6) from the stud.
4. Disconnect the cable assembly routing clips from the inner fender.

 Courtesy of CHRYSLER LLC

7. Remove the positive battery cable nut (4) from the B+ terminal of the starter motor (3). Remove the cable (7) from the starter.
8. Remove the negative battery cable nut (1) from the mounting stud (2) on the engine block. Remove the

cable (8) from the stud.

9. One at a time, trace any remaining battery cable retaining pushpins (6), fasteners and routing clips until the cables are free from the vehicle.
10. Remove the battery cables from the engine compartment.

INSTALLATION

BATTERY CABLE

Fig. 20: Negative Battery Cable Nut, Mounting Stud, Starter Motor, Positive Battery Cable Nut, Battery Cable Retaining Pushpins & Cables

Courtesy of CHRYSLER LLC

WARNING: Remove metallic jewelry to avoid injury by accidental arcing of battery current.

NOTE: Left hand drive gasoline engine shown in illustration, right hand drive and diesel similar.

1. Position the battery cables in the engine compartment.
2. One at a time, install the battery cable retaining pushpins (6), fasteners and routing clips until the cables are installed exactly where they were in the vehicle.
3. Install the negative battery cable (8) to the mounting stud (2) on the engine block. Install the negative battery cable retaining nut (1).
4. Connect the positive battery cable (7) to the B+ terminal of the starter motor (3). Install the retaining nut (4) and tighten it to 13 N.m (115 in. lbs.).

Fig. 21: Removing/Installing Positive Battery Cable Nut From/To B+ Terminal Of Generator & Cable From/To Generator
 Courtesy of CHRYSLER LLC

5. Connect the positive battery cable (2) to the B+ terminal of the generator (5). Install the retaining nut (1) and tighten it to 14 N.m (125 in. lbs.).

 Courtesy of CHRYSLER LLC

6. Position the Totally Integrated Power Module (TIPM) positive cable (2) onto the mounting stud (3) and install the retaining nut (1). Tighten the nut to 9 - 11 N.m (80 - 100 in. lbs.). Close the TIPM cover (4).

Fig. 23: Battery Cable Assembly
 Courtesy of CHRYSLER LLC

7. Connect the battery cable assembly routing clips to the inner fender.
8. Position the negative battery cable (6) onto the mounting stud (7). Install the mounting stud onto the inner fender and tighten to 12 N.m (9 ft. lbs.)
9. Connect the battery positive cable (1). Tighten the cable clamp nut to 5 N.m (45 in. lbs.)
10. Connect the battery negative cable (2). Tighten the cable clamp nut to 5 N.m (45 in. lbs.)

BATTERY TRAY

DESCRIPTION

BATTERY TRAY

Fig. 24: Nuts, Plastic Battery Tray & Inner Fender

Courtesy of CHRYSLER LLC

NOTE: Left hand drive gasoline engine shown in illustration, right hand drive and diesel similar.

The battery is placed and secured in a plastic battery tray (2). The battery tray is located in the left front side of the vehicle and is secured to the inner fender (3) with three nuts (1).

REMOVAL

BATTERY TRAY

Fig. 25: Electrical Connector, Battery, Battery Tray & Solenoid

Courtesy of CHRYSLER LLC

NOTE: Left hand drive gasoline engine shown in illustration, right hand drive and diesel similar.

1. Disconnect and isolate the battery negative cable.
2. Remove the battery. See **REMOVAL**.
3. On gasoline engine equipped vehicles, disconnect the purge solenoid vacuum hose and electrical connector (1). Using an appropriate flat bladed tool, remove the solenoid (4) from the battery tray (3) by disengaging the solenoid mounting clip and lifting it up off the battery tray mounting tab.

Fig. 26: TIPM Positive Cable Retaining Nut, Cable, Mounting Stud & Totally Integrated Power Module (TIPM) Cover
 Courtesy of CHRYSLER LLC

4. Open the Totally Integrated Power Module (TIPM) cover (4).
5. Remove the TIPM positive cable retaining nut (1) and remove the cable (2) from the mounting stud (3).

Fig. 27: Identifying Integrated Power Module (TIPM), TIPM Mounting Bracket & Mounting Tabs
 Courtesy of CHRYSLER LLC

6. Using an appropriate flat bladed tool, depress the four mounting clips to disengage and remove the TIPM housing (1) from the TIPM bracket mounting tabs (3).

Fig. 28: Disconnecting/Connecting TIPM Wire Harness Connectors
 Courtesy of CHRYSLER LLC

7. Disconnect each of the seven TIPM wire harness connectors from the TIPM housing (2).
8. Remove the TIPM from the vehicle.

Fig. 29: TIPM Bracket Retaining Screws, Bracket, Mounting Tabs & Battery Tray
 Courtesy of CHRYSLER LLC

9. Remove the TIPM bracket retaining screws (1) and slide the bracket (2) rearward to disengage the mounting tabs (3). Remove the TIPM bracket from the battery tray (4).

Fig. 30: Nuts, Plastic Battery Tray & Inner Fender
Courtesy of CHRYSLER LLC

10. Remove the three nuts (1) securing the battery tray (2) to the left inner fender (3).
11. Lift the battery tray out of the engine compartment and remove from the vehicle.

INSTALLATION

INSTALLATION

Fig. 31: Nuts, Plastic Battery Tray & Inner Fender
Courtesy of CHRYSLER LLC

1. Position the battery tray (2) into the engine compartment and onto the mounting studs on the left inner fender (3).
2. Install the nuts (1) securing the battery tray (2) to the left inner fender (3).
3. Tighten the nuts to 10.5 N.m (93 in. lbs.)

Fig. 32: TIPM Bracket Retaining Screws, Bracket, Mounting Tabs & Battery Tray
 Courtesy of CHRYSLER LLC

4. Position the TIPM bracket (2) onto the battery tray (4). Slide the bracket (2) forward to engage the slots in the bracket with the mounting tabs of the battery tray (3). Install the TIPM bracket retaining screws (1) into the battery tray (4).

Fig. 33: Disconnecting/Connecting TIPM Wire Harness Connectors
 Courtesy of CHRYSLER LLC

5. Position the TIPM (2) into the engine compartment.
6. Connect each of the seven TIPM wire harness connectors as shown in illustration.

Fig. 34: Identifying Integrated Power Module (TIPM), TIPM Mounting Bracket & Mounting Tabs
 Courtesy of CHRYSLER LLC

7. Position the TIPM (1) onto the mounting bracket (2) and push down until the mounting clips are fully seated onto the mounting tabs (3).

Fig. 35: TIPM Positive Cable Retaining Nut, Cable, Mounting Stud & Totally Integrated Power Module (TIPM) Cover
 Courtesy of CHRYSLER LLC

8. Position the TIPM positive cable (2) onto the mounting stud (3) and install the retaining nut (1). Tighten the nut to 9 - 11 N.m (80 - 100 in. lbs.).

Fig. 36: Electrical Connector, Battery, Battery Tray & Solenoid
Courtesy of CHRYSLER LLC

9. On gasoline engine equipped vehicles, position the purge solenoid (4) onto the mounting tab of the battery tray (3) and push downward until the solenoid locks into place. Connect the purge solenoid vacuum hose and electrical connector (1).
10. Install the battery. See **INSTALLATION**.
11. Connect the battery negative cable.
12. Close the hood.
13. Insert the ignition key and turn it to the "RUN" position and wait twelve seconds. The TIPM will collect the necessary vehicle configuration and VIN data from the CCN and PCM at this time. After twelve seconds turn the ignition key to the "OFF" position and then back to the "ON" position and verify proper vehicle systems operation.

THERMAL GUARD

DESCRIPTION

THERMAL GUARD

Fig. 37: Thermal Guard & Battery
Courtesy of CHRYSLER LLC

On gasoline engine equipped vehicles, a flexible thermal guard (1) wraps around the battery case (2) to enclose the sides of the battery. The thermal guard (1) consists of a plastic cloth outer skin with a polyester based insulator fiber.

REMOVAL

REMOVAL

WARNING: To protect the hands from battery acid, a suitable pair of heavy duty rubber gloves, not the household type, should be worn when removing or servicing a battery. Safety glasses also should be worn.

1. Disconnect and isolate the battery negative cable.
2. Remove the battery. See **REMOVAL**.
3. Carefully lift the thermal guard off over the battery taking care not to tear it.
4. Remove the thermal guard from battery.

INSTALLATION

INSTALLATION

NOTE: When replacing battery, the thermal guard **MUST** be transferred to the new battery.

1. Slip the battery thermal guard over the battery being careful not to tear it.
2. Install the battery into the vehicle. See **INSTALLATION**.
3. Connect the battery negative cable.

2008 ACCESSORIES AND EQUIPMENT

Body - Liberty

WARNING

WARNING - CAUTIONS AND WARNINGS

WARNING: Use an OSHA approved breathing filter when spraying paint or solvents in a confined area. Personal injury can result.

Avoid prolonged skin contact with petroleum or alcohol - based cleaning solvents. Personal injury can result.

Do not stand under a hoisted vehicle that is not properly supported on safety stands. Personal injury can result.

CAUTION: When holes must be drilled or punched in an inner body panel, verify depth of space to the outer body panel, electrical wiring, or other components. Damage to vehicle can result.

Do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.

Always have a fire extinguisher ready for use when welding.

Disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is OFF. Damage to electrical system can result.

Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.

Do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.

Do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.

WARNING - USE OF HEAT DURING REPAIR

WARNING: Chrysler Group engineering's position on the use of heat during collision repair is as follows:

Any body panel or frame component damaged which is to be repaired and reused, must be repaired using the "cold straightening" method. No heat may be used during the straightening process.

During rough straightening prior to panel replacement, damaged panels or frame components may be heated to assist in body/frame

realignment. The application of heat must be constrained to the parts which will be replaced and not allowed to affect any other components.

This "no heat" recommendation is due to the extensive use of high strength and advanced high strength steels in Chrysler Group products. High-strength materials can be substantially and negatively affected from heat input which will not be obviously known to the repairer or consumer.

Ignoring these recommendations may lead to serious compromises in the ability to protect occupants in a future collision event, reduce the engineered qualities and attributes, or decrease the durability and reliability of the vehicle.

Failure to follow these instructions may result in serious or fatal injury.

This statement supersedes any previously released information by the Chrysler Group.

DIAGNOSIS AND TESTING

WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate information in this article for proper procedures.

WATER LEAK TESTS

WARNING: Do not use electric shop lights or tools in water test area. Personal injury can result.

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.

If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.

If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations. Refer to **STANDARD PROCEDURE** .

WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high cross winds. Over compensating on door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate procedure of this article for proper procedures.

ROAD TESTING WIND NOISE

1. Drive the vehicle to verify the general location of the wind noise.
2. Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

POSSIBLE CAUSE OF WIND NOISE

Moldings standing away from body surface can catch wind and whistle.

Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.

Misaligned movable components.

Missing or improperly installed plugs in pillars.

Weld burn through holes.

STANDARD PROCEDURE

BODY LUBRICATION

All mechanisms and linkages should be lubricated when necessary. This will maintain ease of operation and provide protection against rust and excessive wear. The weatherstrip seals should be lubricated to prolong their life as well as to improve door sealing.

All applicable exterior and interior vehicle operating mechanisms should be inspected and cleaned. Pivot/sliding contact areas on the mechanisms should then be lubricated.

1. When necessary, lubricate the operating mechanisms with the specified lubricants.
2. Apply silicone lubricant to a cloth and wipe it on door seals to avoid over-spray that can soil passenger's clothing.
3. Before applying lubricant, the component should be wiped clean. After lubrication, any excess lubricant

should be removed.

- 4. The hood latch, latch release mechanism, latch striker, and safety latch should be lubricated periodically.
- 5. The door lock cylinders should be lubricated twice each year (preferably autumn and spring).

Spray a small amount of lock cylinder lubricant directly into the lock cylinder.

Apply a small amount to the key and insert it into the lock cylinder.

Rotate it to the locked position and then back to the unlocked position several times.

Remove the key. Wipe the lubricant from it with a clean cloth to avoid soiling of clothing.

Component	Fluid, Lubricant, and Genuine Part
Hinges:	
Door & Hood	Mopar® Engine Oil
Lift Gate	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Latches: Hood/Safety Catch	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Seat Regulator & Track	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Lock Cylinders	Mopar® Lock Cylinder Lube

BUZZ, SQUEAK & RATTLE

Buzz, Squeak & Rattles (BSR) may be caused by any one or more of the following and may be corrected as indicated:

- Loose fasteners should be tightened to specifications.
- Damaged or missing clips should be replaced.
- Damaged trim panels should be replaced.
- Incorrectly installed trim panels should be reinstalled properly.

Many BSR complaints such as loose trim, can be serviced using the Mopar® Parts BSR Noise Reduction Kit. This kit contains various tapes including foam, flock and anti-squeak used to eliminate noises caused by metal, plastic and vinyl components. Long life lubricants and greases can also be used on a variety of components. Refer to **Buzz, Squeak & Rattle Kit** table for material contents and usage.

Buzz, Squeak & Rattle Kit

ITEM	FEATURES	APPLICATIONS	SERVICE TEMP
Itch And Squeak Tape	An abrasion resistant material thin enough to conform to most irregular surfaces. Stops most itches and squeaks.	Between metal and metal, metal and plastic, metal and vinyl, vinyl and plastic. Interior. Examples: Trim panels and bezels.	-40° to 225° Fahrenheit (-40° to 107° Celsius)
Black Nylon Flock	Nylon Flock with an aggressive acrylic adhesive. Provides for cushioning and compression fit, also isolates	Between metal and metal, metal and plastic, vinyl and plastic. Examples: Pull cups, bezels,	-40° to 180° Fahrenheit (-40° to 82° Celsius)

	components. Water-resistant.	clips, ducts, top cover to glass, cowl panel.	
High Density Urethane Foam	Tear resistant, highly resilient and durable.	Between metal and metal, metal and plastic. Water-resistant. Examples: I/P, heavy metal rattles, isolating brackets.	-40° to 180° Fahrenheit (-40° to 82° Celsius)
Open Cell Foam Tape	Soft foam conforms to irregular surfaces.	Wire harness and connector wrap. Examples: Seals, gasket, wiring, heat ducts.	-40° to 180° Fahrenheit (-40° to 82° Celsius)
Closed Cell Low Density Foam Tape	Soft, conformable. Water-resistant.	Wherever bulk is needed. Prevents closing flutters and rattles when applied to door watershield. Examples: Door, I/P.	-40° to 180° Fahrenheit (-40° to 82° Celsius)
NYE® Grease 880	Long life.	Suspensions. Examples: Strut busings, sway bars.	-40° to 390° Fahrenheit (-40° to 200° Celsius)
Krytox® Oil	Long life. Will not dry out or harm plastics or rubber.	When access is not possible, oil will migrate to condition. Vinyl, rubber, plastic, metal. Examples: Convertible top bushings, pull cups trim panel inserts.	-30° to 400° Fahrenheit (-34° to 205° Celsius)
Krytox® Grease	Long life. Will not dry out or harm plastics or rubber.	Vinyl, rubber, plastic, metal, glass. Examples: Weather-strips, backlite and windshield moldings.	-30° to 400° Fahrenheit (-34° to 205° Celsius)

HEAT STAKING

1. Remove trim panel.
2. Bend or move the trim panel components at the heat staked joints. Observe the heat staked locations and/or component seams for looseness.
3. Heat stake the components.
 - If the heat staked or component seam location is loose, hold the two components tightly together and using a soldering gun with a flat tip, melt the material securing the components together. Do not over heat the affected area, damage to the exterior of the trim panel may occur.
 - If the heat staked material is broken or missing, use a hot glue gun to apply new material to the area to be repaired. The panels that are being heat staked must be held together while the applying the glue. Once the new material is in place, it may be necessary to use a soldering gun to melt the newly applied material. Do not over heat the affected area, damage to the exterior of the trim panel may occur.

4. Allow the repaired area to cool and verify the repair.
5. Install trim panel.

PLASTIC BODY PANEL REPAIR

There are many different types of plastics used in today's automotive environment. Chrysler groups plastics in three different categories: Rigid, Semi-Rigid, and Flexible. Any of these plastics may require the use of an adhesion promoter for repair. These types of plastic are used extensively on DaimlerChrysler Motors vehicles. Always follow repair material manufacturer's plastic identification and repair procedures.

Rigid Plastics:

Examples of rigid plastic use: Fascias, Hoods, Doors, and other Body Panels, which include SMC, ABS, and Polycarbonates.

Semi-Rigid Plastics:

Examples of semi-rigid plastic use: Interior Panels, Under Hood Panels, and other Body Trim Panels.

Flexible Plastics:

Examples of flexible plastic use: Fascias, Body Moldings, and upper and lower Fascia Covers.

Repair Procedure:

The repair procedure for all three categories of plastics is basically the same. The one difference is the material used for the repair. The materials must be specific for each substrate, rigid repair material for rigid plastic repair, semi-rigid repair material for semi-rigid plastic repair and flexible repair material for flexible plastic repair.

Adhesion Promoter/Surface Modifier:

Adhesion Promoters/Surface Modifiers are required for certain plastics. All three categories may have plastics that require the use of adhesion promoter/surface modifiers. Always follow repair material manufacturer's plastic identification and repair procedures.

SAFETY PRECAUTION AND WARNINGS

WARNING:

Eye protection should be used when servicing components. Personal injury can result.

Use an OSHA approved breathing mask when mixing epoxy, grinding, and spraying paint or solvents in a confined area. Personal injury can result.

Avoid prolonged skin contact with resin, petroleum, or alcohol based solvents. Personal injury can result.

Do not venture under a hoisted vehicle that is not properly

supported on safety stands. Personal injury can result.

NOTE: When holes must be drilled or cut in body panels, verify locations of internal body components and electrical wiring. Damage to vehicle can result.

Do not use abrasive chemicals or compounds on undamaged painted surfaces around repair areas. Damage to finish can result.

RIGID, SEMI-RIGID, AND FLEXIBLE PLASTIC PARTS TYPES

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION
ASA	ACRYLONITRILE STYRENE ACRYLITE	LURAN S	CONSOLES, GRILLES
ABS	ACRYLONITRILE BUTADIENE STYRENE	TERLURAN	"A" PILLARS, CONSOLES, GRILLES
ABS/PC	ABS/PC ALLOY	PULSE, PROLOY, BAYBLEND	DOORS, INSTRUMENT PANELS
ABS/PVC	ABS/PV ALLOY	PROLOY, PULSE, LUSTRAN, CYCLOVIN	DOOR PANELS, GRILLES, TRIM
BMC	BULK MOLDING COMPOUND	BMC	FENDER EXTENSIONS
EMA	EHTYLENE METHYL ACRYLATE/IONOMER	SURLYN, EMA, IONOMER	BUMPER GUARDS, PADS
METTON	METTON	METTON	GRILLES, KICK PANELS, RUNNING BOARDS

TPE	THERMO POLYETHYLENE	TPE, HYTREL, BEXLOY-V	FASCIAS, BUMBERS, CLADDINGS
TPO	THERMOPOLYOLEFIN	POLYTROPE, RENFLEX, SANTOPRENE, VISAFLEX, ETA, APEX, TPO, SHIELDS, CLADDINGS	BUMPERS, END CAPS, TELCAR, RUBBER, STRIPS, SIGHT, INTERIOR B POST
TPP	THERMO-POLYPROPYLENE	TPP	BUMPERS
TPU	THERMOPOLYURETHANE, POLYESTER	TPU, HYTREL, TEXIN, ESTANE	BUMPERS, BODY SIDE, MOLDINGS, FENDERS, FASCIAS

PANEL SECTIONING

Fig. 1: View Of Panel Sectioning
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - EXISTING PANEL
2 - NEW PANEL
3 - PANEL ADHESIVE
4 - BONDING STRIP |
|--|

If it is required to section a large panel for a plastic repair, it will be necessary to reinforce the panel. To bond

two plastic panels together, a reinforcement must overlap both panels. The panels must be "V'd" at a 20 degree angle. The area to be reinforced should be washed, then sanded. Be sure to wipe off any excess soap and water when finished. Lightly sand or abrade the plastic with an abrasive pad or sandpaper. Blow off any dust with compressed air or wipe with a clean dry rag.

When bonding plastic panels, follow repair material manufacturers recommendations. Be sure that enough adhesive has been applied to allow squeeze out and to fill the full bond line. Once the pieces have been brought together, do not move them until the adhesive is cured. The assembly can be held together with clamps, rivets, etc. A faster cure can be obtained by heating with a heat lamp or heat gun. After the parts have been bonded and have had time to cure, rough sand the seam and apply the final adhesive filler to the area being repaired. Smooth the filler with a spreader, wooden tongue depressor, or squeegee. For fine texturing, a small amount of water can be applied to the filler surface while smoothing. The cured filler can be sanded as necessary and, as a final step, cleanup can be done with soapy water. Wipe the surface clean with a dry cloth allowing time for the panel to dry before moving on with the repair.

PANEL REINFORCEMENT

Fig. 2: Identifying Softened Edges
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - SOFTENED EDGES
2 - PANEL ADHESIVE
3 - BONDING STRIP |
|---|

Structural repair procedures for rigid panels with large cracks and holes will require a reinforcement backing. Reinforcements can be made with several applications of glass cloth saturated with structural adhesive. Semi-rigid or flexible repair materials should be used for semi-rigid or flexible backing reinforcement and open meshed fiberglass dry wall tape can be used to form a reinforcement. The dry wall tape allows the resin to penetrate through and make a good bond between the panel and the adhesive. Structurally, the more dry wall tape used, the stronger the repair.

80b6fee0

Fig. 3: Identifying Panel Reinforcement
 Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - PANEL ADHESIVE
2 - REINFORCEMENT |
|---|

Another kind of repair that can be done to repair large cracks and holes is to use a scrap piece of similar plastic and bond with structural adhesive. The reinforcement should cover the entire break and should have a generous amount of overlap on either side of the cracked or broken area.

80b6fee1

Fig. 4: Identifying Beveling 20 Degree Angle
Courtesy of CHRYSLER LLC

When repairing plastic, the damaged area is first "V'd" out, or beveled. Large bonding areas are desirable when repairing plastic because small repairs are less likely to hold permanently. Beveling the area around a crack at a 20° angle will increase the bonding surface for a repair. It is recommended that sharp edges be avoided because the joint may show through after the panel is refinished.

Fig. 5: Applying Fiberglass Tape
Courtesy of CHRYSLER LLC

Panel repair for both flexible and rigid panels are basically the same. The primary difference between flexible panel repair and rigid panel repair is in the adhesive materials used.

The technician should first decide what needs to be done when working on any type of body panel. One should determine if it is possible to return the damage part to its original strength and appearance without exceeding the value of the replacement part.

When plastic repairs are required, it is recommended that the part be left on the vehicle when ever possible. That will save time, and the panel will remain stationary during the repair. Misalignment can cause stress in the repair areas and can result in future failure.

VISUAL INSPECTION

Fig. 6: Identifying Damaged Component
Courtesy of CHRYSLER LLC

1 - PUNCTURE

Composite materials can mask the severity of an accident. Adhesive bond lines, interior structure of the doors, and steel structures need to be inspected carefully to get a true damage assessment. Close inspection may require partial removal of interior trim or inner panels.

Identify the type of repair: Puncture or Crack - Damage that has penetrated completely through the panel. Damage is confined to one general area; a panel section is not required. However, a backer panel, open fiberglass tape, or matted material must be bonded from behind.

PANEL SURFACE PREPARATION

If a body panel has been punctured, cracked, or crushed, the damaged area must be removed from the panel to achieve a successful repair. All spider web cracks leading away from a damaged area must be stopped or removed. To stop a running crack in a panel, drill a 6 mm (0.250 in.) hole at the end of the crack farthest away from the damage. If spider web cracks can not be stopped, the panel would require replacement. The surfaces around the damaged area should be stripped of paint and freed from wax and oil. Scuff surfaces around repair area with 360 grit wet/dry sandpaper, or equivalent, to assure adhesion of repair materials.

PATCHING PANELS

Fig. 7: Identifying Damaged Panel Cutout and Patch
Courtesy of CHRYSLER LLC

- 1 - CUTOUT
- 2 - DAMAGED BODY PANEL
- 3 - 4 MM (0.160 IN.) HOLES
- 4 - PATCH CUT TO SIZE

A panel that has extensive puncture type damage can be repaired by cutting out the damaged material. Use a suitable reciprocating saw or cut off wheel to remove the section of the panel that is damaged. The piece cut out can be used as a template to shape the new patch. It is not necessary to have access to the back of the panel to install a patch. Bevel edges of cutout at 20° to expose a larger bonding area on the outer side. This will allow for an increased reinforcement areas.

PANEL PATCH FABRICATIONS

Fig. 8: Fabricating Panel
 Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - STRUCTURAL ADHESIVE
2 - FIBERGLASS CLOTH OR FIBERGLASS MESH TAPE
3 - WIDTH OF V-GROOVE
4 - WAXED PAPER |
|---|

A patch can be fabricated from any rigid fiberglass panel that has comparable contour with the repair area. Lift gates and fenders can be used to supply patch material. If existing material is not available or compatible, a patch can be constructed with adhesive and reinforcement mesh (dry wall tape). Perform the following operation if required:

1. Cover waxed paper or plastic with adhesive backed nylon mesh (dry wall tape) larger than the patch required.
2. Tape waxed paper or plastic sheet with mesh to a surface that has a compatible contour to the repair area.
3. Apply a liberal coat of adhesive over the reinforcement mesh. If necessary apply a second or third coat of adhesive and mesh after first coat has cured. The thickness of the patch should be the same as the repair area.
4. After patch has cured, peel waxed paper or plastic from the back of the patch.
5. If desired, a thin film coat of adhesive can be applied to the back of the patch to cover mesh for added

strength.

PANEL PATCH INSTALLATION

80b6fee6

Fig. 9: Securing Support Squares to Body Panel

Courtesy of CHRYSLER LLC

- 1 - SUPPORT SQUARES
- 2 - SCREWS
- 3 - DAMAGED BODY PANEL

1. Make a paper or cardboard pattern the size and shape of the cutout hole in the panel.
2. Trim 3 mm (0.125 in.) from edges of pattern so patch will have a gap between connecting surfaces.
3. Using the pattern as a guide, cut the patch to size.
4. Cut scrap pieces of patch material into 50 mm (2 in.) squares to use as patch supports to sustain the patch in the cutout.
5. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) in from edge of cutout hole.
6. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) away from edge of patch across from holes drilled around cutout.

7. Drill 3 mm (0.125 in.) holes in the support squares 13 mm (0.5 in.) from the edge in the center of one side.
8. Scuff the backside of the body panel around the cutout hole with a scuff pad or sandpaper.
9. Mix enough adhesive to cover one side of all support squares.
10. Apply adhesive to cover one side of all support squares.
11. Using number 8 sheet metal screws, secure support squares to back side of body panel with adhesive sandwiched between the panel and squares.

80b6fee8

Fig. 10: Positioning Patch In Cutout and Aligning
Courtesy of CHRYSLER LLC

1 - CUTOUT 2 - SUPPORT SQUARES

12. Position patch in cutout against support squares and adjust patch until the gap is equal along all sides.
13. Drill 3 mm (0.125 in.) holes in the support squares through the pre-drilled holes in the patch.

80b6fee7

14. Apply a coat of adhesive to the exposed ends of the support squares.

80b6fee9

Fig. 12: Installing Screws
Courtesy of CHRYSLER LLC

1 - PATCH 2 - GAP

15. Install screws to hold the patch to support squares. Tighten screws until patch surface is flush with panel surface.
16. Allow adhesive to cure, and remove all screws.

Fig. 13: Grinding Surface
Courtesy of CHRYSLER LLC

1 - PATCH
2 - GAP
3 - DISC GRINDER

17. Using a 125 mm (5 in.) 24 grit disc grinder, grind a 50 mm (2 in.) to 75 mm (3 in.) wide and 2 mm (0.080 in.) deep path across the gaps around the patch. With compressed air, blow dust from around patch.

|--------------|
| 1 - ADHESIVE |
| 2 - MESH |
| 3 - PATCH |
| 4 - SPREADER |

20. Apply adhesive over the mesh around patch, and smooth epoxy with a wide spreader to reduce finish grinding. Use two to three layers of mesh and adhesive to create a stronger repair.

PATCHED PANEL SURFACING

After patch panel is installed, the patch area can be finished using the same methods as finishing other types of body panels. If mesh material is exposed in the patched area, grind surface down, and apply a coat of high quality rigid plastic body filler. Prime, block sand, and paint as required.

DOOR - FRONT

CARRIER PLATE

REMOVAL

CARRIER PLATE - FRONT DOOR

Fig. 21: Removing Battery Cable Terminal Clamp - Typical

CAUTION: Do not attempt to remove the trim panel the conventional way. This door panel has hooks holding it to the door rather than push pins. The door module must be removed as an assembly. Carefully follow these instructions in order to prevent unnecessary damage to the trim panel.

1. Loosen the battery terminal nut and use a battery terminal removal tool (2) to disconnect the negative battery cable from the battery (1).
2. Remove the trim panel from the door. See REMOVAL.

Fig. 22: Door Plug & Rear Exterior Handle Nut
Courtesy of CHRYSLER LLC

3. Remove the door plug (2).
4. Remove rear exterior handle nut (1).

Fig. 23: Door Glass And Window Regulator Liftplate

Courtesy of CHRYSLER LLC

NOTE: The window must be in proper position to disengage glass. Release tab on liftplate must be aligned with access hole in door module. Use a slotted screwdriver in the slot on the window regulator liftplate, press gently outboard while pressing down on the glass to release the glass from the liftplate.

5. Remove the tape covering the access hole on the carrier plate and discard. Access the window regulator liftplate through the hole in the carrier plate.
6. Push down the door glass (1) and use a slotted screwdriver to release the tab on the window regulator liftplate (2). Lift the glass up and secure to the header.

81965a81

Fig. 24: Removing/Installing Door Latch & Latch Bracket Securing Screws

32. Remove the screws and window motor from the carrier plate.

INSTALLATION

CARRIER PLATE - FRONT DOOR

819be48a

Fig. 39: Removing/Installing Screws And Window Motor
Courtesy of CHRYSLER LLC

NOTE: All the lock rods are color coded to help identify the location for the particular lock rod.

1. Install the window motor and screws to the carrier plate and tighten to 3.5 N.m (31 in. lbs.).

819be3fe

Fig. 40: Removing/Installing Screws And Module
Courtesy of CHRYSLER LLC

2. Install the module and screws to the carrier plate and tighten to 1.5 N.m (13 in. lbs.).

Fig. 41: Identifying Connectors & Electrical Harness
Courtesy of CHRYSLER LLC

3. Install the harness to the carrier plate.
4. Install the electrical harness (2) and seat the rubber grommet into the carrier plate.
5. Connect the electrical connector (3) to the motor.
6. Connect the electrical connectors (1) to the module.
7. Route the harness through all of the hooks in the carrier plate.
8. Install the electrical harness (4) and seat the rubber grommet into the carrier plate.

Fig. 42: Removing/Installing Speaker Bolts & Speaker
Courtesy of CHRYSLER LLC

9. Install the speaker and bolts to the carrier and tighten to 1.5 N.m (13 in. lbs.).

819be2c2

Fig. 43: Disconnecting/Connecting Speaker Electrical Connector
Courtesy of CHRYSLER LLC

10. Connect the speaker electrical connector.
11. Install speaker wire to wire clip.

819be294

Fig. 44: Push Pin, Handle & Spring
Courtesy of CHRYSLER LLC

12. Install the handle (2) and spring (3) to the carrier.
13. Install the push pin (1) into the carrier, spring and the handle.

NOTE: **Make sure that the push pin is seated flush with the carrier.**

819be0ef

Fig. 45: Identifying Carrier Plate Slots
Courtesy of CHRYSLER LLC

14. Install the latch bracket assembly to the carrier plate slots (1) then slide the latch bracket until fully seated.

819be020

Fig. 46: Disconnecting/Connecting Latch Electrical Connector
Courtesy of CHRYSLER LLC

15. Connect the latch electrical connector.

8196d37

Fig. 47: Carrier & Interior Handle
 Courtesy of CHRYSLER LLC

16. Install the interior lock rod to the interior handle (2). Make sure the lock rod is positioned properly to the carrier (1).

81d39d40

19. Install the inside lock rod (1) to the carrier plate (3) and seat the grommet (2).

8198c5db

Fig. 51: Disconnecting/Connecting Inside Lock Rod
Courtesy of CHRYSLER LLC

20. Connect the inside lock rod to the latch.

819856ca

Fig. 52: Electrical Connector, Carrier Plate, Screws & Door
Courtesy of CHRYSLER LLC

21. Connect the outside mirror electrical connector.
22. Install the electrical connector (1) to the door (4) and connect the electrical connector.
23. Align the carrier plate (2) to the door (4).

81985a81

Fig. 53: Removing/Installing Door Latch & Latch Bracket Securing Screws
Courtesy of CHRYSLER LLC

24. Install the three screws (2) securing the door latch to the door shut face and tighten screws to 7 N.m (60 in. lbs.).
25. Install the one screw (1) attaching the latch bracket to the door shut face and tighten screw to 7 N.m (60 in. lbs.).

819c4049

Fig. 54: Door Plug & Rear Exterior Handle Nut
Courtesy of CHRYSLER LLC

NOTE: The door glass must be in the full up position in order to access the rear exterior handle nut. Use a light and a magnetic socket on the rear nut to prevent dropping the nut into the door assembly.

26. Install the rear nut (1) to the exterior handle and tighten to 4.5 N.m (40 in. lbs.).
27. Install the door plug (2) to the door.

Fig. 55: Electrical Connector, Carrier Plate, Screws & Door
 Courtesy of CHRYSLER LLC

28. Install the 10 screws (3) to the carrier plate (2) and tighten screws to 5.5 N.m (50 in. lbs.).

Fig. 56: Door Glass And Window Regulator Liftplate
 Courtesy of CHRYSLER LLC

NOTE: The glass should snap into place. Make sure the glass is secure to the liftplate by pulling up on the glass to verify.

29. Connect the door glass (1) to the window regulator (2) by sliding the glass down into the liftplate.
30. Apply the adhesive tape to the inspection hole of the carrier plate.

Fig. 57: Removing/Installing Trim Panel
Courtesy of CHRYSLER LLC

31. Install the trim panel to the door. See INSTALLATION.
32. Adjust the latch assembly, see ADJUSTMENTS.
33. Connect the negative battery cable to the battery.

NOTE: Cycle the door lock, open with interior and exterior door handles and operate the power window to make sure everything is working properly and no binding exists.

DOOR - FRONT

REMOVAL

DOOR - FRONT

Fig. 58: Removing Battery Cable Terminal Clamp - Typical
 Courtesy of CHRYSLER LLC

1. Loosen the battery terminal nut and use a battery terminal removal tool (2) to disconnect the negative battery cable from the battery (1).

Fig. 59: Disconnecting/Connecting Door Harness Electrical Connector From/To Body Connector
 Courtesy of CHRYSLER LLC

2. Disconnect the door harness electrical connector (1) from the body connector (2) at the A-pillar.

Fig. 60: Upper/Lower Hinges, Door & Nuts
Courtesy of CHRYSLER LLC

NOTE: Use a grease pencil or equivalent, mark the location of the upper (1) and lower (3) hinges on the door (2) for alignment during Reinstallation.

3. Support the door with a suitable lifting device.
4. Remove the nuts (4) attaching the door (2) to the upper (1) and lower (3) hinges.
5. Carefully remove the door (2) from the vehicle.

INSTALLATION

DOOR - FRONT

Fig. 61: Upper/Lower Hinges, Door & Nuts
Courtesy of CHRYSLER LLC

1. Carefully position the door (2) to the upper (1) and lower (3) hinges using a suitable lifting device.

2. Loosely install the nuts (4) to the door studs and hinges at the lower A-pillar.
3. Align the door to the body using the reference marks made during the removal procedure.
4. Tighten the hinge to door nuts to 36.5 N.m (27 ft. lbs.).

Fig. 62: Disconnecting/Connecting Door Harness Electrical Connector From/To Body Connector
Courtesy of CHRYSLER LLC

5. Connect the door harness electrical connector (1) to the body connector (2) at the lower A-pillar.
6. Connect the negative battery cable to the battery.
7. If necessary, adjust the front door. See **ADJUSTMENTS**.

ADJUSTMENTS

DOOR - FRONT

NOTE: For vehicles with four doors, it is recommended that you adjust the rear door before adjusting the front door. See **ADJUSTMENTS**.

Door adjustment measurements should be taken from stationary or welded body panels like the roof, rocker or quarter panels.

During adjustment procedures, it is recommended that all the hinge fasteners be loosened except for the upper most fasteners. Adjustments can be made using the upper bolts to hold the door with final torque of the fasteners occurring after correct door positioning is achieved.

A suitable body sealant should be used when removing or moving the hinges.

FORE/AFT

NOTE: Fore/aft (lateral) door adjustment is done by loosening the hinge to the hinge pillar fasteners one hinge at a time and moving the door to the correct position.

1. Support the door with a suitable lifting device.
2. Loosen the hinge to hinge pillar fasteners. See **REMOVAL**.
3. Adjust the door to the correct position. See **SPECIFICATIONS**.
4. Tighten the hinge pillar fasteners to 26 N.m (19 ft. lbs.).

UP/DOWN

NOTE: Up/down door adjustment is done by loosening either the hinge to the hinge pillar fasteners or the hinge to door fasteners and moving the door to the correct position.

NOTE: When the up/down adjustments are done correctly, the top of the door is positioned over flush to the roof. See **SPECIFICATIONS**.

1. Support the door with a suitable lifting device.
2. Loosen the latch striker bolts. See **REMOVAL**.
3. Loosen the hinge to door fasteners (see **REMOVAL**) or loosen the hinge to hinge pillar fasteners (see **REMOVAL**).
4. Adjust the door to the correct position. See **SPECIFICATIONS**.
5. Tighten the hinge pillar fasteners to 26 N.m (19 ft. lbs.) or the door to hinges fasteners to 36.5 N.m (27 ft. lbs.).
6. Tighten the latch striker bolts. See **INSTALLATION**.

IN/OUT

NOTE: In/out door adjustment is done by loosening the hinge to door fasteners one hinge at a time and moving the door to the correct position.

1. Support the door with a suitable lifting device.
2. Loosen the latch striker bolts. See **REMOVAL**.
3. Loosen the hinge to door fasteners. See **REMOVAL**.
4. Adjust the door to the correct position. See **SPECIFICATIONS**.
5. Tighten the door to hinges fasteners to 36.5 N.m (27 ft. lbs.).
6. Tighten the latch striker bolts. See **INSTALLATION**.

GLASS - FRONT DOOR

REMOVAL

GLASS - FRONT DOOR

NOTE: The door glass must be in the full up position in order to access the rear exterior handle nut. Use light and a magnetic socket on the rear nut to prevent from dropping the nut into the door assembly.

3. Install the rear nut (1) to the exterior handle and tighten to 4.5 N.m (40 in. lbs.).
4. Install the door plug (2) to the door.

81965015

Fig. 84: Removing/Installing Trim Panel
 Courtesy of CHRYSLER LLC

5. Install the trim panel to the door. See **INSTALLATION**.
6. Adjust the latch. Refer to. See **ADJUSTMENTS**.

HANDLE - INTERIOR DOOR

REMOVAL

HANDLE - INTERIOR DOOR

Fig. 85: Removing/Installing Trim Panel
Courtesy of CHRYSLER LLC

1. Remove the trim panel. See **REMOVAL**.

Fig. 86: Carrier & Interior Handle
Courtesy of CHRYSLER LLC

2. Remove the interior lock rod from the interior handle.

Fig. 87: Push Pin, Handle & Spring
Courtesy of CHRYSLER LLC

3. Remove the push pin (1) from the handle.
4. Remove the spring (3) and handle (2) from the carrier.

INSTALLATION

HANDLE - INTERIOR DOOR

Fig. 88: Push Pin, Handle & Spring
Courtesy of CHRYSLER LLC

1. Install the handle (2) and spring (3) to the carrier.
2. Install the push pin (1) into the carrier, spring and the handle.

NOTE: **Make sure that the push pin is seated flush with the carrier.**

Fig. 89: Carrier & Interior Handle
 Courtesy of CHRYSLER LLC

3. Install the interior lock rod to the interior handle (2). Make sure the lock rod is positioned properly to the carrier (1).

Fig. 90: Removing/Installing Trim Panel
 Courtesy of CHRYSLER LLC

4. Install the trim panel. See INSTALLATION.

HINGE - FRONT DOOR

REMOVAL

HINGE - FRONT DOOR

Fig. 91: Upper/Lower Hinges, Door & Nuts
 Courtesy of CHRYSLER LLC

1. Remove the front door. See **REMOVAL**.

Fig. 92: Removing/Installing Front Door Hinge
 Courtesy of CHRYSLER LLC

NOTE: Use a grease pencil or equivalent, mark the location of the upper (1) and lower (3) hinge on the body of the lower A-pillar for alignment during installation.

2. Remove the four bolts (2) that secure the upper door hinge (1) and lower door hinge (3) to the body of the lower A-pillar and remove the hinges.

INSTALLATION

HINGE - FRONT DOOR

81988c7e

Fig. 93: Removing/Installing Front Door Hinge
 Courtesy of CHRYSLER LLC

1. Install the upper (1) and lower (3) hinges to the B-pillar and loosely install the bolts.
2. Align the hinges on the A-pillar using the reference marks made during the removal procedure and tighten the bolts to 26 N.m (19 ft. lbs.).

81988c7e

Fig. 94: Upper/Lower Hinges, Door & Nuts
 Courtesy of CHRYSLER LLC

3. Install the front door. See **INSTALLATION**.

LATCH - FRONT DOOR

REMOVAL

LATCH - FRONT DOOR

819856ca

Fig. 95: Electrical Connector, Carrier Plate, Screws & Door
Courtesy of CHRYSLER LLC

1. Remove the carrier plate. See **REMOVAL**.

819856020

Fig. 96: Disconnecting/Connecting Latch Electrical Connector
Courtesy of CHRYSLER LLC

2. Disconnect the latch electrical connector.

Fig. 97: Carrier Plate Slots
 Courtesy of CHRYSLER LLC

3. Turn the carrier plate over and slide the latch bracket assembly to remove from carrier.

Fig. 98: Removing/Installing Slide Fork
 Courtesy of CHRYSLER LLC

4. Remove the slide fork from the latch bracket.

819c11b3

Fig. 99: Release Rod & Swing Clips
 Courtesy of CHRYSLER LLC

NOTE: All the lock rods are color coded to help identify the location for the particular lock rod.

5. Remove the release rod (1) by disengaging the two swing clips (2).

819c1137

Fig. 100: Removing/Installing First Latch Attachment Point
 Courtesy of CHRYSLER LLC

NOTE: The latch has three attachment points to the latch bracket.

6. Remove the first latch attachment point from the latch bracket.

819c114b

Fig. 101: Removing/Installing Second Latch Attachment Point
 Courtesy of CHRYSLER LLC

7. Remove the second latch attachment point from the latch bracket.

819c118e

Fig. 102: Removing/Installing Third Latch Attachment Point
 Courtesy of CHRYSLER LLC

8. Remove the third latch attachment point from the latch bracket and remove the latch from the latch bracket.

INSTALLATION

LATCH - FRONT DOOR

819c1137

Fig. 103: Removing/Installing First Latch Attachment Point
 Courtesy of CHRYSLER LLC

NOTE: The latch has three attachment points to the latch bracket and need to be attached in the following order:

1. Install the first latch attachment point to the latch bracket.

819c118e

Fig. 104: Removing/Installing Third Latch Attachment Point
 Courtesy of CHRYSLER LLC

2. It is necessary to align the third attachment point prior to attaching the second point, but do not attach at this time.

819c1148

Fig. 105: Removing/Installing Second Latch Attachment Point
Courtesy of CHRYSLER LLC

3. Install the second latch attachment point to the latch bracket.

819c118e

Fig. 106: Removing/Installing Third Latch Attachment Point
Courtesy of CHRYSLER LLC

4. Install the third latch attachment point to the latch bracket.

819c11b3

Fig. 107: Release Rod & Swing Clips
 Courtesy of CHRYSLER LLC

5. Install the release rod (1) then engage the two swing clips (2).

819c11c4

Fig. 108: Removing/Installing Slide Fork
 Courtesy of CHRYSLER LLC

6. Install the slide fork to the latch bracket.

819be0ef

Fig. 109: Identifying Carrier Plate Slots
Courtesy of CHRYSLER LLC

7. Install the latch bracket assembly to the carrier plate slots (1) then slide the latch bracket until fully seated.

819be020

Fig. 110: Disconnecting/Connecting Latch Electrical Connector
Courtesy of CHRYSLER LLC

8. Connect the latch electrical connector.

819856ca

Fig. 111: Electrical Connector, Carrier Plate, Screws & Door
Courtesy of CHRYSLER LLC

9. Install the carrier plate. See **INSTALLATION**.

819c4912

Fig. 112: Adjusting Latch
Courtesy of CHRYSLER LLC

10. Adjust the latch as needed. See **ADJUSTMENTS**.

ADJUSTMENTS

LATCH - FRONT DOOR

819c4912

Fig. 113: Adjusting Latch
Courtesy of CHRYSLER LLC

1. Locate the access hole and remove tape covering adjustment hole.
2. Insert a 5/32" hex-wrench through hole and into adjustment screw (2). Loosen screw.
3. Operate outside handle several times to release any restriction because of mis-alignment.
4. Tighten adjustment screw to 4 N.m (35 in. lbs.).
5. Test handle for proper operation.

STRIKER - FRONT DOOR LATCH

REMOVAL

STRIKER - FRONT DOOR LATCH

819639f1

Fig. 114: Striker Loop, Bolts, Striker & B-Pillar
Courtesy of CHRYSLER LLC

1. Remove the bolts (2) from the striker latch (3).
2. Remove the latch striker (3) from the B-pillar (4).

INSTALLATION

STRIKER - FRONT DOOR LATCH

Fig. 115: Striker Loop, Bolts, Striker & B-Pillar
Courtesy of CHRYSLER LLC

NOTE: The striker needs to be properly orientated to the B-pillar. The striker loop (1) must be installed to the inboard side of the B-pillar.

1. Install the striker (3) to the B-pillar (4).
2. Install the bolts (2) and tighten to 26 N.m (19 ft. lbs.).
3. Adjust the door as necessary. See ADJUSTMENTS, and for fit SPECIFICATIONS.

CYLINDER - FRONT DOOR LOCK

REMOVAL

CYLINDER - FRONT DOOR LOCK

Fig. 116: Gasket, Door Lock Cylinder, Door, Carrier Plate & Door Lock Cylinder Retainer
 Courtesy of CHRYSLER LLC

1. Remove carrier plate from door, see **REMOVAL**.
2. Remove door lock cylinder retainer (5) from door lock cylinder (2).
3. Remove door lock cylinder (2) and gasket (1) from door (3).

INSTALLATION

CYLINDER - FRONT DOOR LOCK

Fig. 117: Gasket, Door Lock Cylinder, Door, Carrier Plate & Door Lock Cylinder Retainer
 Courtesy of CHRYSLER LLC

NOTE: The lever on the key cylinder needs to point forward.

1. Install lock cylinder (2) and gasket (1) to door (3).
2. Install lock cylinder retainer (5) to door lock cylinder (2).

NOTE: Make sure the door lock cylinder (2) is engaged to the carrier plate (4).

3. Install the carrier plate to the door, see INSTALLATION.

RUN CHANNEL - FRONT DOOR GLASS

REMOVAL

RUN CHANNEL - FRONT DOOR GLASS

Fig. 118: Electrical Connector, Carrier Plate, Screws & Door
Courtesy of CHRYSLER LLC

1. Remove the door carrier plate from the door, see REMOVAL.

Fig. 119: Removing/Installing Front Door Glass
Courtesy of CHRYSLER LLC

2. Remove the front door glass from the window opening in the door. See **REMOVAL**.

81966572

Fig. 120: Removing/Installing Run Channel
Courtesy of CHRYSLER LLC

3. Remove the run channel from the window opening in the door.

INSTALLATION

RUN CHANNEL - FRONT DOOR GLASS

81966572

Fig. 121: Removing/Installing Run Channel
Courtesy of CHRYSLER LLC

1. Install the run channel to the window opening in the door.

Fig. 122: Removing/Installing Front Door Glass
Courtesy of CHRYSLER LLC

2. Install the front door glass to the window opening in the door, see **INSTALLATION**.

Fig. 123: Electrical Connector, Carrier Plate, Screws & Door
Courtesy of CHRYSLER LLC

3. Install the carrier plate to the door, see **INSTALLATION**.
4. Cycle the window several times to make sure the window doesn't bind on the outer weather-strip or run channel.

PANEL - DOOR TRIM FRONT

REMOVAL

PANEL - DOOR TRIM FRONT

Fig. 124: Removing/Installing Trim Panel
Courtesy of CHRYSLER LLC

1. Remove the door handle trim bezel (6).
2. Remove the fastener (5) from the handle area of the front door trim (4).
3. Use a very thin pry tool to remove the cap screw covers (3) from the front door trim (4).
4. Remove the screws (2) from the front door trim (4).
5. Remove the power window switch and disconnect the electrical connector.
6. Disengage the trim panel from the four way locator at the handle area of the trim panel, then carefully remove the door trim panel (4) from the door (1) by lifting upward until removed from the door lock and the mounting attachments on the carrier plate.

INSTALLATION

PANEL - DOOR TRIM FRONT

Fig. 125: Removing/Installing Trim Panel
Courtesy of CHRYSLER LLC

CAUTION: Pay close attention to the plastic hook attachment points on the inside of the door trim panel. Make sure that every hook is correctly positioned to the door when installing the trim panel. Damage to the trim panel will occur if the hooks in the door panel are not properly positioned to the door during installation.

1. Connect the electrical connectors and install the power window switch.
2. Carefully install the door trim panel (4) to the door (1) by lifting upward and over the door lock into the trim panel then attach the trim panel to the carrier plate attachment points.
3. Install the screws (2) and the cap screw covers (3) to the front door trim (4).
4. Install the fastener (5) at the handle area of the front door trim (4) and tighten screw to 5.5 N.m (50 in. lbs.).
5. Install the door handle trim bezel (6).

REGULATOR - POWER WINDOW

REMOVAL

REGULATOR - POWER WINDOW

NOTE: The window regulator is part of the carrier plate and is not serviceable. Replace the carrier plate if the regulator fails.

1. Replace the carrier plate, see **REMOVAL**.

INSTALLATION

REGULATOR - POWER WINDOW

NOTE: The window regulator is part of the carrier plate and is not serviceable. Replace the carrier plate if the regulator fails.

1. Install the carrier plate, see **INSTALLATION**.

DOORS - REAR

CARRIER PLATE

REMOVAL

CARRIER PLATE - REAR DOOR

Fig. 126: Removing Battery Cable Terminal Clamp - Typical
 Courtesy of CHRYSLER LLC

CAUTION: Do not attempt to remove the trim panel the conventional way. This door panel has hooks holding it to the door rather than push pins. The door module must be removed as an assembly. Carefully follow these instructions in order to prevent unnecessary damage to the trim panel.

1. Loosen the battery terminal nut and use a battery terminal removal tool (2) to disconnect the negative battery cable from the battery (1).

Fig. 127: Removing/Installing Rear Door Trim Panel

Courtesy of CHRYSLER LLC

2. Remove the trim panel from the door, see **REMOVAL**.

Fig. 128: Removing/Installing Door Plug & Rear Exterior Handle Nut
Courtesy of CHRYSLER LLC

3. Remove the door plug (2).
4. Remove rear exterior handle nut (1).

Fig. 129: Window Regulator And Door Glass
Courtesy of CHRYSLER LLC

5. Access the window regulator through the hole in the carrier plate. Disconnect the window regulator (2) from the door glass (1) and support the glass.

81968a6a

Fig. 130: Removing/Installing Rear Door Latch Screws
 Courtesy of CHRYSLER LLC

6. Remove the three screws securing the door latch to the door shut face.

81967443

Fig. 131: Disconnecting/Connecting Door Harness Electrical Connector From/To Body Connector
 Courtesy of CHRYSLER LLC

7. Disconnect the door harness electrical connector (1) from the body connector (2) at the B-pillar.

Fig. 132: Electrical Connector, Carrier Plate, Screws & Door
 Courtesy of CHRYSLER LLC

8. Remove the 9 screws (3) from the carrier plate (2).
9. Remove the electrical connector (1) from the door (4).
10. Remove the carrier plate (2) from the door (4).

Fig. 133: Disconnecting/Installing Inside Lock Rod
 Courtesy of CHRYSLER LLC

NOTE: The window regulator is not serviceable. The new carrier plate will come equipped with the regulator assembly installed.

NOTE: All the lock rods are color coded to help identify the location for the particular lock rod.

11. Disconnect the inside lock rod from the latch.

Fig. 134: Inside Lock Rod, Grommet & Carrier Plate
 Courtesy of CHRYSLER LLC

12. Disengage the grommet (2) and remove the inside lock rod (1) from carrier plate (3).

Fig. 135: Disconnecting/Connecting Interior Handle Lock Rod
 Courtesy of CHRYSLER LLC

13. Disconnect the interior handle lock rod from the latch.

Fig. 136: Carrier & Interior Handle
 Courtesy of CHRYSLER LLC

14. Remove the interior lock rod from the interior handle.

Fig. 137: Removing/Installing Interior Handle Lock Rod And Grommet
 Courtesy of CHRYSLER LLC

15. Remove the interior handle lock rod and grommet from the carrier.

Fig. 138: Disconnecting/Connecting Latch Electrical Connector
Courtesy of CHRYSLER LLC

16. Disconnect the latch electrical connector.

Fig. 139: Carrier Plate Slots
Courtesy of CHRYSLER LLC

17. Turn the carrier plate over and slide the latch bracket assembly to remove from the carrier plate slots (1).

Fig. 140: Push Pin, Handle & Spring
 Courtesy of CHRYSLER LLC

18. Remove the push pin (1) from the handle.
19. Remove the spring (3) and handle (2) from the carrier.

Fig. 141: Disconnecting/Connecting Speaker Electrical Connector
 Courtesy of CHRYSLER LLC

20. Disconnect the speaker electrical connector.

819bs2d8

Fig. 142: Removing/Installing Speaker Bolts & Speaker
Courtesy of CHRYSLER LLC

21. Remove the speaker bolts and speaker from the carrier.

81a31c16

Fig. 143: Carrier Plate Electrical Harnesses & Motor Connectors
Courtesy of CHRYSLER LLC

22. Remove the electrical harness (1) from the carrier plate.
23. Release harness from all the hooks in the carrier plate.
24. Disconnect the connector (2) from the motor.
25. Remove the electrical harness (3) from the carrier plate.
26. Remove the harness from the carrier plate.

Fig. 144: Removing/Installing Screws And Window Motor
Courtesy of CHRYSLER LLC

27. Remove the screws and window motor from the carrier plate.

INSTALLATION

CARRIER PLATE - REAR DOOR

Fig. 145: Removing/Installing Screws And Window Motor
Courtesy of CHRYSLER LLC

1. Install the motor and screws to the carrier plate and tighten to 3.5 N.m (31 in. lbs.).

81a31c16

Fig. 146: Carrier Plate Electrical Harnesses & Motor Connectors
 Courtesy of CHRYSLER LLC

2. Install the harness to the carrier plate.
3. Install the electrical harness (3) and seat the rubber grommet into the carrier plate.
4. Connect the electrical connector (2) to the motor.
5. Route the harness through all of the hooks in the carrier plate.
6. Install the electrical harness (1) and seat the rubber grommet into the carrier plate.

819bs2d8

Fig. 147: Removing/Installing Speaker Bolts & Speaker
 Courtesy of CHRYSLER LLC

7. Install the speaker and bolts to the carrier and tighten to 1.5 N.m (13 in. lbs.).

819be2c2

Fig. 148: Disconnecting/Connecting Speaker Electrical Connector
 Courtesy of CHRYSLER LLC

8. Connect the speaker electrical connector.
9. Install speaker wire to wire clip.

819be294

Fig. 149: Push Pin, Handle & Spring
 Courtesy of CHRYSLER LLC

NOTE: Make sure that the push pin is seated flush with the carrier.

10. Install the handle (2) and spring (3) to the carrier.
11. Install the push pin (1) into the carrier, spring and the handle.

8190a0ef

Fig. 150: Identifying Carrier Plate Slots
Courtesy of CHRYSLER LLC

12. Install the latch bracket assembly to the carrier plate slots (1) then slide the latch bracket until fully seated.

81a3fc6e

Fig. 151: Disconnecting/Connecting Latch Electrical Connector
Courtesy of CHRYSLER LLC

13. Connect the latch electrical connector.

81a3fb13

Fig. 152: Removing/Installing Interior Handle Lock Rod And Grommet
Courtesy of CHRYSLER LLC

14. Install the interior handle lock rod into the carrier and seat the grommet.

81a3fb3c

Fig. 153: Carrier & Interior Handle
Courtesy of CHRYSLER LLC

NOTE: All the lock rods are color coded to help identify the location for the particular lock rod.

15. Install the interior lock rod to the interior handle (2). Make sure the lock rod is positioned properly to the carrier (1).

81a3fad7

Fig. 154: Disconnecting/Connecting Interior Handle Lock Rod
Courtesy of CHRYSLER LLC

16. Connect the interior handle lock rod to the latch.

81d39680

Fig. 155: Inside Lock Rod, Grommet & Carrier Plate
Courtesy of CHRYSLER LLC

17. Install the inside lock rod (1) to the carrier plate (3) and seat the grommet (2).

Fig. 156: Disconnecting/Installing Inside Lock Rod
 Courtesy of CHRYSLER LLC

18. Connect the inside lock rod to the latch.

Fig. 157: Electrical Connector, Carrier Plate, Screws & Door
 Courtesy of CHRYSLER LLC

19. Install the carrier plate (2) to the door (4).
20. Install the electrical connector (1) to the door (4) and connect the electrical connector.

81968a6a

Fig. 158: Removing/Installing Rear Door Latch Screws
Courtesy of CHRYSLER LLC

21. Install the screws securing the door latch to the door shut face and tighten screws to 7 N.m (60 in. lbs.).
22. Install the 9 screws to the carrier plate and tighten screws to 5.5 N.m (50 in. lbs.).

81967443

Fig. 159: Disconnecting/Connecting Door Harness Electrical Connector From/To Body Connector
Courtesy of CHRYSLER LLC

23. Connect the door harness electrical connector (1) to the body connector (2) at the B-pillar.

Fig. 160: Removing/Installing Door Plug & Rear Exterior Handle Nut
 Courtesy of CHRYSLER LLC

24. Install the rear nut (1) to the exterior handle and tighten to 4.5 N.m (40 in. lbs.).
25. Install the door plug (2) to the door.

Fig. 161: Window Regulator And Door Glass
 Courtesy of CHRYSLER LLC

NOTE: Place the glass in the full down position in order to access the window regulator.

26. Access the window regulator through the hole in the carrier plate. Connect the door glass (1) to the window regulator (2).
27. Apply the adhesive tape to the inspection hole of the carrier plate.

Fig. 162: Removing/Installing Rear Door Trim Panel
Courtesy of CHRYSLER LLC

28. Install the trim panel to the door, see **INSTALLATION**.
29. Connect the negative battery cable to the battery.

NOTE: Cycle the door lock, open with interior and exterior door handles and operate the power window to make sure everything is working properly and binding exists.

DOOR - REAR

REMOVAL

DOOR - REAR

Fig. 163: Removing Battery Cable Terminal Clamp - Typical
 Courtesy of CHRYSLER LLC

1. Loosen the battery terminal nut and use a battery terminal removal tool (2) to disconnect the negative battery cable from the battery (1).

Fig. 164: Disconnecting/Connecting Door Harness Electrical Connector From/To Body Connector
 Courtesy of CHRYSLER LLC

2. Disconnect the door harness electrical connector (1) from the body connector (2) at the B-pillar.

81967432

Fig. 165: Removing/Installing Upper/Lower Hinges, Door & Nuts
 Courtesy of CHRYSLER LLC

NOTE: Use a grease pencil or equivalent, mark the location of the upper (1) and lower (3) hinges on the door (2) for alignment during installation.

3. Support the rear door with a suitable lifting device.
4. Remove the nuts (4) attaching the door (2) to the upper (1) and lower (3) hinges.
5. Carefully remove the door (2) from the vehicle.

INSTALLATION

DOOR - REAR

81967432

Fig. 166: Removing/Installing Upper/Lower Hinges, Door & Nuts
 Courtesy of CHRYSLER LLC

1. Carefully position the door (2) to the upper (1) and lower (3) hinges using a suitable lifting device.

2. Loosely install the nuts (4) to the door studs and hinges at the B-pillar.
3. Align the door to the body using the reference marks made during the removal procedure.
4. Tighten the hinge to door nuts to 36.5 N.m (27 ft. lbs.).

Fig. 167: Disconnecting/Connecting Door Harness Electrical Connector From/To Body Connector
Courtesy of CHRYSLER LLC

5. Connect the door harness electrical connector (1) to the body connector (2) at the B-pillar.
6. Connect the negative battery cable.
7. Adjust the door as necessary. See **SPECIFICATIONS**.

ADJUSTMENTS

DOOR - REAR

NOTE: It is recommended that you adjust the rear door before adjusting the front door.

Door adjustment measurements should be taken from stationary or welded body panels like the roof, rocker or quarter panels.

During adjustment procedures, it is recommended that all the hinge fasteners be loosened except for the upper most fasteners. Adjustments can be made using the upper fasteners to hold the door with final torque of the fasteners occurring after correct door positioning is achieved.

FORE/AFT

NOTE: Fore/aft (lateral) door adjustment is done by loosening the hinge to the hinge pillar fasteners one hinge at a time and moving the door to the correct position.

1. Support the door with a suitable lifting device.
2. Loosen the hinge to hinge pillar fasteners. See **REMOVAL**.

3. Adjust the door to the correct position. See **SPECIFICATIONS**.
4. Tighten the hinge pillar fasteners to 26 N.m (19 ft. lbs.). See **INSTALLATION**.

NOTE: Use a suitable body sealer on the hinge to body mating surfaces.

UP/DOWN

NOTE: Up/down door adjustment is done by loosening either the hinge to the hinge pillar fasteners or the hinge to door fasteners and moving the door to the correct position.

NOTE: When the up/down adjustments are done correctly, the top of the door is positioned over flush to the roof. See **SPECIFICATIONS**.

1. Support the door with a suitable lifting device.
2. Remove the latch striker. See **REMOVAL**.
3. Loosen the hinge to hinge pillar fasteners (see **REMOVAL**) or loosen the hinge to door fasteners (see **REMOVAL**).
4. Adjust the door to the correct position. See **SPECIFICATIONS**.
5. Tighten the hinge pillar fasteners to 26 N.m (19 ft. lbs.) or the door to hinges fasteners to 36.5 N.m (27 ft. lbs.). See **INSTALLATION**.
6. Install the latch striker. See **INSTALLATION**.

IN/OUT

NOTE: In/out door adjustment is done by loosening the hinge to door fasteners one hinge at a time and moving the door to the correct position.

1. Support the door with a suitable lifting device.
2. Remove the latch striker. See **REMOVAL**.
3. Loosen the hinge to door fasteners. See **REMOVAL**.
4. Adjust the front of the door to the correct position. See **SPECIFICATIONS**.
5. Tighten the door to hinges fasteners to 36.5 N.m (27 ft. lbs.).
6. Install the latch striker. See **INSTALLATION**.

APPLIQUE - REAR DOOR

REMOVAL

APPLIQUE - REAR DOOR

Fig. 168: Removing/Installing Rear Door Applique
 Courtesy of CHRYSLER LLC

1. Use a trim stick C-4755 or equivalent, remove the door applique (1) from the rear door (2).

INSTALLATION

APPLIQUE - REAR DOOR

Fig. 169: Removing/Installing Rear Door Applique
 Courtesy of CHRYSLER LLC

1. Align the door applique (1) to the rear door (2) and apply enough hand pressure in order to make sure the clips are fully seated.

GLASS - REAR DOOR

REMOVAL

GLASS - REAR DOOR

Fig. 170: Removing/Installing Rear Door Trim Panel
Courtesy of CHRYSLER LLC

1. Remove the trim panel. See **REMOVAL**.

Fig. 171: Removing/Installing Inner Belt Molding Outboard
Courtesy of CHRYSLER LLC

2. Rotate the inner belt molding outboard while pulling up to disengage the retention tabs.

Fig. 172: Window Regulator And Door Glass
 Courtesy of CHRYSLER LLC

NOTE: Place the glass in the full down position in order to access the window regulator.

3. Access the window regulator through the hole in the carrier plate. Disconnect the window regulator (2) from the door glass (1).

Fig. 173: Rotating Glass Upward/Downward Inside Run Channel
 Courtesy of CHRYSLER LLC

NOTE: The following two graphics are shown with the carrier removed for clarity.

4. Rotate the glass upward inside the run channel.

8196b6fe

Fig. 174: Removing/Installing Rear Door Glass
Courtesy of CHRYSLER LLC

5. Remove the door glass from the window opening in the door.

INSTALLATION

GLASS - REAR DOOR

8196b6fe

Fig. 175: Removing/Installing Rear Door Glass
Courtesy of CHRYSLER LLC

NOTE: The following two graphics are shown with the carrier removed for clarity.

1. Install the door glass to the window opening in the door.

8198bc25

Fig. 176: Rotating Glass Upward/Downward Inside Run Channel
 Courtesy of CHRYSLER LLC

2. Rotate the glass downward into the run channel.

81d6535c

Fig. 177: Window Regulator And Door Glass
 Courtesy of CHRYSLER LLC

3. Access the window regulator through the hole in the carrier plate. Connect the door glass (1) to the window regulator (2).

8196aa73

Fig. 178: Removing/Installing Inner Belt Molding Outboard
Courtesy of CHRYSLER LLC

4. Press the belt molding onto the trim panel flange starting at the rear and working forward.

819678a

Fig. 179: Removing/Installing Rear Door Trim Panel
Courtesy of CHRYSLER LLC

5. Install the trim panel. See **INSTALLATION**.
6. Cycle the window several times to make sure the window doesn't bind on the outer weatherstrip or run channel.

HANDLE - EXTERIOR DOOR

REMOVAL

HANDLE - EXTERIOR DOOR

Fig. 180: Removing/Installing Rear Door Trim Panel
 Courtesy of CHRYSLER LLC

1. Remove the trim panel from the door, see **REMOVAL**.

Fig. 181: Removing/Installing Door Plug & Rear Exterior Handle Nut
 Courtesy of CHRYSLER LLC

2. Remove the door plug (2).
3. Remove rear exterior handle nut (1).

81968a22

Fig. 182: Electrical Connector, Carrier Plate, Screws & Door
 Courtesy of CHRYSLER LLC

4. Remove the carrier plate, see **REMOVAL**.

819c4044

Fig. 183: Removing/Installing Front Exterior Handle
 Courtesy of CHRYSLER LLC

5. Remove the front exterior handle nut and remove the handle from the door.

INSTALLATION

HANDLE - EXTERIOR DOOR

819c4044

Fig. 184: Removing/Installing Front Exterior Handle
 Courtesy of CHRYSLER LLC

1. Install the handle and front exterior handle nut to the door and tighten to 4.5 N.m (40 in. lbs.).

81968a22

Fig. 185: Electrical Connector, Carrier Plate, Screws & Door
 Courtesy of CHRYSLER LLC

2. Install the carrier plate to the door, see **INSTALLATION**.

Fig. 186: Removing/Installing Door Plug & Rear Exterior Handle Nut
 Courtesy of CHRYSLER LLC

NOTE: The door glass must be in the full up position in order to access the rear exterior handle nut. Use light and a magnetic socket on the rear nut to prevent from dropping the nut into the door assembly.

3. Install the rear nut (1) to the exterior handle and tighten to 4.5 N.m (40 in. lbs.).
4. Install the door plug (2) to the door.

Fig. 187: Removing/Installing Rear Door Trim Panel
 Courtesy of CHRYSLER LLC

5. Install the trim panel to the door, see **INSTALLATION**.

HANDLE - INTERIOR DOOR

REMOVAL

HANDLE - INTERIOR DOOR

1. Remove the door trim panel, see **REMOVAL**.
2. Remove the interior lock rod from the interior handle (2).

Fig. 189: Push Pin, Handle & Spring

Courtesy of CHRYSLER LLC

3. Remove the push pin (1) from the handle.
4. Remove the spring (3) and handle (2) from the carrier.

INSTALLATION

HANDLE - INTERIOR DOOR

Fig. 190: Push Pin, Handle & Spring
 Courtesy of CHRYSLER LLC

1. Install the handle (2) and spring (3) to the carrier.
2. Install the push pin (1) into the carrier, spring and the handle.

NOTE: Make sure that the push pin is seated flush with the carrier.

Fig. 191: Carrier & Interior Handle
 Courtesy of CHRYSLER LLC

3. Install the interior lock rod to the interior handle (2). Make sure the lock rod is positioned properly to the carrier (1).
4. Install the door trim panel, see **INSTALLATION**.

HINGE - REAR DOOR

REMOVAL

HINGE - REAR DOOR

81967432

Fig. 192: Removing/Installing Upper/Lower Hinges, Door & Nuts
Courtesy of CHRYSLER LLC

1. Remove the rear door, see **REMOVAL**.

819673ad

Fig. 193: Upper/Lower Door Hinge & Bolts
Courtesy of CHRYSLER LLC

NOTE: Use a grease pencil or equivalent, mark the location of the upper (1) and lower (3) hinge on the body of the lower B-pillar for alignment during installation.

2. Remove the bolts (2) that secure the upper door hinge (1) and lower door hinge (3) to the body of the B-pillar and remove the hinges.

INSTALLATION

HINGE - REAR DOOR

Fig. 194: Upper/Lower Door Hinge & Bolts
Courtesy of CHRYSLER LLC

1. Install the upper (1) and lower (3) hinges onto B-pillar and loosely install the bolts (2).
2. Align the hinges to the B-pillar using the reference marks made during the removal procedure and tighten the bolts to 26 N.m (19 ft. lbs.).

Fig. 195: Removing/Installing Upper/Lower Hinges, Door & Nuts
Courtesy of CHRYSLER LLC

3. Install the rear door, see INSTALLATION.

LATCH - REAR DOOR

REMOVAL

LATCH - REAR DOOR

81968a22

Fig. 196: Electrical Connector, Carrier Plate, Screws & Door
Courtesy of CHRYSLER LLC

1. Remove the carrier plate, see **REMOVAL**.

81a3fc6e

Fig. 197: Disconnecting/Connecting Latch Electrical Connector
Courtesy of CHRYSLER LLC

2. Disconnect the latch electrical connector.

Fig. 198: Carrier Plate Slots
 Courtesy of CHRYSLER LLC

3. Turn the carrier plate over and slide the latch bracket assembly to remove from carrier.

Fig. 199: Release Rod & Swing Clips
 Courtesy of CHRYSLER LLC

NOTE: All the lock rods are color coded to help identify the location for the particular lock rod.

4. Remove the release rod (1) by disengaging the two swing clips (2).

819c1137

Fig. 200: Removing/Installing First Latch Attachment Point
 Courtesy of CHRYSLER LLC

NOTE: The latch has three attachment points to the latch bracket.

5. Remove the first latch attachment point from the latch bracket.

819c1148

Fig. 201: Removing/Installing Second Latch Attachment Point
 Courtesy of CHRYSLER LLC

6. Remove the second latch attachment point from the latch bracket.

819c118e

Fig. 202: Removing/Installing Third Latch Attachment Point
 Courtesy of CHRYSLER LLC

7. Remove the third latch attachment point from the latch bracket and remove the latch from the latch bracket.

INSTALLATION

LATCH - REAR DOOR

819c1137

Fig. 203: Removing/Installing First Latch Attachment Point
 Courtesy of CHRYSLER LLC

NOTE: The latch has three attachment points to the latch bracket and need to be attached in the following order:

1. Install the first latch attachment point to the latch bracket.

819c118e

Fig. 204: Removing/Installing Third Latch Attachment Point
 Courtesy of CHRYSLER LLC

2. It is necessary to align the third attachment point prior to attaching the second point, but do not attach at this time.

819c1148

Fig. 205: Removing/Installing Second Latch Attachment Point
 Courtesy of CHRYSLER LLC

3. Install the second latch attachment point to the latch bracket.

819c118e

Fig. 206: Removing/Installing Third Latch Attachment Point
 Courtesy of CHRYSLER LLC

4. Install the third latch attachment point to the latch bracket.

819c11b3

Fig. 207: Release Rod & Swing Clips
 Courtesy of CHRYSLER LLC

5. Install the release rod (1) then engage the two swing clips (2).

8190a0ef

Fig. 208: Identifying Carrier Plate Slots
 Courtesy of CHRYSLER LLC

6. Install the latch bracket assembly to the carrier plate slots (1) then slide the latch bracket until fully seated.

81a31c6e

Fig. 209: Disconnecting/Connecting Latch Electrical Connector
 Courtesy of CHRYSLER LLC

7. Connect the latch electrical connector.

81968a22

Fig. 210: Electrical Connector, Carrier Plate, Screws & Door
 Courtesy of CHRYSLER LLC

8. Install the carrier plate, see INSTALLATION.

81d3b1ab

Fig. 211: Adjusting Rear Door Latch
 Courtesy of CHRYSLER LLC

9. Adjust the latch as needed, see ADJUSTMENTS.

ADJUSTMENTS

LATCH - REAR DOOR

81d3b1ab

Fig. 212: Adjusting Rear Door Latch

Courtesy of CHRYSLER LLC

1. Locate the access hole on door (1) and remove tape (2) covering it.
2. Insert a 5/32" hex-wrench through hole and into adjustment screw. Loosen screw.
3. Operate outside handle several times to release any restriction because of mis-alignment.
4. Tighten adjustment screw to 4.5 N.m (40 in. lbs.).
5. Test handle for proper operation.

STRIKER - REAR DOOR LATCH

REMOVAL

STRIKER - REAR DOOR LATCH

81963895

Fig. 213: Striker Loop, Bolts, Striker & B-Pillar

Courtesy of CHRYSLER LLC

1. Remove the bolts (2) from the striker latch (3).
2. Remove the latch striker (3) from the B-pillar (4).

INSTALLATION

STRIKER - REAR DOOR LATCH

819638F5

Fig. 214: Striker Loop, Bolts, Striker & B-Pillar
Courtesy of CHRYSLER LLC

NOTE: The striker needs to be properly orientated to the B-pillar. The striker loop (1) must be installed to the inboard side of the B-pillar.

1. Install the striker (3) to the B-pillar (4).
2. Install the bolts (2) and tighten to 26 N.m (19 ft. lbs.).
3. Adjust the door as necessary, see **SPECIFICATIONS**.

RUN - REAR DOOR GLASS

REMOVAL

RUN - REAR DOOR GLASS

81968a22

Fig. 215: Electrical Connector, Carrier Plate, Screws & Door
 Courtesy of CHRYSLER LLC

1. Remove the carrier plate from the door, see **REMOVAL**.

81968bfe

Fig. 216: Removing/Installing Rear Door Glass
 Courtesy of CHRYSLER LLC

2. Remove the rear door glass from the window opening in the door, see **REMOVAL**.

8198b5bc

Fig. 217: Removing/Installing Run Channel
Courtesy of CHRYSLER LLC

3. Remove the run channel from the window opening in the door.

INSTALLATION

RUN - REAR DOOR GLASS

8198b5bc

Fig. 218: Removing/Installing Run Channel
Courtesy of CHRYSLER LLC

1. Install the run channel to the window opening in the door.

Fig. 219: Removing/Installing Rear Door Glass
 Courtesy of CHRYSLER LLC

2. Install the rear door glass to the window opening in the door, see **INSTALLATION**.

Fig. 220: Electrical Connector, Carrier Plate, Screws & Door
 Courtesy of CHRYSLER LLC

3. Install the carrier plate to the door, see **INSTALLATION**.
4. Cycle the window several times to make sure the window doesn't bind on the outer weatherstrip or run channel.

PANEL - DOOR TRIM REAR

REMOVAL

PANEL - DOOR TRIM REAR

Fig. 221: Removing/Installing Rear Door Trim Panel
Courtesy of CHRYSLER LLC

1. Remove the door handle trim bezel (6).
2. Remove the fastener (5) from the handle area of the front door trim (4).
3. Use a very thin pry tool to remove the cap screw covers (3) from the door trim (4).
4. Remove the screws (2) from the front door trim (4).
5. Remove the power window switch and disconnect the electrical connector.
6. Disengage the trim panel from the four way locator at the handle area of the trim panel, then carefully remove the door trim panel (4) from the door (1) by lifting upward until removed from the door lock and the mounting attachments on the carrier plate.

INSTALLATION

PANEL - DOOR TRIM REAR

Fig. 222: Removing/Installing Rear Door Trim Panel
Courtesy of CHRYSLER LLC

1. Carefully install the door trim panel (4) to the door (1) by lifting upward and over the door lock into the trim panel then attach the trim panel to the carrier plate attachment points.
2. Connect the electrical connector and install the power window switch.
3. Install the screws (2) to the front door trim (4).
4. Install the cap screw covers (3) to the front door trim (4).
5. Install the fastener (5) at the handle area of the front door trim (4) and tighten screw to 5.5 N.m (50 in. lbs.).
6. Install the door handle trim bezel (6).

REGULATOR - POWER WINDOW

REMOVAL

REGULATOR - POWER WINDOW

NOTE: The window regulator is part of the carrier plate and is not serviceable. Replace the carrier plate if the regulator fails.

1. Replace the carrier plate, see **REMOVAL**.

INSTALLATION

REGULATOR - POWER WINDOW

NOTE: The window regulator is part of the carrier plate and is not serviceable. Replace the carrier plate if the regulator fails.

1. Install the carrier plate, see **INSTALLATION**.

EXTERIOR

APPLIQUE - FRONT FENDER

REMOVAL

APPLIQUE - FRONT FENDER

81948b50

Fig. 223: Screws, Fender & Applique
Courtesy of CHRYSLER LLC

1. Remove the two screws (1) from the fender applique (3).
2. Use a trim stick C-4755 or equivalent, separate the fender applique (3) from the fender (2).

INSTALLATION

APPLIQUE - FRONT FENDER

81948b50

Fig. 224: Screws, Fender & Applique
Courtesy of CHRYSLER LLC

1. Align the fender applique (3) to the fender assembly (2) and apply enough hand pressure in order to make sure the clips are fully seated.
2. Install the two screws (1) to the fender applique (3).

RADIATOR CROSSMEMBER

REMOVAL

CROSSMEMBER - RADIATOR CLOSURE P

80cb3944

Fig. 225: Radiator Crossmember
Courtesy of CHRYSLER LLC

- 1 - CROSSMEMBER
- 2 - RIVETS
- 3 - BOLTS (4)
- 4 - BOLTS (2)
- 5 - HOOD LATCH SUPPORT

1. Remove the grille, see **REMOVAL**.
2. Remove the hood latch, see **REMOVAL**.
3. Remove the rivet securing the washer bottle to the crossmember.
4. Remove the rivets attaching the hood latch support to the crossmember.
5. Remove the bolts (4) and remove the hood latch support (5).

6. Remove the bolts (3) and remove the crossmember (1).

INSTALLATION

CROSSMEMBER - RADIATOR CLOSURE P

80cb3944

Fig. 226: Radiator Crossmember
Courtesy of CHRYSLER LLC

- 1 - CROSSMEMBER
- 2 - RIVETS
- 3 - BOLTS (4)
- 4 - BOLTS (2)
- 5 - HOOD LATCH SUPPORT

1. Install the crossmember (1) and install the bolts (3).
2. Tighten the bolts to 10 N.m (85 in. lbs.).
3. Install the hood latch support (5) and install the bolts (4).

4. Tighten the bolts to 10 N.m (85 in. lbs.).
5. Install new rivets (2) attaching the hood latch support to the crossmember.
6. Install the hood latch, see **INSTALLATION**.
7. Install the grille, see **INSTALLATION**.
8. Install a new rivet securing the washer bottle to the crossmember.

DOOR - FUEL FILL

REMOVAL

DOOR - FUEL FILL

80ce9fd1

Fig. 227: Fuel Fill Door/Housing
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - FUEL FILL DOOR
2 - HOUSING TABS |
|--|

1. Remove the fuel cap.

2. Remove the three screws connecting the fuel door/housing to the filler neck.
3. Reach in through the opening and depress the tabs (2) at the upper and bottom right of the door/housing.
4. Remove the fuel door/housing from the vehicle.

INSTALLATION

DOOR - FUEL FILL

Fig. 228: Fuel Fill Door/Housing
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - FUEL FILL DOOR
2 - HOUSING TABS |
|--|

1. Position the fuel filler door/housing into the vehicle and fully seat the tabs (2).
2. Install the three screws.
3. Install the fuel cap.

FENDER - FRONT

REMOVAL

FENDER - FRONT

Fig. 229: Removing/Installing Fascia Assembly
Courtesy of CHRYSLER LLC

1 - Fascia Support Bracket
2 - Fastener
3 - Carrier
4 - Fog Lamp Connectors
5 - Fascia
6 - Push Pins
7 - Rivet

1. Remove the front fascia, refer to **REMOVAL** .
2. Remove the front fascia support bracket (1).
3. Remove the grille, see **REMOVAL**.

81948b50

Fig. 230: Screws, Fender & Applique
 Courtesy of CHRYSLER LLC

4. Remove the two screws (1) from the fender applique (3).
5. Use a trim stick C-4755 or equivalent, separate the fender applique (3) from the fender (2).
6. Remove the front wheel opening flare molding, see **REMOVAL**.

819abdac

Fig. 231: Removing/Installing Fender
 Courtesy of CHRYSLER LLC

7. Remove the bolts and remove the fender.

INSTALLATION

FENDER - FRONT

Fig. 232: Removing/Installing Fender
Courtesy of CHRYSLER LLC

NOTE: Follow the mandatory torque sequence when tightening the fender bolts.

1. Align the fender with adjacent body parts, install and tighten bolt (2) first then tighten bolt (1) then all remaining bolts (3). Tighten all bolts to 9 N.m (80 in. lbs.). Make sure there are no excessive gaps between the fender and the door assemblies, see **SPECIFICATIONS**.
2. Install the front wheel opening flare molding, see **INSTALLATION**.

Fig. 233: Screws, Fender & Applique
Courtesy of CHRYSLER LLC

3. Align the fender applique (3) to the fender assembly (2) and apply enough hand pressure in order to make sure the clips are fully seated.
4. Install the two screws (1) to the fender applique (3).
5. Install the grille, see **INSTALLATION**.

Fig. 234: Removing/Installing Fascia Assembly
Courtesy of CHRYSLER LLC

1 - Fascia Support Bracket
2 - Fastener
3 - Carrier
4 - Fog Lamp Connectors
5 - Fascia
6 - Push Pins
7 - Rivet

6. Install the fender support bracket (1).
7. Install the fascia assembly, refer to **INSTALLATION** .

GLASS - OUTSIDE REARVIEW MIRROR

REMOVAL

GLASS - OUTSIDE REARVIEW MIRROR

WARNING: Always wear eye and hand protection when servicing the mirror assembly. Failure to observe these warnings may result in personal injury from broken glass.

1. Carefully pull/pry the broken glass holder from the mirror assembly.
2. Disconnect the heated mirror electrical connectors from the terminals on the mirror glass holder, if equipped.

INSTALLATION

GLASS - OUTSIDE REARVIEW MIRROR

CAUTION: It is important to make sure the motor is square to the glass holder (attaching fingers) prior to glass holder attachment, otherwise the glass holder could be installed incorrectly causing poor retention and possible repeat failure.

1. Position the new mirror glass holder to the mirror assembly.

NOTE: Position the mirror glass holder so that the moisture drain hole on the mirror glass holder assembly is facing downward.

2. Align the mirror glass holder's attaching fingers to the mirror motor housing.

NOTE: Ensure that the protective rubber cover of the mirror motor housing is positioned correctly around the bottom of the fingers area.

3. Using one hand, firmly press the mirror glass holder assembly into place while at the same time supporting the housing assembly from the backside with the other hand.

NOTE: Pressure must be applied equally over the center portion of the mirror to engage the mirror glass holder's attaching fingers to the corresponding fingers on the housing assembly. One or more clicks may be heard when finger engagement takes place.

4. Verify retention of the mirror glass holder assembly by gently pulling outward on the mirror glass holder.

GRILLE - RADIATOR

REMOVAL

GRILLE - RADIATOR

Fig. 235: Grille Torx Screws

Courtesy of CHRYSLER LLC

1. Remove the torx screws (1) from the grille to radiator support.
2. Remove the torx screw (2) from the grille to fender.

Fig. 236: Grille Torx Screws RT
Courtesy of CHRYSLER LLC

3. Raise and support the hood.
4. Remove the torx screws (1) from the grille to radiator support.
5. Remove the torx screw (2) from the grille to fender.

Fig. 237: Removing/Installing Grille Push Pins
Courtesy of CHRYSLER LLC

6. Remove the push pins (1) from the grille.

81953530

Fig. 238: Grille Side Fastener
 Courtesy of CHRYSLER LLC

7. Carefully pull on the grille assembly to release the fasteners on both sides of the grille.
8. Remove the front lamp, side marker lamp and the turn signal lamp connectors.

81953550

Fig. 239: Grille Lower Fastener
 Courtesy of CHRYSLER LLC

9. Carefully pull on the grille assembly to release the fasteners located on the lower part of the grille.
10. Remove the front lamp units from both sides of the grille, refer to **REMOVAL** .

INSTALLATION

GRILLE - RADIATOR

81953550

Fig. 240: Grille Lower Fastener
Courtesy of CHRYSLER LLC

1. Install the front lamp units to both sides of the grille, refer to **INSTALLATION** .
2. Install the grille to the vehicle and connect the front lamp, side marker lamp and the turn signal lamp connectors.
3. Carefully push the lower part of the grille until the lower grille fasteners lock properly into position.

81953530

Fig. 241: Grille Side Fastener
Courtesy of CHRYSLER LLC

NOTE: This step requires proper positioning of the grille so as both side of the grille are installed at the same time.

4. Position properly then carefully push the sides of the grille until the fasteners lock properly into position.

81952ab8

Fig. 242: Removing/Installing Grille Push Pins
 Courtesy of CHRYSLER LLC

5. Install the push pins (1) to the grille.

81952a9c

Fig. 243: Grille Torx Screws
 Courtesy of CHRYSLER LLC

6. Install the torx screw (2) to the left side of the grille and fender.
7. Install the torx screws (1) to the left side of the grille and the radiator support.

Fig. 244: Grille Torx Screws RT
Courtesy of CHRYSLER LLC

8. Install the torx screw (2) to the right side of the grille and fender.
9. Install the torx screws (1) to the right side of the grille and the radiator support.
10. Lower the hood.

MIRROR - OUTSIDE REARVIEW

REMOVAL

MIRROR - OUTSIDE REARVIEW

Courtesy of CHRYSLER LLC

- | |
|-------------------------------------|
| 1 - MIRROR ASSEMBLY
2 - NUTS (3) |
|-------------------------------------|

3 - ELECTRICAL CONNECTOR

1. Partially remove the door trim panel as necessary to gain access to the mirror. See **REMOVAL**.
2. Disconnect the electrical connector (3).
3. Remove the three nuts (2) and remove the mirror assembly (1).

INSTALLATION

MIRROR - OUTSIDE REARVIEW

Fig. 246: Mirror Assembly, Nuts & Electrical Connector
Courtesy of CHRYSLER LLC

- | |
|---|
| <ul style="list-style-type: none">1 - MIRROR ASSEMBLY2 - NUTS (3)3 - ELECTRICAL CONNECTOR |
|---|

1. Install the mirror assembly (1).
2. Install the three nuts (2) and tighten to 7 N.m (65 in. lbs.).
3. Connect the electrical connector (3).
4. Install the trim panel, see **INSTALLATION**.

MOLDING - FRONT AND REAR DOOR

REMOVAL

MOLDING - FRONT AND REAR DOOR

Fig. 247: Removing/Installing Front/Rear Door Molding
 Courtesy of CHRYSLER LLC

1. Using a trim stick C-4755 or equivalent, remove and discard the molding (1) from the outside of the door (2).

INSTALLATION

MOLDING - FRONT AND REAR DOOR

Fig. 248: Removing/Installing Front/Rear Door Molding
 Courtesy of CHRYSLER LLC

1. Thoroughly clean all residue from the body side molding attachment area of the door.
2. Wipe area clean with a 50% solution of water and alcohol and wipe dry.
3. Apply new body side molding (1) using the locators in the door (2) and apply pressure of approximately 40 p.s.i. over the entire surface of the molding.

MOLDING - FRONT WHEEL OPENING FLARE

REMOVAL

MOLDING - FRONT WHEEL OPENING FLARE

Fig. 249: Removing/Installing Rivets Connecting Fender Flare To Wheel House Liner
Courtesy of CHRYSLER LLC

1. Remove four rivets connecting the fender flare to the wheel house liner.

Fig. 250: Removing/Installing Fender Flare Molding
Courtesy of CHRYSLER LLC

- | |
|-------------------------|
| 1 - Front Flare Clip |
| 2 - Rear Flare Clip |
| 3 - Front Flare Molding |

2. Using a trim stick C-4755 or equivalent, separate the front flare clips from the front of the molding (1), and rear flare clips from the rear of the molding (2).
3. Remove the fender flare molding (3) from the fender.

INSTALLATION

MOLDING - FRONT WHEEL OPENING FLARE

Fig. 251: Removing/Installing Fender Flare Molding
Courtesy of CHRYSLER LLC

- | |
|-------------------------|
| 1 - Front Flare Clip |
| 2 - Rear Flare Clip |
| 3 - Front Flare Molding |

1. Position and install the front of the molding (1) and the rear of the molding (2) to the fender.
2. Align the front fender molding (3) to the fender assembly and apply enough hand pressure in order to make sure the clips are fully seated.

Fig. 252: Removing/Installing Rivets Connecting Fender Flare To Wheel House Liner
 Courtesy of CHRYSLER LLC

3. Install four rivets connecting the front fender flare molding to the wheel house liner.

MOLDING - REAR WHEEL OPENING FLARE

REMOVAL

Fig. 253: Rear Wheel Flare Molding - Front
 Courtesy of CHRYSLER LLC

- | |
|-------------------------|
| 1 - Door |
| 2 - Rivets |
| 3 - Front Flare Molding |

1. Raise and support the vehicle.
2. Open the rear door and remove the rivets (2) from the inside surface of the door (1).
3. Using a trim stick C-4755 or equivalent, separate the clips attaching the molding (3) to the door (1) and remove the molding.

Fig. 254: Rear Wheel Flare Molding - Rear
Courtesy of CHRYSLER LLC

1 - Body
2 - Rear Fascia
3 - Rear Flare Molding
4 - Rivets

4. Remove the tire and wheel in order to gain access to the rear wheel flare molding.
5. Remove the rivets (4) attaching the rear flare molding (3) to the body (1) and rear fascia (2).
6. Using a trim stick C-4755 or equivalent, separate the clips attaching the molding (3) to the body (1) and the rear fascia (2) and remove the molding.

INSTALLATION

MOLDING - REAR WHEEL OPENING FLARE

Fig. 255: Rear Wheel Flare Molding - Rear
 Courtesy of CHRYSLER LLC

1 - Body
2 - Rear Fascia
3 - Rear Flare Molding
4 - Rivets

1. Position and install the molding (3) to the body (1) and the rear fascia (2), then apply enough hand pressure in order to make sure the clips are fully seated.
2. Install rivets (4) attaching the rear flare molding (3) to the wheel house liner, the body (1) and the rear fascia (2).

Fig. 256: Rear Wheel Flare Molding - Front
 Courtesy of CHRYSLER LLC

1 - Door

2 - Rivets
3 - Front Flare Molding

3. Position and install the molding (3) to the door (1), then apply enough hand pressure in order to make sure the clips are fully seated.
4. Open the rear door and install rivets (2) to the inside surface of the door (1) and into the molding (3).
5. Install wheel and tire and torque the wheel nuts to 136 N.m (100 ft. lbs.).

MOLDING - SILL

REMOVAL

MOLDING - SILL

Fig. 257: Removing/Installing Sill Molding
Courtesy of CHRYSLER LLC

1. Raise and support the vehicle.
2. Use a trim tool C-4755 or equivalent, remove the push pins located at the rear wheel opening (1).
3. Remove the push pins located at the front wheel opening (2).
4. Remove the eight rivets (3) from the sill molding and remove the sill molding from the vehicle.

INSTALLATION

MOLDING - SILL

81955376

Fig. 258: Removing/Installing Sill Molding
Courtesy of CHRYSLER LLC

1. Install the sill molding to the vehicle and install the eight rivets (3) to the sill molding.
2. Install the push pins located at the front wheel opening (2).
3. Install the push pins located at the rear wheel opening (1).

NAME PLATES - EXTERIOR

REMOVAL

NAME PLATES - EXTERIOR

81b6b9a9

Fig. 259: Identifying Side Name Plate (NITRO, R/T And SLT)
Courtesy of CHRYSLER LLC

1. Apply a length of masking tape on the body, parallel to the top edge of the nameplate to use as a guide, if necessary.

Fig. 260: Identifying Name Plate (Dodge, 4x4, 4.0L And CRD)
Courtesy of CHRYSLER LLC

2. Apply a length of masking tape on the body, parallel to the top edge of the nameplate to use as a guide, if necessary.

NOTE: **Exterior nameplates are attached to body panels with adhesive tape.**

3. If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun. Do not exceed 52°C (120°F) when heating emblem.

CAUTION: Use care when separating the emblem from the body surface to avoid scratching the paint.

4. Using a trim stick C-4755 or equivalent, behind the emblem to separate the adhesive backing from the body.
5. Clean adhesive residue from body with MOPAR® Super Clean solvent or equivalent.

INSTALLATION

NAME PLATES - EXTERIOR

Fig. 261: Identifying Name Plate (Dodge, 4x4 And 4.0L)
 Courtesy of CHRYSLER LLC

NOTE: Before applying the emblem, clean the body surface with MOPAR® Super Kleen solvent or equivalent.

1. Remove protective cover from adhesive tape on back of emblem.
2. Position the correct emblem properly on the body.

Fig. 262: Identifying Side Name Plate (NITRO, R/T, SLT And CRD)
 Courtesy of CHRYSLER LLC

3. Position the correct emblem properly on the body.
4. Press emblem firmly to the body with the palm of hand.
5. If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun to assure adhesion. Do not exceed 52°C (120°F) when heating emblem.

PANEL - A-PILLAR

REMOVAL

PANEL - A-PILLAR

Fig. 263: Push Pin, Windshield A-Pillar Molding & Clips
Courtesy of CHRYSLER LLC

- 1. Using a trim stick C-4755 or equivalent, remove the push pin (1).
- 2. Remove the windshield A-pillar molding (2) and clips (3) from the windshield A-pillar.

INSTALLATION

PANEL - A-PILLAR

Fig. 264: Push Pin, Windshield A-Pillar Molding & Clips
Courtesy of CHRYSLER LLC

1. Install the windshield A-pillar molding (2) and clips (3) to the windshield A-pillar.
2. Install the push pin (1).

RACK - LUGGAGE

REMOVAL

RACK - LUGGAGE

81940091

Courtesy of CHRYSLER LLC

- | |
|---------------------------------------|
| 1 - Nuts
2 - Roof Rack
3 - Roof |
|---------------------------------------|

1. Remove the five nuts (1) from the roof rack (2).
2. Remove the roof rack (2) from the roof (3).

INSTALLATION

RACK - LUGGAGE

Fig. 266: Roof Rack Assembly
Courtesy of CHRYSLER LLC

- | |
|---------------------------------------|
| 1 - Nuts
2 - Roof Rack
3 - Roof |
|---------------------------------------|

1. Carefully install the roof rack (2) to the roof (3).
2. Install five nuts (1) and tighten the nuts to 6.2 N.m (55 in. lbs.).

RUNNING BOARD - FULL

REMOVAL

RUNNING BOARD - FULL

Fig. 267: Running Board
Courtesy of CHRYSLER LLC

1. Remove the running board bolts (3).
2. Remove the running board nut (2).
3. Remove the running board (4) from the vehicle.
4. Remove the u-clip fasteners (1) from the vehicle body.

INSTALLATION

RUNNING BOARD - FULL

Fig. 268: Running Board
Courtesy of CHRYSLER LLC

1. Install the u-clip fasteners (1) to the vehicle body.
2. Install the running board (4) and the nut (2) to the vehicle.
3. Install the running board bolts (3). Tighten the running board bolts (3) and nut (2) to 25 N.m (18.5 ft. lbs.).

SCREEN - TOP COWL

REMOVAL

SCREEN - TOP COWL

8194dc06

Fig. 269: Cowl Grille, Push Pins, Hood Seal & Body
Courtesy of CHRYSLER LLC

1. Remove the wiper arms, refer to **REMOVAL** .
2. Remove the hood seal (3).
3. Use a trim stick C-4755 or equivalent, separate the cover assembly from the A-pillar.
4. Remove the push pins (2) and remove the cowl grille (1) from the body (4).

INSTALLATION

SCREEN - TOP COWL

8194dc06

Fig. 270: Cowl Grille, Push Pins, Hood Seal & Body
Courtesy of CHRYSLER LLC

1. Position the cowl grille (1) and engage the clips to the bottom of the windshield.
2. Install the push pins (2) through the cowl grille (1) and into the body (4).
3. Install the hood seal (3).

4. Install the wiper arms, refer to **INSTALLATION** .

SHIELD - FRONT WHEELHOUSE SPLASH

REMOVAL

SHIELD - FRONT WHEELHOUSE SPLASH

Fig. 271: Removing/Installing Rivets Connecting Fender Flare To Wheel House Liner
Courtesy of CHRYSLER LLC

1. Raise and support the vehicle, refer to **STANDARD PROCEDURE** .
2. Remove the wheel and tire to gain access to the front wheel house liner.
3. Carefully remove four rivets from the front fender flare molding.

Fig. 272: Front Wheel House Splash Shield
Courtesy of CHRYSLER LLC

1 - FRONT WHEEL HOUSE LINER
2 - PUSH PINS
3 - RIVET
4 - PUSH PIN
5 - PUSH PINS

4. Remove the rivet (3) securing the wheel house liner to the lower front fascia.
5. Remove all push pins from wheel house liner.
6. Remove the wheel speed sensor harness from the wheel house liner.
7. Remove front wheel house liner from front wheel house opening.

INSTALLATION

SHIELD - FRONT WHEELHOUSE SPLASH

Fig. 273: Front Wheel House Splash Shield
Courtesy of CHRYSLER LLC

1 - FRONT WHEEL HOUSE LINER
2 - PUSH PINS
3 - RIVET
4 - PUSH PIN
5 - PUSH PINS

1. Install front wheel house liner (1) into front wheel house opening.
2. Install the wheel speed sensor harness to the wheel house liner.
3. Align and install three push pins (5) into holes in the wheel house liner and fender inner wheelhouse.
4. Align and install three push pins (2) into holes in the wheel house liner and front fascia.
5. Install the rivet (4) connecting the splash shield to the side sill molding.

6. Install all remaining push pins.
7. Install the rivet (3) into the hole in the wheel house liner and lower front fascia.

Fig. 274: Removing/Installing Rivets Connecting Fender Flare To Wheel House Liner
Courtesy of CHRYSLER LLC

8. Install four rivets to the front fender flare molding, wheel house liner and the fender.
9. Install wheel and tire and torque the wheel nuts to 136 N.m (100 ft. lbs.).

SHIELD - REAR WHEELHOUSE SPLASH

REMOVAL

SHIELD - REAR WHEELHOUSE SPLASH

Fig. 275: Rear Wheelhouse Splash Shield
Courtesy of CHRYSLER LLC

1. Remove the rear wheel flare molding, see **REMOVAL**.
2. Remove the two push pins securing the sill plate molding to the wheel liner and body.
3. Remove the four push pins (3) at the wheelhouse opening (1).
4. Remove the wheel liner (2) from the wheelhouse opening (1).

INSTALLATION

SHIELD - REAR WHEELHOUSE SPLASH

Fig. 276: Rear Wheelhouse Splash Shield
Courtesy of CHRYSLER LLC

1. Install the wheel house liner (2) to the wheel house opening (1).
2. Install the four push pins (3) to the wheel house liner (2).
3. Install the two push pins securing the sill plate molding and the wheel house liner to the body.
4. Install the rear wheel flare molding, see **INSTALLATION**.

FULL OPEN RETRACTABLE ROOF

DESCRIPTION

FULL OPEN RETRACTABLE ROOF

This vehicle is available with the Full Open Retractable Roof (FORR) option. Marketed as Sky Slider™, the unit is made of reinforced acrylic cloth, similar to a convertible top. The material can be collected to the rear of the vehicle or over the front occupant.

Features

Sky Slider™ offers a convenient express one-touch switch for opening and closing, allowing for operator interruption for infinite positioning

The fabric roof can be gathered fully forward, or fully rearward, or partially opened to any position in-between

The top panel nests into the weather-strip seal to minimize wind noise. Factory installation ensures optimum fit, finish and function

A color-keyed, decorative molding joins the FORR assembly to the headliner

The FORR assembly is equipped with a matching headliner

The full-length open roof assembly is attached to the vehicle through a unique roof structure to facilitate similar performance in noise, wind and crash safety as the standard vehicle. This structure is then bonded to the body side reinforcement system.

OPERATION

FULL OPEN RETRACTABLE ROOF

Automatic Roof Operation (Auto Mode)

Automatic Operation is movement of the roof to either the full open or full closed position without the vehicle operator continually pressing one of the three roof switch buttons. Anti-pinch detection is active in auto mode.

Pressing one of the three roof switch buttons for less than 500 milliseconds will result in the roof moving automatically. The roof will continue movement until either the full open or full closed position is reached or the vehicle operator interrupts movement by pressing any roof switch button.

Manual Roof Operation (Manual Mode)

Manual Operation is movement of the roof while the vehicle operator is continually pressing one of the three roof switch buttons. Roof movement is stopped as soon as the button is released. Anti-pinch detection is not active in manual mode.

Pressing one of the three roof switch buttons for more than 500 milliseconds will result in the roof moving manually. While in manual mode, the roof will move in the desired direction until either the full open or full closed position is reached or the roof switch button is released.

Front Open

To open the Front of the roof from the closed position press the vehicle **most rearward** roof switch button. Once the roof is in the **front open mode**, only the front of the roof can be controlled by the vehicle operator. Use the vehicle **most rearward** roof switch button to further open the roof, or the vehicle **most forward** roof switch button to close the roof. Once the roof is fully closed the roof will exit the **front open mode**.

Rear Open

To open the Rear of the roof from the closed position press the vehicle **most forward** roof switch button. Once the roof is in the **rear open mode**, only the rear of the roof can be controlled by the vehicle operator. Use the vehicle **most forward** roof switch button to further open the roof, or the vehicle **most rearward** roof switch button to close the roof. Once the roof is fully closed the roof will exit the **rear open mode**.

Global Close

Pressing the roof switch center button with the roof in any position other than closed position, will result in the roof closing. A short press for less than 500 milliseconds will result in automatic mode closing, and a long press for more than 500 milliseconds will result in manual mode closing.

Power Modes Of Operation

The Electronic Control Unit (ECU) (sometimes referred to as the Power Top Control Module) will function as follows in respect to Country Code Configuration:

Key out door open - (No Function all Markets)

Remote Start active - (No Function all Markets)

Accessory Delay, Front Doors closed, key out - (Manual & Automatic Function for North American Markets) (Manual Function Only for Non-North American Markets)

Key in Accessory Mode - (Manual & Automatic Function for North American Markets) (Manual Function Only for Non-North American Markets)

Ignition On (Engine Off) - (Manual & Automatic Function all Markets)

Ignition On (Engine Running) - (Manual & Automatic Function all Markets)

DIAGNOSIS AND TESTING

FULL OPEN RETRACTABLE ROOF

Any diagnosis of the FULL OPEN RETRACTABLE ROOF (FORR) system should begin with a scan tool and proper Diagnostic Procedures. The scan tool can provide confirmation that the FORR Electronic Control Unit (ECU), (sometimes referred to as the Power Top Control Module) is functional, that all of the electronic modules are sending and receiving the proper messages on the Controller Area Network (CAN) Data Bus, and that the power to the FORR is being sent the proper hard wired output by the FORR switch.

Check the condition of the circuit protection and inspect all wiring connector pins for proper engagement and continuity. For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views wire harness connectors, splices and grounds.

NOTE: Roof limits:

Motor Thermal Protection: The ECU Calculates the internal motor temperature. When the calculated temperature exceeds 365F(185C), the ECU allows the roof to only close. At 392F(200C) The ECU prevents motor movement.

System Low Temperature Operation: (Via the Vehicle Ambient Temp Sensor) At 14F (-10C) the ECU does not allow the system to vent without stopping the other motor. At -4F (-20C) the motors are allowed to close only.

Speed Thresholds: At 86 m.p.h. (138 km/h) we stop operation and at 81

m.p.h. (129 km/h) we resume operation.

NOTE: For the FORR initialization procedure, refer to **STANDARD PROCEDURE** .

SYMPTOM	POSSIBLE CAUSES	CORRECTION
Roof Completely Inoperative	Inoperative control switch	Perform sunroof switch diagnostics
	Inoperative circuit between FORR motor/ECU, control switch, and body harness.	Check the condition of the circuit protection and inspect all wiring. Repair as necessary.
	Inoperative FORR motor/ECU	Replace as necessary Motor/ECU
Audible Whine When Switch Is Depressed, Roof Does Not Operate	Inoperative drive motor gear	Replace drive motor Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
	Broken or worn drive cable	Replace cables left & right hand See <u>REMOVAL</u> . Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
Audible Clicking Or Ratcheting When Switch Is Pressed, FORR Does Not Operate.	Cables out of calibration	Left & right hand cables need to be timed See <u>REMOVAL</u> . Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
	Cable retainer clip worn or broken	Replace cable retainer clip See <u>REMOVAL</u> . Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
	Broken or worn drive cable	Replace cables left & right hand See <u>REMOVAL</u> . Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
	Inoperative drive motor gear	Replace drive motor Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
Front Header Bow Misaligned To Frame	Debris in drive track	Remove debris from track, check cables for wear replace if necessary and reset timing. See <u>REMOVAL</u> . Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
	Broken or worn drive cable	Replace Drive Cables See <u>REMOVAL</u> . Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
		Left & right hand cables need to be timed

	Cables out of time	See <u>REMOVAL</u> . Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
	Broken cap extension	Replace the front drive assembly. See <u>REMOVAL</u> . Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
Rear Header Bow Misaligned To Frame	Debris in drive track	Remove Debris from Track, check cables for wear replace if necessary and reset Timing. See <u>REMOVAL</u> . Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
	Broken or worn drive cable	Replace cables left & right hand See <u>REMOVAL</u> . Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
	Cables out of time	Left & right hand cables need to be timed See <u>REMOVAL</u> . Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
	Broken cap extension	Replace the rear drive assembly. See <u>REMOVAL</u> . Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
Front Lift Arm Not Lifting	Spring disengaged from lift arm	Repair or replace spring if necessary See <u>REMOVAL</u> . Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
	Pin disengaged or broken	Repair or replace nylon pin if necessary See <u>REMOVAL</u> . Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
	Lift arm disengaged from cap extension or broken	Repair or replace front lift arm assembly if necessary See <u>REMOVAL</u> . Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
Floating Bows Not Lifting	Spring disengaged	Repair or replace spring if necessary See <u>REMOVAL</u> . Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
	Broken lift arm assembly	Replace lift arm assembly if necessary See <u>REMOVAL</u> . Re-initialize ECU:

		Refer to <u>STANDARD PROCEDURE</u> .
Top Cover Loose In Side View To Seal	Tension cable not attach at front header	Attach tension cable to front header See <u>REMOVAL</u> . Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
	Tension cable not attach at rear header	Attach tension cable to rear header See <u>REMOVAL</u> . Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
	Tension cable broken	Replace tension cable See <u>REMOVAL</u> . Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
Top Stops Moving Prior To Full Close, Or Full Open	Debris in track	Clean track Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
	ECU lost normed "home" position	Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .
Slider Chatter	Debris in track	Clean track Re-initialize ECU: Refer to <u>STANDARD PROCEDURE</u> .

STANDARD PROCEDURE

FULL OPEN RETRACTABLE ROOF INITIALIZATION

Limits

Temperature

The temperature must be between 5°C (41°F) to 45°C (113°F) for initialization to be performed, Outside of this temperature range an initialization will not start and if requested by a diagnostics scan tool, the Electronic Control Unit (ECU), (sometimes referred to as the Power Top Control Module) will send the proper reject code.

Voltage

Vehicle voltage must be maintained between 11V - 15V.

Roof Initialization Procedure

1. Ensure the Vehicle is in the RUN power mode with the engine running.
2. If roof is in a position other than fully closed; press roof switch center button for less than 1 second and wait for the roof to close.
3. With roof fully closed: Push and hold the roof switch center button for more than 20 seconds and do not release until the following roof cycle is complete:

Front of Roof will Close (Then Stall)

Rear of Roof will Close (Then Stall)

Rear of Roof will Open

Rear of Roof will Close

Rear of Roof Vents (approx two inches)

Front of Roof will Open

Front of Roof will Close

Rear of Roof Closes from Vent

4. Once all movement has stopped, release the roof switch center button. Roof system initialization is now complete.

MANUAL OPERATION

Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - REAR DRIVE MOTOR
2 - FRONT DRIVE MOTOR
3 - DRIVE AXLE LOCATION
4 - 6 mm HEX SOCKET |
|---|

1. Remove the rear dome light, refer to **REMOVAL** .
2. Disconnect the green module electrical connector.
3. Locate the motor drive axle hole (3) and using a 6 mm hex socket or equivalent (4), open or close the desired drive assembly as required.

TRACK CLEANING

81dc951b

Fig. 278: Track Cleaning Areas (1 Of 2)
 Courtesy of CHRYSLER LLC

1. Open the roof fully from front to rear.
2. Using a vacuum remove all loose debris.
3. Apply alcohol to a clean rag and wipe the tracks clean in the areas shown.

81dc9520

Fig. 279: Track Cleaning Areas (2 Of 2)
 Courtesy of CHRYSLER LLC

4. Using a cotton swab apply alcohol to the head of the swab and clean the notch on both sides as indicated.
5. Close the roof and open the rear portion fully and repeat the cleaning process.
6. When cleaning is complete re-initialize the system, see **STANDARD PROCEDURE**.

CABLE

REMOVAL

CABLE

FRONT DRIVE CABLES

1. Remove the front drive assembly, see REMOVAL.
2. Slide the cables out and remove.

REAR DRIVE CABLES

1. Remove the rear drive assembly, see REMOVAL.
2. Slide the cables out and remove.

INSTALLATION

CABLE

FRONT DRIVE CABLES

Fig. 280: Drive Cables
Courtesy of CHRYSLER LLC

- | |
|---|
| <ul style="list-style-type: none">1 - FRONT DRIVE CABLE - BLUE END2 - REAR DRIVE CABLE - RED END3 - FRONT DRIVE CABLE - ORANGE END4 - REAR DRIVE CABLE - GREEN END |
|---|

1. Install the front drive cables into their correct positions, see Fig. 280.

NOTE: It may be necessary to twist the cables while pushing to fully install the

cables.

2. Install the front drive assembly, see INSTALLATION.
3. Re-initialize ECU, see STANDARD PROCEDURE.

REAR DRIVE CABLES

1. Install the rear drive cables into their correct positions, see Fig. 280.

NOTE: It may be necessary to twist the cables while pushing to fully install the cables.

2. Install the rear drive assembly, see INSTALLATION.
3. Re-initialize ECU, see STANDARD PROCEDURE.

CABLE

REMOVAL

CABLE - RETAINER

Fig. 281: Cable Retainer And Rivets
Courtesy of CHRYSLER LLC

1. Remove the drive cables, see REMOVAL.
2. Remove the rivets (3) and remove the motor mounting plate.
3. Remove the cable retainer (1).

Fig. 282: Cable Guide Openings, Rail And Magnet
Courtesy of CHRYSLER LLC

4. Using a magnet (3) draw out the remaining rivet pieces through the cable guide openings (1) in the rail (2).

INSTALLATION

CABLE - RETAINER

Fig. 283: Cable Retainer And Rivets
Courtesy of CHRYSLER LLC

1. Install the cable retainer (1) into the rail.
2. Install the motor mounting plate and install new rivets (3).
3. Install the drive cables (2), see **INSTALLATION**.

CABLE

REMOVAL

CABLE - TENSION

Fig. 284: Tension Cable, Hooks And Lift Arm
Courtesy of CHRYSLER LLC

1. Remove the cover assembly, see **REMOVAL**.
2. Disconnect the tension cable (1) from the hooks (2) of the lift arm (3).

Fig. 285: Tension Cable And Header Bow
Courtesy of CHRYSLER LLC

3. Disconnect the tension cable (3) from the header bows (1) and remove the tension cable from the headliner.

INSTALLATION

CABLE - TENSION

Fig. 286: Tension Cable And Header Bow
 Courtesy of CHRYSLER LLC

1. Install the tension cable (3) into the pocket along the sides of the headliner and attach the cable (3) to the header bows (1).

Fig. 287: Tension Cable, Hooks And Lift Arm
 Courtesy of CHRYSLER LLC

2. Attach the tension cable (1) to the hooks (2) of the lift arms (3).
3. Install the cover assembly, see **INSTALLATION**.

COUPLER

REMOVAL

COUPLER

9. Connect the tension cables (1) to the lift arm hooks (2) along both sides.
10. Install the cover assembly, see **INSTALLATION**.

COVER ASSEMBLY

REMOVAL

COVER ASSEMBLY

Fig. 303: Drive Mechanism, Loop Strip And Screws
 Courtesy of CHRYSLER LLC

1. Open the front drive assembly about 300 mm (12 inches).
2. Separate the headliner hook and loop strip (3) and expose the drive mechanism (1).
3. Remove the five screws (2) and separate the cover assembly from the front drive (1).

Fig. 304: Nylon Pins, Cover Assembly And Drive Assembly Cap
 Courtesy of CHRYSLER LLC

4. Move the front drive forward to gain access to the nylon pin (2).
5. Carefully remove the two nylon pins (2) and separate the cover assembly (1) from the drive assembly cap (3).

Fig. 305: Drive Mechanism, Loop Strip And Screws
 Courtesy of CHRYSLER LLC

6. Manually open the rear drive assembly about 300 mm (12 inches), see **STANDARD PROCEDURE**.
7. Separate the headliner hook and loop strip (3) and expose the drive mechanism.
8. Remove the five screws (2) and separate the cover assembly from the drives (1).

Fig. 306: Lift Arms And Sliders
 Courtesy of CHRYSLER LLC

9. Starting at the front, separate the lift arms from the sliders and remove the top assembly.

INSTALLATION

COVER ASSEMBLY

Fig. 307: Lift Arm, Locators, Rear Sliders And Pins
 Courtesy of CHRYSLER LLC

1. Place the top assembly onto a clean surface top up and roll up from front to back to aid installation.
2. Position the cover assembly onto the roof.
3. Starting at the rear position the cover assembly over the rear sliders (4).
4. Position the springs so that they engage with the locators (1) on the lift arms (3).
5. Fully seat the lift arm pins (2) into the sliders (4).
6. Repeat steps 3 through 5 for the remaining lift arms.

Fig. 308: Lift Arm, Drive Assembly, Compression Spring And Hole
 Courtesy of CHRYSLER LLC

7. Position the forward lift arm (2) over the front drive assembly (3) and install the compression spring (1).
8. Lower the lift arm (2) and line up the hole in the lift arm with the hole (4) in the front drive assembly (3).

Fig. 309: Nylon Pins, Cover Assembly And Drive Assembly Cap
 Courtesy of CHRYSLER LLC

9. Insert the nylon pin (2) with the slot in the end in the horizontal position.
10. Seat the pin (2) fully.
11. Manually position the front and rear drive assemblies about 300 mm (12 inches) open, see **STANDARD PROCEDURE**.

Fig. 310: Drive Mechanism, Loop Strip And Screws
 Courtesy of CHRYSLER LLC

12. Position the rear of the cover down over the rear drive (1) and seat fully.
13. Install the five screws (2).
14. Line up the headliner (3) center notch with the center screw (2) and seat the headliner hook and loop strip (3) fully.
15. Position the front of the cover down over the front drive assembly and seat fully.
16. Install the five screws (2), and seat the headliner hook and loop strip (3) fully.
17. Re-initialize ECU, see **STANDARD PROCEDURE**.

DRIVE ASSEMBLY

REMOVAL

DRIVE ASSEMBLY - FRONT

Fig. 311: Rear Drive Motor, Front Drive Motor, Drive Axle And Hex Socket

- 1 - REAR DRIVE MOTOR
- 2 - FRONT DRIVE MOTOR
- 3 - DRIVE AXLE LOCATION
- 4 - 6 mm HEX SOCKET

1. Drop headliner down as needed to gain access to the motors, see **REMOVAL**.
2. Disconnect the module electrical connector.
3. Manually position the front drive assembly about 300 mm (12 inches) open, see **STANDARD PROCEDURE**.

81d1f019

Fig. 312: Front Motor, Screws And Electrical Connector
Courtesy of CHRYSLER LLC

4. Remove the three screws (2) and separate the front motor (3) from the roof system.

NOTE: Discard the screws (2) and replace with service screws and washers.

5. Disconnect the electrical connector (1) and remove the motor.

81d22b32

Fig. 313: Drive Mechanism, Loop Strip And Screws
 Courtesy of CHRYSLER LLC

6. Manually position the front bow and drive assembly (1) back about 300 mm (12 inches).

CAUTION: When moving the drive assemblies without the motors attached make sure that the assemblies are moved straight back.

7. Separate the headliner hook and loop strip (3) and expose the drive mechanism.
8. Remove the five screws (2) and separate the cover assembly from the drive (1).

81d1f590

Fig. 314: Coupler
 Courtesy of CHRYSLER LLC

9. Remove the wind deflector, see **REMOVAL**.
10. Remove the couplers (1).

Fig. 315: Front Cam Plate
Courtesy of CHRYSLER LLC

11. Remove the front cam plates (2), see **REMOVAL**.

Fig. 316: Nylon Pins, Cover Assembly And Drive Assembly Cap
Courtesy of CHRYSLER LLC

12. Move the front drive forward to gain access to the nylon pin (2).
13. Carefully remove the two nylon pins (2) and separate the cover assembly (1) from the drive assembly cap (3).
14. Remove the nylon push pins (2).

Fig. 317: Drive Link And Drive Assembly
Courtesy of CHRYSLER LLC

15. Disconnect the drive link (4) and remove the drive assembly (1).
16. Pull cables out slightly.

INSTALLATION

DRIVE ASSEMBLY - FRONT

Fig. 318: Bevel, Tear Drop, Front Drive End Cap, Nylon Button And Drive Link
Courtesy of CHRYSLER LLC

- 1 - BEVEL
- 2 - TEAR DROP
- 3 - FRONT DRIVE END CAP
- 4 - NYLON BUTTON
- 5 - DRIVE LINK

1. Install the drive links (5) onto the drive assembly end caps (4) with the tear drops (2) toward the caps (3), the bevels (1) out and the nylon buttons (4) up.

Fig. 319: Drive Link And Drive Assembly
Courtesy of CHRYSLER LLC

2. Push the drive cables into the tracks leaving the hole in the cable end (3) exposed.

NOTE: It may be necessary to twist the cables while pushing to fully install the cables.

3. Insert the rear of the drive assembly (1) into the drive channel.
4. Connect the drive links (4) to the drive cable ends (3) and make sure that the nylon buttons (2) are facing up.

CAUTION: When moving the drive assemblies without the motors attached make sure that the assemblies are moved straight back.

5. Push the drive assembly back into the tracks.

Fig. 320: Front Cam Plate
 Courtesy of CHRYSLER LLC

6. Install the cam plates (2), see INSTALLATION.

Fig. 321: Front Drive Assembly, Cable Ends And Frame
 Courtesy of CHRYSLER LLC

CAUTION: When moving the drive assemblies without the motors attached make sure that the assemblies are moved straight back.

7. Manually push the front drive assembly (1) fully forward.
8. Using a small screwdriver or equivalent, make sure the cable ends (3) are in contact with the frame (2).

Fig. 322: Front Drive Motor And Screws
Courtesy of CHRYSLER LLC

9. Position the front drive motor (1) up onto the motor mounting plate.

CAUTION: Do not install the motor using any twisting motion. Always install the motor straight and use the screws to draw the drive gear into the drive cables.

NOTE: When ever the motors are removed, the screws (2) need to be discarded and replaced with new service screws and washers.

10. Install new motor screws (2) and draw the motor evenly using the motor screws.
11. Connect the electrical connector.

Fig. 323: Lift Arm, Drive Assembly, Compression Spring And Hole
Courtesy of CHRYSLER LLC

12. Position the forward lift arm (2) over the front drive assembly (3) and install the compression spring (1).
13. Lower the lift arm (2) and line up the hole in the lift arm with the hole (4) in the front drive assembly (3).

Fig. 324: Nylon Pins, Cover Assembly And Drive Assembly Cap
Courtesy of CHRYSLER LLC

14. Insert the nylon pin (2) with the slot in the end in the horizontal position.
15. Seat the pin (2) fully.
16. Manually position the front and rear drive assemblies about 300 mm (12 inches) open, see **STANDARD PROCEDURE**.

Fig. 325: Coupler
Courtesy of CHRYSLER LLC

17. Install the couplers (1).
18. Install the wind deflector, see **INSTALLATION**.

Fig. 326: Drive Mechanism, Loop Strip And Screws
 Courtesy of CHRYSLER LLC

19. Position the front of the cover down over the front drive assembly and seat fully.
20. Install the five screws (2), and seat the headliner hook and loop strip (3) fully.
21. Connect the large ECU electrical connector.
22. Install the headliner, see **INSTALLATION**.
23. Re-initialize ECU, see **STANDARD PROCEDURE**.

DRIVE ASSEMBLY

REMOVAL

DRIVE ASSEMBLY - REAR

Fig. 327: Front Motor, Screws And Electrical Connector
 Courtesy of CHRYSLER LLC

1. Remove the front drive assembly, see **REMOVAL**.
2. Remove the three screws (2) and separate the rear motor (3) from the roof system.

NOTE: Discard the screws (2) and replace with service screws and washers.

3. Disconnect the electrical connector (1) and remove the motor.

Fig. 328: Drive Mechanism, Loop Strip And Screws
Courtesy of CHRYSLER LLC

4. Manually position the rear bow and drive assembly (1) forward about 300 mm (12 inches).

CAUTION: When moving the drive assemblies without the motors attached make sure that the assemblies are moved straight back.

5. Separate the headliner hook and loop strip (3) and expose the drive mechanism.
6. Remove the five screws (2) and separate the cover assembly from the drive (1).

Fig. 329: Slider Assembly
 Courtesy of CHRYSLER LLC

7. Slide the cover and slider assembly (2) out of the front of the tracks and roll up backwards as you go.
8. Remove the cover assembly from the vehicle.
9. Slide drive assembly forward and remove.
10. Pull cables out slightly.

INSTALLATION

DRIVE ASSEMBLY - REAR

Fig. 330: Bevel, Tear Drop, Front Drive End Cap, Nylon Button And Drive Link
 Courtesy of CHRYSLER LLC

- | |
|-------------------------|
| 1 - BEVEL |
| 2 - TEAR DROP |
| 3 - FRONT DRIVE END CAP |

4 - NYLON BUTTON

5 - DRIVE LINK

NOTE: Front drive assembly shown, rear drive assembly similar.

1. Install the drive links (5) onto the drive assembly end caps (4) with the tear drops (2) toward the caps (3), the bevels (1) out and the nylon buttons (4) up.

Fig. 331: Drive Link And Drive Assembly
Courtesy of CHRYSLER LLC

NOTE: Front drive assembly shown, rear drive assembly similar.

2. Push the drive cables into the tracks leaving the hole in the cable end (3) exposed.

NOTE: It may be necessary to twist the cables while pushing to fully install the cables.

3. Insert the rear of the drive assembly (1) into the drive channel.
4. Connect the drive links (4) to the drive cable ends (3) and make sure that the nylon buttons (2) are facing up.

CAUTION: When moving the drive assemblies without the motors attached make sure that the assemblies are moved straight back.

5. Push the drive assembly back into the tracks.

81d228dc

Fig. 332: Rear Drive Assembly, Cable Ends And Frame
Courtesy of CHRYSLER LLC

CAUTION: When moving the drive assemblies without the motors attached make sure that the assemblies are moved straight back.

6. Manually push the rear drive assembly (1) rearward fully.
7. Using a small screwdriver or equivalent, make sure the cable ends (2) are in contact with the frame (3).

81d22b56

Fig. 333: Front Drive Motor And Screws
Courtesy of CHRYSLER LLC

8. Position the rear drive motor (1) up onto the motor mounting plate.

CAUTION: Do not install the motor using any twisting motion. Always install the motor straight and use the screws to draw the drive gear into the drive cables.

NOTE: When ever the motors are removed, the screws (2) need to be discarded and replaced with new service screws and washers.

9. Install the motor screws (2) and draw the motor up evenly using the motor screws.
10. Connect the electrical connector.

Fig. 334: Slider Assembly
Courtesy of CHRYSLER LLC

11. Clean the tracks (1), see **STANDARD PROCEDURE**.

NOTE: Apply 5 grams of Nyogel 729F Grease to the drive track only (3).

12. Install the top assembly and sliders (2) back to front into the tracks (1) and slide back unrolling the top as you proceed.

Fig. 335: Drive Mechanism, Loop Strip And Screws
Courtesy of CHRYSLER LLC

13. Manually position the rear drive assembly about 300 mm (12 inches) open, see **STANDARD PROCEDURE**.
14. Position the rear of the cover down over the rear drive (1) and seat fully.
15. Install the five screws (2).
16. Line up the headliner (3) center notch with the center screw (2) and seat the headliner hook and loop strip (3) fully.
17. Install the front drive assembly, see **INSTALLATION**.

HEADLINER

REMOVAL

HEADLINER

81ctb01e

|---|
| 1 - HEADLINER BOW SLEEVES
2 - HEADLINER BOWS
3 - FRONT OF HEADLINER
4 - COVER BOW SLEEVES
5 - REAR OF HEADLINER |
|---|

1. Install the headliner bows (2) in the correct sleeves (1).
2. Install the tension cables.
3. Install the cover, see **INSTALLATION**.

LIFT ARM AND BOW ASSEMBLY

REMOVAL

LIFT ARM AND BOW ASSEMBLY

Description

Fig. 338: Cover Assembly
Courtesy of CHRYSLER LLC

- 1 - HEADLINER BOWS (5)
- 2 - REAR LIFT ARMS (8)
- 3 - FRONT LIFT ARMS (2)
- 4 - TENSION CABLES (2)
- 5 - FRONT LIFT ARM COMPRESSION SPRINGS (2)
- 6 - FRONT HEADER BOW
- 7 - ROOF BOWS (10)
- 8 - REAR HEADER BOW

Header Bows

81d22b32

Fig. 339: Drive Mechanism, Loop Strip And Screws
 Courtesy of CHRYSLER LLC

1. Open the front drive assembly about 300 mm (12 inches).
2. Separate the headliner hook and loop strip (3) and expose the drive mechanism (1).
3. Remove the five screws (2) and separate the cover assembly from the front drive (1).

81d22b11

Fig. 340: Tension Cable And Header Bow
 Courtesy of CHRYSLER LLC

4. Disconnect the tension cable (3) from the header bows (1).
5. Remove and discard the push nuts (4).
6. Carefully release the mesh strap (2) from the header bow (1) two sided tape and remove the header bow from the cover assembly.

Fig. 341: Drive Mechanism, Loop Strip And Screws
 Courtesy of CHRYSLER LLC

1. Open the front drive assembly about 300 mm (12 inches).
2. Separate the headliner hook and loop strip (3) and expose the drive mechanism (1).
3. Remove the five screws (2) and separate the cover assembly from the front drive (1).

Fig. 342: Nylon Pins, Cover Assembly And Drive Assembly Cap
 Courtesy of CHRYSLER LLC

4. Move the front drive forward to gain access to the nylon pin (2).
5. Carefully remove the two nylon pins (2) and separate the cover assembly (1) from the drive assembly cap (3).

Fig. 343: Tension Cable, Hooks And Lift Arm
 Courtesy of CHRYSLER LLC

6. Disconnect the tension cables (1) from the lift arm hooks (2) along both sides.

Fig. 344: Lift Arm Support Tabs And The Cover Pockets
 Courtesy of CHRYSLER LLC

7. Release the lift arm support tabs from the pocket (3) in the cover.

81d22934

Fig. 345: Lift Arm And Bows
 Courtesy of CHRYSLER LLC

8. Grasp the bows and pull the lift arms (1) from the bows (2) along one side of the cover assembly and discard the lift arms.

Rear Lift Arm and Bow Assemblies

81d1ec9b

Fig. 346: Lift Arms And Sliders
 Courtesy of CHRYSLER LLC

1. Open the rear drive assembly about 300 mm (12 inches).
2. Using a spreading tool (1) or equivalent, spread the slider assembly (3) apart and separate the lift arms from the slider.

CAUTION: Use care when separating the lift arms from the sliders to avoid losing the springs.

Fig. 347: Tension Cable, Hooks And Lift Arm
 Courtesy of CHRYSLER LLC

3. Disconnect the tension cables (1) from the lift arm hooks (2) along both sides.

Fig. 348: Lift Arm Support Tabs And The Cover Pockets
 Courtesy of CHRYSLER LLC

4. Release the lift arm support tabs from the pocket (3) in the cover.

81d22934

Fig. 349: Lift Arm And Bows
Courtesy of CHRYSLER LLC

5. Grasp the bows and pull the lift arms (1) from the bows (2) along one side of the cover assembly and discard the lift arms.

INSTALLATION

LIFT ARM AND BOW ASSEMBLY

Description

81cfa8d9

Fig. 350: Cover Assembly
Courtesy of CHRYSLER LLC

- 1 - HEADLINER BOWS (5)
- 2 - REAR LIFT ARMS (8)
- 3 - FRONT LIFT ARMS (2)
- 4 - TENSION CABLES (2)
- 5 - FRONT LIFT ARM COMPRESSION SPRINGS (2)
- 6 - FRONT HEADER BOW
- 7 - ROOF BOWS (10)
- 8 - REAR HEADER BOW

Header Bows

Fig. 351: Tension Cable And Header Bow
Courtesy of CHRYSLER LLC

1. Position the header bow (1) into the cover assembly.
2. Install new push nuts (4).
3. Secure the mesh strap (2) to the header bow using new two sided tape.
4. Connect the tension straps (3) to the hooks on the header bows (1).

81d22914

Fig. 352: Lift Arm, Drive Assembly, Compression Spring And Hole
 Courtesy of CHRYSLER LLC

5. Position the forward lift arm (2) over the front drive assembly (3) and install the compression spring (1).
6. Lower the lift arm (2) and line up the hole in the lift arm with the hole (4) in the front drive assembly (3).

81d1f7b3

Fig. 353: Nylon Pins, Cover Assembly And Drive Assembly Cap
 Courtesy of CHRYSLER LLC

7. Insert the nylon pin (2) with the slot in the end in the horizontal position.
8. Seat the pin (2) fully.

Fig. 354: Drive Mechanism, Loop Strip And Screws
 Courtesy of CHRYSLER LLC

9. Position the front drive assembly about 300 mm (12 inches) open.
10. Position the front of the cover down over the front drive assembly and seat fully.
11. Install the five screws (2), and seat the headliner hook and loop strip (3) fully.
12. Re-initialize ECU, see **STANDARD PROCEDURE**.

Front Lift Arm and Bow Assembly

Fig. 355: Lift Arm And Bows
 Courtesy of CHRYSLER LLC

1. Place the lift arms and bows into the bow sleeves.

NOTE: Always install new lift arms (1) when they have been separated from the bows (2).

2. Using a bar clamp or plastic hammer, install new lift arms (1) onto the bows (2) and seat fully.

81d2264c

Fig. 356: Lift Arm Support Tabs And The Cover Pockets
Courtesy of CHRYSLER LLC

3. Insert the lift arm support tabs (2) into the cover pockets (3).

81d226e7

Fig. 357: Tension Cable, Hooks And Lift Arm
Courtesy of CHRYSLER LLC

4. Connect the tension cables (1) to the lift arm hooks (2) along both sides.

Fig. 358: Lift Arm, Drive Assembly, Compression Spring And Hole
 Courtesy of CHRYSLER LLC

5. Position the forward lift arm (2) over the front drive assembly (3) and install the compression spring (1).
6. Lower the lift arm (2) and line up the hole in the lift arm with the hole (4) in the front drive assembly (3).

Fig. 359: Nylon Pins, Cover Assembly And Drive Assembly Cap
 Courtesy of CHRYSLER LLC

7. Insert the nylon pin (2) with the slot in the end in the horizontal position.
8. Seat the pin (2) fully.

Fig. 360: Drive Mechanism, Loop Strip And Screws
 Courtesy of CHRYSLER LLC

9. Position the front drive assembly about 300 mm (12 inches) open.
10. Position the front of the cover down over the front drive assembly and seat fully.
11. Install the five screws (2), and seat the headliner hook and loop strip (3) fully.
12. Re-initialize ECU, see **STANDARD PROCEDURE**.

Rear Lift Arm and Bow Assembly

Fig. 361: Lift Arm And Bows
 Courtesy of CHRYSLER LLC

1. Place the lift arms and bows into the bow sleeves.

NOTE: Always install new lift arms (1) when they have been separated from the bows (2).

2. Using a bar clamp or plastic hammer, install new lift arms (1) onto the bows (2) and seat fully.

81d2264c

Fig. 362: Lift Arm Support Tabs And The Cover Pockets
Courtesy of CHRYSLER LLC

3. Insert the lift arm support tabs (2) into the cover pockets (3).

81d226e7

Fig. 363: Tension Cable, Hooks And Lift Arm
Courtesy of CHRYSLER LLC

4. Connect the tension cables (1) to the lift arm hooks (2) along both sides.

Fig. 364: Lift Arm, Locators, Rear Sliders And Pins
 Courtesy of CHRYSLER LLC

5. Position the cover assembly over the slider (4).
6. Position the spring so that it engages with the locator (1) on the lift arm (3).
7. Seat the lift arm pins (2) into the slider (4) fully.
8. Re-initialize ECU, see **STANDARD PROCEDURE**.

PLATE

REMOVAL

PLATE - CAM

Fig. 365: Front Cam Plate
 Courtesy of CHRYSLER LLC

1. Lower the headliner in vehicle as necessary to gain access to the cam plate stud (4) being serviced, see

REMOVAL.

2. Remove the stud nut (4) from inside the vehicle.
3. Remove the screw (1).
4. Remove the rivet (3) and remove the cam plate (2).

INSTALLATION

PLATE - CAM

Fig. 366: Front Cam Plate
Courtesy of CHRYSLER LLC

1. Install the cam plate (2) and install the rivet (3).
2. Install the screw (1).
3. Install the stud nut (4) from inside the vehicle and tighten to 5 N.m (44 in. lbs.).
4. Install the headliner, see **INSTALLATION**.
5. Re-initialize ECU, see **STANDARD PROCEDURE**.

PLATE

REMOVAL

PLATE - MOTOR MOUNTING

Fig. 367: Drive Mechanism, Loop Strip And Screws
 Courtesy of CHRYSLER LLC

NOTE: Both motor mounting plates must be removed when servicing one or the other. It is necessary to remove both plates in order to remove the rivet pieces from the roof rail.

1. Drop headliner down as needed to gain access to the motors, see **REMOVAL**.
2. Disconnect the large module electrical connector.
3. Manually position the front drive assembly about 300 mm (12 inches) open, see **STANDARD PROCEDURE**.
4. Separate the headliner hook and loop strip (3) and expose the drive mechanism.
5. Remove the five screws (2) and separate the cover assembly from the drive (1).

Fig. 368: Front Motor, Screws And Electrical Connector
 Courtesy of CHRYSLER LLC

6. Remove the three screws (2) and separate the front motor (3) from the roof system.

NOTE: Discard the screws (2) and replace with service screws and washers.

7. Disconnect the electrical connector (1) and remove the motor.
8. Manually position the front bow and drive assembly (1) forward fully.

CAUTION: When moving the drive assemblies without the motors attached make sure that the assemblies are moved straight back.

Fig. 369: Drive Mechanism, Loop Strip And Screws
Courtesy of CHRYSLER LLC

9. Manually position the rear drive assembly about 300 mm (12 inches) open, see **STANDARD PROCEDURE**.
10. Separate the headliner hook and loop strip (3) and expose the drive mechanism.
11. Remove the five screws (2) and separate the cover assembly from the drive (1).

Fig. 370: Front Motor, Screws And Electrical Connector
 Courtesy of CHRYSLER LLC

12. Remove the three screws (2) and separate the rear motor (3) from the roof system.

NOTE: Discard the screws (2) and replace with service screws and washers.

13. Disconnect the electrical connector (1) and remove the motor.
14. Manually position the rear bow and drive assembly (1) rearward fully.

CAUTION: When moving the drive assemblies without the motors attached make sure that the assemblies are moved straight back.

Fig. 371: Cable Retainer And Rivets
 Courtesy of CHRYSLER LLC

15. Remove the rivets (3) and remove the motor mounting plates.

Fig. 372: Cable Guide Openings, Rail And Magnet
 Courtesy of CHRYSLER LLC

16. Using a magnet (3) draw out the remaining rivet pieces through the cable guide openings (1) in the rail (2).

INSTALLATION

PLATE - MOTOR MOUNTING

Fig. 373: Cable Retainer And Rivets
 Courtesy of CHRYSLER LLC

NOTE: Both motor mounting plates must be removed when servicing one or the other. It is necessary to remove both plates in order to remove the rivet pieces from the roof rail.

1. Install the motor mounting plates and install new rivets (3).

Fig. 374: Cable Retainer And Rivets
 Courtesy of CHRYSLER LLC

2. Install the motor mounting plates and install new rivets (3).

Fig. 375: Rear Drive Assembly, Cable Ends And Frame
 Courtesy of CHRYSLER LLC

CAUTION: When moving the drive assemblies without the motors attached make sure that the assemblies are moved straight back.

3. Manually push the rear drive assembly (1) rearward fully.
4. Using a small screwdriver or equivalent, make sure the cable ends (2) are in contact with the frame (3).

Fig. 376: Front Drive Motor And Screws
Courtesy of CHRYSLER LLC

5. Position the rear drive motor (1) up onto the motor mounting plate.

CAUTION: Do not install the motor using any twisting motion. Always install the motor straight and use the screws to draw the drive gear into the drive cables.

NOTE: When ever the motors are removed, the screws (2) need to be discarded and replaced with new service screws and washers.

6. Install the motor screws (2) and draw the motor up evenly using the motor screws.
7. Connect the electrical connector.

Fig. 377: Drive Mechanism, Loop Strip And Screws
Courtesy of CHRYSLER LLC

8. Manually position the rear drive assembly about 300 mm (12 inches) open, see **STANDARD PROCEDURE**.
9. Position the rear of the cover down over the rear drive (1) and seat fully.
10. Install the five screws (2).
11. Line up the headliner (3) center notch with the center screw (2) and seat the headliner hook and loop strip (3) fully.

Fig. 378: Front Drive Assembly, Cable Ends And Frame
Courtesy of CHRYSLER LLC

CAUTION: When moving the drive assemblies without the motors attached make sure that the assemblies are moved straight back.

12. Manually push the front drive assembly (1) fully forward.
13. Using a small screwdriver or equivalent, make sure the cable ends (3) are in contact with the frame (2).

Fig. 379: Front Drive Motor And Screws

Courtesy of CHRYSLER LLC

14. Position the front drive motor (1) up onto the motor mounting plate.

CAUTION: Do not install the motor using any twisting motion. Always install the motor straight and use the screws to draw the drive gear into the drive cables.

NOTE: When ever the motors are removed, the screws (2) need to be discarded and replaced with new service screws and washers.

15. Install the motor screws (2) and draw the motor evenly using the motor screws.
16. Connect the electrical connector.

Fig. 380: Drive Mechanism, Loop Strip And Screws
Courtesy of CHRYSLER LLC

17. Manually position the front and rear drive assemblies about 300 mm (12 inches) open, see **STANDARD PROCEDURE**.
18. Position the front of the cover down over the front drive assembly and seat fully.
19. Install the five screws (2), and seat the headliner hook and loop strip (3) fully.
20. Connect the large ECU electrical connector.
21. Install the headliner, see **INSTALLATION**.
22. Re-initialize ECU, see **STANDARD PROCEDURE**.

SLIDER ASSEMBLY

REMOVAL

SLIDER ASSEMBLY

Fig. 381: Rear Drive Motor, Front Drive Motor, Drive Axle And Hex Socket
 Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - REAR DRIVE MOTOR
2 - FRONT DRIVE MOTOR
3 - DRIVE AXLE LOCATION
4 - 6 mm HEX SOCKET |
|---|

1. Remove the front drive assembly, see **REMOVAL**.
2. Manually move the rear drive assembly to open about 10 inches.

Fig. 382: Drive Mechanism, Loop Strip And Screws
 Courtesy of CHRYSLER LLC

3. Separate the headliner hook and loop strip (3) and expose the drive mechanism.
4. Remove the five screws (2) and separate the cover assembly from the rear drive (1).

Fig. 383: Slider Assembly
 Courtesy of CHRYSLER LLC

5. Pull the cover assembly forward and disengage the sliders (2) from the rails (1).

Fig. 384: Lift Arms And Sliders
 Courtesy of CHRYSLER LLC

6. Roll the cover assembly (2) back until you get to the slider (3) being serviced.
7. Using a spreading tool (1) or equivalent, spread the slider assembly (3) apart and separate the lift arms from the slider.

CAUTION: Use care when separating the lift arms from the sliders to avoid losing the springs.

Fig. 385: Slider Assembly
 Courtesy of CHRYSLER LLC

8. Remove the slider (2) being serviced from the track (1).

INSTALLATION

SLIDER ASSEMBLY

Fig. 386: Slider Assembly
 Courtesy of CHRYSLER LLC

1. Clean the track as necessary, see **STANDARD PROCEDURE**.

NOTE: Apply 5 grams of Nyogel 729F Grease to the drive track only (3).

2. Install the slider (2) being serviced into the track (1) and slide back.

Fig. 387: Lift Arm, Locators, Rear Sliders And Pins
 Courtesy of CHRYSLER LLC

3. Position the cover assembly over the slider (4).
4. Position the spring so that it engages with the locator (1) on the lift arm (3).
5. Seat the lift arm pins (2) into the slider (4) fully.

Fig. 388: Slider Assembly
 Courtesy of CHRYSLER LLC

6. Unroll the top assembly and engage the sliders (2) into the tracks (1).

Fig. 389: Drive Mechanism, Loop Strip And Screws
 Courtesy of CHRYSLER LLC

7. Position the rear of the cover down over the rear drive and seat fully.
8. Install the five screws (2).
9. Line up the headliner (3) center notch with the center screw (2) and seat the headliner hook and loop strip fully.
10. Install the front drive assembly, see **INSTALLATION**.

WIND DEFLECTOR

REMOVAL

WIND DEFLECTOR

Fig. 390: Wind Deflector And Screws
 Courtesy of CHRYSLER LLC

1. Open the front of the roof enough to clear the wind deflector assembly (2).
2. Remove the center support screw.
3. Using an offset screwdriver, remove the two inner screws (1).
4. Remove the outer screws (3).

Fig. 391: Wind Deflector, Tab And The Rail
Courtesy of CHRYSLER LLC

5. Lift the front of the wind deflector assembly up and separate from the rail (3).

INSTALLATION

WIND DEFLECTOR

Fig. 392: Wind Deflector, Tab And The Rail
Courtesy of CHRYSLER LLC

1. Install the wind deflector onto the rail (3) with the tab (1) above the rail (3) and the tab (2) below the rail

(3).

Fig. 393: Wind Deflector And Screws
Courtesy of CHRYSLER LLC

2. Install the four screws (3).
3. Using an offset screwdriver, install the two inner screws (1).
4. Install the center support screw.

HOOD

BUMPER - HOOD

REMOVAL

BUMPER - HOOD

Fig. 394: Hood Adjustment Bumper

Courtesy of CHRYSLER LLC

1. Remove the hood adjustment bumpers.

INSTALLATION

BUMPER - HOOD

Fig. 395: Hood Adjustment Bumper
Courtesy of CHRYSLER LLC

1. Install the hood adjustment bumpers. Make sure there are no excessive gaps between the areas around the hood, adjust as necessary, see **SPECIFICATIONS**.

HINGE - HOOD

REMOVAL

HINGE - HOOD

81948b50

Fig. 396: Screws, Fender & Applique
 Courtesy of CHRYSLER LLC

1. Raise and support the hood.
2. Remove the two screws (1) from the fender applique.
3. Use a trim stick C-4755 or equivalent, separate the fender applique (3) from the fender (2).

8194f9d7

Fig. 397: Support Cylinder
 Courtesy of CHRYSLER LLC

NOTE: It is not necessary to remove the hood to replace one or both hinges. The hinges can be replaced one at a time.

4. Remove hood support cylinder, see **REMOVAL**.

819489e1

Fig. 398: Hood Hinge
Courtesy of CHRYSLER LLC

5. Using a grease pencil or equivalent, mark position of hinge (2).
6. Remove nuts (3) attaching hinge (2) to the body.
7. Remove nuts (1) attaching hinge (2) to hood.
8. Remove hinge (2) from the vehicle.

INSTALLATION

HINGE - HOOD

819489e1

Fig. 399: Hood Hinge
Courtesy of CHRYSLER LLC

1. Install the hinge (2) to the vehicle use the reference position made during removal.
2. Install nuts (3) attaching hinge (2) to the body and tighten to 20 N.m (15 ft. lbs.).
3. Install nuts (1) attaching hinge (2) to hood and tighten to 20 N.m (15 ft. lbs.).

8194f9d7

Fig. 400: Support Cylinder
 Courtesy of CHRYSLER LLC

4. Install hood support cylinder, see INSTALLATION.

81948b50

Fig. 401: Screws, Fender & Applique
 Courtesy of CHRYSLER LLC

5. Install the two screws (1) to the fender applique.

HOOD

REMOVAL

HOOD

8194e09a

Fig. 402: Removing/Installing Hood
 Courtesy of CHRYSLER LLC

WARNING: Before removal of the nuts on the hood hinges get a helper to hold the hood in position to keep from the hood falling from the vehicle causing personal injury and/or damage to the vehicle.

NOTE: Use a grease pencil or equivalent, mark location of hood hinges on the hood for installation and alignment purposes.

1. Remove nuts (3) attaching hinges (4) to hood (1).
2. With the aid of a helper, remove hood from vehicle.

INSTALLATION

HOOD

8194e09a

Fig. 403: Removing/Installing Hood

Courtesy of CHRYSLER LLC

1. With the aid of a helper, the position hood (1) onto the hinges (4).
2. Install nuts (3) finger-tight.
3. Align hinges with installation reference marks made previously and tighten bolts to 20 N.m (15 ft. lbs.).
4. Inspect hood for proper alignment and adjust as necessary, see **ADJUSTMENTS**.

ADJUSTMENTS

HOOD

1. If hood is low in relation to cowl panel, insert shims between hinge and hood.
2. Adjust hood bumper in or out to adjust hood-to-fender height alignment.
3. Adjust the hood latch as necessary. Tighten the bolts to 13.5 N.m (10 ft. lbs.).
4. Align the latch striker so that striker enters the latch squarely and without binding.

LATCH - HOOD

REMOVAL

LATCH - HOOD

81951996

Fig. 404: Release Cable & Bolts
Courtesy of CHRYSLER LLC

NOTE: Mark the location of the latch with a grease marker prior to removal from the vehicle.

1. Remove the bolts (1) from the latch.
2. Disconnect the release cable (2) and remove the latch from the vehicle.

INSTALLATION

LATCH - HOOD

81951996

Fig. 405: Release Cable & Bolts
Courtesy of CHRYSLER LLC

1. Install the latch to the vehicle in the same position noted during removal.
2. Install the bolts (1) and tighten to 13.5 N.m (10 ft. lbs.).
3. Attach the latch release cable (2) to the latch.

RELEASE - HOOD LATCH

REMOVAL

RELEASE - HOOD LATCH

8195167c

Fig. 406: Latch Release Cable
Courtesy of CHRYSLER LLC

- 1 - Grommet
- 2 - Push Pin
- 3 - Latch Release Cable
- 4 - Hood Latch
- 5 - Latch Release Handle

1. Remove the latch release cable (3) from the latch (4).
2. Remove the push pin (2) from the grille, carefully remove the latch release cable from under the grille and from the retaining tabs on the grille.
3. Remove the cowl trim cover.
4. Remove the bolts from the hood latch handle (5).
5. Pull from the inside of the vehicle to remove the cable. Disconnect any remaining attaching clips and pull the cable grommet (1) and cable from the body.

INSTALLATION

RELEASE - HOOD LATCH

8195167c

Fig. 407: Latch Release Cable
Courtesy of CHRYSLER LLC

- 1 - Grommet
- 2 - Push Pin
- 3 - Latch Release Cable
- 4 - Hood Latch
- 5 - Latch Release Handle

NOTE: Lubricate the grommet with soapy water to ease with installation of the latch release cable to the body.

1. Install the latch release cable (1) through the opening in the body from the inside of the vehicle. Pull from the engine compartment until the grommet is seated properly in the body.

NOTE: **Route the latch release cable in the same position as noted during removal.**

2. Install the latch release cable to the grille retaining tabs, carefully route under the push pin (2) connection on the grille.
3. Install the push pin (2) to the grille.
4. Install the latch release cable (3) to the latch (4).
5. Install the bolts to the hood latch handle (5) and tighten to 4 N.m (33 in. lbs.).
6. Install the cowl trim cover.

RELEASE - HOOD LATCH HANDLE

REMOVAL

RELEASE - HOOD LATCH HANDLE

Fig. 408: Latch Release Handle
Courtesy of CHRYSLER LLC

1. Remove the cowl trim panel, see **REMOVAL**.
2. Remove the two bolts (2) from the handle (1).
3. Disconnect the hood release cable (3) from the handle (1).
4. Remove the handle (1) from the vehicle.

INSTALLATION

RELEASE - HOOD LATCH HANDLE

81951414

Fig. 409: Latch Release Handle
Courtesy of CHRYSLER LLC

1. Install the hood release cable (3) to the handle (1).
2. Install the two bolts (2) to the handle (1) and tighten to 4 N.m (33 in. lbs.)
3. Install the cowl trim cover, see **INSTALLATION**.

BRACKET - LATCH SUPPORT

REMOVAL

BRACKET - LATCH SUPPORT

819983fe

Fig. 410: Latch Support
Courtesy of CHRYSLER LLC

1. Remove the grille, see **REMOVAL**.
2. Remove the latch from the latch support, see **REMOVAL**.

3. Remove the upper bolts (1) and the lower bolts (3) from the latch support (2).
4. Remove the latch support (2) from the vehicle.

INSTALLATION

BRACKET - LATCH SUPPORT

819983fe

Fig. 411: Latch Support
Courtesy of CHRYSLER LLC

1. Install the latch support (2) to the vehicle.
2. Install the upper bolts (1) and the lower bolts (3) to the latch support (2) and tighten to 8.5 N.m (75 in. lbs.).
3. Install the latch to the latch support, see **INSTALLATION**.
4. Install the grille, see **INSTALLATION**.

SUPPORT - HOOD LATCH

REMOVAL

CAUTION: Do not pull the supports from the middle while removing.

3. Pulling at the ends only, remove the support cylinder.

INSTALLATION

SUPPORT - HOOD LATCH

81299501

Fig. 415: Removing/Installing Support Cylinder Retaining Clip
Courtesy of CHRYSLER LLC

- 1 - RETAINING CLIP
- 2 - BALL SOCKET
- 3 - BALL STUD

1. Make sure the retaining clips (1) are seated into the ball socket (2) fully.

8194f9d7

Fig. 416: Support Cylinder
Courtesy of CHRYSLER LLC

CAUTION: Do not install the support cylinders by pressing at the center of the cylinder. Press the ends only.

2. Install the support cylinder over the ball studs with the thin end connected to the body side of the hinge and the retaining clips snapping into place.

INSTRUMENT PANEL

WARNING

RESTRAINT SYSTEM

WARNING: To avoid personal injury or death, during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar® parts catalog.

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or

service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid personal injury or death on vehicles equipped with airbags, before performing any welding operations disconnect and isolate the battery negative (ground) cable and disconnect all wire harness connectors from the airbag control module (ACM). Failure to take the proper precautions could result in accidental airbag deployment and other possible damage to the supplemental restraint system circuits and components.

WARNING: To avoid personal injury or death, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate, or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 2500 psi.

WARNING: To avoid personal injury or death, when handling a seat belt tensioner retractor, proper care should be exercised to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover.

WARNING: To avoid personal injury or death, replace all restraint system components only with parts specified in the DaimlerChrysler Mopar® parts catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.

WARNING: To avoid personal injury or death, the fasteners, screws, and bolts originally used for the restraint system components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the restraint system. Any time a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the DaimlerChrysler Mopar® parts catalog.

WARNING: To avoid personal injury or death, when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down.

BEZEL - CLUSTER

REMOVAL

BEZEL - CLUSTER

Fig. 417: Cluster Bezel
Courtesy of CHRYSLER LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING**.

NOTE: **Position the steering column to the lowest position to ease in the removal of the cluster bezel.**

2. Using a trim stick C-4755 or equivalent, remove the cluster bezel from the instrument panel assembly.

INSTALLATION

BEZEL - CLUSTER

Fig. 418: Cluster Bezel
 Courtesy of CHRYSLER LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING.**
2. Position and install the cluster bezel to the instrument panel, use hand pressure to seat the bezel clips.

BEZEL - INSTRUMENT PANEL CENTER

REMOVAL

BEZEL - INSTRUMENT PANEL CENTER

Fig. 419: Instrument Panel Center Bezel
 Courtesy of CHRYSLER LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING.**

2. Set the park brake and move the transmission gear selector into the most rearward position.
3. Using a trim stick C-4755 or equivalent and starting at the top of the center bezel, pry the bezel away from the instrument panel far enough to disengage the snap clip retainers that secure it to the instrument panel.
4. Reach behind the bezel to access and disconnect all electrical connections.
5. Remove the center bezel from the instrument panel.
6. Remove all heating and air conditioning vents, control units and power outlets from the center bezel.

INSTALLATION

BEZEL - INSTRUMENT PANEL CENTER

Fig. 420: Instrument Panel Center Bezel
Courtesy of CHRYSLER LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING**.
2. Install all heating and air conditioning vents, control units, power outlets to the center bezel.
3. Connect the electrical connectors.
4. Position the center bezel and seat the retaining clips starting with the lower clips first using hand pressure.
5. Place the transmission into park.

BEZEL - HVAC

REMOVAL

BEZEL - HVAC

Fig. 421: Instrument Panel Air Outlet R and I
 Courtesy of CHRYSLER LLC

1. Remove the defroster grille, see **REMOVAL**.
2. Remove the A-pillar trim molding from the side of the vehicle being serviced, see **REMOVAL**.
3. Remove the screw (1) that secures the top of the air outlet (2) to the instrument panel (4).
4. Using a trim stick C-4755 or equivalent (3), gently pry the lower portion of the air outlet rearward to disengage the two metal retaining clips from the instrument panel and remove the outlet.
5. If required, carefully disengage the plastic retaining tabs that secure the air outlet grille to the back of air outlet and remove the grille from the outlet.

INSTALLATION

BEZEL - HVAC

Fig. 422: Instrument Panel Air Outlet R and I
 Courtesy of CHRYSLER LLC

1. Carefully install the air outlet grille onto the back of air outlet and engage the plastic retaining tabs that secure grille to the outlet. Make sure the retaining tabs are fully engaged.
2. Position the instrument panel air outlet(s) to the instrument panel and engage the two metal retaining clips to the instrument panel. Make sure the retainers are fully engaged.
3. Install the screw (1) that secures the top of the air outlet (2) to the instrument panel (4). Tighten the screw to 1.2 N.m (10 in. lbs.).
4. Install the A-pillar trim molding(s), see **INSTALLATION**.
5. Install the defroster grille, see **INSTALLATION**.

BIN - INSTRUMENT PANEL

REMOVAL

BIN - INSTRUMENT PANEL

CAUTION: Carefully disengage the retaining clips on the instrument panel bin, make sure the tool does not scratch the instrument panel assembly while removing.

1. Remove the screws underneath the bin mat and remove bin.
2. Using a trim stick C-4755 or equivalent, release the clips attaching the instrument panel bin to the instrument panel.

INSTALLATION

BIN - INSTRUMENT PANEL

CAUTION: Carefully align the upper center tray clips to the instrument panel slots. Make sure the panel is properly positioned to avoid breaking the clip tabs on the bin.

1. Align and install the instrument panel bin to the instrument panel.
2. Use hand pressure to engage the instrument panel bin clips to the instrument panel slots.
3. Install screws underneath the bin mat and tighten.

BIN - STEERING COLUMN COVER

REMOVAL

BIN - STEERING COLUMN COVER

1. Remove the steering column cover panel, see **REMOVAL**.
2. Use a trim stick C-4755 or equivalent, disengage the lower hinges of the steering column cover bin from the steering column cover panel.

INSTALLATION

BIN - STEERING COLUMN COVER

1. Install the steering column cover bin lower hinges to the steering column cover panel.
2. Install the steering column cover panel, see **INSTALLATION**.

COVER - STEERING COLUMN

REMOVAL

COVER - STEERING COLUMN

8196d206

Fig. 423: Knee Blocker
Courtesy of CHRYSLER LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING**.
2. Position the steering column into the highest position to ease in the removal of the steering column cover. Reach into the steering column opening at the top of the steering column cover and pull the top rearward to disengage cover blocker clips.
3. Gently swing the cover open.
4. While the cover is in a full down position, slide the cover to the left or outboard of the driver side, this will allow the claws of the cover to disengage from the trim panel hinges, and then pull the cover rearward to remove the steering column cover.

INSTALLATION

COVER - STEERING COLUMN

8196d206

Fig. 424: Knee Blocker
Courtesy of CHRYSLER LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING.**
2. Align steering column cover's claws to instrument panel tabs. When claws are aligned with tabs, slide the cover to the right or inboard of the driver side to engage the claws over the instrument panels hinges.
3. Gently swing the steering column cover upward until the clips touch the corresponding slots in the instrument panel and use hand pressure to engage the clips.

END CAP - INSTRUMENT PANEL

REMOVAL

END CAP - INSTRUMENT PANEL

819ec577

Fig. 425: Instrument Panel End Cap
Courtesy of CHRYSLER LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING**.
2. Using a trim stick C-4755 or equivalent, remove the end cap bezel from the instrument panel assembly.

INSTALLATION

END CAP - INSTRUMENT PANEL

Fig. 426: Instrument Panel End Cap
Courtesy of CHRYSLER LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING**.
2. Position the end cap and seat the retaining clips using hand pressure.

GLOVE BOX - INSTRUMENT PANEL

REMOVAL

GLOVE BOX - INSTRUMENT PANEL

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING**.
2. Open the glove box.
3. Squeeze the stop tabs located on the sides of the box while and swing the glove box door open.
4. With box in the full down position slide the box to the right off of the hinges and remove.

INSTALLATION

GLOVE BOX - INSTRUMENT PANEL

1. Before proceeding with the following repair procedure, review all warnings and cautions. See

WARNING.

2. Position the box on and slide the box to the left to engage the hinges.
3. Close the glove box.

GRILLE-DEFROSTER

REMOVAL

GRILLE-DEFROSTER

8196d433

Fig. 427: Defroster Grille
Courtesy of CHRYSLER LLC

CAUTION: Carefully disengage the retaining clips on the defroster grille, make sure the tool does not scratch the instrument panel assembly while removing.

1. Using a trim stick C-4755 or equivalent, release the rearward edge clips, and secondly once the rearward edge clips are released. Move in an upward and rearward direction to release the front edge clips of the instrument panel top cover.
2. Remove the defroster grille from instrument panel.

INSTALLATION

GRILLE-DEFROSTER

8196d433

Fig. 428: Defroster Grille
Courtesy of CHRYSLER LLC

CAUTION: Carefully align the defroster grille clips to the instrument panel slots. Make sure the panel is properly positioned to avoid breaking the clip tabs on the defroster grille.

1. Position the defroster grille at a 45° angle and engage the forward clips first then engage the rear clips of the defroster grille to the instrument panel.
2. Use hand pressure to engage the defroster grille clips to the instrument panel slots.

LATCH - GLOVE BOX DOOR

REMOVAL

LATCH - GLOVE BOX DOOR

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING**.
2. Remove the glove box, see **REMOVAL**.
3. Remove the three screws and remove the glove box latch.

INSTALLATION

LATCH - GLOVE BOX DOOR

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING**.
2. Position the latch to the glove box.
3. Install the three screws.
4. Install the glove box, see **INSTALLATION**.

PANEL - INSTRUMENT

REMOVAL

PANEL - INSTRUMENT

Fig. 429: Removing Battery Cable Terminal Clamp - Typical
Courtesy of CHRYSLER LLC

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.

NOTE: Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight-ahead position.

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING**.
2. Loosen the battery terminal nut and use a battery terminal removal tool (2) to disconnect the negative battery cable from the battery (1).

819543f7

Fig. 430: Instrument Panel, Slots & Moldings
 Courtesy of CHRYSLER LLC

3. Remove the right and left A-pillar trim moldings using a small pry tool or equivalent, lift the A-pillar trim molding (3) from the A-pillar slots (2) releasing the clips on the molding.

819d2bec

Fig. 431: Removing/Installing Fasteners And Close Out Panels
 Courtesy of CHRYSLER LLC

4. Remove the fasteners and close out panels from the lower I/P.

Fig. 432: Removing/Installing Floor Console
 Courtesy of CHRYSLER LLC

5. Remove the floor console, see **REMOVAL**.

Fig. 433: Removing/Installing Nuts And Instrument Panel Support Bracket
 Courtesy of CHRYSLER LLC

6. Remove the nuts and the instrument panel support bracket.

8196d206

Fig. 434: Knee Blocker
Courtesy of CHRYSLER LLC

7. Reach into the steering column opening at the top of the knee blocker and pull the top rearward to disengage upper knee blocker clips.
8. Gently swing the knee blocker open.
9. While the cover is in a full down position, slide the cover to the left or outboard of the driver side, this will allow the claws of the cover to disengage from the trim panel hinges, and then pull the cover rearward to remove the steering column cover.

8195d70f

Fig. 435: Cowl Trim Panel
Courtesy of CHRYSLER LLC

10. Remove the right and left cowl side panels, see **REMOVAL**.

819d4076

Fig. 436: Lower Instrument Panel
 Courtesy of CHRYSLER LLC

11. Remove bolts (1) and the nuts (2) from the lower instrument panel mounts.

NOTE: Using a grease pencil or equivalent, mark the position of the steering wheel.

12. Remove the steering column from the vehicle, refer to **REMOVAL** .

8196d433

Fig. 437: Defroster Grille
 Courtesy of CHRYSLER LLC

CAUTION: Carefully disengage the retaining clips on the defroster grille. Make sure the tool does not scratch the instrument panel assembly while removing.

13. Using a trim stick C-4755 or equivalent, release the rearward edge clips, and secondly once the rearward

edge clips are released. Move in an upward and rearward direction to release the front edge clips of the instrument panel top cover.

14. Remove the defroster grille from the instrument panel.

819d4224

Fig. 438: Upper Instrument Panel
Courtesy of CHRYSLER LLC

15. Remove the bolts (2) attaching the instrument panel (1) to the body (3).

80cd5d6e

Fig. 439: Pedal Support Bracket
 Courtesy of CHRYSLER LLC

16. Disconnect the electrical connector at the inner side of the pedal support bracket.
17. Remove the two bolts at the front of the pedal support bracket.
18. Remove the two bolts from the bottom side of the pedal support bracket.

81a957b6

Fig. 440: Center Instrument Panel Attachment
Courtesy of CHRYSLER LLC

19. Remove the instrument panel center bezel.
20. Disconnect the following electrical connections:
 - Control Head
 - Lighter
 - Switch Bank
21. Remove the fasteners from the center instrument panel attachment.

81a957b2

Fig. 441: Upper Instrument Panel Attachment
Courtesy of CHRYSLER LLC

22. Remove the glove box, see **REMOVAL**.
23. Remove the fastener from the upper instrument panel attachment.

81a957c3

Fig. 442: Lower Instrument Panel Attachment

Courtesy of CHRYSLER LLC

24. Remove the fastener from the lower instrument panel attachment.

Fig. 443: 40 Way Electrical Connectors And NAG1 Connector
Courtesy of CHRYSLER LLC

25. Disconnect the two 40 way electrical connectors (1) and the Nag1 connector for the transmission if equipped.
26. Remove the electrical connections on the instrument panel harness.
27. Remove the instrument panel from the vehicle compartment.

INSTALLATION

PANEL - INSTRUMENT

Fig. 444: 40 Way Electrical Connectors And NAG1 Connector
Courtesy of CHRYSLER LLC

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.

NOTE: Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight-ahead position.

NOTE: Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING.**

1. Install the instrument panel to the vehicle.
2. Connect the two 40 way electrical connectors (1) and the Nag1 connector for the transmission, if equipped.

81a957c3

Fig. 445: Lower Instrument Panel Attachment
Courtesy of CHRYSLER LLC

3. Install the fastener to the lower instrument panel attachment.

81a957b2

Fig. 446: Upper Instrument Panel Attachment
Courtesy of CHRYSLER LLC

4. Install the fastener to the upper instrument panel attachment.
5. Install the glove box, see **INSTALLATION**.

81a957b6

Fig. 447: Center Instrument Panel Attachment
Courtesy of CHRYSLER LLC

6. Install the fasteners to the center instrument panel attachment.
7. Connect the following electrical connections:
 - Control Head
 - Lighter
 - Switch Bank
8. Install the instrument panel center bezel.

Fig. 448: Pedal Support Bracket
 Courtesy of CHRYSLER LLC

9. Install the two bolts to the bottom side of the pedal support bracket.
10. Install the two bolts at the front of the pedal support bracket.
11. Connect the electrical connector at the inner side of the pedal support bracket.

Fig. 449: Upper Instrument Panel
Courtesy of CHRYSLER LLC

CAUTION: Make sure the clips located at the center stack and between the HVAC duct and instrument panel are engaged before tightening the upper instrument panel bolts.

12. Install the bolts (2) attaching the instrument panel (1) to the body (3) and tighten to 28 N.m (20.5 ft. lbs.).

8196d433

Fig. 450: Defroster Grille
Courtesy of CHRYSLER LLC

CAUTION: Carefully align the defroster grille clips to the instrument panel slots. Make sure the panel is properly positioned to avoid breaking the clip tabs from the defroster grille.

13. Align and install the defroster grille to the instrument panel.
14. Use hand pressure to engage the defroster grille clips to the instrument panel slots.
15. Install the steering column to the vehicle, refer to **INSTALLATION** .

819d4076

Fig. 451: Lower Instrument Panel
Courtesy of CHRYSLER LLC

16. Install the bolts (1) and tighten to 6 N.m (55 in. lbs.).
17. Install the nuts (2) to the lower instrument panel mounts and tighten to 30.5 N.m (22.5 ft. lbs.).

8195470F

Fig. 452: Cowl Trim Panel
Courtesy of CHRYSLER LLC

18. Install the right and left cowl side panels, see **INSTALLATION**.

8196d206

Fig. 453: Knee Blocker
Courtesy of CHRYSLER LLC

19. Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING.**
20. Align steering column cover's claws to instrument panel tabs. When claws are aligned with tabs, slide the cover to the right or inboard of the driver side to engage the claws over the instrument panels hinges.
21. Gently swing the steering column cover upward until the clips touch the corresponding slots in the instrument panel and use hand pressure to engage the clips.

819d3f96

Fig. 454: Removing/Installing Nuts And Instrument Panel Support Bracket
Courtesy of CHRYSLER LLC

22. Install the instrument panel support bracket and nuts and tighten to 28 N.m (20.5 ft. lbs.).

Fig. 455: Removing/Installing Floor Console
Courtesy of CHRYSLER LLC

23. Install the floor console, see **INSTALLATION**.

Fig. 456: Removing/Installing Fasteners And Close Out Panels
Courtesy of CHRYSLER LLC

24. Install the close out panels and the bolts to the lower I/P and tighten to 2.5 N.m (22 in. lbs.).

Fig. 457: Instrument Panel, Slots & Moldings
Courtesy of CHRYSLER LLC

25. Align the right and left A-pillar trim tabs on the moldings (3) to the top cover slot of the instrument panel (1).
26. Align the two clips on the molding to the slots (2) on the A-pillar. Snap the A-pillar trim molding (3) into place using hand pressure.
27. Connect the negative battery cable to the battery.

STRIKER - GLOVE BOX DOOR LATCH

REMOVAL

STRIKER - GLOVE BOX DOOR LATCH

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING**.
2. Open the glove box.
3. Remove the two striker screws and remove the latch striker.

INSTALLATION

STRIKER - GLOVE BOX DOOR LATCH

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING**.
2. Install the striker and install the two screws.
3. Loosen the screws to adjust if necessary.

INTERIOR

BASE - FLOOR CONSOLE

REMOVAL

BASE - FLOOR CONSOLE

Fig. 458: Floor Console Shift Bezel
Courtesy of CHRYSLER LLC

1. Using a trim stick C-4755 or equivalent, pry the shift bezel out of the floor console.
2. If equipped, remove electrical connectors attached to shift bezel.

Fig. 459: Console Lid, End Cap & Electrical Connectors
Courtesy of CHRYSLER LLC

3. Open console lid (1).
4. Using a trim stick C-4755 or equivalent, release the fasteners at the four locations around the floor console end cap (2).
5. Disconnect electrical connectors (3) from end cap (2).
6. Remove end cap (2).

Fig. 460: Removing/Installing Floor Console
 Courtesy of CHRYSLER LLC

7. Remove ash cup (3) from console (1).
8. Remove bin (4) from console (1).
9. Remove two screws (2) from front of console (1).
10. Remove two screws (5) from rear of console (1) located inside the console bin.
11. Lift console (1) at back and remove.

INSTALLATION

BASE - FLOOR CONSOLE

Fig. 461: Removing/Installing Floor Console
 Courtesy of CHRYSLER LLC

1. Install the console (1) into the vehicle.
2. Install the two screws (5) to the rear of the console (1), located inside the console bin.

3. Install the two screws (2) in the front of console (1).
4. Install the bin (4) to the console (1).
5. Install the ash cup (3) to the console (1).

Fig. 462: Console Lid, End Cap & Electrical Connectors
Courtesy of CHRYSLER LLC

6. Connect the electrical connectors (3) to the end cap (2).
7. Align the end cap (2) to the console, use hand pressure to seat the clips.

Fig. 463: Floor Console Shift Bezel
Courtesy of CHRYSLER LLC

8. If equipped, connect electrical connectors attached to shift bezel.
9. Align and use hand pressure to install the shift bezel into the floor console.

BEZEL - CONSOLE SHIFT

REMOVAL

BEZEL - CONSOLE SHIFT

1. If equipped with a manual transmission and built before February 11, 2008, using a slide-hammer, snap out the shift knob from the lever.

8195c171

Fig. 464: Floor Console Shift Bezel
Courtesy of CHRYSLER LLC

2. Using a trim stick C-4755 or equivalent, pry the shift bezel out of the floor console. If equipped with a manual transmission, the lever boot will come off with the bezel.
3. If equipped, remove electrical connectors attached to shift bezel.
4. If equipped with a manual transmission and built on or after February 11, 2008, using a slide-hammer, snap out the shift knob from the lever.

NOTE: If equipped with a manual transmission and built on or after February 11, 2008, to remove the boot from the console bezel, operate the retaining clips to release the boot frame. Do not attempt using a trim stick on the top surface, that will damage the part.

INSTALLATION

BEZEL - CONSOLE SHIFT

1. If equipped with a manual transmission and built on or after February 11, 2008, snap in the shift knob on the shift lever.

8195c171

Fig. 465: Floor Console Shift Bezel
 Courtesy of CHRYSLER LLC

2. If equipped, connect electrical connectors attached to shift bezel.
3. Align and use hand pressure to install the shift bezel into the floor console.
4. If equipped with a manual transmission and built before February 11, 2008, snap in the shift knob on the shift lever.

CARPET - FLOOR

REMOVAL

CARPET - FLOOR

Front Carpet

8195eb8b

Fig. 466: Front Carpet
 Courtesy of CHRYSLER LLC

1. Remove front seats, see **REMOVAL**.
2. Remove the floor console, see **REMOVAL**.
3. Remove the rear seats, see **REMOVAL**.
4. Remove the cowl trim panels, see **REMOVAL**.
5. Remove the B-pillar lower trim, see **REMOVAL**.
6. Remove all electrical harnesses from the carpet.
7. Remove the carpet from the vehicle.

INSTALLATION

CARPET - FLOOR

Fig. 467: Front Carpet
Courtesy of CHRYSLER LLC

1. Install the carpet to the vehicle.
2. Route all the electrical harness pigtails into the carpet at the varies locations.
3. Install the B-pillar lower trim, see **INSTALLATION**.
4. Install the cowl trim panels, see **INSTALLATION**.
5. Install the rear seats, see **INSTALLATION**.
6. Install the floor console, see **INSTALLATION**.
7. Install the front seats, see **INSTALLATION**.

COVER - B PILLAR LOWER

REMOVAL

COVER - B PILLAR LOWER

Fig. 468: Lower B Pillar Cover
 Courtesy of CHRYSLER LLC

1. Using a trim stick C-4755 or equivalent, pry up on the trim panel (2), releasing the retaining clips from the body (4).
2. Remove the trim panel (2) from the B-pillar (1).
3. Remove the trim panel (2) by sliding the panel forward releasing the panel from the scuff clips in the body (3).

INSTALLATION

COVER - B PILLAR LOWER

Fig. 469: Lower B Pillar Cover
 Courtesy of CHRYSLER LLC

1. Align and install the trim panel clips (3) rearward and into quarter trim panel.
2. Push the trim panel (2) down into the body (4) using hand pressure until all clips are seated.

3. Align and install the trim panel (2) to the body slots (1) on the B-pillar. Snap into place using hand pressure.

COVER - B PILLAR UPPER

REMOVAL

COVER - B PILLAR UPPER

Fig. 470: Upper B-Pillar Trim
Courtesy of CHRYSLER LLC

1. Remove the seat belt bolt (3).
2. Using a trim stick C-4755 or equivalent, pry out the screw cover from the top of the trim panel (2), remove the screw.
3. Remove the trim (2) by sliding up and out of the B-pillar lower trim.
4. Remove the seatbelt webbing from the B-pillar upper trim (2).

INSTALLATION

COVER - B PILLAR UPPER

8195a102

Fig. 471: Upper B-Pillar Trim
Courtesy of CHRYSLER LLC

1. Feed the seatbelt webbing through the B-pillar trim (2). Slide the belt adjuster to top position.
2. Install the trim (2) by sliding down and into the B-pillar lower trim.
3. Align the 4-way locator and seat the B-pillar trim (2) to the body.
4. Install the screw and screw cover.
5. Install the seat belt bolt (3) and tighten to 44.5 N.m (33 ft. lbs.).

COVER - C PILLAR

REMOVAL

COVER - C PILLAR

819590fe

Fig. 472: C-Pillar Cover
Courtesy of CHRYSLER LLC

1. Remove the seat belt bolt (3).
2. Using a trim stick C-4755 or equivalent, pry out the screw cover from the top of the trim panel (2), remove the screw.
3. Remove the trim (2) by sliding up and out of the quarter trim molding.
4. Remove the seatbelt webbing from the C-pillar trim (2).

INSTALLATION

COVER - C PILLAR

Fig. 473: C-Pillar Cover
Courtesy of CHRYSLER LLC

1. Feed the seatbelt webbing through the C-pillar trim (2).
2. Install the trim (2) by sliding down and into the quarter trim molding.
3. Align the 4-way locator and seat the C-pillar trim (2) to the body.
4. Install the screw and screw cover.
5. Install the seat belt bolt (3) and tighten to 62 N.m (46 ft. lbs.).

CAP - FLOOR CONSOLE END

REMOVAL

CAP - FLOOR CONSOLE END

Fig. 474: Console Lid, End Cap & Electrical Connectors
 Courtesy of CHRYSLER LLC

1. Open console lid (1).
2. Using a trim stick C-4755 or equivalent, release the fasteners at the four locations around the floor console end cap (2).
3. Disconnect electrical connectors (3) from end cap (2).
4. Remove end cap (2).

INSTALLATION

CAP - FLOOR CONSOLE END

Fig. 475: Console Lid, End Cap & Electrical Connectors
 Courtesy of CHRYSLER LLC

1. Connect the electrical connectors (3) to the end cap (2).
2. Align the end cap (2) to the console, use hand pressure to seat the clips.

FLOOR - LOAD

REMOVAL

FLOOR - LOAD

Fig. 476: Load Floor Panel, Load Floor & Rear Seat Bracket
Courtesy of CHRYSLER LLC

1. Position the rear seats in the forward position.
2. Remove the load floor panel (1) from the load floor (2) and the rear seat bracket (3).

Fig. 477: Load Floor
Courtesy of CHRYSLER LLC

3. Remove the nuts (2) from the load floor (1).
4. Lift the rear of the floor panel (1) up and rearward to release from the body hooks (4).
5. Remove the load floor (1) from the vehicle.

INSTALLATION

FLOOR - LOAD

Fig. 478: Load Floor
Courtesy of CHRYSLER LLC

1. Install the load floor (1) to the vehicle.
2. Lift the rear of the floor panel (1) up and forward to catch the hooks (4).
3. Lower the load floor (1) onto the studs (3).
4. Install the nuts (2) to the load floor (1) and tighten the nuts to 28 N.m (20.5 ft. lbs.).

Fig. 479: Load Floor Panel, Load Floor & Rear Seat Bracket
Courtesy of CHRYSLER LLC

5. Install the load floor panel (1) to the load floor (2) and the rear seat bracket (3). Use hand pressure to seat the clips.
6. Return the rear seats in the upright position.

HANDLE - ASSIST

REMOVAL

HANDLE - ASSIST

81a6a93c

Fig. 480: Handle Assist
Courtesy of CHRYSLER LLC

1. Using a small pry tool or equivalent, release the assist handle by prying open the covers (1) at either end.
2. Remove the screws (2) from the assist handle.

INSTALLATION

HANDLE - ASSIST

81a6a93c

Fig. 481: Handle Assist
Courtesy of CHRYSLER LLC

NOTE: **Inspect and replace the screw retaining clips if damaged.**

1. Position the assist handle to the headliner and install the screws (2).
2. Close the covers (1) on either end of the assist handle.

HEADLINER

REMOVAL

HEADLINER

Fig. 482: Harness Clip, D-Pillar Body & Body Harness Connectors
Courtesy of CHRYSLER LLC

1. Disconnect the negative battery cable.
2. If equipped, remove the sunroof opening trim ring.
3. Remove the quarter trim, see **REMOVAL**.
4. Remove the upper B-pillar trim, see **REMOVAL**.
5. Remove the A-pillar trim, see **REMOVAL**.
6. If equipped, remove the overhead console, refer to **REMOVAL**.
7. Remove the sun visor support, see **REMOVAL**.
8. Remove the visors, see **REMOVAL**.
9. Remove the assist handles, see **REMOVAL**.
10. Disconnect the body harness connectors (3).
11. Remove the harness clip (1) from the D-pillar body (2).

Fig. 483: Mirror Electrical Connector
 Courtesy of CHRYSLER LLC

12. If equipped, disconnect the electrical connector (1) from the mirror (2).

Fig. 484: Dual Lock Areas, Sunroof, Spacer Foam Blocker, Headliner & Sunroof Motor Jumper
 Courtesy of CHRYSLER LLC

13. Disconnect the sunroof motor jumper (5).
14. Using a trim stick C-4755 or equivalent, separate the dual lock fasteners (1) of the headliner (4) to remove the headliner from the sunroof (2).

8195ce9d

Fig. 485: Lift Gate Washer Hose
Courtesy of CHRYSLER LLC

15. Cut the lift gate washer hose (1) at the A-pillar.

8195ce10

Fig. 486: DVD Electrical Connector
Courtesy of CHRYSLER LLC

16. Remove the harness clip (2) from the D-pillar body (1).
17. Disconnect the DVD electrical connectors (3).

Fig. 487: Satellite Radio Body Antenna Connector, Power Connector & Radio Body Antenna Connector
 Courtesy of CHRYSLER LLC

18. If equipped, disconnect the satellite radio body antenna connector (1).
19. Disconnect the power connector (2).
20. Disconnect the radio body antenna connector (3).

Fig. 488: Radio/Satellite Connections L/F
 Courtesy of CHRYSLER LLC

21. Disconnect the radio and/or satellite electrical connectors along the left A-pillar.

Fig. 489: Headliner Rear Connections
 Courtesy of CHRYSLER LLC

22. Remove the Center High Mount Stop Lamp (CHMSL) and disconnect the lift gate washer hose (4), refer to **REMOVAL** .
23. Disconnect the electrical connector for the lift gate harness (1).
24. Remove the clip (3) from the header roof (2).

Fig. 490: Headliner & Roof
 Courtesy of CHRYSLER LLC

CAUTION: It is necessary to fold the corner and the side up between the C and D pillar area of the headliner to remove from the vehicle. The corner must be folded up and not down to avoid damaging the headliner.

25. Fold the rear seat in the down position and remove the headliner (2) from the roof (1).

INSTALLATION

HEADLINER

Fig. 491: Headliner & Roof
Courtesy of CHRYSLER LLC

CAUTION: It is necessary to fold the corner and the side up between the C and D pillar area of the headliner to remove from the vehicle. The corner must be folded up and not down to avoid damaging the headliner.

1. Install the headliner (2) to the roof (1).

Fig. 492: Headliner Rear Connections
Courtesy of CHRYSLER LLC

2. Connect the lift gate washer drain hose (4) to the Center High Mounted Stop Lamp (CHMSL) and install to the lift gate, refer to **INSTALLATION**.
3. Connect the electrical connector for the lift gate harness (1).
4. Install the clip (3) to the header roof (2).

Fig. 493: Radio/Satellite Connections L/F
Courtesy of CHRYSLER LLC

5. Connect the radio and/or satellite electrical connectors along the left A-pillar.

Fig. 494: Satellite Radio Body Antenna Connector, Power Connector & Radio Body Antenna Connector
Courtesy of CHRYSLER LLC

6. Connect the satellite radio body antenna connector (1).
7. Connect the power connector (2).
8. Connect the radio body antenna connector (3).

Fig. 495: DVD Electrical Connector
 Courtesy of CHRYSLER LLC

9. Attach the harness clip (2) to the D-pillar body (1).
10. Connect the DVD electrical connectors (3).

Fig. 496: Lift Gate Washer Hose
 Courtesy of CHRYSLER LLC

NOTE: Install a union where the lift gate washer hose was cut during removal.

11. Connect the lift gate washer hoses (1) with a union at the A-pillar.

Fig. 497: Dual Lock Areas, Sunroof, Spacer Foam Blocker, Headliner & Sunroof Motor Jumper
 Courtesy of CHRYSLER LLC

12. Connect the sunroof motor jumper (5).
13. Remove the tape backing from the spacer foam blocker (3), use hand pressure on the foam blocker to stick the headliner and the sunroof together.
14. Use hand pressure at the dual lock areas (1) of the headliner (4) to make sure the headliner sticks to the sunroof (2).

Fig. 498: Mirror Electrical Connector
 Courtesy of CHRYSLER LLC

15. Connect the electrical connector (1) for the mirror (2).

Fig. 499: Harness Clip, D-Pillar Body & Body Harness Connectors
Courtesy of CHRYSLER LLC

16. Connect the body harness connectors (3).
17. Attach the harness clip (1) to the D-pillar body (2).
18. Install the assist handles, see **INSTALLATION**.
19. Install the visors, see **INSTALLATION**.
20. Install the visor supports, see **INSTALLATION**.
21. Install the overhead console, refer to **INSTALLATION** .
22. Install the A-pillar trim and grab handles, see **INSTALLATION**.
23. Install the upper B-pillar trim, see **INSTALLATION**.
24. Install the quarter trim panels, see **INSTALLATION**.
25. Install the sunroof opening trim ring, if equipped.
26. Connect the negative battery cable.

LATCH - ARMREST LID

REMOVAL

LATCH - ARMREST LID

Fig. 500: Armrest Lid Latch
 Courtesy of CHRYSLER LLC

NOTE: Using a grease pencil or equivalent, mark location of lid latch (2) on the console lid (3) for installation alignment.

1. Remove the two screws (1) attaching the console lid latch (2) to the console lid (3).
2. Remove the lid latch (2) from the console lid (3).

INSTALLATION

LATCH - ARMREST LID

Fig. 501: Armrest Lid Latch
 Courtesy of CHRYSLER LLC

NOTE: Align the lid latch (2) with the reference marks made during removal.

1. Install the two screws (1) attaching the console lid latch (2) to the console lid (3).
2. Check the adjustment of the lid latch (2) and adjust as necessary by loosening the two screws (1) and moving the lid latch (2) right or left as needed until the console lid (3) closes properly.

LID - FLOOR CONSOLE

REMOVAL

LID - FLOOR CONSOLE

Fig. 502: Floor Console Lid
Courtesy of CHRYSLER LLC

1. Remove the two screws (1) attaching the console lid (2) to the hinge (3).
2. Remove the console lid (2) from the hinge (3).
3. Remove the three screws (5) attaching the hinge (3) to the console (4).
4. Remove the hinge (3) from the console (4).

INSTALLATION

LID - FLOOR CONSOLE

Fig. 503: Floor Console Lid
Courtesy of CHRYSLER LLC

1. Install the hinge (3) to the console (4).
2. Install the three screws (5) attaching hinge (3) to the console (4).
3. Install the console lid (2) to the hinge (3).
4. Install the two screws (1) attaching the console lid (2) to the hinge (3).

MIRROR - REAR VIEW

REMOVAL

MIRROR - REAR VIEW

80b3c6eb

Fig. 504: Removing/Installing Rear View Mirror
Courtesy of CHRYSLER LLC

- 1 - CONNECTOR
- 2 - SCREW
- 3 - REAR VIEW MIRROR
- 4 - SUPPORT BUTTON
- 5 - WINDSHIELD

1. If equipped, disconnect mirror harness connector.
2. Loosen the mirror base setscrew.
3. Slide the mirror base upward and off the bracket.

INSTALLATION

MIRROR - REAR VIEW

80b3c6eb

Fig. 505: Removing/Installing Rear View Mirror
 Courtesy of CHRYSLER LLC

- 1 - CONNECTOR
- 2 - SCREW
- 3 - REAR VIEW MIRROR
- 4 - SUPPORT BUTTON
- 5 - WINDSHIELD

1. Position the mirror base at the bracket and slide it downward onto the support bracket.
2. Tighten the setscrew 1 N.m (15 in. lbs.) torque.
3. If equipped, connect mirror harness connector.

REAR VIEW MIRROR - SUPPORT BRACKET

1. Mark the position for the mirror bracket on the outside of the windshield glass with a wax pencil.
2. Clean the bracket contact area on the glass. Use a mild powdered cleanser on a cloth saturated with isopropyl (rubbing) alcohol. Finally, clean the glass with a paper towel dampened with alcohol.
3. Sand the surface on the support bracket with fine grit-sandpaper. Wipe the bracket surface clean with a

paper towel.

4. Apply accelerator to the surface on the bracket according to the following instructions:
 - Crush the vial to saturate the felt applicator.
 - Remove the paper sleeve.
 - Apply accelerator to the contact surface on the bracket.
 - Allow the accelerator to dry for five minutes.
 - Do not touch the bracket contact surface after the accelerator has been applied.
5. Apply adhesive accelerator to the bracket contact surface on the windshield glass. Allow the accelerator to dry for one minute. Do not touch the glass contact surface after the accelerator has been applied.
6. Install the bracket according to the following instructions:
 - Apply one drop of adhesive at the center of the bracket contact-surface on the windshield glass.
 - Apply an even coat of adhesive to the contact surface on the bracket.
 - Align the bracket with the marked position on the windshield glass.
 - Press and hold the bracket in place for at least one minute.

NOTE: **Verify that the mirror support bracket is correctly aligned, because the adhesive will cure rapidly.**

7. Allow the adhesive to cure for 8-10 minutes. Remove any excess adhesive with an alcohol-dampened cloth.
8. Allow the adhesive to cure for an additional 8-10 minutes before installing the mirror.

MOLDING - A PILLAR

REMOVAL

MOLDING - A PILLAR

81954367

Fig. 506: Instrument Panel, Slots & Moldings
Courtesy of CHRYSLER LLC

1. Using a small pry tool or equivalent, lift the A-pillar trim molding (3) from the A-pillar slots (2) releasing the clips on the molding.

NOTE: The top tethered clip has a locking tab that needs to be lifted in order for clip to slide out of the trim attachment point.

2. Remove the top clip from the trim molding.

INSTALLATION

MOLDING - A PILLAR

Fig. 507: Instrument Panel, Slots & Moldings
Courtesy of CHRYSLER LLC

1. Align the A-pillar trim tab on the molding (3) to the top cover slot of the instrument panel (1).
2. Install the top clip on the trim molding.
3. Align the two clips on the molding to the slots (2) on the A-pillar. Snap the A-pillar trim molding (3) into place using hand pressure.

MOLDING - HEADLINER

REMOVAL

MOLDING - HEADLINER

Fig. 508: Headliner Molding
 Courtesy of CHRYSLER LLC

1. Open the lift gate.

NOTE: **Align second clip from Right (Cross Car Locator) to its slot first. This helps line up the rest of clips.**

2. Pull down at the center of the headliner molding (3) only enough to allow the tab (2) to be released from the quarter trim molding.
3. Carefully pull down to remove the remaining clips (4) attaching the molding to the body then move the molding to the left to released the tab from the quarter trim molding.

INSTALLATION

MOLDING - HEADLINER

Fig. 509: Headliner Molding

Courtesy of CHRYSLER LLC

1. Install the headliner molding (3) to the body by sliding the tab (1) on the right side into the quarter trim molding.
2. Pull down at the center of the headliner molding (3) only enough to allow the tab (2) to be slide into the other side of the quarter trim molding.
3. Using hand pressure snap the remaining clips (4) into place.
4. Close the lift gate.

PANEL - COWL SIDE

REMOVAL

PANEL - COWL SIDE

Fig. 510: Cowl Trim Panel
Courtesy of CHRYSLER LLC

1. Using a trim stick C-4755 or equivalent, remove the cowl trim cover (1) by pulling it away from the A-pillar and releasing the clip (2), continue lifting up the cowl trim panel (1) to release the clips (3) from the body.

INSTALLATION

PANEL - COWL SIDE

Fig. 511: Cowl Trim Panel
 Courtesy of CHRYSLER LLC

1. Align and install the cowl trim cover (1) by sliding the rear tabs of the cowl trim cover under the B-pillar trim.

CAUTION: When installing the cowl trim cover make sure not to damage the body plugs around the sill area. If damage occurs to the body plugs replace with new plugs. Failure to replace a damaged body plug will result in a water leak to the floor area of the vehicle.

2. Using hand pressure install the clips (3) into the body and the A-pillar (2).

PANEL - LOAD FLOOR

REMOVAL

PANEL - LOAD FLOOR

Fig. 512: Load Floor Panel, Load Floor & Rear Seat Bracket
Courtesy of CHRYSLER LLC

1. Position the rear seats in the forward position.
2. Remove the load floor panel (1) from the load floor (2) and the rear seat bracket (3).

INSTALLATION

PANEL - LOAD FLOOR

Fig. 513: Load Floor Panel, Load Floor & Rear Seat Bracket
Courtesy of CHRYSLER LLC

1. Install the load floor panel (1) to the load floor (2) and the rear seat bracket (3). Use hand pressure to seat the clips.
2. Return the rear seats in the upright position.

PANEL - QUARTER TRIM

REMOVAL

PANEL - QUARTER TRIM

8195a236

Fig. 514: Quarter Trim Panel
 Courtesy of CHRYSLER LLC

1. Using a trim stick C-4755 or equivalent, remove the rear door scuff plate, see **REMOVAL**.
2. Fold down the rear seat.
3. Remove the C-pillar cover, see **REMOVAL**.
4. Remove the screws and the cargo tie downs.
5. Remove the quarter trim panel (1) by carefully pulling at the clip locations (3).

8195a23d

Fig. 515: Quarter Trim Panel Electrical Connector
 Courtesy of CHRYSLER LLC

6. If replacing the left side quarter trim panel disconnect the 12v power supply electrical connector (2) from the socket (1).

INSTALLATION

PANEL - QUARTER TRIM

8195a23d

Fig. 516: Quarter Trim Panel Electrical Connector
 Courtesy of CHRYSLER LLC

1. If installing the left side quarter trim panel connect the 12v power supply electrical connector (2) from the socket (1).

8195a23e

Fig. 517: Quarter Trim Panel
 Courtesy of CHRYSLER LLC

2. Install the quarter trim panel (1) to the inside of the vehicle, carefully align and install the bottom of the quarter trim panel slots into the load floor first. Then continue to seat the remaining clips on the panel, working from the bottom up. Use hand pressure to seat the clips (3).
3. Install the cargo tie downs and tighten the screw.
4. Install the rear door scuff plate, see **INSTALLATION**.
5. Install the C-pillar cover, see **INSTALLATION**.
6. Return the rear seat to the up position.

REMOVAL

PLATE - SCUFF

Fig. 518: Rear Door Scuff Plate
Courtesy of CHRYSLER LLC

1. Open the lift gate.
2. Using a trim stick C-4755 or equivalent, release the retaining clips and remove the scuff plate (1) from the body (2).

INSTALLATION

PLATE - SCUFF

Fig. 519: Rear Door Scuff Plate
Courtesy of CHRYSLER LLC

1. Align the trim clips and use hand pressure to install the scuff plate (1) to the body (2).

2. Close the lift gate.

SUPPORT - SUN VISOR

REMOVAL

SUPPORT - SUN VISOR

9523-93

Fig. 520: Removing/Installing Sun Visor Support

Courtesy of CHRYSLER LLC

1. Disengage the sun visor (1) from the sun visor support (2).
2. Remove the screw that secures the support to the roof panel and remove the support from the headliner (3).

INSTALLATION

SUPPORT - SUN VISOR

9523-93

Fig. 521: Removing/Installing Sun Visor Support
Courtesy of CHRYSLER LLC

1. Position the sun visor support (2) on the headliner (3) and install the screw that secures the support to the roof panel.
2. Engage the sun visor (1) and sun visor support.

VISOR - SUN

REMOVAL

VISOR - SUN

Fig. 522: Removing/Installing Sun Visor
Courtesy of CHRYSLER LLC

1. Remove the two screws and remove the sun visor (2) from the headliner/roof assembly (1).
2. If equipped, disconnect the illuminated vanity mirror wire harness connector.

INSTALLATION

VISOR - SUN

Fig. 523: Removing/Installing Sun Visor
Courtesy of CHRYSLER LLC

1. If equipped, connect the illuminated vanity mirror wire harness connector.
2. Position the sun visor (2) to the headliner/roof (1) and install the screws. Tighten the screws to 2 N.m (20 in. lbs.).

LIFTGATE

BUMPER - LIFTGATE

REMOVAL

BUMPER - LIFTGATE

Fig. 524: Lift Gate Bumper
Courtesy of CHRYSLER LLC

1. Open the lift gate.
2. Remove the screws (2) and bumper (1) from the body.

INSTALLATION

BUMPER - LIFTGATE

Fig. 525: Lift Gate Bumper
Courtesy of CHRYSLER LLC

NOTE: Make sure the bumper is properly oriented with printed arrows pointing inboard.

1. Install the bumper (1) and screws (2) to the body and tighten to 12 N.m (106 in. lbs.).
2. Close the lift gate.

HANDLE - EXTERIOR

REMOVAL

HANDLE - EXTERIOR

Fig. 526: Liftgate Trim Panel
Courtesy of CHRYSLER LLC

1. Remove two bolts (2) from the lower trim panel (3).
2. Using a trim stick C-4755 or equivalent, release the fasteners at all of the locations around the trim panel (3).
3. Lift the trim panel (3) from the lift gate (1).

Fig. 527: Latch Cable
Courtesy of CHRYSLER LLC

4. Disconnect the latch cable (1) from the lift gate handle (2).

Fig. 528: Exterior Lift Gate Handle
Courtesy of CHRYSLER LLC

5. Remove the two nuts (4).
6. Disconnect the electrical connector (2).
7. Using a trim stick C-4755 or equivalent, remove the exterior lift gate handle (1) from the lift gate (3).

INSTALLATION

HANDLE - EXTERIOR

Fig. 529: Exterior Lift Gate Handle
Courtesy of CHRYSLER LLC

1. Install the exterior lift gate handle (1) to the lift gate (3).
2. Install the two nuts (4) and tighten to 8 N.m (6 ft. lbs.).
3. Connect the electrical connector (2).

81961518

Fig. 530: Latch Cable
 Courtesy of CHRYSLER LLC

4. Connect the latch cable (1) to the lift gate handle (2).

8195a778

Fig. 531: Liftgate Trim Panel
 Courtesy of CHRYSLER LLC

5. Align and install the trim panel (3) to the left gate (1), use hand pressure to seat all of the fasteners around the trim panel (3).
6. Install the two bolts (2) to the lower trim panel (3) and tighten to and tighten to 7 N.m (65 in. lbs.).

HINGE - LIFTGATE

REMOVAL

HINGE - LIFTGATE

Fig. 532: Headliner Molding
 Courtesy of CHRYSLER LLC

1. Open the lift gate.
2. Pull down at the center of the headliner molding (3) only enough to allow the tab (2) to be released from the quarter trim molding.
3. Carefully pull down to remove the remaining clips (4) attaching the molding to the body then move the molding to the left to released the tab from the quarter trim molding.

Fig. 533: Lift Gate Hinge
 Courtesy of CHRYSLER LLC

4. Using a grease pencil or equivalent, mark the position of the hinges (1) to aid with installation.

CAUTION: Support the lift gate while the hinge is removed.

5. Place a block under the lift gate and remove the nuts (3) from the hinge (1) located on the body.
6. Remove the bolts (4) from the hinge (1) located on the body.
7. Remove the bolts (2) from the hinge (1) at the lift gate.
8. Remove the hinge (1) from the vehicle.

INSTALLATION

HINGE - LIFTGATE

Fig. 534: Lift Gate Hinge
Courtesy of CHRYSLER LLC

1. Apply body sealer on the hinge to body mating surface. Align hinges with the installation reference marks made previously.
2. Remove the block under the lift gate and install the hinge (1) to the vehicle.
3. Install the bolts (4) to the hinge (1) at the body location and tighten bolts to 28.5 N.m (21 ft. lbs.).
4. Install the nuts (3) to the hinge (1) at the body location and tighten nuts to 28.5 N.m (21 ft. lbs.).
5. Install the bolts (2) to the hinge (1) at the lift gate location and tighten bolts to 28.5 N.m (21 ft. lbs.).
6. Adjust as necessary, see **ADJUSTMENTS**.

Fig. 535: Headliner Molding
 Courtesy of CHRYSLER LLC

7. Install the headliner molding (3) to the body by sliding the tab (1) on the right side into the quarter trim molding.
8. Pull down at the center of the headliner molding (3) only enough to allow the tab (2) to be slide into the other side of the quarter trim molding.
9. Using hand pressure snap the remaining clips (4) into place.
10. Close the lift gate.

LATCH - LIFTGATE

REMOVAL

LATCH - LIFTGATE

Fig. 536: Liftgate Trim Panel
 Courtesy of CHRYSLER LLC

1. Remove two bolts (2) from the lower trim panel (3).
2. Using a trim stick C-4755 or equivalent, release the fasteners at all of the locations around the trim panel (3).
3. Lift the trim panel (3) from the lift gate (1).

81960765

Fig. 537: Lift Gate Latch
Courtesy of CHRYSLER LLC

4. Remove the three bolts (4) from the lift gate latch (3).
5. Disconnect the electrical connectors (5).
6. Disconnect the cable (2) from the latch (3).
7. Remove the lift gate latch (3) from the lift gate (1).

INSTALLATION

LATCH - LIFTGATE

81960765

Fig. 538: Lift Gate Latch
Courtesy of CHRYSLER LLC

1. Install the latch (3) to the lift gate (1).
2. Install the three bolts (4) to the lift gate latch (3) and tighten the bolts to 11 N.m (95 in. lbs.).
3. Connect the cable (2) to the latch (3).
4. Connect the electrical connectors (5).

Fig. 539: Liftgate Trim Panel
Courtesy of CHRYSLER LLC

5. Align and install the trim panel (3) to the lift gate (1), use hand pressure to seat all of the fasteners around the trim panel (3).
6. Install the two bolts (2) to the lower trim panel (3) and tighten to 7 N.m (65 in. lbs.).

LATCH - ACCESS PANEL

DESCRIPTION

LATCH - ACCESS PANEL

This panel provides access to the lift gate latch. If power is interrupted to the latch, then the lift gate can be opened manually by removing the access panel and pushing the latch release lever down.

REMOVAL

LATCH - ACCESS PANEL

NOTE: The latch access panel is located on the lift gate trim panel near the latch mechanism.

1. Using a trim stick C-4755 or equivalent, remove the access panel.

INSTALLATION

LATCH - ACCESS PANEL

1. Position and install the latch access panel to the lift gate trim panel.

LIFTGATE

REMOVAL

LIFTGATE

Fig. 540: Headliner Molding
Courtesy of CHRYSLER LLC

1. Open the lift gate.
2. Pull down at the center of the headliner molding (3) only enough to allow the tab (2) to be released from the quarter trim molding.
3. Carefully pull down to remove the remaining clips (4) attaching the molding to the body then move the molding to the left to released the tab from the quarter trim molding.

Fig. 541: Liftgate Trim Panel
 Courtesy of CHRYSLER LLC

4. Remove two bolts (2) from the lower trim panel (3).
5. Using a trim stick C-4755 or equivalent, release the fasteners at all of the locations around the trim panel (3).
6. Lift the trim panel (2) from the lift gate (1).
7. Disconnect the lift gate harness connector, remove the grommet and electrical harness.

Fig. 542: Lift Gate Support Cylinder & Lift Gate Support Tool
 Courtesy of CHRYSLER LLC

8. Support the lift gate with a lift gate support tool (1).
9. Remove the support cylinders (2) from the lift gate and body.

81961d3c

Fig. 543: Lift Gate/Hinge
Courtesy of CHRYSLER LLC

10. Remove the center high mounted stop lamp, refer to **REMOVAL** .
11. Disconnect all electrical connectors and remove electrical harness from the lift gate.

CAUTION: With assistance support the lift gate while the hinges are being removed.

12. Using a grease pencil or equivalent, mark the position of the hinges (1) to aid with installation.
13. Remove nuts (2) from the hinges (1) located on the body.

WARNING: Make sure assistants are prepared when removing the bolts from the hinges. When the bolts are removed the lift gate is no longer attached to the vehicle and can fall.

14. Remove the bolts (3) from the hinges (1) located on the body.
15. Remove the lift gate (4) from the vehicle.

INSTALLATION

LIFTGATE

81961d3c

Fig. 544: Lift Gate/Hinge
Courtesy of CHRYSLER LLC

NOTE: With assistance, support the lift gate while the hinges are being installed.

1. With assistance, install the lift gate (4) to the vehicle.
2. Apply body sealer on the hinge to body mating surface. Align hinges with installation reference marks made previously.
3. Install the bolts (3) to the hinges (1) at the body location and tighten bolts to 28.5 N.m (21 ft. lbs.).
4. Install the nuts (2) to the hinges (1) at the body location and tighten nuts to 28.5 N.m (21 ft. lbs.).

CAUTION: With assistance, support the lift gate while the hinges are being removed.

5. Install electrical harness to the lift gate and connect all electrical connections.

NOTE: Use a soapy water solution or equivalent to lubricate the grommet.

6. Install the electrical harness, grommet and connector to the vehicle.
7. Install the center high mounted stop lamp, refer to **INSTALLATION**.
8. Check and adjust lift gate as necessary, see **ADJUSTMENTS**.

Fig. 545: Lift Gate Support Cylinder & Lift Gate Support Tool
 Courtesy of CHRYSLER LLC

9. Install the support cylinders (2) to the lift gate and body.

Fig. 546: Liftgate Trim Panel
 Courtesy of CHRYSLER LLC

10. Align and install the trim panel (3) to the left gate (1), use hand pressure to seat all of the fasteners around the trim panel (3).
11. Install the two bolts (2) to the lower trim panel (3) and tighten to 7 N.m (65 in. lbs.).

Fig. 547: Headliner Molding
 Courtesy of CHRYSLER LLC

12. Install the headliner molding (3) to the body by sliding the tab (1) on the right side into the quarter trim molding.
13. Pull down at the center of the headliner molding (3) only enough to allow the tab (2) to be slide into the other side of the quarter trim molding.
14. Using hand pressure snap the remaining clips (4) into place.
15. Close the lift gate.

ADJUSTMENTS

LIFTGATE

In/out

Fig. 548: Lift Gate/Hinge
 Courtesy of CHRYSLER LLC

NOTE: The position of the lift gate can be adjusted upward or downward by the use of slots in the hinge. An inward or outward adjustment is achieved by use of slots in the body. If an inward or outward adjustment is needed, use a body sealer on the hinge to body mating surface.

1. Using a trim stick C-4755 or equivalent, remove the headliner molding.
2. For the upper lift gate adjustments, loosen the hinge nuts (2) and bolts (3) but do not remove. Adjust to specifications, see **SPECIFICATIONS**.
3. Apply body sealer on the hinge to body mating surface.
4. Tighten the hinge bolts to 28.5 N.m (21 ft. lbs.).
5. Tighten the hinge nuts to 28.5 N.m (21 ft. lbs.).

Fig. 549: Lift Gate Latch Striker
Courtesy of CHRYSLER LLC

6. Remove the rear door scuff plate.
7. For the lower lift gate adjustments, loosen the striker screws (2) and adjust to specifications, see **SPECIFICATIONS**.
8. Tighten the striker screws to 28 N.m (20.5 ft. lbs.).
9. Install the rear door scuff plate.
10. Position the headliner molding and seat fully.

Up/Down and Left/Right

81961d3c

 Courtesy of CHRYSLER LLC

1. Loosen the hinge to lift gate bolts (2) but do not remove.

8195d78b

Fig. 551: Lift Gate Latch Striker
 Courtesy of CHRYSLER LLC

2. Remove the rear door scuff plate.
3. Loosen the striker screws (2).
4. Adjust the lift gate up/down position to specifications, see **SPECIFICATIONS**.

81961d3c

Fig. 552: Lift Gate/Hinge
Courtesy of CHRYSLER LLC

5. Apply body sealer on the hinge to lift gate mating surface.
6. Tighten the hinge to lift gate bolts to 28.5 N.m (21 ft. lbs.).

8195d98b

Fig. 553: Lift Gate Latch Striker
Courtesy of CHRYSLER LLC

7. Confirm the lower lift gate in/out position and tighten the striker screws to 28 N.m (20.5 ft. lbs.).
8. Install the lift gate trim scuff plate and install the screws.

PANEL - LIFTGATE TRIM

REMOVAL

PANEL - LIFTGATE TRIM

Fig. 554: Liftgate Trim Panel
Courtesy of CHRYSLER LLC

1. Remove two bolts (2) from the lower trim panel (3).
2. Using a trim stick C-4755 or equivalent, release the fasteners at all of the locations around the trim panel (3).
3. Lift the trim panel (3) from the lift gate (1).

INSTALLATION

PANEL - LIFTGATE TRIM

Fig. 555: Liftgate Trim Panel
Courtesy of CHRYSLER LLC

1. Align and install the trim panel (3) to the lift gate (1), use hand pressure to seat all of the fasteners around the trim panel (3).
2. Install the two bolts (2) to the lower trim panel (3) and tighten to 7 N.m (65 in. lbs.).

STRIKER - LIFTGATE

REMOVAL

STRIKER - LIFTGATE

81954x22

Fig. 556: Rear Door Scuff Plate
Courtesy of CHRYSLER LLC

1. Open the lift gate.
2. Using a trim stick C-4755 or equivalent, release the retaining clips and remove the scuff plate (1) from the body (2).

8195d78b

Fig. 557: Lift Gate Latch Striker
Courtesy of CHRYSLER LLC

3. Using a grease pencil or equivalent, mark location of latch striker (1).
4. Remove the two screws (2) from the latch striker (1).

INSTALLATION

STRIKER - LIFTGATE

Fig. 558: Lift Gate Latch Striker
Courtesy of CHRYSLER LLC

1. Install the latch striker (1) to the body. Align latch striker (1) with the reference marks made previously.
2. Install the two screws (2) to the latch striker (1) and tighten the screws to 28 N.m (20.5 ft. lbs.).

Fig. 559: Rear Door Scuff Plate
Courtesy of CHRYSLER LLC

3. Align the trim clips and use hand pressure to install the scuff plate (1) to the body (2).
4. Close the lift gate.
5. Adjust the lift gate as necessary, see **ADJUSTMENTS**.

ADJUSTMENTS

STRIKER - LIFTGATE

1. Loosen the striker bolts.
2. Adjust the striker up/down so that it is centered within the latch opening.
3. Adjust the striker fore/aft so the swing gate is under flush to the body -0.5 mm (+/- 1.0 mm).
4. Adjust the striker cross-car engagement to the latch by adding 2.0 mm shims as necessary.

NOTE: Make sure the striker is not twisted within the latch opening. Striker should be parallel to the opening.

5. Tighten the striker bolts to 28 N.m (21 ft. lbs.).

SUPPORT - LIFTGATE

REMOVAL

SUPPORT - LIFTGATE

8195db0c

Fig. 560: Lift Gate Support Cylinder & Lift Gate Support Tool
Courtesy of CHRYSLER LLC

1. Raise and support the lift gate with a lift gate support tool (1).
2. Remove the support cylinder (2) from the lift gate and body.

INSTALLATION

SUPPORT - LIFTGATE

Fig. 561: Lift Gate Support Cylinder & Lift Gate Support Tool
 Courtesy of CHRYSLER LLC

1. Install the support cylinder (2) to the lift gate and body.
2. Remove lift gate support tool (1) and close the lift gate.

SUPPORT - BRACKET/ BALL STUD

REMOVAL

SUPPORT - BRACKET/ BALL STUD

Fig. 562: Bracket/Ball Stud Support
 Courtesy of CHRYSLER LLC

1. Raise and support the lift gate with a lift gate support tool.
2. Remove the support cylinder (5) from the support cylinder bracket (2) and body.
3. Remove the bolts (3) from the support cylinder bracket (2).

4. Remove the bracket (2) from the lift gate (1).
5. Remove the ball stud (4) from the body.

INSTALLATION

SUPPORT - BRACKET/ BALL STUD

Fig. 563: Bracket/Ball Stud Support
Courtesy of CHRYSLER LLC

1. Install the ball stud (4) to the body and tighten securely.
2. Install the bracket (2) to the lift gate (1).
3. Install the bolts (3) to the support cylinder bracket (2) and tighten the bolts.
4. Install the support cylinder (5) to the support cylinder bracket (2) and body.
5. Remove the lift gate support tool.

GLASS - FLIPPER

REMOVAL

GLASS - FLIPPER

81d2a042

Fig. 564: Support Cylinder And Flipper Glass
 Courtesy of CHRYSLER LLC

1. Open the flipper glass (1).
2. Using a grease pencil or equivalent, mark the position of the hinge on the body to aid installation.
3. Remove the support cylinders (2), see **INSTALLATION**.

81d2a002

Fig. 565: Flipper Glass And Screws
 Courtesy of CHRYSLER LLC

4. Disconnect the electrical connectors, if equipped.
5. Open the glass to the full travel with the support cylinders off.
6. Remove the screws (3) and remove the glass (1).

INSTALLATION

GLASS - FLIPPER

Fig. 566: Flipper Glass And Screws
Courtesy of CHRYSLER LLC

1. Install the flipper glass (1) and install the screws (3).

NOTE: Flipper glass hinges must follow the contour of the roof line before the screws are tightened.

2. Tighten the screws to 9.5 N.m (84 in. lbs.)
3. Connect the electrical connector, if equipped.

Fig. 567: Support Cylinder And Flipper Glass
Courtesy of CHRYSLER LLC

4. Install the support cylinders (2), see **INSTALLATION**.
5. Adjust the glass (1), see **SPECIFICATIONS**.

LATCH - FLIPPER GLASS

REMOVAL

LATCH - FLIPPER GLASS

Fig. 568: Liftgate Trim Panel
Courtesy of CHRYSLER LLC

1. Remove the trim panel (3), see **REMOVAL**.

Fig. 569: Flipper Glass Latch And Electrical Connectors
Courtesy of CHRYSLER LLC

2. Disconnect the electrical connectors (2, 4).
3. Remove the nuts (3) and remove the latch.

INSTALLATION

LATCH - FLIPPER GLASS

Fig. 570: Flipper Glass Latch And Electrical Connectors
 Courtesy of CHRYSLER LLC

1. Install the latch onto the liftgate studs (1) and install the nuts (3).
2. Tighten the nuts (3) to 13 N.m (115 in. lbs.)
3. Connect the electrical connectors (2, 4).
4. Adjust the glass (1), see **SPECIFICATIONS**.

Fig. 571: Liftgate Trim Panel
 Courtesy of CHRYSLER LLC

5. Install the liftgate trim (3), see **INSTALLATION**.

SUPPORT CYLINDER - FLIPPER GLASS

REMOVAL

SUPPORT CYLINDER - FLIPPER GLASS

80f70308

- 1 - RETAINING CLIP
- 2 - BALL SOCKET
- 3 - BALL STUD

WARNING: Do not remove the flip-up glass support rods with the glass closed. The support rod pistons are operated by high pressure gas and could cause personal injury and/or vehicle damage if they are removed with the pistons compressed (glass closed). Once removed, do not attempt to disassemble or repair the support rods.

1. Make sure the retaining clips (1) are seated into the ball socket (2) fully.

Fig. 576: Support Cylinder And Flipper Glass
 Courtesy of CHRYSLER LLC

2. Install the support cylinder (2) over the ball studs with the thin end connected to the glass and the retaining clips snapping into place.

HINGE - FLIPPER GLASS

REMOVAL

HINGE - FLIPPER GLASS

Fig. 577: Support Cylinder And Flipper Glass
 Courtesy of CHRYSLER LLC

1. Remove the support cylinders and support glass, see **REMOVAL**.

Fig. 578: Flipper Glass And Screws
Courtesy of CHRYSLER LLC

NOTE: It is not necessary to remove the glass to replace one or both hinges. The hinges can be replaced one at a time.

2. Open the flipper glass (1).
3. Using a grease pencil or equivalent, mark the position of the hinge (2) on the body to aid installation.
4. Remove the hinge to body bolts (3).

80f7101a

PAINT CODE

DESCRIPTION

PAINT CODE

Exterior vehicle body colors are identified on the Vehicle Certification Label. Refer to **DESCRIPTION** . The first digit of the paint code listed on the vehicle indicates the sequence of application, i.e.: P = primary coat, Q = secondary coat. The color names provided in the Paint and Trim Code Description chart are the color names used on most repair product containers. . See **SPECIFICATIONS**.

BASE COAT/CLEAR COAT FINISH

DESCRIPTION

BASECOAT/CLEARCOAT FINISH

The original equipment finish is a multi step process that involves cleaning, applying electro de-position (E-coat), anti-chip primer, basecoat, and clearcoat steps.

On most vehicles a two-part paint application (basecoat/clearcoat) is used. Color paint that is applied to primer is called basecoat. The clear coat protects the basecoat from ultraviolet light and provides a durable high-gloss finish.

**CAUTION: Do not use abrasive chemicals or compounds on painted surfaces.
Damage to finish can result.**

**Do not use harsh alkaline based cleaning solvents on painted surfaces.
Damage to finish or color can result.**

PAINT TOUCH-UP

DESCRIPTION

PAINTED SURFACE TOUCH-UP

When a painted metal surface has been scratched or chipped, it should be touched-up as soon as possible to avoid corrosion. For best results, use Mopar® Scratch Filler/Primer, Touch-Up Paints and Clear Topcoat.

WARNING: Use an OSHA approved respirator and safety glasses when spraying paint or solvents in a confined area. Personal injury can result.

OPERATION

1. Scrape loose paint and corrosion from inside scratch or chip.
2. Clean affected area with Mopar® Tar/Road Oil Remover, and allow to dry.
3. Fill the inside of the scratch or chip with a coat of filler/primer. Do not overlap primer onto good surface finish. The applicator brush should be wet enough to puddle-fill the scratch or chip without running. Do not stroke brush applicator on body surface. Allow the filler/primer to dry hard.
4. Cover the filler/primer with color touch-up paint. Do not overlap touch-up color onto the original color coat around the scratch or chip. Butt the new color to the original color, if possible. Do not stroke applicator brush on body surface. Allow touch-up paint to dry hard.
5. On vehicles without clearcoat, the touch-up color can be lightly finesse sanded (1500 grit) and polished with rubbing compound.
6. On vehicles with clearcoat, apply clear top coat to touch-up paint with the same technique as described in step 4. Allow clear topcoat to dry hard. If desired, step 5 can be performed on clear topcoat.

WARNING: Avoid prolonged skin contact with petroleum or alcohol-based cleaning solvents. Personal injury can result.

FINESSE SANDING/BUFFING & POLISHING

DESCRIPTION

FINESSE SANDING/BUFFING & POLISHING

CAUTION: Do not remove more than .5 mils of clearcoat finish, if equipped. Basecoat paint must retain clearcoat for durability.

Use a Paint Thickness Gauge #PR-ETG-2X or equivalent to determine film thickness before and after the repair.

Minor acid etching, orange peel, or smudging in clearcoat or single-stage finishes can be reduced with light finesse sanding, hand buffing, and polishing. **If the finish has been finesse sanded in the past, it cannot be repeated. Finesse sanding operation should be performed by a trained automotive paint technician.**

SEATS

WARNING

RESTRAINT SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS. Such repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Any wire harness containing broken, cut, burned or otherwise damaged electrically conductive SRS wiring, terminals or connector components must be removed and replaced with an entire new wire harness. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar® Parts Catalog.

WARNING: To avoid serious or fatal injury on vehicles equipped with side curtain airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service. The ORC contains a rollover sensor, which enables the system to deploy the side curtain airbags in the event of a vehicle rollover event. If an ORC is accidentally rolled during service while still connected to battery power, the side curtain airbags will deploy. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, before performing any welding operations disconnect and isolate the battery negative (ground) cable and disconnect all wire harness connectors from the Occupant Restraint Controller (ORC). Failure to take the proper precautions could result in accidental airbag deployment and other possible damage to the Supplemental Restraint System (SRS) circuits and components.

WARNING: To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate, or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi).

WARNING: To avoid serious or fatal injury when handling a seat belt tensioner retractor, proper care should be exercised to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover.

WARNING: To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the DaimlerChrysler Mopar® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.

WARNING: To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Any time a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the DaimlerChrysler Mopar® Parts Catalog.

WARNING: To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down.

REMOVAL

SEAT - FRONT

Fig. 587: Front Bolts, Seat Belt Bolts, Seat Belts, Side Shield & Electrical Connectors
 Courtesy of CHRYSLER LLC

WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. See WARNING.

1. Remove the head rests to ease with seat removal.

2. Remove the side shield (4) to expose the seat belt bolts.
3. Position the recliner lever up and remove the seat belt bolts (2) and seat belts (3), refer to **REMOVAL** .
4. Slide the seats back and remove the front bolts (1).
5. Disconnect the electrical connectors (5).

81971b50

Fig. 588: Rear Nuts And Bolts
 Courtesy of CHRYSLER LLC

6. Slide the seats to forward position and remove the rear nuts (1) and bolts (2).
7. Remove the seats from the vehicle.

INSTALLATION

SEAT - FRONT

81971b4c

Fig. 589: Front Bolts, Seat Belt Bolts, Seat Belts, Side Shield & Electrical Connectors
 Courtesy of CHRYSLER LLC

WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. See WARNING.

NOTE: Start all seat fasteners first before tightening to specifications.

1. Install the seats to the vehicle.
2. Slide the seats to the rearward position, connect the electrical connectors (5) and install the bolts (1).
3. Tighten the inboard bolts first then tighten the outboard bolts (1) to 62 N.m (46 ft. lbs.).
4. Install the seat belts (3) and bolts (2), refer to INSTALLATION .

81971b50

Fig. 590: Rear Nuts And Bolts

Courtesy of CHRYSLER LLC

5. Tighten the rear nuts (1) to 62 N.m (46 ft. lbs.).
6. Tighten the rear bolts (2) to 62 N.m (46 ft. lbs.).
7. Install the side shield (4) to the seats.
8. Install the head rest to the seats.
9. Do not reconnect the battery negative cable at this time. The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component, refer to STANDARD PROCEDURE .
10. Following successful completion of the supplemental restraint system verification test procedure, perform the Occupant Classification System Verification Test using a scan tool. Refer to the appropriate diagnostic procedures.

SEAT BACK - FRONT

REMOVAL

SEAT BACK - FRONT

Driver Seat 6 Way

WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. See WARNING.

1. Remove the front seat, see REMOVAL.
2. For the drivers seat illustration, see DESCRIPTION.
3. Remove the power seat switch cover (30).
4. Remove the screws (28) and remove the side shield (27).
5. Remove the screws (26) and remove the outer shield (25).
6. Remove the inner shield (25).
7. Remove the outer shield (9).
8. Remove the screws (13) and remove the inner shield (12).
9. Remove the left side bolts (21) and the right side bolts (11).
10. Separate the seat back from the seat frame assembly.

Driver Seat 2 Way

WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. See WARNING.

1. Remove the front seat, see REMOVAL.
2. For the drivers seat illustration, see DESCRIPTION.
3. Remove the screws (22) and remove the side shield (24).
4. Remove the screws (21) and remove the outer shield (25).
5. Remove the inner shield (25).
6. Remove the outer shield (9).
7. Remove the screws (10) and remove the inner shield (11).
8. Remove the left side bolts (19) and the right side bolts (13).
9. Separate the seat back from the seat frame assembly.

Passenger Seat

WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. See WARNING.

1. Remove the front seat, see REMOVAL.
2. For the passenger seat illustration, see DESCRIPTION.
3. Remove side shield (24).
4. Remove the screws (27) and remove the shield (23).

5. Remove upper shield (21).
6. Remove the shield from the lower seat cushion frame.
7. Remove the screws (8) and remove the shield (12).
8. Remove the shield (13).
9. Remove the recliner handle (14).
10. Remove the left side bolts (22) and the right side bolts (15).
11. Separate the seat back from the seat frame assembly.

DISASSEMBLY

DISASSEMBLY

Driver Seat

WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING.**

1. Remove the front seat back, see **REMOVAL.**
2. For the drivers seat illustration, see **DESCRIPTION.**
3. Remove the headrest (4).
4. Remove the seat back shield (19).
5. Remove the seat back cover (39).
6. Remove the left guide (5) and right guide (3) from the seat back cushion (2).
7. Remove the seat back cushion (2) from the seat back frame (16).

Passenger Seat

WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING.**

1. Remove the front seat back, see **REMOVAL.**
2. For the passenger seat illustration, see **DESCRIPTION.**
3. Remove the headrest (3).
4. Remove the seat back shield (18).
5. Remove the seat back cover (48).
6. Remove the left guide (4) and right guide (2) from the seat back cushion (44).
7. Remove the seat back cushion (44) from the seat back frame (29).

ASSEMBLY

ASSEMBLY

Driver Seat

WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. See WARNING.

1. For the drivers seat illustration, see DESCRIPTION.
2. Install the seat back cushion (2) to the seat back frame (16).
3. Install the left guide (5) and right guide (3) to the seat back cushion (2).
4. Install the seat back cover (39).
5. Install the seat back shield (19).
6. Install the headrest (4).
7. Install the front seat back, see INSTALLATION.

Passenger Seat

WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. See WARNING.

1. For the passenger seat illustration, see DESCRIPTION.
2. Install the seat back cushion (44) to the seat back frame (29).
3. Install the left guide (4) and right guide (2) to the seat back cushion (44).
4. Install the seat back cover (48).
5. Install the seat back shield (18).
6. Install the headrest (3).
7. Install the front seat back, see INSTALLATION.

INSTALLATION

SEAT BACK - FRONT

Driver Seat 6 Way

WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. See WARNING.

1. For the drivers seat illustration, see DESCRIPTION.
2. Install the left side bolts (21) and the right side bolts (11) and tighten to 47.5 N.m (35 ft. lbs.).
3. Install the inner shield (12) and screws (13).
4. Install the outer shield (9).
5. Install the inner shield (25).
6. Install the outer shield (25) and screws (26).

7. Install the side shield (27) and screws (28).
8. Install the power seat switch cover (30).
9. Install the front seat to the vehicle, see **INSTALLATION**.

Driver Seat 2 Way

WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING**.

1. For the drivers seat illustration, see **DESCRIPTION**.
2. Install the left side bolts (19) and the right side bolts (13) and tighten to 47.5 N.m (35 ft. lbs.).
3. Install the inner shield (11) and screws (10).
4. Install the outer shield (9).
5. Install the inner shield (25).
6. Install the outer shield (25) and screws (21).
7. Install the side shield (24) and screws (22).
8. Install the front seat to the vehicle, see **INSTALLATION**.

Passenger Seat

WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING**.

1. For the passenger seat illustration, see **DESCRIPTION**.
2. Install the left side bolts (22) and the right side bolts (15) and tighten to 47.5 N.m (35 ft. lbs.).
3. Install the recliner handle (14).
4. Install the shield (13).
5. Install the shield (12) and screws (8).
6. Install the shield to the lower seat cushion frame.
7. Install upper shield (21).
8. Install the shield (23) and screws (27).
9. Install side shield (24).
10. Install the front seat to the vehicle, see **INSTALLATION**.

SEAT CUSHION - FRONT

REMOVAL

SEAT CUSHION - FRONT

816a7796

Fig. 591: Removing/Installing Seat Weight Sensor
 Courtesy of CHRYSLER LLC

WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. See WARNING.

1. Remove the passenger or drivers front seat, see REMOVAL.
2. Remove the seat weight sensors if equipped, passenger seat only, refer to REMOVAL .

818f7bee

Fig. 592: Occupant Classification Module
Courtesy of CHRYSLER LLC

3. Disconnect the electrical connectors and remove the occupant classification module, refer to **REMOVAL** .

Fig. 593: OCS Electrical Connectors
Courtesy of CHRYSLER LLC

4. Remove the electrical harness connectors from the OCS mounting plate.

Fig. 594: Heated Seat Element Electrical Connectors
Courtesy of CHRYSLER LLC

5. Remove the electrical connectors for both the heated seat back and seat elements.

Fig. 595: Passenger Outer Trim Screws
Courtesy of CHRYSLER LLC

6. Remove the recliner handle.
7. Remove the two screws from the side of the outer seat trim.

Fig. 596: Rear Seat Screws
Courtesy of CHRYSLER LLC

8. Remove the two screws from the rear of the outer seat trim and remove the trim panel.
9. Remove the seat position sensor.

Fig. 597: Locating Heated Seat Module
Courtesy of CHRYSLER LLC

CAUTION: The Heated Seat Module mounting tab can be damaged during module removal and installation. Use care to properly align tab to prevent binding that could result in tab breakage.

10. Position the right front seat to the full rearward position.
11. Disconnect and isolate the battery negative cable.
12. Disconnect the wire harness connector (4) from the heated seat module (3).
13. Unsnap the heated seat module retaining tab (2) from the seat pan (1).
14. Remove the heated seat module (3) from the vehicle.
15. Remove the three nuts and remove the left seat track.
16. Remove the three nuts and remove the right seat track.
17. Remove the electrical harness from the seat bottom.

Fig. 598: Recliner Cable
 Courtesy of CHRYSLER LLC

18. Remove the recliner cable from the left and right side of the seat.

Fig. 599: Seat Frame Bolts
 Courtesy of CHRYSLER LLC

19. Remove the two seat frame bolts from the left and right side of the seat.
20. Separate the seat bottom and the seat back.

DISASSEMBLY

DISASSEMBLY

WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. See WARNING.

1. Remove the seat cushion section from the front seat assembly, see **REMOVAL**.
2. Remove the seat cover plastic retaining clips from the seat frame.
3. Remove the cover and cushion together from the seat frame.
4. Fold the seat cover back to expose the hog rings, cut and remove all hog rings.
5. Remove the seat cover from the seat cushion.

ASSEMBLY

ASSEMBLY

WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING**.

1. Install the seat cover to the seat cushion.
2. Fold the seat cover back to access the hog ring locations and install new hog rings to the seat cushion and cover.
3. Install the cover and cushion together to the seat frame.
4. Install the seat cover plastic retaining clips to the seat frame.
5. Install the seat cushion section to the front seat assembly, see **INSTALLATION**.

INSTALLATION

SEAT CUSHION - FRONT

61a2a30c

Fig. 600: Seat Frame Bolts
Courtesy of CHRYSLER LLC

WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING**.

1. Install the seat bottom to the seat back frame.
2. Install the two seat frame bolts to the left and right side of the seat and tighten to 47.5 N.m (35 ft. lbs.)

Fig. 601: Recliner Cable
Courtesy of CHRYSLER LLC

3. Install the recliner cable to the left and right side of the seat if equipped, passenger side only.
4. Install the electrical harness to the seat bottom.
5. Install the right and left seat tracks to the seat frame and tighten the nuts to 27.5 N.m (20 ft. lbs.).

Fig. 602: Locating Heated Seat Module
Courtesy of CHRYSLER LLC

CAUTION: The Heated Seat Module mounting tab can be damaged during module removal and installation. Use care to properly align tab to prevent binding that could result in tab breakage.

6. Install the heated seat module (3) into the vehicle.
7. Position the retaining tab (2) with the mounting hole in the seat pan (1). Firmly apply even pressure to the module (3) until the mounting tab is fully seated.
8. Connect the wire harness connector (4) to the heated seat module (3).

Fig. 603: Passenger Outer Trim Screws
Courtesy of CHRYSLER LLC

9. Install the seat position sensor.
10. Install the two screws to the side of the outer seat trim.

Fig. 604: Rear Seat Screws
Courtesy of CHRYSLER LLC

11. Install the two screws to the rear of the outer seat trim.
12. Install the recliner handle.

81a29376

Fig. 605: Heated Seat Element Electrical Connectors
 Courtesy of CHRYSLER LLC

13. Install the electrical connectors for both the heated seat back and seat elements.

81a293ba

Fig. 606: OCS Electrical Connectors
 Courtesy of CHRYSLER LLC

14. Install the electrical harness connectors to the OCS mounting plate.

Fig. 607: Occupant Classification Module
 Courtesy of CHRYSLER LLC

15. Install the occupant classification module and connect the electrical connectors if equipped, passenger side only, refer to **INSTALLATION** .

Fig. 608: Removing/Installing Seat Weight Sensor
 Courtesy of CHRYSLER LLC

16. Install the seat weight sensors if equipped, passenger seat only, refer to **INSTALLATION** .

17. Install the passenger or drivers front seat, see INSTALLATION.

5. Remove the four bolts from the cushion legs.

81973a81

Fig. 616: Seat Bracket Nuts, Center Seat Belt, Seat Module Electrical Connector & Center Bracket Bolts
 Courtesy of CHRYSLER LLC

NOTE: Lift the bottom cushion and prop up to access the fasteners.

6. Remove the two seat bracket nuts (1) from the seat brackets.
7. Remove the center bracket bolts (4) and the center seat belt (2).
8. Remove the electrical connector (3) from the seat module.
9. Fold down the seat backs and remove from the vehicle.

INSTALLATION

Fig. 617: Seat Bracket Nuts, Center Seat Belt, Seat Module Electrical Connector & Center Bracket Bolts
Courtesy of CHRYSLER LLC

1. Fold the seat in a flat position and install the seat assembly to the rear studs.
2. Connect the electrical connector (3) to the seat module.
3. Install the anchor bolt to the seat belt (2), and tighten to 62 N.m (46 ft. lbs.), refer to **INSTALLATION** .
4. Install the two seat bracket nuts (1) to the seat brackets and tighten to 62 N.m (46 ft. lbs.)
5. Install the seat bracket bolt (4) to the seat bracket and tighten to 62 N.m (46 ft. lbs.)

Fig. 618: Removing/Installing Bolts From Cushion Legs
Courtesy of CHRYSLER LLC

6. Install the four seat bracket bolts to the seat brackets and tighten to 54 N.m (40 ft. lbs.).

Fig. 619: Removing/Installing Seat Bracket Nuts
 Courtesy of CHRYSLER LLC

7. Install the three seat bracket nuts the seat brackets and tighten to 54 N.m (40 ft. lbs.).

Fig. 620: Load Floor Panel, Load Floor & Rear Seat Bracket
 Courtesy of CHRYSLER LLC

8. Install the load floor panel (1) to the load floor (2) and the rear seat bracket (3). Use hand pressure to seat the clips.
9. Return the rear seats in the upright position.
10. Connect the negative battery cable to the battery.

SEAT BACK - REAR

REMOVAL

SEAT BACK - REAR

Fig. 621: Removing/Installing 40/60 Seat
Courtesy of CHRYSLER LLC

1. Remove the 40 and 60 seat, see **REMOVAL**.
2. Remove the screw and trim covering.

SEAT CUSHION - REAR

REMOVAL

SEAT CUSHION - REAR

60/40 Split Seat - 40

Fig. 673: Removing/Installing Seat Bolt From Floor Bracket
Courtesy of CHRYSLER LLC

CAUTION: Relieve the tension on the cable by positioning the seat correctly. Failure to relieve tension will result in damage to the cable.

1. Remove the 60/40 rear seat from the vehicle and place on a clean work bench, see **REMOVAL**.
2. Remove the seat bolt (1) from the floor bracket (2).
3. Disconnect the cable.
4. Remove the front bracket to the cushion bolts to separate the forward legs to the cushion.
5. Disconnect the cable housing.

Fig. 674: 40 Seat Pivot Bolt
Courtesy of CHRYSLER LLC

6. Remove the seat assembly from the pivot bolt (1) on the floor bracket (2).

60/40 Split Seat - 60

Fig. 675: Removing/Installing Seat Bolt From Floor Bracket
Courtesy of CHRYSLER LLC

CAUTION: Relieve the tension on the cable by positioning the seat correctly. Failure to relieve tension will result in damage to the cable.

1. Remove the seat bolt (1) from the floor bracket (2) on the right side of the 40 seat.
2. Disconnect the cable.
3. Remove the 40 seat from the pivot bolt.

619a3c8b

Fig. 676: 40 Seat Pivot Bolt
Courtesy of CHRYSLER LLC

4. Remove the pivot bolt (1) from the floor bracket (2).
5. Disconnect the cable.

619a649c

Fig. 677: 60 Seat Bolt

6. Remove the seat bolt (2) from the floor bracket (1) on the left side of the 60 seat.

7. Remove the 60 seat from the seat back frame.

DISASSEMBLY

DISASSEMBLY

60/40 Split Seat - 40

1. Remove the 40 seat cushion section from the rear seat assembly, see **REMOVAL**.
2. Remove the seat cover plastic retaining clips from the seat frame.
3. Remove the cover and cushion together from the seat frame.
4. Fold the seat cover back to expose the hog rings, cut and remove all hog rings.
5. Remove the seat cover from the seat cushion.

60/40 Split Seat - 60

1. Remove the 60 seat cushion section from the rear seat assembly, see **REMOVAL**.
2. Remove the seat cover plastic retaining clips from the seat frame.
3. Remove the cover and cushion together from the seat frame.
4. Fold the seat cover back to expose the hog rings, cut and remove all hog rings.
5. Remove the seat cover from the seat cushion.

ASSEMBLY

ASSEMBLY

60/40 Seat - 60

1. Install the seat cover to the seat cushion.
2. Fold the seat cover back to access the hog ring locations and install new hog rings to the seat cushion and cover.
3. Install the cover and cushion together to the seat frame.
4. Install the seat cover plastic retaining clips to the seat frame.
5. Install the 60 seat cushion section to the rear seat assembly, see **INSTALLATION**.

60/40 Seat - 40

1. Install the seat cover to the seat cushion.
2. Fold the seat cover back to access the hog ring locations and install new hog rings to the seat cushion and cover.
3. Install the cover and cushion together to the seat frame.
4. Install the seat cover plastic retaining clips to the seat frame.
5. Install the 40 seat cushion section to the rear seat assembly, see **INSTALLATION**.

INSTALLATION

SEAT CUSHION - REAR

60/40 Split Seat - 60

Fig. 678: 60 Seat Bolt
Courtesy of CHRYSLER LLC

1. Position the 60 seat to the seat back frame.
2. Install the seat bolt (2) to the floor bracket (1) and seat frame on the left side of the 60 seat and tighten to 27.5 N.m (20 ft. lbs.).

Fig. 679: 40 Seat Pivot Bolt
Courtesy of CHRYSLER LLC

3. Install the 60 seat pivot bolt (1) to the floor bracket (2) and seat frame and tighten to 27.5 N.m (20 ft. lbs.).
4. Attach the cable to the seat back frame and to the seat riser.

5. Install the 40 seat onto the pivot bolt.

Fig. 680: Removing/Installing Seat Bolt From Floor Bracket
Courtesy of CHRYSLER LLC

6. Install the seat bolt (1) to the floor bracket (2) on the right side of the 40 seat and tighten to 27.5 N.m (20 ft. lbs.).
7. Attach the cable to the seat back frame and to the seat riser.

60/40 Split Seat - 40

Fig. 681: 40 Seat Pivot Bolt
Courtesy of CHRYSLER LLC

1. Install the seat pivot bolt (1) to the floor bracket (2) and tighten to 27.5 N.m (20 ft. lbs.).
2. Install the seat onto the pivot bolt.

Fig. 682: Removing/Installing Seat Bolt From Floor Bracket
 Courtesy of CHRYSLER LLC

3. Install the seat bolt (1) to the floor bracket (2) on the right side of the 40 seat and tighten to 27.5 N.m (20 ft. lbs.).
4. Attach the cable to the seat back frame and to the seat riser.

STATIONARY GLASS

GLASS - QUARTER WINDOW

REMOVAL

GLASS - QUARTER WINDOW

Fig. 683: Quarter Glass, Adhesive Backed Spacers & Spacers
 Courtesy of CHRYSLER LLC

1. Remove the quarter trim panel as necessary to gain access to the glass seal from the inside, see **REMOVAL**.
2. Cut urethane bonding from around quarter glass (1) using a suitable sharp cold knife. A pneumatic cutting device can be used if available.
3. Remove glass from vehicle.

INSTALLATION

GLASS - QUARTER WINDOW

Fig. 684: Quarter Glass, Adhesive Backed Spacers & Spacers
Courtesy of CHRYSLER LLC

CAUTION: Open a window before installing glass. This will avoid pressurizing the passenger compartment. If a door or swing gate flip-up glass is slammed before urethane is cured, water leaks can result.

The quarter glass fence should be cleaned of old urethane bonding material. Support spacers should be cleaned and properly installed onto the quarter glass.

1. Clean inside of glass with Mopar® Glass Cleaner and lint-free cloth.
2. Apply PVC (vinyl) primer 25 mm (1 in.) wide around edge of glass. Wipe with clean/dry lint-free cloth.
3. Apply fence primer around edge of fence. Allow at least eighteen minutes drying time.
4. Apply a 10 mm (0.4 in.) bead of urethane around window vinyl border location.
5. Install the adhesive backed spacers (2) to the upper part of the quarter glass (1).
6. Install the spacers (3) to the lower part of the quarter glass (1).
7. Position quarter glass (1) into window opening and lock clips into place.
8. Install the quarter trim panel if removed, see **REMOVAL**.
9. After urethane has cured, water test quarter glass to verify repair.

GLASS - WINDSHIELD

WARNING

WINDSHIELD SAFETY PRECAUTIONS

WARNING: Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly in an accident.

Urethane adhesives are applied as a system. Use glass cleaner, glass prep solvent, glass primer, PVC (vinyl) primer and pinch weld (fence) primer provided by the adhesive manufacturer. If not, structural integrity could be compromised.

DaimlerChrysler does not recommend glass adhesive by brand. Technicians should review product labels and technical data sheets, and use only adhesives that their manufacturers warrant will restore a vehicle to the requirements of FMVSS 212. Technicians should also insure that primers and cleaners are compatible with the particular adhesive used.

Be sure to refer to the urethane manufacturer's directions for curing time specifications, and do not use adhesive after its expiration date.

Vapors that are emitted from the urethane adhesive or primer could cause personal injury. Use them in a well-ventilated area.

Skin contact with urethane adhesive should be avoided. Personal injury may result.

Always wear eye and hand protection when working with glass.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.

REMOVAL

GLASS - WINDSHIELD

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **WARNING**.
2. Remove inside rear view mirror, see **REMOVAL**.
3. Remove the wiper arms, refer to **REMOVAL**.

8194dc06

Fig. 685: Cowl Grille, Push Pins, Hood Seal & Body
Courtesy of CHRYSLER LLC

4. Remove the hood seal (3).
5. Use a trim stick C-4755 or equivalent, separate the cover assembly from the a-pillar.
6. Remove the four push pins (2) and remove the cowl grille (1) from the body (4).

8195aa09

Fig. 686: Push Pin, Windshield A-Pillar Molding & Clips
Courtesy of CHRYSLER LLC

7. Using a trim stick C-4755 or equivalent, remove the push pin (1).
8. Remove the windshield A-pillar molding (2) and clips (3) from the windshield A-pillar.

Fig. 687: Removing/Installing Windshield
Courtesy of CHRYSLER LLC

9. Cut urethane bonding from around windshield using a suitable sharp cold knife. A pneumatic cutting device can be used if available.
10. Remove windshield from vehicle.

INSTALLATION

GLASS - WINDSHIELD

Fig. 688: Removing/Installing Windshield
Courtesy of CHRYSLER LLC

WARNING: Review all warnings and cautions in this procedure before preceding with installation.

CAUTION: Open a window before installing windshield. This will avoid pressurizing

the passenger compartment. If a door or swing gate flip-up glass is slammed before urethane is cured, water leaks can result.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

The windshield fence should be cleaned of old urethane bonding material. Support spacers should be cleaned and properly installed on weld studs or repair screws at bottom of windshield opening.

1. Place replacement windshield into windshield opening. Position glass in the center of the opening against the support spacers. Mark the glass at the support spacers with a grease pencil or masking tape and ink pen to use as a reference for installation. Remove replacement windshield from windshield opening.

81968F52

Fig. 689: Windshield Spacers
Courtesy of CHRYSLER LLC

2. Position the windshield inside up on a suitable work surface with two padded, wood 10 cm by 10 cm by 50 cm (4 in. by 4 in. by 20 in.) blocks, placed parallel 75 cm (2.5 ft.) apart.
3. Clean inside of windshield with Mopar® Glass Cleaner and lint-free cloth.
4. Apply clear glass primer 25 mm (1 in.) wide around edge of windshield. Wipe with clean/dry lint-free cloth.
5. Apply black-out primer 15 mm (.75 in.) wide on top and sides of windshield and 25 mm (1 in.) on bottom of windshield. Allow at least three minutes drying time.
6. Position adhesive backed spacers at the edge of the windshield opening.
7. Align the dot on the upper molding to the tick mark in the center of the glass and install upper molding onto windshield.
8. Apply a 10 mm (0.4 in.) bead of urethane around perimeter of windshield along the inside of the moldings. Apply two beads along the bottom edge.
9. Apply fence primer around the perimeter of the windshield opening fence. Allow at least 18 minutes drying time.

Fig. 690: Removing/Installing Windshield
Courtesy of CHRYSLER LLC

10. With aid of a helper, position windshield over windshield opening. Align reference marks at bottom of windshield to support spacers.
11. Slowly lower windshield glass to windshield opening fence. Guide top molding into proper position if necessary. Push windshield inward to fence spacers at bottom and until top molding is flush to roof line.
12. Clean excess urethane from exterior with Mopar® Super Clean or equivalent.

Fig. 691: Push Pin, Windshield A-Pillar Molding & Clips
Courtesy of CHRYSLER LLC

13. Install the windshield A-pillar molding (2) and clips (3) to the windshield A-pillar.
14. Install the push pin (1).

8194dc06

Fig. 692: Cowl Grille, Push Pins, Hood Seal & Body
Courtesy of CHRYSLER LLC

15. Position the cowl grille (1) and engage the clips to the bottom of the windshield.
16. Install the four push pins (2) through the cowl grille (1) and into the body (4).
17. Install the hood seal (3).
18. Install the wiper arms, refer to **INSTALLATION** .
19. Install inside rear view mirror, see **INSTALLATION**.
20. After urethane has cured, water test windshield to verify repair.

SUNROOF

DESCRIPTION

SUNROOF

WARNING: Keep fingers and other body parts out of sunroof opening at all times.

The sunroof features a power sliding glass panel and a sunshade which can be manually positioned anywhere along its travel, rearward of glass panel front edge.

The sunroof is electrically operated from two switches located on the windshield header, rearward of the map lamp. To operate the sunroof the ignition switch must be in either the Accessory or On/Run position. One switch (vent) is a push button type and opens the sunroof to the vent position only. The other switch (open/close) is a rocker type for opening and closing the sunroof. Pressing and releasing the open button once the sunroof will express open and the wind deflector will raise. If the button is pressed a second time the sunroof will stop in that position. Pressing and releasing the button while the sunroof is in the open position will cause the sunroof to express close and the wind deflector will lower. If the button is pressed a second time the sunroof will stop in that position.

SUNROOF OPERATION INSTRUCTIONS

SWITCH INPUTS			
-	OPEN	CLOSE	VENT
FULL VENT	Push and hold switch until glass stops in flush closed position, the glass will then express open Press the switch for less than 0.65 seconds for express to full open	Push and hold switch until glass stops in flush closed position. Press the switch for less than 0.65 seconds for express to full closed	No action
VENT RANGE	Push and hold switch until glass passes through flush closed position. Glass will then open	Push and hold switch until glass stops in flush closed position.	Push and hold switch until glass stops in full vent position.
FLUSH	Press switch for less than 0.65 seconds for express to full open. Press switch for more than 0.65 seconds and glass will stop when switch is released	No action	Press and hold switch. Glass will travel through flush closed to full vent. Glass will stop when switch is released or when fully vented. Press switch for less than 0.65 seconds for express to full vent
FULL OPEN	No action	Press and hold switch until glass stops in flush closed position or anywhere in between. Press switch for less than 0.65 seconds for express to flush closed	Press and hold switch. Glass will travel through flush closed to full vent. Glass will stop when switch is released. Press switch for less than 0.65 seconds for express to full vent

DIAGNOSIS AND TESTING

SUNROOF

Before beginning sunroof diagnostics verify that all other power accessories are in proper operating condition. For electrical diagnostic information follow the chart "Sunroof Diagnosis Chart". Refer to **DIAGNOSIS AND TESTING** (POWER TOP-FULL OPEN RETRACTABLE DIAGNOSTICS). Refer to **DIAGNOSIS AND TESTING** (POWER FULL OPEN RETRACTABLE ROOF - SERVICE INFORMATION). Refer to **DIAGNOSIS AND TESTING** (POWER TOP - SUNROOF - SERVICE INFORMATION). Also refer to **SYSTEM WIRING DIAGRAMS** for circuit, splice and component descriptions.

Before beginning diagnosis for wind noise or water leaks, verify that the sunroof is in a fully closed position. A common problem is the sunroof is left in an open position, this can be caused by releasing the control switch before the sunroof was fully closed. The sunroof module is equipped with a water-management system. If however, the sunroof glass is in a partial closed position, high pressure water may be forced beyond the water management system boundaries and onto the headlining.

MECHANICAL SUNROOF DIAGNOSIS

SYMPTOM	POSSIBLE CAUSE
Sunroof water leak.	Drain tubes clogged or kinked or disconnected from the sunroof. Glass panel improperly adjusted. Faulty glass panel seal.
Gurgling sound from sunroof.	Low spot in drain hose routing, allowing water to stand.
Wind noise from sunroof.	Front of glass panel too high or rear too low. Wind deflector not deploying. Glass not centered in opening. Faulty glass panel seal.
Rattles from open sunroof while driving.	Loose or broken attaching hardware. Worn or broken mechanism.
Sunroof does not stop in the fully closed position.	Drive motor has lost position of glass, teach procedure required to reprogram drive motor. Refer to <u>DRIVE MOTOR TEACH PROCEDURE</u> .

WATER DRAINAGE AND WIND NOISE DIAGNOSIS

Adequate drainage is provided by a drain trough in the sunroof housing which encircles the sliding glass panel and leads to drain hoses. If a wet headliner or other water leak complaints are encountered, before performing any adjustments, first ensure that the drainage system is not plugged or disconnected. Use a pint container to pour water into the sunroof housing drain trough. If water flow is restricted, use compressed air to blow out any material plugging the drain system. Retest system again.

To further check for a disconnected drain hose:

1. Lower headliner as necessary to gain access to sunroof housing drain tubes. See **REMOVAL**.
2. Repair as necessary.
3. Install headliner. See **INSTALLATION**.

The sliding glass panel is designed to seal water entry with a snug fit between the roof and the seal. The fit can be checked by inserting a piece of paper between the roof and the seal. The piece of paper should have some resistance when pulled out when the glass panel is in the closed position. The sunroof housing will drain off a minimum amount of water. Excessive wind noise could result if the gap clearances are exceeded. The sunroof glass panel may need to be adjusted. See **ADJUSTMENTS** for proper procedures.

DEFLECTOR - SUNROOF WIND

REMOVAL

DEFLECTOR - SUNROOF WIND

Fig. 693: Pressing Spring Lock With Small Flat Bladed Tool And Pushing Wind Deflector Reward To Release From Car Top Opening
Courtesy of CHRYSLER LLC

1. Open the sunroof glass to the full open position.
2. Press the spring lock (1) with a small flat bladed tool and push the wind deflector (2) reward to release from the car top opening.
3. Repeat the previous step on the opposite side.

Fig. 694: Rotating Wind Deflector Up And Release From Mounting Hole In Sunroof Frame
Courtesy of CHRYSLER LLC

4. Rotate the wind deflector (1) up and release from the mounting hole (2) in the sunroof frame.

INSTALLATION

DEFLECTOR - SUNROOF WIND

Fig. 695: Rotating Wind Deflector Up And Release From Mounting Hole In Sunroof Frame
 Courtesy of CHRYSLER LLC

1. Position the wind deflector springs (1) into the mounting holes (2) in the sunroof frame.
2. Rotate forward and down into position.

Fig. 696: Sliding Wind Deflector And Spring Forward Under Car Top Lip And Making Sure Spring Lock Snaps Into Place
 Courtesy of CHRYSLER LLC

3. Slide the wind deflector and spring (1) forward under the car top lip and make sure the spring lock snaps into place (2) fully.

GLASS - SUNROOF

REMOVAL

GLASS - SUNROOF

- | |
|--|
| 1 - SCREWS
2 - GLASS PANEL
3 - MODULE ASSEMBLY |
|--|

1. Position glass panel (2) on to mechanism lift arm.
2. Start the four attaching screws (1).
3. Center glass in opening by running a business card around the glass.
4. Adjust glass panel. See **ADJUSTMENTS**.

ADJUSTMENTS

GLASS - SUNROOF

Fig. 699: Removing/Installing Sunroof Glass Panel
Courtesy of CHRYSLER LLC

1 - SCREWS 2 - GLASS PANEL 3 - MODULE ASSEMBLY
--

1. Move the sunshade rearward to the open position.
2. Move the sunroof glass panel to the fully closed position.
3. Adjust the glass one corner at a time.
 - a. Loosen four glass screws (1).
 - b. Lift glass assembly and align the top of the glass panel to the top of the roof panel.
 - c. Tighten screw to 3.5 N.m (31 in. lbs.).
 - d. Repeat steps a and b for each corner of the glass panel.
 - e. When properly adjusted, the front of the glass panel is flush to 2 mm (0.78 in.) lower than the roof surface and the rear edge of the glass panel is flush to 2 mm (0.78 in.) higher than the roof surface.

81414d9a

5. Separate the remaining support clips (1).
6. Disconnect the grommet (2) from the body (3) and remove the rear hose as necessary.

INSTALLATION

HOSE - SUNROOF DRAIN

Fig. 705: Support Clips, Grommet, Body & Rear Hose
 Courtesy of CHRYSLER LLC

1. Install the rear hose (4) and connect the grommet (2) to the body (3).

2. Connect the support clips (1).

Fig. 706: Sunroof Assembly, Rear Hose & Support Clips
Courtesy of CHRYSLER LLC

3. Route the hose as required and connect the remaining support clips (3).
4. Connect the hose (2) to the sunroof assembly (1).

Fig. 707: Sunroof Assembly, Front Hose & Support Clips
Courtesy of CHRYSLER LLC

5. Connect the front hose lower grommet to the body.
6. Connect the front hose (2) to the sunroof assembly (1) and connect the support clips (3).

MOTOR - SUNROOF WITH CONTROL UNT

DESCRIPTION

MOTOR - SUNROOF WITH CONTROL UNT

For motor and control unit service. Refer to **REMOVAL** (POWER FULL OPEN RETRACTABLE ROOF - SERVICE INFORMATION). Refer to **REMOVAL** (POWER TOP - SUNROOF - SERVICE INFORMATION).

SEAL- SUNROOF GLASS

REMOVAL

SEAL- SUNROOF GLASS

1. Remove sunroof glass panel, see **REMOVAL**.
2. Place glass panel on clean work area with the top side up. Support the glass assembly from underside to avoid bending or otherwise damaging the mounting tabs.
3. Grasp the seal and pull seal away from the glass panel. The seal is a one piece seal.

INSTALLATION

SEAL- SUNROOF GLASS

Fig. 708: Sunroof Glass Seal
Courtesy of CHRYSLER LLC

NOTE: Always position seal seam on center of the passenger side of glass panel.

1. Place seal (1) into position.
2. Seat the seal (1) into the glass channel fully. Using care working the seal around the glass (2), being careful not to over stretch the seal while installing.
3. Install the glass panel, see **INSTALLATION**.

SUNROOF - MODULE/FRAME ASSEMBLY

REMOVAL

SUNROOF - MODULE/FRAME ASSEMBLY

Fig. 709: Disconnecting/Connecting Front Drain Tube At Sunroof
 Courtesy of CHRYSLER LLC

1. Move glass panel to fully closed position.
2. Disconnect and isolate negative battery cable.
3. If equipped, remove the overhead console, refer to **REMOVAL** .
4. Remove headliner, see **REMOVAL**.
5. Disconnect wire harness.
6. Disconnect the front drain tube (3) at the sunroof (2).

Fig. 710: Disconnecting/Connecting Rear Drain Tube At Sunroof
 Courtesy of CHRYSLER LLC

7. Disconnect the rear drain tube at the sunroof (1).

81a189b5

Fig. 711: Roof Panel, Sunroof Module Assembly, Module Bracket Bolts & Fasteners
Courtesy of CHRYSLER LLC

8. Remove two module bracket bolts (3) and loosen the remaining six fasteners (5).
9. With the aid of a helper, remove fasteners (5) attaching sunroof module assembly (2) to roof panel (1).
10. Remove the glass panel.
11. Remove the sunshade, see **REMOVAL**.
12. Remove the drive motor. Refer to **REMOVAL** (POWER FULL OPEN RETRACTABLE ROOF - SERVICE INFORMATION). Refer to **REMOVAL** (POWER TOP - SUNROOF - SERVICE INFORMATION).
13. Remove the wire harness.
14. Remove the trough.
15. Remove the module side brackets.
16. Remove the deflector.

INSTALLATION

SUNROOF - MODULE/FRAME ASSEMBLY

81a18965

Fig. 712: Roof Panel, Sunroof Module Assembly, Module Bracket Bolts & Fasteners
Courtesy of CHRYSLER LLC

1. Install the module brackets.
2. Install the drive motor. Refer to **INSTALLATION** (POWER FULL OPEN RETRACTABLE ROOF - SERVICE INFORMATION). Refer to **INSTALLATION** (POWER TOP - SUNROOF - SERVICE INFORMATION).
3. Install the sunshade, see **INSTALLATION**.
4. Install the trough.
5. Install the glass panel.
6. Raise rear end of sunroof module assembly (2) to the roof (1) and guide into position and start the rear fasteners (3).
7. Raise front end of sunroof module assembly (2) to the roof (1) and guide into position, start the remaining fasteners (3).
8. Visually line up the alignment guide holes with the guide holes in the roof of the vehicle.
9. Tighten the fasteners to 9 N.m (80 in. lbs.).
10. Tighten the nuts (4).

Fig. 713: Disconnecting/Connecting Rear Drain Tube At Sunroof
 Courtesy of CHRYSLER LLC

11. Connect the rear drain tube at the sunroof (1).

Fig. 714: Disconnecting/Connecting Front Drain Tube At Sunroof
 Courtesy of CHRYSLER LLC

12. Connect the front drain tube (3) at the sunroof (2).
13. Install the wire harness.
14. Connect battery negative cable.
15. If equipped, install the overhead console, refer to **INSTALLATION** .
16. Perform the sunroof motor teach procedure, refer to **STANDARD PROCEDURE** .
17. Test sunroof operation, adjust glass as necessary, see **ADJUSTMENTS**.
18. Install the headliner, see **INSTALLATION**.

REMOVAL

SUNSHADE - SUNROOF

8142fe05

Fig. 715: Removing/Installing Drain Channel
Courtesy of CHRYSLER LLC

1. Remove the drain trough, see **REMOVAL**.
2. Push up the front center of the sunshade (1) to pop out the front two feet.

8142fe06

Fig. 716: Removing/Installing Sunshade
Courtesy of CHRYSLER LLC

3. Rotate the sunshade (2) so that the other feet (1) are removed from the guide track.

INSTALLATION

SUNSHADE - SUNROOF

Fig. 717: Removing/Installing Sunshade
Courtesy of CHRYSLER LLC

1. Verify the sunshade track is free of obstructions like the trim lace/ring.
2. Start with sunshade (2) at an angle with one foot (1) in the track.
3. Rotate the sunshade so the other rear foot is in the track as well as the 2 other feet (3) on the same side as the first foot.

8142fe08

Fig. 718: Removing/Installing Drain Channel
Courtesy of CHRYSLER LLC

4. To insert the remaining two feet (2) apply force to the middle front of sunshade (3) and guide them into the track.
5. Check that all the feet are in the right track and verify sunshade operation.
6. Install the drain trough, see **INSTALLATION**.

SWITCH - SUNROOF CONTROL

DESCRIPTION

SWITCH - SUNROOF CONTROL

Vehicles equipped with a power sunroof utilize a sunroof control switch. On this model, the sunroof control switch is located in the overhead console, in between the two reading lamps. The switch is mounted in the overhead console with four plastic retaining tabs, molded into the switch housing.

This switch incorporates four selections of operation open, auto open, close and vent. The individual switches in

the sunroof control switch unit cannot be repaired. If one switch is damaged or faulty, the entire sunroof control switch unit must be replaced.

OPERATION

SWITCH - SUNROOF CONTROL

With the operation of the sunroof control switch, voltage is directed to the sunroof motor, through the switch contacts or control module. If the control switch is depressed and held depressed the voltage signal is controlled manually through the switch contacts, so when the switch is released the sunroof stops.

Refer to the Owner's Manual for more information on the operation of the sunroof switch and system.

DIAGNOSIS AND TESTING

SWITCH - SUNROOF CONTROL

The following test will determine if the sunroof control switch is operating properly.

- 1. Remove the overhead console from the headliner, refer to **REMOVAL** .
- 2. Remove the sunroof control switch from the overhead console, see **REMOVAL**.
- 3. Using an ohmmeter, test the switch terminals for proper continuity using the table below. If any of the terminals do not show proper continuity, replace the sunroof control switch.

SWITCH POSITION (DEPRESSED)	CONTINUITY BETWEEN TERMINALS
VENT (V)	3, 4
OPEN (AUTO)	1, 4
CLOSE	2, 4

REMOVAL

SWITCH - SUNROOF CONTROL

- 1. Disconnect and isolate the negative battery cable.
- 2. Remove the overhead console from the headliner, refer to **REMOVAL** .
- 3. Disconnect the sunroof control switch electrical connector. Depress the connector retaining tab and pull the connector straight out.
- 4. To remove the switch from the overhead console, push on the back of the switch until it comes free from the overhead console.

INSTALLATION

SWITCH - SUNROOF CONTROL

- 1. Install the switch in the overhead console assembly. Be certain the switch is securely snapped in place.
- 2. Connect the sunroof control switch electrical connector. Be certain the switch connector is securely

snapped in place.

3. Install the overhead console, refer to **INSTALLATION** .
4. Connect the negative battery cable.

TROUGH - SUNROOF

REMOVAL

TROUGH - SUNROOF

Fig. 719: Separating/Installing Trough Pins From Glass Lift Mechanisms
Courtesy of CHRYSLER LLC

1. Remove the glass, see **REMOVAL**.
2. Separate the trough pins (3) from the glass lift mechanisms (1).

Fig. 720: Pushing Down On Center Of Trough To Flatten It Out And Installing Remaining Trough Guide And Guide Shoe Into Track

Courtesy of CHRYSLER LLC

3. Slide trough (1) to one side and push down on the center of the trough until the guide shoe tab (3) releases from the track (2).
4. Slide the trough in the opposite direction to release the other shoe and lift the trough out of the sunroof opening.

INSTALLATION

TROUGH - SUNROOF

Fig. 721: Pushing Down On Center Of Trough To Flatten It Out And Installing Remaining Trough Guide And Guide Shoe Into Track

Courtesy of CHRYSLER LLC

1. Insert one of the trough guides (3) and guide shoe (2) into the track.
2. Push down on the center of the trough (1) to flatten it out and install the remaining trough guide (3) and guide shoe (2) into the track.

Fig. 722: Separating/Installing Trough Pins From Glass Lift Mechanisms
 Courtesy of CHRYSLER LLC

3. Install the trough guide pins into the glass lift mechanism (3) and seat fully.
4. Install the glass, see INSTALLATION.

WEATHERSTRIP/SEALS

WEATHERSTRIP - A-PILLAR

REMOVAL

WEATHERSTRIP - A-PILLAR

Fig. 723: Push Pin, Windshield A-Pillar Molding & Clips
 Courtesy of CHRYSLER LLC

1. Using a trim stick C-4755 or equivalent, remove the push pin (1).
2. Remove the windshield A-pillar molding (2) and clips (3) from the windshield A-pillar.

INSTALLATION

WEATHERSTRIP - A-PILLAR

Fig. 724: Push Pin, Windshield A-Pillar Molding & Clips
Courtesy of CHRYSLER LLC

1. Install the windshield A-pillar molding (2) and clips (3) to the windshield A-pillar.
2. Install the push pin (1).

WEATHERSTRIP - FDB - INNER

REMOVAL

WEATHERSTRIP - FDB - INNER

8196a4f2

Fig. 725: Removing/Installing Inner Door Weatherstrip
 Courtesy of CHRYSLER LLC

1. Remove the door trim panel, see **REMOVAL**.
2. Rotate the outer belt molding outboard while pulling up to disengage the retention tabs.

INSTALLATION

WEATHERSTRIP - FDB - INNER

8196a4f2

Fig. 726: Removing/Installing Inner Door Weatherstrip
 Courtesy of CHRYSLER LLC

1. Press the belt molding onto the trim panel flange starting at the rear and working forward.
2. Install the door trim panel, see **INSTALLATION**.

WEATHERSTRIP - FDB - OUTER

REMOVAL

WEATHERSTRIP - FDB - OUTER

80bfd7d

5. Remove outer belt molding.

INSTALLATION

WEATHERSTRIP - FDB - OUTER

8196a374

Fig. 729: Removing/Installing Outer Belt Molding
Courtesy of CHRYSLER LLC

1. Press the outer belt molding onto the outer door window flange starting at the rear and working forward.
2. Cycle the window to make sure the window doesn't bind on the outer belt molding.

WEATHERSTRIP - FRONT DOOR

REMOVAL

WEATHERSTRIP - FRONT DOOR

8196a061

Fig. 730: Front Door Weatherstrip
Courtesy of CHRYSLER LLC

1. Open the front door.
2. Remove weatherstrip from the body mount flange.

INSTALLATION

WEATHERSTRIP - FRONT DOOR

8196a061

Fig. 731: Front Door Weatherstrip
Courtesy of CHRYSLER LLC

NOTE: Position the seal to the bottom of the door opening, with bulb facing outboard, starting the installation at the center of the lower flange. Press the seal onto the sill flange and work around the perimeter of the door opening until fully seated. Work 1/2 the way around and then start at the other end of the seal working back, making sure the splice joint has no gap and smoothing the seal to avoid puckers or wrinkles. If in extreme cold temperatures preheating the weatherstrip to 23.8° C (75° F) may be required to fully seat the weatherstrip.

1. Install the weatherstrip to the body mount flange.
2. Trim the weatherstrip if necessary, and connect the ends together along the flange.

WEATHERSTRIP - FD - MOUNTED

REMOVAL

WEATHERSTRIP - FD - MOUNTED

Fig. 732: Front Door Mounted Weatherstrip

1. Carefully remove the plastic hook style clips on the weatherstrip from the door and remove the seal from the door.

INSTALLATION

WEATHERSTRIP - FD - MOUNTED

Fig. 733: Front Door Mounted Weatherstrip
Courtesy of CHRYSLER LLC

1. Position the seal correctly and install the plastic hook style clips on the weatherstrip to the door.

WEATHERSTRIP - HOOD TO COWL

REMOVAL

WEATHERSTRIP - HOOD TO COWL

81950af1

Fig. 734: Cowl Weather-Strip
Courtesy of CHRYSLER LLC

1. Raise and support the hood.
2. Remove the cowl weather-strip (1) by peeling the cowl seal from the cowl grille.

INSTALLATION

WEATHERSTRIP - HOOD TO COWL

81950af1

Fig. 735: Cowl Weather-Strip
Courtesy of CHRYSLER LLC

1. Install the cowl weather-strip (1) to the cowl grille.
2. Remove the hood support rod and lower the hood.

WEATHERSTRIP - LIFT GATE OPENING

REMOVAL

WEATHERSTRIP - LIFT GATE OPENING

Fig. 736: Lift Gate Opening Weatherstrip
Courtesy of CHRYSLER LLC

1. Open the lift gate.
2. Remove the weatherstrip seal from the lift gate opening.

INSTALLATION

WEATHERSTRIP - LIFT GATE OPENING

Fig. 737: Lift Gate Opening Weatherstrip
Courtesy of CHRYSLER LLC

NOTE: **Seat the lift gate weatherstrip fully into all corners without stretching. If in extreme cold temperatures preheating the weatherstrip to 23.8° C (75° F) may be required to fully seat the weatherstrip.**

1. Install the weatherstrip to the upper right and left hand corners of the lift gate opening.
2. Using hand pressure seat the seal into the upper corners then seat across the header.
3. Seat the seal down the D-pillar to the lower flange on both sides.
4. Seat the seal along the lower flange to the slice joint.
5. Trim the weatherstrip if necessary, and connect the ends together along the flange.

WEATHERSTRIP - RDB - INNER

REMOVAL

WEATHERSTRIP - RDB - INNER

8196ss73

2008 BRAKES

Base - Service Information - Liberty

BASE - SERVICE INFORMATION

DESCRIPTION

BRAKE SYSTEM

ESP and Power assist four wheel disc brakes are standard equipment. Front disc brake components consist of single piston calipers and ventilated rotors. Rear disc brakes use a drum in hat design for the parking brake which is activated by brake shoes pressing against the inside of the drum in hat rotor.

The parking brake mechanism is lever and cable operated. The cables are attached on a equalizer on the lever cable. The parking brakes are operated by a hand lever.

The vehicle is equipped with ESP (Electronic Stability Program). There are four wheel speed sensors, one sensor at each wheel to monitor input.

A dual diaphragm vacuum power brake booster is used for all applications. All models have an aluminum master cylinder with plastic reservoir.

Factory brake lining on all models consists of an organic base material combined with metallic particles. The original equipment linings do not contain asbestos.

WARNING

WARNING

WARNING: DaimlerChrysler does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information. Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

CAUTION: Never use gasoline, kerosene, alcohol, motor oil, transmission fluid, or any fluid containing mineral oil to clean the system components. These fluids damage rubber cups and seals. Use only fresh brake fluid or Mopar brake cleaner to clean or flush brake system components. These are the only cleaning materials recommended. If system contamination is suspected, check the fluid for dirt, discoloration, or separation into distinct layers. Also check the reservoir cap seal for distortion. Drain and flush the system with new brake fluid if contamination is suspected.

CAUTION: Use Mopar brake fluid, or an equivalent quality fluid meeting SAE/DOT standards J1703 and DOT 3. Brake fluid must be clean and free of contaminants. Use fresh fluid from sealed containers only to ensure proper antilock component operation.

CAUTION: Use Mopar multi-mileage or high temperature grease to lubricate caliper slide surfaces, drum brake pivot pins, and shoe contact points on the backing plates. Use multi-mileage grease or GE 661 or Dow 111 silicone grease on caliper slide pins to ensure proper operation.

DIAGNOSIS AND TESTING

BASE BRAKE SYSTEM

Base brake components consist of the brake shoes, calipers, rotors, brake lines, master cylinder, booster, and parking brake components.

Brake diagnosis involves determining if the problem is related to a mechanical, hydraulic, or vacuum operated component.

The first diagnosis step is the preliminary check.

PRELIMINARY BRAKE CHECK

1. Check condition of tires and wheels. Damaged wheels and worn, damaged, or underinflated tires can cause pull, shudder, vibration, and a condition similar to grab.
2. If complaint was based on noise when braking, check suspension components. Jounce front and rear of vehicle and listen for noise that might be caused by loose, worn or damaged suspension or steering components.
3. Inspect brake fluid level and condition. Note that the brake reservoir fluid level will decrease in proportion to normal lining wear. **Also note that brake fluid tends to darken over time. This is normal and should not be mistaken for contamination.**
 - If fluid level is abnormally low, look for evidence of leaks at calipers, brake lines, and master cylinder.
 - If fluid appears contaminated, drain out a sample to examine. System will have to be flushed if fluid is separated into layers, or contains a substance other than brake fluid. The system seals and cups will also have to be replaced after flushing. Use clean brake fluid to flush the system.
4. Check parking brake operation. Verify free movement and full release of cables and hand lever. Also note if vehicle was being operated with parking brake partially applied.
5. Check brake pedal operation. Verify that pedal does not bind and has adequate free play. If pedal lacks free play, check pedal and power booster for being loose or for bind condition. Do not road test until condition is corrected.
6. Check booster vacuum check valve and hose.
7. If components checked appear OK, road test the vehicle.

ROAD TESTING

1. If complaint involved low brake pedal, pump pedal and note if it comes back up to normal height.
2. Check brake pedal response with transmission in Neutral and engine running. Pedal should remain firm under constant foot pressure.
3. During road test, make normal and firm brake stops in 40-64 km/h (25-40 mph) range. Note faulty brake operation such as low pedal, hard pedal, fade, pedal pulsation, pull, grab, drag, noise, etc.
4. Attempt to stop the vehicle with the parking brake only and note grab, drag, noise, etc.

PEDAL FALLS AWAY

A brake pedal that falls away under steady foot pressure is generally the result of a system leak. The leak point could be at a brake line, fitting, hose, or caliper. If leakage is severe, fluid will be evident at or around the leaking component.

Internal leakage (seal by-pass) in the master cylinder caused by worn or damaged piston cups, may also be the problem cause.

An internal leak in the ABS or junction block may also be the problem with no physical evidence.

Pedal fall-away can also be caused by the vacuum level building in the booster. This is common, especially in vehicles equipped with a vacuum pump, and is not an indication of malfunction. To differentiate between a leak and vacuum build, turn off the engine, and pump the pedal 4-5 times (until the vacuum is depleted), then press and hold the pedal with constant force. If the pedal still falls away, pursue root causing leaks. If the pedal remains firm under this condition, leaks are not the issue.

LOW PEDAL

If a low pedal is experienced, pump the pedal several times. If the pedal comes back up worn linings or rotors are the most likely causes. The proper course of action is to inspect and replace all worn components.

SPONGY PEDAL

A spongy pedal is most often caused by air in the system. However, substandard brake lines and hoses can also cause a spongy pedal. The proper course of action is to bleed the system, and replace substandard quality brake hoses if suspected.

HARD PEDAL OR HIGH PEDAL EFFORT

A hard pedal or high pedal effort may be due to lining that is water soaked, contaminated, glazed, or badly worn. The power booster or check valve could also be faulty.

Hard pedal is also a symptom of a vacuum leak - check hoses and connections.

PEDAL PULSATION

Pedal pulsation is caused by components that are loose, or beyond tolerance limits.

The primary cause of pulsation are disc brake rotors with excessive lateral runout or thickness variation. Other causes are loose wheel bearings or calipers and worn, damaged tires.

NOTE: Some pedal pulsation may be felt during ABS activation.

BRAKE DRAG

Brake drag occurs when the lining is in constant contact with the rotor or drum. Drag can occur at one wheel, all wheels, fronts only, or rears only.

Drag is a product of incomplete brake shoe release. Drag can be minor or severe enough to overheat the linings, rotors and drums.

Minor drag will usually cause slight surface charring of the lining. It can also generate hard spots in rotors and drums from the overheat-cool down process. In most cases, the rotors, drums, wheels and tires are quite warm to the touch after the vehicle is stopped.

Severe drag can char the brake lining all the way through. It can also distort and score rotors and drums to the point of replacement. The wheels, tires and brake components will be extremely hot. In severe cases, the lining may generate smoke as it chars from overheating.

Common causes of brake drag are:

- Seized or improperly adjusted parking brake cables.
- Loose/worn wheel bearing.
- Seized caliper piston.
- Caliper binding on corroded bushings or rusted slide surfaces.
- Loose caliper mounting.
- Drum parking brake shoes binding on worn/damaged support plates.
- Mis-assembled components.
- Long booster output rod.

If brake drag occurs at all wheels, the problem may be related to a blocked master cylinder return port, or faulty power booster (binds-does not release).

BRAKE FADE

Brake fade is usually a product of overheating caused by brake drag. However, brake overheating and resulting fade can also be caused by riding the brake pedal, making repeated high deceleration stops in a short time span, or constant braking on steep mountain roads. Refer to **BRAKE DRAG** for causes.

BRAKE PULL

Front brake pull condition could result from:

- Contaminated lining in one caliper

- Seized caliper piston
- Binding caliper
- Loose caliper
- Rusty caliper slide surfaces
- Improper brake shoes
- Damaged rotor

A worn, damaged wheel bearing or suspension component are further causes of pull. A damaged front tire (bruised, ply separation) can also cause pull.

A common and frequently misdiagnosed pull condition is where direction of pull changes after a few stops. The cause is a combination of brake drag followed by fade at one of the brake units.

As the dragging brake overheats, efficiency is so reduced that fade occurs. Since the opposite brake unit is still functioning normally, its braking effect is magnified. This causes pull to switch direction in favor of the normally functioning brake unit.

An additional point when diagnosing a change in pull condition concerns brake cool down. Remember that pull will return to the original direction, if the dragging brake unit is allowed to cool down (and is not seriously damaged).

REAR BRAKE GRAB OR PULL

Rear grab or pull is usually caused by improperly adjusted or seized parking brake cables, contaminated lining, bent or binding shoes and support plates, or improperly assembled components. This is particularly true when only one rear wheel is involved. However, when both rear wheels are affected, the master cylinder or proportioning valve could be at fault.

BRAKES DO NOT HOLD AFTER DRIVING THROUGH DEEP WATER PUDDLES

This condition is generally caused by water soaked lining. If the lining is only wet, it can be dried by driving with the brakes very lightly applied for a mile or two. However, if the lining is both soaked and dirt contaminated, cleaning and/or replacement will be necessary.

BRAKE LINING CONTAMINATION

Brake lining contamination is mostly a product of leaking calipers, worn seals, driving through deep water puddles, or lining that has become covered with grease and grit during repair. Contaminated lining should be replaced to avoid further brake problems.

WHEEL AND TIRE PROBLEMS

Some conditions attributed to brake components may actually be caused by a wheel or tire problem.

A damaged wheel can cause shudder, vibration and pull. A worn or damaged tire can also cause pull.

Severely worn tires with very little tread left can produce a grab-like condition as the tire loses and recovers

traction. Flat-spotted tires can cause vibration and generate shudder during brake operation. A tire with internal damage such as a severe bruise, cut, or ply separation can cause pull and vibration.

BRAKE NOISES

Some brake noise is common with some disc brakes during the first few stops after a vehicle has been parked overnight or stored. This is primarily due to the formation of trace corrosion (light rust) on metal surfaces. This light corrosion is typically cleared from the metal surfaces after a few brake applications causing the noise to subside.

BRAKE SQUEAK/SQUEAL

Brake squeak or squeal may be due to linings that are wet or contaminated with brake fluid, grease, or oil. Glazed linings and rotors with hard spots can also contribute to squeak. Dirt and foreign material embedded in the brake lining will also cause squeak/squeal.

A very loud squeak or squeal is frequently a sign of severely worn brake lining. If the lining has worn through to the brake shoes in spots, metal-to-metal contact occurs. If the condition is allowed to continue, rotors and drums can become so scored that replacement is necessary.

BRAKE CHATTER

Brake chatter is usually caused by loose or worn components, or glazed/burnt lining. Rotors with hard spots can also contribute to chatter. Additional causes of chatter are out-of-tolerance rotors, brake lining not securely attached to the shoes, loose wheel bearings and contaminated brake lining.

THUMP/CLUNK NOISE

Thumping or clunk noises during braking are frequently **not** caused by brake components. In many cases, such noises are caused by loose or damaged steering, suspension, or engine components. However, calipers that bind on the slide surfaces can generate a thump or clunk noise.

STANDARD PROCEDURE

MANUAL BLEEDING

Use Mopar brake fluid, or an equivalent quality fluid meeting SAE J1703-F and DOT 3 standards only. Use fresh, clean fluid from a sealed container at all times.

Do not pump the brake pedal at any time while bleeding. Air in the system will be compressed into small bubbles that are distributed throughout the hydraulic system. This will make additional bleeding operations necessary.

Do not allow the master cylinder to run out of fluid during bleed operations. An empty cylinder will allow additional air to be drawn into the system. Check the cylinder fluid level frequently and add fluid as needed.

Bleed only one brake component at a time in the following sequence:

Master Cylinder
Junction Block
Right Rear Wheel
Left Rear Wheel
Right Front Wheel
Left Front Wheel

1. Remove reservoir filler caps and fill reservoir.
2. If calipers were overhauled, open all caliper bleed screws. Then close each bleed screw as fluid starts to drip from it. Top off master cylinder reservoir once more before proceeding.

8086EA2F

Fig. 1: Bleed Hose Setup
Courtesy of CHRYSLER LLC

- 3. Attach one end of bleed hose to bleed screw and insert opposite end in glass container partially filled with brake fluid. Be sure end of bleed hose is immersed in fluid.
- 4. Open up bleeder, then have a helper press down the brake pedal. Once the pedal is down close the bleeder. Repeat bleeding until fluid stream is clear and free of bubbles. Then move to the next wheel.

PRESSURE BLEEDING - BASE BRAKES

Use Mopar brake fluid, or an equivalent quality fluid meeting SAE J1703-F and DOT 3 standards only. Use fresh, clean fluid from a sealed container at all times.

Do not pump the brake pedal at any time while bleeding. Air in the system will be compressed into small bubbles that are distributed throughout the hydraulic system. This will make additional bleeding operations necessary.

Do not allow the master cylinder to run out of fluid during bleed operations. An empty cylinder will allow additional air to be drawn into the system. Check the cylinder fluid level frequently and add fluid as needed.

Bleed only one brake component at a time in the following sequence:

- Master Cylinder
- Right Rear Wheel
- Left Rear Wheel
- Right Front Wheel
- Left Front Wheel

Follow the manufacturers instructions carefully when using pressure equipment. Do not exceed the tank manufacturers pressure recommendations. Generally, a tank pressure of 103-139 kPa (15-20 psi) is sufficient for bleeding.

Fill the bleeder tank with recommended fluid and purge air from the tank lines before bleeding.

Do not pressure bleed without a proper master cylinder adapter. The wrong adapter can lead to leakage, or drawing air back into the system. Use adapter provided with the equipment or Adapter 6921.

HYDRAULIC/MECHANICAL

BRAKE LINES

DESCRIPTION

BRAKE HOSES AND LINES

Flexible rubber hose is used at both front and rear brake. Solid crimp one piece double walled ISO style flare steel tubing is also part of the rubber hoses. They are serviced as one piece to the major hydraulic braking components.

DIAGNOSIS AND TESTING

BRAKE LINE AND HOSES

Flexible rubber hose is used at both front and rear brakes. Inspect the hoses whenever the brake system is serviced, at every engine oil change, or whenever the vehicle is in for service.

Inspect the hoses for surface cracking, scuffing, or worn spots. Replace any brake hose/line immediately if the fabric casing of the hose is exposed due to cracks or abrasions.

Also check brake hose installation. Faulty installation can result in kinked, twisted hoses, or contact with the wheels and tires or other chassis components. All of these conditions can lead to scuffing, cracking and eventual failure.

The steel brake lines should be inspected periodically for evidence of corrosion, twists, kinks, leaks, or other damage. Heavily corroded lines will eventually rust through causing leaks. In any case, corroded or damaged brake lines/hoses should be replaced.

Factory replacement brake lines/hoses are recommended to ensure quality, correct length and superior fatigue life. Care should be taken to make sure that brake line/hose mating surfaces are clean and free from nicks and burrs. Also remember that the brake lines are serviced as a whole assembly with the rubber hoses in a solid crimp design.

Use new copper seal washers at all caliper connections. Be sure brake line connections are properly made (not cross threaded) and tightened to recommended torque.

REMOVAL

LEFT FRONT BRAKE HOSE/LINE

1. Install prop rod on the brake pedal to keep pressure on the brake system, Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open. This will allow you to bleed out the area of repair instead of the entire system.
2. Remove the left front brake tube at the HCU.
3. Raise and support vehicle.
4. Disconnect the wheel speed sensor from the hose.
5. Remove the brake hose banjo bolt at the caliper.
6. Disconnect the brake hose/line from the body.
7. Remove the brake hose/line from the vehicle.

LEFT REAR BRAKE LINE/HOSE

1. Install prop rod on the brake pedal to keep pressure on the brake system, Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open. This will allow you to bleed out the area of repair instead of the entire system.
2. Remove the brake tube at the HCU.
3. Raise and support vehicle.
4. Remove the exhaust from the engine manifolds and the hanger bracket at the transmission.

5. Remove the fuel tank. Refer to **REMOVAL** .

Fig. 5: Identifying Bracket, Brake Hose/Line, Fuel Line Bundle & Retainers
Courtesy of CHRYSLER LLC

6. Remove the brake hose banjo bolt at the caliper.
7. Remove the bracket (2) on the body securing the brake/fuel line bundle then remove the brake line (3) from the fuel line bundle (4).
8. Disconnect the brake hose/line from the retainers (1) on the body.
9. Remove the brake hose/line (3) from the vehicle.

RIGHT FRONT BRAKE HOSE/LINE

1. Install prop rod on the brake pedal to keep pressure on the brake system, Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open. This will allow you to bleed out the area of repair instead of the entire system.
2. Remove the air box assembly.

Fig. 6: Identifying Brake Line & Mounting Clip Studs
 Courtesy of CHRYSLER LLC

3. Remove the right front brake tube at the HCU.
4. Remove the brake line (2) from the mounting clip studs (1).
5. Disconnect the electrical connectors to the body control module on the inner fender.
6. Raise and support vehicle.
7. Remove the tire and wheel assembly.
8. Disconnect the wheel speed sensor routing clips (1) from the hose (4).
9. Remove the brake hose banjo bolt (3) at the caliper.
10. Disconnect the brake hose/line from the body.
11. Remove the brake hose/line from the vehicle.

RIGHT REAR BRAKE LINE/HOSE

Fig. 7: Mounting Bracket

1. Install prop rod on the brake pedal to keep pressure on the brake system, Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open. This will allow you to bleed out the area of repair instead of the entire system.
2. Raise and support the vehicle.
3. Remove the caliper banjo bolt (4).
4. Disconnect the brake hose/line union fitting (1).
5. Remove the brake line from the mounting clips (2) at the body.
6. Remove the brake hose/line mounting bolt (3) from the body.
7. Remove the line/hose (6).

INSTALLATION

LEFT FRONT BRAKE HOSE/LINE

1. Install the line/hose.
2. Install the brake hose banjo bolt at the caliper.
3. Reconnect the wheel speed sensor routing clips to the hose.
4. Install the tire and wheel assembly.
5. Lower the vehicle.
6. Install the line to the mounting clips on the body.
7. Install the brake line to the HCU.
8. Remove the prop rod from the brake pedal.
9. Bleed the area of repair for the brake system. **If a proper pedal is not felt during bleeding an area of repair then a base bleed system must be performed. . See STANDARD PROCEDURE.**

LEFT REAR BRAKE HOSE/LINE

Fig. 8: Identifying Bracket, Brake Hose/Line, Fuel Line Bundle & Retainers
 Courtesy of CHRYSLER LLC

1. Install the brake hose/line (3) to the vehicle.
2. Reconnect the brake hose/line in the retainers (1) to the body.
3. Reinstall the brake line (3) to the fuel line bundle (4) and install the bracket (2).
4. Install the exhaust to the manifolds and reinstall the exhaust hanger at the transmission.
5. Install the fuel tank. Refer to **INSTALLATION** .
6. Install the brake hose banjo bolt at the caliper.
7. Lower the vehicle.
8. Install the brake tube at the HCU.
9. Remove the prop rod.
10. Bleed the area of repair for the brake system. **If a proper pedal is not felt during bleeding an area of repair then a base bleed system must be performed.** . See **STANDARD PROCEDURE**.

RIGHT FRONT BRAKE HOSE/LINE

1. Install the line/hose (6).

2. Install the brake hose/line mounting bolt (3) to the body.
3. Install the caliper banjo bolt (4).
4. Install the brake line to the mounting clips (2) at the body.
5. Reconnect the brake hose/line union fitting (1).
6. Remove the prop rod from the brake pedal.
7. Bleed the area of repair for the brake system. **If a proper pedal is not felt during bleeding an area of repair then a base bleed system must be performed.** . See STANDARD PROCEDURE.

BRAKE PADS/SHOES

REMOVAL

PADS-DISC BRAKE-FRONT

Fig. 12: Identifying Caliper Mounting Bolts, Disc Brake Caliper, Inboard/Outboard Pads & Adapter
Courtesy of CHRYSLER LLC

1. Raise and support the vehicle.
2. Remove the front wheel and tire assembly.
3. Drain a small amount of fluid from the master cylinder brake reservoir with a **clean** suction gun.
4. Bottom the caliper pistons into the caliper by prying the caliper over.
5. Remove the caliper mounting bolts (1).
6. Remove the disc brake caliper (2) from the adapter (4).

CAUTION: Never allow the disc brake caliper to hang from the brake hose. Damage to the brake hose will result. Provide a suitable support to hang the caliper securely.

7. Remove the inboard and outboard pads (3).

PADS-DISC BRAKE-REAR

Fig. 13: Caliper Assembly
Courtesy of CHRYSLER LLC

1. Raise and support vehicle.
2. Remove the wheel and tire assemblies.
3. Compress the caliper (1).
4. Remove the rear caliper mounting bolts (4). See **REMOVAL**.

NOTE: **Do not allow brake hose to support caliper assembly.**

5. Remove the caliper by tilting the top up and off the caliper adapter.
6. Support and hang the caliper.
7. Remove the brake pads (2) from the caliper (1).

INSTALLATION

PADS-DISC BRAKE-FRONT

Fig. 14: Identifying Caliper Mounting Bolts, Disc Brake Caliper, Inboard/Outboard Pads & Adapter
 Courtesy of CHRYSLER LLC

1. Install the inboard and outboard pads (3).
2. Install the caliper (2). See **INSTALLATION**.
3. Install the tire and wheel assembly. Refer to **STANDARD PROCEDURE** .

PADS-DISC BRAKE-REAR

Fig. 15: Caliper Assembly
 Courtesy of CHRYSLER LLC

1. Install the brake pads (2) to the caliper adapter.
2. Install caliper (1) to the rotor and then install the caliper mounting bolts (4). See **INSTALLATION**.
3. Install wheel and tire assemblies and lower vehicle. Refer to **STANDARD PROCEDURE** .
4. Apply brakes several times to seat caliper pistons and brake shoes and obtain firm pedal.
5. Top off master cylinder fluid level.

DISC BRAKE CALIPERS

DESCRIPTION

DISC BRAKE CALIPER

The calipers are a single piston type. The calipers are free to slide laterally, this allows continuous compensation for lining wear.

OPERATION

DISC BRAKE CALIPER

When the brakes are applied fluid pressure is exerted against the caliper piston. The fluid pressure is exerted equally and in all directions. This means pressure exerted against the caliper piston and within the caliper bore will be equal. See **Fig. 16**.

Fig. 16: Brake Caliper Operation
 Courtesy of CHRYSLER LLC

1 - CALIPER
2 - PISTON
3 - PISTON BORE
4 - SEAL
5 - INBOARD SHOE
6 - OUTBOARD SHOE

Fluid pressure applied to the piston is transmitted directly to the inboard brake shoe. This forces the shoe lining

against the inner surface of the disc brake rotor. At the same time, fluid pressure within the piston bore forces the caliper to slide inward on the mounting bolts. This action brings the outboard brake shoe lining into contact with the outer surface of the disc brake rotor.

In summary, fluid pressure acting simultaneously on both piston and caliper, produces a strong clamping action. When sufficient force is applied, friction will attempt to stop the rotors from turning and bring the vehicle to a stop.

Application and release of the brake pedal generates only a very slight movement of the caliper and piston. Upon release of the pedal, the caliper and piston return to a rest position. The brake shoes do not retract an appreciable distance from the rotor. In fact, clearance is usually at, or close to zero. The reasons for this are to keep road debris from getting between the rotor and lining and in wiping the rotor surface clear each revolution.

The caliper piston seal controls the amount of piston extension needed to compensate for normal lining wear.

During brake application, the seal is deflected outward by fluid pressure and piston movement. See **Fig. 17**. When the brakes (and fluid pressure) are released, the seal relaxes and retracts the piston.

The amount of piston retraction is determined by the amount of seal deflection. Generally the amount is just enough to maintain contact between the piston and inboard brake shoe.

DISASSEMBLY

DISC BRAKE CALIPER

80876f87

Fig. 20: Padding Caliper Interior - Typical
Courtesy of CHRYSLER LLC

1. Remove brake shoes from caliper.
2. Drain brake fluid out of caliper.
3. Take a piece of wood and pad it with one-inch thickness of shop towels (1). Place this piece in the outboard shoe side of the caliper in front of the piston. This will cushion and protect caliper piston during removal.

80876f89

Fig. 21: Removing Caliper Piston - Typical
Courtesy of CHRYSLER LLC

4. Remove caliper piston (2) with **short bursts** of low pressure compressed air. Direct air through fluid inlet port and ease piston out of bore.

CAUTION: Do not blow the piston out of the bore with sustained air pressure. This could result in a cracked piston. Use only enough air pressure to ease the piston out.

WARNING: Never attempt to catch the piston as it leaves the bore. This may

result in personal injury.

Fig. 22: Removing Caliper Piston Dust Boot - Typical
Courtesy of CHRYSLER LLC

5. Remove caliper piston dust boot with suitable pry tool (1).

80876f8d

Fig. 23: Removing Piston Seal - Typical
Courtesy of CHRYSLER LLC

6. Remove caliper piston seal with wood or plastic tool (1). Do not use metal tools as they will scratch piston bore.

Fig. 24: Mounting Bolt Bushing & Boot - Typical
Courtesy of CHRYSLER LLC

7. Remove caliper mounting bolt bushings (1) and boots (2).

CLEANING

DISC BRAKE CALIPER

Clean the caliper components with clean brake fluid or brake clean only. Wipe the caliper and piston dry with lint free towels or use low pressure compressed air.

CAUTION: Do not use gasoline, kerosene, thinner, or similar solvents. These products may leave a residue that could damage the piston and seal.

INSPECTION

DISC BRAKE CALIPER

The piston is made from a phenolic resin (plastic material) and should be smooth and clean.

The piston must be replaced if cracked or scored. Do not attempt to restore a scored piston surface by sanding or polishing.

CAUTION: If the caliper piston is replaced, install the same type of piston in the caliper. Never interchange phenolic resin and steel caliper pistons. The pistons, seals, seal grooves, caliper bore and piston tolerances are different.

The bore can be **lightly** polished with a brake hone to remove very minor surface imperfections. See **Fig. 25**.

The caliper should be replaced if the bore is severely corroded, rusted, scored, or if polishing would increase bore diameter more than 0.025 mm (0.001 inch).

80876f77

8. Seat dust boot (3) in caliper with Installer Tool C-4842 (2) and Tool Handle C-4171 (1).

9. Replace caliper bleed screw if removed.

INSTALLATION

CALIPER-DISC BRAKE-FRONT

Fig. 31: Disc Brake Caliper Components
Courtesy of CHRYSLER LLC

1. Install caliper (4) to the caliper adapter (5).
2. Coat the caliper mounting bolts (3) with silicone grease. Begin with the bolt closet to the bleeder screws (top), Then install and tighten the bolts to 37 N.m (28 ft. lbs.).

CAUTION: Verify brake hose is not twisted or kinked before tightening fitting bolt.

3. Install the brake hose banjo bolt (2) and brake hose to the caliper (4) with **new seal washers** and tighten fitting bolt to 31 N.m (23 ft. lbs.) if removed.
4. Remove the prop rod from the vehicle.
5. Bleed the area of repair for the brake system. **If a proper pedal is not felt during bleeding an area of repair then a base bleed system must be performed.** . See STANDARD PROCEDURE.
6. Install the wheel and tire assemblies. Refer to STANDARD PROCEDURE .
7. Remove the supports and lower the vehicle.
8. Verify a firm pedal before moving the vehicle.

CALIPER-DISC BRAKE-REAR

Fig. 32: Identifying Bolts, Brake Hose & Brake Hose Banjo Bolt
 Courtesy of CHRYSLER LLC

1. Install the brake pads if removed.
2. Install caliper. Tighten the bolts (6) to 37 N.m (28 ft. lbs.)

CAUTION: Verify brake hose (5) is not twisted or kinked before tightening fitting bolt.

3. Install the brake hose (5) to the caliper with **new seal washers** and install the brake hose banjo bolt (4) tighten fitting bolt to 31 N.m (23 ft. lbs.).
4. Remove the prop rod from the vehicle.
5. Bleed the area of repair for the brake system. **If a proper pedal is not felt during bleeding an area of repair then a base bleed system must be performed.** . See STANDARD PROCEDURE.
6. Install the wheel and tire assemblies. Refer to STANDARD PROCEDURE .
7. Remove the supports and lower the vehicle.
8. Verify a firm pedal before moving the vehicle.

DISC BRAKE CALIPER ADAPTER

REMOVAL

DISC BRAKE CALIPER ADAPTER

Fig. 33: Disc Brake Caliper Components
Courtesy of CHRYSLER LLC

1. Raise and support the vehicle.
2. Remove the front wheel and tire assembly.
3. Drain a small amount of fluid from master cylinder brake reservoir with a **clean** suction gun.
4. Bottom the caliper pistons into the caliper by prying the caliper over.
5. Remove the caliper mounting bolts (3).
6. Remove the disc brake caliper (4) from the adapter (5).

CAUTION: Never allow the disc brake caliper to hang from the brake hose. Damage to the brake hose will result. Provide a suitable support to hang the caliper securely.

7. Remove the inboard and outboard brake pads. See **REMOVAL**.
8. Remove the caliper adapter mounting bolts (1).

INSTALLATION

DISC BRAKE CALIPER ADAPTER

Fig. 34: Disc Brake Caliper Components
Courtesy of CHRYSLER LLC

1. Install the caliper adapter mounting bolts (1). Tighten the mounting bolts to 135 N.m (100 ft. lbs).
2. Install the inboard and outboard pads. See **INSTALLATION**.
3. Install the caliper mounting bolts (3). See **INSTALLATION**.
4. Install the tire and wheel assembly. Refer to **STANDARD PROCEDURE** .

ROTORS

DIAGNOSIS AND TESTING

BRAKE DRUM IN HAT ROTOR

The maximum allowable diameter of the drum braking surface is indicated on the drum outer edge. Always replace the drum if machining would cause drum diameter to exceed the size limit indicated on the drum in hat.

BRAKE DRUM RUNOUT

Measure drum diameter and runout with an accurate gauge. The most accurate method of measurement involves mounting the drum in a brake lathe and checking variation and runout with a dial indicator.

Machine the drum if runout or variation exceed values. Replace the drum in hat rotor if machining causes the drum in hat rotor to exceed the maximum allowable diameter.

DISC BRAKE ROTOR

The rotor braking surfaces should not be refinished unless necessary.

Light surface rust and scale can be removed with a lathe equipped with dual sanding discs. The rotor surfaces can be restored by machining in a disc brake lathe if surface scoring and wear are light.

Replace the rotor under the following conditions:

severely scored
tapered
hard spots
cracked
below minimum thickness

ROTOR MINIMUM THICKNESS

Measure rotor thickness at the center of the brake shoe contact surface. Replace the rotor if worn below minimum thickness, or if machining would reduce thickness below the allowable minimum.

Rotor minimum thickness is usually specified on the rotor hub. The specification is either stamped or cast into the hub surface.

ROTOR RUNOUT

J8905-68

Fig. 35: Checking Rotor Runout & Thickness Variation
Courtesy of CHRYSLER LLC

1 - DIAL INDICATOR

Check rotor lateral runout with dial indicator C-3339 (1). See **Fig. 35**. Excessive lateral runout will cause brake pedal pulsation and rapid, uneven wear of the brake shoes. Position the dial indicator plunger approximately 25.4 mm (1 in.) inward from the rotor edge. The dial indicator should be positioned in the center of the rotor surface. Maximum allowable rotor runout is 0.102 mm (0.004 in.).

ROTOR THICKNESS VARIATION

Fig. 36: Measuring Rotor Thickness
Courtesy of CHRYSLER LLC

1 - MICROMETER

2 - ROTOR

Variations in rotor thickness will cause pedal pulsation, noise and shudder.

Measure rotor thickness at 6 to 12 points around the rotor face. See **Fig. 36**.

Position the micrometer (1) approximately 25.4 mm (1 in.) from the rotor (2) outer circumference for each measurement.

Thickness should not **vary** by more than 0.013 mm (0.0005 in.) from point-to-point on the rotor. Machine or replace the rotor if necessary.

STANDARD PROCEDURE

BRAKE DRUM IN HAT ROTOR MACHINING

The brake drum in hat rotor can be machined on a drum lathe when necessary. Initial machining cuts should be limited to 0.12 - 0.20 mm (0.005 - 0.008 in.) at a time as heavier feed rates can produce taper and surface variation. Final finish cuts of 0.025 to 0.038 mm (0.001 to 0.0015 in.) are recommended and will generally provide the best surface finish.

Be sure the drum in hat rotor is securely mounted in the lathe before machining operations. A damper strap should always be used around the drum to reduce vibration and avoid chatter marks.

The maximum allowable diameter of the drum braking surface is stamped or cast into the drum in hat rotor.

CAUTION: Replace the drum in hat rotor if machining will cause the drum to exceed the maximum allowable diameter.

DISC BRAKE ROTOR MACHINING

NOTE: A hub mounted on-vehicle lathe is highly recommended. This type of lathe trues the rotor to the vehicles hub/bearing.

The disc brake rotor can be machined if scored or worn. The on-vehicle lathe must machine both sides of the rotor simultaneously with dual cutter heads. The rotor mounting surface must be clean before placing on the on-vehicle lathe. Equipment capable of machining only one side at a time may produce a tapered rotor. **This type of rotor machining is not recommended .**

NOTE: Proper wheel torque is also critical to help prevent any warping of the disc brake rotor.

CAUTION: Brake rotors that do not meet minimum thickness specifications before or after machining must be replaced.

REMOVAL

DISC BRAKE ROTOR-FRONT

81a6120a

Fig. 37: Front Disc Brake Rotor
Courtesy of CHRYSLER LLC

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.

CAUTION: Never allow the disc brake caliper to hang from the brake hose. Damage to the brake hose will result. Provide a suitable support to hang the caliper securely.

3. Remove the caliper adapter (2). See **REMOVAL**.
4. Remove the disc brake rotor (3).

DISC BRAKE ROTOR-REAR

81a581d2

Fig. 38: Rear Disc Brake Rotor

The brake pedal (4) is attached to the booster push rod (5). When the pedal is depressed, the primary booster push rod (5) is depressed which moves the booster secondary rod. The booster secondary rod depresses the master cylinder piston (1). See **Fig. 42**.

REMOVAL

BRAKE PEDAL

Fig. 43: Identifying Retainer Clip, Pedal & Booster Mounting Nuts
 Courtesy of CHRYSLER LLC

1. Remove the knee blocker under the steering column. Refer to **REMOVAL** .
2. Remove the retainer clip (3) securing the booster push rod to pedal (2).
3. Remove the brake lamp switch. Refer to **REMOVAL** .
4. Remove the two nuts securing the pedal to the column bracket.
5. Remove the pedal from the vehicle.

Fig. 44: Pedal Bushing
 Courtesy of CHRYSLER LLC

6. Remove the pedal bushing if necessary.

INSTALLATION

BRAKE PEDAL

Fig. 45: Pedal Bushing
 Courtesy of CHRYSLER LLC

1. Lubricate the brake pedal pin and bushings with Mopar multi-mileage grease.
2. Install the pedal bushings if removed.

Fig. 46: Identifying Retainer Clip, Pedal & Booster Mounting Nuts
 Courtesy of CHRYSLER LLC

3. Install the pedal into the vehicle.
4. Install the nuts securing the pedal to the column bracket.
5. Tighten the nuts to 22.6 N.m (200 in. lbs.).
6. Install the booster push rod on the pedal pin and install a new retainer clip (3).
7. Install the brake lamp switch. Refer to **INSTALLATION** .
8. Install the knee blocker. Refer to **INSTALLATION** .

DESCRIPTION

POWER BRAKE BOOSTER

Fig. 47: Brake Master/Booster Assembly
Courtesy of CHRYSLER LLC

The booster assembly consists of a housing divided into separate chambers by two internal diaphragms. The outer edge of each diaphragm is attached to the booster housing. The diaphragms are connected to the booster primary push rod.

Two push rods are used in the booster. The primary push rod connects the booster to the brake pedal. The secondary push rod connects the booster (2) to the master cylinder (1) to stroke the cylinder pistons.

The booster assembly is of the tie-bar design. This means the structural support of the assembly is through the tie-bars, whose ends protrude through the booster shell. One end is the master cylinder mounting stud and the other end is the booster mounting stud. The booster assembly (with properly functioning check valve installed) may not have a good vacuum seal unless the booster is installed on the dash panel mounting bracket with master cylinder and booster mounting nuts properly torqued.

OPERATION

POWER BRAKE BOOSTER

80f2ad83

Fig. 48: Power Brake Booster Cut Away
Courtesy of CHRYSLER LLC

- 6 - PRIMARY PUSH ROD (TO BRAKE PEDAL)
- 7 - BOOSTER MOUNTING STUDS

- | |
|--|
| 8 - SECONDARY PUSH ROD (TO MASTER CYLINDER)
9 - SPRING
10 - MASTER CYLINDER MOUNTING STUDS |
|--|

The atmospheric inlet valve is opened and closed by the primary push rod (6). Booster vacuum supply is through a hose attached to an intake manifold fitting at one end and to the booster check valve (1) at the other. The vacuum check valve (1) in the booster housing (4) is a one-way device that prevents vacuum leak back.

Power assist is generated by utilizing the pressure differential between normal atmospheric pressure and a vacuum. The vacuum needed for booster operation is taken directly from the engine intake manifold. The entry point for atmospheric pressure is through a filter and inlet valve at the rear of the housing. See **Fig. 48**.

The chamber areas forward of the booster diaphragms are exposed to vacuum from the intake manifold. The chamber areas to the rear of the diaphragms, are exposed to normal atmospheric pressure of 101.3 Kilopascals (14.7 pounds/square in.).

Brake pedal application causes the primary push rod to open the atmospheric inlet valve. This exposes the area behind the diaphragms to atmospheric pressure. The resulting pressure differential provides the extra apply force for power assist.

The booster check valve, check valve grommet and booster seals are serviceable.

DIAGNOSIS AND TESTING

MASTER CYLINDER/POWER BOOSTER

1. Start engine and check booster vacuum hose connections. A hissing noise indicates vacuum leak. Correct any vacuum leak before proceeding, also ensure booster mounting nuts are torqued correctly.
2. Stop engine and shift transmission into Neutral.
3. Pump brake pedal until all vacuum reserve in booster is depleted.
4. Press and hold brake pedal under light foot pressure. The pedal should hold firm, if the pedal falls away master cylinder is faulty (internal leakage). This could also indicate an external leak, such as at fittings, hoses, HCU, etc, or a symptom of an internal leak in the HCU
5. Start engine and note pedal action. It should fall away slightly under light foot pressure then hold firm. If no pedal action is discernible, power booster, vacuum supply, or vacuum check valve is faulty. Proceed to the POWER BOOSTER VACUUM TEST.
6. If the POWER BOOSTER VACUUM TEST passes, rebuild booster vacuum reserve as follows: Release brake pedal. Increase engine speed to 1500 RPM, close the throttle and immediately turn off ignition to stop engine.
7. Wait a minimum of 90 seconds and try brake action again. Booster should provide two or more vacuum assisted pedal applications. If vacuum assist is not provided, booster is faulty.

POWER BOOSTER VACUUM TEST

1. Connect vacuum gauge to booster check valve with short length of hose and T-fitting. See **Fig. 49**.
2. Start and run engine at curb idle speed for one minute.

3. Observe the vacuum supply. If vacuum supply is not adequate, repair vacuum supply.
4. Clamp hose shut between vacuum source and check valve.
5. Stop engine and observe vacuum gauge.
6. If vacuum drops more than one inch Hg (33 millibars) within 15 seconds, booster diaphragm or check valve is faulty.

J9005-81

1 - TEE FITTING

2 - SHORT CONNECTING HOSE

3 - CHECK VALVE
4 - CHECK VALVE HOSE
5 - CLAMP TOOL
6 - INTAKE MANIFOLD
7 - VACUUM GAUGE

POWER BOOSTER CHECK VALVE TEST

1. Disconnect vacuum hose from check valve.
2. Remove check valve and valve seal from booster.
3. Use a hand operated vacuum pump for test.
4. Apply 15-20 inches vacuum at large end of check valve. See **Fig. 50**.
5. Vacuum should hold steady. If gauge on pump indicates vacuum loss, check valve is faulty and should be replaced.

REMOVAL

POWER BRAKE BOOSTER - LHD

818ba82a

Fig. 51: Identifying Reservoir, Fluid Level Electrical Connector, Brake Lines, Mounting Nuts & Booster Check Valve

Courtesy of CHRYSLER LLC

1. Disconnect the wire (3) to the fluid level switch at the bottom of the reservoir (2).
2. Remove the master cylinder (2). See **REMOVAL**.
3. Disconnect vacuum hoses from booster check valve (1).
4. Remove the brake lines (4) from the master cylinder and the HCU (ABS vehicles only) or the junction block for clearance.
5. Disconnect the HCU from the mounts and move to the side for clearance of the booster.

818ba345

Fig. 52: Identifying Retainer Clip, Pedal & Booster Mounting Nuts
Courtesy of CHRYSLER LLC

6. Remove knee blocker under the steering column. Refer to **REMOVAL** .
7. Remove the brake light switch and discard. Refer to **REMOVAL** .
8. Remove retaining clip (3) that secures booster push rod to brake pedal (2).
9. Remove nuts attaching booster (1) to the dash panel.
10. In engine compartment, slide booster studs out of dash panel, tilt booster upward, and remove booster from engine compartment.

POWER BRAKE BOOSTER - RHD

1. Remove the air box. Refer to **REMOVAL** .
2. Siphon the fluid out of the master cylinder.

Fig. 53: Brake Booster
Courtesy of CHRYSLER LLC

3. Remove the brake lines from the master cylinder.
4. Remove the master cylinder. See **REMOVAL**.
5. Disconnect vacuum hose from booster check valve (1).

Fig. 54: Identifying Retainer Clip, Pedal & Booster Mounting Nuts
 Courtesy of CHRYSLER LLC

6. Remove knee blocker under the steering column. Refer to **REMOVAL** .
7. Remove the brake light switch and discard. Refer to **REMOVAL** .
8. Remove retaining clip (3) that secures booster push rod to brake pedal (2).
9. Remove nuts (1) attaching booster to the dash panel.
10. In engine compartment, slide booster studs out of dash panel, tilt booster upward, and remove booster from engine compartment.

INSTALLATION

POWER BRAKE BOOSTER - LHD

Fig. 55: Identifying Retainer Clip, Pedal & Booster Mounting Nuts
 Courtesy of CHRYSLER LLC

1. Align and position booster on the dash panel.

2. Install booster mounting nuts (1). Tighten nuts just enough to hold booster in place.

NOTE: Lubricate the pedal pin with Mopar multi-mileage grease before installation.

3. Slide booster push rod onto the brake pedal (2). Then secure push rod to pedal pin with retaining clip (3).
4. Tighten booster mounting nuts (1) to 25 N.m (220 in. lbs.).
5. Install a new brake lamp switch and reconnect the electrical connector.
6. Install the knee blocker. Refer to **INSTALLATION**.

Fig. 56: Identifying Reservoir, Fluid Level Electrical Connector, Brake Lines, Mounting Nuts & Booster Check Valve

Courtesy of CHRYSLER LLC

7. If original master cylinder is being installed, check condition of seal at rear of master cylinder. Replace seal if cut, or torn.
8. Clean cylinder mounting surface of brake booster. Use shop towel wetted with brake cleaner for this purpose. Dirt, grease, or similar materials will prevent proper cylinder seating and could result in vacuum leak.
9. Align and install master cylinder on the booster studs. Install mounting nuts and tighten to 25 N.m (220 in. lbs.).
10. Connect vacuum hose to booster check valve (1).
11. Remount the HCU. Tighten bracket mounting nuts to 14 N.m (125 in. lbs.).
12. Connect and secure the brake lines (4) to HCU or junction block and master cylinder. Start all brake line fittings by hand to avoid cross threading.
13. Connect the wire to fluid level switch (3) at the bottom of the reservoir (2).
14. Fill and bleed base brake system. See **STANDARD PROCEDURE**.
15. Verify proper brake operation before moving vehicle.

Fig. 57: Identifying Retainer Clip, Pedal & Booster Mounting Nuts
 Courtesy of CHRYSLER LLC

1. Align and position booster on the dash panel.
2. Install booster mounting nuts (1). Tighten nuts just enough to hold booster in place.

NOTE: **Lubricate the pedal pin with Mopar multi-mileage grease before installation.**

3. Slide booster push rod onto the brake pedal (2). Then secure push rod to pedal pin with retaining clip (3).
4. Tighten booster mounting nuts (1) to 39 N.m (29 ft. lbs.).
5. Install a new brake lamp switch and reconnect the electrical connector.
6. Install the knee blocker. Refer to **INSTALLATION** .

Fig. 58: Brake Booster
 Courtesy of CHRYSLER LLC

7. If original master cylinder is being installed, check condition of seal at rear of master cylinder. Replace seal if cut, or torn.
8. Clean cylinder mounting surface of brake booster. Use shop towel wetted with brake cleaner for this purpose. Dirt, grease, or similar materials will prevent proper cylinder seating and could result in vacuum leak.
9. Align and install master cylinder on the booster studs (2). Install mounting nuts and tighten to 17.5 N.m (155 in. lbs.). See **INSTALLATION**.
10. Connect vacuum hose to booster check valve (1).
11. Connect and secure the brake lines to master cylinder. Start all brake line fittings by hand to avoid cross threading.
12. Connect the wire to fluid reservoir.
13. Install the air box.
14. Fill and bleed base brake system. See **STANDARD PROCEDURE**.
15. Verify proper brake operation before moving vehicle.

MASTER CYLINDER

DESCRIPTION

MASTER CYLINDER

The master cylinder has a removable plastic reservoir. The cylinder body is made of aluminum and contains a primary and secondary piston assembly. The cylinder body including the piston assemblies are not serviceable. If diagnosis indicates an internal problem with the cylinder body, it must be replaced as an assembly. The reservoir and grommets are the only replaceable parts on the master cylinder.

OPERATION

MASTER CYLINDER

The master cylinder bore contains a primary and secondary piston. The primary piston supplies hydraulic pressure to the front brakes. The secondary piston supplies hydraulic pressure to the rear brakes. The master cylinder reservoir stores reserve brake fluid for the hydraulic brake circuits.

DIAGNOSIS AND TESTING

MASTER CYLINDER/POWER BOOSTER

1. Start engine and check booster vacuum hose connections. A hissing noise indicates vacuum leak. Correct any vacuum leak before proceeding, also ensure booster mounting nuts are torqued correctly.
2. Stop engine and shift transmission into Neutral.
3. Pump brake pedal until all vacuum reserve in booster is depleted.
4. Press and hold brake pedal under light foot pressure. The pedal should hold firm, if the pedal falls away master cylinder is faulty (internal leakage). This could also indicate an external leak, such as at fittings, hoses, HCU, etc, or a symptom of an internal leak in the HCU

5. Start engine and note pedal action. It should fall away slightly under light foot pressure then hold firm. If no pedal action is discernible, power booster, vacuum supply, or vacuum check valve is faulty. Proceed to the POWER BOOSTER VACUUM TEST.
6. If the POWER BOOSTER VACUUM TEST passes, rebuild booster vacuum reserve as follows: Release brake pedal. Increase engine speed to 1500 RPM, close the throttle and immediately turn off ignition to stop engine.
7. Wait a minimum of 90 seconds and try brake action again. Booster should provide two or more vacuum assisted pedal applications. If vacuum assist is not provided, booster is faulty.

POWER BOOSTER VACUUM TEST

1. Connect vacuum gauge to booster check valve with short length of hose and T-fitting. See **Fig. 49**.
2. Start and run engine at curb idle speed for one minute.
3. Observe the vacuum supply. If vacuum supply is not adequate, repair vacuum supply.
4. Clamp hose shut between vacuum source and check valve.
5. Stop engine and observe vacuum gauge.
6. If vacuum drops more than one inch Hg (33 millibars) within 15 seconds, booster diaphragm or check valve is faulty.

J9005-81

1 - TEE FITTING
2 - SHORT CONNECTING HOSE
3 - CHECK VALVE
4 - CHECK VALVE HOSE
5 - CLAMP TOOL
6 - INTAKE MANIFOLD
7 - VACUUM GAUGE

1. Disconnect vacuum hose from check valve.
2. Remove check valve and valve seal from booster.
3. Use a hand operated vacuum pump for test.
4. Apply 15-20 inches vacuum at large end of check valve. See **Fig. 50**.
5. Vacuum should hold steady. If gauge on pump indicates vacuum loss, check valve is faulty and should be replaced.

1 - BOOSTER CHECK VALVE
2 - APPLY TEST VACUUM HERE
3 - VALVE SEAL

STANDARD PROCEDURE

MASTER CYLINDER BLEEDING

A new master cylinder should be bled before installation on the vehicle. Required bleeding tools include bleed

tubes and a wood dowel to stroke the pistons. Bleed tubes can be fabricated from brake line.

1. Mount master cylinder in vise.
2. Attach bleed tubes to cylinder outlet ports. Then position each tube end into reservoir. See **Fig. 61**.
3. Fill reservoir with fresh brake fluid.
4. Press cylinder pistons inward with wood dowel. Then release pistons and allow them to return under spring pressure. Continue bleeding operations until air bubbles are no longer visible in fluid.

Fig. 61: Master Cylinder - Typical

2 - RESERVOIR

REMOVAL

MASTER CYLINDER

Fig. 62: Identifying Reservoir, Fluid Level Electrical Connector, Brake Lines, Mounting Nuts & Booster Check Valve

Courtesy of CHRYSLER LLC

1. Siphon and drain the fluid from the reservoir (2).
2. Disconnect the fluid level electrical connector (3) from the reservoir (2).
3. Remove the brake lines (4) at the master cylinder.
4. Remove mounting nuts (5) from the master cylinder.

Fig. 63: Master Cylinder
Courtesy of CHRYSLER LLC

5. Remove master cylinder.
6. Remove cylinder cover and drain the rest of the fluid.
7. If master cylinder reservoir requires service, see **REMOVAL**.

INSTALLATION

MASTER CYLINDER

8195c916

Fig. 64: Master Cylinder
Courtesy of CHRYSLER LLC

NOTE: If master cylinder is replaced, bleed cylinder before installation.

8195c921

Fig. 65: Identifying Brake Booster & Brake Booster Studs
Courtesy of CHRYSLER LLC

1. Clean cylinder mounting surface of brake booster (3).

NOTE: Insure the O-ring is on the master cylinder at the booster interface.

2. Install master cylinder onto brake booster studs (4).

818ba82a

Fig. 66: Identifying Reservoir, Fluid Level Electrical Connector, Brake Lines, Mounting Nuts & Booster Check Valve

Courtesy of CHRYSLER LLC

3. Install mounting nuts (5) and tighten to 17 N.m (151 in. lbs.).
4. Connect the brake lines (4) to the master cylinder and tighten to 19 N.m (168 in. lbs.).
5. Connect fluid level electrical connector (3) to the reservoir (2).
6. Fill and bleed base brake system. See **STANDARD PROCEDURE**.

FLUID

DESCRIPTION

BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar brake fluid or an equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from a container which has been left open. An open container of brake fluid will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

STANDARD PROCEDURE

BRAKE FLUID LEVEL

8195c90c

Fig. 67: Identifying Master Cylinder Reservoir
 Courtesy of CHRYSLER LLC

Always clean the master cylinder reservoir and caps before checking fluid level. If not cleaned, dirt could enter the fluid.

The fluid fill level is indicated on the side of the master cylinder reservoir (1).

The correct fluid level is to the MAX indicator on the side of the reservoir. If necessary, add fluid to the proper level.

FLUID RESERVOIR

REMOVAL

RESERVOIR

818ba82a

Fig. 68: Identifying Reservoir, Fluid Level Electrical Connector, Brake Lines, Mounting Nuts & Booster Check Valve

Courtesy of CHRYSLER LLC

1. Install prop rod on brake pedal to keep pressure on the brake system.
2. Remove reservoir cap and siphon fluid into drain container.
3. Remove the electrical connector (3) from the fluid level switch in the reservoir (2).

Fig. 69: Identifying Reservoir & Tabs
Courtesy of CHRYSLER LLC

4. Remove the reservoir (1) from the master cylinder by pulling the four tabs (3) outward to release.

Fig. 70: Identifying Master Cylinder Reservoir
Courtesy of CHRYSLER LLC

5. Remove the reservoir (1) from the master cylinder by pulling upwards.
6. If replacing the reservoir (1) remove the fluid level sensor (2) by squeezing the tabs together while pulling on the sensor (2).

Fig. 71: Master W/O Reservoir
 Courtesy of CHRYSLER LLC

7. Remove old grommets (2) from cylinder body (1).

INSTALLATION

RESERVOIR

Fig. 72: Master W/O Reservoir
 Courtesy of CHRYSLER LLC

CAUTION: Do not use any type of tool to install the grommets (2). Tools may cut, or tear the grommets creating a leak problem after installation. Install the grommets using finger pressure only and insure that the grommets are properly seated and checked for leaks after installation.

1. Lubricate new grommets (2) with clean brake fluid and Install new grommets (2) onto reservoir outlets (1). Use finger pressure to install and seat grommets.

8195c90c

Fig. 73: Identifying Master Cylinder Reservoir
Courtesy of CHRYSLER LLC

2. Start reservoir (1) and grommets into holes on master cylinder.

818ba84b

Fig. 74: Identifying Reservoir & Tabs
Courtesy of CHRYSLER LLC

3. Then rock reservoir (1) back and forth while pressing downward to seat it in the holes on the master cylinder. **Make sure the four tabs are securely seated over the nubs (3).**

8195c90c

Fig. 75: Identifying Master Cylinder Reservoir
 Courtesy of CHRYSLER LLC

4. Install the fluid level sensor (2) if removed by just inserting the sensor in the reservoir until the tabs click.

818ba82a

Fig. 76: Identifying Reservoir, Fluid Level Electrical Connector, Brake Lines, Mounting Nuts & Booster Check Valve
 Courtesy of CHRYSLER LLC

5. Reconnect the electrical connector (3) to the fluid reservoir level switch.
6. Remove the prop rod from the vehicle.
7. Fill and bleed base brake system. See **STANDARD PROCEDURE**.

SUPPORT PLATE

REMOVAL

SUPPORT PLATE

Fig. 77: Identifying Support Plate & Attaching Bolts
 Courtesy of CHRYSLER LLC

1. Remove wheel and tire assembly.
2. Remove the disc brake caliper. See **REMOVAL**.
3. Remove the rotor. See **REMOVAL**.
4. Remove the axle shaft. Refer to **REMOVAL** .
5. Remove the park brake shoes. See **REMOVAL**.
6. Remove the bolts (2) attaching the support plate (1) to the axle and remove the support plate (1).

INSTALLATION

SUPPORT PLATE

Fig. 78: Identifying Support Plate & Attaching Bolts
 Courtesy of CHRYSLER LLC

1. Install support plate (1) on axle flange. Tighten attaching bolts (2) to 115 N.m (85 ft. lbs.).

2. Install the park brake shoes. See **INSTALLATION**.
3. Install axle shaft. Refer to **INSTALLATION** .
4. Adjust brake shoes to drum with brake gauge. See **ADJUSTMENTS**.
5. Install the rotor. See **INSTALLATION**.
6. Install the caliper. See **INSTALLATION**.
7. Install the wheel and tire assembly. Refer to **STANDARD PROCEDURE** .

PARKING BRAKE

DESCRIPTION

PARKING BRAKE

The parking brake is a hand lever and cable operated system used to apply the rear brakes.

OPERATION

PARKING BRAKE

A hand operated lever in the passenger compartment is the main application device. The front cable is connected between the hand lever and the rear cables with an equalizer.

The rear cables are connected to the actuating lever on each primary brake shoe. The levers are attached to the brake shoes by a pin either pressed into, or welded to the lever. A clip is used to secure the pin in the brake shoe. The pin allows each lever to pivot independently of the brake shoe.

To apply the parking brakes, the hand lever is pulled upward. This pulls the rear brake shoe actuating levers forward, by means of a tensioner and cables. As the actuating lever is pulled forward, the parking brake strut (which is connected to both shoes), exerts a linear force against the secondary brake shoe. This action presses the secondary shoe into contact with the drum. Once the secondary shoe contacts the drum, force is exerted through the strut. This force is transferred through the strut to the primary brake shoe causing it to pivot into the drum as well.

A gear type ratcheting mechanism is used to hold the lever in an applied position. Parking brake release is accomplished by the hand lever release button.

A parking brake switch is mounted on the parking brake lever and is actuated by movement of the lever. The switch, which is in circuit with the red warning light in the dash, will illuminate the warning light whenever the parking brakes are applied.

Parking brake is self-adjusting when the lever is pulled. The cable tensioner, once adjusted at the factory, should not need further adjustment under normal circumstances.

ADJUSTMENTS

PARKING BRAKE LOCK OUT

Fig. 79: Parking Brake Lock Out
 Courtesy of CHRYSLER LLC

NOTE: **The parking brake is self-adjusting, it can not be adjusted.**

1. Remove the center floor console. Refer to **REMOVAL** .
2. With lever in DOWN position, pull up on the core cable (4) rotating the drum (5) until the drum cut-out aligns with hole on lever tab (3), then install a punch (2) in this hole and drum cut-out. Release grasp on core cable.
3. The park brake system is now locked out to perform necessary repairs.

CABLES

REMOVAL

REAR PARKING BRAKE CABLES

1. Lock out the parking brake cables. See **ADJUSTMENTS**.

80cb48d2

Fig. 80: Mounting Brackets
Courtesy of CHRYSLER LLC

1 - PARK BRAKE CABLES 2 - CARPET

2. Remove the rear seat. Refer to **REMOVAL** .
3. Pull the carpet forward far enough in the rear to gain access to the two parking brake cables through the floor.

Fig. 81: Identifying Cables & Equalizer
 Courtesy of CHRYSLER LLC

4. Disconnect the two cables (1) from the equalizer (2) and then remove the cables from the mount using a proper sized box end wrench over the tangs.

Fig. 82: Identifying Cables, Floor & Grommets
 Courtesy of CHRYSLER LLC

5. Push the cables (1) through the floor (3) with the grommets (2).

Fig. 83: Identifying Brake Lever & Brake Cable
Courtesy of CHRYSLER LLC

6. Remove the stabilizer bar bracket retainer.
7. Remove the park brake cable from the stabilizer bar retainer and mount.
8. Remove the cable from the axle bracket with a proper sized box end wrench over the tangs.
9. Remove the brake cable (2) from the brake lever (3).

INSTALLATION

REAR PARKING BRAKE CABLES

Fig. 84: Identifying Brake Lever & Brake Cable
Courtesy of CHRYSLER LLC

1. Install the cables (2) into the axle bracket.
2. Reconnect the cable to the park brake lever (1).
3. Install the park brake cable between the stabilizer bar retainer bracket and the mount. Tighten the bolts to

47 N.m (35 ft. lbs.).

Fig. 85: Identifying Cables, Floor & Grommets
Courtesy of CHRYSLER LLC

4. Push the cables (1) through the floor (3) and seat the grommets (2).

Fig. 86: Identifying Cables & Equalizer
Courtesy of CHRYSLER LLC

5. Reconnect the two cables (1) to the front mount and then to the equalizer (2).

80cb48d2

Fig. 87: Mounting Brackets
Courtesy of CHRYSLER LLC

- | |
|-------------------------------------|
| 1 - PARK BRAKE CABLES
2 - CARPET |
|-------------------------------------|

6. Lay the carpet (2) back down in the rear.
7. Install the rear seat. Refer to **INSTALLATION** .
8. Remove the lock out device on the lever.
9. Adjust the park brake shoes. See **ADJUSTMENTS**.
10. Test the parking brake.

LEVER

REMOVAL

PARKING BRAKE LEVER

Fig. 88: Identifying Parking Brake Lever Assembly Mounting Nuts, Parking Brake Lamp Switch Wire, Lever Assembly & Occupant Restraint Controller Mounting Nuts
 Courtesy of CHRYSLER LLC

1. Remove the center floor console. Refer to **REMOVAL** .
2. Lock out the parking brakes. See **ADJUSTMENTS**.
3. Disengage the front cables from the equalizer.
4. Disconnect the parking brake lamp switch wire (2).
5. Remove the occupant restraint controller mounting nuts (4). Refer to **REMOVAL** .
6. Remove the parking brake lever assembly mounting nuts (1).
7. Remove the lever assembly (3).

INSTALLATION

PARKING BRAKE LEVER

Fig. 89: Identifying Parking Brake Lever Assembly Mounting Nuts, Parking Brake Lamp Switch Wire, Lever Assembly & Occupant Restraint Controller Mounting Nuts

Courtesy of CHRYSLER LLC

1. Install the parking brake lever assembly (3).
2. Install the parking brake lever assembly (3) to the mounting bolts and tighten the nuts (1) to 16 N.m (140 in. lbs.).
3. Engage the front cables to the equalizer.
4. Reconnect the parking brake lamp switch wire (2).
5. If installing a new parking brake lever remove the pin that comes on the lever when shipped.
6. If you are reinstalling the original park brake lever remove the lock out device at this time.
7. Install the occupant restraint controller. Refer to **INSTALLATION** .
8. Test the parking brake lever.
9. Install the center floor console. Refer to **INSTALLATION** .

SHOES

DESCRIPTION

DRUM IN HAT PARK BRAKES

Fig. 90: Identifying Brake Shoes

Courtesy of CHRYSLER LLC

Drum in hat park brakes are dual shoe, internal expanding units with an automatic self adjusting mechanism.

OPERATION

DRUM IN HAT PARK BRAKE

When the parking brake lever is pulled the brake cable pulls the brake shoes outward against the brake drum. When the brake lever is released the return springs attached to the brake shoes pull the shoes back to their original position.

REMOVAL

PARK BRAKE SHOES - DRUM IN HAT

Fig. 91: Identifying Rear Park Brake Shoes & Axle Shaft
Courtesy of CHRYSLER LLC

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the disc brake caliper. See **REMOVAL**.
4. Remove the disc brake rotor. See **REMOVAL**.
5. Remove the axle shaft (2). Refer to **REMOVAL**.

Fig. 92: Identifying Brake Shoes
Courtesy of CHRYSLER LLC

6. Disassemble the rear park brake shoes (1).

CLEANING

REAR DRUM IN HAT BRAKE

Clean the individual brake components, including the support plate exterior, with a water dampened cloth or with brake cleaner. Do not use any other cleaning agents. Remove light rust and scale from the brake shoe contact pads on the support plate with fine sandpaper.

INSPECTION

REAR DRUM IN HAT BRAKE

81a614d1

Fig. 93: Identifying Brake Shoes
Courtesy of CHRYSLER LLC

As a general rule, riveted brake shoes (1) should be replaced when worn to within 0.78 mm (1/32 in.) of the rivet heads. Bonded lining should be replaced when worn to a thickness of 1.6 mm (1/16 in.).

Examine the lining contact pattern to determine if the shoes are bent or the drum is tapered. The lining should exhibit contact across its entire width. Shoes exhibiting contact only on one side should be replaced and the drum checked for runout or taper.

Inspect the adjuster screw assembly. Replace the assembly if the star wheel or threads are damaged, or the components are severely rusted or corroded.

Discard the brake springs and retainer components if worn, distorted or collapsed. Also replace the springs if a brake drag condition had occurred. Overheating will distort and weaken the springs.

Inspect the brake shoe contact pads on the support plate, replace the support plate if any of the pads are worn or rusted through. Also replace the plate if it is bent or distorted.

INSTALLATION

PARK BRAKE SHOES - DRUM IN HAT

81a614d1

Fig. 94: Identifying Brake Shoes
Courtesy of CHRYSLER LLC

NOTE: On a new vehicle or after parking brake lining replacement, it is recommended that the parking brake system be conditioned prior to use. This is done by making one stop from 25 mph on dry pavement or concrete using light to moderate force on the parking brake lever.

1. Reassemble the rear park brake shoes (1).
2. Adjust the rear brake shoes (5). See **ADJUSTMENTS**.

81a614c1

Fig. 95: Identifying Rear Park Brake Shoes & Axle Shaft
Courtesy of CHRYSLER LLC

3. Install the axle shaft (2). Refer to **INSTALLATION**.
4. Install the disc brake rotor. See **INSTALLATION**.
5. Install the disc brake caliper. See **INSTALLATION**.

6. Install the tire and wheel assembly. Refer to **STANDARD PROCEDURE** .
7. Lower the vehicle.

ADJUSTMENTS

REAR DRUM IN HAT PARK BRAKE (ROTOR INSTALLED) USING ADJUSTMENT TOOL

Adjustment can be made with a standard brake gauge or with adjusting tool. Adjustment is performed with the complete brake assembly installed on the backing plate.

1. Be sure parking brake lever is fully released.
2. Raise vehicle so rear wheels can be rotated freely.
3. Remove plug from each access hole in brake support plates.
4. Insert adjusting tool through support plate access hole and engage tool in teeth of adjusting screw star wheel. See **Fig. 96**.

Fig. 96: Brake Adjustment
Courtesy of CHRYSLER LLC

2 - LEVER
3 - BRAKE SHOE WEB
4 - SCREWDRIVER
5 - ADJUSTING TOOL
6 - ADJUSTER SPRING

5. Rotate adjuster screw star wheel (move tool handle upward) until slight drag can be felt when wheel is rotated.
6. Push and hold adjuster lever away from star wheel with thin screwdriver.
7. Back off adjuster screw star wheel until brake drag is eliminated.
8. Repeat adjustment at opposite wheel. Be sure adjustment is equal at both wheels.
9. Install support plate access hole plugs.
10. Lower vehicle.
11. Apply park brake hand lever and make sure park brakes hold the vehicle stationary.
12. Release park brake hand lever.

REAR DRUM IN HAT PARK BRAKE (ROTOR REMOVED)

Under normal circumstances, the only time adjustment is required is when the shoes are replaced, removed for access to other parts, or when one or both rotors are replaced.

Adjustment can be made with a standard brake gauge or with adjusting tool. Adjustment is performed with the complete brake assembly installed on the backing plate.

CAUTION: Before adjusting the park brake shoes be sure that the park brake lever is in the fully released position. If park brake lever is not in the fully released position, the park brake shoes can not be accurately adjusted.

1. Raise vehicle.
2. Remove tire and wheel.
3. Remove disc brake caliper from caliper adapter. See **REMOVAL**.
4. Remove rotor from the axle shaft. See **REMOVAL**.

Fig. 97: Measuring Park Brake Drum Diameter
Courtesy of CHRYSLER LLC

NOTE: When measuring the brake drum diameter, the diameter should be measured in the center of the area in which the park brake shoes contact the surface of the brake drum.

Fig. 98: Reading Park Brake Drum Diameter
Courtesy of CHRYSLER LLC

1 - SPECIAL TOOL C-3919
2 - RULER

5. Using Brake Shoe Gauge, Special Tool C-3919 (1), or equivalent, **accurately** measure the inside diameter of the park brake drum portion of the rotor. See **Fig. 97**.
6. Using a ruler (2) that reads in 64th of an inch, accurately read the measurement of the inside diameter of the park brake drum from the special tool. See **Fig. 98**.

80b0987b

Fig. 99: Setting Gauge To Park Brake Shoe Measurement
Courtesy of CHRYSLER LLC

- | |
|--------------------------------------|
| 1 - RULER
2 - SPECIAL TOOL C-3919 |
|--------------------------------------|

7. Reduce the inside diameter measurement of the brake drum that was taken using Special Tool C-3919 (2) by 1/64 of an inch. Reset Gauge, Brake Shoe, Special Tool C-3919 (2) or the equivalent used, so that the outside measurement jaws are set to the reduced measurement. See **Fig. 99**.
8. Place Gauge, Brake Shoe, Special Tool C-3919 (2), or equivalent over the park brake shoes. The special tool must be located diagonally across at the top of one shoe and bottom of opposite shoe (widest point) of the park brake shoes.
9. Using the star wheel adjuster, adjust the park brake shoes until the lining on the park brake shoes just touches the jaws on the special tool.
10. Repeat step 8 above and measure shoes in both directions.
11. Install brake rotor on the axle shaft. See **INSTALLATION**.
12. Rotate rotor to verify that the park brake shoes are not dragging on the brake drum. If park brake shoes are dragging, remove rotor and back off star wheel adjuster one notch and recheck for brake shoe drag against drum. Continue with the previous step until brake shoes are not dragging on brake drum.
13. Install disc brake caliper on caliper adapter. See **INSTALLATION**.
14. Install wheel and tire.
15. Tighten the wheel mounting nuts in the proper sequence until all nuts are torqued to half the specified

torque. Then repeat the tightening sequence to the full specified torque of 129 N.m (95 ft. lbs.).

16. Lower vehicle.

CAUTION: Before moving vehicle, pump brake pedal several times to ensure the vehicle has a firm enough pedal to stop the vehicle.

NOTE: After parking brake lining replacement, it is recommended that the parking brake system be conditioned prior to use. This is done by making one stop from 25 mph on dry pavement or concrete using light to moderate force on the parking brake hand lever.

17. Road test the vehicle to ensure proper function of the vehicle's brake system.

Charging System - Liberty

CHARGING SYSTEM

DESCRIPTION

CHARGING SYSTEM

The charging system consists of:

Generator

Electronic Voltage Regulator (EVR) circuitry within the Powertrain Control Module (PCM)

Ignition switch

Battery (refer to **BATTERY SYSTEM - SERVICE INFORMATION** article for information)

Battery temperature sensor

Generator Lamp (if equipped)

Check Gauges Lamp (if equipped)

Wiring harness and connections (refer to **SYSTEM WIRING DIAGRAMS** article for information)

OPERATION

CHARGING SYSTEM

Fig. 1: CHARGING SYSTEM
Courtesy of CHRYSLER LLC

- 1 - PCM
- 2 - TIPM
- 3 - Battery

- 4 - Generator
- 5 - Feed Back Circuit B+
- 6 - Control Circuit
- 7 - Battery Sense

On gasoline powered engines, the charging system is turned on and off with the PCM (Powertrain Control Module) and ignition switch with engine running. On diesel powered engines, the charging system is turned on and off with the ECM (Engine Control Module) and ignition switch with engine running. The field circuit will not be energized until engine is running and ignition switch on. This voltage is connected through the PCM and supplied to one of the generator field terminals (Gen. Source B+) at the back of the generator. The generator is internally grounded. The generator regulates the field using pin-1 of the field connector (high side driver).

The generator is driven by the engine through a serpentine belt and pulley, or a decoupler pulley arrangement.

The PCM, or ECM receives a voltage input from the generator (5) and also a battery voltage input (7) from the TIPM (Totally Integrated Power Module), it then compares the voltages to the desired voltage programmed in the EVR (Electronic Voltage Regulator) software, and, if there is a difference it sends a signal to the generator EVR circuit to increase or decrease output. It uses a Pulse Width Modulation (PWM) to send signals to the generator circuitry to control the amount of output from the generator. The amount of DC current produced by the generator is controlled by the EVR circuitry contained within the generator.

All vehicles are equipped with On-Board Diagnostics (OBD). All OBD-sensed systems, including EVR circuitry, are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for certain failures it detects.

The Check Gauges Lamp (if equipped) monitors: **charging system voltage**, engine coolant temperature and engine oil pressure. If an extreme condition is indicated, the lamp will be illuminated. This is done as reminder to check the three gauges. The lamp is located on the instrument panel.

Voltage is monitored at the B+ terminal stud to insure it is connected. If the B+ cable is loose, the PCM will shut down generator field. Because of this new feature, pin-2 of the field connector is internally connected to the B+ terminal.

The generator used with diesel engines is internally regulated. The generator and ECM communicate for diagnostics, etc. If the generator regulator becomes disconnected from the ECM, it will still operate, but in a default mode.

DIAGNOSIS AND TESTING

CHARGING SYSTEM

The following procedures may be used to diagnose the charging system if:

- the check gauges lamp (if equipped) is illuminated with the engine running
- the voltmeter (if equipped) does not register properly
- an undercharged or overcharged battery condition occurs.

Remember that an undercharged battery is often caused by:

- accessories being left on with the engine not running
- a faulty or improperly adjusted switch that allows a lamp to stay on.

INSPECTION

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the On-Board Diagnostic (OBD) system. Some charging system circuits are checked continuously, and some are checked only under certain conditions.

To perform a complete test of the charging system, use a diagnostic scan tool. Perform the following inspections before attaching the scan tool.

1. Inspect the battery condition. Refer to **BATTERY SYSTEM - SERVICE INFORMATION** article for procedures.
2. Inspect condition of battery cable terminals, battery posts, connections at engine block, starter solenoid and relay. They should be clean and tight. Repair as required.
3. Inspect all fuses in both the fuse block and Power Distribution Center (PDC) for tightness in receptacles. They should be properly installed and tight. Repair or replace as required.
4. Inspect generator mounting bolts for tightness. Replace or tighten bolts if required. Refer to **GENERATOR** for torque specifications.
5. Inspect generator drive belt condition and tension. Tighten or replace belt as required. Refer to Belt Tension Specifications in **SPECIFICATIONS** .
6. Inspect automatic belt tensioner (if equipped). Refer to **COOLING** article for information.
7. Inspect generator electrical connections at generator field, battery output, and ground terminal (if equipped). Also check generator ground wire connection at engine (if equipped). They should all be clean and tight. Repair as required.

GENERATOR

DESCRIPTION

GENERATOR

The generator is belt-driven by the engine using a serpentine type drive belt. It is serviced only as a complete assembly. If the generator fails for any reason, the entire assembly must be replaced.

OPERATION

GENERATOR

As the energized rotor begins to rotate within the generator, the spinning magnetic field induces a current into the windings of the stator coil. Once the generator begins producing sufficient current, it also provides the current needed to energize the rotor.

The stator winding connections deliver the induced AC current to 3 positive and 3 negative diodes for rectification. From the diodes, rectified DC current is delivered to the vehicle electrical system through the generator battery terminal.

Although the generators appear the same externally, different generators with different output ratings are used on this vehicle. Be certain that the replacement generator has the same output rating and part number as the original unit. Refer to **SPECIFICATIONS** and see Generator Ratings for amperage ratings and part numbers.

Noise emitting from the generator may be caused by: worn, loose or defective bearings; a loose or defective drive pulley; incorrect, worn, damaged or misadjusted fan drive belt; loose mounting bolts; a misaligned drive pulley or a defective stator or diode.

REMOVAL

REMOVAL - 2.8L DIESEL

Fig. 4: Identifying Generator & Mounting Bolts
Courtesy of CHRYSLER LLC

CAUTION: Disconnect negative cable from battery before removing battery output wire from generator. Failure to do so can result in injury.

1. Disconnect and isolate negative battery cable at battery.

CAUTION: Never force a belt over a pulley rim using a screwdriver. The synthetic fiber of the belt can be damaged.

CAUTION: When installing a serpentine accessory drive belt, the belt **MUST** be routed correctly. The water pump will be rotating in the wrong

direction if the belt is installed incorrectly, causing the engine to overheat. Refer to belt routing label in engine compartment, or refer to Belt Schematics in COOLING article .

2. Remove generator drive belt. Refer to COOLING article for procedures.
3. Unsnap plastic protective cover from B+ mounting stud.
4. Remove B+ terminal mounting nut at top of generator.
5. Disconnect field wire electrical connector at rear of generator by pushing on connector tab.
6. Remove four generator mounting bolts (2).
7. Remove generator (1) from vehicle.

REMOVAL - 3.7L

CAUTION: Disconnect negative cable from battery before removing battery output wire from generator. Failure to do so can result in injury.

1. Disconnect and isolate negative battery cable at battery.

CAUTION: Never force a belt over a pulley rim using a screwdriver. The synthetic fiber of the belt can be damaged.

CAUTION: When installing a serpentine accessory drive belt, the belt **MUST** be routed correctly. The water pump will be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to

overheat. Refer to belt routing label in engine compartment, or refer to Belt Schematics in COOLING article .

2. Remove generator drive belt. Refer to COOLING article for procedures.
3. Unsnap plastic protective cover from B+ mounting stud.
4. Remove B+ terminal mounting nut at top of generator.
5. Disconnect field wire electrical connector at rear of generator by pushing on connector tab.
6. Remove one vertical generator mounting bolt (2) and two horizontal mounting bolts (3) and (4).
7. Remove generator (1) from vehicle.

INSTALLATION

INSTALLATION - 2.8L DIESEL

Fig. 6: Identifying Generator & Mounting Bolts
Courtesy of CHRYSLER LLC

1. Position generator (1) to engine and install four mounting bolts (2). Tighten all four bolts to 54 N.m (40 ft. lbs.).
2. Snap field wire connector into rear of generator.
3. Install B+ terminal and nut to generator mounting stud. Tighten nut to 13 N.m (115 in. lbs.)
4. Snap plastic protective cover to B+ terminal.

CAUTION: Never force a belt over a pulley rim using a screwdriver. The synthetic fiber of the belt can be damaged.

CAUTION: When installing a serpentine accessory drive belt, the belt MUST be

routed correctly. The water pump will be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat. Refer to belt routing label in engine compartment, or refer to Belt Schematics in COOLING article .

5. Install drive belt. Refer to COOLING article for belt routing, belt adjustment and bolt tightening procedures.
6. Install negative battery cable to battery.

INSTALLATION - 3.7L

Fig. 7: Identifying Generator & Mounting Bolts
Courtesy of CHRYSLER LLC

1. Position generator (1) to engine and install three mounting bolts (2), (3) and (4). Tighten two horizontal mounting bolts (3) and (4) to 57 N.m (42 ft. lbs.). Tighten vertical mounting bolt (2) to 40 N.m (29 ft. lbs.)
2. Snap field wire connector into rear of generator.
3. Install B+ terminal and nut to generator mounting stud. Tighten nut to 13 N.m (115 in. lbs.)
4. Snap plastic protective cover to B+ terminal.

CAUTION: Never force a belt over a pulley rim using a screwdriver. The synthetic fiber of the belt can be damaged.

CAUTION: When installing a serpentine accessory drive belt, the belt **MUST** be routed correctly. The water pump will be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat. Refer to belt routing label in engine compartment, or refer

to Belt Schematics in COOLING article .

5. Install drive belt. Refer to COOLING article for belt routing, belt adjustment and bolt tightening procedures.
6. Install negative battery cable to battery.

PULLEY - GENERATOR DECOUPLER

DESCRIPTION

GENERATOR DECOUPLER

Fig. 8: Generator Decoupler Pulley
Courtesy of CHRYSLER LLC

The generator decoupler is used only with certain engines. The decoupler is used in place of the standard generator drive pulley.

OPERATION

GENERATOR DECOUPLER

The generator decoupler is used only with certain engines. The decoupler is a one-way clutch designed to help reduce belt tension fluctuation, vibration, reduce fatigue loads, improve belt life, reduce hubloads on components, and reduce noise. Dry operation is used (no grease or lubricants). The decoupler is not temperature sensitive and also has a low sensitivity to electrical load. The decoupler is a non-serviceable item and is to be replaced as an assembly. See **Fig. 8**.

DIAGNOSIS AND TESTING

GENERATOR DECOUPLER

CONDITION	POSSIBLE CAUSES	CORRECTION
Does not drive generator (generator not charging)	Internal failure -	Replace decoupler -
Noise coming from decoupler	Internal failure	Replace decoupler

REMOVAL

GENERATOR DECOUPLER

The generator decoupler is used only with certain engines.

3. **Do not use an adjustable, ratcheting "click type" torque wrench. Most "click type" wrenches will only allow torque to be applied in a clockwise rotation. Use a dial-type or beam-type wrench.** Tighten in counterclockwise rotation and tighten to 110 N.m (81 ft. lbs.).
4. Install accessory drive belt, and generator. Refer to **INSTALLATION** .
5. Connect negative battery cable.

REGULATOR - VOLTAGE

DESCRIPTION

ELECTRONIC VOLTAGE REGULATOR

The Electronic Voltage Regulator (EVR) is not a separate component. It is actually a voltage regulating circuit located within the Powertrain Control Module (PCM). The EVR is not serviced separately. If replacement is necessary, the PCM must be replaced.

OPERATION

ELECTRONIC VOLTAGE REGULATOR

The amount of DC current produced by the generator is controlled by EVR circuitry contained within the Powertrain Control Module (PCM). This circuitry is connected in series with the generators second rotor field terminal and its ground.

Voltage is regulated by cycling the ground path to control the strength of the rotor magnetic field. The EVR circuitry monitors system line voltage (B+) and battery temperature. It then determines a target charging voltage. If sensed battery voltage is 0.5 volts or lower than the target voltage, the PCM grounds the field winding until sensed battery voltage is 0.5 volts above target voltage. A circuit in the PCM cycles the ground side of the generator field up to 100 times per second (100Hz), but has the capability to ground the field control wire 100% of the time (full field) to achieve the target voltage. If the charging rate cannot be monitored (limp-in), a duty cycle of 25% is used by the PCM in order to have some generator output. Also refer to **OPERATION** for additional information.

DIAGNOSIS AND TESTING

B1230-PTS SENSOR 8 CIRCUIT PERFORMANCE

Circuit Schematic

SENSOR-PARK ASSIST NO. 8 (PARKTRONICS)

MODULE-PARK ASSIST C2 (PARKTRONICS)

01616500

Fig. 1: PTS Sensor 8 Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS**.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

Monitor Conditions

When Monitored:

During Reverse and during self test in Forward between 18 km/h (11 mph) and 40 km/h (25 mph).

Set Conditions

- **Set Condition:**

If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

Possible Causes

Possible Causes
(D701) PTS SENSOR NO. 8 SIGNAL CIRCUIT SHORT TO GROUND
(D701) PTS SENSOR NO. 8 SIGNAL CIRCUIT SHORT TO BATTERY
(D701) PTS SENSOR NO. 8 SIGNAL CIRCUIT OPEN
PTS SENSOR NO. 8
PARK ASSIST MODULE

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK PARK ASSIST SENSOR NO. 8 FOR INTERNAL SHORT

819d4552

Fig. 2: Checking Park Assist Sensor No. 8
Courtesy of CHRYSLER LLC

Disconnect Park Assist Sensor No. 8.

With the scan tool, read Park Assist Module DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 3.

No

Replace Park Assist Sensor No. 8.

Perform **BODY VERIFICATION TEST - VER 1** .

3. CHECK THE (D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT FOR A SHORT TO

GROUND

Fig. 3: Checking Park Assist Sensor No. 8 Signal Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Park Assist module harness connectors C1 and C2.

Using a 12-volt test light connected to 12-volts check the (D701) Park Assist Sensor No. 8 Signal circuit at the Park Assist module C2 harness connector.

Does the test light illuminate brightly?

Yes

Repair the (D701) Park Assist Sensor No. 8 Signal circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. **CHECK THE (D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**

Fig. 4: Checking Park Assist Sensor No. 8 Signal Circuit
Courtesy of CHRYSLER LLC

Turn the ignition on.

Using a 12-volt test light connected to ground check the (D701) Park Assist Sensor No. 8 Signal circuit at the Park Assist module C2 harness connector for a short to battery.

Does the test light illuminate brightly?

Yes

Repair the (D701) Park Assist Sensor No. 8 Signal circuit for a short to battery.

Perform **BODY VERIFICATION TEST - VER 1**.

No

Go To 5.

5. CHECK THE (D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT FOR AN OPEN

Fig. 5: Measuring Resistance Of Park Assist Sensor No. 8 Signal Circuit
Courtesy of CHRYSLER LLC

Measure the resistance of the (D701) Park Assist Sensor No. 8 Signal circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor No. 8 harness connector.

Is the resistance below 5.0 ohms?

No

Repair the (D701) Park Assist Sensor No. 8 Signal circuit for an open.
 Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Replace the Park Assist Module in accordance with service information.
 Perform **BODY VERIFICATION TEST - VER 1** .

B1231-PTS SENSOR 8 CIRCUIT LOW

Circuit Schematic

0161a705

Fig. 6: PTS Sensor 8 Circuit Schematic
 Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

Monitor Conditions

When Monitored:

While the vehicle is in reverse at speeds less than 16 km/h (10 mph).

Set Conditions

- **Set Condition:**

Sensor ring down time is too short (700 [micro]secs).

Possible Causes

Possible Causes
(D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT SHORTED TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT
(D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT SHORTED TO (X779) PARK ASSIST DISPLAY GROUND CIRCUIT
(D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT SHORTED TO (Z920) PARK ASSIST MODULE GROUND CIRCUIT
(D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT SHORTED TO GROUND
PARK ASSIST SENSOR NO. 8
PARK ASSIST MODULE

Diagnostic Test

1. **CHECK FOR ACTIVE DTC**

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 2.

No

The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform **BODY VERIFICATION TEST - VER 1**.

2. CHECK PARK ASSIST SENSOR NO. 8 FOR A SHORT TO GROUND

819d4552

Fig. 7: Checking Park Assist Sensor No. 8
Courtesy of CHRYSLER LLC

Shift the transmission into park.

With the scan tool, erase DTCs.

Turn the ignition off.

Disconnect Park Assist Sensor No. 8.

Turn the ignition on.

Shift the transmission into reverse.

With the scan tool, read Park Assist Module DTCs.

Does the scan tool display this DTC as active?

Yes

Go To 3.

No

Replace Park Assist Sensor No. 8 in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

3. **CHECK THE (D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT FOR A SHORT TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT**

Fig. 8: Measuring Resistance Between Park Assist Sensor No. 8 Signal Circuit And Park Assist Sensor Ground Circuit

Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Park Assist Module harness connector.

Measure the resistance between the (D701) Park Assist Sensor No. 8 Signal circuit and the (X750) Park Assist Sensor Ground circuit.

Is the resistance below 10K ohms?

Yes

Repair the (D701) Park Assist Sensor No. 8 Signal circuit for a short to the (X750) Park Assist Sensor Ground circuit.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. **CHECK THE (D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT FOR A SHORT TO (X779) PARK ASSIST DISPLAY GROUND CIRCUIT**

Fig. 9: Measuring Resistance Between Park Assist Sensor No. 8 Signal Circuit And Park Assist Display Ground Circuit

Courtesy of CHRYSLER LLC

Measure the resistance between the (D701) Park Assist Sensor No. 8 Signal circuit and the (X779) Park Assist Display Ground circuit.

Is the resistance below 10K ohms?

Yes

Repair the (D701) Park Assist Sensor No. 8 Signal circuit for a short to the (X779) Park Assist Display Ground circuit.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 5.

5. **CHECK THE (D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT FOR A SHORT TO (Z920) PARK ASSIST MODULE GROUND CIRCUIT**

819d4715

Fig. 10: Measuring Resistance Between Park Assist Sensor No. 8 Signal Circuit And Park Assist Module Ground Circuit

Courtesy of CHRYSLER LLC

Measure the resistance between the (D701) Park Assist Sensor No. 8 Signal circuit and the (Z920) Park Assist Module Ground circuit.

Is the resistance below 10K ohms?

Yes

Repair the (D701) Park Assist Sensor No. 8 Signal circuit for a short to the (Z920) Park Assist Module Ground circuit.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 6.

6. CHECK THE (D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT FOR A SHORT TO GROUND

Fig. 11: Checking Park Assist Sensor No. 8 Signal Circuit

Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (D701) Park Assist Sensor No. 8 Signal circuit.

Is the resistance below 10K ohms?

Yes

Repair the (D701) Park Assist Sensor No. 8 Signal circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Park Assist Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1233-PTS SENSOR 8 RING TIME TOO SHORT

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

Monitor Conditions

When Monitored:

While the vehicle is in reverse for speeds less than 16 km/h (10 mph).

Set Conditions

- **Set Condition:**

Sensor ring down time exceeds limit (greater than 1450 [micro]secs).

Possible Causes

Possible Causes
PARK ASSIST SENSOR NO. 8

Diagnostic Test

1. **CHECK FOR ACTIVE DTC**

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into Reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Is this DTC active?

Yes

Go To 2.

No

The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform **BODY VERIFICATION TEST - VER 1** .

2. REPLACE PARK ASSIST SENSOR NO. 8

View Repair

Repair

Replace Park Assist Sensor No. 8 in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B1234-PTS SENSOR 8 RING TIME TOO LONG

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

Monitor Conditions

When Monitored:

While the vehicle is in reverse for speeds less than 16 km/h (10 mph).

Set Conditions

- **Set Condition:**

Data line stuck at 0.

Possible Causes

Possible Causes
PARK ASSIST SENSOR NO. 8

Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

Monitor Conditions

When Monitored:

During Reverse and during self test in Forward between 18 km/h (11 mph) and 40 km/h (25 mph).

Set Conditions

- **Set Condition:**

If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

Possible Causes

Possible Causes
(D703) PTS SENSOR NO. 9 SIGNAL CIRCUIT SHORT TO GROUND
(D703) PTS SENSOR NO. 9 SIGNAL CIRCUIT SHORT TO BATTERY
(D703) PTS SENSOR NO. 9 SIGNAL CIRCUIT OPEN
PTS SENSOR NO. 9
PARK ASSIST MODULE

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Does the scan tool display this DTC as active?

Yes

Go To step 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK PARK ASSIST SENSOR NO. 9 FOR INTERNAL SHORT

819d4a58

Fig. 13: Checking Park Assist Sensor No. 9
Courtesy of CHRYSLER LLC

Disconnect Park Assist Sensor No. 9.

With the scan tool, read Park Assist Module DTCs.

Does the scan tool display this DTC as active?

Yes

Go To step 3.

No

Replace Park Assist Sensor No. 9.

Perform **BODY VERIFICATION TEST - VER 1** .

3. **CHECK THE (D703) PARK ASSIST SENSOR NO. 9 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 14: Checking Park Assist Sensor No. 9 Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Park Assist module harness connectors C1 and C2.

Using a 12-volt test light connected to 12-volts check the (D703) Park Assist Sensor No. 9 Signal circuit at the Park Assist module C2 harness connector.

Does the test light illuminate brightly?

Yes

Repair the (D703) Park Assist Sensor No. 9 Signal circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To step 4.

4. **CHECK THE (D703) PARK ASSIST SENSOR NO. 9 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**

Fig. 15: Checking Park Assist Sensor No. 9 Signal Circuit
Courtesy of CHRYSLER LLC

Turn the ignition on.

Using a 12-volt test light connected to ground check the (D703) Park Assist Sensor No. 9 Signal circuit at the Park Assist module C2 harness connector for a short to battery.

Does the test light illuminate brightly?

Yes

Repair the (D703) Park Assist Sensor No. 9 Signal circuit for a short to battery.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To step 5.

5. **CHECK THE (D703) PARK ASSIST SENSOR NO. 9 SIGNAL CIRCUIT FOR AN OPEN**

Fig. 16: Measuring Resistance Of Park Assist Sensor No. 9 Signal Circuit
Courtesy of CHRYSLER LLC

Measure the resistance of the (D703) Park Assist Sensor No. 9 Signal circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor No. 9 harness connector.

Is the resistance below 5.0 ohms?

No

Repair the (D703) Park Assist Sensor No. 9 Signal circuit for an open.
 Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Replace the Park Assist Module in accordance with service information.
 Perform **BODY VERIFICATION TEST - VER 1** .

B1236-PTS SENSOR 9 CIRCUIT LOW

Circuit Schematic

(D710) PTS SENSOR NO. 11 SIGNAL CIRCUIT SHORT TO GROUND
(D710) PTS SENSOR NO. 11 SIGNAL CIRCUIT SHORT TO BATTERY
(D710) PTS SENSOR NO. 11 SIGNAL CIRCUIT OPEN
PTS SENSOR NO. 11
PARK ASSIST MODULE

Diagnostic Test

1. **TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Does the scan tool display this DTC as active?

Yes

Go To step 2.

No

The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform **BODY VERIFICATION TEST - VER 1** .

2. CHECK PARK ASSIST SENSOR NO. 11 FOR INTERNAL SHORT

819d5c21

Fig. 35: Checking Park Assist Sensor No. 11
Courtesy of CHRYSLER LLC

Disconnect Park Assist Sensor No. 11.

With the scan tool, read Park Assist Module DTCs.

Does the scan tool display this DTC as active?

Yes

Go To step 3.

No

Replace Park Assist Sensor No. 11.

Perform **BODY VERIFICATION TEST - VER 1** .

3. CHECK THE (D710) PARK ASSIST SENSOR NO. 11 SIGNAL CIRCUIT FOR A SHORT TO

GROUND

Fig. 36: Checking Park Assist Sensor No. 11 Signal Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Park Assist module harness connectors C1 and C2.

Using a 12-volt test light connected to 12-volts check the (D710) Park Assist Sensor No. 11 Signal circuit at the Park Assist module C2 harness connector.

Does the test light illuminate brightly?

Yes

Repair the (D710) Park Assist Sensor No. 11 Signal circuit for a short to ground.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To step 4.

4. CHECK THE (D710) PARK ASSIST SENSOR NO. 11 SIGNAL CIRCUIT FOR A SHORT TO

BATTERY

Fig. 37: Checking Park Assist Sensor No. 11 Signal Circuit
Courtesy of CHRYSLER LLC

Turn the ignition on.

Using a 12-volt test light connected to ground check the (D710) Park Assist Sensor No. 11 Signal circuit at the Park Assist module C2 harness connector for a short to battery.

Does the test light illuminate brightly?

Yes

Repair the (D710) Park Assist Sensor No. 11 Signal circuit for a short to battery.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To step 5.

5. **CHECK THE (D710) PARK ASSIST SENSOR NO. 11 SIGNAL CIRCUIT FOR AN OPEN**

Fig. 38: Measuring Resistance Of Park Assist Sensor No. 11 Signal Circuit
Courtesy of CHRYSLER LLC

Measure the resistance of the (D710) Park Assist Sensor No. 11 Signal circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor No. 11 harness connector.

Is the resistance below 5.0 ohms?

No

Repair the (D710) Park Assist Sensor No. 11 Signal circuit for an open.
 Perform **BODY VERIFICATION TEST - VER 1** .

Yes

Replace the Park Assist Module in accordance with service information.
 Perform **BODY VERIFICATION TEST - VER 1** .

B127C-PTS SENSOR 11 CIRCUIT LOW

Circuit Schematic

01010609

Fig. 39: PTS Sensor 11 Circuit Schematic
Courtesy of CHRYSLER LLC

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

Monitor Conditions

When Monitored:

While the vehicle is in reverse for speeds less than 16km/h (10 mph).

Set Conditions

- **Set Condition:**

Sensor ring down time is too short (700 [micro]secs).

Possible Causes

Possible Causes
(D710) PARK ASSIST SENSOR NO. 11 SIGNAL CIRCUIT SHORTED TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT
(D710) PARK ASSIST SENSOR NO. 11 SIGNAL CIRCUIT SHORTED TO (X779) PARK ASSIST DISPLAY GROUND CIRCUIT

Turn the ignition off.

Disconnect the Park Assist Module harness connector.

Measure the resistance between the (D710) Park Assist Sensor No. 11 Signal circuit and the (X750) Park Assist Sensor Ground circuit.

Is the resistance below 10K ohms?

Yes

Repair the (D710) Park Assist Sensor No. 11 Signal circuit for a short to the (X750) Park Assist Sensor Ground circuit.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. **CHECK THE (D710) PARK ASSIST SENSOR NO. 11 SIGNAL CIRCUIT FOR A SHORT TO (X779) PARK ASSIST DISPLAY GROUND CIRCUIT**

Fig. 43: Measuring Resistance Between Park Assist Sensor No. 11 Signal Circuit And Park Assist Module Ground Circuit

Courtesy of CHRYSLER LLC

Measure the resistance between the (D710) Park Assist Sensor No. 11 Signal circuit and the (Z920) Park Assist Module Ground circuit.

Is the resistance below 10K ohms?

Yes

Repair the (D710) Park Assist Sensor No. 11 Signal circuit for a short to the (Z920) Park Assist Module Ground circuit.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 6.

- 6. CHECK THE (D710) PARK ASSIST SENSOR NO. 11 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 44: Checking Park Assist Sensor No. 11 Signal Circuit
 Courtesy of CHRYSLER LLC

Measure the resistance between ground and the (D710) Park Assist Sensor No. 11 Signal circuit and ground.

Is the resistance below 10K ohms?

Yes

Repair the (D710) Park Assist Sensor No. 11 Signal circuit for a short to ground.
 Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace the Park Assist Module in accordance with the service information.
 Perform **BODY VERIFICATION TEST - VER 1** .

B127E-PTS SENSOR 11 RING TIME TOO SHORT

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

Monitor Conditions

When Monitored:

While the vehicle is in reverse for speeds less than 16 km/h (10 mph).

Set Conditions

- **Set Condition:**

Sensor ring down time exceeds limit (greater than 1450 [micro]secs).

Possible Causes

Possible Causes
PARK ASSIST SENSOR NO. 11

Diagnostic Test

1. **CHECK FOR ACTIVE DTC**

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into Reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Is this DTC active?

Yes

Go To 2.

No

The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform **BODY VERIFICATION TEST - VER 1** .

2. **REPLACE THE PARK ASSIST SENSOR N0. 11**

View Repair

Repair

Replace Park Assist Sensor No. 11 in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B127F-PTS SENSOR 11 RING TIME TOO LONG

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

Monitor Conditions

When Monitored:

While the vehicle is in reverse for speeds less than 16km/h (10 mph).

Set Conditions

- **Set Condition:**

Data line stuck at 0.

View Repair

Repair

Replace Park Assist Sensor No. 11 in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B210D-BATTERY VOLTAGE LOW

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

When Monitored:

With the ignition on.

Set Conditions

- **Set Condition:**

Battery voltage less than 9 volts for approximately 5 to 6 seconds.

Possible Causes

Possible Causes
RESISTANCE IN THE BATTERY POSITIVE CIRCUIT RESISTANCE IN THE GENERATOR CASE GROUND GENERATOR OPERATION (K20) GENERATOR FIELD CONTROL CIRCUIT OPEN (K20) GENERATOR FIELD CONTROL CIRCUIT SHORTED TO GROUND GROUND CIRCUIT OPEN PCM

Diagnostic Test

1. CHECK FOR ANY POWERTRAIN CONTROL MODULES DTCS

NOTE: Make sure the Battery is in good condition. Using the Midtronics Battery Tester, test the Battery before continuing.

NOTE: Inspect the vehicle for after market accessories that may exceed the Generator System output.

NOTE: Make sure the generator drive belt is in good operating condition.

NOTE: Inspect the fuses in the TIPM. If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.

Turn the ignition on.

With the scan tool, read active PCM DTC's.

Does the scan tool display any active PCM DTC's?

Yes

Refer to **DIAGNOSIS AND TESTING** for the diagnostic test procedure.

No

Check the above conditions that can cause a low voltage condition. Repair as necessary.
Perform **BODY VERIFICATION TEST - VER 1** .

B210E-BATTERY VOLTAGE HIGH

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

While the vehicle is in reverse for speeds less than 16km/h (10 mph).

Set Conditions

- **Set Condition:**

Park Assist Module supply voltage greater than 16.0 volts.

Possible Causes

Possible Causes
VEHICLE CHARGING SYSTEM
PARK ASSIST MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Is this DTC active?

Yes

Go To 2.

No

The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform **BODY VERIFICATION TEST - VER 1** .

2. VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM

NOTE: Troubleshoot any PCM charging/cranking DTCs before proceeding.

NOTE: Make sure the battery is fully charged.

Are any charging system DTCs present?

Yes

Refer to **DIAGNOSIS AND TESTING** .

No

Replace the Park Assist Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

B2126-SENSOR SUPPLY VOLTAGE LOW

Circuit Schematic

81610306

(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
PARK ASSIST SENSOR
PARK ASSIST MODULE

Diagnostic Test

1. **CHECK FOR AN ACTIVE DTC**

Turn the ignition on.

Apply the park brake.

Shift the transmission into Reverse.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

With the scan tool, read DTCs.

Is this DTC active?

Yes

Go To 2.

No

The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform **BODY VERIFICATION TEST - VER 1**.

2. CHECK EACH PARK ASSIST SENSOR FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect one Park Assist Sensor.

Turn the ignition on.

With the scan tool, read Park Assist Module DTCs. If this DTC is still active, repeat this procedure by disconnecting another park assist sensor. However, if this DTC changes from active to stored, or if all four sensors have been disconnected, proceed as follows:

Is this DTC still active?

Yes

Go To 3.

No

Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1**.

3. CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT

Fig. 46: Measuring Resistance Between Park Assist Sensor Supply Circuit And Park Assist Sensor Ground Circuit
 Courtesy of CHRYSLER LLC

NOTE: Perform this test with all Park Assist Sensors disconnected.

Turn the ignition off.

Disconnect the Park Assist Module harness connector.

Measure the resistance between the (X700) Park Assist Sensor Supply circuit and the (X750) Park Assist Sensor Ground circuit.

Is the resistance below 10K ohms?

Yes

Repair the (X700) Park Assist Sensor Supply circuit for a short to the (X750) Park Assist Sensor Ground circuit.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go To 4.

4. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO (X779) PARK ASSIST DISPLAY GROUND CIRCUIT**

Fig. 47: Measuring Resistance Between Park Assist Sensor Supply Circuit And Park Assist Display Ground Circuit

Ignition status = 7h

Possible Causes

Possible Causes
NO COMMUNICATION WITH INSTRUMENT CLUSTER DTCS STORED OR ACTIVE IN THE INSTRUMENT CLUSTER ACTIVE DTCS IN THE TIPM PARK ASSIST MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Is this DTC active?

Yes

Go To 2.

No

The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform **BODY VERIFICATION TEST - VER 1**.

2. INSTRUMENT CLUSTER IS ACTIVE ON THE CAN C INTERIOR BUS

With the scan tool, select ECU View.

Verify that the Instrument Cluster is active on the bus.

Is the Instrument Cluster active on the bus?

Yes

Go To 3.

No

(Refer to **DIAGNOSIS AND TESTING**) for No Response diagnostic procedures.

Perform **BODY VERIFICATION TEST - VER 1**.

3. DTCS STORED OR ACTIVE IN THE INSTRUMENT CLUSTER

Check for Ignition Switch DTCs in the Instrument Cluster.

Are any DTCs active or stored in the Instrument Cluster?

Yes

Refer to the appropriate article and perform the diagnostics for the DTCs.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Go to 4.

4. **ACTIVE DTCS IN THE TIPM**

With the scan tool, select ECU View and select TIPM.

With the scan tool, read active DTCs.

Are any Communication DTCs active in the TIPM Park Assist System?

Yes

Refer to the appropriate article and perform the diagnostics for the DTCs.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Replace and program the Park Assist Module in accordance with the Service Information.

Perform **BODY VERIFICATION TEST - VER 1** .

The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken

wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform **BODY VERIFICATION TEST - VER 1**.

2. CHECK THE (D777) PARK ASSIST DISPLAY SIGNAL CIRCUIT FOR AN OPEN

Fig. 56: Measuring Resistance Of Park Assist Display Signal Circuit
Courtesy of CHRYSLER LLC

Turn the ignition off.

Disconnect the Park Assist Module harness connector.

Disconnect the Park Assist Display Module harness connector.

Measure the resistance of the (D777) Park Assist Display Signal circuit between the Park Assist Module harness connector and the Park Assist Display harness connector.

Is the resistance below 10.0 ohms?

Yes

Go To 3.

No

Repair the (D777) Park Assist Display Signal circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1**.

3. CHECK THE (X777) PARK ASSIST DISPLAY SUPPLY CIRCUIT FOR AN OPEN

Fig. 57: Measuring Resistance Of Park Assist Display Supply Circuit
Courtesy of CHRYSLER LLC

Measure the resistance of the (X777) Park Assist Display Supply circuit between the Park Assist Module harness connector and the Park Assist Display harness connector.

Is the resistance below 10.0 ohms?

Yes

Go To 4.

No

Repair the (X777) Park Assist Display Supply circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1**.

4. CHECK THE (X779) PARK ASSIST DISPLAY GROUND CIRCUIT FOR AN OPEN

Fig. 58: Checking Park Assist Display Ground Circuit
 Courtesy of CHRYSLER LLC

Using a 12-volt test light connected to 12-volts check the (X779) Park Assist Display Ground circuit at the Park Assist Display harness connector.

Does the test light illuminate brightly?

Yes

Go To 5.

No

Repair the (X779) Park Assist Display Ground circuit for an open.

Perform **BODY VERIFICATION TEST - VER 1**.

5. **CHECK THE OPERATION OF THE PARK ASSIST DISPLAY**

Replace the Park Assist Display in accordance with the service information.

Reconnect the Park Assist Module harness connector.

Turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display U1101-LOST COMMUNICATION WITH PTS DISPLAY?

Yes

Replace the Park Assist Module in accordance with the service information.

Perform **BODY VERIFICATION TEST - VER 1** .

No

Test Complete.

Perform **BODY VERIFICATION TEST - VER 1** .

CHIME/BUZZER - SERVICE INFORMATION

DESCRIPTION

CHIME WARNING SYSTEM

81d35ce3

Fig. 1: Chime Warning System
Courtesy of CHRYSLER LLC

A chime warning system is standard factory-installed equipment. The chime warning system uses an electromechanical transducer and an electromechanical relay that are soldered onto the electronic circuit board inside of the ElectroMechanical Instrument Cluster (EMIC) (1) to provide audible indications of various vehicle conditions that may require the attention of the vehicle operator or occupants. The EMIC also includes the hardware and software necessary to serve as the electronic body control module and is sometimes referred to as the Cab Compartment Node or CCN.

The electromechanical transducer generates beep tones and chime tones, while the electromechanical relay generates click tones to emulate the sounds associated with conventional turn signal and hazard warning flasher operation. The microprocessor-based EMIC utilizes electronic **chime request** messages received from other modules in the vehicle over the Controller Area Network (CAN) data bus and the Local Interface Network (LIN) data bus along with hard wired inputs to monitor many sensors and switches throughout the vehicle. In response to those inputs, the circuitry and programming of the EMIC allow it to control the audible outputs that

are produced through its on-board transducer and relay.

The EMIC is capable of producing the following audible outputs:

- **Slow Rate Repetitive Click** - Repeated **click** tones that are issued at a slow rate of about 90 clicks per minute.
- **Fast Rate Repetitive Click** - Repeated **click** tones that are issued at a fast rate of more than about 180 clicks per minute.
- **Single Chime Tone** - A single **chime** tone.
- **Slow Rate Repetitive Chime** - Repeated **chime** tones that are issued at a slow rate of about 50 chimes per minute.
- **Fast Rate Repetitive Chime** - Repeated **chime** tones that are issued at a fast rate of about 180 chimes per minute.

Hard wired circuitry connects the EMIC and the various chime warning system switch and sensor inputs to their modules and to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the EMIC through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The EMIC chime warning system circuits and components cannot be adjusted or repaired. If the EMIC circuitry, the on-board transducer or the relay are damaged or ineffective, the EMIC unit must be replaced.

PARK ASSIST SYSTEM

81d35d29

Fig. 2: Park Assist System
Courtesy of CHRYSLER LLC

A park assist system is an optional factory-installed electronic parking aid. During parking and other similar vehicle maneuvers this system alerts the vehicle operator to obstacles located in the path immediately behind the vehicle which, due to the surrounding rear vehicle structure, might be otherwise difficult to perceive. When an object is detected, the system uses an electromechanical transducer and Light Emitting Diode (LED) indicators within the park assist display unit to provide the vehicle operator with visual and audible indications of the presence and proximity of such objects.

The park assist system includes the following major components, which are described in further detail elsewhere in this service information:

Instrument Cluster (1) - In vehicles equipped with the optional park assist system, the Electronic Vehicle Information Center (EVIC) within the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) displays textual warnings and error messages and emits audible warnings related to the current operating status of the park assist system and provides an interface that allows the vehicle operator to manually disable or enable the system using the customer programmable features option.

Park Assist Display (4) - Vehicles equipped with the park assist system have a park assist display unit mounted in the rear of the headliner just forward of the liftgate opening. The body of the display is concealed above the headliner where it is secured by a retainer on the back of the headliner substrate. Only the narrow, oval-shaped smoked clear lens of the display is visible on the outer surface of the headliner.

Park Assist Module (3) - Vehicles equipped with the park assist system include a park assist module

which is secured through integral mounting tabs by push-in type fasteners to the quarter inner panel above and behind the right rear wheel house where it is concealed beneath the quarter inner trim panel.

Park Assist Sensors (5) - Vehicles equipped with the park assist system have four ultrasonic park assist sensors that are concealed behind the rear bumper fascia. Each sensor is snapped into an individual molded plastic mounting bracket located at horizontal intervals along the back side of the rear bumper fascia.

Park Assist Switch (2) - The optional park assist system can be manually disabled or enabled using either a park assist switch that is integral to the instrument panel switch pod in the instrument panel center stack below the heater and air conditioner controls, or using the settings function found in the menu for the Electronic Vehicle Information Center (EVIC) of vehicles without a park assist switch in the instrument panel switch pod.

Hard wired circuitry connects the various park assist system components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other and to the vehicle electrical system through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The park assist system components cannot be adjusted or repaired. If any of the park assist system components is damaged or ineffective, that component must be replaced.

OPERATION

CHIME WARNING SYSTEM

The chime warning system operates on battery voltage received through a fuse in the Totally Integrated Power Module (TIPM) on a non-switched fused B(+) circuit so that the system may operate regardless of the ignition switch position. The chime warning system also monitors the ignition switch position so that some chime features are functional only with the ignition switch in the ON position, while others are functional regardless of the ignition switch position.

The chime warning system provides an audible indication to the vehicle operator or occupants under the following conditions:

Airbag Indicator Warning - The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) transducer will generate one short chime when the ignition switch is in the ON position, and the airbag indicator is illuminated. This warning indicates that a failure condition has been monitored affecting the operation of the Supplemental Restraint System (SRS) related components or circuits. This warning will only occur following completion of the airbag indicator bulb test, and will only occur once during any ignition cycle.

Door Ajar Warning - The EMIC/CCN will generate one short chime when the ignition switch is in the ON position, when the door ajar indicator is illuminated, or when a **DOOR(S) OPEN** textual message is displayed in the odometer Vacuum Fluorescent Display (VFD) unit of the instrument cluster. This warning indicates that a door is, or multiple doors are not closed or completely latched while the vehicle

is moving.

Fasten Seat Belt Indicator Warning - The EMIC/CCN transducer will generate repetitive chimes at a slow rate to announce that the seat belt switches and the ignition switch indicate that a front seat belt is not fastened with the ignition switch in the ON position. Vehicles with the optional Occupant Classification System (OCS) monitor both outboard front seat belts, while vehicles without OCS monitor only the driver side front seat belt. The chime warning system also supports the enhanced seat belt reminder (beltminder) when this feature is enabled. Refer to **OPERATION** .

Gate Ajar Indicator Warning - The EMIC/CCN transducer will generate one short chime when the liftgate ajar indicator is illuminated, or when a **LIFTGATE OPEN** textual message is displayed in the odometer VFD unit of the instrument cluster. This warning indicates that the liftgate is not closed or completely latched while the vehicle is moving.

Head/Park Lamps-On Warning - The EMIC/CCN transducer will generate repetitive chimes at a fast rate to indicate that inputs from the headlamp switch and the ignition switch indicate that the exterior lamps are turned ON with the ignition switch in the OFF position, and a hard wired input is received indicating that the driver side front door is open. The chimes will continue to sound until the exterior lamps are turned OFF, the driver side front door is closed, or the ignition switch is turned to the ON position, whichever occurs first.

Key-In-Ignition Warning - The EMIC/CCN transducer will generate repetitive chimes at a fast rate to indicate that inputs from the key-in ignition switch, the ignition switch, and the driver side front door ajar switch indicate that the key is in the ignition lock cylinder with the ignition switch in the OFF position with the driver side front door open. The chimes will continue to sound until the key is removed from the ignition lock cylinder, the driver side front door is closed, or the ignition switch is turned to the ON position, whichever occurs first.

Low Fuel Indicator Warning - The EMIC/CCN transducer will generate one short chime when the low fuel indicator is illuminated in the instrument cluster. This warning indicates that the monitored fuel level in the fuel tank is low. This chime will only occur once during any ignition cycle.

Park Brake Reminder - The EMIC/CCN transducer will generate one short chime when the brake/park brake indicator is illuminated to announce that the park brake is applied or not fully released and the vehicle is moving. This chime will repeat each time the input conditions are met.

Overspeed Warning - The EMIC transducer will generate one short chime when the vehicle speed is over a pre-programmed speed value. This feature is only enabled on vehicles that have been configured for sale in a Middle East Gulf Coast Country (GCC).

Park Brake Reminder - The instrument cluster chime tone generator will generate ten repetitive chimes at a slow rate to announce that the hard wired input from the park brake switch and an electronic **vehicle speed** message input received from the PCM over the CAN data bus indicates that the park brake is applied and the vehicle is moving. This chime feature will repeat each time the input conditions are met.

Sentry Key Customer Learn Mode Announcement - The EMIC/CCN transducer will generate one short chime to confirm that the Sentry Key electronic **Customer Learn** mode is active, which indicates that the Sentry Key Remote Entry Module/Wireless Control Module (SKREEM/WCM) is prepared for programming additional Sentry Key transponders. This chime feature is only active on vehicles equipped with the optional Sentry Key system, and sold in a market where Customer Learn programming is an allowed feature.

Turn Signal On Warning - The EMIC/CCN transducer will generate repetitive chimes at a slow rate to indicate that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle speed greater than 22 kilometers-per-hour (15 miles-per hour). Vehicles built for markets other than the United

States and Canada have a revised distance threshold of 4 kilometers (2.49 miles) for this feature. The chime will continue until the turn signal input becomes inactive or until the electronic **vehicle speed** message indicates that the speed is less than 22 kilometers-per-hour (15 miles-per-hour), whichever occurs first. The hazard warning flashers will not activate this chime feature.

Warning Indicator Announcement - The EMIC/CCN transducer will generate one short chime each time the Malfunction Indicator Lamp (MIL) lamp or certain other indicators are illuminated by the instrument cluster circuitry. The MIL and certain other indicators may be illuminated when any critical engine or transmission systems are operating outside of their normal parameters. The instrument cluster monitors electronic messages received over the CAN data bus to determine when to illuminate these indicators.

The EMIC/CCN provides chime service for all available features in the chime warning system, except for the audible warning function provided by each of the optional park assist system display modules. The EMIC/CCN relies upon its internal programming, numerous hard wired inputs, and electronic message inputs received from other modules over the Controller Area Network (CAN) and the Local Interface Network (LIN) data buses to provide the chime warning system features. The internal programming of the EMIC/CCN determines the priority of each chime request input that is received, as well as the rate and duration of each chime that is to be generated.

The hard wired circuits between components related to the chime warning system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the chime warning system or the electronic controls or communication between modules and other devices that provide some features of the chime warning system. The most reliable, efficient, and accurate means to diagnose the chime warning system or the electronic controls and communication related to chime warning system operation requires the use of a diagnostic scan tool.

PARK ASSIST SYSTEM

The park assist system is active only when the ignition switch is in the ON or START positions, the parking brake is released, the transmission gear selector lever is in the REVERSE position and the vehicle speed is less than 16 kilometers-per-hour (10 miles-per-hour). In vehicles equipped with this option, the system is enabled from the factory as a default. The system can be manually disabled and enabled by the vehicle operator using either the park assist switch integral to the instrument panel switch pod, or by using the settings menu of the Electronic Vehicle Information Center (EVIC) of vehicles not equipped with a park assist switch in the instrument panel switch pod. If the vehicle operator does not want the system active, momentarily depressing the park assist switch OFF button, or selecting the park assist disable setting of the EVIC will disable the system until the switch button is depressed again or the EVIC park assist setting is changed to enabled.

Reasons for disabling the system include trailer towing and off road use. With a trailer attached to the vehicle the audible and visible park assist alerts would be incessant whenever the gear selector lever was in the REVERSE position due to the proximity of the trailer to the rear of the vehicle. Similarly, operating the vehicle off road may cause the park assist alerts to become distracting due to the proximity of large trees or boulders and the extreme rear approach angles that may be encountered while maneuvering on off road trails or terrain.

When the system is disabled, a **PARK ASSIST OFF** icon and textual message will appear in the EVIC display of the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) whenever the gear selector lever is in the REVERSE position.

The microprocessor based park assist module is the central component of the park assist system. It supplies voltage to the park assist sensors and the park assist display, receives and analyzes data from the sensors, calculates and communicates the proper display information to the park assist display, performs system diagnostics, and communicates with other electronic modules in the vehicle or with a diagnostic scan tool over the Controller Area Network (CAN) data bus. The module operates on battery voltage received through a fuse in the Totally Integrated Power Module (TIPM), and is grounded through a take out of the body wire harness.

Four ultrasonic park assist sensors in the rear bumper fascia allow the park assist system to locate and identify the proximity of nearby obstacles. These sensors each generate ultrasonic sound pulses when triggered by the park assist module, then signal the module when an echo of the reflected sound pulses is received. The detection distance range from the rear of the vehicle is about 0.3 meters (11.8 inches) to about 2 meters (80 inches), and the detection height range from the ground is about 0.2 meters (7.8 inches) to about 0.8 meters (31 inches). The detection area extends somewhat around both rear sides (corners) of the vehicle.

The park assist display unit provides the vehicle operator with both visible and audible warnings indicating the relative range of a detected object. The display is visible to the vehicle operator over an inboard shoulder when looking rearward while backing the vehicle up, but is not visible in a properly adjusted inside rear view mirror when looking forward. The display contains two sets of eight Light Emitting Diode (LED) indicator units, one set dedicated to each side of the vehicle, and an audible chime tone transducer. The LED units are concealed beneath a smoked oval lens and are not clearly visible when they are not illuminated. When the park assist system is active and no obstacles are detected, the two outermost, amber LED units in the display are illuminated at a reduced intensity to provide visual confirmation that the system is operating.

The display provides a visual indication of a detected object by illuminating one or more LED indicators, amber first followed by red, moving toward the center of the display as the vehicle gets closer to the object. As the vehicle comes to within about 40 centimeters (31 inches) of the object, 1 red LED is illuminated and the display emits a series of short, intermittent, audible beeps. If the audio system is turned ON, the audio output will be muted automatically while the park assist audible warning is being generated. The audible warning changes from intermittent beeps to a continuous tone as the final red indicators are illuminated on 1 or both sides of the display and the vehicle comes to within 30.5 centimeters (12 inches) of a detected object.

When the park assist module monitors a problem in any of the park assist system circuits or components, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit, illuminates all four red LED units in the park assist display, sends an electronic message to the EVIC, and a **SERVICE PARK ASSIST SYSTEM** textual message is displayed in the EVIC display.

The hard wired circuits between components related to the park assist system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist system or the electronic controls or communication between modules and other devices that provide some features of

the park assist system. The most reliable, efficient, and accurate means to diagnose the park assist system or the electronic controls and communication related to park assist system operation requires the use of a diagnostic scan tool.

DIAGNOSIS AND TESTING

CHIME WARNING SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired circuits between components related to the chime warning system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the chime warning system or the electronic controls or communication between modules and other devices that provide some features of the chime warning system. The most reliable, efficient, and accurate means to diagnose the chime warning system or the electronic controls and communication related to chime warning system operation requires the use of a diagnostic scan tool.

PARK ASSIST SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

If a **SERVICE PARK ASSIST SYSTEM** textual message appears in the Electronic Vehicle Information Center (EVIC) display, be certain to confirm the following:

- Be certain that the rear bumper is free of dirt and debris to keep the system operating properly.
- Be certain that the parking brake is not applied.

- The presence of jackhammers, large trucks, and other vibrations in the vicinity of the vehicle could impact the performance of the system.

The hard wired circuits between components related to the park assist system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist system or the electronic controls or communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient, and accurate means to diagnose the park assist system or the electronic controls and communication related to park assist system operation requires the use of a diagnostic scan tool.

DISPLAY-PARK ASSIST

DESCRIPTION

PARK ASSIST DISPLAY

Fig. 3: Identifying Rear Park Assist Display
Courtesy of CHRYSLER LLC

The park assist display (1) is located in the headliner at the rear of the vehicle, just forward of the upper liftgate opening header. Only the smoked clear plastic display lens (3) is visible on the headliner. The lens prevents the 4 red Light Emitting Diode (LED) units and 12 amber LED units from being clearly visible unless they are illuminated by the electronic circuitry of the display.

The remainder of the display including the mounting provisions and the electrical connection are concealed above the headliner. A molded plastic housing with an integral connector receptacle (2) at one end contains and protects the electronic circuitry of the display, including an audible tone transducer and an electronic communication chip.

Fig. 4: Identifying Rear Park Assist Display Housing
Courtesy of CHRYSLER LLC

A molded plastic retainer (1) with three integral tabs (2) engages three slots integral to the display housing above the lens. The retainer is installed over the display housing above the headliner substrate to engage and securely lock the display into the opening in the headliner. An arrow and the text **REAR** are molded into an integral installation tab (3) to ensure correct retainer orientation.

The park assist display is serviced only as a complete unit. It cannot be adjusted or repaired. If ineffective or damaged, the entire display unit must be replaced.

OPERATION

PARK ASSIST DISPLAY

Fig. 5: Identifying LEDs
Courtesy of CHRYSLER LLC

The park assist display provides the vehicle operator with visual feedback by illuminating amber or red Light Emitting Diode (LED) units individually or in unison, and audible feedback by energizing an audible tone transducer on the display electronic circuit board to emit either an intermittent or a continuous tone. While the park assist system is active, the number, position and color of the illuminated LED units as well as the audible signal frequency indicate the relative position and distance of obstacles detected at the rear of the vehicle.

The park assist display receives battery current and ground from and is completely controlled by the park assist module. The display also contains an electronic communication chip that allows bi-directional communication to occur with the park assist module over a dedicated serial bus line. The microprocessor in the park assist module completely controls the display outputs, continually monitors the display status, and will store a Diagnostic Trouble Code (DTC) in memory for any monitored fault it detects in the park assist display. The illumination intensity of the LED units is also controlled by the park assist module based upon internal programming and electronic **panel lamps dimming** messages received over the Controller Area Network (CAN) data bus.

When the ignition switch is turned to the ON position, all 16 of the LED units in the display will illuminate in unison for approximately 1 second as a bulb test. This output will be interrupted if the system is active and senses an obstacle. Following the conclusion of the bulb test, when the system is active but no obstacle is detected, the display will indicate system readiness by illuminating the two outermost amber LED units (1) at a reduced intensity. As an obstacle is detected, the outermost amber LED unit (5) on the side of the vehicle where the obstacle was detected will be illuminated at normal intensity and a single short audible tone (one-half second duration) is sounded. Then additional amber LED units (6) will begin illuminating inward (2 or 4) as the obstacle gets closer until, finally, the two red LED units (7) are illuminated.

When the final red LED unit (3) is illuminated, the obstacle is approximately 40 centimeters (16 inches) from

the rear corner of the vehicle or approximately 50 centimeters (19.7 inches) from the rear bumper face and an intermittent audible tone will be generated. The frequency of the audible tone will increase as the obstacle continues to become closer until the tone is continuous when the obstacle is about 15 centimeters (6 inches) from the rear corner of the vehicle or about 30 centimeters (11.8 inches) from the rear bumper face. Whenever a park assist audible tone is being generated, the park assist module sends electronic messages to the radio over the CAN data bus to mute the audio system. The audible tone will be cancelled after about two seconds if the detected distance to the obstacle remains constant. See the PARK ASSIST DISPLAY OUTPUTS table for additional details.

The hard wired circuits between components related to the park assist display may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist display or the electronic controls or communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient, and accurate means to diagnose the park assist display or the electronic controls and communication related to park assist display operation requires the use of a diagnostic scan tool.

PARK ASSIST DISPLAY OUTPUTS				
DISPLAY LED	DETECTION DISTANCE		LED COLOR	AUDIBLE SIGNAL
	REAR CORNERS	REAR CENTER		
1st LED	-	200 cm (78.7 in.)	Amber	Single Tone (One-Half Second Duration)
2nd LED		130 cm (51.2 in.)	Amber	None
3rd LED		115 cm (45.3 in.)	Amber	None
4th LED	80 cm (31.5 in.)	100 cm (39.3 in.)	Amber	None
5th LED	65 cm (25.5 in.)	85 cm (33.5 in.)	Amber	None
6th LED	50 cm (20 in.)	70 cm (27.6 in.)	Amber	None
7th LED	40 cm (16 in.)	50 cm (19.7 in.)	Red	40 cm (16 in.) Intermittent
8th LED	15 cm (6 in.)	30 cm (11.8 in.)	Red	30 cm (11.8 in.) Continuous

REMOVAL

PARK ASSIST DISPLAY

Fig. 6: Park Assist Display
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the trim from the upper liftgate opening. Refer to **REMOVAL** .
3. Partially remove the quarter trim panel from both upper D-pillars. Refer to **REMOVAL** .
4. Carefully pull down the rear edge of the headliner (5) from the upper liftgate opening header (2) far enough to access the rear park assist display housing (3) and the display retainer (4).
5. Disconnect the wire harness connector (1) from the connector receptacle on the left end of the display housing.
6. Carefully spread the front and rear edges of the molded plastic retainer far enough to disengage the three retainer tabs from the slots in the display housing, then lift the retainer off of the display housing.
7. Push the right end of the display out through the lower surface of the headliner, then slide the display toward the right side of the vehicle far enough to disengage the connector receptacle from the headliner opening.

INSTALLATION

PARK ASSIST DISPLAY

Fig. 7: Park Assist Display
Courtesy of CHRYSLER LLC

1. Carefully position the connector receptacle on the left end of the park assist display housing (3) through the left end of the display opening in the lower surface of the headliner (5).
2. Slide the display toward the left side of the vehicle far enough to engage the right end of the display housing into the right end of the display opening in the headliner.
3. Carefully pull down the rear edge of the headliner from the upper liftgate opening header (2) far enough to access the rear park assist display housing.
4. With the display lens held flush against the lower surface of the headliner, position the molded plastic retainer (4) over the display housing with the installation tab oriented towards the rear of the vehicle.
5. Slide the retainer down over the display housing until it is flush with the headliner substrate and the three tabs of the retainer are engaged in the three slots of the display housing.
6. Reconnect the wire harness connector (1) to the connector receptacle on the left end of the display housing.
7. Reinstall the quarter trim panel onto both upper D-pillars. Refer to **INSTALLATION** .
8. Reinstall the trim onto the upper liftgate opening. Refer to **INSTALLATION** .
9. Reconnect the battery negative cable.

MODULE-PARK ASSIST

DESCRIPTION

PARK ASSIST MODULE

8192aa52

Fig. 8: Park Assist Module
Courtesy of CHRYSLER LLC

The Park Assist Module (3) is secured with three push-in plastic fasteners through three mounting tabs (2) integral to the module housing to the right inner quarter panel above the right rear wheel housing. The module is concealed beneath the quarter inner trim panel. Concealed within the molded plastic park assist module housing is a microprocessor and the other electronic circuitry of the module. The module housing is sealed to enclose and protect the internal electronic circuitry. The module software is flash programmable.

Two connector receptacles (1) containing terminal pins are integral to the forward-facing side of the housing. The module is connected to the vehicle electrical system through two dedicated take outs and connectors of the body wire harness.

The park assist module cannot be adjusted or repaired and, if damaged or ineffective, it must be replaced.

OPERATION

PARK ASSIST MODULE

The microprocessor in the park assist module contains the park assist system logic circuits. The module uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the Controller Area Network (CAN) data bus. This method of communication is also used for park assist system diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

The module provides voltage to the four park assist sensors located behind the rear bumper fascia and to the park assist display located in the headliner just forward of the liftgate opening header. The module then monitors return inputs from each of the sensors and the display on dedicated hard wired data communication circuits. The sensor inputs allow the module to determine when an obstacle is in the rear path of the vehicle and enables the module to calculate the relative location of the obstacle, and whether the distance to that obstacle is increasing or decreasing.

Pre-programmed decision algorithms and calibrations allow the module microprocessor to determine the

appropriate park assist system outputs based upon the inputs received from the park assist sensors and electronic messages received from other modules in the vehicle over the CAN data bus. When the programmed conditions are met the module sends electronic messages to the park assist displays over a dedicated serial bus to obtain the proper park assist system visual and audible outputs. The module also broadcasts electronic messages over the CAN data bus to enable the other electronic features of the park assist system.

The park assist module microprocessor continuously monitors all of the park assist system electrical circuits and components to determine the system readiness. If the module detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) and sends the appropriate electronic messages to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over the CAN data bus to control operation of certain park assist system audible warnings and textual messages displayed in the Electronic Vehicle Information Center (EVIC) display of the cluster.

The park assist module receives battery current on a fused ignition switch output (run-start) circuit through a fuse in the Junction Block (JB). The module receives ground through a ground circuit and take out of the body wire harness. These connections allow the module to be operational whenever the ignition switch is in the START or ON positions.

The hard wired circuits between components related to the park assist module may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist module or the electronic controls or communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient, and accurate means to diagnose the park assist module or the electronic controls and communication related to park assist module operation requires the use of a diagnostic scan tool.

REMOVAL

Fig. 9: Identifying Right Quarter Inner Panel, Park Assist Module, Plastic Push-In Fasteners & Body Wire Harness Connectors

Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Partially remove the trim from the right quarter inner panel to access the park assist module (2), which is located above and behind the right rear wheel house, forward of the D-pillar. Refer to **REMOVAL** .
3. Disconnect the two body wire harness connectors (4) from the park assist module connector receptacles.
4. Remove the three plastic push-in fasteners (3) that secure the module to the right quarter inner panel (1).
5. Remove the module from the right quarter inner panel.

INSTALLATION

PARK ASSIST MODULE

Fig. 10: Identifying Right Quarter Inner Panel, Park Assist Module, Plastic Push-In Fasteners & Body Wire Harness Connectors

Courtesy of CHRYSLER LLC

1. Position the park assist module (2) to the right quarter inner panel (1) behind and above the right rear wheel house, forward of the D-pillar.
2. Secure the module to the right quarter inner panel using three plastic push-in fasteners (3).
3. Reconnect the two body wire harness connectors (4) to the module connector receptacles.
4. Reinstall the trim onto the right quarter inner panel. Refer to **INSTALLATION** .
5. Reconnect the battery negative cable.

SENSOR-PARK ASSIST

DESCRIPTION

PARK ASSIST SENSOR

Fig. 11: Park Assist Sensor
Courtesy of CHRYSLER LLC

Vehicles equipped with the park assist system have four park assist sensors (1) installed on the rear bumper fascia. Only the membrane (3) of each sensor is visible through a hole in the outer vertical surface of the fascia. The remainder of each sensor including the sensor mounting bracket, the sensor spacer and the sensor wiring connection is concealed behind the fascia. A sensor wire harness behind the fascia connects the sensors to the vehicle electrical system.

Each of the four sensors is identical in construction and is interchangeable. The electronic circuitry and a communication chip for each sensor is enclosed and protected within the molded black plastic sensor housing. The housing includes an integral connector receptacle (4) and two integral latch tabs (2). The sensor membrane extends from the surface of the sensor housing, and is finished to match or contrast with the outer surface of the fascia.

Fig. 12: Locating Park Assist Sensors
Courtesy of CHRYSLER LLC

The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since this vehicle uses only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.

Fig. 13: Locating Park Assist Sensor Membranes
Courtesy of CHRYSLER LLC

A resilient O-ring spacer around the circumference of each of the four sensor membranes (2) isolates the membrane from the openings in the fascia (1). Each sensor is snapped into its own dedicated molded plastic mounting bracket. Each mounting bracket is heat-staked to the back side of the rear fascia.

The park assist sensors cannot be adjusted or repaired. If ineffective or damaged they must be replaced. The sensors and the spacers are each available for individual service replacement.

OPERATION

PARK ASSIST SENSOR

The park assist sensors are ultrasonic transceivers that are completely controlled by the park assist module. The sensors transmit and receive ultrasonic signals. The sensors each receive battery current and ground in parallel from the module, but are each connected to individual dedicated serial bus communication circuits to the module.

Each sensor membrane is oscillated, then quieted by the module in a pulsing fashion. While the sensor membrane oscillates, it emits an ultrasonic signal. This signal will bounce or echo off of objects in the path of the vehicle. While quieted, each membrane receives the echoes of the ultrasonic signals it and the other sensors have transmitted. The sensors then communicate this echo data over the serial bus lines back to the module. The microprocessor in the module uses the intervals between the ultrasonic transmission and reception data from the sensors to calculate the distance to any obstacles identified by the ultrasonic echoes.

The hard wired circuits between components related to the park assist sensors may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist sensors or the electronic controls or communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient, and accurate means to diagnose the park assist sensors or the electronic controls and communication related to park assist sensor operation requires the use of a diagnostic scan tool.

REMOVAL

PARK ASSIST SENSOR

Fig. 14: Identifying Park Assist Sensor Components
Courtesy of CHRYSLER LLC

NOTE: The park assist sensors (3) and the sensor spacers (O-rings) are each available for separate service replacement. The sensor brackets (5) are bonded to and integral to the back side of the rear bumper fascia (2).

1. Disconnect and isolate the battery negative cable.
2. Remove the rear wheel flare and loosen the bumper fascia on the same side of the vehicle as the park assist sensor requiring service. Refer to **REMOVAL**.
3. From the back of the fascia (2), disconnect the wire harness connector (4) from the park assist sensor (3) connector receptacle.
4. Carefully pry the sensor bracket (5) latch features (1) away from the top and bottom latch tabs of the sensor far enough to disengage the sensor from the bracket.
5. Disengage the O-ring spacer from around the circumference of the sensor membrane protrusion.

INSTALLATION

PARK ASSIST SENSOR

Fig. 15: Identifying Park Assist Sensor Components
 Courtesy of CHRYSLER LLC

NOTE: The park assist sensors (3) and the sensor spacers (O-rings) are each available for separate service replacement. The sensor brackets (5) are bonded to and integral to the back side of the rear bumper fascia (2).

1. Engage the O-ring spacer around the circumference of the sensor membrane protrusion.

NOTE: Production and all service replacement O-ring spacers are tapered. The wide side (base) of the O-ring should be seated against the sensor housing and the narrow side should be oriented toward the outer surface of the sensor membrane and the rear fascia.

2. Align and insert the sensor (3) into the sensor bracket (5) on the back of the rear bumper fascia (2) until the bracket latch features (1) are fully engaged over the top and bottom latch tabs of the sensor. Be certain that the sensor membrane is flush with the outer surface of the fascia.

NOTE: Be certain that each sensor membrane is properly centered in the openings of the rear fascia and that the O-ring spacers are not pinched. Improper centering or pinched O-rings can be detrimental to proper park assist sensor operation.

3. From the back of the fascia, reconnect the wire harness connector (4) to the sensor connector receptacle.
4. Reinstall the rear wheel flare and the bumper fascia on the same side of the vehicle as the park assist sensor that was serviced. Refer to **INSTALLATION**.
5. Reconnect the battery negative cable.

SWITCH-PARK ASSIST

DESCRIPTION

PARK ASSIST SWITCH

Fig. 16: Identifying Park Assist Switch
Courtesy of CHRYSLER LLC

The park assist switch (2) is integral to the instrument panel switch pod (1), which is secured to the instrument panel center bezel just below the heater and air conditioner controls. The park assist switch push button is clearly identified with a white International Control and Display Symbol graphic for **Parking Aid** and the text **OFF**. An amber Light Emitting Diode (LED) unit is illuminated behind a small clear plastic jewel-like lens in the push button to give a visual indication whenever the park assist system has been manually disabled with the ignition switch in the ON or START positions. The switch button also has panel lamps dimmer controlled illumination for night visibility.

All of the circuitry and components of the park assist switch are contained within a molded black plastic instrument panel switch pod housing. A single connector receptacle is integral to the back of the switch pod housing. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The park assist switch cannot be adjusted or repaired and, if the switch is ineffective or damaged, the entire instrument panel switch pod unit must be replaced. Refer to **REMOVAL**.

OPERATION

PARK ASSIST SWITCH

The status of the park assist switch is continually monitored by the circuitry within the instrument panel switch pod. The switch pod receives battery voltage at all times on a fused battery feed circuit, and a path to ground at all times through the instrument panel wire harness. The only other inputs to and outputs from the switch pod consist of electronic communication with the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) over the single wire Local Interface Network (LIN) data bus.

Each time the park assist switch push button is depressed the switch pod circuitry sends an electronic **park assist switch status** message input to the EMIC over the LIN data bus. The EMIC then sends an electronic **park assist switch request** message to the park assist module over the Controller Area Network (CAN) data bus. The park assist module responds to each **park assist switch request** message by toggling the status of the park assist system from enabled to disabled, or from disabled to enabled, then sends an electronic **park assist system status** message back to the EMIC over the CAN data bus as confirmation.

The EMIC responds to the system status message by sending a message to the switch pod over the LIN data bus to control the park assist switch Light Emitting Diode (LED) unit so that the LED is illuminated with the system disabled and the ignition switch in the ON or START positions, and is extinguished with the system enabled or

with the ignition switch in any position except ON or START.

The hard wired circuits between components related to the park assist switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient, and accurate means to diagnose the park assist switch or the electronic controls and communication related to park assist switch operation requires the use of a diagnostic scan tool.

2008 TRANSMISSION

Clutch - Liberty

WARNING

CLUTCH

WARNING: DaimlerChrysler does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information. Whether the product contains asbestos or not, dust and dirt can accumulate on manual clutch parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

DIAGNOSIS AND TESTING

CLUTCH

Drive the vehicle at normal speeds. Shift the transmission through all gear ranges and observe clutch action. If the clutch chatters, grabs, slips or does not release properly, remove and inspect the clutch components. If the problem is noise or hard shifting, further diagnosis may be needed as the transmission or another driveline component may be at fault.

NOTE: Vehicles equipped with a Dual Mass Flywheel may produce a rattle when the engine is shut off. This noise is considered normal.

CLUTCH CONTAMINATION

Fluid contamination is a frequent cause of clutch malfunctions. Oil, water or clutch fluid on the clutch disc and pressure plate surfaces will cause chatter, slip and grab. Inspect components for oil, hydraulic fluid or water/road splash contamination.

Oil contamination indicates a leak at either the rear main seal or transmission input shaft. Clutch fluid leaks are usually from damaged slave cylinder push rod seals. Heat buildup caused by slippage between the pressure plate, disc and flywheel can bake the oil residue onto the components. The glaze-like residue ranges in color from amber to black.

Road splash contamination is dirt/water entering the clutch housing due to loose bolts, housing cracks. Driving through deep water puddles can force water/road splash into the housing through such openings.

IMPROPER RELEASE OR CLUTCH ENGAGEMENT

Clutch release or engagement problems are caused by wear or damage clutch components. A visual inspection of the release components will usually reveal the problem part.

Release problems can result in hard shifting and noise. Look for leaks at the clutch cylinders and interconnecting line and loose slave cylinder bolts. Also worn/loose release fork, pivot stud, clutch disc, pressure plate or release bearing.

Engagement problems can result in slip, chatter/shudder and noisy operation. The causes may be clutch disc contamination, wear, distortion or flywheel damage. Visually inspect to determine the actual cause of the problem.

CLUTCH MISALIGNMENT

Clutch components must be in proper alignment with the crankshaft and transmission input shaft. Misalignment caused by excessive runout or warpage of any clutch component will cause grab, chatter and improper clutch release.

PRESSURE PLATE AND DISC RUNOUT

Check the clutch disc before installation. Axial (face) runout of a **new** disc should not exceed 0.50 mm (0.020 in.). Measure runout about 6 mm (1/4 in.) from the outer edge of the disc facing. Obtain another disc if runout is excessive.

Check condition of the clutch before installation. A warped cover or diaphragm spring will cause grab and incomplete release or engagement. Be careful when handling the cover and disc. Impact can distort the cover, diaphragm spring, release fingers and the hub of the clutch disc.

Use an alignment tool when positioning the disc on the flywheel. The tool prevents accidental misalignment which could result in cover distortion and disc damage.

A frequent cause of clutch cover distortion (and consequent misalignment) is improper bolt tightening.

FLYWHEEL RUNOUT

Check flywheel runout whenever misalignment is suspected. Flywheel runout should not exceed 0.08 mm (0.003 in.). Measure runout at the outer edge of the flywheel face with a dial indicator. Mount the indicator on a stud installed in place of one of the flywheel bolts.

Common causes of runout are:

- heat warpage
- improper machining
- incorrect bolt tightening
- improper seating on crankshaft flange shoulder
- foreign material on crankshaft flange

Flywheel machining is not recommended. The flywheel clutch surface is machined to a unique contour and machining will negate this feature. Minor flywheel scoring can be cleaned up by hand with 180 grit emery or with surface grinding equipment. Remove only enough material to reduce scoring (approximately 0.001 - 0.003 in.). Heavy stock removal is **not recommended**. Replace the flywheel if scoring is severe and deeper than

0.076 mm (0.003 in.). Excessive stock removal can result in flywheel cracking or warpage after installation; it can also weaken the flywheel and interfere with proper clutch release.

Clean the crankshaft flange before mounting the flywheel. Dirt and grease on the flange surface may cock the flywheel causing excessive runout. Use new bolts when remounting a flywheel and secure the bolts with Mopar® Lock And Seal or equivalent. Tighten flywheel bolts to specified torque only. Overtightening can distort the flywheel hub causing runout.

DIAGNOSIS CHART

The **Diagnosis Chart** describes common clutch problems, causes and correction. Conditions, causes and corrective action are outlined in the indicated columns.

Diagnosis Chart

CONDITION	POSSIBLE CAUSES	CORRECTION
Disc facing worn out	1. Normal wear. 2. Driver frequently rides (slips) the clutch. Results in rapid overheating and wear. 3. Insufficient clutch cover diaphragm spring tension.	1. Replace cover and disc. 2. Replace cover and disc. 3. Replace cover and disc.
Clutch disc facing contaminated with oil, grease, or clutch fluid.	1. Leak at rear main engine seal or transmission input shaft seal. 2. Excessive amount of grease applied to the input shaft splines. 3. Road splash, water entering housing. 4. Slave cylinder leaking.	1. Replace appropriate seal. 2. Remove grease and apply the correct amount of grease. 3. Replace clutch disc. Clean clutch cover and reuse if in good condition. 4. Replace hydraulic clutch linkage.
Clutch is running partially disengaged.	1. Release bearing sticking or binding and does not return to the normal running position.	1. Verify failure. Replace the release bearing and transmission front bearing retainer as necessary.
Flywheel below minimum thickness specification.	1. Improper flywheel machining. Flywheel has excessive taper or excessive material removal.	1. Replace flywheel.
Clutch disc, cover and/or diaphragm spring warped or distorted.	1. Rough handling. Impact bent cover, spring, or disc. 2. Improper bolt tightening procedure.	1. Replace disc or cover as necessary. 2. Tighten clutch cover using proper procedure.
Facing on flywheel side of disc torn, gouged, or worn.	1. Flywheel surface scored or nicked. 2. Clutch disc sticking or binding on transmission input shaft.	1. Correct surface condition if possible. Replace flywheel and disc as necessary. 2. Lubricate splines with high temperature grease.
Clutch disc facing burnt. Flywheel	1. Frequent operation under high	1. Correct condition of flywheel

and cover pressure plate surfaces heavily glazed.	loads or hard acceleration conditions. 2. Driver frequently rides (slips) clutch. Results in rapid wear and overheating of disc and cover.	and pressure plate surface. Replace clutch cover and disc. Alert driver to problem cause. 2. Correct condition of flywheel and pressure plate surface. Replace clutch cover and disc. Alert driver to problem cause.
Clutch disc binds on input shaft splines.	1. Clutch disc hub splines damaged during installation. 2. Input shaft splines rough, damaged, or corroded.	1. Clean, smooth, and lubricate hub splines if possible. Replace disc if necessary. 2. Clean, smooth, and lubricate shaft splines if possible. Replace input shaft if necessary.
Clutch disc rusted to flywheel and/or pressure plate.	1. Clutch not used for an extended period of time (e.g. long term vehicle storage).	1. Sand rusted surfaces with 180 grit sanding paper. Replace clutch cover and flywheel if necessary.
Pilot bearing seized, loose, or rollers are worn.	1. Bearing cocked during installation. 2. Bearing defective. 3. Bearing not lubricated. 4. Clutch misalignment.	1. Install and lubricate a new bearing. 2. Install and lubricate a new bearing. 3. Install and lubricate a new bearing. 4. Inspect clutch and correct as necessary. Install and lubricate a new bearing.
Clutch will not disengage properly.	1. Low clutch fluid level. 2. Clutch cover loose. 3. Clutch disc bent or distorted. 4. Clutch cover diaphragm spring bent or warped. 5. Clutch disc installed backwards. 6. Release fork bent or fork pivot loose or damaged. 7. Clutch master or slave cylinder failure.	1. Replace hydraulic linkage assembly. 2. Follow proper bolt tightening procedure. 3. Replace clutch disc. 4. Replace clutch cover. 5. Remove and install clutch disc correctly. 6. Replace fork or pivot as necessary. 7. Replace hydraulic linkage assembly.
Clutch pedal squeak.	1. Pivot pin loose. 2. Master cylinder bushing not lubricated. 3. Pedal bushings worn out or cracked.	1. Tighten pivot pin if possible. Replace clutch pedal if necessary. 2. Lubricate master cylinder bushing. 3. Replace and lubricate bushings.
Clutch master or slave cylinder	1. Master or slave cylinder	1. Replace clutch hydraulic

plunger dragging or binding	components worn or corroded.	linkage assembly.
Release bearing is noisy.	1. Release bearing defective or damaged.	1. Replace release bearing.
Contact surface of release bearing damaged.	1. Clutch cover incorrect or release fingers bent or distorted. 2. Release bearing defective or damaged. 3. Release bearing misaligned.	1. Replace clutch cover and release bearing. 2. Replace the release bearing. 3. Check and correct runout of clutch components. Check front bearing sleeve for damage/alignment. Repair as necessary.
Partial engagement of clutch disc. One side of disc is worn and the other side is glazed and lightly worn.	1. Clutch pressure plate position incorrect. 2. Clutch cover, spring, or release fingers bent or distorted. 3. Clutch disc damaged or distorted. 4. Clutch misalignment.	1. Replace clutch disc and cover. 2. Replace clutch disc and cover. 3. Replace clutch disc. 4. Check alignment and runout of flywheel, disc, pressure plate, and clutch housing. Correct as necessary.

STANDARD PROCEDURE

CLUTCH

Use Mopar® brake fluid, or an equivalent quality fluid meeting SAE J1703-F and DOT 3 standards only. Use fresh, clean fluid from a sealed container at all times.

Do not allow the master cylinder to run out of fluid during bleed operations. An empty cylinder will allow additional air to be drawn into the system. Check the cylinder fluid level frequently and add fluid as needed.

BLEED CLUTCH HYDRAULIC CIRCUIT

Fig. 1: Identifying Bleeder & Slave Cylinder
Courtesy of CHRYSLER LLC

1. Verify fluid level in brake master cylinder, top off brake fluid as necessary.
2. Open bleeder (1) on slave cylinder (2) and install a length of clear hose to divert fluid into suitable container. Push and hold clutch pedal down then close bleeder. Repeat this step several times.
3. Remove slave cylinder from transmission.
4. Hold slave cylinder with actuator rod pointing down and open bleeder. Push cylinder actuator rod in completely then close bleeder. Repeat this step several times.
5. Remove drain hose and replace dust cap on bleeder and install slave cylinder on transmission.
6. Actuate clutch pedal 25 times, then start engine and verify clutch operation and pedal feel.

If pedal feels spongy or clutch does not fully disengage, air is still trapped in the hydraulic circuit and must be bleed again.

PRESSURE BLEED CLUTCH HYDRAULIC CIRCUIT

Follow manufacturers instructions carefully when using pressure equipment. Do not exceed the tank manufacturers pressure recommendations. Generally, a tank pressure of 15-20 psi is sufficient for bleeding.

Fill bleeder tank with recommended DOT 3 fluid and purge air from the tank lines before bleeding.

Do not pressure bleed without a proper master cylinder adapter. The wrong adapter can lead to leakage, or drawing air back into the system. Use adapter provided with the equipment or Adapter 6921.

NOTE: When pressure bleeding system slave cylinder must be removed and actuator rod pointing downward to remove trapped air.

DISC-CLUTCH

REMOVAL

DISC CLUTCH/PRESSURE PLATE

8137541b

Fig. 2: Pressure Plate
Courtesy of CHRYSLER LLC

1. Remove transmission.
2. Mark position of pressure plate (1) on flywheel with paint or a scribe for assembly reference, if clutch is not being replaced.
3. Loosen pressure plate bolts evenly and in rotation to relieve spring tension and avoid warping the plate.
4. Remove pressure plate bolts and pressure plate and disc.

INSTALLATION

DISC CLUTCH/PRESSURE PLATE

J9106-18

Fig. 3: Aligning Clutch Disc-Typical
 Courtesy of CHRYSLER LLC

1. Lightly scuff sand flywheel face with 180 grit emery cloth, then clean with a wax and grease remover.
2. Lubricate pilot bearing with Mopar® high temperature bearing grease or equivalent.
3. Check runout and operation of **new** clutch disc.

NOTE: **Disc must slide freely on transmission input shaft splines.**

4. With the disc on the input shaft, check face runout with dial indicator. Check runout at disc hub 6 mm (1/4 in.) from outer edge of facing. Obtain another clutch disc if runout exceed 0.5 mm (0.020 in.).
5. Position clutch disc on flywheel with side marked flywheel against the flywheel.

NOTE: **If not marked, the flat side of disc hub goes towards the flywheel.**

6. Insert clutch alignment tool (3) through the clutch disc and into the pilot bearing.
7. Position clutch pressure plate (2) over disc and on the flywheel (1).
8. Install pressure plate bolts finger tight.

CAUTION: Use only the factory bolts to mount the pressure plate. The bolts

must be the correct size. If bolts are too short, there isn't enough thread engagement, if too long bolts interfere with the Dual Mass Flywheel.

9. Tighten pressure plate bolts evenly and in rotation a few threads at a time.

CAUTION: The bolts must be tightened evenly and to specified torque. Failure to follow these instructions will distort the pressure plate.

10. Tighten pressure plate bolts 33 N.m (24 ft. lbs.).
11. Apply light coat of Mopar® high temperature bearing grease or equivalent to clutch disc hub and splines of transmission input shaft.

CAUTION: Do not over lubricate shaft splines. This will result in grease contamination of disc.

12. Install transmission.

DISC CLUTCH/PRESSURE PLATE - 2.8L DIESEL

8132789b

Fig. 4: Clutch Disc
Courtesy of CHRYSLER LLC

1. Lightly scuff sand flywheel face with 180 grit emery cloth, then clean with a wax and grease remover.
2. Lubricate pilot bearing with Mopar® high temperature bearing grease or equivalent.
3. Check runout and operation of **new** clutch disc.

NOTE: **Disc must slide freely on transmission input shaft splines.**

4. With the disc on the input shaft, check face runout with dial indicator. Check runout at disc hub 6 mm (1/4 in.) from outer edge of facing. Obtain another clutch disc if runout exceed 0.5 mm (0.020 in.).
5. Position clutch disc on flywheel with side marked flywheel side (1) against the flywheel. If not marked, the flat side of disc hub goes towards the flywheel.

J9106-18

Fig. 5: Aligning Clutch Disc-Typical

6. Insert clutch alignment tool (3) through the clutch disc and into the pilot bearing.
7. Position clutch pressure plate (2) over disc and on the flywheel (1).

Fig. 6: Pressure Plate
Courtesy of CHRYSLER LLC

8. Install pressure plate bolts (1) finger tight.
9. Tighten pressure plate bolts evenly and in rotation a few threads at a time.

CAUTION: The bolts must be tightened evenly and to specified torque. Failure to follow these instruction will distort the pressure plate.

10. Tighten pressure plate bolts to 33 N.m (24 ft. lbs.).
11. Apply light coat of Mopar® high temperature bearing grease or equivalent to clutch disc hub and splines of transmission input shaft.

CAUTION: Do not over lubricate shaft splines. Failure to follow these instructions will contaminate the disc.

12. Install transmission.

BEARING-CLUTCH RELEASE

REMOVAL

BEARING-CLUTCH RELEASE

80be45ed

Fig. 7: Clutch Release Bearing
Courtesy of CHRYSLER LLC

1. Remove transmission.
2. Disconnect release bearing (1) from release fork (2) and remove the bearing.
3. Inspect bearing slide surface of transmission front bearing retainer. Replace retainer if slide surface is scored, worn, or cracked.
4. Inspect release fork and fork pivot. Be sure pivot is secure and in good condition. Be sure fork is not distorted or worn. Replace release fork retainer spring if bent or damaged.

INSTALLATION

BEARING-CLUTCH RELEASE

80be45ed

Fig. 8: Clutch Release Bearing
Courtesy of CHRYSLER LLC

1. Lubricate crankshaft pilot bearing with Mopar® high temperature bearing grease or equivalent. Apply grease to end of long shank, small diameter flat blade screwdriver. Then insert tool through clutch disc hub to reach bearing.
2. Lubricate input shaft splines, bearing retainer slide surface, fork pivot and release fork pivot surface.
3. Install new release bearing (1) and secure to release fork (2).
4. Install transmission.

FLYWHEEL

DESCRIPTION

FLYWHEEL

DUAL MASS FLYWHEEL

80c8b7b4

Fig. 9: Dual Mass Flywheel
 Courtesy of CHRYSLER LLC

The Dual Mass Flywheel is used on all engines. The flywheel incorporates the ring gear (5) around the outer circumference to mesh with the starter to permit engine cranking. The primary flywheel (6) side is bolted to the crankshaft. The secondary flywheel (3) side serves as the driving member to the clutch disc. Internal springs (4) between the flywheels are used to dampen energy. The Dual Mass Flywheel is serviced as an assembly only and should never be taken apart.

DIAGNOSIS AND TESTING

FLYWHEEL

Check flywheel runout whenever misalignment is suspected. Flywheel runout should not exceed 0.08 mm

(0.003 in.). Measure runout at the outer edge of the flywheel face with a dial indicator. Mount the indicator on a stud installed in place of one of the flywheel bolts.

Common causes of runout are:

- heat warpage
- improper machining
- incorrect bolt tightening
- improper seating on crankshaft flange shoulder
- foreign material on crankshaft flange

Flywheel machining is not recommended. The flywheel clutch surface is machined to a unique contour and machining will negate this feature. Minor flywheel scoring can be cleaned up by hand with 180 grit emery or with surface grinding equipment. Remove only enough material to reduce scoring (approximately 0.001 - 0.003 in.). Heavy stock removal is **not recommended**. Replace the flywheel if scoring is severe and deeper than 0.076 mm (0.003 in.). Excessive stock removal can result in flywheel cracking or warpage after installation; it can also weaken the flywheel and interfere with proper clutch release.

Clean the crankshaft flange before mounting the flywheel. Dirt and grease on the flange surface may cock the flywheel causing excessive runout. Use new bolts when remounting a flywheel and secure the bolts with Mopar® Lock And Seal or equivalent. Tighten flywheel bolts to specified torque only. Overtightening can distort the flywheel hub causing runout.

REMOVAL

REMOVAL

1. Remove transmission.
2. Remove clutch pressure plate and disc.
3. Remove flywheel-to-crankshaft bolts and remove flywheel assembly.

INSTALLATION

INSTALLATION

1. Clean the surfaces of the flywheel and pressure plate.
2. Install flywheel with **new** bolts and tighten in a criss-cross pattern. Tighten bolts to 95 N.m (70 ft. lbs.). On 2.8L diesel engine tighten bolts to 25 N.m (180 ft. lbs.) then rotate wrench 60°.
3. Install clutch disc and pressure plate.
4. Install transmission.

BEARING-PILOT

REMOVAL

BEARING-PILOT

1. Remove transmission.
2. Remove pressure plate and clutch disc.
3. Remove pilot bearing with an internal (blind hole) puller.

INSTALLATION

BEARING-PILOT

Fig. 10: Pilot Bearing Installer
Courtesy of CHRYSLER LLC

1. Lubricate new bearing with Mopar® high temperature bearing grease or equivalent.
2. Start new pilot bearing (1) into crankshaft by hand. Then seat bearing with clutch alignment tool (2).
3. Install clutch disc and pressure plate.
4. Install transmission.

Fig. 19: Identifying Actuator Rod & Clutch Pedal Pin
 Courtesy of CHRYSLER LLC

1. Remove steering column lower cover and knee blocker for access.
2. Disengage bushing (1) attaching clutch master cylinder actuator to pedal pivot (2).
3. Remove nuts attaching pedal and bracket to dash panel and upper cowl support.
4. Separate pedal assembly from vehicle.

INSTALLATION

PEDAL-CLUTCH

Fig. 20: Identifying Actuator Rod & Clutch Pedal Pin

Courtesy of CHRYSLER LLC

- 1. Place clutch pedal and bracket over studs on dash panel and cowl support.
- 2. Install pedal and bracket to dash panel nuts and tighten to 39 N.m (29 ft. lbs.).
- 3. Install actuator (1) on brake pedal pivot (2).

SWITCH-CLUTCH PEDAL POSITION

DESCRIPTION

SWITCH-CLUTCH PEDAL POSITION

The clutch pedal position switch is attached to the side of the clutch master cylinder.

The clutch pedal position switch override relay is located in the Power Distribution Center (PDC). Refer to PDC cover label for location within PDC.

OPERATION

SWITCH-CLUTCH PEDAL POSITION

The clutch pedal position switch is used to prevent starter motor engagement unless the clutch pedal is depressed. An input from this switch is also used to either shut down/prevent operation of the speed control system when the clutch pedal is depressed.

Four Wheel Drive Feature: The clutch pedal position switch override relay, inhibits operation of the position switch when the vehicle transfer case is in the four wheel drive low-range position. This enables the starter motor to operate without depressing the clutch pedal, for off-road applications. If Diagnostic Trouble Codes (DTC's) for the override relay or transfer case switch are stored, override relay will be inhibited.

DIAGNOSIS AND TESTING

SWITCH-CLUTCH PEDAL POSITION

START INTERLOCK TEST - DIESEL AND GAS

81a1387a

Fig. 21: Clutch Pedal Switch Connector
 Courtesy of CHRYSLER LLC

Ohm meter set on continuity: One lead on switch START INTERLOCK post 2 and second lead on COMMON post 3.

Pedal Released - No Continuity

Pedal Depressed End Of Stroke - Continuity

CRUISE TEST - DIESEL ONLY

81a1387a

Fig. 22: Clutch Pedal Switch Connector
 Courtesy of CHRYSLER LLC

Ohm meter set on continuity: One lead on switch CRUISE post 1 and second lead on COMMON post 3.

Pedal Released - Continuity

Pedal Depressed Beginning Of Stroke - No Continuity

REMOVAL

REMOVAL

Fig. 23: Identifying Wiring Harness & Pedal Position Switch
Courtesy of CHRYSLER LLC

1. Disconnect wiring harness (1) from pedal position switch (2).

Fig. 24: Identifying Pedal Position Switch
Courtesy of CHRYSLER LLC

2. Pry pedal position switch (1) off clutch master cylinder.

INSTALLATION

INSTALLATION

Fig. 25: Identifying Pedal Position Switch
Courtesy of CHRYSLER LLC

1. Snap pedal position switch (1) on clutch master cylinder.

Fig. 26: Identifying Wiring Harness & Pedal Position Switch
Courtesy of CHRYSLER LLC

2. Connect harness (1) to clutch pedal position switch (2).

FUEL 6
(GAS)

CAV	CIRCUIT	FUNCTION
1	F342 16BR/WT	FUSED ASD RELAY OUTPUT

2

K58 16BR/VT

INJECTOR 6 CONTROL

LAMP-CENTER HIGH MOUNTED STOP - LT. GRAY 2 WAY

LAMP- CENTER HIGH MOUNTED STOP

	CIRCUIT	FUNCTION
1	Z920 18BK/LB	GROUND
2	L51 18WT/DG	BRAKE LAMP SWITCH OUTPUT

LAMP-COURTESY-LEFT REAR - 3 WAY

LAMP-COURTESY-LEFT REAR

CAV	CIRCUIT	FUNCTION
A	M24 22YL/WT	COURTESY LAMP FEED
B	Z919 20BK	GROUND
C	M27 22YL/LB	DEMAND FEED

LAMP-COURTESY-RIGHT REAR - 3 WAY

LAMP- COURTESY- RIGHT REAR

CAV	CIRCUIT	FUNCTION
A	M24 22YL/WT	COURTESY LAMP FEED
B	Z919 20BK	GROUND
C	M27 22YL/LB	DEMAND FEED

LAMP-DOME - BLACK 3 WAY

LAMP- DOME

CAV	CIRCUIT	FUNCTION
1	-	-
2	M24 18YL/WT	COURTESY LAMPS DRIVER
3	Z919 18BK/DB	GROUND

LAMP-FOG-LEFT FRONT - BLACK 2 WAY

LAMP-FOG- LEFT FRONT

CAV	CIRCUIT	FUNCTION
A	L89 18WT/YL	LEFT FRONT FOG LAMP CONTROL
B	Z907 18BK/WT	GROUND

LAMP-FOG-RIGHT FRONT - BLACK 2 WAY

LAMP-FOG- LEFT FRONT

CAV	CIRCUIT	FUNCTION
A	L90 18WT/OR	RIGHT FRONT FOG LAMP CONTROL
B	Z908 18BK/DB	GROUND

LAMP-FOOTWELL-FRONT LEFT - BLACK 2 WAY

**LAMP-
FOOTWELL-
FRONT
LEFT**

CAV	CIRCUIT	FUNCTION
1	M24 20YL/WT	COURTESY LAMPS DRIVER
2	Z911 18BK/LG	GROUND

LAMP-FOOTWELL-FRONT RIGHT - BLACK 2 WAY

**LAMP-
FOOTWELL-
FRONT
RIGHT**

CAV	CIRCUIT	FUNCTION
1	M24 20YL/WT	COURTESY LAMPS DRIVER
2	Z911 18BK/PK	GROUND

LAMP-HEADLAMP-LEFT - GREEN 3 WAY (EXCEPT EXPORT) FEMALE

**LAMP-
HEADLAMP-
LEFT**

(EXCEPT EXPORT)

CAV	CIRCUIT	FUNCTION
1	L43 18WT/DB	LEFT LOW BEAM DRIVER
2	L911 18BK/LG	LEFT HEADLAMP RETURN SIGNAL
3	L33 18WT/LG	LEFT HIGH BEAM DRIVER

LAMP-HEADLAMP-LEFT - 3 WAY (EXPORT)

LAMP-
HEADLAMP-
LEFT

(EXPORT)

CAV	CIRCUIT	FUNCTION
1	L33 18WT/LG	LEFT HIGH BEAM DRIVER
2	L43 18WT/DB	LEFT LOW BEAM DRIVER
3	L911 18BK/LG	LEFT HEADLAMP RETURN SIGNAL

LAMP-HEADLAMP-RIGHT - GREEN 3 WAY (EXCEPT EXPORT) FEMALE

**LAMP-
HEADLAMP-
RIGHT**

(EXCEPT EXPORT)

CAV	CIRCUIT	FUNCTION
1	L44 18WT/TN	RIGHT LOW BEAM DRIVER
2	L910 18BK/TN	RIGHT HEADLAMP RETURN SIGNAL
3	L34 18WT/GY	RIGHT HIGH BEAM DRIVER

LAMP-HEADLAMP-RIGHT - BLACK 3 WAY (EXPORT)

**LAMP-
HEADLAMP-
RIGHT**

(EXPORT)

CAV	CIRCUIT	FUNCTION
1	L34 18WT/GY	RIGHT HIGH BEAM DRIVER
2	L44 18WT/TN	RIGHT LOW BEAM DRIVER
3	L910 18BK/TN	RIGHT HEADLAMP RETURN SIGNAL

LAMP-LICENSE - BLACK 4 WAY

LAMP-LICENSE

CAV	CIRCUIT	FUNCTION
1	L17 18WT/LG	LEFT REAR PARK LAMP CONTROL OUTPUT
2	Z920 18BK/GY	GROUND
3	Q80 20OR/VT	FLIP-UP GLASS SWITCH SENSE
4	-	-

LAMP-MAP-MIRROR MOUNTED - 4 WAY

LAMP-PARK/TURN-LEFT FRONT - BLACK 3 WAY (EXCEPT EXPORT)

**LAMP-
PARK/
TURN-
LEFT

	K399 18BR/GY	O2 2/2 HEATER CONTROL
2	Z933 18BK	GROUND
3	K904 18DB/DG	O2 RETURN (DOWN)
4	K243 18BR	O2 2/2 SIGNAL

SENSOR-PARK ASSIST-NO. 10 - 3 WAY (PARKTRONICS)

SENSOR-
PARK
ASSIST NO. 10
(PARKTRONICS)

CAV	CIRCUIT	FUNCTION

1	X700 20GY/OR	PARK ASSIST SENSOR SUPPLY
2	X750 20GY/LB	PARK ASSIST SENSOR GROUND
3	D704 20WT/DG	PARK ASSIST SENSOR NO. 10 SIGNAL

SENSOR-PARK ASSIST-NO. 11 - 3 WAY (PARKTRONICS)

**SENSOR-
PARK
ASSIST NO. 11
(PARKTRONICS)**

CAV	CIRCUIT	FUNCTION
1	X700 20GY/OR	PARK ASSIST SENSOR SUPPLY
2	X750 20GY/LB	PARK ASSIST SENSOR GROUND
3	D710 20WT	PARK ASSIST SENSOR NO. 11 SIGNAL

SENSOR-PARK ASSIST-NO. 8 - 3 WAY (PARKTRONICS)

SENSOR- PARK ASSIST NO. 8 (PARKTRONICS)

CAV	CIRCUIT	FUNCTION
1	X700 20GY/OR	PARK ASSIST SENSOR SUPPLY
2	X750 20GY/LB	PARK ASSIST SENSOR GROUND
3	D701 20WT/LB	PARK ASSIST SENSOR NO. 8 SIGNAL

SENSOR-PARK ASSIST-NO. 9 - 3 WAY (PARKTRONICS)

SENSOR-
PARK
ASSIST NO. 9
(PARKTRONICS)

CAV	CIRCUIT	FUNCTION
1	X700 20GY/OR	PARK ASSIST SENSOR SUPPLY
2	X750 20GY/LB	PARK ASSIST SENSOR GROUND
3	D703 20WT/OR	PARK ASSIST SENSOR NO. 9 SIGNAL

SENSOR-POST-CATALYST EXHAUST GAS TEMPERATURE - BLACK 2 WAY (DIESEL)

**SENSOR-
POST-
CATALYST
EXHAUST GAS
TEMPERATURE
(DIESEL)**

CAV	CIRCUIT	FUNCTION
1	K915 20BR/WT	POST-CATALYST EXHAUST GAS TEMPERATURE RETURN
2	K353 20OR/BR	POST-CATALYST EXHAUST GAS TEMPERATURE SIGNAL

SENSOR-RAIN - 4 WAY

CAV	CIRCUIT	FUNCTION
1	F306 16DB/PK	FUSED ACCESSORY RELAY OUTPUT
2	Z919 20BK	GROUND
3	D508 20WT/GY	COM LIN
4	-	-

SENSOR-SEAT TRACK POSITION-DRIVER - GRAY 2 WAY (EXCEPT EXPORT)

**SENSOR-
SEAT TRACK
POSITION-
DRIVER
(EXCEPT EXPORT)**

	CIRCUIT	FUNCTION
1	R261 20LB/WT	DRIVER SEAT TRACK POSITION SENSOR SIGNAL
2	R263 20LB/VT	DRIVER SEAT TRACK POSITION SENSOR SUPPLY

SENSOR-SEAT TRACK POSITION-PASSENGER - GRAY 2 WAY (EXCEPT EXPORT)

**SENSOR-
SEAT TRACK
POSITION-
PASSENGER**

(EXCEPT EXPORT)

CAV	CIRCUIT	FUNCTION
1	R262 20WT/LB	PASSENGER SEAT TRACK POSITION SENSOR SIGNAL
2	R264 20VT/LB	PASSENGER SEAT TRACK POSITION SENSOR SUPPLY

SENSOR-SEAT WEIGHT-LEFT FRONT - 3 WAY (EXCEPT EXPORT)

SENSOR-

CAV	CIRCUIT	FUNCTION
1	R728 20LB/YL	SEAT WEIGHT SENSOR GROUND
2	R717 20LG/DG	SEAT WEIGHT LEFT FRONT SENSOR SIGNAL
3	R701 20LG	SEAT WEIGHT SENSOR 5 VOLT SUPPLY

SENSOR-SEAT WEIGHT-LEFT REAR - 3 WAY (EXCEPT EXPORT)

3

1

CAV	CIRCUIT	FUNCTION
1	R728 20LB/YL	SEAT WEIGHT SENSOR GROUND
2	R705 20LG/OR	SEAT WEIGHT LEFT REAR SENSOR SIGNAL
3	R701 20LG	SEAT WEIGHT SENSOR 5 VOLT SUPPLY

SENSOR-SEAT WEIGHT-RIGHT FRONT - 3 WAY (EXCEPT EXPORT)

3

1

SENSOR

CAV	CIRCUIT	FUNCTION
1	R728 20LB/YL	SEAT WEIGHT SENSOR GROUND
2	R718 20LB/DG	SEAT WEIGHT RIGHT FRONT SENSOR SIGNAL
3	R701 20LG	SEAT WEIGHT SENSOR 5 VOLT SUPPLY

SENSOR-SEAT WEIGHT-RIGHT REAR - 3 WAY (EXCEPT EXPORT)

SENSOR-

CAV	CIRCUIT	FUNCTION
1	R728 20LB/YL	SEAT WEIGHT SENSOR GROUND
2	R706 20LB/OR	SEAT WEIGHT RIGHT REAR SENSOR SIGNAL
3	R701 20LG	SEAT WEIGHT SENSOR 5 VOLT SUPPLY

SENSOR-SIDE IMPACT-LEFT 1 - GRAY 4 WAY

CAV	CIRCUIT	FUNCTION
1	R13 20LG/TN	LEFT SIDE IMPACT SENSOR 1 SIGNAL
2	R15 20LG/BR	LEFT SIDE IMPACT SENSOR 1

		GROUND
3	R19 20LG/WT	LEFT SIDE IMPACT SENSOR 2 GROUND
4	R17 20LG	LEFT SIDE IMPACT SENSOR 2 SIGNAL

SENSOR-SIDE IMPACT-LEFT 2 - GRAY 4 WAY

GRAY

4

1

SENSOR-SIDE IMPACT-LEFT 2

CAV	CIRCUIT	FUNCTION

2	R19 20LG/WT	LEFT SIDE IMPACT SENSOR 2 GROUND
3	-	-
4	-	-

SENSOR-SIDE IMPACT-RIGHT 1 - GRAY 4 WAY

SENSOR-SIDE
IMPACT-
RIGHT 1

CAV	CIRCUIT	FUNCTION
1	R14 20TN/LG	RIGHT SIDE IMPACT SENSOR 1 SIGNAL
2	R16 20BR/LG	RIGHT SIDE IMPACT SENSOR 1 GROUND
3	R20 20WT/LG	RIGHT SIDE IMPACT SENSOR 2 GROUND
4	R18 20LB	RIGHT SIDE IMPACT SENSOR 2 SIGNAL

SENSOR-SIDE IMPACT-RIGHT 2 - GRAY 4 WAY

SENSOR- SIDE IMPACT- RIGHT 2

CAV	CIRCUIT	FUNCTION
1	R18 20LB	RIGHT SIDE IMPACT SENSOR 2 SIGNAL
2	R20 20WT/LG	RIGHT SIDE IMPACT SENSOR 2 GROUND
3	-	-
4	-	-

SENSOR-STEERING ANGLE - 4 WAY (ESP)

SENSOR- STEERING ANGLE (ESP)

CAV	CIRCUIT	FUNCTION
1	D65 20WT/BK	CAN C BUS (+)
2	D64 20WT/LB	CAN C BUS (-)
3	Z910 20BK/RD	GROUND (EXCEPT EVIC/EXCEPT REAR SEAT VIDEO)
3	Z910 20BK/TN	GROUND (EXCEPT EVIC/REAR SEAT VIDEO)
3	Z910C 20BK	GROUND (RHD GAS)

SENSOR-TRANSMISSION RANGE - LT. GREEN 10 WAY (RLE)

SENSOR-
TRANSMISSION
RANGE
(RLE)

CAV	CIRCUIT	FUNCTION
1	-	-
2	-	-
3	T13 18DG/VT	SENSOR GROUND
4	T54 18DG/OR	TRANSMISSION

		TEMPERATURE SIGNAL
5	-	-
6	-	-
7	T1 18DG/LB	TRS T1 SIGNAL
8	T3 18DG/DB	TRS T3 SIGNAL
9	T42 18DG/YL	TRS T42 SIGNAL
10	T41 18YL/DB	TRS T41 SIGNAL

SENSOR-WATER IN FUEL - GREEN 2 WAY (DIESEL)

**SENSOR-
WATER IN
FUEL
(DIESEL)**

CAV	CIRCUIT	FUNCTION
1	G123 20VT/LG	WATER IN FUEL SIGNAL
1	K923 20BR/WT	WATER IN FUEL RETURN (4X4)
2	K923 20BR/WT	WATER IN FUEL RETURN

SENSOR-WHEEL SPEED-ABS-LEFT FRONT - BLACK 2 WAY

**SENSOR-
WHEEL
SPEED-ABS-
LEFT
FRONT**

CAV	CIRCUIT	FUNCTION
1	B9 18DG/LG	LEFT FRONT WHEEL SPEED SENSOR SUPPLY
2	B8 18DG/TN	LEFT FRONT WHEEL SPEED SENSOR SIGNAL

SENSOR-WHEEL SPEED-ABS-LEFT REAR - BLACK 2 WAY

SENSOR-
WHEEL
SPEED-ABS-
LEFT
REAR

	CIRCUIT	FUNCTION
1	B4 18LG	LEFT REAR WHEEL SPEED SENSOR SUPPLY
2	B3 18LG/DB	LEFT REAR WHEEL SPEED SENSOR SIGNAL

SENSOR-WHEEL SPEED-ABS-RIGHT FRONT - BLACK 2 WAY

**SENSOR-
WHEEL
SPEED-ABS-
RIGHT
FRONT**

CAV	CIRCUIT	FUNCTION
1	B7 18DG/VT	RIGHT FRONT WHEEL SPEED SENSOR SUPPLY

2	B6 18DG/WT	RIGHT FRONT WHEEL SPEED SENSOR SIGNAL
---	------------	--

SENSOR-WHEEL SPEED-ABS-RIGHT REAR - BLACK 2 WAY

SENSOR-
WHEEL
SPEED-ABS-
RIGHT
REAR

CAV	CIRCUIT	FUNCTION
1	B2 18YL	RIGHT REAR WHEEL SPEED SENSOR SUPPLY
2	B1 18YL/DB	RIGHT REAR WHEEL SPEED SENSOR SIGNAL

SIREN - BLACK 3 WAY (EXPORT)

SIREN

(EXPORT)

CAV

1

2

CIRCUIT

A412 18RD

FUNCTION

FUSED B(+)

	Z908 18BK/LG	GROUND
3	D96 18WT/LB	SIREN SIGNAL CONTROL

SOLENOID-EGR - 2 WAY (DIESEL)

SOLENOID-EGR
(DIESEL)

CAV	CIRCUIT	FUNCTION
1	F344 16BR/GY	FUSED ASD RELAY OUTPUT
2	K35 20DB/VT	EGR CONTROL

SOLENOID-EVAP/PURGE - BLACK 2 WAY

SOLENOID- EVAP/ PURGE

CAV	CIRCUIT	FUNCTION
1	K70 18DB/BR	EVAP PURGE RETURN
2	K52 18DB/WT	EVAP PURGE CONTROL

SOLENOID-FUEL PRESSURE - BLACK 2 WAY (DIESEL)

SOLENOID- FUEL PRESSURE (DIESEL)

CAV	CIRCUIT	FUNCTION
1	K369 20BR/OR	FUEL PRESSURE 12 VOLT SUPPLY
1	K369 18BR/OR	FUEL PRESSURE 12 VOLT SUPPLY (4X4)
2	K370 20BR	FUEL PRESSURE CONTROL
2	K370 18BR	FUEL PRESSURE CONTROL (4X4)

SOLENOID-FUEL QUANTITY - BLACK 2 WAY (DIESEL)

SOLENOID- FUEL QUANTITY (DIESEL)

CAV	CIRCUIT	FUNCTION
1	K366 20BR/LG	FUEL QUANTITY 12 VOLT SUPPLY
2	K365 20DB/BR	FUEL QUANTITY CONTROL

SOLENOID-THROTTLE VALVE - BLACK 4 WAY (DIESEL)

**SOLENOID-
THROTTLE
VALVE
(DIESEL)**

CAV	CIRCUIT	FUNCTION
1	Z904 16BK/TN	GROUND
2	F344 16BR/GY	FUSED ASD RELAY OUTPUT
3	K54 20DB/WT	THROTTLE VALVE CONTROL
4	-	-

SPEAKER-LEFT FRONT DOOR - WHITE 3 WAY

SPEAKER- LEFT FRONT DOOR

CAV	CIRCUIT	FUNCTION
1	X201 18GY/VT	LEFT FRONT SPEAKERS (+) (EXCEPT AMPLIFIER)
2	-	-
3	X291 18GY/YL	LEFT FRONT SPEAKERS (-) (EXCEPT AMPLIFIER)

SPEAKER-LEFT REAR DOOR - WHITE 3 WAY

**SPEAKER-
LEFT
REAR
DOOR**

CAV	CIRCUIT	FUNCTION
1	X205 18GY/LG	LEFT REAR SPEAKER (+)
2	-	-
3	X295 18GY/DG	LEFT REAR SPEAKER (-)

SPEAKER-RIGHT FRONT DOOR - WHITE 3 WAY

--

SPEAKER- RIGHT FRONT DOOR

CAV	CIRCUIT	FUNCTION
1	X202 18DG/VT	RIGHT FRONT SPEAKERS (+) (EXCEPT AMPLIFIER)
2	-	-
3	X292 18DG/YL	RIGHT FRONT SPEAKERS (-) (EXCEPT AMPLIFIER)

SPEAKER-RIGHT REAR DOOR - WHITE 3 WAY

SPEAKER- RIGHT REAR DOOR

CAV	CIRCUIT	FUNCTION
1	X206 18DG/LG	RIGHT REAR SPEAKER (+)
2	-	-
3	X296 18DG/GY	RIGHT REAR SPEAKER (-)

SPEAKER-SUBWOOFER - BLACK 4 WAY (PREMIUM)

**SPEAKER-
SUBWOOFER
(PREMIUM)**

CAV	CIRCUIT	FUNCTION
1	X300 18GY/BR	AMPLIFIED SUBWOOFER 1 (+)
2	X390 18DG/BR	AMPLIFIED SUBWOOFER 1 (-)

CAV	CIRCUIT	FUNCTION
1	Z913 18BK/LB	GROUND
2	K107 18VT/WT	ESM SIGNAL

SWITCH-HOOD AJAR - BLACK 2 WAY

**SWITCH-
HOOD
AJAR**

CAV	CIRCUIT	FUNCTION
1	G70 18VT/LB	HOOD AJAR SWITCH SENSE
2	G931 18VT/BR	SENSOR GROUND

SWITCH-HORN - BLACK 2 WAY

**SWITCH-
HORN**

CAV	CIRCUIT	FUNCTION
1	X3 20DB	HORN SWITCH SENSE
2	Y13 20VT/YL	SIGNAL RETURN

SWITCH-IGNITION - BLACK 5 WAY

SWITCH-MEMORY

CAV	CIRCUIT	FUNCTION
1	-	-
2	G920 20VT/YL	MEMORY SELECT SWITCH RETURN
3	G200 20VT/BR	MEMORY SELECT SWITCH MUX
4	-	-

SWITCH-OIL PRESSURE - BLACK 2 WAY (GAS)

SWITCH-OIL PRESSURE (GAS)

CAV	CIRCUIT	FUNCTION
1	G6 16VT/GY	EOP SIGNAL
2	-	-

SWITCH-PARKING BRAKE - BLACK 1 WAY

**SWITCH-
PARKING
BRAKE**

CAV	CIRCUIT	FUNCTION
1	B25 18DG/WT	PARK BRAKE SWITCH SENSE

SWITCH-POWER WINDOW-LEFT REAR - GRAY 6 WAY

--	--	--	--	--	--

**SWITCH-
POWER
WINDOW-
LEFT**

REAR

CAV	CIRCUIT	FUNCTION
1	Q411 14OR/WT	MASTER WINDOW SWITCH LEFT REAR (UP)
2	Q15 14OR/LB	WINDOW LOCK OUT SWITCH OUTPUT
3	Q211 14TN/LB	LEFT REAR WINDOW DRIVER (DOWN)
4	Q111 14TN/YL	LEFT REAR WINDOW DRIVER (UP)
5	Z913 14BK/LB	GROUND
6	Q611 14OR/GY	MASTER WINDOW SWITCH LEFT REAR (DOWN)

SWITCH-POWER WINDOW-RIGHT REAR - GRAY 6 WAY

**SWITCH-
POWER
